October 15th, 2015

To the Honorable Members of the Scottish Parliament:

Re: Efficacy of the HPV immunisation

I have firsthand knowledge of the brain damage caused to several young girls after receiving an HPV vaccine. First and foremost, the HPV immunisation is not needed for it is unlikely that women with adequate Vitamin D levels will ever develop cervical dysplasia let alone cancer. This is a nutritional disease. If the concern was to prevent cervical cancer then Vitamin D supplements should be mandated not a dangerous vaccine.

Furthermore, an inexpensive drug, Isoprinosine will clear HPV from the human body in a couple of weeks, even the cancer causing strains. And combined with conization of the cervix this combination is extremely promising for patients who get cervical cancer.

The dark side, so to speak, of this is the HPV immunisation that not only does not perform as promised but in many will set off an immune response that will leave its victims sterile, and in others it will cause an encephalitis or death.

To date there is no evidence that this vaccine has prevented even one case of cervical cancer, so why is this apparently high risk intervention being pushed?

The answer is money of course, but this is a very sick and criminal way to make money. Yes, I have very strong opinions about this because I have had to treat victims of this vaccine, I have seen lives destroyed and girls so sick (before they died) all I could do was talk to their families on the phone.

Will no one, stand up to the medical cartel that is pushing this on our children?

Very truly yours,
