Foreword

Purpose of the series

The aim of this series is to bring together in a single place all the official Parliamentary documents relating to the passage of the Bill that becomes an Act of the Scottish Parliament (ASP). The list of documents included in any particular volume will depend on the nature of the Bill and the circumstances of its passage, but a typical volume will include:

- every print of the Bill (usually three – “As Introduced”, “As Amended at Stage 2” and “As Passed”);
- the accompanying documents published with the “As Introduced” print of the Bill (and any revised versions published at later Stages);
- every Marshalled List of amendments from Stages 2 and 3;
- every Groupings list from Stages 2 and 3;
- the lead Committee’s “Stage 1 report” (which itself includes reports of other committees involved in the Stage 1 process, relevant committee Minutes and extracts from the Official Report of Stage 1 proceedings);
- the Official Report of the Stage 1 and Stage 3 debates in the Parliament;
- the Official Report of Stage 2 committee consideration;
- the Minutes (or relevant extracts) of relevant Committee meetings and of the Parliament for Stages 1 and 3.

All documents included are re-printed in the original layout and format, but with minor typographical and layout errors corrected. An exception is the groupings of amendments for Stage 2 and Stage 3 (a list of amendments in debating order was included in the original documents to assist members during actual proceedings but is omitted here as the text of amendments is already contained in the relevant marshalled list).

Where documents in the volume include web-links to external sources or to documents not incorporated in this volume, these links have been checked and are correct at the time of publishing this volume. The Scottish Parliament is not responsible for the content of external Internet sites. The links in this volume will not be monitored after publication, and no guarantee can be given that all links will continue to be effective.

Documents in each volume are arranged in the order in which they relate to the passage of the Bill through its various stages, from introduction to passing. The Act itself is not included on the grounds that it is already generally available and is, in any case, not a Parliamentary publication.

Outline of the legislative process

Bills in the Scottish Parliament follow a three-stage process. The fundamentals of the process are laid down by section 36(1) of the Scotland Act 1998, and amplified by Chapter 9 of the Parliament’s Standing Orders. In outline, the process is as follows:
• Introduction, followed by publication of the Bill and its accompanying documents;
• Stage 1: the Bill is first referred to a relevant committee, which produces a report informed by evidence from interested parties, then the Parliament debates the Bill and decides whether to agree to its general principles;
• Stage 2: the Bill returns to a committee for detailed consideration of amendments;
• Stage 3: the Bill is considered by the Parliament, with consideration of further amendments followed by a debate and a decision on whether to pass the Bill.

After a Bill is passed, three law officers and the Secretary of State have a period of four weeks within which they may challenge the Bill under sections 33 and 35 of the Scotland Act respectively. The Bill may then be submitted for Royal Assent, at which point it becomes an Act.

Standing Orders allow for some variations from the above pattern in some cases. For example, Bills may be referred back to a committee during Stage 3 for further Stage 2 consideration. In addition, the procedures vary for certain categories of Bills, such as Committee Bills or Emergency Bills. For some volumes in the series, relevant proceedings prior to introduction (such as pre-legislative scrutiny of a draft Bill) may be included.

The reader who is unfamiliar with Bill procedures, or with the terminology of legislation more generally, is advised to consult in the first instance the Guidance on Public Bills published by the Parliament. That Guidance, and the Standing Orders, are available for sale from Stationery Office bookshops or free of charge on the Parliament’s website (www.scottish.parliament.uk).

The series is produced by the Legislation Team within the Parliament’s Chamber Office. Comments on this volume or on the series as a whole may be sent to the Legislation Team at the Scottish Parliament, Edinburgh EH99 1SP.

Notes on this volume

The Bill to which this volume relates followed the standard 3 stage process described above.

At Stage 1, the Bill was considered by a number of other committees in addition to the lead committee (the Transport, Infrastructure and Climate Change Committee). The reports of those other committees are included in the Stage 1 Report at Annexe B. Where those reports did not include the oral evidence taken by those committees, or the relevant extracts from their minutes, these are included in this volume after the committee report in Annexe B.

A number of items of further correspondence and additional submissions that were not included in the reports of the lead committee or the other committees are included in this volume at the appropriate point.

The Subordinate Legislation Committee considered the Scottish Government’s response to the Stage 1 Report at its meeting on 19 May 2009. The Committee
noted the response without comment or debate, and so no material relating to that meeting is included in this volume.

Schedule 1—The Scottish Committee on Climate Change
Schedule 2—Minor and consequential modifications
Climate Change (Scotland) Bill

[AS INTRODUCED]

An Act of the Scottish Parliament to set a target for the year 2050, an interim target for the year 2030, and to provide for annual targets, for the reduction of greenhouse gas emissions; to provide about the giving of advice to the Scottish Ministers relating to climate change; to confer power on Ministers to impose climate change duties on public bodies; to make further provision about mitigation of and adaptation to climate change; to make provision about energy efficiency; to make provision about the reduction and recycling of waste; and for connected purposes.

PART 1

EMISSIONS REDUCTION TARGETS

The 2050 target

1 The 2050 target

(1) The Scottish Ministers must ensure that the net Scottish emissions account for the year 2050 is at least 80% lower than the baseline.

(2) In this Act, the target set out in subsection (1) is known as the “2050 target”.

The interim target

2 The interim target

(1) The Scottish Ministers must ensure that the net Scottish emissions account for the year 2030 is at least 50% lower than the baseline.

(2) In this Act, the target set out in subsection (1) is known as the “interim target”.

Annual targets

3 Annual targets

(1) The Scottish Ministers must—

(a) for each year in the period 2010-2050, set a target for the maximum amount of the net Scottish emissions account;

(b) ensure that the net Scottish emissions account for each year in that period does not exceed the target set for that year.

(2) The target—
(a) for 2010, must be set at an amount that is less than the estimated net Scottish emissions account for 2009;
(b) for each year in the period 2011-2019, must be set at an amount that is less than the target for the preceding year;
(c) for each year in the period 2020-2050, must be set at an amount that is at least 3% less than the target for the preceding year.

In this Act—

(a) an “annual target” for any year means the target for the maximum amount of the net Scottish emissions account set for that year in accordance with this section and section 4;
(b) references to an annual target being met are references to the net Scottish emissions account for a year not exceeding the annual target for that year (and cognate expressions are to be construed accordingly).

4 Setting annual targets

(1) The Scottish Ministers must, by order, set the annual targets for each year in the periods mentioned in paragraphs (a) to (g) of subsection (2).

(2) The Scottish Ministers must set the annual targets for each year—

(a) in the period 2010-2022, no later than 1 June 2010;
(b) in the period 2023-2027, no later than 31 October 2011;
(c) in the period 2028-2032, no later than 31 October 2016;
(d) in the period 2033-2037, no later than 31 October 2021;
(e) in the period 2038-2042, no later than 31 October 2026;
(f) in the period 2043-2047, no later than 31 October 2031;
(g) in the period 2048-2050, no later than 31 October 2036.

(3) The Scottish Ministers must, when setting annual targets, have regard—

(a) in relation to each year in the period 2010-2030, to the achievement of the interim target and the 2050 target;
(b) in relation to each year in the period 2031-2050, to the achievement of the 2050 target.

(4) The Scottish Ministers must, when setting annual targets, also have regard to the following matters (the “target-setting criteria”—

(a) scientific knowledge about climate change;
(b) technology relevant to climate change;
(c) economic circumstances, in particular the likely impact of the target on—

(i) the Scottish economy;
(ii) the competitiveness of particular sectors of the Scottish economy;
(iii) small and medium-sized enterprises;
(d) fiscal circumstances, in particular the likely impact of the target on taxation, public spending and public borrowing;
(e) social circumstances, in particular the likely impact of the target on those living in poverty;
(f) the likely impact of the target on those living in remote and rural communities;
(g) energy policy, in particular the likely impact of the target on energy supplies, the renewable energy sector and the carbon and energy intensity of the Scottish economy;
(h) European and international law and policy relating to climate change.

5 Advice before setting annual targets

(1) The Scottish Ministers must, before laying a draft of a statutory instrument containing an order under section 4(1) before the Scottish Parliament, request advice from the relevant body.

(2) As soon as reasonably practicable after laying such a draft, the Scottish Ministers must publish a statement setting out in respect of the annual targets set by the order—

   (a) the reasons for setting those annual targets at those levels;

   (b) the extent to which those targets take account of the target-setting criteria.

(3) If the order under section 4(1) makes provision different from that recommended by the relevant body, the Scottish Ministers must publish a statement setting out the reasons why.

(4) A statement under subsection (2) or (3) may be published in such manner as the Scottish Ministers consider appropriate.

(5) In this Part, the “relevant body” means—

   (a) where no order has been made under section 19(1) designating a person or body as the advisory body, the UK Committee on Climate Change; or

   (b) where such an order has been made, the advisory body.

(6) In subsection (5)(a), the “UK Committee on Climate Change” means the Committee on Climate Change established under section 32 of the Climate Change Act 2008 (c.27) (the “2008 Act”).

6 Modifying annual targets etc.

(1) The Scottish Ministers may, by order, modify—

   (a) the percentage figure mentioned in section 3(2)(c);

   (b) an annual target set by virtue of section 4(1);

   (c) any date mentioned in paragraphs (a) to (g) of section 4(2);

   (d) the target-setting criteria in section 4(4).

(2) The Scottish Ministers may make an order under subsection (1)(a) only if they consider that it is no longer necessary for annual targets to be set by reference to that percentage figure.

(3) The Scottish Ministers may make an order under subsection (1)(b) only if they consider that it is appropriate to do so as a result of significant changes to the basis on which the annual target was set.
(4) The Scottish Ministers may make an order under subsection (1)(c) or (d) only if they consider it appropriate to do so.

(5) The power in subsection (1)(a) may not be exercised so as to substitute a percentage of less than zero.

(6) The power in subsection (1)(b)—
   (a) may be exercised only before the beginning of the year to which the target relates;
   (b) may not be exercised if the effect of doing so would be that the target for the year would be greater than the target for the preceding year.

7 Advice before modifying annual targets etc.

(1) The Scottish Ministers must, before laying a draft of a statutory instrument containing an order under section 6(1) before the Scottish Parliament, request advice from the relevant body.

(2) If the order under section 6(1) makes provision different from that recommended by the relevant body, the Scottish Ministers must publish a statement setting out the reasons why.

(3) A statement under subsection (2) may be published in such manner as the Scottish Ministers consider appropriate.

Advice on progress

8 Progress towards targets

(1) The Scottish Ministers must in each year, beginning with the year 2011, request the relevant body to prepare a report setting out that body’s views on—
   (a) progress towards achievement of—
      (i) annual targets;
      (ii) the interim target;
      (iii) the 2050 target;
   (b) whether the annual targets, the interim target or the 2050 target are likely to be achieved;
   (c) any further effort which may be necessary to achieve annual targets, the interim target or the 2050 target.

(2) In the second year following a year for which an annual target has been set (a “target year”), the Scottish Ministers must request the relevant body to prepare a report setting out that body’s views on—
   (a) whether the annual target for the target year was met;
   (b) the way in which that target was or was not met;
   (c) the action taken by the Scottish Ministers to reduce net Scottish emissions during that year.

(3) The Scottish Ministers must lay a response to the relevant body’s report under this section before the Scottish Parliament as soon as reasonably practicable after they receive that body’s report.
9 **Greenhouse gases**

(1) In this Act, a “greenhouse gas” means—

(a) carbon dioxide;
(b) methane;
(c) nitrous oxide;
(d) hydrofluorocarbons;
(e) perfluorocarbons;
(f) sulphur hexafluoride.

(2) The Scottish Ministers may, if they consider it appropriate to do so, by order, modify subsection (1) so as to—

(a) add a gas;
(b) modify the description of a gas.

(3) The power in subsection (2)(a) may be exercised only if it appears to the Scottish Ministers that an agreement or arrangement at European or international level recognises that the gas to be added contributes to climate change.

(4) The Scottish Ministers must, before laying a draft of a statutory instrument containing an order under subsection (2) before the Scottish Parliament, request advice from the relevant body.

(5) If the order makes provision different from that recommended by the relevant body, the Scottish Ministers must publish a statement setting out the reasons why.

(6) A statement under subsection (5) may be published in such manner as the Scottish Ministers consider appropriate.

10 **Baseline**

(1) In this Act, the “baseline” means the aggregate amount of—

(a) net Scottish emissions of carbon dioxide for 1990; and
(b) net Scottish emissions of each of the greenhouse gases other than carbon dioxide for the year that is the baseline year for that gas.

(2) The baseline years for greenhouse gases other than carbon dioxide are—

(a) for methane, 1990;
(b) for nitrous oxide, 1990;
(c) for hydrofluorocarbons, 1995;
(d) for perfluorocarbons, 1995;
(e) for sulphur hexafluoride, 1995.
11 Baselines for additional greenhouses gases

(1) This section applies where the Scottish Ministers have made an order under section 9(2)(a) adding a greenhouse gas.

(2) In this section, such a gas is referred to as an “additional greenhouse gas”.

(3) The Scottish Ministers may, by order, make provision as to the manner of determining, in the case of an additional greenhouse gas, the amount of net Scottish emissions for the baseline year.

(4) An order under subsection (3) may in particular—

(a) designate a year as the baseline year for the additional greenhouse gas;

(b) provide for the amount of net Scottish emissions of the gas for that year to be treated for the purposes of this Act as the amount of net Scottish emissions of that gas for that baseline year.

Supplementary

12 The net Scottish emissions account

(1) The net Scottish emissions account means the aggregate amount of net Scottish emissions of greenhouse gases—

(a) reduced by the amount of carbon units credited to the net Scottish emissions account for the period in accordance with regulations under subsection (2);

(b) increased by the amount of carbon units that, in accordance with such regulations, are to be debited from the net Scottish emissions account for the period.

(2) The Scottish Ministers may, by regulations, make provision about—

(a) the circumstances in which carbon units may be credited to the net Scottish emissions account for a period;

(b) the circumstances in which such units may be debited from that account for a period;

(c) the manner in which this is to be done.

(3) The regulations must contain provision for ensuring that carbon units that are credited to the net Scottish emissions account for a period cease to be available to offset other greenhouse gas emissions.

13 Attribution of emissions to Scotland

For the purposes of section 15(1), emissions of a greenhouse gas are attributable to Scotland if—

(a) they are emitted from sources in Scotland;

(b) they are attributed to Scotland by virtue of an order under section 14(1).

14 Scottish share of emissions from international aviation and international shipping

(1) The Scottish Ministers may, by order, make provision regarding the emissions of greenhouse gases from international aviation and international shipping that are attributable to Scotland.
(2) An order under subsection (1) may make provision—

(a) as to the period or periods (whether past or future) in which emissions of a greenhouse gas are to be taken into account as Scottish emissions of that gas;

(b) as to the manner in which such emissions are to be taken into account in determining Scottish emissions of that gas for the year that is the baseline year for that gas.

(3) The Scottish Ministers must, before laying a draft of a statutory instrument containing an order under subsection (1) before the Scottish Parliament, request advice from the relevant body.

(4) If the order makes provision different from that recommended by the relevant body, the Scottish Ministers must publish a statement setting out the reasons why.

(5) A statement under subsection (4) may be published in such manner as the Scottish Ministers consider appropriate.

15 Scottish emissions and removals

(1) In this Act—

“emissions”, in relation to a greenhouse gas, means emissions of that gas into the atmosphere that are attributable to human activity;

“Scottish emissions”, in relation to a greenhouse gas, means emissions of that gas which are attributable to Scotland;

“Scottish removals”, in relation to a greenhouse gas, means removals of that gas from the atmosphere due to land use, land-use change or forestry activities in Scotland;

“the net Scottish emissions” for a period, in relation to a greenhouse gas, means the amount of Scottish emissions of that gas for the period reduced by the amount of Scottish removals of that gas for the period.

(2) The Scottish Ministers may, if they consider it appropriate to do so, by order, modify the definition of Scottish removals in subsection (1).

(3) The amount of Scottish emissions and Scottish removals of a greenhouse gas for a period must, in so far as reasonably practicable, be determined consistently with international carbon reporting practice.

16 Measurement of emissions etc.

(1) For the purposes of this Act, greenhouse gas emissions, reductions of such emissions and removals of greenhouse gases from the atmosphere are measured or calculated in tonnes of carbon dioxide equivalent.

(2) A “tonne of carbon dioxide equivalent” means one metric tonne of carbon dioxide or an amount of any other greenhouse gas with an equivalent global warming potential (calculated consistently with international carbon reporting practice).

17 International carbon reporting practice

In this Act, “international carbon reporting practice” means accepted practice in relation to reporting for the purposes of—
(a) the protocols to the United Nations Framework Convention on Climate Change;
(b) such other agreements or arrangements at European or international level as the Scottish Ministers may, by order, specify.

18 Carbon units and carbon accounting

(1) The Scottish Ministers may, by regulations, make provision for a scheme—
(a) for registering or otherwise keeping track of carbon units;
(b) for establishing and maintaining accounts in which carbon units may be held, and between which they may be transferred, by the Scottish Ministers.

(2) Regulations under subsection (1) may, in particular, provide for an existing scheme to be adapted for these purposes.

(3) The regulations may also include provision—
(a) designating a person or body to administer the scheme;
(b) establishing a person or body for that purpose and making such provision in relation to the appointment of members, staffing, expenditure, procedure and otherwise of the person or body as the Scottish Ministers consider appropriate;
(c) conferring power on the Scottish Ministers to give guidance or directions to the person or body administering the scheme;
(d) conferring power on the Scottish Ministers to delegate the performance of any of the functions conferred on them by the regulations;
(e) requiring the payment by persons using the scheme of such charges as are reasonably required to cover the reasonable costs incurred in operating the scheme.

(4) In this Act, a “carbon unit” means a unit of a kind specified in regulations made under subsection (1) and which represents—
(a) a reduction in an amount of greenhouse gas emissions;
(b) the removal of an amount of greenhouse gas from the atmosphere;
(c) an amount of greenhouse gas emissions allowed under a scheme or arrangement imposing a limit on such emissions.

PART 2

ADVISORY FUNCTIONS

Advisory body

19 Meaning of advisory body

(1) The Scottish Ministers may, by order, designate—
(a) a body established under section 20(1); or
(b) such other public body as they consider appropriate,
to exercise the functions mentioned in subsection (3) (the “advisory functions”).

(2) In this Act, the body designated by virtue of subsection (1) is the “advisory body”.

12
Climate Change (Scotland) Bill
Part 2—Advisory functions

(3) The advisory functions are—

(a) the function of providing advice, analysis, information and other assistance to the Scottish Ministers in respect of Ministers’ functions under sections 5, 7, 8 and 9(4);

(b) the functions conferred on the advisory body by sections 22 to 27; and

(c) such other functions relating to advice on climate change as the Scottish Ministers may confer by an order under subsection (1).

(4) An order under subsection (1) may in particular provide—

(a) for the conferral of functions on the advisory body relating to advice on climate change;

(b) for the information that advice must contain;

(c) for the factors to which the body is to have regard in giving that advice;

(d) for the period within which the body must give that advice;

(e) as to whom that advice is to be given;

(f) for the form and manner in which that advice is to be published and laid before the Scottish Parliament.

(5) In subsection (1)(b), a “public body” means a person or body with functions of a public nature.

Scottish Committee on Climate Change

(1) The Scottish Ministers may, by order, establish a body for the purpose of exercising the advisory functions.

(2) The body established by virtue of subsection (1) is to be known as the Scottish Committee on Climate Change (the “Committee”).

(3) Schedule 1 makes further provision about the Committee.

(4) An order under subsection (1) may in particular provide—

(a) for the conferral of functions on the Committee relating to advice on climate change;

(b) in relation to the status, constitution and proceedings of the Committee as the Scottish Ministers consider appropriate;

(c) for the information that the Committee’s advice must contain;

(d) for the factors to which the Committee is to have regard in giving that advice;

(e) for the period within which the Committee must give that advice;

(f) as to whom that advice is to be given;

(g) for the form and manner in which that advice is to be published and laid before the Scottish Parliament.

Application of sections 22 to 27

(1) Sections 22 to 27 have effect only from—
(a) the date when an order made by the Scottish Ministers under section 19(1) comes into force; or
(b) such later date or dates as the Scottish Ministers may specify in an order under that section.

(2) When an order under section 19(1) bringing section 24 into effect comes into force, subsection (3) of section 8 ceases to have effect.

22 Advice on annual targets etc.

(1) When requested to do so by the Scottish Ministers, the advisory body must provide the Scottish Ministers with advice as regards—
(a) annual targets Ministers propose to set under section 4;
(b) a modification Ministers propose to make under section 6.

(2) When providing advice under subsection (1)(a), the advisory body must—
(a) express a view as to whether the annual targets are appropriate; and
(b) explain that view by reference to the target-setting criteria.

(3) When providing advice under subsection (1)(a), the advisory body must also express a view as to—
(a) the extent to which the annual targets should be met—
(i) by taking action to reduce net Scottish emissions;
(ii) by the use of carbon units that in accordance with regulations under section 12(2) may be credited to the net Scottish emissions account;
(b) the respective contributions towards meeting the annual targets that should be made—
(i) by the traded sector of the Scottish economy;
(ii) by the other sectors of the Scottish economy;
(c) the sectors of the Scottish economy in which there are particular opportunities for contributions to be made towards meeting the targets through reductions in emissions of greenhouse gases.

(4) The advisory body must provide advice under this section within such period as the Scottish Ministers may reasonably request.

(5) In subsection (3)(b)(i), “traded sector” means the sectors of the Scottish economy which are covered by trading schemes within the meaning of section 44 of the 2008 Act.

23 Reporting on progress towards targets

(1) The advisory body must, in each year beginning with the specified year, prepare a report setting out that body’s views on—
(a) progress towards achievement of—
(i) annual targets;
(ii) the interim target;
(iii) the 2050 target;
(b) whether the annual targets, the interim target or the 2050 target are likely to be achieved;

(c) any further effort which may be necessary to achieve annual targets, the interim target or the 2050 target.

5 (2) In subsection (1), the “specified year” means such year as the Scottish Ministers may, by order, specify.

(3) A report prepared in the second year following a year for which an annual target has been set (a “target year”), must also set out the advisory body’s views on—

(a) whether the annual target for the target year was met;

(b) the way in which that target was or was not met;

(c) the action taken by the Scottish Ministers to reduce net Scottish emissions during that year.

(4) The advisory body must lay a report under this section before the Scottish Parliament no later than—

(a) 31 January in the third year following the target year; or

(b) such other later date as the Scottish Ministers may, by order, appoint.

24 Scottish Ministers’ response to reports on progress

(1) The Scottish Ministers must lay before the Scottish Parliament a response to a report laid by the advisory body before the Parliament under section 23.

(2) The response to the advisory body’s report must be laid before the Parliament no later than—

(a) 31 March in the third year following the year for which an annual target has been set; or

(b) such later date as the Scottish Ministers may, by order, appoint.

25 Duty of advisory body to provide advice or other assistance

When requested to do so by the Scottish Ministers, the advisory body must provide advice, analysis, information or assistance as regards—

(a) the exercise of the Scottish Ministers’ functions under this Act;

(b) the exercise of Ministers’ functions in relation to climate change other than under this Act;

(c) other matters relating to climate change.

26 Guidance to advisory body

(1) The advisory body must have regard to any guidance given by the Scottish Ministers to it in relation to the exercise of its functions under this Act.

(2) The Scottish Ministers may not give the advisory body guidance as to the content of any advice or report.

(3) The power to give guidance under subsection (1) includes power to vary or revoke the guidance.
Part 3—Reporting duties

27 Power to give directions to advisory body

(1) The Scottish Ministers may, if they consider it appropriate to do so, give the advisory body directions as to the exercise of its functions under this Act.

(2) The Scottish Ministers may not direct the advisory body as to the content of any advice or report.

(3) The power to give directions under subsection (1) includes power to vary or revoke the directions.

(4) The advisory body must comply with any directions given under subsection (1).

PART 3
REPORTING DUTIES

28 Reports on annual targets

(1) The Scottish Ministers must lay before the Scottish Parliament a report in respect of each year in the period 2010-2050 for which an annual target has been set (a “target year”).

(2) The report must state whether the annual target for the target year has been met.

(3) If the annual target has not been met, the report must explain why.

(4) The report must also contain the information mentioned in section 29.

(5) The report under this section must be laid before the Parliament no later than 31 October in the second year after the target year.

29 Reports on annual targets: content

(1) In respect of each greenhouse gas, the report must—

(a) state the amount of net Scottish emissions for the baseline year;

(b) state the amount of net Scottish emissions for the target year;

(c) state whether the amount of net Scottish emissions represents an increase or decrease compared to the equivalent amount for the previous target year;

(d) identify the methods used to measure or calculate the amount of net Scottish emissions (including in particular any change to those methods).

(2) The report must also set out the aggregate amount for the target year of net Scottish emissions.

(3) The report must also—

(a) state the amount of the net Scottish emissions account for the target year;

(b) state the total amount of carbon units—

(i) that have been credited to or debited from the net Scottish emissions account for the target year;

(ii) that have been purchased in the target year;

(iii) that have been held and not surrendered in the target year;
(c) give details of the number and type of those carbon units.

(4) The report must also—
(a) state the amount of Scottish gross electricity consumption for the target year;
(b) state the amount of Scottish electricity generation for the target year.

(5) If the method of measuring or calculating net Scottish emissions changes and that change is such as to require adjustment of an amount for an earlier target year, the report must specify the adjustment required and state the adjusted amount.

(6) An adjustment under subsection (5) must, in so far as reasonably practicable, be made in accordance with international carbon reporting practice.

(7) The report may contain such other information as the Scottish Ministers consider appropriate and, in particular, may state the amount of Scottish electricity generation from each source for the target year.

#### 30 Reports on proposals and policies for meeting annual targets

(1) As soon as reasonably practicable after making an order under section 4(1) setting annual targets, the Scottish Ministers must lay before the Scottish Parliament a report containing the following information.

(2) The report must, in particular, set out—
(a) the Scottish Ministers’ proposals and policies for meeting the annual targets;
(b) how those proposals and policies are expected to contribute towards the achievement of the interim target and the 2050 target;
(c) the timescales over which those proposals and policies are expected to take effect.

(3) The report must also explain how the proposals and policies set out in the report are expected to affect different sectors of the Scottish economy.

(4) The second and each subsequent report under this section—
(a) must contain an assessment of the progress towards implementing proposals and policies set out in earlier reports;
(b) may make such adjustments to those proposals and policies as the Scottish Ministers consider appropriate.

#### 31 Reports on proposals and policies where annual targets not met

(1) This section—
(a) applies if the Scottish Ministers lay a report under section 28 which states that an annual target has not been met;
(b) does not apply if that report relates to the annual target for 2050.

(2) As soon as reasonably practicable after the report referred to in subsection (1)(a) has been laid, the Scottish Ministers must lay a report before the Scottish Parliament setting out proposals and policies to compensate in future years for the excess emissions.

#### 32 Report on the interim target

(1) The Scottish Ministers must lay before the Scottish Parliament a report containing the following information in respect of the year 2030.
(2) The report must state whether the interim target has been met.
(3) If the interim target has not been met, the report must explain why.
(4) In respect of each greenhouse gas, the report must state the amount of net Scottish emissions for 2030.

(5) The report must also—
   (a) state the amount of the net Scottish emissions account for 2030;
   (b) state the total amount of carbon units—
      (i) that have been credited to or debited from the net Scottish emissions account for 2030;
      (ii) that have been purchased in 2030;
      (iii) that have been held and not surrendered in 2030;
   (c) give details of the number and type of those carbon units.

(6) In subsections (4) and (5), the amount means the amount set out in the report for 2030 made under section 28.
(7) The report may contain such other information as the Scottish Ministers consider appropriate.
(8) The report under this section must be laid before the Parliament no later than 31 October 2032.

### Report on the 2050 target

(1) The Scottish Ministers must lay before the Scottish Parliament a report containing the following information in respect of the year 2050.
(2) The report must state whether the 2050 target has been met.
(3) If the 2050 target has not been met, the report must explain why.
(4) In respect of each greenhouse gas, the report must state the amount of net Scottish emissions for 2050.

(5) The report must also—
   (a) state the amount of the net Scottish emissions account for 2050;
   (b) state the total amount of carbon units—
      (i) that have been credited to or debited from the net Scottish emissions account for 2050;
      (ii) that have been purchased in 2050;
      (iii) that have been held and not surrendered in 2050;
   (c) give details of the number and type of those carbon units.

(6) In subsections (4) and (5), the amount means the amount set out in the report for 2050 made under section 28.
(7) The report may contain such other information as the Scottish Ministers consider appropriate.
(8) The report under this section must be laid before the Parliament no later than 31 October 2052.
34 Reports: provision of further information to the Scottish Parliament

(1) Where the Scottish Ministers lay a report mentioned in subsection (2) before the Scottish Parliament, they must, as soon as reasonably practicable after doing so, and in so far as reasonably practicable, make a statement to the Parliament relating to the report.

(2) Those reports are reports under—
   (a) section 28(1) (report on annual target);
   (b) section 30(1) (report on proposals and policies for meeting annual targets);
   (c) section 31(2) (report on proposals and policies to compensate for excess emissions);
   (d) section 32(1) (report on interim target);
   (e) section 33(1) (report on 2050 target).

(3) Where the Scottish Ministers lay a report referred to in subsection (2)(a), they must also, as soon as reasonably practicable after doing so, and in so far as reasonably practicable, meet with the persons who convene and chair such committees of the Scottish Parliament as are for the time being appointed by virtue of standing orders.

35 Further provision about reporting duties

(1) The Scottish Ministers may, if they consider it appropriate to do so, by order, make further provision imposing duties on themselves to report to the Scottish Parliament.

(2) An order under subsection (1) may in particular—
   (a) provide for the information to be provided under the duties;
   (b) provide for the period in relation to which that information is to be provided;
   (c) provide for the period within which that information is to be provided.

PART 4

DUTIES OF PUBLIC BODIES RELATING TO CLIMATE CHANGE

Duties of public bodies

36 Duties of public bodies relating to climate change

(1) The Scottish Ministers may, if they consider it appropriate to do so, by order, make provision relating to the imposition on public bodies of duties relating to climate change (“climate change duties”).

(2) In this Part, a public body which has climate change duties by virtue of subsection (1) is a “relevant public body”.

(3) An order under subsection (1) may in particular—
   (a) impose climate change duties on—
      (i) all public bodies;
      (ii) public bodies of a particular description;
      (iii) individual public bodies;
(b) impose different climate change duties on different public bodies or descriptions of public body;
(c) remove climate change duties.

(4) Before laying a draft of a statutory instrument containing an order under subsection (1) before the Scottish Parliament, the Scottish Ministers must consult, in so far as reasonably practicable, the persons mentioned in subsection (5).

(5) Those persons are—
(a) such associations of local authorities; and
(b) such other persons,
as the Scottish Ministers consider appropriate.

(6) The Scottish Ministers must co-operate with a relevant public body to help that body comply with its climate change duties.

37 Guidance to relevant public bodies

(1) Relevant public bodies must have regard to any guidance given by the Scottish Ministers to them in relation to climate change duties.

(2) Before giving guidance under subsection (1), the Scottish Ministers must consult, in so far as reasonably practicable, the persons mentioned in subsection (3).

(3) Those persons are—
(a) such associations of local authorities; and
(b) such other persons,
as the Scottish Ministers consider appropriate.

(4) The Scottish Ministers may vary or revoke guidance given under this section and where guidance is varied to a substantial extent, subsections (2) and (3) apply.

(5) The Scottish Ministers must publish any guidance given under this section.

38 Reporting on climate change duties

(1) The Scottish Ministers may, by order, make provision—
(a) requiring relevant public bodies to prepare reports on compliance with climate change duties;
(b) setting out what information reports must contain;
(c) setting out the form and manner of reports;
(d) setting out the period within which reports must be sent to the Scottish Ministers.

(2) An order under subsection (1) may in particular—
(a) require two or more relevant public bodies to prepare a joint report in relation to compliance with one or more climate change duties; and
(b) require those bodies to co-operate with each other for the purpose of preparing that report.
39 **Appointment of monitoring body**

(1) The Scottish Ministers may, by order, designate one or more persons or bodies to monitor whether relevant public bodies are—

(a) complying with climate change duties;

(b) having regard to any guidance given under section 37.

(2) In this Part, a person or body designated under subsection (1) is the “monitoring body”.

40 **Investigations**

(1) The monitoring body may carry out an investigation into—

(a) a relevant public body’s compliance with climate change duties;

(b) whether a relevant public body is having regard to guidance given under section 37.

(2) The monitoring body must carry out an investigation if the Scottish Ministers direct it to do so.

41 **Investigations: investigators’ powers**

(1) In this section an “investigator” means—

(a) the monitoring body;

(b) a person authorised by the monitoring body for the purpose of carrying out investigations.

(2) An investigator may use the powers set out in subsections (3) to (5) if the investigator considers that it is necessary to do so for the purposes of or in connection with an investigation.

(3) An investigator may, by notice in writing, require any relevant public body to provide any relevant document or relevant information in the possession, or under the control, of the relevant public body.

(4) An investigator may require any person who possesses or controls any document or information referred to in subsection (3) to provide an explanation of the document or information.

(5) An investigator may take copies of, or extracts from, any document or information produced in accordance with subsection (3).

(6) Nothing in this section authorises an investigator to require the disclosure of anything which a person would be entitled to refuse to disclose on grounds of confidentiality in proceedings in the Court of Session.

42 **Reporting by monitoring body**

(1) The Scottish Ministers may direct the monitoring body to prepare a report relating to—

(a) the monitoring body’s activities under this Act;

(b) investigations carried out by the monitoring body;
(c) its use of resources in carrying out its functions under this Act;
(d) any other matters the Scottish Ministers may direct.

(2) The report may include information relating to a continuing investigation only if the Scottish Ministers direct that information to be included.

(3) The monitoring body must send the report to the Scottish Ministers.

### Guidance to monitoring body

(1) The monitoring body must have regard to any guidance given by the Scottish Ministers to it in relation to the exercise of its functions under this Part.

(2) Before giving guidance under subsection (1), the Scottish Ministers must consult, in so far as reasonably practicable, the persons mentioned in subsection (3).

(3) Those persons are—
   (a) the monitoring body; and
   (b) such other persons,

   as the Scottish Ministers consider appropriate.

(4) The Scottish Ministers may vary or revoke guidance given under this section and where guidance is varied to a substantial extent, subsections (2) and (3) apply.

(5) The Scottish Ministers must publish any guidance given under this section.

### Power to direct monitoring body

(1) The Scottish Ministers may give directions to the monitoring body relating to the exercise of its functions under this Part.

(2) The Scottish Ministers may vary or revoke a direction given under this section.

(3) The monitoring body must comply with a direction given under this section.

---

**PART 5**

**OTHER CLIMATE CHANGE PROVISIONS**

**CHAPTER 1**

**Adaptation**

**Adaptation programmes**

**Programmes for adaptation to climate change**

(1) This section applies where the Secretary of State lays a report under section 56 of the 2008 Act (report on impact of climate change) before Parliament.

(2) The Scottish Ministers must lay a programme before the Scottish Parliament—
   (a) addressing the risks identified in the report under section 56 of the 2008 Act; and
   (b) in particular, setting out—
(i) the Scottish Ministers’ objectives in relation to adaptation to climate change;

(ii) their proposals and policies for meeting those objectives;

(iii) the period within which those proposals and policies will be introduced.

Where the report laid under section 56 of the 2008 Act is a subsequent report (within the meaning of subsection (3) of that section), the programme under this section must contain an assessment of the progress made towards implementing the objectives, proposals and policies set out in the previous programme laid under subsection (2).

(4) The Scottish Ministers must lay each programme under this section as soon as reasonably practicable after the Scottish Ministers receive the Secretary of State’s report.

Muirburn

46 Variation of permitted times for making muirburn

After section 23 of the Hill Farming Act 1946 (c.73) (prohibition of muirburn at certain times), insert—

“23A Power to vary permitted times for making muirburn

(1) The Scottish Ministers may, by order, specify such dates as they consider appropriate as the dates before which or after which it is lawful to make muirburn in any year.

(2) Where such an order has effect, section 23 applies as if the dates specified in the order were substituted for the dates mentioned in subsection (1), (2) or, as the case may be, (3) of that section.

(3) The Scottish Ministers may make an order under subsection (1) only if they consider it necessary or expedient to do so in relation to climate change.

(4) The power conferred by subsection (1) is exercisable by statutory instrument.

(5) A statutory instrument containing an order under subsection (1) is subject to annulment in pursuance of a resolution of the Scottish Parliament.”.

CHAPTER 2

FORESTRY

47 Power to modify functions of Forestry Commissioners

(1) The Scottish Ministers may, by order, modify the functions of the Forestry Commissioners in or as regards Scotland.

(2) The Scottish Ministers may make an order under subsection (1) only where they consider it necessary or expedient to do so—

(a) in order to comply with their duty under section 1, 2 or 3(1)(b); or

(b) otherwise in relation to climate change.

(3) An order under subsection (1) may in particular include provision enabling the Forestry Commissioners to—

(a) form, or participate in the forming of, a body corporate;
20 Climate Change (Scotland) Bill
Part 5—Other climate change provisions
Chapter 3—Energy efficiency

(b) invest in a body corporate;
(c) provide loans;
(d) establish a trust;
(e) act, or appoint a person to act, as—

5

(i) an officer of a body corporate; or
(ii) a trustee of a trust.

4 The order may also make provision about the delegation by the Forestry Commissioners
of their functions, including—

(a) the circumstances in and purposes for which those functions may be delegated;
(b) the functions which may be delegated;
(c) the persons to whom such functions may be delegated.

CHAPTER 3
ENERGY EFFICIENCY

Promotion of energy efficiency

48 Duty of Scottish Ministers to promote energy efficiency

15 (1) The Scottish Ministers must prepare and publish a plan for the promotion of energy

efficiency in Scotland.

(2) That plan must include provision about the promotion of the energy efficiency of living

accommodation.

20 (3) The plan prepared under subsection (1) must be published no later than 12 months after

the day on which this section comes into force.

(4) The Scottish Ministers—

(a) may, from time to time; and
(b) must, before the end of the period mentioned in subsection (5),

review the plan prepared and published under this section.

25 (5) The period referred to in subsection (4)(b) is the period of 3 years beginning with the
date on which—

(a) the plan is first published; or
(b) the plan was last reviewed under subsection (4).

30 (6) Where, following a review under subsection (4), the Scottish Ministers vary the plan,
they must, as soon as reasonably practicable after so doing, publish the plan as so varied.

(7) In preparing or varying the plan, the Scottish Ministers must have regard to the
contributions which improvements to buildings and changes in building standards can
make to the delivery of energy efficiency and to the reduction of greenhouse gas

emissions.

35 (8) In this section—

“energy efficiency” includes the use of—
(a) technologies reliant on renewable sources of energy; and
(b) materials the manufacture or use of which produces or involves lower emissions of greenhouse gases than other materials;

“fossil fuel” means—

(a) coal;
(b) lignite;
(c) peat;
(d) natural gas (within the meaning of the Energy Act 1976 (c.76));
(e) crude liquid petroleum;
(f) petroleum products (within the meaning of that Act);
(g) any substance produced directly or indirectly from a substance mentioned in paragraphs (a) to (f);

“renewable sources” means sources other than fossil fuel and nuclear fuel.

49 Laying of plans and reports

(1) The Scottish Ministers must, as soon as reasonably practicable after publishing a plan under section 48(1) or (6), lay it before the Scottish Parliament.

(2) The Scottish Ministers must, before the end of the period mentioned in subsection (3), lay before the Parliament a report on what steps have been taken in implement of the plan.

(3) The period referred to in subsection (2) is the period of 12 months beginning with the date on which—

(a) the plan is first published; or
(b) a report was last laid under subsection (2).

Energy performance of non-domestic buildings

50 Non-domestic buildings: assessment of energy performance and emissions

(1) The Scottish Ministers may, by regulations, make provision relating to the assessment of—

(a) the energy performance of non-domestic buildings;
(b) the emission of greenhouse gases produced by or otherwise associated with such buildings or with activities carried out in such buildings.

(2) The regulations may in particular include provision about—

(a) the circumstances in which the regulations apply;
(b) the non-domestic buildings to which the regulations apply;
(c) the persons who may be required to have assessments carried out;
(d) the periods within which such assessments must be carried out;
(e) the procedure and methodology for assessing the energy performance of buildings;
(f) the procedure and methodology for assessing the greenhouse gas emissions produced by or otherwise associated with buildings or activities;

(g) the persons who may carry out such assessments;

(h) the issuing of certificates following such assessments, including the form, manner and content of such certificates;

(i) subject to subsection (3), the enforcement authority in relation to the regulations;

(j) subject to subsection (4), the functions of that authority;

(k) the keeping of information and its production to the enforcement authority;

(l) the enforcement of the duties imposed by the regulations;

(m) offences in relation to failures to comply with requirements of the regulations.

(3) The enforcement authority provided for in the regulations is to be—

(a) a local authority; or

(b) such other person or body as the Scottish Ministers consider appropriate.

(4) The functions of the enforcement authority may include power to levy charges to recover the reasonable costs incurred by it in exercising its functions under the regulations.

(5) In this section, “non-domestic building”—

(a) means a building other than a dwelling;

(b) does not include—

(i) any yard, garden, outbuilding or other land or buildings;

(ii) any common areas, associated with such a dwelling.

---

**Renewable heat**

(1) The Scottish Ministers must take such steps as they consider appropriate to promote the use of heat produced from renewable sources.

(2) The steps which the Scottish Ministers may take for the purposes of subsection (1) include, in particular, steps to promote—

(a) the installation of plant which is or may be fuelled by renewable sources;

(b) the adaptation of plant so as to enable it to be fuelled by renewable sources;

(c) the production of heat by plant which is fuelled partly by renewable sources and partly by other sources.

(3) For the purposes of subsection (1), heat produced by any plant is produced from renewable sources to the extent that the plant is fuelled by renewable sources.

(4) In this section—

“plant” includes any equipment, apparatus or appliance;

“renewable sources” has the same meaning as in section 48.
CHAPTER 4

WASTE REDUCTION AND RECYCLING

Waste prevention and management plans

52 Waste prevention and management plans

(1) The Scottish Ministers may, by regulations, require persons of the kinds specified—
   (a) to prepare plans for the prevention, reduction, management, recycling, use and
disposal of waste produced by or otherwise associated with their activities;
   (b) to comply with those plans.

(2) The regulations may in particular include provision about—
   (a) the circumstances in which plans must be prepared, including when more than one
plan must be prepared;
   (b) the kinds of waste in relation to which plans must be prepared;
   (c) the periods—
      (i) to which plans relate;
      (ii) within which plans must be prepared;
   (d) the content of plans;
   (e) subject to section 60—
      (i) the enforcement authority in relation to the regulations; and
      (ii) the functions of that authority, including the approval by it of plans
prepared under the regulations;
   (f) the keeping of plans and other information and their production to the
enforcement authority;
   (g) the enforcement of the duties imposed by the regulations;
   (h) offences in relation to failures to comply with requirements of the regulations.

(3) The enforcement authority must have regard to any guidance given by the Scottish
Ministers to it in relation to the functions conferred on it by the regulations.

(4) In this Chapter—
   “recycling”, in relation to any waste, includes recovery and re-use (whether or not
the waste is subjected to any process) (and cognate expressions are to be
construed accordingly);
   “specified” means specified in regulations (and cognate expressions are to be
construed accordingly);
   “waste” has the meaning given by section 75(2) of the Environmental Protection
Act 1990 (c.43) (the “1990 Act”).
53 **Information on waste**

(1) The Scottish Ministers may, by regulations, require persons of the kinds specified to provide SEPA with information on the waste produced by or otherwise associated with such persons’ activities.

(2) The regulations may in particular include provision about—

(a) the circumstances in which information must be provided;

(b) the information required to be provided, including the periods to which the information relates;

(c) the form and manner in which information must be provided;

(d) the periods within which information must be provided;

(e) the functions of SEPA in relation to the regulations;

(f) the keeping of information and its production to SEPA;

(g) the enforcement of the duties imposed by the regulations;

(h) offences in relation to failures to comply with requirements of the regulations.

(3) The power to make regulations under this section is without prejudice to section 34(5) of the 1990 Act and any other enactment to the same effect as that section; and any duty imposed on any person by regulations under this section is without prejudice to any duty to provide information on waste imposed by regulations under that section or by virtue of any other such enactment.

(4) SEPA may give guidance to persons to whom the regulations apply on how to comply with the requirements of the regulations.

(5) In this section and in section 60, “SEPA” means the Scottish Environment Protection Agency.

54 **Recyclable waste: facilities for deposit etc.**

(1) The Scottish Ministers may, by regulations, require—

(a) persons of the kinds specified to provide facilities for the deposit of waste;

(b) authorised persons—

     (i) to collect waste deposited by virtue of paragraph (a);

     (ii) to ensure, in so far as reasonably practicable, that such waste collected by or transferred to them (whether in accordance with section 34 of the 1990 Act or otherwise) is recycled.

(2) The regulations may in particular include provision about—

(a) the circumstances in which facilities must be provided, including the places at which they must be provided;

(b) the persons for whom facilities must be provided;

(c) the kinds of waste for which facilities must be provided;
(d) the circumstances in which authorised persons must collect waste, including which authorised persons must do so;

(e) the charging by authorised persons for collecting waste, for recycling waste and for otherwise ensuring waste is recycled;

(f) subject to section 60—

(i) the enforcement authority in relation to the regulations; and

(ii) the functions of that authority;

(g) the keeping of records and their production to the enforcement authority;

(h) the enforcement of the duties imposed by the regulations;

(i) offences in relation to failures to comply with requirements of the regulations.

(3) The enforcement authority must have regard to any guidance given by the Scottish Ministers to it in relation to the functions conferred on it by the regulations.

(4) The Scottish Ministers may not, by regulations under this section, impose requirements on persons to provide facilities for the deposit of waste in circumstances in relation to which regulations under section 55 may be made.

(5) In this section and in section 55, “authorised person” has the same meaning as in section 34(3) of the 1990 Act.

55 Recyclable waste: facilities for deposit at events etc.

(1) The Scottish Ministers may, by regulations, confer power on local authorities to issue notices requiring—

(a) persons responsible for organising temporary events open to the public to provide facilities for the deposit of waste by persons attending those events;

(b) authorised persons to—

(i) collect waste deposited by virtue of paragraph (a);

(ii) ensure, in so far as reasonably practicable, that such waste collected by or transferred to them (whether in accordance with section 34 of the 1990 Act or otherwise) is recycled.

(2) The regulations may in particular include provision about—

(a) the events in relation to which notices can be issued;

(b) the circumstances in which facilities must be provided, including the places at which they must be provided;

(c) the persons for whom facilities must be provided;

(d) the kinds of waste for which facilities must be provided;

(e) the persons to whom notices can be issued;

(f) the content of notices;

(g) the form of and manner in which notices can be issued, including the times at which notices can be issued;

(h) appeals against notices;
(i) the circumstances in which authorised persons must collect waste, including which authorised persons must do so;

(j) the charging by authorised persons for collecting waste, recycling waste and otherwise ensuring waste is recycled;

(k) subject to section 60—
   (i) the enforcement authority in relation to notices; and
   (ii) the functions of that authority;

(l) the keeping of records by persons to whom notices are issued and their production to the enforcement authority;

(m) the enforcement of duties imposed by notices;

(n) offences in relation to failures to comply with requirements of notices.

(3) Local authorities must have regard to any guidance given by the Scottish Ministers to them in relation to the functions conferred on them by the regulations.

(4) The enforcement authority must have regard to any guidance given by the Scottish Ministers to it in relation to the functions conferred on it by the regulations.

Procurement of recyclate

56 Procurement of recyclate

(1) The Scottish Ministers may, by regulations, require persons of the kinds specified to comply with the requirement in subsection (2).

(2) That requirement is to ensure that things procured or constructed by or on behalf of such persons—
   (a) comprise of; or
   (b) include or contain a certain proportion of, recyclate.

(3) The regulations may in particular include provision about—
   (a) the circumstances in which the requirement applies;
   (b) the kinds of things in relation to which the requirement applies;
   (c) the proportion of recyclate that such things must include or contain;
   (d) how such proportions are to be determined;
   (e) the circumstances in which a person may apply to the Scottish Ministers to have the requirement disapplied;
   (f) subject to section 60—
       (i) the enforcement authority in relation to the regulations; and
       (ii) the functions of that authority;
   (g) the keeping of records and their production to the enforcement authority;
   (h) the enforcement of the duties imposed by the regulations;
   (i) offences in relation to failures to comply with requirements of the regulations.
(4) The enforcement authority must have regard to any guidance given by the Scottish Ministers to it in relation to the functions conferred on it by the regulations.

(5) Persons to whom the regulations apply must have regard to any guidance given by—
   (a) the Scottish Ministers;
   (b) the enforcement authority,
   to them in relation to the requirements imposed by the regulations.

(6) In this section, “recyclate” means waste that has been recycled.

**Reduction of packaging**

57 **Targets for reduction of packaging etc.**

10 (1) The Scottish Ministers may, by regulations—
   (a) set targets—
       (i) for the reduction of packaging;
       (ii) for the reduction of greenhouse gas emissions produced by the manufacture of or otherwise associated with packaging;
   (b) require persons of the kinds specified to comply with those targets.

(2) The regulations may in particular include provision about—
   (a) the circumstances in which the requirement in subsection (1)(b) applies;
   (b) the kinds of packaging in relation to which targets may be set;
   (c) the targets in relation to such packaging (including how targets may be set);
   (d) the methods of determining whether targets have been met;
   (e) subject to section 60—
       (i) the enforcement authority in relation to the regulations; and
       (ii) the functions of that authority;
   (f) the keeping of records and other information and their production to the enforcement authority (including the periods to which records or information must relate and within which it must be produced to the authority);
   (g) the enforcement of the duties imposed by the regulations;
   (h) offences in relation to failures to comply with requirements of the regulations.

(3) The enforcement authority must have regard to any guidance given by the Scottish Ministers to it in relation to the functions conferred on it by the regulations.

(4) In this section and in section 58, “packaging” has the meaning given by Article 3 of Directive 94/62/EC of the European Parliament and of the Council on packaging and packaging waste.

**Deposit and return**

58 **Deposit and return schemes**

(1) The Scottish Ministers may, by regulations, establish deposit and return schemes.
(2) A “deposit and return scheme” is a scheme under which—
(a) the sale price of articles includes a returnable element (a “deposit”);
(b) persons who return the packaging associated with such articles are entitled to be
paid a sum equal to that deposit.

(3) Retailers may be required, under a deposit and return scheme, to—
(a) include a deposit in the price of articles placed on the market by them;
(b) pay a sum equal to the deposit to persons who return packaging associated with
such articles to them;
(c) return such packaging to the producers of it or of the articles with which it is
associated.

(4) Producers may be required, under a deposit and return scheme, to—
(a) include a deposit in the price of articles placed on the market by them;
(b) pay a sum equal to the deposit to retailers who return packaging to them;
(c) ensure that some or all of such packaging is recycled.

(5) A deposit and return scheme may also provide for a person or body (in place of retailers
and producers) to—
(a) ensure that deposits are included in the price of articles placed on the market;
(b) receive returned packaging;
(c) pay sums equal to deposits to persons who return such packaging;
(d) return such packaging to the producers of it or of the articles with which it is
associated;
(e) recover sums equal to deposits from such producers;
(f) ensure that some or all of the packaging returned is recycled.

(6) The Scottish Ministers may make regulations under this section only where they
consider it necessary or expedient to do so for the purpose of promoting or securing an
increase in the recycling of materials.

(7) The regulations may in particular include provision about—
(a) the persons who are retailers and producers for the purposes of deposit and return
schemes;
(b) the articles to which such schemes apply;
(c) the deposits to be included in the price of such articles;
(d) the packaging associated with such articles, the return of which entitles persons
returning it to payment of sums equal to deposits;
(e) the methods by which such packaging is to be identified;
(f) information on the operation of schemes (including notices on premises where
articles are offered for sale and the content of such notices);
(g) the places to which packaging can be returned;
(h) the registration of retailers and producers to whom schemes apply (including the
reasonable fees payable in relation to such registration);
Part 5—Other climate change provisions
Chapter 4—Waste reduction and recycling

(i) subject to section 60—
   (i) the enforcement authority in relation to the regulations; and
   (ii) the functions of that authority;
(j) the keeping of records and other information and their production to the enforcement authority;
(k) the enforcement of the duties imposed by the regulations;
(l) offences in relation to failures to comply with requirements of the regulations.

Carrier bag charges

Charges for supply of carrier bags

(1) The Scottish Ministers may, by regulations, require suppliers of goods—
   (a) to charge for carrier bags supplied at the place where the goods are supplied for the purpose of enabling the goods to be taken away or delivered;
   (b) to apply the net proceeds raised by such charges to the advancement of environmental protection or improvement or to any other purposes that may be reasonably regarded as analogous.

(2) The regulations may in particular include provision about—
   (a) the circumstances in which the requirement applies;
   (b) the suppliers to whom the requirement applies;
   (c) the carrier bags to which the requirement applies;
   (d) the minimum amount to be charged for each carrier bag;
   (e) how the net proceeds raised by the charge are to be ascertained;
   (f) the purposes to which those net proceeds are to be applied;
   (g) subject to section 60—
      (i) the enforcement authority in relation to the regulations; and
      (ii) the functions of that authority;
   (h) the keeping of records and their production to the enforcement authority;
   (i) the enforcement of the duties imposed by the regulations;
   (j) offences in relation to failures to comply with requirements of the regulations.

(3) The enforcement authority must have regard to any guidance given by the Scottish Ministers to it in relation to the functions conferred on it by the regulations.

General provision

Enforcement authorities

(1) This section applies to any regulations made under this Chapter other than under section 53.

(2) The enforcement authority provided for in the regulations is to be—
   (a) SEPA;
(b) a local authority; or
(c) such other person or body as the Scottish Ministers consider appropriate.

(3) The regulations may provide for the functions of the enforcement authority in relation to the regulations to be exercised by two or more such authorities and about the functions of each such authority.

(4) The regulations may also provide for enforcement authorities to levy charges to recover the reasonable costs incurred by them in exercising their functions under the regulations.

61 Penalties

(1) A person who commits an offence under regulations made under this Part is liable to such penalties, not exceeding those mentioned in subsection (2), as are provided for in the regulations.

(2) Those penalties are—
   (a) on summary conviction, a fine not exceeding the statutory maximum;
   (b) on conviction on indictment, a fine.

62 Equal opportunities

(1) The persons mentioned in subsection (2) must exercise their functions under this Act in a manner which encourages equal opportunities and in particular the observance of the equal opportunities requirements.

(2) Those persons are—
   (a) the Scottish Ministers;
   (b) the advisory body.

(3) In this section, “equal opportunities” and the “equal opportunities requirements” have the same meanings as those expressions have in section L2 of Part 2 of Schedule 5 to the Scotland Act 1998 (c.46).

63 Crown application

(1) This Act and any orders and regulations made under it bind the Crown.

(2) No contravention by the Crown of any provision made by virtue of this Act makes the Crown criminally liable.

(3) But the Court of Session may, on the application of any public body or office-holder having responsibility for enforcing that provision, declare unlawful any act or omission of the Crown which constitutes such a contravention.

(4) Despite subsection (2), any provision made by virtue of this Act applies to persons in the public service of the Crown as it applies to other persons.
64 Subordinate legislation

(1) Any power conferred by this Act on the Scottish Ministers to make orders or regulations is exercisable by statutory instrument.

(2) Any such power—

(a) may be exercised so as to make different provision for different cases or descriptions of case or for different purposes;

(b) includes power to make such consequential, incidental, supplementary, transitory, transitional or saving provision as the Scottish Ministers consider appropriate.

(3) An order or regulations under this Act may modify any enactment (including this Act).

(4) Subject to subsections (5) to (8), no statutory instrument containing an order or regulations under this Act (other than an order under section 67(2)) may be made unless a draft of the instrument has been laid before, and approved by resolution of, the Scottish Parliament.

(5) A statutory instrument containing an order mentioned in subsection (6) or regulations mentioned in subsection (7) is subject to annulment in pursuance of a resolution of the Scottish Parliament.

(6) Those orders are orders under—

(a) section 17(b);

(b) section 38(1);

(c) paragraph 2(2) of schedule 1.

(7) Those regulations are—

(a) the second or subsequent regulations under section 12(2) (other than regulations which make provision altering the amount by which a carbon unit credited or debited to the net Scottish emissions account for a period reduces or, as the case may be, increases the net Scottish emissions account for that period);

(b) the second or subsequent regulations under section 18(1) (other than regulations which make provision specifying a carbon unit of a kind not previously specified in regulations under that section);

(c) regulations under section 50(1) which make provision about the matter mentioned in section 50(4) only;

(d) regulations under section 58(1) which make provision about one or more of the following matters only—

(i) the deposits mentioned in section 58(7)(c);

(ii) the form and content of notices mentioned in section 58(7)(f);

(iii) setting the registration fees mentioned in section 58(7)(h);

(e) regulations under Chapter 4 of Part 5 which make provision about the matter mentioned in section 60(4) only.

(8) Subsection (5) does not apply to an order or regulations which includes provision modifying an Act or an Act of the Scottish Parliament.

65 Interpretation

In this Act—
“additional greenhouse gas” has the meaning given by section 11(2);
“advisory body” has the meaning given by section 19(2);
“advisory functions” has the meaning given by section 19(3);
“annual target” has the meaning given by section 3(3);
“authorised person” has the meaning given by section 54(5);
“baseline” has the meaning given by section 10(1);
“baseline year” means—
(a) in relation to a greenhouse gas mentioned in section 10(2), the year mentioned in subsection (2)(a), (b), (c), (d) or, as the case may be, (e);
(b) in relation to an additional greenhouse gas, any year designated by virtue of section 11(3);
“carbon unit” has the meaning given by section 18(4);
“climate change duties” means duties imposed on public bodies by virtue of section 36(1);
“Committee” means the Scottish Committee on Climate Change;
“deposit and return scheme” means a scheme established by virtue of section 58(1);
“emissions” has the meaning given by section 15(1);
“energy efficiency” has the meaning given by section 48(8);
“greenhouse gas” has the meaning given by section 9(1);
“interim target” has the meaning given by section 2(2);
“international carbon reporting practice” has the meaning given by section 17;
“local authority” means a council constituted under section 2 of the Local Government etc. (Scotland) Act 1994 (c.39);
“monitoring body” has the meaning given by section 39(2);
“net Scottish emissions” has the meaning given by section 15(1);
“net Scottish emissions account” has the meaning given by section 12(1);
“packaging” has the meaning given by section 57(4);
“public body” has the meaning given by section 19(5);
“relevant body” has the meaning given by section 5(5);
“relevant public body” has the meaning given by section 36(2);
“recycling” has the meaning given by section 52(4);
“renewable sources” has the meaning given by section 48(8);
“Scottish Committee on Climate Change” has the meaning given by section 20(2);
“Scottish emissions” has the meaning given by section 15(1);
“Scottish removals” has the meaning given by section 15(1);
“SEPA” has the meaning given by section 53(5);
“target year” means a year for which an annual target has been set;  
“target-setting criteria” means the matters mentioned in section 4(4)(a) to (h);  
“the 1990 Act” means the Environmental Protection Act 1990 (c.43);  
“the 2008 Act” means the Climate Change Act 2008 (c.27);  
“the 2050 target” has the meaning given by section 1(2);  
“UK Committee on Climate Change” has the meaning given by section 5(6);  
“waste” has the meaning given by section 52(4).

66 Minor and consequential modifications

Schedule 2 makes minor modifications and modifications consequential on the provisions of this Act.

67 Short title and commencement

(1) This Act may be cited as the Climate Change (Scotland) Act 2009.

(2) This Act (other than this section and sections 22 to 27 and 64) comes into force on such day as the Scottish Ministers may, by order, appoint.

(3) Sections 22 to 27 come into force in accordance with section 21.

(4) Different days may, under subsection (2), be appointed for different purposes.
SCHEDULE 1
(introduced by section 20)

THE SCOTTISH COMMITTEE ON CLIMATE CHANGE

Status

1 (1) The Committee is a body corporate.

(2) The Committee is not to be regarded as a servant or agent of the Crown, nor is it to be regarded as having any status, privilege or immunity of the Crown.

(3) The Committee’s members and employees are not to be regarded as civil servants.

(4) The Committee’s property is not to be regarded as property of, or held on behalf of, the Crown.

Membership of the Committee

2 (1) The Committee is to consist of the following members—

(a) a person to chair the Committee (“the Chair”); and

(b) not fewer than five and not more than eight other members.

(2) The Scottish Ministers may, by order, modify sub-paragraph (1)(b) so as to alter the number of other members of the Committee.

(3) Members of the Committee are appointed by the Scottish Ministers.

(4) In appointing members to the Committee, the Scottish Ministers must have regard to the desirability of the Committee (taken as a whole) having expertise or experience in the following—

(a) business competitiveness;

(b) climate change policy at Scottish, UK and international level (in particular the social impact of such policy);

(c) climate science and other branches of environmental science;

(d) economic analysis and forecasting;

(e) emissions trading;

(f) energy production and supply;

(g) financial investment;

(h) technology development and diffusion.

Period, and conditions, of appointment of members

3 (1) Each member of the Committee is to be appointed for a period not exceeding five years.

(2) A member holds and vacates office in accordance with the terms and conditions of appointment.

(3) A member may resign office as a member of the Committee by giving written notice to the Scottish Ministers.

(4) On ceasing to be a member, a person is eligible to be reappointed for one further period.
Persons not eligible for appointment

4 No person may be appointed as a member of the Committee if that person is, or has at any time during the previous year been, a member of—

(a) the House of Commons;
(b) the Scottish Parliament;
(c) the European Parliament.

Removal of members of Committee

5 (1) Subject to sub-paragraph (3), the Chair may, by giving written notice, remove a member from office if the Chair is satisfied that one of the situations set out in sub-paragraph (2) exists.

(2) Those situations are—

(a) that the member is insolvent;
(b) that the member has been convicted of a criminal offence;
(c) that the member has been absent from meetings of the Committee for a period longer than six months without the permission of the Chair;
(d) that the member is otherwise unable or unfit to discharge the functions of a member or is unsuitable to continue as a member.

(3) The Chair may only remove a member from office with the agreement of the Scottish Ministers.

(4) The Scottish Ministers may, by giving written notice, remove the Chair from office if the Scottish Ministers are satisfied that one of the situations set out in sub-paragraph (2) exists.

(5) For the purposes of sub-paragraph (2)(a), a member is insolvent when—

(a) a voluntary arrangement proposed by the member is approved;
(b) the member is adjudged bankrupt;
(c) the member’s estate is sequestrated;
(d) the member enters into a debt arrangement programme under Part 1 of the Debt Arrangement and Attachment (Scotland) Act 2002 (asp 17) as the debtor;
(e) the member grants a trust deed for creditors.

Remuneration, allowances and pensions of members

6 (1) The Committee must pay its members such remuneration and allowances as the Scottish Ministers may in each case determine.

(2) The Committee may, with the agreement of the Scottish Ministers—

(a) pay (or make arrangements for the payment);
(b) make payments towards the provision;
(c) provide and maintain schemes (whether contributory or not) for the payment,
of such pensions, allowances or gratuities to or in respect of any person who is or has ceased to be a member of the Committee, as the Committee may determine.

(3) The reference in sub-paragraph (2) to pensions, allowances and gratuities includes pensions, allowances and gratuities paid by way of compensation for loss of office.

Chief executive and other employees

7 (1) The Committee is to employ a chief executive.

(2) The chief executive is to be appointed by the Committee on such terms and conditions as the Committee may determine.

(3) The appointment of the chief executive and the terms and conditions of that appointment are subject to the agreement of the Scottish Ministers.

(4) The Committee may appoint other employees on such terms and conditions as the Committee may determine.

(5) The Scottish Ministers may give directions to the Committee as regards the appointment of employees under sub-paragraph (4), which may relate in particular to—

(a) the number of appointments;

(b) the terms and conditions of employment.

(6) The Committee must comply with directions given under sub-paragraph (5).

(7) The Committee may, with the agreement of the Scottish Ministers—

(a) pay (or make arrangements for the payment);

(b) make payments towards the provision;

(c) provide and maintain schemes (whether contributory or not) for the payment, of such pensions, allowances or gratuities to or in respect of any person who is or has ceased to be an employee of it, as the Committee may determine.

(8) The reference in sub-paragraph (7) to pensions, allowances and gratuities includes pensions, allowances and gratuities paid by way of compensation for loss of office.

Accounts

8 (1) The Committee must—

(a) keep proper accounts and accounting records;

(b) prepare in respect of each financial year a statement of accounts;

(c) send the statement of accounts to the Scottish Ministers.

(2) The Committee must comply with any directions which the Scottish Ministers gives it in relation to the matters mentioned in sub-paragraph (1).

(3) The Scottish Ministers must, as soon as reasonably practicable after receiving the statement of accounts from the Committee—

(a) send the statement of accounts to the Auditor General for Scotland for auditing;

(b) lay the audited statement before the Scottish Parliament.

(4) The Committee must make its audited statement of accounts and its accounting records available so that they may be inspected by any person.
(5) Those documents are to be made available—
(a) at any reasonable time; and
(b) without charge.

(6) In this paragraph and paragraph 9, “financial year” means—
(a) the period beginning with the day the Committee is established and ending with
31 March in the following calendar year;
(b) each subsequent period of 12 months ending with 31 March.

Reports

9 (1) As soon as practicable after the end of each financial year, the Committee must prepare
a report on—
(a) the discharge of the Committee’s functions during that year;
(b) the actions that the Committee proposes to take during the following year in
pursuance of its functions.

(2) The Committee must—
(a) send a copy of the report to the Scottish Ministers; and
(b) publish the report.

(3) The Committee must prepare and publish the report in accordance with any directions
which the Scottish Ministers may give.

(4) The Scottish Ministers must as soon as reasonably practicable after receiving the report
from the Committee, lay a copy of it before the Scottish Parliament.

(5) The Committee may publish such other reports on matters relevant to its functions as it
considers appropriate.

Sub-committees

10 (1) The Committee may establish sub-committees for any purposes relating to its functions.

(2) A sub-committee must comply with any directions given to it by the Committee.

Proceedings

11 (1) Subject to the remaining provisions of this paragraph, the Committee may regulate—
(a) its own procedure (including any quorum);
(b) the procedure of any sub-committee (including any quorum).

(2) The Chair must, if present, chair meetings of the Committee or any sub-committee of
the Committee.

(3) If the Chair is not available to be present at a meeting of the Committee (or any sub-
committee of the Committee), the Chair is to appoint another member to chair the
meeting.

(4) The Chair has a casting vote and any person appointed by the Chair under sub-paragraph
(3) has a casting vote for the purposes of that appointment.
(5) The validity of any proceedings of the Committee (or any of its sub-committees) is not affected by a vacancy in membership nor by any defect in the appointment of a member.

**Delegation of functions**

12 (1) The Committee may, subject to sub-paragraph (2), authorise—

(a) any of its members;
(b) any of its sub-committees;
(c) its chief executive;
(d) any other employee,

to exercise such of its functions (and to such extent) as it may determine.

(2) The Committee may not authorise the exercise of the following functions under sub-paragraph (1)—

(a) the approval of annual reports and accounts;
(b) the approval of any budget or other financial plan.

(3) Sub-paragraph (1) does not affect the responsibility of the Committee for the exercise of its functions.

**General powers**

13 (1) The Committee may do anything which appears to it—

(a) to be necessary or expedient for the purpose of, or in connection with, the exercise of its functions;
(b) to be conducive to the exercise of its functions.

(2) In particular, the Committee may—

(a) enter into contracts;
(b) with the agreement of the Scottish Ministers, borrow money;
(c) with the agreement of the Scottish Ministers, acquire and dispose of land;
(d) obtain advice and assistance from any person who, in the Committee’s opinion, is qualified to give it.

(3) The Committee may pay to any person from whom advice or assistance is obtained such fees, remuneration and allowances as the Committee may, with the agreement of the Scottish Ministers, determine.

**Hill Farming Act 1946 (c.73)**

1 In section 23(1) of the Hill Farming Act 1946 (prohibition of muirburn at certain times), after “section” insert “and to section 23A,”.
Environment Act 1995 (c.25)

2 In section 41(1) of the Environment Act 1995 (power to make schemes imposing charges), after paragraph (e), insert—

“(f) as a means of recovering costs incurred by it in performing functions conferred by regulations under section 53 of the Climate Change (Scotland) Act 2009 (asp 00), SEPA may require the payment to it of such charges as may from time to time be prescribed;”.

Ethical Standards in Public Life etc. (Scotland) Act 2000 (asp 7)

3 In the Ethical Standards in Public Life etc. (Scotland) Act 2000, in schedule 3 (devolved public bodies) at the appropriate place, insert—

“The Scottish Committee on Climate Change”.

Scottish Public Services Ombudsman Act 2002 (asp 11)

4 In the Scottish Public Services Ombudsman Act 2002, in Part 2 of schedule 2 (listed authorities) at the appropriate place, insert—

“The Scottish Committee on Climate Change”.

Freedom of Information (Scotland) Act 2002 (asp 13)

5 In the Freedom of Information (Scotland) Act 2002, in Part 7 of schedule 1 (Scottish public authorities) at the appropriate place, insert—

“The Scottish Committee on Climate Change”.

Public Appointments and Public Bodies etc. (Scotland) Act 2003 (asp 4)

6 In the Public Appointments and Public Bodies etc. (Scotland) Act 2003, in schedule 2 (specified authorities) at the appropriate place in the list of advisory bodies, insert—

“The Scottish Committee on Climate Change”.

Housing (Scotland) Act 2006 (asp 1)

7 In the Housing (Scotland) Act 2006, section 179 (duty of Scottish Ministers to prepare strategy for improving energy efficiency of living accommodation) is repealed.
An Act of the Scottish Parliament to set a target for the year 2050, an interim target for the year 2030, and to provide for annual targets, for the reduction of greenhouse gas emissions; to provide about the giving of advice to the Scottish Ministers relating to climate change; to confer power on Ministers to impose climate change duties on public bodies; to make further provision about mitigation of and adaptation to climate change; to make provision about energy efficiency; to make provision about the reduction and recycling of waste; and for connected purposes.

Introduced by: John Swinney
On: 4 December 2008
Supported by: Stewart Stevenson
Bill type: Executive Bill
These documents relate to the Climate Change (Scotland) Bill (SP Bill 17) as introduced in the Scottish Parliament on 4 December 2008

CLIMATE CHANGE (SCOTLAND) BILL

EXPLANATORY NOTES

(AND OTHER ACCOMPANYING DOCUMENTS)

CONTENTS

1. As required under Rule 9.3 of the Scottish Parliament’s Standing Orders, the following documents are published to accompany the Climate Change (Scotland) Bill introduced in the Parliament on 4 December 2008:

   • Explanatory Notes;
   • a Financial Memorandum;
   • the Scottish Government’s Statement on legislative competence; and
   • the Presiding Officer’s Statement on legislative competence.

A Policy Memorandum is printed separately as SP Bill 17–PM.
EXPLANATORY NOTES

INTRODUCTION

2. These Explanatory Notes have been prepared by the Scottish Government in order to assist the reader of the Bill and to help inform debate on it. They do not form part of the Bill and have not been endorsed by the Parliament.

3. The Notes should be read in conjunction with the Bill. They are not, and are not meant to be, a comprehensive description of the Bill. So where a section or schedule, or a part of a section or schedule, does not seem to require any explanation or comment, none is given.

THE BILL

4. Climate change is one of the most serious threats facing Scotland and the world. The most severe consequences include famine, drought and extinction of species. Urgent action is needed by all nations to avoid the most severe climate change.

5. The aim of the Climate Change (Scotland) Bill is to establish a framework to drive greater efforts at reducing Kyoto Protocol greenhouse gas emissions in Scotland. The Bill will create mandatory climate change targets to reduce Scotland’s greenhouse gas emissions. This will signal clearly that the Scottish Government is serious in tackling greenhouse gases and wishes to set a strong example to other countries in the global effort to reduce climate change.

6. The provisions in this Bill will set a long-term target to reduce Scotland’s emissions of Kyoto Protocol greenhouse gases by 80% by the year 2050. This long term target will be supported by a framework of annual targets intended to drive the policies necessary for achieving this target. Many of the policy measures required to meet these targets will not require legislation to implement, but certain climate change mitigation and adaptation policies have been identified which do require legislation and this Bill contains provisions in Part 5 to allow these to be taken forward.

7. The Bill policy areas are separated into five parts.

- **Part 1** creates the statutory framework for the greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050. To help ensure the delivery of these targets this part of the Bill also requires that the Scottish Ministers set annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050.

- **Part 2** contains provisions which will allow the Scottish Ministers to establish a Scottish Committee on Climate Change or to designate an existing body to exercise advisory functions.

- **Part 3** places duties on the Scottish Ministers requiring that they report regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill.
• **Part 4** contains powers to allow the Scottish Ministers, by order, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

• **Part 5 – Chapter 1** requires the Scottish Ministers to lay programmes on adaptation to climate change before the Scottish Parliament and provides for an enabling power for the Scottish Ministers to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

• **Part 5 – Chapter 2** will allow modification by secondary legislation of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change.

• **Part 5 – Chapter 3** contains three distinct sets of provisions.
  - The first set of provisions require the Scottish Ministers to produce an action plan setting out their current and proposed measures to promote the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change towards energy efficiency.
  - The second set of provisions contains measures for assessing the energy performance of existing non-domestic buildings in order to raise awareness of the contribution that those buildings can make to mitigating climate change through reducing energy demand and thereby emissions of greenhouse gases.
  - The third set of provisions places a duty on the Scottish Ministers to take such steps as they consider appropriate to promote the use of heat from renewable sources.

• **Part 5 – Chapter 4** contains provisions which will enable the Scottish Ministers to make regulations relating to the acquisition of accurate information about waste and the promotion of waste reduction and recycling by different methods.

**PART 1 – EMISSIONS REDUCTION TARGETS**

8. The provisions set out in Part 1 of the Bill create the statutory framework for the greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050. To help ensure the delivery of these targets the Bill requires that the Scottish Ministers set annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050.

**The 2050 target**

9. Section 1 sets out the 80% target for 2050. Subsection (1) defines the obligation on the Scottish Ministers as reducing the net Scottish emissions account by 80% by 2050 relative to the defined baseline year. The net Scottish emissions account is defined in section 12 of the Bill. For any one year it will consist of the total of Scottish emissions, reduced by the amount of Scottish removals and adjusted to reflect carbon units credited and debited to the account.
The interim target

10. Section 2 sets out the 50% interim target for 2030. It will work in the same way as the 2050 target.

Annual targets

11. Subsection (1) of section 3 requires that the Scottish Ministers set annual targets for the maximum amount of the net Scottish emissions account for each year in the period 2010-2050 and must ensure that those targets are not exceeded.

12. Subsection (2) establishes criteria that the annual targets must meet. Subsection (2)(a) specifies that the annual target for the year 2010 is an amount which is less than the estimated net Scottish emissions account for 2009. Subsection (2)(b) requires that the targets for each year in the period 2011-2019 must be set so that each is an amount which is less than the target for the preceding year. Subsection (2)(c) requires that the targets for each year in the period 2020-2050 must be set so that each is an amount which is at least 3% less than the target for the preceding year.

Setting annual targets

13. Section 4 contains a number of conditions which must be met when the Scottish Ministers set annual targets. Subsections (1) and (2) establish that the targets must be set by order and must be set for certain periods by prescribed dates.

14. Subsection (3) imposes a duty on the Scottish Ministers to take account of both the interim 2030 target and the final 2050 target when setting the annual targets up to 2030. After 2030, the Scottish Ministers must consider the 2050 target when setting the annual targets from 2031 onwards.

15. Subsection (4) details a number of scientific, economic, social and international criteria which must be considered by the Scottish Ministers when setting annual targets. This list is not intended to be the sole list of factors that the Scottish Ministers consider when setting annual targets and additional factors can also be considered.

Advice before setting annual targets

16. Section 5 requires the Scottish Ministers to request expert advice before laying an order containing annual targets and to publish a statement explaining why the annual targets are being set at certain levels, and how these annual targets take account of the target-setting criteria described in section 4(4) of the Bill. If the Scottish Ministers have chosen to set annual targets in a manner which differs from the expert advice provided, they must publish a statement setting out the reason why. Subsection (5) defines “relevant body” for the purposes of the Part, which will be the UK Committee on Climate Change or a Scottish body designated under section 19.
Modifying annual targets

17. Section 6 allows the Scottish Ministers to modify, by order, annual targets, the minimum annual target percentage reduction applying from 2020, dates by which annual targets must be set and target-setting criteria. The annual targets set by order may only be modified if the Scottish Ministers believe there have been significant changes to the basis on which an annual target was set.

18. Subsection (6) further constrains this ability to modify by preventing its use in the year to which a target relates and its use in a way which would result in the target for the year being greater than the target for the preceding year (i.e. allowing emissions to increase between years). An order to modify the 3% minimum reduction in emissions applying from 2020 may be made only where it is no longer considered necessary for that minimum to be achieved, and it can expressly not be used to substitute a percentage of less than zero. An order to modify either the date by which annual targets are to be set, or the target-setting criteria, may be made only where the Scottish Ministers consider it appropriate.

19. Section 7 requires the Scottish Ministers to request expert advice from the relevant body before laying an order for modification under section 6 and if this advice is not followed, this provision requires the Scottish Ministers to publish a statement explaining why.

Progress towards targets

20. Section 8 requires the Scottish Ministers, from 2011, to request that the relevant body prepare a report on its view on the progress towards achievement of annual targets, the interim target and the 2050 target, a view on whether these targets are likely to be achieved and what further effort may be required to meet the targets.

21. Subsection (2) requires that in the second year following an annual target, the Scottish Ministers must request the relevant body to prepare a report detailing its views on whether the annual target for the target year was met, the way in which the target was or was not met and the action taken by the Scottish Ministers to reduce net Scottish emissions during that year. Subsection (3) requires the Scottish Ministers to lay a response to this report before the Scottish Parliament as soon as reasonably practicable after receiving the report.

Greenhouse gases

22. Section 9 defines the greenhouse gases targeted by the Bill and allows for this list of gases to be amended, by order, by adding gases or modifying their description. The power to add new greenhouse gases may be exercised only if it appears to the Scottish Ministers that European or international agreements or arrangements recognise the contribution to climate change of a gas. Before laying an order modifying section 9(1), the Scottish Ministers must request advice from the relevant body.
The baseline

23. Section 10 defines the baseline years for each greenhouse gas covered by the statutory targets.

Baseline years for additional greenhouse gases

24. Section 11 applies in the situation where the list of target gases for the Bill is expanded and a baseline year is required. If a new greenhouse gas is added to the list of target gases for the Bill, subsections (3) and (4) allow the Scottish Ministers to specify by order what the baseline year is to be and how the net Scottish emissions are to be determined for the baseline year for the new gas.

Net Scottish emissions account

25. Section 12 defines the net Scottish emissions account as the aggregate of net Scottish emissions, minus any carbon units credited to the account for the period plus any carbon units debited from the account for the period. Subsection (2) enables the Scottish Ministers to define in regulations which carbon units can be credited to and debited from the net Scottish emissions account, and how this can be done. Subsection (3) provides that regulations must ensure that, where carbon units are used to reduce the net Scottish emissions account, they are not also used to offset other emissions elsewhere. This would lead to their “double-counting”.

Attribution of emissions to Scotland

26. Section 13 defines which greenhouse gases are attributable to Scotland for the purposes of calculating net Scottish emissions. These are emissions of greenhouse gases emitted from sources in Scotland plus Scotland’s share of emissions from international aviation and international shipping.

Scottish share of emissions from international aviation and international shipping

27. Section 14 allows the Scottish Ministers to make provision, by order, for a proportion of emissions from international aviation and international shipping to be attributed to Scotland. That order may make provision for the period or periods in which gases are to be regarded as Scottish emissions, and as to the manner in which such emissions are to be taken into account. Before laying such an order, the Scottish Ministers must seek advice from the relevant body and if this advice is not followed, they must publish a statement explaining why they are following a different approach.

Scottish emissions and removals

28. Section 15 defines Scottish emissions and Scottish removals of greenhouse gases, and defines the total of these for a period as the net Scottish emissions for that period.
29. Subsection (2) allows the Scottish Ministers to modify the definition of Scottish removals by order. Subsection (3) requires the amount of emissions and removals to be determined, in so far as reasonably practicable, consistently with international carbon reporting practice, defined in section 17.

Measurement of emissions

30. Section 16 provides that emissions, emissions reductions and removals are to be measured in tonnes of carbon dioxide equivalent, and defines that term.

International carbon reporting practice

31. Section 17 defines international carbon reporting practice in terms of the protocols to the United Nations Framework Convention on Climate Change, or other European or international arrangements or agreements which the Scottish Ministers specify by order. This power allows the definition to be updated to take account of new international arrangements and agreements.

Carbon units and carbon accounting

32. Section 18 enables the Scottish Ministers to define “carbon unit” in regulations, and provides the Scottish Ministers with the power by regulations, to establish a scheme or use an existing scheme, for the registering and tracking of carbon units and for establishing and maintaining accounts in which carbon units may be held.

PART 2 – ADVISORY FUNCTIONS

Advisory body

33. The emissions reduction provisions in the Bill impose duties on the Scottish Ministers, which require them to establish annual emissions reductions targets in secondary legislation. Ministers will be required to seek expert, independent advice in advance of setting or modifying annual targets, adding greenhouse gases to the Bill, or making provision attributing a proportion of greenhouses gases from international aviation and international shipping to Scotland.

34. Subsections (1) and (2) of section 19 give the Scottish Ministers the power to designate a body or person to undertake the advice functions in sections 5, 7, 8 and 9 and the additional advice functions in sections 22 to 27. Thereafter the body or person will be referred to as the advisory body and will take on the role of the UK Committee on Climate Change.

35. Subsection (3) sets out the functions (the “advisory functions”) which the advisory body has.

36. Subsection (4) sets out examples of what may be included in an order under subsection (1), such as the information requirements for the advice. Subsection (5) defines the term “public body” as used in subsection (1).
Scottish Committee on Climate Change

37. Section 20 allows the Scottish Ministers to establish, by order, a body to undertake the advisory functions under the Bill. If established, this body would be known as the Scottish Committee on Climate Change.

38. Subsection (3) gives effect to schedule 1 which sets out details of the constitution and operation of this Committee and subsection (4) identifies the types of further provision which may be included in an order establishing a Scottish Committee on Climate Change.

39. Section 21 makes it clear that the obligations for this body to provide advice to the Scottish Ministers under sections 22-27 do not apply until the Scottish Ministers designate, under section 19, a body to exercise advisory functions. Until such an advisory body is designated, the Scottish Ministers will seek advice from the UK Committee on Climate Change (which will be the relevant body for the purposes of sections 5 to 9).

Advice on annual targets

40. Section 22 obliges the advisory body to respond to requests by the Scottish Ministers for advice on proposed annual targets and proposed modifications of annual targets.

41. Subsection (2) requires the body to provide a view on whether a proposal for an annual target is appropriate, and explain that view.

42. Subsection (3) requires the body to express views on a number of factors relating to annual targets. Specifically, it should provide a view on the relative merits of taking action to reduce emissions, compared with the use of carbon units. It should also express a view on the contributions to targets which may be provided by sectors covered by trading schemes and those not covered by such schemes, and the contributions to targets that may be made by reductions in emissions of greenhouse gases in particular sectors of the economy.

43. Subsection (4) requires that the body must provide its advice within the period requested by the Scottish Ministers. Subsection (5) defines the meaning of ‘traded sector’ for subsection (3)(b)(i). This refers to the definition contained in section 66 of the UK Climate Change Act 2008.

Reporting on progress towards targets

44. Section 23 requires the advisory body to prepare an annual report setting out its views on the Scottish Ministers’ progress towards meeting the annual targets, the interim target, and the 2050 target. It should also provide views on whether these targets are likely to be achieved and views on any action considered necessary to achieve these targets. This duty will be switched on by the Scottish Ministers at an appropriate time after an advisory body has been designated.
45. Subsection (3) requires that the body’s report in the second year after the year covered by a target ends must express a view on whether the annual target for the target year was met and a view on the action taken by the Scottish Ministers to reduce greenhouse gas emissions during that year.

46. Subsection (4) specifies deadlines for laying the reports before the Scottish Parliament.

Scottish Ministers’ response to reports on progress

47. Section 24 obliges the Scottish Ministers to respond to a report provided by the advisory body under section 23 and to lay that response before the Scottish Parliament.

Duty of body to provide advice or other assistance

48. Section 25 obliges the advisory body to respond to requests for advice, analysis, information and assistance by the Scottish Ministers in connection with their functions under the Bill, their other climate change functions, or in relation to climate change generally.

Guidance to advisory body

49. Section 26 requires that the advisory body must have regard to any guidance given by the Scottish Ministers in respect of its functions under the Bill. Subsection (2) provides that the Scottish Ministers may not give the body guidance on the content of any advice or report. Subsection (3) permits the Scottish Ministers to vary or revoke any guidance issued.

Power to give directions to advisory body

50. Section 27 gives the Scottish Ministers the power to direct the advisory body in terms of its functions under the Bill. Subsection (2) provides that the Scottish Ministers may not direct the body on the content of any advice or report and subsection (3) permits the Scottish Ministers the power to vary or revoke the directions. Subsection (4) requires the body to comply with any directions given.

PART 3 – REPORTING DUTIES

51. The Bill requires that the Scottish Ministers report regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill.

Reports on annual targets

52. Section 28 requires the Scottish Ministers to lay annual reports before the Scottish Parliament in respect of each year from 2010 to 2050. Subsections (2) to (4) specify information that the annual report must contain. Subsection (5) requires the annual report to be laid before the
These documents relate to the Climate Change (Scotland) Bill (SP Bill 17) as introduced in the Scottish Parliament on 4 December 2008

Scottish Parliament no later than 31 October in the second year after that to which the annual target discussed in the report relates.

53. Section 29 specifies further requirements for the content of the information contained in each annual target report.

Reports on proposals and policies for meeting annual targets

54. Subsection (1) of section 30 requires the Scottish Ministers to produce a report as soon as reasonably practicable after making an order under section 4 setting annual targets. Subsection (2) requires this report to set out the proposals and policies intended to meet the annual targets, and their timescales, with an explanation of how these are expected to contribute towards the delivery of the interim target and the 2050 target.

55. Subsection (3) requires the report to explain how the proposals and policies are expected to affect the different sectors of the Scottish economy and subsection (4) requires the second and each subsequent report to provide an assessment of progress towards implementation of the policies and proposals in earlier reports, and any adjustments to those policies considered appropriate.

Reports on proposals and policies where annual targets not met

56. If the annual report indicates that the annual target has not been met, section 31 requires the Scottish Ministers to lay a report before the Scottish Parliament, which sets out the proposals and policies to compensate in future years for the excess emissions.

Report on the interim target

57. Section 32 requires the Scottish Ministers to lay a report before the Scottish Parliament in respect of the interim target, for the year 2030. Subsections (2) to (8) determine what the report must contain and its timescale for laying.

Report on the 2050 target

58. Section 33 requires the Scottish Ministers to lay a report before the Scottish Parliament in respect of the 2050 target. Subsections (2) to (8) determine what the report must contain and its timescale for laying.

Reports: provision of further information to the Scottish Parliament

59. Section 34(1) requires that where the Scottish Ministers lay various reports before the Scottish Parliament relating to annual targets, the interim target and the 2050 target, they must, as soon as reasonably practicable, make a statement on the report in the Scottish Parliament. Subsection (2) specifies all the reports which trigger this obligation. Subsection (3) requires that in terms of the report on the annual target, the Scottish Ministers must also meet with the
Scottish Parliament committee conveners. All of these duties apply only as far as is reasonably practicable.

Further provision about reporting duties

60. Section 35 permits the Scottish Ministers to impose new duties on themselves, by order, to report to the Scottish Parliament. Subsection (2) sets out further provision which may also be made by such an order.

PART 4 – DUTIES OF PUBLIC BODIES RELATING TO CLIMATE CHANGE

Duties of public bodies

61. Section 36 enables the Scottish Ministers to impose duties relating to climate change, by order, on bodies or persons exercising functions of a public nature, referred to as ‘relevant public bodies’. Subsection (3) allows the order to impose different duties on different public bodies.

62. Subsections (4) and (5) oblige the Scottish Ministers, in so far as reasonably practicable, to consult with such associations of local authorities and such other persons as they consider appropriate before laying an order imposing such duties. Subsection (6) states that the Scottish Ministers must co-operate with the relevant public bodies to help those bodies comply with duties imposed under this section.

Guidance to relevant public bodies

63. Section 37 requires relevant public bodies to have regard to any guidance issued by the Scottish Ministers in relation to climate change duties. Subsections (2) and (3) oblige the Scottish Ministers to consult with such associations of local authorities and such other persons as they consider appropriate before creating guidance, in so far as it is reasonably practicable to do so. Subsection (4) allows the Scottish Ministers to vary or revoke this guidance and subsection (5) requires the Scottish Ministers to publish guidance.

Reporting on climate change duties

64. Section 38 enables the Scottish Ministers, by order, to require relevant public bodies to report on how they are complying with a duty imposed under section 36 and enables the Scottish Ministers to set out what must be in the report, its format, and the time by which it must be submitted to them. Where relevant public bodies are working together on a particular duty, the Scottish Ministers may require them to co-operate with each other to prepare a joint report.

Appointment of monitoring body

65. Section 39 enables the Scottish Ministers, by order, to designate one or more persons or bodies to monitor how relevant public bodies are complying with duties imposed under section
These documents relate to the Climate Change (Scotland) Bill (SP Bill 17) as introduced in the Scottish Parliament on 4 December 2008

36 or how they are having regard to guidance given under section 37. The person or body is referred to as the “monitoring body”.

Investigations

66. Section 40 enables a monitoring body to carry out investigations into how relevant public bodies are complying with duties imposed under section 36, or whether they are having regard to guidance given under section 37. Section 41 defines the powers of investigators in these circumstances; “investigators” may be either the monitoring body or a person authorised by that body.

Reporting by monitoring body

67. Section 42 enables the Scottish Ministers to direct a monitoring body to prepare a report on its activities, use of resources and any other matters. Those reports will not normally mention continuing investigations unless the Scottish Ministers direct this. Subsection (3) requires the monitoring body to submit the report to the Scottish Ministers.

Guidance to monitoring body

68. Section 43 requires a monitoring body to have regard to any guidance issued by the Scottish Ministers relating to its functions under Part 4 of the Bill. Subsections (2) and (3) oblige the Scottish Ministers to consult with the monitoring body and such other persons as they consider appropriate, in so far as reasonably practicable, before giving guidance.

69. Subsection (4) allows the Scottish Ministers to vary or revoke this guidance and where a variation is substantial, the Scottish Ministers are obliged to consult the persons listed in subsection (3), in accordance with subsection (2), before varying the guidance. Subsection (5) requires the Scottish Ministers to publish any guidance given under this section.

Power to direct monitoring body

70. Section 44 enables the Scottish Ministers to give directions to a monitoring body relating to its functions under Part 4 of the Bill. Subsection (2) allows a direction given under this section to be varied or revoked. Subsection (3) requires the monitoring body to comply with a direction given under this section.

PART 5 – OTHER CLIMATE CHANGE PROVISIONS

Chapter 1 – Adaptation

Programme for adaptation to climate change

71. Section 45 applies when the Secretary of State lays a report before the UK Parliament on the impact of climate change on the United Kingdom under section 56 of the Climate Change Act.
These documents relate to the Climate Change (Scotland) Bill (SP Bill 17) as introduced in the Scottish Parliament on 4 December 2008

2008. Receipt by the Scottish Ministers of this report triggers an obligation under this section for the Scottish Ministers to lay a programme before the Scottish Parliament addressing the risks identified in the report and setting out the Scottish Ministers’ objectives, proposals and policies in relation to adaptation to climate change.

72. Subsection (3) requires subsequent programmes to contain an assessment of progress towards objectives set out in the previous programme. Subsection (4) requires the Scottish Ministers to lay each programme under this section before the Scottish Parliament as soon as reasonably practicable after receiving the Secretary of State’s report.

Variation of permitted times for making muirburn

73. Section 46 of the Bill inserts a new section 23A into the Hill Farming Act 1946 (the “1946 Act”).

74. Subsection (1) of new section 23A enables the Scottish Ministers to make an order specifying the dates before which or after which it is lawful to make muirburn in any year. Subsection (2) of new section 23A clarifies the effect of an order made under subsection (1), that is, to substitute for any of the dates specified in section 23(1), (2) or (3) of the 1946 Act, the dates specified in any such order.

75. Subsection (3) of new section 23A provides that the Scottish Ministers may make an order under new section 23A(1) of the 1946 Act only where they consider it necessary or expedient to do so in relation to climate change. Subsection (5) of new section 23A of the 1946 Act provides that any statutory instrument containing an order made under subsection (1) of that section is subject to negative resolution procedure.

76. Schedule 2 to the Bill provides for a minor amendment of section 23(1) of the 1946 Act, to clarify that section 23 of the 1946 Act is subject to any provision made by order under new section 23A(1) of that Act.

Chapter 2 – Forestry

Power to modify functions of Forestry Commissioners

77. Section 47(1) allows the Scottish Ministers, by order, to modify the functions of the Forestry Commissioners in or as regards Scotland. Subsection (2) provides that such modifications may be made only where the Scottish Ministers consider it necessary or expedient to allow them to comply with their duties under sections 1, 2 or 3(1)(b) of the Bill to reduce greenhouse gas emissions or more generally in relation to climate change.

78. Subsection (3) provides that the order may modify the Forestry Commissioners’ functions to allow them to form or participate in corporate bodies or trusts.
79. Subsection (4) provides that the order may also allow the Forestry Commissioners to delegate functions to other bodies.

80. Section 64 makes more general provision in relation to the power to make an order under section 47, and makes provision as to the Parliamentary procedure for such an order. Subsections (2) and (3) of section 64, provide that an order made by the Scottish Ministers under section 47 may make different provision for different cases or purposes, or make any appropriate consequential, incidental, supplementary, transitory, transitional or saving provision, including modification of any enactment. Section 64(4) provides that an order made under section 47 is subject to affirmative resolution procedure.

Chapter 3 – Energy efficiency

Duty of the Scottish Ministers to promote energy efficiency

81. Section 48 requires the Scottish Ministers, within 12 months of the section coming into force, to publish a plan for the promotion of energy efficiency in Scotland. The plan must specifically cover the promotion of the energy efficiency of living accommodation. Under subsections (4) and (5), Ministers are required to review the plan at least every 3 years.

82. Following a review, the Scottish Ministers must in accordance with subsection (6) publish the plan if the review results in changes to the plan.

83. When preparing a plan and when varying it after a review, subsection (7) requires the Scottish Ministers to have regard to the contribution that improvements to buildings and changes in building standards can make to improving overall energy efficiency and lowering carbon emissions in Scotland.

84. “Energy efficiency” is defined in subsection (8) and includes the use of technologies reliant on renewables sources of energy and the use of materials that produce lower greenhouse gas emissions than alternatives. “Fossil fuel” and “renewable sources” are also defined in subsection (8).

Laying of plans and reports

85. Section 49(1) requires the Scottish Ministers to lay the initial plan and any subsequent revised plan before the Scottish Parliament as soon as is reasonably practicable after it is published. Subsections (2) and (3) require Ministers to lay a report before the Scottish Parliament on what steps have been taken to implement the plan. The report must be laid within 12 months of the plan being first published and at least annually thereafter.
Non-domestic buildings: assessment of energy performance and emissions

86. Section 50 confers power on the Scottish Ministers to make regulations providing for the assessment of: (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings.

87. Subsection (2) sets out some of the provisions which may be included in the regulations, including: the kinds of non-domestic buildings covered; persons who are required to obtain assessments; time periods for carrying out assessments; procedures and methodologies for assessing energy performance and emissions; persons who can carry out such assessments; the issuing of certificates following assessment; enforcement authorities; the keeping of records; enforcement of the regulations; and offences.

88. Subsection (3) makes provision about the enforcement authority provided for in the regulations and subsection (4) allows the enforcement authority to levy charges to recover reasonable costs incurred by exercising the functions under the regulations.

89. Subsection (5) defines “non-domestic building” as all buildings, other than buildings which are dwellings. Yards, gardens, outbuildings and other land or buildings associated with dwellings, and any common areas so associated, are also excluded from the meaning of “non-domestic building”.

Promotion of renewable heat

90. Section 51(1) imposes a duty on the Scottish Ministers to put in place measures, as appropriate, to promote the use of heat produced from renewable sources. These include the measures mentioned in subsection (2) relating to the promotion of the installation of a new renewable energy system fuelled wholly or partly from renewable sources and the adaptation of equipment so that it can be fuelled by renewable sources.

Chapter 4 – Waste reduction and recycling

Waste prevention and management plans

91. Section 52 enables the Scottish Ministers to make detailed provision, by regulations, requiring persons specified in such regulations to make waste prevention and management plans, and to comply with them. Some of the detail which may be included in the regulations is specified in subsection (2), but this is without prejudice to the generality of the section. Some essential terms are defined in subsection (4).

92. The effect of regulations made under this section could be, for example, to provide that a builder should draw up plans for how he proposed to reduce waste generated by a building operation by, for example, the re-use of rubble on-site. On a different scale, they might require an office to prepare a plan showing how it will minimise waste – for example by adopting double-sided printing. A person might be required by virtue of subsection (2)(a) to prepare more than one plan, for instance to deal with different types of waste.
93. Subsection (3) ensures that any enforcement authority appointed in relation to this section must have regard to any guidance the Scottish Ministers may give in relation to its functions, which may include the approval of waste prevention and management plans (subsection (2)(e)(ii)). Further provision about enforcement authorities is made by section 60.

94. It is very likely that a system of enforcement, including offences and penalties, would be required to ensure that plans were actually drawn up and complied with, but this will be a matter for regulations. Maximum penalties which may be imposed in any regulations made under this Chapter are specified in section 61.

**Information on waste**

95. Section 53 enables the Scottish Ministers to make detailed provision, by regulations, requiring the provision of information by persons specified in those regulations about waste associated with their activities to the Scottish Environment Protection Agency (SEPA). Some of the detail which may be included in the regulations is specified in subsection (2), but without prejudice to the generality of the section. “Waste” is a term which has already been defined in section 52(4): this definition matches that of Directive 2006/12/EC on waste\(^1\).

96. Subsection (3) refers to section 34(5) of the Environmental Protection Act 1990\(^2\) (the “1990 Act”). This enables the Scottish Ministers to make regulations requiring those who import, produce, carry, keep, treat or dispose of controlled waste to make, retain and furnish documents. The powers have been used to make the Environmental Protection (Duty of Care) Regulations 1991\(^3\) (the “1991 Regulations”) and the Special Waste Regulations 1996 (the “1996 Regulations”)\(^4\). These regulations require notes to be prepared when waste covered by them is transferred. Subsection (3) ensures that regulations made under section 53 are not construed as replacing the separate requirements contained in existing regulations.

97. It is very likely that a system of enforcement, including offences and penalties, would be required to ensure that information is provided correctly and timeously, but this will be a matter for regulations. Powers to make such provision are contained in subsection (2)(g) and (h).

**Recyclable waste: facilities for deposit etc.**

98. Section 54 enables the Scottish Ministers to make detailed provision, by regulations, requiring persons specified in those regulations to provide facilities for the deposit of waste, and requiring that waste deposited in such facilities be collected by an authorised person and, as far as practicable, recycled. Some of the detail which may be included in the regulations is specified in subsection (2), but without prejudice to the generality of the section. “Waste” and “recycling” are terms which have already been defined in section 52(4). “Authorised person” is defined in subsection (5) in terms of section 34(3) of the 1990 Act, and includes local authorities and holders of waste management licences.

---

\(^1\) OJ No. L 114, 27.4.2006, p9

\(^2\) 1990 c.43

\(^3\) SI 1991/2839, as amended by SSI 2003/533

99. The power this section grants could be used to require offices to have facilities to collect paper for recycling, for example. Such facilities might be no more than a box, but more complex facilities, such as can-crushers, could also be required, as appropriate. This section could not be used to require facilities to be provided at temporary public events, which are covered by section 55 (see section 54(4)). Subsection (2)(b) may be used to restrict the categories of person who must be allowed to use the facilities, such as staff only in an office environment.

100. Subsection (2)(d) may be used to require an authorised person to remove the waste deposited, for example where the person providing the facilities could otherwise encounter difficulties in getting the waste uplifted. If this power were exercised, subsection (2)(e) could be used to set charges to finance this collection, and the recycling of the relevant material.

101. It is very likely that a system of enforcement, including offences and penalties, would be required to ensure that facilities were provided and used properly, but this will be a matter for regulations. Relevant powers are contained in subsection (2)(h) and (i).

Provision of facilities for deposit of recyclable waste at events etc.

102. Section 55 enables the Scottish Ministers to make detailed provision, by regulations, empowering local authorities to issue notices requiring organisers of temporary public events to provide facilities for the deposit of waste, and requiring that the waste be collected by an authorised person and, as far as practicable, recycled. Subsection (4) of section 54 ensures that events are not subject to requirements, possibly competing, made under both sections.

103. An example of how the power might be used could be a local authority requiring the holder of a music festival to ensure that facilities to collect the kinds of waste to which such a festival might give rise (such as bottles, cans, or plastic cups) are provided for the duration of that festival.

104. Subsection (2)(g) could be used to ensure that notices were issued sufficiently far in advance of the relevant events. Provision for appeals against notices may be made under subsection (2)(h). Subsection (2)(k) to (n) deal with enforcement and provide for the appointment of an enforcement authority, which need not necessarily be the local authority. Further provision on enforcement authorities is made by section 60.

Procurement of recyclate

105. Section 56 enables the Scottish Ministers to make detailed provision, by regulations, requiring persons specified in those regulations to ensure that specified things procured or constructed by them include or contain a certain amount or proportion of recyclate. Some of the detail which may be included in the regulations is specified in subsection (3), but without prejudice to the generality of the section. “Recyclate” is defined by subsection (6) in relation to the definition of “recycling” in section 52(4).

106. Subsection (3)(d) could be used to deal with measurement of the proportion of recyclate present in complex items. Subsection (3)(e) could be used to allow the requirement to procure
These documents relate to the Climate Change (Scotland) Bill (SP Bill 17) as introduced in the Scottish Parliament on 4 December 2008

recyclate to be disapplied on application to the Scottish Ministers, for example where this could conflict with Community internal market rules.

107. It is very likely that a system of enforcement, including offences and penalties, would be required to ensure that recyclate was procured in at least the proper proportion, but this will be a matter for regulations.

Targets for reduction of packaging etc.

108. Section 57 enables the Scottish Ministers to make detailed provision, by regulations, setting targets for reducing the amount of packaging in use (subsection (1)(a)(i)), or the amount of greenhouse gas emissions associated with packaging (subsection (1)(a)(ii)). Some of the detail which may be included in the regulations is specified in subsection (2), but without prejudice to the generality of the section. “Packaging” is defined by subsection (4) in terms of Directive 94/62/EC on packaging and packaging waste.

109. Subsection (2)(c) would allow targets to be set by a variety of means, for instance by reference to turnover or market share. Subsection (2)(f) could be used to require the production of baseline information about the amount of packaging in circulation, which might then be used to set targets. It is very likely that a system of enforcement, including offences and penalties, would be required to ensure that accurate information was provided and the targets actually met, but this would be a matter for the regulations.

Deposit and return schemes

110. Section 58 enables the Scottish Ministers to make detailed provision, by regulations, setting up deposit and return schemes for packaging associated with specified products, where Ministers are satisfied that it is necessary or expedient to do so in order to promote recycling. Some of the detail which may be included in the regulations is specified in subsections (3), (4) (5) and (7), but without prejudice to the generality of the section. Subsections (4)(c) and (5)(f) would confer power to require that packaging returned under such a scheme was recycled.

111. Subsection (5) would permit regulations to establish an administrative body to act on behalf of relevant producers and retailers in certain respects. Subsection (7) deals with matters such as mechanisms for identifying packaging as falling within a scheme, customer information and specification of the places to which packaging could be returned and the deposit reclaimed. The latter could for example be used to deal with return of packaging to a different retailer selling similar types of product. It is very likely that a system of enforcement, including offences and penalties, would be required to ensure that deposits were actually taken and repaid, and subsection (7)(i) to (l) contain appropriate powers.

Charges for the supply of carrier bags

112. Section 59 enables the Scottish Ministers to make detailed provision, by regulations, requiring persons supplying carrier bags to take goods away to charge for those bags, and requiring that the net proceeds of such charges be applied to environmental good causes. Some of the detail which may be included in the regulations is specified in subsection (2), but without prejudice to the generality of the section.

113. Subsection (2)(c) provides a power to specify the carrier bags in respect of which a charge would have to be made. This could be used to exempt certain bags, for example where Ministers were satisfied that they were likely to be re-used rather than quickly becoming waste.

114. The amount of the charge is to be fixed, and may be varied, by regulations. The charge is to be levied, not by central or local government, but by the supplier of the bag to which the regulations may apply. Subsection (2)(a) to (c) provide that the regulations may apply the charge to particular kinds of goods, or bags, or suppliers of goods. Subsection (2)(e) enables regulations to provide a mechanism for the calculation of the net proceeds of the charge.

115. Subsections (1)(b) and (2)(f) would allow Ministers to ensure that the net proceeds were spent on broadly environmental purposes, and to define those purposes in more detail if that was thought necessary (such as specifying that funds raised were to be spent in Scotland). It is very likely that a system of enforcement, including offences and penalties, would be required to ensure that charges were levied, appropriately accounted for, and devoted to appropriate causes, but this would be a matter for the regulations.

Enforcement authorities

116. Section 53 names SEPA as the enforcement authority in respect of waste information. Other provisions in this Chapter enable the Scottish Ministers to specify, by regulations, enforcement authorities in respect of them. Section 60 allows the Scottish Ministers to specify SEPA, a local authority or such other person or body as may be selected. Subsection (3) allows the functions of an enforcement authority to be divided between different specified bodies. Subsection (4) provides that enforcement authorities may charge to recover costs reasonably incurred in connection with their functions. SEPA, however, already has a charging power under section 41(1) of the Environment Act 1995, so charging in respect of its functions under section 53 has been dealt with as a consequential amendment of that section (see schedule 2, paragraph 2).

Penalties

117. Section 61 sets out the maximum penalties for offences created by regulations under any section in Part 5 of the Bill (namely, section 50 in Chapter 3 and sections 52 to 59 in Chapter 4). The statutory maximum for summary cases (those heard without a jury) is currently £10,000, and was set by the Criminal Proceedings etc. (Reform) (Scotland) Act 2007. It may, however, be varied by order by the Scottish Ministers by powers given by the Criminal Procedure (Scotland) Act 2007.

6 2007 asp 6
These documents relate to the Climate Change (Scotland) Bill (SP Bill 17) as introduced in the Scottish Parliament on 4 December 2008

Act 1995. Where a prosecution is on indictment rather than under summary procedure, the court may impose an unlimited fine.

PART 6 – GENERAL AND MISCELLANEOUS

118. Section 62 requires the Scottish Ministers and the advisory body, when exercising their functions under the Bill, to encourage equal opportunities and the observance of the equal opportunities requirements.

119. Section 63 provides that the Bill applies to the Crown, including to Her Majesty in her private capacity.

120. Section 64 provides for the procedure for the making of orders and regulations under the Bill. Subsections (2) and (3) provide that such orders and regulations may make different provision for different cases or purposes, or make any appropriate consequential, incidental, supplementary, transitory, transitional or saving provision, including modification of any enactment. Subsections (4) and (5) provide that all orders and regulations made under the Bill, except a commencement order made under section 67, are subject to affirmative resolution procedure except those listed in subsections (6) and (7). The orders and regulations listed in those subsections are subject to negative resolution procedure, unless they modify an Act of Parliament or an Act of the Scottish Parliament (in which case they are subject to affirmative resolution procedure).

121. Section 65 brings together defined expressions used in the Bill and either defines them or indicates where in the Bill definitions of them can be found.

122. Section 66 introduces schedule 2, which contains amendments and repeals to other legislation.

123. Section 67 provides that all of the provisions of the Bill, except this section, sections 22 to 27 (powers and duties of advisory body) and section 64 (providing for procedure for orders and regulations), are to come into force on a day set by the Scottish Ministers by order. This section and section 64 come into force on Royal Assent. Sections 22 to 27 come into force in accordance with section 21 (i.e. when an order designating the advisory body is made under section 19). This section also provides for the short title of the Bill.

SCHEDULE 1 – THE SCOTTISH COMMITTEE ON CLIMATE CHANGE

124. Schedule 1 makes provision for the detailed constitution, powers and proceedings of the Scottish Committee on Climate Change which may be established under section 20 of the Bill. The Committee is to consist of a chair and no fewer than five and no more than eight other members. These numbers may be varied by order made by the Scottish Ministers, subject to negative resolution procedure. Members are to be appointed for a period of up to five years. Members are eligible to be reappointed for one further period.

7 1995 c. 46
125. In appointing members, the Scottish Ministers are to have regard to the desirability of the Committee (taken as a whole) having expertise or experience in business competitiveness, climate change policy, climate science and other branches of environmental science, economic analysis and forecasting, emissions trading, energy production and supply, financial investment and technology development and diffusion.

126. Schedule 1 provides for the circumstances in which members may be removed, for the disqualification of MPs, MSPs and MEPs from membership, and for remuneration, pensions and allowances.

127. Schedule 1 also provides for the appointment of a Chief Executive of the Committee, with the approval of the Scottish Ministers, and for the appointment of other staff by the Committee. The schedule makes provision for the procedure of the Committee, for the establishment of sub-committees, for its general powers and for the delegation of its functions. The Committee is to be required to keep proper accounts to be audited by the Auditor General for Scotland, and to publish an Annual Report which is to be laid before the Scottish Parliament by the Scottish Ministers.

SCHEDULE 2 – MINOR AND CONSEQUENTIAL MODIFICATIONS

128. Schedule 2 sets out minor and consequential modifications to other legislation required as a result of the Bill.

FINANCIAL MEMORANDUM

INTRODUCTION

129. This document sets out the financial implications of the Climate Change (Scotland) Bill. It should be read in conjunction with the Policy Memorandum and the Bill itself. The Policy Memorandum, published separately, explains in detail the policy intentions of the Bill.

130. The main aim of the Climate Change (Scotland) Bill is to establish a challenging long term target which requires the Scottish Ministers to reduce the emission of those greenhouse gases covered by the Kyoto Protocol by 80% by 2050. The Kyoto Protocol greenhouse gases are carbon dioxide, methane, nitrous oxide and the fluoride gases (hydrofluorocarbons, perfluorocarbons and sulphur hexafluoride), collectively referred to as the basket of greenhouse gases. The Bill also contains provisions on topics with a contribution to make to tackling climate change – through mitigation of greenhouse gases or adaptation to the impacts of climate change.

131. The topics in the Climate Change (Scotland) Bill are set out under five significant parts:

- **Part 1** creates the statutory framework for the greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050. To help ensure the delivery of these targets this part of the Bill also
These documents relate to the Climate Change (Scotland) Bill (SP Bill 17) as introduced in the Scottish Parliament on 4 December 2008

requires that the Scottish Ministers set annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050.

- **Part 2** contains provisions which will allow the Scottish Ministers to establish a Scottish Committee on Climate Change or to designate an existing body to exercise advisory functions.

- **Part 3** places duties on the Scottish Ministers requiring that they report regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill.

- **Part 4** contains powers to allow the Scottish Ministers, by order, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

- **Part 5 – Chapter 1** requires the Scottish Ministers to lay programmes on adaptation to climate change before the Scottish Parliament and provides for an enabling power for the Scottish Ministers to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

- **Part 5 – Chapter 2** will allow modification by secondary legislation of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change.

- **Part 5 – Chapter 3** contains three distinct sets of provisions.
  
  - The first set of provisions require the Scottish Ministers to produce an action plan setting out their current and proposed measures to promote energy efficiency in Scotland, as well as measures to encourage behavioural change towards energy efficiency.
  
  - The second set of provisions contains measures for assessing the energy performance of existing non-domestic buildings in order to raise awareness of the contribution that those buildings can make to mitigating climate change through reducing energy demand and thereby emissions of greenhouse gases.
  
  - The third set of provisions places a duty on the Scottish Ministers to take such steps as they consider appropriate to promote the use of heat from renewable sources.

- **Part 5 – Chapter 4** contains provisions which will enable the Scottish Ministers to make regulations relating to the acquisition of accurate information about waste and the promotion of waste reduction and recycling by different methods.

**PART 1 – EMISSIONS REDUCTION TARGETS**

**2050 Target**

132. Part 1 of the Bill establishes the 2050 emissions reduction target for the basket of greenhouse gases and underpins this long term target with a framework of annual targets. This Bill establishes targets which go beyond the findings of known studies and reports which explore and estimate the potential costs of addressing climate change, globally and in the UK.
133. Estimating costs can be done in two ways. One is to look at the resource costs of measures including the introduction of low carbon technologies and changes in land use, compared with the costs of the business as usual alternative. The second is to use macroeconomic models to explore the system-wide effects of the transition to a low carbon economy. These can be helpful in tracking the dynamic interactions of different factors over time. However these approaches are inevitably complex and their results can be affected by a whole range of assumptions. The studies described below provide a useful starting point for identifying the potential costs to Scotland of delivering emission reductions in 2050 in order to meet the 80% target.

134. The Stern Review on the Economics of Climate Change is considered to be the most comprehensive review carried out to date on the economics of climate change. The Stern Review report states all countries will be affected by climate change and unabated climate change risks raising average temperatures by over 5°C from pre-industrial levels. Based on the assessment of the science carried out by the Intergovernmental Panel on Climate Change on 2001, the Review report states that the dangers of unabated climate change will be an increase in global temperature and that an increase of 2-3 °C will reduce global GDP by between 5% and 20%.

135. By contrast the report estimates the costs of stabilising greenhouse gas concentrations in the atmosphere to avoid such a temperature rise, to be 1% (+/-3%) of global GDP. This range assumes that sensible policies are put in place and deliver the induced technological progress required.

136. Stern goes further to indicate that there are also likely to be economic benefits associated with taking action to shift to a low carbon economy and reports that the global market for low carbon technologies could worth at least $500 billion per annum by 2050 if the world acts on the scale required.

137. The “80% Challenge: Delivering a low-carbon UK” report by the Institute for Public Policy Research, WWF and RSPB, published in October 2007, used the same economic model as that used for the UK Impact Assessment for the UK Climate Change Act (refer to paragraph 8), to indicate that an 80% reduction in carbon dioxide emissions, including international aviation and shipping emissions, may cost up to 3% of GDP in 2050. It can be expected that increasing the target to include the other five gases will increase this estimated cost.

138. The Final Impact Assessment for the UK Climate Change Act, published April 2008, indicates that the long run costs to the UK of achieving a 60% reduction in carbon emissions are likely to be in the range 0.3-1.5% of GDP in 2050, depending on the price of fossil fuel and the availability of low-carbon technologies.

---

8 The Stern Review was published on 20 October 2006 by HM Treasury and was carried out by Sir Nicolas Stern, Head of the UK Government Economic Service and former World Bank Chief Economist. [http://www.hm-treasury.gov.uk/sternreview_index.htm](http://www.hm-treasury.gov.uk/sternreview_index.htm)
9 World Bank estimates suggest that 1% of global GDP equates to around $650 billion, taking into account both exchange rates and also the purchasing power of each world currency against the dollar, in 2007. [http://www.ippr.org/members/download.asp?f=%2Fecomms%2Ffiles%2F80%5Fchallenge%5Fpdf](http://www.ippr.org/members/download.asp?f=%2Fecomms%2Ffiles%2F80%5Fchallenge%5Fpdf)
139. On 7 October 2008, the expert, independent UK Committee on Climate Change\textsuperscript{13} issued its advice on the level of emissions reductions recommended for the UK. It advised that the UK should aim to reduce emissions of Kyoto Protocol greenhouse gases by at least 80\% by 2050. Based on the Stern Review Report data, the Committee estimates that stabilisation of greenhouse gases at levels of 500-550ppm carbon dioxide equivalent, are between 1\%-2\% of GDP in 2050. This is significant, but is fully consistent with continued growth and development, in contrast with unabated climate change which will eventually pose significant threats to growth. The Committee also stated that the costs to the UK of this level of emissions reductions can be made affordable with appropriate policies and trajectories.

140. The UK Government has agreed with this recommendation and announced on 16 October 2008 that they would seek to amend the target in the UK Climate Change Act to match these recommendations. These amendments to the UK Bill were agreed on 28 October. Meeting an 80\% target is viewed by the Committee as challenging but feasible based on a range of options for reducing emissions including:

- Energy efficiency improvement in buildings and industry (eg. loft and cavity wall insulation, use of more efficient appliances, turning appliances off and using less air conditioning), which will be particularly important for reducing emissions in the period to 2020.
- Decarbonisation of the power sector, starting now and continuing through the 2020s, based on replacing existing conventional fossil fuel fired plant with renewable technologies (eg wind, tidal) and carbon capture and storage.
- Transport sector decarbonisation, first through improving fuel efficiency of conventional engines and increased use of sustainable first generation Biofuels, with progressive introduction of new technologies such as electric cars, plug in hybrids and hydrogen vehicles, and second generation Biofuels.
- Heat sector decarbonisation through increased use of biomass in boilers and combined heat and power, air exchange and ground source heat pumps, and modern electric storage heating.
- Decarbonisation of industry and the energy intensive sector in particular, through the introduction of new technologies such as carbon capture and storage to decarbonise the energy used to produce products such as cement, iron and steel.

2050 target – Costs for the Scottish Government, local authorities, public bodies and Scottish businesses

141. The Scottish Government’s assessment of the potential range and timing of options to deliver an 80\% reduction are tied up with actions at the EU and UK level. The first overview assessment of potential options has recently been published\textsuperscript{14} with a focus on measures likely to have a material and lasting impact on emissions in 2050. This is not to downplay the importance

\textsuperscript{13} The UK Committee on Climate Change is currently operating in shadow form pending its formal establishment under the UK Climate Change Act.

\textsuperscript{14} AEA Energy & Environment, ‘Mitigating against climate change in Scotland: Identification and initial assessment of policy options.’ November 2008
of other supporting policy measures such as advice, procurement and training, but recognition of
the overarching nature of the initial study.

142. The study concludes that options available and currently known could generate around a
75% emissions reduction based upon our 1990 emissions figure. This percentage includes
options about which there is currently considerable uncertainty so focussing in on the more
certain options within this long list, the report concludes that this sub-set of options could
potentially deliver around 63% of the total emissions reduction necessary. It is extremely
difficult to cost even this sub-set of options but the report further concludes that implementing
these measures in 2050 might cost in the region of £1.7 billion (expressed in 2005 prices). This
figure is not an assessment of the wider economic costs from implementation nor does it
disaggregate the overall cost to show how it falls between producers, consumers or taxpayers.
The cost simply relates the cost of implementing those particular measures in that year.

143. A further study covering the wider economic and societal costs and benefits was
commissioned and it has also recently been published. The overall conclusions suggest that
reductions in carbon dioxide emissions from a number of policy options may be at the cost of a
small reduction in GDP, but it is always important to bear in mind Stern’s conclusions that the
do nothing option will be far more costly in the long run. The results from the Fraser of Allander
study15 should be seen as early findings illustrating the potential trade offs across different
sectors of the economy rather than a comprehensive answer on the economic cost of meeting our
emissions target.

144. The UK Committee on Climate Change cost estimate for delivering the UK Bill target of
80% emissions reduction in 2050, ie. 1%-2% of GDP is a close cost comparison available for
calculating the cost of delivering the Scottish 2050 emissions reduction target. Estimates for the
impact on the UK as a whole are an appropriate proxy for the cost for Scotland as the structure of
the Scottish economy is broadly similar to the structure of the UK economy. For example the
manufacturing sector represents approximately 14% of the output from the Scottish economy,
whereas the corresponding figure for the UK is 14.7%.

145. On this basis the potential costs of delivering an 80% emissions reduction in Scotland
could also be considered to be in the region of 1%-2% of GDP in 2050. Were this cost
applicable in 2006, not 2050, then Table 1 shows that the potential Scottish costs would be in the
region of £1-£2 billion. Clearly 1-2% of GDP in 2050 will generate a higher figure. These costs
will apply across the whole of the Scottish economy – Scottish Government, local authorities,
public bodies and Scottish businesses.

146. The cost referred to in paragraph 142 is an estimate based on the preliminary work
commissioned by the Scottish Government in identifying how Scotland can meet the 80%
emissions reduction target in 2050. This preliminary work represents the first steps in a
progressive process and will be built on by the Scottish Government’s Strategic Overview
project, expected to report in 2009. For the purposes of costing the delivery of the 2050 target at

15 Fraser of Allander Institute and Department of Economics, University of Strathclyde, ‘The impact on the Scottish
economy of reducing greenhouse has emissions in Scotland: Illustrative findings from an experimental computable
general equilibrium model for Scotland, November 2008
these documents relate to the Climate Change (Scotland) Bill (SP Bill 17) as introduced in the Scottish Parliament on 4 December 2008

this time, the Scottish Government intends to use the cost information referred to in paragraph 145 i.e. 1-2% of GDP in 2050.

147. Costs in 2050 are not transferrable to earlier years as there will likely be a very different cost profile in between. Emissions reductions to 2050 are unlikely to follow a straight line trajectory. Reductions will occur through the advancement of technology as well as through changing demand and changing behavioural patterns. The introduction of a small number of measures can be expected to result in a step change in Scottish emissions (e.g. new, more carbon efficient power stations coming on line). Others will lead to a gradual change in emissions (e.g. take up of new vehicle technology) while advances in building efficiencies may be significantly slower to reduce emissions. Each of these changes will impose different costs on different sectors of the economy at different times over the period to 2050. It is not possible to accurately predict when technologies will be introduced or the rates of reductions that will occur from changing behaviours and shifting demand. Overall with all these factors in play, it is impossible to accurately predict what will happen and when. That is why it is not possible to predict cost profiles during the period of change in the years out to 2050.

These documents relate to the Climate Change (Scotland) Bill (SP Bill 17) as introduced in the Scottish Parliament on 4 December 2008

148. These costs will be borne by producers and tax payers through higher input prices for goods and public services and by consumers through higher retail prices, leading to lower overall GDP of the order highlighted in the previous paragraph. There is considerable uncertainty about precisely where these costs will fall and how they will impact on output by sector will depend upon the paths chosen to deliver the emissions reductions.

149. However, in a global context, it should be noted that the cost estimate of taking action to reduce emissions is lower than the cost to society if no action is taken to alleviate climate change – estimated by the Stern Review to be in the order of 5-20% of global GDP.

2030 target – Costs for the Scottish Government, local authorities, public bodies and Scottish businesses

150. Similar difficulties arise with costing the delivery of the 2030 target with any certainty. In addition to steady, year-on-year emissions reductions (eg arising from enhanced energy efficiency), some of the more significant emissions reductions will take the form of step changes resulting from, for example, the introduction of new technology. This means that in practice a straight line reduction trajectory is unlikely. For example if carbon capture and storage is successfully introduced as a mechanism for avoiding emissions of carbon dioxide into the atmosphere, the national reduction trajectory will take the form of series of step changes as the technology is adopted at fossil fuelled power stations.

151. Unfortunately no climate change studies have been identified which estimate the costs of reducing emissions by 2030 which could provide a reference point on which to base Scottish costs. Because emissions reductions will not occur in a straight line trajectory, taking a proportion of the cost estimated for delivering the 2050 target would not provide a credible cost estimate. The risks and errors with such an approach are too significant.

Annual targets – Costs for the Scottish Government, local authorities, public bodies and Scottish businesses

152. The long term target 2050 target will be underpinned by a series of annual targets, the first of which will be set by order in 2010. The Bill does not specify the methods by which the annual emissions reductions targets are to be delivered. The costs and efficiencies arising as a result of the proposals will depend on a large number of interrelated factors. These include wider economic variables such as macroeconomic conditions and GDP growth, largely exogenous factors such as average winter temperatures and the stability of European energy markets and points more specific to Scotland such as the level at which the annual targets are set, the gradient of the emissions reductions trajectories selected and the costs of the available abatement technologies adopted over the period to 2050. All statutory orders prescribing annual targets will be accompanied by a regulatory impact assessment (RIA) which details the likely cost implications.

153. The Scottish Ministers will be required by the Bill to seek expert, independent advice to identify the most cost effective emissions reductions available when setting annual targets and when identifying the most cost effective way of delivering the post-2020 emissions reduction trajectory required by the Bill.
154. At this time it is not possible to identify what these annual targets will be or how much it will cost to deliver them, at least in part because baseline future emissions are strongly linked to economic activity. As discussed earlier, costs in 2050 are not transferrable to earlier years as there will likely be a very different cost profile in between. This why it is not possible to provide costs for the delivering the emissions reductions targets in earlier years.

155. More specifically the Scottish Government expects to be informed on a number of issues by independent advice, which in the first instance is to be obtained from the UK Committee on Climate Change. Under the UK Climate Change Act, the Committee is required to provide advice to the UK Government by 1 December 2008 on the recommended emissions budgets for the first three UK budget periods. The Scottish Government intends to ask the Committee to draw on this advice and advise on the level of annual targets to be set under the Scottish Bill and on the most cost effective abatement methods available to deliver these targets. This advice is not expected to be available until the second half of 2009. Pending this advice it is not possible to quantify the cost of delivering the annual targets to be set under the Bill.

156. In the event of Scotland failing to meet an annual target, the Bill includes powers to address any excess in emissions through the purchase of carbon units. Carbon units represent emissions reductions from recognised sources outside of Scotland.

157. Emissions data for Scotland is currently produced by disaggregating UK emissions data. This information is available eighteen to twenty months after the end of a reporting year. Therefore the first year in which these costs might arise for the purchase of units is 2012 in connection with Scotland’s emissions performance in 2010. The cost of purchasing carbon units is determined by the market but is expected to range from at least £15 - £30 per tonne of carbon dioxide equivalent. Should Ministers take up the option to purchase carbon units, the cost can be expected to fall to the Scottish Government from 2012 onwards. It is not possible to estimate at this time exact costs of purchasing carbon credits as this will depend on whether the annual targets are met and if there is any failure, the extent of that failure.

158. The cost of meeting a specific annual or interim target will form part of the overall cost of meeting the 2050 target. For information the cost of any carbon unit purchase represents a transfer of money from Scotland to the country generating a validated carbon unit.

**Carbon accounting – Costs for the Scottish Government local authorities, public bodies and Scottish businesses**

159. In relation to the net Scottish emissions account, the Bill will allow for the Scottish Ministers to create a scheme, by order, for the tracking of carbon units and establishing and maintaining accounts for holding carbon units. Such a scheme could be administered by the Scottish Government and any costs would be absorbed within existing administration budgets. The potential annual cost of this task is estimated to be **£60,000**. This cost is based on the employer costs of employing the equivalent of a policy analyst, costed at approximately £60,000 per annum. It is possible that this cost could also be applied in an alternative manner by employing a range of lower grade staff, with employer costs not exceeding this £60,000 estimate.
160. If the Scottish Ministers do create a carbon accounting scheme, these costs will apply to the Scottish Government. There will not be any associated costs for local authorities or Scottish businesses. If the Scottish Ministers require a public body to undertake this activity on their behalf, for example the Scottish Environment Protection Agency, these costs could apply to the public body instead of the Scottish Government.

PART 2 – ADVISORY FUNCTIONS

Advice from the UK Committee on Climate Change Committee

161. The emissions reduction provisions in the Climate Change (Scotland) Bill impose duties on the Scottish Ministers, which among other things, require the Scottish Ministers to establish annual emissions reductions targets in secondary legislation. Ministers will be required to seek expert, independent advice in advance of setting annual targets. It is expected that this advice will be sought from the UK Committee on Climate Change, or corresponding Scottish Committee, on these annual targets, on the basis of the most cost effective abatement mechanisms for reducing greenhouse gas emissions.

162. If the Bill is approved by Parliament, the first main task for the Scottish Ministers, after it is enacted, will be to set the annual targets for greenhouse gas emissions reductions. These annual targets will be set in batches with the first batch of annual targets expected to cover the period up to and including 2022. Each set of annual targets will be prescribed in orders. All such orders will be accompanied by a fully costed Regulatory Impact Assessment (RIA), detailing the abatement and mitigation policies required to deliver the relevant set of annual targets. The Bill will require the first set of annual targets to be established by June 2010 with subsequent sets established by order at intervals thereafter. This will ensure that a clearly defined statutory reduction pathway is available to guide abatement effort over the short to medium term.

163. The Scottish Ministers intend to seek advice in the short term from the UK Committee on Climate Change. As one of the devolved administrations contributing to the UK target, Scotland has committed to fund this independent, expert Committee and its financial contribution for 2008-09 is £275k, which includes set-up costs and the initial phase of research. Future contributions are expected to be similar although additional funding may be required if the Committee is commissioned to provide advice and the cost of that task is particularly expensive, for example, because the Committee requires to recruit more staff or commission external research in order to develop the advice. Analysis related to the Scottish target and trajectory may at times require extra funding for this reason.

164. If the Scottish Ministers decide to establish a Scottish Committee on Climate Change in the future, for which provision is made in the Bill, the annual costs could be in the region of £2.5m, similar to the current annual cost of running the UK Committee (refer to Table 2). The nature of the advice required and the range of expertise necessary in such a Committee suggests that it would be difficult to save costs by adopting a scaled down operation for Scotland. This would represent a potential increase in costs. There would be little, if any, saving on the core contribution to the UK Committee which advises all 4 administrations on their shared objective of the UK target in the context of a wide-ranging analysis of the UK situation as a whole. There would be a saving in that it would not be necessary to commission any analysis relating to the Scottish target from the UK Committee on Climate Change which might incur extra costs if the
task were expensive to carry out. Utilising the expertise of the UK Committee on Climate Change remains the most cost effective option for obtaining advice, currently available to the Scottish Ministers.

PART 3 – REPORTING DUTIES

165. The Bill establishes a number of reporting requirements for the Scottish Ministers linked to the greenhouse gas emissions targets. All of these will have a minimal cost impact on the Scottish Government and any costs will be absorbed within existing administration budgets. The potential annual cost of this administration task is estimated to be £17,000 (50% of a policy officer’s employer costs costed at approximately £34,000 per annum).

166. The different reporting requirements are:

- An annual report on greenhouse gas emissions in Scotland;
- A report and statement on proposals and policies designed to meet future annual targets, published as soon as practicable after each set of annual targets are set;
- A report and statement on remedial measures in the event that an annual emissions target is exceeded;
- Reports on policies and proposals for adaptation to climate change (under Part 5, section 45), in response to each UK wide risk assessment issued under the UK Climate Change Act;

\(^{16}\) Corporate identity costs will only be incurred in 2008-09 when the Committee becomes a statutory body after Royal Assent.
• A statement as to whether the 2030 greenhouse gas emissions reduction target has been met;
• A final statement on whether the 2050 greenhouse gas emissions reduction target has been met.

167. The main emissions target provisions do not apply any reporting duties to local authorities or other public bodies.

PART 4 – DUTIES OF PUBLIC BODIES RELATING TO CLIMATE CHANGE

Power to impose duties on public bodies in relation to climate change

168. The Scottish Ministers anticipate that all sectors of society will play their appropriate part in reducing the emissions of greenhouse gases and therefore contribute to tackling climate change. But it is recognised that as emissions reductions become harder and more expensive to deliver, there may come a time when the Scottish Ministers have to ensure consistent and fair contributions to delivery across the public sector. This is why the Bill proposes a power to allow, by order, to impose duties on public bodies in relation to climate change. There will be full consultation with the bodies concerned before such provisions would be used.

169. If such powers are introduced, the Scottish Ministers can also be expected to identify an appropriate monitoring body to ensure that the new duties are met. The cost of undertaking such duties will depend on the requirements of the duty and the extent to which the duty is applied across the public sector. There would be full discussion and consultation with the future monitoring body before any monitoring duty is applied. These negotiations would include the provision of additional funding if this is required by the body to meet the monitoring duty.

170. Overall this can be considered to contribute to delivering the emissions targets contained by the Bill and therefore would not pose an additional cost above that required to meet the annual targets, the 2030 target and the 2050 target. If additional duties for public bodies are introduced through an order, such an order would be accompanied by a fully costed Regulatory Impact Assessment.
Table 3: Summary of potential costs for Parts 1-4 Emissions Reductions

</tr>
</tbody>
</table>

Note. Potential for some saving on payment to UK Committee on Climate Change for work in relation to Scottish target – see paragraph 164.

* Note - The estimated cost for delivering the 2050 target will apply across all sectors of the economy in Scotland – central government, public sector including local government and private businesses.

PART 5 – OTHER CLIMATE CHANGE PROVISIONS

CHAPTER 1 – ADAPTATION

Programmes for adaptation to climate change

171. Section 45 requires the Scottish Ministers to take specific action where the Secretary of State lays a report before the UK Parliament on the impact of climate change under section 56 of the Climate Change Act 2008.

172. As soon as reasonably practicable following receipt by them of the Secretary of State’s report, the Scottish Ministers must respond by laying a programme before the Scottish Parliament which addresses the adaptation risks identified under section 56 of the UK Act and which sets out the Scottish Ministers’ adaptation objectives and their proposals and policies for meeting these objectives. After the first laying of the report, subsequent reports will require the Scottish Ministers to include within their programmes an assessment of progress under the previous programme.
173. This action will initially be triggered within three years of the in-force date of the relevant section of the UK Act, and thereafter at least once every five years. But the response required will form a considerable part of a policy official’s workload when it is required. Overall it is anticipated that this work will be absorbed within existing administration budgets and will approximate to 50% of a policy analyst’s time during the year in which the duty is triggered. This is cost is estimated as £30,000 based on the employer costs of employing the equivalent of a policy analyst, costed at approximately £60,000 per annum. This cost will only occur for the Scottish Government. It is possible that this cost could also be applied in an alternative manner by employing a range of lower grade staff, with employer costs not exceeding this £30,000 estimate.

Variation of permitted times for making muirburn

174. Muirburn is a current land management activity, which must adapt to the effects of climate change in order to remain effective. The making of muirburn is the act of controlled burning of vegetation on open muir or moorland. Its use provides fresh food sources on rough grassland or actively managed grouse moors and it manages older vegetation which can be a source of fuel for wildfires.

175. The making of muirburn is regulated by the Hill Farming Act 1946 which provides that muirburn is permitted at prescribed times of the year. In Scotland, climate change has altered climate and seasonal weather patterns and as a result, the ability of muirburn as a land management tool has been, and will in the future be adversely affected.

176. The provisions in Part 5, Chapter 1 of the Bill will give the Scottish Ministers the power to use secondary legislation to set and vary the permitted periods for making muirburn where they consider it necessary in relation to climate change. As muirburn is a current activity, the order-making power is not expected to give rise to additional costs. The administrative costs incurred by the Scottish Government in bringing forward an order are expected to be minimal and will be absorbed within existing administration budgets.

CHAPTER 2 – FORESTRY

Renewable energy development and releasing capital for woodland creation

177. These provisions will allow the Scottish Ministers to confer functions on Forestry Commissioners in Scotland by secondary legislation, where they consider it necessary or expedient in relation to climate change. The immediate intent is to take forward proposals to allow the Forestry Commission to enter into joint ventures for renewable energy development and to allow them to let timber cutting rights to fund climate change activity.

The National Forest Estate – renewable energy development

178. Renewable energy development on the National Forest Estate through joint ventures will be revenue generating. Recent studies have shown that there is significant untapped potential for wind and hydro developments on the national forest estate. Annual net income potential might be expected to reach perhaps £10m/yr by 2012 and perhaps £30m/yr by 2020. Initial capital costs
to the Forestry Commission will depend on specific joint venture arrangements, but the use of the renewables sites themselves as the Forestry Commission share is preferred. There are further options to fund initial capital from routine land disposal programmes.

179. Additional cash resources will be required by the Forestry Commission Scotland (FCS) initially to establish joint venture arrangements, estimated at £0.5m/yr in 2009/10 and 2010/11. This will be found from FCS’s operational budgets.

The National Forest Estate – releasing capital for woodland creation

180. It is intended to secure powers through the Bill to allow, by secondary legislation, the release of capital from the National Forest Estate through the letting of timber cutting rights. The intention is to evaluate options for releasing value from the £850M total estimated value of the Estate. This would be done by letting cutting rights over some of the more commercial parts of the estate. The income would depend upon a range of factors including, critically, the area covered by a lease and its terms; one option being evaluated is a 75 year lease over about 100,000 hectares (or up to 25% of the national forest estate). The receipts might be secured as an up-front payment or as an income stream. Additional cash resources would be required initially to let the cutting rights and establish contracts, estimated at £0.2m/yr in 2009/10 and 2010/11. This will be found from Forestry Commission operational budgets. Current timber supply contracts will be safeguarded through the letting process and it is expected that the forestry and timber sectors will benefit from resultant market diversification. All secondary legislation will be accompanied by a fully costed Regulatory Impact Assessment.

181. The receipts from the letting of cutting rights would provide additional funding for woodland creation. One option being consulted upon is to supplement current woodland creation measures by transferring cutting rights receipts to a membership-led body created to use this resource for woodland creation. Such a body might also be given the landlord’s interest in the leased land to hold in perpetuity for the nation. Detailed proposals have yet to be developed, and will include consideration of State Aids issues. Additional cash resources would be required initially to establish the appropriate bodies, estimated at £0.3m/yr in 2009/10 and 2010/11. This will be found from Forestry Commission operational budgets.

182. This proposal will not create additional financial burdens on local authorities or other public bodies, individuals and businesses. As well as helping to mitigate climate change, an enhanced rate of woodland creation will provide economic stimulus to Scotland’s forestry sector.

* Note – After the first two years it is expected that the annual running costs of these activities will not exceed the figures shown and will be funded from the income generated.

PART 5, CHAPTER 3 – ENERGY EFFICIENCY

183. Chapter 3 of the Bill aims to improve the energy performance of non-domestic buildings and improve energy efficiency generally across Scotland.

Energy efficiency

184. These provisions will put a duty in statute on the Scottish Ministers to produce a plan for promoting energy efficiency in Scotland. The action plan will provide details of the measures to improve energy efficiency and/or to promote micro-generation across all Scottish Government Directorates. This duty is part of current planned activity, is not expected to give rise to additional resources and will be met from within existing Scottish Government administration budgets.

Energy performance of non-domestic buildings

185. The aim of improving the energy performance of existing non-domestic buildings is to raise the contribution that the existing non-domestic stock can make to mitigating climate change. Buildings account for over 40% of emissions and there is scope to further reduce these levels. They are to be subject to an assessment of the emissions of greenhouse gases and energy performance, an enhanced form of energy performance certificate (EPC). The results of the recent consultation on this will inform the detailed route forward but could call on building owners or their delegated persons to draw up improvement action plans. These plans may include building work actions for owners to follow which lead to improved performance, and where appropriate could also include operational measures that building users may choose to act on. To deliver this policy, substantive provision is made in five areas some of which are subject to the results of the ongoing consultation as follows:

1) Extending the scope of enhanced EPCs to take account of operational ratings as well as asset ratings and also embodied energy/carbon when a robust methodology is available to
address the issue of historic and traditional buildings. Varying the lifespan of such assessments/certificates.

2) Requiring owners or their delegated persons to obtain enhanced EPCs (even though they are not selling or renting out their buildings).

3) Requiring owners of non-domestic buildings to formulate action plans for building work arising from the advice on their enhanced EPCs and encouraging them to implement their action plan.

4) Developing appropriate standards for such building work e.g. energy efficient lighting, roof space insulation or sub-metering.

5) Empowering local authorities, or similar public bodies, to check and enforce enhanced EPCs.

186. The costs and savings outlined in this memorandum are those costs and efficiencies that are directly attributable to responsibilities and tasks set out in the energy performance of existing non-domestic buildings part of the Bill. The provisions in the Bill will clarify the roles and responsibilities of the Scottish Ministers, local authorities, building owners and other responsible persons and authorities for improving the energy performance of existing non-domestic buildings in Scotland. This will result in reductions in emissions and energy use, which will ultimately lead to the reduction in economic costs to occupiers of non-domestic buildings and in general, the greater good of the population.

187. The costs identified are preliminary estimates in the absence of detailed secondary legislation, which cannot be developed until the Bill is enacted and the new responsibilities that will be placed on building owners or their delegated persons and the authorities involved, are agreed. All secondary legislation introduced will be accompanied by costed regulatory impact assessments. The menu of provisions in the Bill can be assembled in different ways and for the purpose of this Memorandum have been formed into seven different scenarios which will be informed by the consultation. This illustrates the range of costs that could occur, depending on the approach to implementation adopted. The consultation, Action on Climate Change: Proposals for Improving the Energy Performance of Existing Non-Domestic Buildings was issued on 2 September 2008 and closed on 25 November 2008.

188. The total cost depends on a number of factors. The variables that could cause the greatest fluctuation in costs will be the type of buildings covered and the extent to which the enhanced EPCs are applied to the stock. The consultation on proposals for improving the energy performance of existing non-domestic buildings sought views on these scenarios. The responses to this consultation will inform the development of the regulations (in particular scenarios 3), 4) and 5)) which the provisions in this Bill will enable the Scottish Ministers to create.

189. The seven scenarios are as follows:

1) Enhanced EPC on sale or rent for all buildings and for larger public buildings frequently visited by the public with additional guidance to promote uptake of recommendations;

17 http://www.scotland.gov.uk/Publications/2008/08/15155233/1
2) Enhanced EPC on sale or rent for all buildings and all large buildings with additional guidance to promote uptake of recommendations and an increase in the frequency of certification;

3) Enhanced EPC on sale or rent for all buildings and for larger public buildings frequently visited by the public with additional guidance, an increase in the frequency of certification, and compulsory uptake of recommendations;

4) Enhanced EPC on sale or rent for all buildings and for all large buildings with additional guidance, an increase in the frequency of certification, and compulsory uptake of recommendations;

5) Enhanced EPC on sale or rent for all buildings and for all buildings with additional guidance, an increase in the frequency of certification, and compulsory uptake of recommendations;

6) Enhanced EPC and operational rating on sale or rent and for larger public buildings frequently visited by the public; and

7) Enhanced EPC and operational rating on sale or rent and for larger public buildings frequently visited by the public with additional guidance.

Improving the energy performance of existing non-domestic buildings

190. Additional costs to the Scottish Government will be incurred as a result of the new Ministerial duties and powers set out in the Bill and are set out below on the basis of the scenario adopted and any financial support.

Table 5: Potential costs for Scottish Government for each energy performance scenario

</tr>
</tbody>
</table>
191. The costs have been abstracted from the Partial Regulatory Impact assessment contained within the Consultation Action on Climate Change: Proposals for Improving the Energy Performance of Existing Non-Domestic Buildings\textsuperscript{18}. Scenarios 1, 2, 6 and 7 require ACEPs to be carried out buildings for sale or rental and for large buildings but there is not compulsion to implement the recommendations. Scenario 3 restricts the compulsory uptake of recommendations to large public buildings and Scenario 4 restricts the compulsory uptake of recommendations to large buildings. The high cost in relation to Scenario 5 in relation to all of the other scenarios is that ACEPs require to be obtained for all buildings irrespective of sale or rental and size and the recommendations have to be implemented for all buildings.

192. The one-off costs include staff costs to develop secondary legislation, impact assessments and guidance, media campaigns to create public awareness, training and research. The average annual cost includes staff for maintaining the system, support funding for businesses where appropriate and additional research and media campaigns where necessary to alert the public of changes to the system.

\textit{Costs on local authorities}

193. The Bill will have both cost and resource implications for local authorities. It is difficult to estimate the likely total cost of these new duties. The costs of implementing this will depend on how the menu of provisions in the Bill is assembled in the secondary legislation. The secondary legislation will be accompanied by a costed regulatory impact assessment. The scenarios below give an indication of potential costs and are likely to include the commissioning of building surveys, calculating energy and carbon performance of buildings, formulating action plans and carrying out building work. One off costs are not anticipated. If local authorities are exempt through relaxation provisions from enhanced EPCs then as building owners they will not bear any costs. If the provisions do apply, then the estimated costs in Table 6 will fall to local authorities. If enforcement responsibilities are given to local authorities, it is expected that a self financing system based on penalty charges could be utilised.

Costs on other bodies, individuals and businesses

194. Building owners or their delegated persons are likely to incur costs as a result of future secondary legislation brought in under the powers set out in the Bill. The costs of implementing this will be dependent on how the menu of provisions in the Bill is assembled in the secondary legislation. The secondary legislation will be accompanied by a costed regulatory impact assessment. Table 7 outlines the ranges of potential costs, based on scenarios 1-7 and are likely to include the commissioning of building surveys, calculating energy and carbon performance of buildings, formulating action plans and carrying out building work. One off costs are not anticipated.

Renewable heat

195. These provisions in the Bill are designed to enable the Scottish Ministers to encourage, incentivise and promote the generation of heat from renewable sources. These measures are not expected to give rise to additional costs for the Scottish Government as this activity is currently undertaken and funded as part of the Community and Householder Renewables Initiative and the Scottish Biomass Support Scheme. It is not envisaged that there will be any costs arising from these provisions for local authorities, bodies, individuals or businesses.

196. The Scottish Community and Householder Renewables Initiative aims to bring renewable energy to households and communities across Scotland. It has two funding streams to assist with the installation of a range of renewable technologies, one stream for households and one for communities. The support includes capital grants and advice which is delivered by a team of development officers based across Scotland. The total budget allocation over the current spending review period is £13.5 million per annum.

197. The Scottish Biomass Support Scheme is a capital grants scheme targeted at the business sector to help with the costs of installing a biomass heating system and for demonstration of district heating. The budget for the programme is £2 million over the financial years, 2009-10 and 2010-2011. This total budget is used for renewable heat.

PART 5, CHAPTER 4 – WASTE REDUCTION AND RECYCLING

198. These provisions set out measures aimed at improving waste and recycling in Scotland, to help move Scotland to a “zero waste” society. “Zero waste” is about reducing the unnecessary use of raw materials, sustainable design of products, preventing waste, and recovering value from products and materials when they reach the end of their lives through recycling, composting or energy recovery.

199. The provisions in this part of the Bill establish enabling powers to introduce secondary legislation. The costs and efficiencies arising as a result of the proposals will vary widely according to how and when they are implemented. Consequently it is not possible to provide exact costings for the proposals which will come forward in secondary legislation. All secondary legislation will be accompanied by a Regulatory Impact Assessment and what follows is an indication of possible costs and savings in a range of scenarios.

Costs for the Scottish Government

200. In the case of all the provisions in this part of the Bill, the Scottish Government would incur the costs of making the regulations. These would arise in the ordinary course of the Scottish Government’s business, and it is anticipated that they will be absorbed into the administration budget.

Waste prevention and management plans

201. Depending on the provisions of the regulations, the Scottish Government may also be required to produce plans of its own to prevent and manage waste. The costs of these plans would depend on their complexity, and the range of issues they are intended to address. Since it
is envisaged that a plan should be made for each individual relevant project the costs would also depend on the number of relevant projects the Government might undertake.

202. A useful comparator may be the costs assessed for Site Waste Management Plans, which are compulsory in England & Wales under the Site Waste Management Plans Regulations 2008. These are likely to represent the minimum set of parameters Scottish regulations might set for plans. (Plans similar to those which are statutory in England are presently optional in Scotland, and are encouraged by Scottish Planning Policy 10.) These plans apply to all aspects of construction work including preparatory work such as demolition and excavation. They are required for civil engineering projects as well as projects involving the maintenance, alteration and decoration of existing structures. The installation, maintenance or removal of all related services such as electrical, gas, water, sewage and telecommunications are also subject to this requirement.

203. Details of these costs are available in the Department for Food and Rural Affairs (Defra) consultation paper (http://www.defra.gov.uk/environment/waste/topics/construction/index.htm) which assesses the costs of writing a site waste management plan over a number of project values, from £350 in the case of a project worth £70,000, to £1,600 for a project worth £1,600,000. However, in practice drawing up such a plan can deliver cost efficiencies by reducing waste, and therefore waste costs. At the time the consultation paper was published, these efficiencies were estimated at £210 for a project worth £70,000 to £4,800 for a project worth £1,600,000. At the time, it estimated that a site waste management plan was cost-neutral at a project value of £250,000. Above that figure, the larger the project value, the greater the efficiency. Clearly this is an aspect which may be borne in mind when drawing up any Regulations made under this provision.

204. The consultation paper notes that factors such as ongoing increases in landfill tax could further enhance the potential savings of site waste management plans. Landfill tax is currently escalating by £8/tonne per annum for non-inert waste. As time goes on, therefore, it is likely that the break-even point will reduce.

205. These provisions give the Scottish Ministers powers to require a wider range of waste prevention and management plans than site waste management plans drawn up under the 2008 regulations in England & Wales. Costs will relate to the range of aspects which must be considered, and arise through the necessity to carry out an assessment of wastes arising, identifying how the wastes may be dealt with and preparing the plan. In all cases, it is likely that the preparation of a waste prevention and management plan will lead to efficiencies in waste related costs, through minimisation in particular, but also through identifying opportunities to extract value through reuse and/or recycling, leading to resource savings. The value of these efficiencies is likely to increase owing to the landfill tax escalator, irrespective of resource costs. Envirowise currently estimates waste costs at 4% of turnover (http://www.envirowise.gov.uk/dsur5yhjtw) [Link no longer operates]. Addressing more aspects in a waste plan can increase plan costs, while also increasing opportunities for efficiencies.

Waste data returns

206. The Scottish Ministers will be required to make returns on any waste produced, and which was the subject of regulations. A transfer note containing information on the weight,
nature and destination of the waste must be prepared under the Environmental Protection (Duty of Care) Regulations 1991. In the case of hazardous waste, more detailed provision is made in the Special Waste Regulations 1996. It is likely that similar information would be required. The additional costs would therefore be **marginal**.

**Duties to provide recycling facilities**

207. The Scottish Ministers may be subject to a requirement to provide receptacles for material to be recycled. Costs will depend on the type of recycling facilities required, which will be a matter for regulations made under these provisions. However, any regulations are likely to concentrate, at least initially, on materials which are easy to collect and for which there is a ready market, and in this respect the Scottish Ministers already provide receptacles for recycling paper, beverage cans, plastic cups and batteries. It is therefore not anticipated that there would be additional costs arising from this provision.

208. An estimate of the costs involved in the provision of recycling facilities may be found in a consultation carried out by Defra last year on public place recycling (on materials which can occur in litter bins) on a voluntary basis, which can be found at http://www.defra.gov.uk/corporate/consult/recyclebins/consultation.pdf.[Link no longer operates] This suggested a range of one-off costs for England of £1.1 million to £3.3 million, with annual recurring costs thereafter ranging from £0.3 million to £0.9 million. These costs are for a voluntary scheme: any compulsory scheme would be likely to have a wider reach and could cost more.

209. The provision of the bins was estimated to cost between £484 and £600 per bin. These costs are dependent on the nature of the facilities provided and the cost of receptacles varies widely. For example, at the Scottish Government offices at Victoria Quay, Edinburgh, paper collection boxes are provided free as part of the general waste contract, specialised containers for plastic cups each cost £60, can crushers can cost up to £600 individually and those currently in use cost £120 nine years ago.

210. Organisations which provide these facilities are likely to find that they must arrange for the collection and recycling of wastes for which they are not the producers. This will increase costs but also potentially benefit society through the more efficient use of resources, and a reduction in waste disposal by landfill thereby reducing the generation of methane emissions. As an indication of costs, the total waste for the Victoria Quay offices (about 2000 people) in 2007-08 was approximately 260 tonnes (82% paper and card, 4% wood and 3% plastic). Most was collected in a container whose rental was £1.18 a day and whose daily uplift cost £60.60. The majority of this was recycled - 200 tonnes.

211. On the other hand, there are likely to be some off-setting efficiencies. Where recycling facilities are provided it is likely that the organisation providing them will recycle more of its own wastes. This has the effect of reducing disposal costs. Regulations made under these provisions are not likely to come into force before 2010. In 2010 – 2011, the landfill tax will be £48/tonne for non-inert wastes, and is predicted to increase at a rate of £8/tonne every year thereafter. Gate fees at landfill, net of tax, are in the region of £20/tonne at present.
**Procurement contracts and recyclate**

212. If regulations are established for this provision, the Scottish Ministers would also be subject to their requirements. However, this is unlikely to add any costs. The type of materials likely to be specified are traded widely therefore must be priced competitively. It is reasonable to assume that the replacement of virgin materials with recycled ones is unlikely to increase costs. Rather than a price barrier, the recycling industry often talks of a “perception” barrier preventing the use of products derived from waste. A requirement that recycled products be used is a means of addressing such a perception barrier.

**Targets for reducing packaging**

213. The Scottish Ministers do not produce packaging therefore are unlikely to be affected by a substantive scheme, except by the costs of making Regulations.

**Deposit and return schemes**

214. Costs arising from these provisions will depend on the detail of the regulations. There are currently operational deposit and return schemes in Scotland which do not result in costs for the Scottish Ministers, for example the AG Barr scheme. At the other end of the scale, all those who contribute to a particular type of packaging entering the Scottish market could be obliged to participate in a scheme which provides for the return and recycling of that packaging. Clearing-house functions may arise from this and the set-up costs would probably have to be met by the Scottish Government (though they may be recovered through charges to users).

215. Both Norway and Denmark, countries with a similar sized population to Scotland’s, operate deposit and return schemes which depend on a central function. Details may be found at [http://www.resirk.no](http://www.resirk.no) and [http://www.dansk-retursystem.dk](http://www.dansk-retursystem.dk) respectively. Some indication of the set up costs may be gleaned from the value of the material assets of these organisations at dates close to set-up. Resirk’s “property, plant and equipment” were worth NKR 3.9m (currently c. £40,000) in 2002 (four years after foundation) and Retursystem’s were worth DKR 14.7m (currently c. £161,000) in 2000, the year of founding. This gives a range of £40,000 to £200,000 for value of physical assets at today’s prices. Beyond this, of course, there would be time costs and fees involved in any set-up process, but much of this would be absorbed into the administration budget.

**Carrier bag charges**

216. The only costs, other than those incurred through making the regulations, anticipated for the Scottish Government are those related to publicity campaigns.

217. A Member’s Bill to introduce a levy on plastic bags was introduced in an earlier session of Parliament. The Regulatory Impact Assessment (RIA) for this Bill can be found at [http://www.scottish.parliament.uk/business/committees/environment/papers-05/rap05-28.pdf#page=20](http://www.scottish.parliament.uk/business/committees/environment/papers-05/rap05-28.pdf#page=20). This document contains links to a research report, *Proposed Plastic Bag Levy – Extended Impact Assessment*, which forms the basis for much of its material. The features of the scheme proposed in the Climate Change (Scotland) Bill are somewhat different from this Member’s Bill but much of the information is relevant. For example, the RIA mentions the cost of an education campaign which it estimates at £750,000.
Costs for local authorities

Waste prevention and management plans

218. Local authorities could be required by regulation to make waste prevention and management plans – the costs (£350 - £1,600) and potential efficiencies (£210 - £4,800) attributable to the Scottish Government (detailed in paragraph 203) would potentially apply here also.

219. It is also possible that enforcement duties may fall to local authorities, depending on the nature of the regulations. This could include enforcement powers and duties including the registration of plans, and ensuring that obligated bodies have the necessary plans. The number of obligated bodies would depend on the nature of the plans. However, registration of any single plan is unlikely to take in excess of an hour. Assuming that the average employer cost of a member of staff is £25,000, this would make the cost of registration of any plan unlikely to exceed £15, since a FTE is assumed to work about 2,000 hours a year. Any regulations could provide for registration charge to off-set these administrative costs.

220. Where a report is required for the procurator fiscal with a view to prosecution, this may take three hours of an officer’s time and be equivalent to a cost of £45. Legal officers’ costs could be significantly higher than this, potentially bringing the preparation costs for a case to be in excess of £1,000 - but these are likely to be rare.

Waste data returns

221. Local authorities would be obliged to make returns on any waste produced which was the subject of future regulations. They are already obliged to provide information by the 1991 and 1996 Regulations mentioned above. It is likely that similar information would be required here and the additional costs would be marginal. As local authorities handle significant waste for third parties, information is already provided for this waste and no change is anticipated here.

Duties to provide recycling facilities

222. Local authorities may be expected to provide recycling facilities under the provisions of any regulations brought forward on this matter, and the estimate of £60 - £600 for each receptacle, mentioned in paragraph 209, would apply.

223. The same principle would apply to the enforcement of the provision of recycling facilities. This could apply to local authorities and is particularly likely in the case of the provision of facilities at one-off events. Enforcement is likely to consist of ensuring that facilities are provided, are properly used and that the materials collected are sent for recycling rather than to landfill for disposal. Similarly costs for the officers involved are likely to be in the region of £15 an hour plus travelling time and expenses. In the event of any prosecutions becoming necessary, the costs indicated above would also apply.
These documents relate to the Climate Change (Scotland) Bill (SP Bill 17) as introduced in the Scottish Parliament on 4 December 2008

Procurement contracts and recyclate

224. Regulations on this would likely apply to local authorities but are unlikely to add costs. The type of materials which may be specified are already traded widely and the replacement of virgin materials with recycled materials is unlikely to increase costs.

225. Depending on the form of the regulations, local authorities may be the enforcing body. This would involve examining invoices, and perhaps also making spot checks. The amount of work involved is unlikely to amount to as much as 1 FTE per local authority, so no more than 32 FTEs would be needed in Scotland as a whole (at an annual cost of about £800,000). In the event of prosecution being necessary the costs outlined earlier could be incurred.

Targets for reducing packaging

226. Costs will be dependent on the eventual form of any regulations and it is possible that local authorities would enforce the targets. As they would apply over Scotland as a whole, this could involve Designating "home" or "lead" authorities with a particular connection to main retailers. In these instances particular arrangements would have to be made to support that authority in its work. Local authorities are already responsible for enforcing the Packaging (Essential Requirements) Regulations 2003, which provide that packaging should meet “essential requirements”.

227. Potential costs are unlikely to include visits to retailers and other users of packaging. Instead, the function of enforcing targets may be carried out by examining records, many of which are likely to exist already, such as those relating to materials used, and waste returns. There are approximately 265,000 private sector businesses in Scotland, many of which very small, and either do not produce packaging or are likely to be excluded under a de minimis provision. The Scottish Retail Consortium records 13,805 VAT registered enterprises in Scotland, and the Federation of Small Businesses has a membership of over 19,000, which it believes is over 99% of the relevant businesses in Scotland. It seems likely that a figure of 20,000 could reasonably represent the number of enterprises which put packaging on the market in Scotland. If inspection of a data return is estimated to take one hour, inspection of 20,000 returns would take 20,000 hours, which represents approximately 10 FTEs, on the assumption than a FTE is assumed to work about 2,000 hours a year. The cost of 10 FTEs is approximately 10 x £25,000 = £250,000 per annum.

228. There will be opportunities for efficiencies through creating less packaging. For local authorities in particular this would mean that household waste disposal costs could reduce. For every 1% reduction, savings in landfill tax costs could amount to £144,000 – based on 60% of household waste being disposed of at landfill at a cost of £48/tonne in 2010-2011. This equates to almost 6 FTEs.

Deposit and return schemes

229. It is not anticipated that any variant of a deposit and return scheme, introduced under regulations would have significant costs for local authorities. These proposals are more likely to have a financial benefit for local authorities, by reducing the amount of waste they have to handle. Materials which have a monetary value when handed back are less likely to become litter
– which local authorities have a duty to clear. Experience in Denmark indicates that 85% of bottles are returned via their scheme.

**Carrier bag charges**

230. Costs may arise for local authorities if regulations apply an enforcement duty. The RIA produced for the Members Bill indicated a potential cost of £3.5 million per annum. It is likely that any eventual Regulations would be aimed at carrier bags generally rather than just plastic bags and this may increase the costs beyond those indicated by the RIA. Enforcing and policing is estimated at £2.5m. Occasional prosecution costs may also arise.

**Costs on other bodies, individuals and businesses**

**Waste prevention and management plans**

231. Other bodies, individuals and businesses are likely to be among those whom Regulations made under this part of the bill could require to make waste prevention and management plans. Similar costs (£350 - £1600) and efficiencies (£210 - £4,800) to those outlined in para 203 could apply.

232. The regulations could specify a different enforcement body – for example the Scottish Environment Protection Agency (SEPA). Potential costs are likely to be similar to the £15 per registration described before although there could be economies of scale if this function were carried out by a single national body, which could mean that, overall, fewer individuals need to be employed. Again, it is possible that the regulations would enable SEPA (or any other body charged with enforcement) to recover these costs by charging.

233. Where charges were levied for purposes such as registering plans, this could be a cost for all bodies under a duty to prepare such plans, including the Scottish Government and local authorities.

**Waste data returns**

234. Other bodies and businesses would be required to make returns on any waste produced, which may be covered by future regulations. As described earlier there are already existing controls for the transfer of waste. It is likely that much the same information would be required and additional costs should therefore be marginal. Householders would not be required to make such returns.

235. While these costs should be marginal, they would be dependent on the detail of regulations - including the complexity of the business, and the frequency with which it generated waste. The regulations could also exempt certain bodies or businesses from providing this information.

236. These provisions are aimed at providing information on the volumes of waste which arise to improve information on overall impacts and help create more effective strategies for waste prevention, minimisation and recovery. It will be necessary to collate this data – and to ensure that it is correctly provided. It is appropriate that such a duty would fall on SEPA. SEPA already
collects data on household waste and makes estimates for commercial and industrial waste. These provisions would improve the accuracy of the information for this duty.

237. However it is to be expected that new enforcement costs will arise as additional activity will be required. It would be reasonable to estimate this as one FTE (\textbf{\£25,000 per annum}). The prosecution costs outlined earlier may also occasionally arise.

\textit{Duties to provide recycling facilities}

238. Other bodies, individuals and businesses are likely to be amongst those bodies required through regulations to provide recycling facilities and similar costs to those given in paragraph 209 would apply (\textbf{\£60 - \£600 per receptacle}).

239. As before, the Scottish Environment Protection Agency (SEPA) could be designated the enforcement body for any regulations made under these provisions. Similar costs and opportunities for efficiencies and cost recovery would apply.

\textit{Procurement contracts and recyclate}

240. Other bodies, businesses etc would be subject to the requirements made by Regulations. However, this is unlikely to add any costs for the reasons explained previously.

241. A national organisation such as SEPA could be the enforcing body for any regulations. Enforcement would include examining invoices and perhaps also making spot checks. The amount of work involved is likely to cost less than is outlined for enforcement costs by local authorities (\textbf{\£800,000 per annum}), given that economies of scale would be available. In the event of prosecution being necessary the costs outlined previously could also apply. This would be extremely rare, given that there appears to be little or no cost incentive to avoid the procurement of recyclate.

\textit{Targets for reducing packaging}

242. Another body, possibly SEPA, could oversee the regime established to enforce the targets for packaging reduction. The costs would be similar to those described previously - \textbf{\£250,000 per annum}. Obligated bodies and businesses would be required to return forms. As many bodies and businesses, are obliged to provide similar information for the purposes of the existing Producer Responsibility Obligations (Packaging Waste) Regulation 2007, the additional cost is unlikely to be significant.

243. Meeting the target could involve costs. For example, research and development costs for “lightweighting” and for new methods of presenting products involving less packaging. This could involve the purchase of machines for consumers to insert refillable containers. However these costs could be offset by efficiencies elsewhere in areas such as transportation costs and the resulting reduction in shelf space. Additionally less packaging could mean reductions in obligations to recover packaging in terms of the 2007 Regulations - in July 2008 a packaging waste recovery note for paper cost £2 – 3 per tonne, and for aluminium it cost £60 – 70 per tonne (http://www.letsrecycle.com/prices/prnPrices.jsp). This obligation would not impact on householders.
Deposit and return schemes

244. Any form of deposit and return scheme which may be developed under regulations would be likely to have costs for other bodies and for businesses. This cost could be off-set by an increase in re-use and recycling of the materials collected and lower disposal costs.

245. The extent to which such a scheme would cost or benefit individuals would depend on the extent to which they returned all the materials subject to the scheme. Broadly, a 100% return would be cost neutral – the deposit fee, included in the price, would be recovered. Those persons choosing not to return the materials would be unable to recover the deposit fee thereby discouraging thoughtless disposal.

246. If schemes similar to the existing AG Barr scheme were compulsory for a range of Scottish operators, retailers would incur storage and packaging return costs. However, retailers are already obliged, under the Producer Responsibility Obligations (Packaging Waste) Regulations 2007, to recover a certain amount of glass, steel, aluminium paper/board, plastic and wood, which are principally the materials likely to be targeted for deposit and return schemes. Any deposit and return scheme would supplement, and not replace, these producer responsibility obligations. This could make it easier for retailers to meet the relevant targets, which are expected to increase over time.

247. Producers would be likely to incur a one-off cost of arranging for marking to refer to the deposit. Retailers and producers would also incur the cost of maintaining records and possibly making returns.

248. Regulations could require the designation of a competent authority to inspect returns and ensure a scheme is operated. With more ambitious schemes, such as those operated in Norway and Denmark, there is also a clearing house function. In the case of the Danish scheme, packaging captured by the scheme is registered and marked, to indicate that the deposit fee has been paid. Retailers return the materials and the clearing house issues a payment from the deposit fees. The clearing house collects, or arranges to collect, the materials from the retailers and also arranges for it to be recycled. The clearing house may also carry out the functions of overseeing and enforcing the system.

249. This is clearly a more expensive option. In 2006, the Danish and Norwegian systems cost £17.8m and £17.4m respectively to operate. An estimate of £15-£20 million per annum running costs for a Scottish system handling the same materials (essentially soft drinks packaging) would appear to be reasonable. These costs would have to be recovered through the deposit fees and other possible means, such as sale of recyclate. A similar system could apply to a wider or narrower range of materials, which would affect the costs accordingly.

250. The greater expense of the Danish/Norwegian model could be off-set by the collection and recycling of greater volumes of materials and the subsequent reduction of disposal costs. There could be added benefits through the greater disincentive for littering and fly-tipping and other forms of unauthorised disposal.
251. The Danish experience illustrates an 85% return rate. Dansk Retursystem is empowered to spend any profit on improving the system as it was set up as a non-profit making body. The same principle could be applied in Scotland. Regulations could permit the scheme to spend money on improvements and these could include supporting recycling facilities or the provision of reverse vending machines, which automate the return of the relevant material.

252. However AG Barr’s experience with its current scheme indicates that return rates have dropped from 99% in 1976 to 70% at the beginning in 2007. The firm has recently increased its deposit from 20p to 30p a bottle to address this but it is too early to analyse any results arising from this.

**Carrier bag charges**

253. The RIA mentions the costs incurred by the Irish Government, which set up a centralised collection service. The set-up costs were approximately €1.5m. This, however, included the costs of an advertising campaign, which would probably be borne by the Scottish Government rather than by other bodies. Ongoing costs are €300,000 (currently c. £240,000) pa, while €12 million (currently c. £9,700,000) a year is raised by the levy. Any scheme the Scottish Government would establish will be subject to set-up and collection costs. It is appreciated that there might be a disproportionate outlay at the beginning of any scheme: for example, the Regulatory Impact Assessment suggests a cost of £1,349,000 for updating tills etc.

254. Costs would arise for the enforcing authority for the regulations. As discussed earlier, this could be local authorities. The Regulatory Impact Assessment referenced in the Member’s Bill estimated that these costs could be **£3.5 million per annum**. It is likely that any eventual Regulations would be aimed at carrier bags in general, rather than just the plastic ones considered in the Member’s Bill. Although this may increase the costs, a single enforcement body could derive economies of scale and reduce costs. Enforcement and policing was estimated to cost **£2.5m**.

255. Retailers who issue carrier bags would be subject to a requirement to set a charge and to administer that charge including the potential transfer to good causes approved by the Scottish Ministers. It is expected that any costs would be recoverable from the income realised from charges. The UK Government will levy VAT on the charge, payable to HM Revenue & Customs; this too will be a cost, which will presumably be passed on to the consumer.

256. Users of the carrier bags would pay the charge. The Regulatory Impact Assessment indicated an income of £7.75m on the basis of a charge of 10p per bag. For comparison, in Ireland the income raised from a tax of €0.15, is approximately €12m (£9.7m) a year. If SMEs, charities and promotions were exempted from the charges indicated by the Member’s Bill, the Regulatory Impact Assessment calculated the potential income as £5.43m a year. The proposals included in the Climate Change (Scotland) Bill may have a higher cost as a wider range of bags is under consideration. However this could be off-set by greater efficiencies in waste reduction, litter clear-up, loss of amenity etc. The inclusion of paper bags (as is probable under the present proposals) would result, according to the Regulatory Impact Assessment, in an income of **£8.14 million per annum**.
257. Consumers can avoid paying this type of charge by using their own bags (though this may mean they have to purchase other items, such as bin-liners). A “bag-for-life” which may be used for carrying shopping instead of the kind of carrier bag likely to be aimed at costs from £1 - £3 and may last indefinitely.

258. Good causes in Scotland would benefit from any profits arising from the system. It is also possible that the Scottish Ministers could provide that only profit arising from the minimum level of charge would be allocated to good causes. If retailers chose to charge more, it is possible that additional profit could be retained by the retailer.

259. The Regulatory Impact Assessment suggested that the changes proposed in the Member’s Bill would cost 300 – 700 jobs in Scotland. This figure would be likely to increase if non-plastic carrier bags were also subject to a charge. However there would be some off-setting such as increased employment in the manufacture and distribution of bags for life.

**SCOTTISH GOVERNMENT STATEMENT ON LEGISLATIVE COMPETENCE**

260. On 4 December 2008, the Cabinet Secretary for Finance and Sustainable Growth (John Swinney MSP) made the following statement:

“In my view, the provisions of the Climate Change (Scotland) Bill would be within the legislative competence of the Scottish Parliament.”

---

**PRESIDING OFFICER’S STATEMENT ON LEGISLATIVE COMPETENCE**

261. On 4 December 2008, the Presiding Officer (Alex Fergusson MSP) made the following statement:

“In my view, the provisions of the Climate Change (Scotland) Bill would be within the legislative competence of the Scottish Parliament.”
INTRODUCTION

1. This document relates to the Climate Change (Scotland) Bill introduced in the Scottish Parliament on 4 December 2008. It has been prepared by the Scottish Government to satisfy Rule 9.3.3(c) of the Parliament’s Standing Orders. The contents are entirely the responsibility of the Scottish Executive and have not been endorsed by the Parliament. Explanatory Notes and other accompanying documents are published separately as SP Bill 17–EN.

POLICY OBJECTIVES OF THE BILL

General overview

2. The provisions in this Bill will set a long-term target to reduce Scotland’s emissions of Kyoto Protocol greenhouse gases by 80% by the year 2050. This long term target will be supported by a framework of annual targets intended to drive the policies necessary for achieving this target. Many of the policy measures required to meet these targets will not require legislation to implement them, but certain climate change mitigation and adaptation policies have been identified which do require legislation and this Bill contains provisions in Part 5 which will allow these to be taken forward.

3. The Bill policy areas are separated into five Parts:

- **Part 1** creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050. To help ensure the delivery of these targets, this Part of the Bill also requires that the Scottish Ministers set annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050.

- **Part 2** contains provisions which will allow the Scottish Ministers to establish a Scottish Committee on Climate Change, or to designate an existing body, to exercise advisory functions.

- **Part 3** places duties on the Scottish Ministers requiring that they report regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill.

- **Part 4** contains powers to allow the Scottish Ministers, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.
Part 5 contains other climate change provisions and is divided into the following four chapters:

- **Chapter 1** contains provisions relating to adaptation to the impact of climate change. It requires that the Scottish Ministers produce a report setting out their objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced. Part 5 Chapter 1 of the Bill also contains an enabling power for the Scottish Ministers to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

- **Chapter 2** will allow modification by regulations of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change.

- **Chapter 3** contains three distinct sets of provisions. The first set of provisions in this Chapter require the Scottish Ministers to produce an action plan setting out their current and proposed measures to promote the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change towards energy efficiency. The second set of provisions contains measures for assessing the energy performance of existing non-domestic buildings in order to raise awareness of the contribution that those buildings can make to mitigating climate change through reducing energy demand and thereby emissions of greenhouse gases. The third set of provisions in this Chapter place a duty on the Scottish Ministers to take such steps as they consider appropriate to promote the use of heat from renewable sources.

- **Chapter 4** contains provisions which will enable the Scottish Ministers to make regulations addressing issues of importance in moving towards a zero waste society, and securing a more sustainable use of resources, thereby limiting the emissions of greenhouse gases which contribute to climate change.

**BACKGROUND**

**Scientific context**

4. Radiation from the sun is necessary to sustain all life on Earth. A proportion of this radiation passes through the atmosphere and warms the atmosphere and the surface of the Earth. The short wavelength radiation is absorbed by the Earth’s surface, which is heated as a result. This energy is then re-irradiated at longer wavelengths as infra-red radiation. A proportion of the out-going infra-red radiation is absorbed by greenhouse gases in the atmosphere. The higher the concentration of greenhouse gases in the atmosphere, the greater the proportion of longer-wave radiation that is trapped and so the greater is the warming. This process naturally keeps the Earth’s surface warmer than would be the case otherwise - an average surface temperature of +15°C as opposed to an average of -18°C without it. However, human-induced greenhouse gas emissions enhance this effect to create greater warming than would occur naturally.

5. The main greenhouse gases are water vapour and carbon dioxide (CO₂). Other important greenhouse gases include methane (CH₄), nitrous oxide (N₂O) perfluorocarbons (PFCs)
hydrofluorocarbons (HFCs) and sulphur hexafluoride (SF6). With the exception of water vapour, the concentration of these gases in the atmosphere has been increasing since the beginning of the industrial era. This increase is due largely to human activities. For example, carbon dioxide concentrations in the atmosphere have increased from a range of 275 to 285 parts per million (ppm) in the pre-industrial age to 375ppm in 2005 and the rate at which this concentration is increasing, is accelerating.

6. The weight of international scientific evidence highlights the serious and urgent nature of climate change. The Fourth Assessment Report (AR4) of the Intergovernmental Panel on Climate Change (IPCC)\(^1\) is clear that emission of greenhouse gases caused by human activity is the primary driver of the observed changes in climate.

7. According to AR4, mean global temperatures are projected to rise between 1.1 and 6.4°C above 1990 levels by the end of this century, depending on the level of global emissions. Such an increase in temperature will result in continued melting of ice caps, glaciers and sea ice, changes in rainfall patterns, intensification of tropical cyclones and a further rise in global sea levels of between 20 and 60cm by the end of this century.

International action

8. The international community has already begun a coordinated response to the challenge. The United Nations Framework Convention on Climate Change (UNFCCC) has as its ultimate objective “stabilization of greenhouse gas concentrations in the atmosphere at a level that would prevent dangerous anthropogenic interference with the climate system”.

9. The current international agreement to reduce greenhouse gas emissions is the Kyoto Protocol. In ratifying the Protocol a number of industrialised countries have committed to reduce their emissions of carbon dioxide, methane, nitrous oxide, HFCs, PFCs, and sulphur hexafluoride (collectively known as the “basket of six greenhouse gases”) by on average, 5.2% below 1990 levels by 2008-2012. Another international agreement is needed to set commitments beyond 2012. Negotiations on this are set to be concluded by the end of 2009 at the UNFCCC Conference of the Parties in Copenhagen.

10. The European Union (EU), as a signatory to the Kyoto Protocol, has committed to reducing its collective greenhouse gas emissions by 8%. The United Kingdom share of the EU collective target is a reduction of 12.5% in its emissions of the basket of gases. At the Spring European Council on 8 and 9 March 2007, EU Heads of Government agreed a unilateral binding target to reduce the EU’s greenhouse gas emissions by at least 20% by 2020 (compared to 1990 levels) and to increase this commitment to a 30% reduction if an international agreement is reached.\(^2\)

---

\(^2\) This commitment forms part of the European Commission’s proposed Energy and Climate Change Package. More information about this is available from: [http://ec.europa.eu/energy/climate_actions/index_en.htm](http://ec.europa.eu/energy/climate_actions/index_en.htm)
United Kingdom action

11. The UK Government introduced a Climate Change Bill into the House of Lords on 14 November 2007. The Bill received Royal Assent on 26 November 2008. The UK Act contains a headline target of reducing the UK’s emissions of the basket of six greenhouse gases by 80% by 2050 and it provides a framework for setting a limit on the total amount that can be emitted by the UK over successive five-year periods (carbon budgeting). It also establishes an independent Committee on Climate Change to advise on the level of those carbon budgets and on a range of other climate change issues. It contains reporting requirements, enabling powers to create trading schemes relating to greenhouse gas emissions, and provisions on adaptation to the effects of climate change. Following the Scottish Parliament’s agreement on 20 December 2007 to a Legislative Consent Motion, most of the provisions of the UK Act, on enactment, will extend to Scotland, although some provisions, such as those on waste, do not extend to Scotland.

Scottish action

12. In its Fourth Assessment Report, the Intergovernmental Panel on Climate Change states that global emissions should be 50 to 85% lower (than 2000 levels) in 2050 to limit warming to 2.0°C - 2.4°C. Although Scotland only accounts for 0.15% of global greenhouse gas emissions, the Scottish Ministers believe that it is right that Scotland, a country which led the industrial revolution, should show leadership in legislating to reduce emissions of greenhouse gases and should aim to achieve the top end of the scale indicated.

CONSULTATION

Proposals for a Scottish Climate Change Bill

13. Between 29 January and 23 April 2008, the Scottish Government held a public consultation on proposals for a Scottish Climate Change Bill. The consultation document provided a summary of the science of climate change and set out the Scottish Government’s proposals for legislating to reduce Scotland’s emissions and to adapt to the ongoing effects of climate change. The consultation document was made available on the Scottish Government’s website and a wide range of stakeholders were invited to respond.

14. A total of 21,046 responses were received. 318 non-campaign responses were received from individuals and organisations. A further 20,728 responses were received from campaigns run by five non-governmental organisations. Copies of the non-campaign responses and examples of campaign responses were published on the Scottish Government website where permission was given to do so by the respondents concerned.

Consultation workshops

15. As part of the consultation process, the Scottish Government held four stakeholder workshops. Three of these events were hosted in partnership with the Convention of Scottish Local Authorities, Highlands and Islands Enterprise and Scottish Enterprise respectively. All aspects of these workshops including the presentations, workshop notes for participants, and

3 The consultation on proposals for a Scottish Climate Change Bill and related documents are available from: http://www.scotland.gov.uk/Topics/Environment/Climate-Change/16327/Climate-Change-Bill/SCCBConsultation
This document relates to the Climate Change (Scotland) Bill (SP Bill 17) as introduced in the Scottish Parliament on 4 December 2008

detailed reports on the views expressed, were recorded and made available on the Scottish Government website4.

Strategic Environmental Assessment

16. A Strategic Environmental Assessment of the consultation proposals was also undertaken, and the environmental report was published on 8 February 20085.

Analysis of consultation responses and the Scottish Government response

17. The majority of respondents welcomed the consultation, the commitment and intention to introduce legislation or establish a framework, and/or the leadership shown by Scotland. A large amount of primarily qualitative information was provided around four main themes: targets; supporting framework; reporting and scrutiny framework; and supporting measures. Some common themes or core messages arose repeatedly, in respondents’ consideration of the consultation questions, including: the seriousness of climate change and the need for early action; a commitment to taking action in Scotland; the need for targets and actions to be specified; the complexity of the issue of climate change; the need for a basis in science, knowledge and advice; the need for research; the need for regular monitoring and reporting; the need for scrutiny within a flexible but robust framework; the need for everyone in Scotland to play their part in tackling climate change; the need for leadership, direction, clarity and certainty in the way forward; and the need for links to other relevant work.

18. Given the large number of responses and variety of views expressed in answer to the open questions which were asked, it is not possible to go into further detail about the outcomes of the consultation in this Policy Memorandum. However, the Scottish Government commissioned an analysis of the consultation responses, the report of which was published on 20 August 2008. This report presents in detail the themes and messages which emerged from the consultation responses and is available on the Scottish Government’s website6.

19. On 27 October 2008, the Scottish Government published its response to the main points raised during the consultation on proposals for a Scottish Climate Change Bill. This response included the main policies proposed for the Bill. The response document is available on the Scottish Government’s website7. The policy content of the Bill is described in detail below.

20. The consultation on proposals for a Scottish Climate Change Bill principally covered the policies addressed by the provisions contained in Parts 1 to 4 of the Bill. Additional separate consultations were carried out in respect of the policies addressed by the provisions contained in

This document relates to the Climate Change (Scotland) Bill (SP Bill 17) as introduced in the Scottish Parliament on 4 December 2008

the chapters of part 5 of the Bill. Details of these additional consultations are given under each of the respective topic headings of this Policy Memorandum.

PART 1: EMISSIONS REDUCTION TARGETS

Policy objectives

21. The provisions set out in Part 1 of the Bill create the statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050. To help ensure the delivery of these targets the Bill requires that the Scottish Ministers set annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050.

Net Scottish emissions account

22. The 2050 target is defined by placing a duty on the Scottish Ministers to ensure that the net Scottish emissions account for the year 2050 is at least 80% lower than the baseline year. This is commensurate with the Scottish Ministers’ desire to achieve close to the top end of the 50 to 85% reduction in greenhouse gas emissions as Scotland’s share of the reductions that the IPCC states in its Fourth Assessment Report is necessary, globally, by 2050 to limit average temperature rises to 2.0-2.4°C.

23. The Bill establishes that the following are “greenhouse gases”: carbon dioxide, methane and nitrous oxide, for which the baseline year is 1990; and perfluorocarbons, hydrofluorocarbons and sulphur hexafluoride, for which the baseline year is 1995. This is in accordance with the international practices established under the Kyoto Protocol.

24. “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping. In the case of the latter, this recognises that Scottish emissions from international aviation and international shipping will, by their very nature, occur in part outside Scotland’s borders.

25. The Bill defines the term “net Scottish emissions” as the amount of Scottish emissions minus the amount of Scottish removals. “Scottish removals” are defined as being removals of greenhouse gases from the atmosphere due to land use, land use change and forestry activities in Scotland. The Bill allows the Scottish Ministers to modify the definition of Scottish removals to take account of potential additional types of removal which may be recognised in the future.

26. The term “net Scottish emissions account” is established in the Bill as a point of reference against which the target can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland. It is the overall sum of these elements that form the net Scottish emissions account: i.e. net Scottish emissions (emissions plus removals) plus carbon units sold, minus carbon units purchased and used to offset emissions.
27. Carbon units represent emissions reductions or removals and emissions allowed under trading schemes. The Bill allows for the Scottish Ministers to make regulations specifying which carbon units are recognised for the purpose of the net Scottish emissions account. It is the Scottish Ministers' intention that such regulations specify units that are compliant with the internationally recognised criteria established under the Kyoto Protocol. 

28. The Bill also allows the Scottish Ministers to create regulations providing for a scheme for registering carbon units and for establishing accounts in which they may be held and/or transferred between. These regulations may also make provision for appointing a person or body to administer such a scheme. The number of carbon units purchased, held, used and sold in a given calendar year will be reported upon annually.

**Interim and annual targets**

29. The Bill creates an **interim target** which requires that the Scottish Ministers ensure that the net Scottish emissions account for the year 2030 is at least 50% lower than the baseline. The 2030 interim target is intended to act as a milestone on the path to 2050, strengthening the requirement for early emissions reductions to be delivered in the run up to 2050.

30. To ensure early and consistent action, the Bill requires that the Scottish Ministers set **annual emissions reduction targets** for each calendar year from 2010 to 2050. These annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive. Subsequent batches will include five annual targets: 2023 to 2027, 2028 to 2032 and so on. The Scottish Ministers are required to set the first batch of targets for 2010 to 2022 no later than 1 June 2010. Subsequent batches must be set no later than 31 October in the 12th year before the beginning of the period in question. This is intended to give stakeholders certainty of the Scottish Government’s emissions reduction trajectory so that they can plan with certainty over the longer term. These batches of annual targets will also coincide with the carbon budgets established under the provisions of the UK Climate Change Act 2008, to assist organisations operating throughout the UK. This approach also recognises that reserved policy measures introduced in support of the UK carbon budgets will bear down on emissions in Scotland, thereby contributing to the achievement of Scotland’s targets.

31. From the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Like the mid-point 2030 target, this is designed to ensure early action is taken to reduce Scottish emissions. Prior to 2020, the Scottish Ministers will be expected to set annual targets which build towards delivering emissions reductions of at least 3% each year.

**Measurement of emissions**

32. The measurement of Scottish emissions and removals must be carried out, as far as reasonably practicable, in accordance with international carbon reporting practice. It is intended that this will be achieved by using data disaggregated from the UK Greenhouse Gas Inventory. This Inventory is submitted each year by the UK Government to the United Nations Framework Convention on Climate Change.

---

8 Details of the units compliant with emissions trading under the Kyoto Protocol are available from: [http://unfccc.int/kyoto_protocol/mechanisms/emissions_trading/items/2731.php](http://unfccc.int/kyoto_protocol/mechanisms/emissions_trading/items/2731.php)
This document relates to the Climate Change (Scotland) Bill (SP Bill 17) as introduced in the Scottish Parliament on 4 December 2008

Convention on Climate Change. The Bill establishes that if this information is in accordance with the protocols of the United Nations Framework Convention on Climate Change it is considered to be in accordance with international practice. The Bill also gives the Scottish Ministers the power to specify a different European or international agreement, to allow flexibility should the basis of international carbon reporting change. The term “as far as reasonably practicable” is used in recognition of the fact that Scotland is not a full member of the United Nations or Member State of the European Union so may not be able to satisfy those requirements within international carbon reporting practice that can only be achieved by full members of such organisations.

PART 2: ADVISORY FUNCTIONS

33. The emissions reduction provisions in the Climate Change (Scotland) Bill impose duties on the Scottish Ministers, which require them to establish annual emissions reductions targets in secondary legislation. Ministers will be required to seek expert, independent advice in advance of setting annual targets.

34. The UK Climate Change Act 2008 establishes a Committee on Climate Change to provide expert advice to the UK Government and Devolved Administrations. Initially, the Scottish Ministers intend to seek independent, expert advice from the UK Committee. As one of the Devolved Administrations contributing to the UK emissions reduction target, Scotland contributes to the funding of this independent, expert Committee. In the longer term, the Scottish Ministers will take a view on the effectiveness of the advice from this Committee for Scotland’s interests. Should the Scottish Ministers determine that the UK Committee on Climate Change does not meet all the advice needs for Scotland, the Bill contains provisions which will allow the Scottish Ministers to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

35. Climate change is a wide-ranging and complex subject. The Bill requires that the Scottish advisory body, should one be established or designated, must provide advice, analysis, information or assistance regarding the Scottish Ministers’ functions relating to climate change when asked to do so by the Scottish Ministers. The UK Climate Change Act 2008 contains similar provisions requiring that the UK Committee on Climate Change provide relevant advice to the Scottish Ministers when requested to do so.

36. Each year, following the annual report on emissions, detailed in paragraph 37 below, the Scottish Ministers must, if no Scottish body has been tasked with carrying out the advisory functions mentioned in section 19 of the Bill, request the Committee to publish its views on the progress towards achievement of the annual targets that have been set, the interim 2030 target and the 2050 target. If a Scottish body has been tasked with carrying out the advisory functions, that body will, by virtue of the provisions in section 23 of the Bill, be required to publish an equivalent report. Ministers will be required to publish a response to the points made in these reports.

PART 3: REPORTING DUTIES

37. It is intended that the Scottish Ministers be subject to strong and robust reporting requirements. The Bill therefore requires that the Scottish Ministers report regularly to the
Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The reporting requirements in Part 3 are as follows:

- **Annual reporting duty**: the Scottish Ministers are placed under a duty to lay an annual report before the Parliament giving details of Scotland’s emissions, including the net Scottish emissions account; the use of carbon units; Scotland’s electricity consumption; and Scotland’s electricity generation. If the annual emissions target has been exceeded, the report should also explain why.

- **Report and statement on proposals and polices designed to meet future annual emissions targets**: as soon as reasonably practicable after setting any set of annual emissions targets, the Scottish Ministers will be required to lay a report before the Scottish Parliament setting out proposals and policies for meeting the current and future annual emissions targets, up to and including the annual targets just set. In practice, this report will require to be made at least once every five years.

- **Report and statement on proposals and policies designed to compensate for exceeding annual emissions targets**: where the net Scottish emissions account exceeds an emissions target, the Scottish Ministers are also required lay a report setting out the proposals and policies by which they intend to compensate for the excess emissions.

- **Final statements for 2030 and 2050**: the Scottish Ministers will also lay statements setting out whether the 2030 and 2050 emissions reduction targets have been met and, if not, why not. These reports will be distinct from the annual reports for 2030 and 2050 which will focus on the action in these two calendar years as opposed to the long-term targets.

**PART 4: DUTIES OF PUBLIC BODIES RELATING TO CLIMATE CHANGE**

38. The Scottish Ministers anticipate that all sectors of society in Scotland will contribute appropriately to taking action on climate change. In this context, the public sector in Scotland has a pivotal role to play, by showing leadership and by setting and delivering policies that encourage and enable action by others.

39. The Scottish Government is committed to working in partnership with the public sector in reducing the target greenhouse gas emissions which affect climate change. But it is recognised that as emissions reductions become harder and more expensive to deliver, there may come a time when the Scottish Ministers have to ensure consistent and fair contributions to delivery across the public sector. This is why the Bill contains a power to allow the Scottish Ministers, by regulations, to impose duties on public bodies in relation to climate change (these could concern emissions reduction or adaptation to the effects of climate change), to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

40. This part of the Bill also contains powers which enable the Scottish Ministers to designate one or more persons or bodies to monitor whether relevant public bodies are discharging their climate change duties appropriately. It is intended that, should the Scottish Ministers exercise this power, an existing body or bodies, or a person or persons already carrying out a similar function, would be designated for this purpose.
41. The Bill enables the Scottish Ministers to require the monitoring body to make reports on their activities and to issue guidance or directions to the monitoring body relating to the exercise of its functions. These measures are intended to ensure that any such monitoring body operates in a transparent way and that Ministers can ensure that it performs its monitoring functions in a way considered best suited to securing the best possible oversight and scrutiny of public bodies’ action on climate change.

42. If the Scottish Ministers decide to use these provisions in the future it is intended that there will be full consultation with the public bodies concerned.

**Alternative approaches considered for Parts 1 to 4**

43. The first consideration was whether a Scottish Climate Change Bill was required since the UK Government was in the process of legislating for a UK Climate Change Bill, now Act, at the time these proposals were first being considered. The Scottish Ministers are fully supportive of the UK efforts to reduce greenhouse gas emissions. In recognition of the fact that the UK Act relates in large part to areas which are devolved under the Scotland Act 1998, a Legislative Consent Motion was passed by the Scottish Parliament on 20 December 2007.

44. The Scottish Ministers wish to set a target to reduce greenhouse gas emissions by 80% by 2050, in line with the upper end of the 50 to 85% range set out in the Intergovernmental Panel on Climate Change’s Fourth Assessment Report. Proposals for the Scottish Climate Change Bill were originated at the time when the UK Government’s 2050 target was for 60% reduction of carbon dioxide emissions. In addition to participating in the shared UK objective, the Scottish Ministers wished to make a clear commitment for Scotland.

45. The UK Government requested early advice from the Committee on Climate Change (operating in a shadow capacity prior to the enactment of the UK Bill). This advice was issued on 7 October 2008 and, as a result, the UK Government, with the agreement of the Scottish Ministers, amended the UK Bill on 28 October 2008 to increase the 2050 target to 80% and to include all six greenhouse gases. Nevertheless, the Scottish Ministers consider that there should be separate, complementary UK and Scottish climate change legislation which allows Scotland to drive forward emissions reductions and break down barriers to reducing climate change and which will have the dual effect of meeting the Scottish target and contributing towards the achievement of the UK target.

46. Paragraphs 13 to 19 provide details on the public consultation on the proposals for a Scottish Climate Change Bill. Stakeholder views were sought on a wide range of issues during this exercise and the responses helped the development of the policies included in the Scottish Bill. Amongst the issues considered in the consultation the following issues were key:

- **Should the Bill’s targets focus solely on carbon dioxide rather than the basket of the six Kyoto Protocol greenhouse gases, which all contribute towards climate change?** Carbon dioxide has the lowest global warming potential per unit of the six

---

gases but is emitted in vastly greater quantities than the others combined. However, it may be difficult or even impossible to eliminate some greenhouse gases and if other greenhouse gases prove difficult and/or very costly to abate, greater reductions in carbon dioxide will be needed to compensate. Therefore a target based on a basket of greenhouse gases could place additional costs on the economy as compared to a carbon dioxide only target.

The majority of responses to the consultation on proposals for a Scottish Climate Change Bill favoured targeting the basket of six gases. Based on the Stern Review Report\(^\text{11}\) data, the Committee on Climate Change estimates that the cost of stabilising greenhouse gases at levels of 500-550ppm carbon dioxide equivalent is between 1%-2% of GDP in 2050. This sum is significant, but is fully consistent with continued growth and development, in contrast with unabated climate change which will eventually pose significant threats to growth, estimated by Stern at between 5%-20% of global GDP. The Scottish Ministers therefore decided that the 2050 emissions reduction target set in the Climate Change (Scotland) Bill should cover the basket of six greenhouse gases.

**Should the framework supporting the delivery of the long term emissions reduction targets be based upon multi-year emissions budgets or annual targets?** Multi-year emissions budgets would provide flexibility within the long-term emissions reduction trajectory. However, annual targets provide greater certainty as to the magnitude of emissions reductions that need to be made at any given time. A large number of the responses to the Bill consultation expressed a preference for annual targets. The Scottish Ministers decided that the Bill should establish a framework of annual targets which will be based on expert advice from the Committee on Climate Change and will be set more than 10 years in advance so that private and public sector organisations can plan with certainty over the longer term. The science and economics of climate change will continue to develop between now and 2050 and the annual target model will create a credible framework which is flexible enough to adapt to changing circumstances but strong enough to drive sustained emissions reductions over the coming decades.

**Should the expert advisory body be the UK Committee on Climate change or an equivalent Scottish body?** The Scottish Ministers intend to seek advice initially from the UK Committee on Climate Change. This approach was supported by the majority of consultation responses on this issue. As one of the Devolved Administrations, contributing to the UK target, Scotland contributes to the funding of this independent, expert Committee. This currently costs the Scottish Ministers £275,000 a year. If the Scottish Ministers decide to establish a Scottish Committee on Climate Change in the future, the annual costs could be in the region of £2.5 million, based on achieving a number of efficiencies on the current annual cost of running the UK Committee. Utilising the expertise of the UK Committee on Climate Change remains the most cost effective option for obtaining advice currently available to the Scottish Ministers. However, this must be balanced with the need to obtain suitable advice which recognises Scotland’s individual circumstances. That is why the Climate Change (Scotland) Bill contains provisions to allow the Scottish

\(^{11}\) Stern Review on the Economics of Climate Change, available from: [http://www.hm-treasury.gov.uk/stern_review_climate_change.htm](http://www.hm-treasury.gov.uk/stern_review_climate_change.htm)
Ministers to create a Scottish body (or confer the functions on an existing body) to provide advice in the future. This recognises that the UK Committee on Climate Change is a new expert and independent body which has not yet been given the opportunity to prove itself. Should the Scottish Ministers find this Committee cannot provide the advice required by Scotland, the Bill makes adequate provision to take forward a tailored Scottish solution in the future.

47. The alternative approaches considered for the policies addressed by the provisions contained in the chapters of part 5 of the Bill are given under each of the respective topic headings of this Policy Memorandum.

PART 5: OTHER CLIMATE CHANGE PROVISIONS

PART 5, CHAPTER 1: ADAPTATION

Adaptation programmes

48. The UK Climate Change Act 2008 requires that the Secretary of State lay reports in the UK Parliament setting out an assessment of the risks for the United Kingdom of the current and predicted impact of climate change. These reports must also be sent to the Scottish Ministers. The Scottish Government will contribute to the preparation of these UK-wide risk assessments.

49. The UK Act requires that the Secretary of State lay programmes before the UK Parliament setting out the objectives of the UK Government in relation to adaptation to climate change. This is to be done as soon as reasonable practicable after the UK-wide risk assessment is laid in Parliament. The UK Act does not place these duties on the Scottish Government. The Scottish Government chose not to take part in this provision of the UK Act as the Scottish Ministers have the powers to direct their own adaptation programmes in devolved areas of responsibility and can introduce any necessary provisions through legislation made in the Scottish Parliament. Part 5 Chapter 1 of the Climate Change (Scotland) Bill therefore places a duty on the Scottish Ministers to produce an equivalent report for Scotland, setting out their objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced. These reports should respond to the risks posed by climate change identified in each UK-wide risk assessment. In practice, the UK climate change impact report will be published at least every five years and the Scottish Ministers response should be made as soon as practicable thereafter.

Alternative approaches

50. Adapting to the effects of changing weather patterns is a fundamental part of the measures required to respond to climate change. Consideration was given requiring that a climate change risk assessment for Scotland be carried out separate from the UK assessment detailed in paragraph 48 above. However, it was felt that the information contained in the UK report will be sufficient for Scotland’s purposes. Scottish Government officials sit of the steering group for the UK risk assessment.
Variation of permitted times for making muirburn

51. Part 5 Chapter 1 of the Bill also provides for an enabling power for the Scottish Ministers to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

52. Muirburn is an essential land management tool, the majority of which is currently carried out throughout the Scottish uplands; however it can be carried out on any land regardless of altitude. It is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. It is predominantly carried out by land managers such as hill farmers, crofters, estate managers and gamekeepers. The use of muirburn enables the provision of fresh food sources on rough grassland or managed moorland for livestock, game and wildlife, and the management of older vegetation which can act as a source of fuel for wildfires.

53. Some 8.7% of Scotland is covered by heather moorland, 15.7% by heather moorland and peatland mosaics and 14.5% by rough grassland and moorland mosaics. Moorland is an important breeding and feeding habitat for invertebrates, mammals and bird species. Well managed muirburn is important to maintain diversity of moorland vegetation. The aim of muirburn is to provide a mosaic of young, intermediate and mature heather and vegetation, which supports a range of habitats. Rough grasslands support a wide variety of plant species and this provides food and shelter for many invertebrates, birds and small mammals, along with providing grazing for livestock. Rotational muirburn carried out in small patches improves botanical diversity and vegetation structures. Aging plants become less productive and viable, and as they age the amount of dead material increases as the amount of live vegetation decreases.

54. The majority of Scottish soils are organic and most of the UK’s peat resource is in Scotland. 50% of the UK’s total soil carbon store is in Scotland and 80% of this is in peat. The approximate carbon storage is three thousand million tonnes of carbon. The majority of the land on which muirburn is carried out lies on top of these soils. Controlled burning aims to burn the vegetation above the height of the soil and for the fire not to penetrate into the soil and peat. Although carbon dioxide and nitrous oxide are released through muirburn, by burning, in particular, old heather, new heather growth is encouraged and plant density increases. The quantity of greenhouse gases released from burning can be minimised by the use of controlled muirburn as a measure to minimise the risk of wildfires occurring.

55. Wildfires are any unplanned and uncontrolled wildland fire that, regardless of ignition source, may require suppression response or other action. Although wildfires can occur naturally in the Scottish uplands as a result of lightning strikes, a number of such fires also occur as a result of man and can be the result of a vehicle exhaust, bonfire, campfire or a dropped cigarette. The risk of a wildfire occurring in remote upland areas of Scotland is significantly increased where effective muirburn has not been carried out, as muirburn reduces available fuel sources.

The impact of climate change

56. Climate change poses a serious challenge for our plants and wildlife, changing the natural environment at a faster rate than some species can adapt to. In Scotland, climate change has altered our climate and seasonal weather patterns. A number of key changes have been recorded
in Scotland since 1961\textsuperscript{12}. Temperatures have risen in every season. Scotland became 20% wetter by 2004, with an increase in precipitation of almost 70%. The snow season has shortened and there has been more than a 25% reduction in the number of frost days across the country. The growing season has lengthened significantly. Future climate scenarios produced in 2002\textsuperscript{13} suggest there will be a number of further changes to the Scottish climate. Annual temperatures will rise, winters may become wetter and summers will become generally drier. Average snowfall will decrease and snowless winters may become normal in some areas. There are no consistent or robust estimates of wind speed changes. Soil moisture changes will be dependant on precipitation, temperature and wind speed. In summer, Scotland as well as the rest of the UK will experience a decrease in the average soil moisture.

57. These climatic changes have impacted on the ability to undertake muirburn and have reduced the frequency of suitable burning days. As a result, the ability of muirburn to be used as a land management tool has been adversely affected.

\textit{Policy objective}

58. As a result of the need to adapt to the effects of climate change, greater flexibility is now required in relation to the periods during which muirburn is permitted. This is proposed to be achieved though an order-making power for the Scottish Ministers to specify the permitted muirburn dates in subordinate legislation. The policy objective is to enable the effective future continuation of this necessary land management activity.

\textit{Legislation}

59. The making of muirburn is regulated by the Hill Farming Act 1946 (“the 1946 Act”), which permits muirburn in Scotland in respect of land below 450m (1500ft) above sea level, between 1 October and 15 April inclusive. This period may be extended to 30 April in the circumstances provided for under the 1946 Act. For lands more than 450m (1500ft) above sea level there is the possibility of a further extension to 15 May. The permitted muirburn season has not varied since the 1946 Act came into force and, at present, there are no powers available to the Scottish Ministers, to vary the permitted muirburn season to enable the exercise of this land management tool to adapt to the changing climate.

60. In addition to the 1946 Act, the Muirburn Code published by the Scottish Government\textsuperscript{14} provides guidance for those making muirburn, and sets out the types and areas of land which are suitable for making muirburn and identifies those areas which are considered unsuitable for muirburn, such as exposed peat hags and gullies. The Code is supported by the Prescribed Burning on Moorland. A Supplement to The Muirburn Code: A Guide to Best Practice\textsuperscript{15}, a technical support document. Although the Code itself is not legally binding, it requires to be

\textsuperscript{14} The Muirburn Code, available from: http://www.scotland.gov.uk/Publications/2008/04/08154231/0

followed by those in receipt of Single Farm Payment as muirburn is also regulated through cross-compliance requirements. Suspected breaches of cross-compliance requirement obligations in relation to the Code are investigated by the Scottish Government, Scottish Natural Heritage or Scottish Environmental Protection Agency (SEPA).

61. This Part of the Bill contains a provision to enable the Scottish Ministers to vary, by order, the permitted muirburn season in subordinate legislation, in order for this activity to adapt to climate change.

Consultation process

62. The Scottish Government’s Consultation on Provisions Relating to Muirburn Dates\(^\text{16}\) started on 25 August 2008 and concluded on 17 November 2008. The consultation was sent to key non-government organisations and individuals and sought their views on whether it was necessary for the Scottish Ministers to be given powers to vary the permitted dates for muirburn in the future. The consultation also sought views on whether there are other amendments required to the muirburn provisions within the 1946 Act which are considered necessary in order to adapt to climate change. The consultation also requested views on the climate change related impacts that affect how practitioners carry out muirburn. The Scottish Government received 56 responses to the muirburn consultation, the detail of which was being analysed at the time this Bill was introduced to the Scottish Parliament.

Alternative approaches

63. The muirburn season could remain as specified in section 23 of the 1946 Act with no provision for the Scottish Ministers to be able to vary the permitted muirburn season. However, if the status quo is retained it is highly likely that in the future the Scottish Government will come under pressure to seek such a power to enable land managers to adapt to climate change, as weather patterns continue to show evidence of change, which has an adverse effect on the ability to effectively undertake muirburn.

64. If no action is taken, there is likely to be an adverse reduction in the number and frequency of available burning days as a result of changing climatic conditions. As a result, heather and other moorland and grassland vegetation will become less productive. This will lead to a reduction in available habitats for species, some of which are specially protected, and the future viability of those plant species will reduce. The increase in the amount of dry fuel sources resulting from less pro-active muirburn will lead to an increased risk of wildfires burning down into the soil and reaching the peat layer. This in turn will lead to the risk of significant releases of carbon from the peat. It is anticipated that the fire and rescue services will be required to attend more wildfires as this risk increases. Any increase in incidences of wildfires could also impact on the economy through disturbance to tourism in rural areas.

Implementation

65. Implementing this policy proposal will require subordinate legislation and a Regulatory Impact Assessment. It is anticipated that the current permitted muirburn season will not be changed immediately.

PART 5, CHAPTER 2: FORESTRY

Maximising the potential of Scotland’s forest estate to support the Scottish Government’s climate change objectives

66. Part 5 Chapter 2 of the Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation. A consultation on these proposals was launched on 4 November 2008 to help inform the detailed development of these regulations. The consultation will close on 27 January 2009.

The National Forest Estate – renewable energy development

67. The National Forest Estate – land owned by the Scottish Ministers – extends to 665,000 hectares and has the potential to make a significant contribution to Scotland’s renewable energy targets through wind and hydro power generation. The Bill will enable the Scottish Ministers to make an order which will allow the Forestry Commissioners to enter into joint ventures with developers and local communities to accelerate renewable energy development. The joint venture approach offers enhanced returns from developments on the National Forest Estate will give local communities an opportunity to have a stake in the developments and will facilitate a strategic approach to developing the renewables potential of the Estate.

The National Forest Estate – releasing capital for woodland creation

68. The Scottish Forestry Strategy articulates the significant potential of forestry to help Scotland mitigate and adapt to climate change. Many types of woodland creation can contribute cost-effectively towards net emissions reduction and there is good potential to increase Scotland’s woodland area. This is being encouraged through grant incentives and through direct woodland creation on the National Forest Estate. However, a new approach is needed to achieve a step-change in activity commensurate with the challenges of climate change.

69. One option being explored, and covered by the consultation, is to release capital from the National Forest Estate, through the letting of cutting rights, to provide additional funding for woodland creation.

70. The Scottish Government places a high priority on efficient management of its capital assets. The National Forest Estate is the single largest public land resource held by the Scottish

17 Consultation on forestry provisions in the Scottish Climate Change Bill, available from: [http://www.forestry.gov.uk/fcesclimateconsultation](http://www.forestry.gov.uk/fcesclimateconsultation)

18 The Scottish Forestry Strategy and associated documents are available from: [http://www.forestry.gov.uk/sfs](http://www.forestry.gov.uk/sfs)
This document relates to the Climate Change (Scotland) Bill (SP Bill 17) as introduced in the Scottish Parliament on 4 December 2008

Government with a capital value in the order of £850 million. Forestry Commission Scotland has been evaluating the contribution that each part of the estate makes to delivery of the Scottish Forestry Strategy. It is clear that many parts of the estate are widely appreciated for the public benefits they bring, for example in terms of recreation, conservation, and community involvement. However, for a proportion of the estate these benefits are limited and the focus is likely to remain on commercial outputs. These areas are the most appropriate for the letting of cutting rights.

71. The Bill will provide an order making power that will allow for the delegation of the Forestry Commission’s land management function. This will enable the Scottish Ministers to lease land for forestry purposes and enable Forestry Commission Scotland to let cutting rights over that land, with the land management function being delegated to the lessee. Public benefits will be safeguarded through careful structuring of the agreements and rigorous selection of appropriate areas. The shaping of proposals will be in discussion with stakeholders. The consultation paper launched on 4 November 2008 seeks views on transferring the proceeds from leases and cutting rights to a not-for-profit trust, for investment in woodland creation. It also seeks views on transferring the landlord’s interest in this land to a not-for-profit trust, and on Ministers stipulating the constitution of such a not-for-profit trust.

Alternative approaches

72. Alternative approaches were considered in relation to (i) maximising the potential of the National Forest Estate to contribute to Scotland’s renewable energy targets (ii) the use of woodland creation as a means of helping to mitigate climate change and (iii) the funding and delivery of an enhanced woodland creation programme.

73. It would be possible to continue with the current approach to developing renewable energy generation on the National Forest Estate, whereby land is leased to developers. While leases have worked reasonably well, joint ventures have the potential to offer better financial returns and to provide a vehicle for allowing the local community to have a stake in the development. Another option is direct development of renewables by the Forestry Commission itself; however, without access to major capital finance and the necessary technical expertise, this is only feasible for very small-scale (e.g. hydro) schemes.

74. Given the challenging nature of the 80% emissions reduction target, woodland creation is a cost effective way of reducing net greenhouse gas emissions. A strategy that did not utilise this potential would have to place greater reliance on more expensive mitigation measures, or increase the risk of exceeding the annual emissions targets. Given the Scottish Government’s level of ambition in emissions reduction this is not seen as a sensible alternative. Well-designed woodlands can also deliver a wide range of economic, social and environmental co-benefits. A recent discussion paper produced by Forestry Commission has demonstrated that suitable land is available to meet the Scottish Forestry Strategy aspiration of 25% of Scotland woodland cover by the second half of the century. These new woodlands would be sequestering over 4 million tonnes of carbon dioxide per year by 205019.

75. Current sources of funding for woodland creation are the Scotland Rural Development Programme (SRDP), and, to a much lesser extent, proceeds from land sales through an existing “repositioning” programme on the National Forest Estate. The SRDP has made provision for £23 million per year (over the period 2007-13) for woodland creation, but grant rates are constrained by the Rural Development Regulation (EC 1698/2005)\(^{20}\). Given the complex range of cultural and fiscal factors affecting land use change, woodland expansion under the SRDP is likely to fall well short of the desired 10,000 hectares per year. Another alternative is to scale up the repositioning programme on the National Forest Estate, selling more land for investment in woodland creation. However, undertaking this on the required scale would require a change in strategic direction, leading to concern over loss of public benefits in relation to land that was sold.

**PART 5, CHAPTER 3: ENERGY EFFICIENCY**

**Promotion of energy efficiency**

76. The provisions on energy efficiency are intended to cover how the Scottish Ministers will promote energy efficiency in Scotland, particularly in relation to how this will improve the energy performance of buildings in Scotland. The provisions require the Scottish Ministers to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

77. Section 179 of the Housing (Scotland) Act 2006\(^{21}\) requires the Scottish Ministers to prepare a strategy for improving the energy efficiency of living accommodation. Section 179(6) allows that strategy to be part of a strategy for improving energy efficiency generally. The proposals for an action plan in the Climate Change (Scotland) Bill will have that practical effect. The Scottish Ministers therefore propose to repeal section 179 of the 2006 Act to avoid duplication. In addition, the proposals in the Bill will strengthen the existing statutory duty in the 2006 Act in terms of reporting and publishing. Bringing the duty in relation to living accommodation within the general duty in the Bill will ensure a consistent approach to tackling energy efficiency across all sectors, and will allow for better alignment of reporting on implementation and carbon savings, which can then be accounted against the overall target of this Bill.

78. The Scottish Ministers are required to report on the action plan annually, and to revise the action plan on a regular basis, but as a minimum every three years in line with the Spending Review process.

79. The action plan could be developed without the need for primary legislation, but the Scottish Government believes that a legislative requirement to develop, revise and report on an action plan will give it the weight which this issue requires. It will show the level of importance that these measures will play in tackling climate change and helping with rising fuel costs. It will also be an important means for delivering a coordinated approach.

---

This document relates to the Climate Change (Scotland) Bill (SP Bill 17) as introduced in the Scottish Parliament on 4 December 2008

Consultation

80. The then Scottish Executive published a draft consultation on an energy efficiency and microgeneration strategy for Scotland which ran from 12 March to 11 June 2007\(^{22}\). There were 38 responses to the consultation which were analysed to produce a consultation analysis report. The consultation analysis report\(^{23}\) and a separate Scottish Government response to the issues raised by respondents were published on 4 June 2008\(^{24}\). There was broad support for steps to be taken to encourage improvements in energy efficiency across Scotland. Recognition was given to the role that the public sector must play, encouraging others by leading by example. The responses to the consultation have been taken into account in determining what measures to improve energy efficiency in Scotland would be supported under the current spending period. These will be considered as part of the development of the action plan.

81. A Strategic Environmental Assessment of the draft strategy was also undertaken, and the environmental report was published on 30 March 2007 as part of the consultation process\(^{25}\).

Alternative approaches

82. There are limitations on the actions that are within the legislative competence of the Scottish Government for promoting energy efficiency. The Scottish Government considered developing an Energy Efficiency Strategy for Scotland; however it was decided that an Action Plan would be a more appropriate way of articulating all the actions being taken to improve energy efficiency in Scotland. It would provide a consistent way of recording targets and monitoring performance against these, including: energy savings; financial savings; and where possible the carbon savings which were a result of these measures. This would then allow the Scottish Government to report on how this is contributing to the overall target of this Bill.

Energy performance of existing non-domestic buildings

83. The aim of the provisions for improving the energy performance of existing non-domestic buildings is to raise the contribution that the existing non-domestic stock can make to mitigating climate change. Buildings account for over 40% of emissions and there is scope to reduce these levels. They are to be subject to an assessment of the emissions of greenhouse gases and energy performance, an enhanced form of energy performance certificate (EPC). The results of the ongoing consultation will inform the detailed route forward but could call on building owners or their delegated persons to draw up improvement action plans. These plans may include building work actions for owners to follow which lead to improved performance, and where appropriate could also include operational measures that building users may choose to act on. This would also apply to traditional and historic buildings, recognising that appropriate environmental improvements should be undertaken with due consideration to the historic character of the buildings in question.

---

84. The EU Directive 2002/91/EC on the energy performance of buildings (EPBD) introduced a requirement for existing non-domestic buildings to have EPCs in certain circumstances. EPCs provide important information on the energy performance of buildings; however, the EPBD does not require any action to be taken following the EPC to improve energy performance. It relies instead on the operation of market forces and wider forces in society, such as growing awareness of the importance of climate change, to drive improvements. Building owners may consider that there is a market advantage in making energy performance improvements following an EPC, or they may wish to do so for environmental reasons, but there is no other encouragement for them to take action at present.

85. In addition, EPCs are only required at the points of sale or rental, and for large public buildings of over 1000m². There is potential scope to go beyond the regime already required by the EPBD. This cannot be done using the powers contained within the European Communities Act 1972.

86. EPCs have a lifespan of 10 years and, in Scotland, legislation requires that all EPCs be produced using an asset rating. An asset rating is a calculated rating based on standard weather data and building use. It is similar in principle to “typical use” consumption figures for cars and is useful when comparing two buildings with different users, i.e. provides like-for-like figures. This is not only useful for potential owners and occupiers of buildings, but also has the ability to drive those who invest in buildings, the building owners, to spend money on appropriate carbon emission reducing building fabric and services.

87. A Low Carbon Building Standards Strategy for Scotland (The Sullivan Report) includes the following recommendations for Scottish Government concerning existing non-domestic buildings and energy performance certificates. These recommendations have helped to develop the provisions:

- consideration of developing practical performance standards for existing buildings (aligned with the energy performance certificates);
- introduction of legislation to require all owners of non-domestic buildings to conduct a carbon and energy assessment and produce a programme for upgrading;
- empowerment of local authorities, or similar public bodies, to check such assessments;
- publication of guidance for different types of non-domestic buildings to assist in this process;
- consideration of ways to encourage owners to implement recommendations arising from the carbon and energy assessment; and
- primary legislation to allow the Scottish Ministers the opportunity to extend the provision and type of Energy Performance Certificates.

88. Subject to the results of the consultation the Bill provisions will allow for a range of options for improving the energy performance of existing buildings, in the following ways:

- extending the scope of energy performance certificates into enhanced EPCs to take account of operational ratings as well as asset ratings and also embodied energy/carbon when a robust methodology is available to address the issue of historic and traditional buildings. This includes varying the lifespan of such assessments/certificates;
- requiring owners or their delegated persons to obtain enhanced EPCs (even though they are not selling or renting out their buildings);
- requiring owners of non-domestic buildings to formulate action plans for building work arising from the advice on their enhanced EPCs and encouraging them to implement their action plans;
- developing appropriate standards for such building work e.g. energy efficient lighting, roof space insulation or sub-metering; and
- empowering local authorities, or similar public bodies, to check enhanced EPCs.

89. The provisions are enabling in nature and provide for regulations in a number of areas to be made in due course. This is particularly the case in relation to the content and form of assessment.

Consultation

90. A public consultation, Action on Climate Change: Proposals for Improving the Energy Performance of Existing Non-Domestic Buildings ran from 2 September to 25 November 2008. It set out proposals for measures to require the assessment of the energy performance of non-domestic buildings and the implementation of measures to reduce carbon emissions, including the costs and benefits of seven different scenarios, which could arise depending on the regulations which are developed from the provisions in this Bill. A total of 69 responses were received and were being analysed at the time this Bill was introduced to the Scottish Parliament. The responses to this consultation will inform the development of the regulations.

Policy objectives

91. The provisions in the Bill enable the Scottish Ministers to create regulations which could be used to place obligations on building owners, responsible authorities and other bodies for improving the energy performance of non-domestic buildings.

92. These regulations could require that the owners of non-domestic buildings, or persons delegated by those owners, obtain an enhanced Energy Performance Certificate of their building, even if they are not required to obtain Energy Performance Certificate under the Energy Performance of Buildings Directive. Following such an assessment, owners could simply be given guidance to encourage them to implement the recommendations; or they could be legally required to develop a programme of cost-effective improvements to reduce emissions and improve energy performance, and thereafter they can carry out any necessary improvements.

93. Enhanced EPCs will encourage adoption of improvement measures by building owners or their delegated persons, when they consider it to be the most appropriate solution to reducing carbon emissions. Improvement measures could include insulation, measures to reduce air infiltration, equipment efficiency and equipment controls, and low carbon equipment where these are cost-effective.

94. It is intended that owners, or their delegated persons, will be required to retain the assessment and keep a record of the improvements that are made. They would also be expected to obtain a further enhanced EPC after a further period of time and draw up a further programme of improvements. One criticism of the EPBD is that at 10 years, the lifespan of an EPC is too long and when such a certificate reaches 7-8 years, it may no longer reflect the energy performance of the building. The provisions therefore allow for the lifespan of EPCs to be varied.

95. The provisions also allow for the regulations to require operational ratings to be undertaken alongside asset-based ratings. An operational rating takes account of how the building is used and managed and is useful for energy managers of the building because it includes factors they control. This has the scope to encourage those who manage non-domestic buildings to deliver carbon savings from the equipment already installed. With the inclusion of operational ratings, as well as asset ratings, not only would improvements affecting comfort loads be incorporated, but also improvements that affect how the building is managed.

Assessment of historic and traditional buildings

96. In certain cases the characteristics of historic and traditional buildings will require that the enhanced EPC process be developed to ensure that historic and traditional buildings are treated appropriately.

97. For the assessment process, taking into account the needs of traditional and historic buildings would require determining appropriate measures to reduce carbon emissions with due consideration to the historic character of the building; including the embodied energy of existing materials and any replacement materials. Any improvement programme would be designed to ensure that environmental improvements are undertaken with due consideration.

Implementation

98. Implementation of such duties would be phased in gradually through regulations introduced in secondary legislation. One approach would be to start with the largest buildings then progress in a series of well publicised stages until all non-domestic buildings were covered. The provisions would apply to public buildings, including the Government estate. The Scottish Ministers would have the ability to relax the provisions where appropriate.

99. Assessments would be targeted at building owners who frequently have complex decisions to make relating to the management of their buildings. Building owners may be able to delegate their enhanced EPC responsibilities to others, for example the tenants of buildings in certain instances. With operational ratings adopted as well as asset ratings it is appropriate that the person who does the asset rating also completes the operational rating.
**Alternative approaches**

100. Consideration has been given to the possibility of taking no action to legislate further in this area. This would mean that the production of enhanced EPCs would be wholly related to the turnover of buildings for sale or rental and there would be no incentive to improve existing non-domestic buildings other than by market forces.

101. The Bill allows for regulations to be created which will enable various approaches to be taken to the extent to which the enhanced EPCs are applied to the existing non-domestic building stock.

102. The consultation on proposals for improving the energy performance of existing non-domestic buildings sought views on these scenarios. The responses to this consultation will inform the development of the regulations which the provisions in this Bill will enable the Scottish Ministers to create.

103. Seven scenarios are possible as follows:

- enhanced EPCs on sale or rent for all buildings and for larger public buildings frequently visited by the public with additional guidance to promote uptake of recommendations;
- enhanced EPCs on sale or rent for all buildings and all large buildings with additional guidance to promote uptake of recommendations and an increase in the frequency of certification;
- enhanced EPCs on sale or rent for all buildings and for larger public buildings frequently visited by the public with additional guidance, an increase in the frequency of certification, and compulsory uptake of recommendations;
- enhanced EPCs on sale or rent for all buildings and for all large buildings with additional guidance, an increase in the frequency of certification, and compulsory uptake of recommendations;
- enhanced EPCs on sale or rent for all buildings and for larger public buildings frequently visited by the public with additional guidance.
- enhanced EPCs and operational rating on sale or rent and for larger public buildings frequently visited by the public; and
- enhanced EPCs and operational rating on sale or rent and for larger public buildings frequently visited by the public with additional guidance.

**Renewable heat**

104. Part 5 Chapter 3 of the Bill also places a duty on the Scottish Ministers to take such steps as they consider appropriate to promote the use of heat from renewable sources.

105. The Scottish Ministers have devolved responsibility for the promotion of heat from renewable sources. Its policy aim is to build a commercially viable, diverse, renewable heat
industry in Scotland. Renewable heat take-up across the UK is very low (<1%) and making progress on renewable heat will be crucial if we are to meet the EU 2020 target of 20% of final consumption of energy from renewable sources (which is made up of individual targets for electricity, heat and transport).

Consultation

106. Between 6 October and 1 December 2008 the Scottish Government, in cooperation with the Forum for Renewable Energy Development in Scotland, consulted on a framework for the development and deployment of renewable energy in Scotland29. The consultation sought views on the Scottish Government’s target of 20% of total Scottish energy use from renewables by 2020. It sets out what the Scottish Government is doing and what more it considers requires to be done to achieve this target. The intention is that the framework should contribute to the Scottish element of the UK National Action Plan for renewable energy if and when the proposed EU directive on renewable heat comes into force. In terms of renewable heat the consultation recommended that Scotland will need to produce 11% of heat from renewable sources in order to meet the overall target of 20%.

107. This framework includes a Scottish Action Plan on renewable heat which sets out a range of actions the Scottish Government is pursing on renewable heat under devolved competence, details are:

- providing existing financial support to the renewable heat market through Scottish Community and Householder Renewables Initiative and Scottish Rural Development Programme;
- providing an additional round of the Scottish Biomass Support Scheme focusing on heat only projects by businesses and demonstrator district heating schemes;
- providing a consumer information pack and case studies on best practice;
- introducing a target by April 2009 of 11% heat demand to come from renewables sources by 2020;
- preparing a National Waste Management Plan considering banning waste biomass being sent to landfill therefore providing fuel source for renewable heat;
- funding pilot projects for biomass heating to combat fuel poverty in off-gas-grid areas, with recommendations from Scottish Fuel Poverty Forum to follow; and
- consultation on proposed changes to energy building standards.

108. A total of 63 responses to this consultation were received by the closure date of 1 December 2008. These were being analysed at the time this Bill was introduced to Parliament.

109. The Scottish Government considers that there is a clear role for an incentive mechanism to promote the use of renewable heat to help accelerate the growth of renewable heat take-up thereby ensuring that Scotland meets its target. The UK Government recently consulted on the

forms of a likely incentive as part of its Renewable Energy Strategy. The work to introduce a regulatory and financial incentive mechanism to increase the take-up of renewable heat is at an early stage. The use of such a mechanism is a new step and involves certain challenges given the nature of the heat market – decentralised deployment; variety of fuel sources; no heat unit source or traded sector. Such a broad mechanism will take time to phase in and could touch on reserved matters. The Scottish Government is working closely with the UK Government as this work develops.

Alternative approaches

110. An alternative to taking these powers would be to do nothing. However, that risks Scotland and the UK not being able to meet the heat component of the EU renewable energy targets by 2020 as it is unlikely that voluntary action will result in sufficient growth of the renewable heat sector. The provisions in this Part of the Bill will enable the Scottish Ministers to introduce measures deemed appropriate to incentivise the production of heat from renewable sources.

PART 5, CHAPTER 4: WASTE REDUCTION AND RECYCLING

Policy objectives

111. This Chapter of the Bill sets out measures aimed at improving waste and recycling. These will help Scotland move to a “zero waste” society. “Zero waste” is about reducing the unnecessary use of raw materials, sustainable design of products, preventing waste, and recovering value from products and materials when they reach the end of their lives through recycling, composting or energy recovery. “Zero waste” contributes to our work on combating climate change. Waste management alone contributes about 2.5% of Scottish greenhouse gas emissions. However, reducing these emissions is a very small part of what can be achieved in combating climate change by adopting a zero waste strategy. Preventing and reducing the unnecessary use and processing of raw materials, using recyclate and getting value from waste rather than just throwing it away can all contribute much more to tackling climate change.

112. The provisions in this Chapter of the Bill enable the Scottish Ministers to make regulations addressing issues of importance in moving towards a zero waste society, and securing a more sustainable use of resources, thereby limiting anthropogenic climate change. It is important to note that implementing the provisions in this Chapter of the Bill would require secondary legislation which would be developed following further consultation and also be scrutinised by the Scottish Parliament.

113. Part 5 Chapter 4 of the Bill gives powers to the Scottish Ministers to make regulations in the following areas:

- waste prevention and management plans;
- waste data;
- deposit of recyclable waste;

---

This document relates to the Climate Change (Scotland) Bill (SP Bill 17) as introduced in the Scottish Parliament on 4 December 2008

- procurement of recyclate;
- reduction of packaging;
- deposit and return schemes;
- charges for carrier bags.

Consultation Paper on Potential Legislative Measures to Implement Zero Waste

114. The consultation paper summarised the Scottish Government’s proposals for legislative proposals on zero waste. The consultation was made available on the Scottish Government’s website, and a wide range of stakeholders were invited to respond to the consultation. The consultation period ran from 28 July to 6 October 2008.

115. Some 80 organisations and individuals responded to the consultation. Opinion on the proposals was relatively balanced, especially given the small nature of the sample. Non-governmental organisations and private individuals tended to favour legislation, whereas business bodies, particularly those in retail, tended to be more opposed. Support was greatest for waste prevention and management plans, and for mandatory waste data returns, and least for action on carrier bags.

Alternative approaches

116. Details of any possible alternative approaches are given in the consideration of the individual topics. In the case of all the proposals in this Chapter of the Bill, however, an alternative approach to taking these powers would have been not to take them. Adopting this approach would not change the short-term position. Whether or not powers are taken, they have no immediate effect until they are turned into regulations. It is possible that voluntary action will achieve some of the goals for such legislation, in which case further action will be unnecessary. If voluntary action does not achieve these goals, however, legislative action will be, in the Scottish Government’s view, necessary. Without the powers now being proposed, appropriate legislation would not be possible.

Waste prevention and management plans

117. Commercial and industrial waste makes up the vast majority of Scotland’s waste. Although there is guidance and advice available to businesses on reducing the amount of waste they generate, there is no legal obligation requiring them to plan formally for such a reduction. Scottish Government policy on waste management is to move away from landfill towards ensuring that waste is re-used, recycled or recovered where possible. This leads to more efficient use of resources and a need for fewer waste disposal facilities. In both cases, this helps tackle climate change. As with prevention, the commercial and industrial sectors have a large contribution to make to this.

118. Site waste management plans are encouraged by Scottish Planning Policy (SPP) 10\textsuperscript{32} and by voluntary work through bodies such as Envirowise. The Bill gives the Scottish Ministers a power to make regulations imposing a duty on prescribed persons to prepare waste prevention and management plans; as well as making plans compulsory, a wider range of activities would be aimed at than by SPP 10.

119. This proposal is for a power to place a duty on businesses and public bodies to prepare formal waste prevention and management plans. Ministers would prescribe in regulations the businesses and bodies required to prepare a plan (or plans), as well as the matters to be included in a plan. It is intended that the plans can be required for a range of different matters. For example, the eventual regulations might require a plan for an individual construction project. Alternatively, they might require a plan for waste generated by a business on an on-going, day-to-day basis (e.g., office waste). It is intended that these regulations would deal with measures to prevent as well as manage waste, and would not necessarily be restricted to individual projects.

120. Should the preparation of waste prevention and management plans be made compulsory by regulations under this Chapter of the Bill, a regime will need to be established to ensure that plans are drawn up, that they are sufficiently rigorous, and that they are followed. A body will need to be established, or nominated, to do this. The provisions of this Chapter of the Bill grant powers enabling such a regime to be set up.

121. The revised Waste Framework Directive which was adopted on 20 October 2008 states that by 2020 the preparing for re-use, recycling and other material recovery, including backfilling operations using waste to substitute other materials, of non-hazardous construction and demolition waste excluding naturally occurring material defined in category 17 05 04 in the European Waste Catalogue (EWC) shall be increased to a minimum of 70% by weight. These provisions would help meet that requirement.

Waste data returns

122. These provisions enable the Scottish Ministers, through the creation of regulations, to require businesses and public bodies to provide information to SEPA about the waste that they produce. It will be difficult to move to a zero waste society without much better information about waste arising and their management, treatment and disposal in Scotland. Good, reliable waste data informs policy-makers when they are developing new ways of reducing and managing waste. It informs the private sector when it is seeking to invest in waste infrastructure as part of the move away from landfill. Such information would also help to meet the obligations under the Waste Statistics Regulation (2150/2002/EC)\textsuperscript{33}. This establishes a framework for the production of Community statistics on the generation, recovery and disposal of waste. It requires Member States and the European Commission to produce Community statistics on the generation, recovery and disposal of waste.

123. There are other Community considerations. The Waste Framework Directive, as revised on revised on 17 June 2008 and adopted on 20 October 2008, states:

“In order to comply with the objectives of this Directive, and to move towards a European recycling society with a high level of resource efficiency, Member States shall take the necessary measures designed to achieve the following targets:

(a) by 2020 the preparing for re-use and the recycling of waste materials such as at least paper, metal, plastic and glass from households and possibly from other origins as far as these waste streams are similar to waste from households, shall be increased to a minimum of overall 50% by weight

(b) by 2020 the preparing for re-use, recycling and other material recovery, including backfilling operations using waste to substitute other materials, of non-hazardous construction and demolition waste excluding naturally occurring material defined in category 17 05 04 in the European Waste Catalogue (EWC) shall be increased to a minimum of 70% by weight.34.”

124. The Scottish Government and SEPA currently lack reliable data with which to assess compliance with (b).

125. Other means were considered for achieving better information on waste. For example, there is an obligation under section 34 of the Environment Protection Act 199035 to transfer a written description of waste at the time that waste is transferred. This obligation is set out in detail in the Environmental Protection (Duty of Care) Regulations 199136 (SI 1991/2839). Furthermore, use could be made of section 2(2) of the European Communities Act 197237 to make regulations dealing with waste information, on the basis of the Waste Statistics Regulation. However, the former does not cover non-controlled waste (gaseous effluents; radioactive waste; mineral waste; animal carcases, faecal matter etc; waste waters and decommissioned explosives). The latter excludes radioactive waste. To ensure that a full range of statistics is available for all wastes, new primary legislation is necessary.

126. A regime of enforcement would be necessary to ensure that the statistics required are actually returned, and are accurate. SEPA is mentioned in this context because it already collates waste statistics. There are enforcement powers attached to the 1991 Regulations, but these are not very efficient, since no body is given a specific duty to enforce them. Provision to address these matters is in this Chapter of the Bill.

Deposit of recyclable waste

127. The intention behind this provision is to encourage recycling by providing people with opportunities to deposit waste for recycling when they are not at home. This will contribute to a more efficient use of resources, cut the need for landfill, and help to combat littering and other improper waste disposal.

128. In recent years there has been a significant improvement in recycling and composting facilities provided by local authorities for householders which has led to increased recycling and composting rates for household waste. It is now intended to give people more opportunities to recycle their waste when they are at work or in some public places or attending certain public events. Although many employers provide recycling facilities for their staff there is no legal requirement for them to do so. Recycling facilities are also found in other places such as at airports, in the street and at various retail outlets (for example, plastic bag recycling facilities), but again there is currently no legal requirement to provide these facilities.

129. There are some statutory obligations on businesses to take back certain types of waste, for example retailers of electrical and electronic equipment must take back waste electrical and electronic equipment in certain circumstances. It is not intended that these provisions should affect these producer responsibility schemes, except to the extent that businesses under obligations to take back waste and send it for recycling or re-use (e.g., under the Producer Responsibility Obligations (Packaging Waste) Regulations 2007 (SI 2007/871)) should be able to use material collected in receptacles provided under these new duties to meet those obligations.

130. It is intended that the regulations may require receptacles to be provided for a broad range of types of waste. Without prejudicing detailed considerations, it is possible that, for example, supermarkets could provide recycling facilities at or near tills for packaging which customers could remove in situ. Offices could provide receptacles in which employees could recycle their own paper, as well as that of the workplace. This would not be a complete innovation: already such facilities are available in places. In practice, Ministers would only prescribe types of waste if there was capacity to recycle that waste and a market for the resulting recyclate.

131. It is intended that businesses or public bodies or event organisers which are under a duty to provide these facilities will also be under a duty to transfer the waste collected in them to a person with the correct environmental authorisations, specifically to be recycled or re-used, and that there may be a duty to ensure that it actually is recycled or re-used.

132. These provisions would also enable those who hold sporting or cultural events to be placed under a duty to provide receptacles in which those attending could leave materials such as plastic cups and programmes. These materials could also be recycled. Again, there are already examples of those who hold events giving their customers the opportunity to recycle.

133. Should duties to provide such facilities be established through regulations, it will be necessary for a monitoring and enforcement regime to be established to ensure that they are provided, and used and operate correctly. This Chapter of the Bill contains provisions allowing such a regime to be set up, and to establish or nominate a body to operate the regime.

134. These provisions are not intended to implement any specific European obligations, although they will contribute to the UK’s obligations under the Landfill Directive (1999/31/EC)\textsuperscript{39} to reduce the amount of waste being put to landfill. The revised Waste Framework Directive which was adopted on 20 October 2008 states that Member States shall take measures to promote high quality recycling and to this end they shall set up separate collection of waste where technically, environmentally and economically practicable and appropriate to meet the necessary quality standards for the relevant recycling sectors. These provisions would help meet that requirement.

Procurement of recyclate

135. These provisions give the Scottish Ministers powers to set binding requirements in regulations on businesses and public bodies requiring them to include a specification that a minimum percentage of materials used will be made from recyclate or re-used materials in certain procurement contracts. (Recylcate is material which has been reprocessed, whereas re-used materials are put to their new use without further processing.) This will encourage more efficient use of resources in itself and could help to generate a wider market for, and broader acceptance of, the use of recyclate and re-used materials.

136. Again, there is a possible alternative to statutory requirements. There are voluntary arrangements in place which set targets for recycled content in public sector procurement contracts in Scotland. In November 2006 the then Scottish Executive requested public bodies to set minimum levels of recycled content in certain procurement contracts.

137. These voluntary arrangements relate to construction projects and procurement of paper. They specify that at least 10% of the total value of materials used in construction projects over £1million should be derived from recycled or re-used content; there should be at least 50% recycled content products used in printing and writing paper contracts; and there should be 100% recycled content in products used in tissue paper contracts.

138. It is possible that voluntary action by public bodies and others could result in widespread use of recyclate and re-used materials. This is not yet the case, however, and the Scottish Ministers note that the voluntary arrangements described above apply only to public bodies, whereas the proposals in this Chapter of the Bill could apply to businesses as well.

139. It is likely that in very many cases the use of recyclate and re-used materials would cut the costs of contracts, for both public bodies and businesses, particularly as recycling markets improve. However, the Scottish Ministers are aware that there may be a reluctance to use former

wastes. Essentially, this is a kind of market failure which may be addressed by Government action.

140. Again, in the event of making the specification of recyclate and re-used materials compulsory through regulations, arrangements would be required to ensure that these materials were specified, and that the contractual obligations were observed. A body would have to be set up or nominated to do this. This Chapter of the Bill contains provisions allowing such a regime to be developed.

Reduction of packaging

141. The Bill gives the Scottish Ministers powers to set binding targets for overall reductions in packaging. The purpose of these targets is to reduce the amount of packaging that ends up as waste, thus reducing the use of resources and cutting the need for waste disposal facilities.

142. The Packaging and Packaging Waste Directive (94/62/EC) divides packaging into three types: sales packaging or primary packaging (packaging conceived so as to constitute a sales unit to the final user or consumer at the point of purchase); grouped packaging or secondary packaging (packaging conceived so as to constitute at the point of purchase a grouping of a certain number of sales units whether the latter is sold as such to the final user or consumer or whether it serves only as a means to replenish the shelves at the point of sale, it can be removed from the product without affecting its characteristics); and transport packaging or tertiary packaging (packaging conceived so as to facilitate handling and transport of a number of sales units or grouped packagings in order to prevent physical handling and transport damage).

143. It is intended that targets might be set either for all three types of packaging taken together, or in respect of each type individually.

144. The duty to meet the targets would fall primarily on retailers, but might also be placed on those who put packaging on the market in Scotland, i.e., those supplying packaged goods to retailers.

145. The targets would be set in regulations and could be either in absolute or relative terms. They might require a reduction in a certain weight or volume of packaging, or they might require a reduction of a certain percentage in the amount of packaging supplied by a particular retailer. Alternatively, they might be based on factors such as retail growth or market share. It is also possible that instead of requiring a reduction in the actual amount of packaging, the regulations might instead require a reduction in the potential amount of greenhouse gases generated by the packaging.

146. The reduction of the overall amount of packaging supplied to consumers could be met in a variety of different ways. It would be up to the retailers and suppliers to decide how to meet those targets. The intention is to encourage retailers and others to seek, for example, alternatives to traditional packaging and marketing techniques. For example, if a retailer was required to

---

reduce the amount of packaging it provided to consumers by 5%, the retailer would be able to choose how to meet this target. Among the means it may use to do so could be one or more of the following:

- “light-weighting” the packaging used, such as reducing the weight of glass bottles (this has been a common practice in recent years);
- using different forms of packaging, such as greaseproof paper for meat, instead of plastic trays and sleeves;
- incentivising consumers to buy in bulk, or disincentivising purchases in small amounts using more packaging;
- encouraging refills;
- altering display arrangements to obviate the need for packaging;
- removing packaging altogether;
- supplying concentrated products which require less packaging; and
- removing layers of packaging.

147. Although retailers, suppliers and wholesalers are not directly responsible for packaging all goods supplied in shops, they may change the way in which some goods are packaged (e.g., own brands and loose goods provided in shops) and also feed these targets back up the supply chain to their suppliers by requiring them through ordinary contractual arrangements to provide different forms of packaging.

148. At present, it is difficult to disaggregate statistics about packaging for Scotland from those provided for the UK as a whole, and the methods used to do so may be inexact. This is because there is no obligation to provide Scottish statistics. As a first step, therefore, the regulations would contain provisions requiring those subject to them to supply information about the amount of packaging used in Scotland, which would then be used as a baseline measure for setting the targets.

149. Alternative means of meeting this objective are possible. The Courtauld Commitment is an agreement between WRAP (the Waste and Resources Action Programme) and major retailers to, first of all, halt the growth in packaging provided to consumers and then to reduce the overall amount of such packaging. Preliminary data suggests the first target may have been met. Real progress under this Commitment towards genuine reductions in packaging could obviate the need to make these reductions a statutory requirement; however, it is important to take the powers now so that measures may be taken if the Commitment fails to yield satisfactory results.

150. Should binding packaging reduction targets be set through regulations, provision will be needed to monitor and enforce these targets. Enforcement would include ensuring that returns were properly and correctly made. A body would have to be established or empowered to do this (it could, for example, be SEPA, which already has some responsibilities in relation to packaging). This Chapter of the Bill contains provisions allowing such a regime to be set up.
Deposit and return schemes

151. There are voluntary schemes in operation in Scotland whereby food packaging, particularly drinks bottles, may be returned to retailers against repayment of a deposit notionally included in the purchase price of the product. The retailer then returns the packaging to the producer and is reimbursed for payment of the deposit. There are some statutory deposit and return schemes in operation in other parts of the world, including within the EU, for example in Denmark, Sweden and Germany.

152. The Bill gives the Scottish Ministers powers to set up a statutory deposit and return scheme through regulations. This would require retailers to include a specified deposit as part of the price of the product when supplying certain types of packaging to purchasers. The deposit would then be repaid to the purchaser (or anyone else who brought it back) on return of the packaging (whether to the same retailer or another). The intention is that regulations would specify the types of packaging for which a deposit must be charged, and the amount of the deposit.

153. A deposit and return scheme would reduce the use of resources by ensuring that more packaging was recycled, since deposits would be paid against return of the actual packaging, which could then be recycled or re-used. At the same time, by taking packaging out of the general waste stream, it should reduce reliance on waste disposal (landfill and incineration) as well as reducing the amount of littering and fly-tipping.

154. Provision is also included regarding the administration of the system, obligations as between producers of packaging and retailers, and record-keeping and enforcement. A central administrative body is responsible for the operation of the Danish scheme, for example, and it may be felt necessary to establish an equivalent here. An approval mechanism of alternative bodies with which those under the obligation to operate deposit and return schemes might also be required.

155. An alternative to providing powers through this Chapter of the Bill would be to consider the use of sections 93 – 95 of the Environment Act 1995\textsuperscript{41} to set up a producer responsibility scheme, which might have deposit-and-return characteristics. However, such a scheme – like one set up under the provisions of this part of the Bill - would have to be carefully tailored both to meet the requirements of the Scottish situation, and Community requirements on the circulation of goods. The regulations would have to deal with the need for an organising body, its establishment, and its powers and duties. A great deal of flexibility is required, and the provisions in the 1995 Act do not appear to provide this, appearing in fact to be rather detailed and prescriptive and designed to provide the kind of producer responsibility scheme currently operated for packaging, waste electrical and electronic equipment, and end-of-life vehicles, rather than a deposit-and-return scheme.

Charges for carrier bags

156. The Scottish Ministers are given powers in this part of the Bill to make regulations about charging by sellers of goods for the supply of carrier bags. Carrier bags are given away freely in large numbers. Many goods are already packaged and carrier bags are often simply “add on”

packaging that has no essential purpose. The provisions in the Bill are designed to reduce the number of these bags in circulation. The objectives of doing so by means of a charge are to protect the environment both by the reduction in the number of carrier bags and by investing the charges raised in an appropriate manner, and to raise awareness of environmental issues such as recycling and litter.

157. These powers enable Ministers to prescribe in regulations which retailers are required to charge for carrier bags. This may be done by reference to the type of goods sold, the type of seller, turnover or other factors. The regulations would also define “carrier bags” and specify either the amount to be charged for each bag, or provide for how that amount is to be determined. The regulations would also be able to specify how the net proceeds are to be used, to ensure (if necessary) that the proceeds are applied to causes which operate in Scotland.

158. Records will need to be kept about matters such as the number, type and tonnage of carrier bags for which a seller has imposed the charge. The powers also extend to appointing a body or bodies to monitor the accuracy of these records, and also to enforce the regulations, including ensuring that the proceeds were actually spent on the required good causes and to impose sanctions for failure to comply with the regulations.

159. Alternative means of achieving these aims have been considered. The Scottish Government is actively working with retailers on voluntary measures aimed at reducing the number of carrier bags used by consumers. At a meeting between the Scottish Government and retailers on 15 May 2008, it was agreed to set up a Zero Waste Retailers Group which will consider various options to cut bag use on a voluntary basis. Retailers have recently announced that they will aim to cut carrier bag use by 50% by Spring 2009, using 2006 as a baseline. Some retailers have independently introduced a charge for such bags.

160. The Scottish Ministers want to continue working with retailers on a voluntary basis and see legislation in this area as the course of last resort. However, they wish to have powers available to them to require retailers to charge consumers for carrier bags in the event that voluntary measures are unsuccessful.

**EFFECTS ON EQUAL OPPORTUNITIES, HUMAN RIGHTS, ISLAND COMMUNITIES, LOCAL GOVERNMENT, AND SUSTAINABLE DEVELOPMENT**

**Equal opportunities**

161. The Climate Change (Scotland) Bill contains a broad framework which will enable the Scottish Government to tackle climate change, with a limited number of specific provisions, mostly in the form of powers enabling the creation of secondary legislation, to reduce emissions directly or adapt to the risks associated with climate change impacts. Rather than the framework created by the Bill, it is the specific policies which will need to be introduced at a later date to meet the targets in the Bill which may have an impact on equal opportunities, including age, disability and gender. These measures will be subject to appropriate assessment and consultation prior to implementation. A provision is included in the Bill to ensure that the Scottish Ministers and the advisory body take account of equal opportunities when carrying out their functions under this Bill.
162. An Equality Impact Assessment of the Climate Change (Scotland) Bill has been carried out and is published on the Scottish Government website.42

Human rights

163. Section 29 of the Scotland Act 1998 sets out the limits on the legislative competence of the Scottish Parliament. One of those limits is that the Bill must not include any provision which is incompatible with any of the rights granted by the European Convention on Human Rights (ECHR) which are listed in Schedule 1 to the Human Rights Act 1998 (known as “the Convention rights”). Ministers’ view is that none of the provisions in the Bill is incompatible with any of the Convention rights.

164. Part 1 of the Bill creates a framework of powers and duties setting a framework for the reduction of greenhouse gas emissions. Nothing in Part 1 of the Bill directly affects the rights or obligations of any person in such a way as to engage their Convention rights.

165. Part 2 of the Bill provides powers which would enable the Scottish Ministers to create a new, independent, non-departmental public body and confer functions on it. There are also powers to confer equivalent functions on a designated existing body. It also confers related duties upon the Scottish Ministers. Neither the powers to enable the creation of a public body nor the creation of any of the functions or duties in Part 2 has any direct effect on the rights or obligations of any person in such a way as to engage their Convention rights.

166. Part 3 of the Bill creates duties on the Scottish Ministers to make reports and provides for the Scottish Ministers to create additional reporting requirements. These provisions contain no elements which interfere with any person’s Convention rights.

167. Part 4 of the Bill creates powers which enable the Scottish Ministers to place duties on public bodies in relation to climate change and to give guidance to public bodies in relation to climate change. These enabling powers do not in themselves affect any person’s Convention rights and it is very unlikely that the exercise of the powers could affect any person’s human rights. Section 6 of the Human Rights Act 1998 also requires that a public authority, which includes the Scottish Ministers, must act in a way that is compatible with the Convention rights. Therefore no interference in the Convention rights is expected to result from the use of these powers.

168. Part 5 Chapter 1 of the Bill creates a power which enables the Scottish Ministers to vary by order the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change. This order-making power has the potential, upon exercise, to engage Protocol 1 Article 1 of the European Convention on Human Rights, which provides for the right to the peaceful enjoyment of one’s possessions. Restricting the times during which muirburn may be made on land may be considered to amount to a control of use of that land. However, this power is considered to be in the public interest, and therefore compliant with the Convention, as its exercise is dependant on the legitimate social and

42 Climate Change (Scotland) Bill Equality Impact Assessment, available from:
http://www.scotland.gov.uk/Topics/Environment/Climate-Change/16327/Climate-Change-Bill
environmental aim of adapting to climate change. The power is also considered to comprise a proportionate legislative response to changing climatic conditions.

169. *Part 5 Chapter 2* of the Bill creates powers for the Scottish Ministers to modify the functions of the Forestry Commissioners by regulations where it is necessary or expedient to do so in relation to climate change. These enabling powers do not in themselves affect any person’s Convention rights; it is only in the exercise of the power that a person’s rights may be engaged. However, as detailed above, section 6 of the Human Rights Act 1998 requires that a public authority, which includes the Scottish Ministers, must act in a way that is compatible with the Convention rights. Therefore no interference in the Convention rights is expected result from the use of these powers.

170. The requirement in *Part 5 Chapter 3* for the Scottish Ministers to produce an energy efficiency action plan contains no elements which could interfere with any person’s Convention rights.

171. *Part 5 Chapter 3* of the Bill also contains provisions for improving the energy performance of existing non-domestic buildings. These provisions, upon exercise, have the potential to engage Protocol 1 Article 1 of the European Convention on Human Rights, which provides for the right to the peaceful enjoyment of one’s possessions. Placing requirements on building owners or their delegates to certify or improve the energy performance of their buildings may be considered to amount to a control of use of that property. However, this power is considered to be in the public interest, and therefore compliant with the Convention, as its exercise is dependant on the legitimate social and environmental aim of acting to reduce greenhouse gas emissions and mitigate against the effects of climate change. Any powers which may be given to local authorities to check enhanced EPCs would have the potential to engage Article 8, the right to respect for private and family life, home and correspondence, by gathering and holding information in that process. However, local authorities will be bound by the Data Protection Act 1998 to prevent the disclosure of personal information.

172. The final set of provisions in *Part 5 Chapter 3* of the Bill contains a duty on the Scottish Ministers to promote the use of heat produced from renewable sources. These powers in themselves are not considered likely to affect a person’s human rights. However, the Scottish Ministers actions in establishing a grant scheme may engage Article 8 the right to respect for private and family life, home and correspondence, by gathering and holding information in that process. The Scottish Ministers will be bound by the Data Protection Act 1998 to prevent the disclosure of personal information. The Scottish Ministers are also required to put in place measures to protect people who might be unduly disadvantaged by the introduction of such a scheme.

173. *Part 5 Chapter 4* of the Bill contains measures aimed at reducing waste and increasing recycling. This Chapter of the Bill has no immediate effect on any rights granted by the Convention. Any effect would be experienced only if the powers to make regulations it sets out were actually to be exercised by the Scottish Ministers, and the effect would then depend on the form that those regulations might take. Proposals for such regulations would be subject to detailed consultation with interested parties in accordance with normal practice, and in each
instance Ministers would be subject to the need, established by section 54(2)(a) of the Scotland Act 1998, not to contravene any of the rights granted by the Convention.

**Island communities**

174. The Climate Change (Scotland) Bill contains provision which requires that the Scottish Ministers take account of those living in remote and rural communities, such as island communities, when setting the annual emissions reduction targets. The relevance of this is that these targets will drive the policies put in place over the decades to 2050 and it is those policies which may potentially have an effect on those living in remote communities such as the Scottish islands.

175. The Scottish Ministers are committed to ensuring that every policy which is designed to reduce emissions directly will be subject to the appropriate level of assessment and consultation prior to implementation. If any of the measures developed under the provisions within this Bill were to present a risk of an undesirable impact, it could be possible to adapt the measures in order to avoid that impact. For example, if measures on packaging reduction were thought likely to have an undesirable effect on the transport of goods to or from island communities, it could be possible to exempt those communities from the legislation. This would be considered as part of the Regulatory Impact Assessment for any secondary legislation brought forward.

**Local government**

176. Certain provisions within the Bill allow for the creation of regulations which may impact on local government. Part 4 provides the Scottish Ministers with the ability to impose, by regulations, duties on bodies with functions of a public nature, which could include local authorities. This Part also provides the Scottish Ministers with the ability to give guidance to bodies with functions of a public nature in relation to these duties and to report upon their compliance with climate change duties. The effects will vary greatly, depending on a range of factors including whether the regulations are introduced and the nature of the duties or guidance created. A provision is included in the Bill to ensure that the Scottish Ministers consult with such associations of local authorities as are appropriate when creating duties under Part 4 of the Bill.

177. *Part 5 Chapter 3* of the Bill contains provisions for improving the energy performance of existing non-domestic buildings. Local authorities will have interests in these provisions both as building owners and as enforcement bodies through the menu of Bill provisions, subject to the results of the ongoing consultation, as follows:

- extending the scope of energy performance certificates into enhanced EPCs to take account of operational ratings as well as asset ratings and also embodied energy/carbon when a robust methodology is available to address the issue of historic and traditional buildings. Varying the lifespan of such assessments/certificates;
- requiring owners or their delegated persons to obtain enhanced EPCs (even though they are not selling or renting out their buildings);
• requiring owners of non-domestic buildings to formulate action plans for building work arising from the advice on their enhanced EPCs and encouraging them to implement their action plan;
• developing appropriate standards for such building work e.g. energy efficient lighting, roof space insulation or sub-metering; and
• empowering local authorities, or similar public bodies, to check enhanced EPCs.

178. Part 5 Chapter 4 of the Bill includes provisions on waste reduction and recycling. These provisions may result in savings, such as from the costs of using a landfill service, including landfill tax, or from the reduced need for litter collection. The provisions may result in modest increases in administrative costs. More detail on the financial implications is available in the Financial Memorandum.

Sustainable development

179. The goal of sustainable development is to enable all people throughout the world to satisfy their basic needs and enjoy a better quality of life without compromising the quality of life of future generations. This lies at the core of the Scottish Government’s aim to reduce emissions of Scottish greenhouse gases by 80% by 2050, which represents a major step in making Scotland more sustainable.

180. Climate change is a global issue which, ultimately, requires a global response. However, by taking action, Scotland can demonstrate leadership and do its part in addressing some of the problems which would otherwise be expected to arise from climate change, such as the impact on communities of increased flooding and chaotic weather; and the economic damage, estimated by the Stern Review as costing the world economy between 5% and 20% of GDP each year.

181. It is intended that the framework introduced by this Bill will drive government policies over the coming decades which will in turn mainstream activities to reduce emissions. The Scottish Government wants to be able to create an environment in Scotland which will help position Scottish businesses to take advantage of new markets for low-carbon technologies, estimated by the Stern Review as being worth at least $500 billion globally by 2050.

182. The muirburn provisions in Part 5 Chapter 1 of the Bill have potential benefits for the sustainability of the rural economy, upland habitats and species. If land managers cannot continue muirburn in a manner which takes account of changing climate, there could be an increased risk of reduced grazing for livestock in rural areas across Scotland, including those on the Scottish islands. This could compound the effects of any economic downturn in hill farming. There could also be an increased risk of land abandonment, which would impact on the viability and sustainability of rural communities including the loss of land used to help supply local sustainable food sources. Muirburn has the potential to support the continued sustainability and diversity of upland habitats and the species these habitats support, through well managed burning proving regeneration, habitat mosaics, botanical diversity and vegetation structures.

183. The shooting and stalking industry, which relies on actively managed moors, is worth £240 million to the Scottish economy. Heather requires active land management to encourage its
regeneration and seeding through a range of activities including muirburn. The exact value of Scottish heather to the economy is not known, but it is known that 78% of UK visitors and 89% of international visitors explore the Scottish scenery. All of these elements have the potential to adversely impact on economic sustainability, particularly in more rural areas.

184. The forestry provisions in Part 5 Chapter 2 of the Bill allow the role played by the Forestry Commission in tackling climate change to be extended through increased woodland creation and renewable energy developments. Many types of woodland creation can contribute cost-effectively towards net emissions reduction through the resulting photosynthesis potential of the trees and plants. Woodland creation also has strong potential benefits to the sustainability of both rural and urban areas, creating sustainable wood fibre and renewable fuel resources, sustaining employment in forestry, supporting development of forest habitat networks, extending the role of woodlands in natural flood and water management, supporting urban regeneration, and increasing opportunities for recreation, access, outdoor learning and community participation in woodlands.

185. Part 5 Chapter 3 concerns energy efficiency, energy performance of non-domestic buildings and renewable heat. As well as supporting the reduction of greenhouse gas emissions these provisions should also have the additional benefit of driving forward more efficient use of resources and improving the security of Scotland’s energy supply.

186. Energy – its generation and usage – are key areas from which emission reductions will be sought. The Review of Fuel Poverty in Scotland, published on 22 May 2008, indicates that around half of pensioner households in private homes were estimated to be fuel poor in 2005-06. Increases in fuel costs may affect those in pensioner households and those with a disability/long-term illness proportionately more in a negative way. However, measures in the Bill, such as the duty on the Scottish Ministers to prepare and publish an action plan for the promotion of energy efficiency, may result in greater energy efficiency measures which may affect these households more positively.

187. By providing for regulations to be made designed to improve the energy performance of non-domestic buildings, the Bill could enable steps to be taken which would help the owners of these buildings, including many Scottish businesses, to reduce over the long-term the amount of energy they consume, helping to control their costs and therefore improve economic viability. In the Scottish public sector, making more efficient use of resources in this way could result in significant improvements to the social benefit of public spending.

188. The waste management and recycling provisions in Part 5 Chapter 4 of the Bill will help to reduce the local and global environmental impact of our consumption and production through a more efficient use of resources and the generation of less waste, and a concomitant reduction in the amount of greenhouse gases generated by its management. This Chapter of the Bill will also

---

help protect the natural environment is for future generations, by minimising the land set aside for waste disposal facilities.
This document relates to the Climate Change (Scotland) Bill (SP Bill 17) as introduced in the Scottish Parliament on 4 December 2008

CLIMATE CHANGE (SCOTLAND) BILL

DELEGATED POWERS MEMORANDUM

PURPOSE

1. This memorandum has been prepared by the Scottish Government in accordance with Rule 9.4A of the Parliament’s Standing Orders, in relation to the Climate Change (Scotland) Bill. It describes the purpose of each of the subordinate legislation provisions in the Bill and outlines the reasons for seeking the proposed powers. This memorandum should be read in conjunction with the Explanatory Notes and Policy Memorandum for the Bill.

2. The contents of this Memorandum are entirely the responsibility of the Scottish Government and have not been endorsed by the Scottish Parliament.

Outline of Bill provisions

3. The Bill contains provisions aimed at providing a framework to ensure that the Scottish Government takes immediate and sustained action to reduce Scotland’s greenhouse gas emissions by 80% from 1990/1995 levels by the year 2050. It also contains a number of measures to help Scotland reduce its emissions and adapt to climate change.

4. The Bill has six parts:

- **Part 1** creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050. To help ensure the delivery of these targets, this Part of the Bill also requires that Scottish Ministers set annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050.

- **Part 2** contains provisions relating to advice. Among other things, this Part allows the Scottish Ministers to establish a Scottish Committee on Climate Change, or to designate an existing body, to exercise advisory functions.

- **Part 3** places duties on the Scottish Ministers requiring that they report regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill.

- **Part 4** contains powers to allow the Scottish Ministers, by order, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating
This document relates to the Climate Change (Scotland) Bill (SP Bill 17) as introduced in the Scottish Parliament on 4 December 2008

to their climate change duties and to require that they report upon the discharge of those duties.

- **Part 5** contains a number of provisions to reduce emissions and adapt to climate change and is divided into the four chapters—
  - Chapter 1 requires Scottish Ministers to lay a programme for adaptation to climate change before the Scottish Parliament, and allows for the ability to vary the permitted times for making muirburn.
  - Chapter 2 allows the Scottish Ministers to modify the functions of the Forestry Commissioners in or as regards Scotland but only if it is necessary for climate change purposes.
  - Chapter 3 allows of the Scottish Ministers to make regulations for the assessment of the carbon and energy performance of non-domestic buildings, places a duty on the Scottish Ministers to promote energy efficiency, and places a duty on the Scottish Ministers to promote renewable heat.
  - Chapter 4 allows the Scottish Ministers to make regulations in relation to waste reduction and recycling.

- **Part 6** contains general and miscellaneous provisions.

5. Further information about the Bill’s provisions is contained in the Explanatory Notes and Financial Memorandum published separately as SP Bill [17-EN], and in the Policy Memorandum published separately as SP Bill [17-PM].

**Rationale for subordinate legislation**

6. The Bill contains a number of delegated powers provisions which are explained in more detail below. In deciding whether these provisions should be specified on the face of the Bill or left to subordinate legislation, the Scottish Government has carefully considered the importance of each matter against the need to—

- ensure that future measures needed for the purposes of reducing emissions or adapting to the effects of climate change are flexible and can be introduced, if required, quickly in the light of experience without the need for primary legislation; and
- allow detailed administrative arrangements to be kept up to date within the basic structures and principles set out in the primary legislation.

**General subordinate legislation provision**

7. Section 64 (subordinate legislation) contains the Bill’s general subordinate legislation provision. Subsection (1) provides that any power conferred on the Scottish Ministers to make orders or regulations is exercisable by statutory instrument. Subsection (2) allows different provision to be made for different purposes and permits the powers to be used to make consequential, incidental, supplementary, transitory, transitional or saving provision. Subsection
This document relates to the Climate Change (Scotland) Bill (SP Bill 17) as introduced in the Scottish Parliament on 4 December 2008.

(3) enables secondary legislation made under this Bill to amend the Bill and any other piece of legislation.

8. Subsection (4) provides that the procedure applicable to the making of secondary legislation under this Bill is generally affirmative resolution procedure. Subsections (6) to (8) set out the exceptions to this, which attract negative resolution procedure.

9. All of the delegated powers provisions in the Climate Change (Scotland) Bill are listed in this Memorandum, with a short explanation of what each power allows, why the power has been taken in the Bill and why the form of Parliamentary procedure selected is considered appropriate.

DELEGATED POWERS

PART 1 – EMISSIONS REDUCTION TARGETS

Section 4 - Setting annual targets

Power conferred on: Scottish Ministers
Power exercisable by: order made by statutory instrument
Parliamentary procedure: affirmative resolution of the Scottish Parliament

Provision

10. Section 4 imposes a requirement on the Scottish Ministers to set annual targets by order. Subsection (2) states for which years the targets must be set. The Scottish Ministers intend to set targets in batches; the first batch will be for 13 years (2010-2022), with subsequent targets set in batches of five years until the last batch, which will be three years in length (2048-2050). The dates by which each batch of targets must be set are also given. The annual targets must be set in accordance with provisions in section 3. Section 4(3) requires that, in setting annual targets, the Scottish Ministers must have regard to the targets for 2030 and 2050. Subsection (4) requires that, in setting annual targets, the Scottish Ministers must have regard to a range of matters. Section 5 further requires the Scottish Ministers to seek advice from the advisory body before laying a statutory instrument under section 4 and to publish a statement after the instrument is laid.

Reason for taking power

11. The rationale behind having targets set in advance is to provide certainty for the public and private sectors so that they can take them into account when making investment decisions, providing sufficient incentive to invest and innovate. Some technologies or changes in plant need a long lead in time and some behaviours take time to change. Setting targets in batches recognises that it is not possible now to accurately forecast up until 2050 the range of factors which need to be taken into account regarding reducing Scotland’s greenhouse gas emissions.

Choice of procedure

12. The annual targets will set the future trajectory of Scotland’s emissions and the amount of emissions over this time. The impact of this trajectory on the economy and people’s lives is as significant as a target for a specific point in time, the interim target in 2030 and the final target in
2050. The affirmative resolution procedure is considered appropriate due to the socio-economic impacts the targets will have on Scotland.

Section 6 - Modifying annual targets

Power conferred on: Scottish Ministers
Power exercisable by: order made by statutory instrument
Parliamentary procedure: affirmative resolution of the Scottish Parliament

Provision

13. Section 6 allows the Scottish Ministers to modify various parts of sections 3 and 4 by order. Subsection (1)(a) enables the Scottish Ministers to modify the percentage figure by which annual targets must reduce year-on-year from 2020. Subsection (2) restricts this power so that the percentage may be modified only if the Scottish Ministers consider that it is no longer necessary to set the targets by reference to that percentage. Subsection (5) further states that the percentage may not be changed to a figure less than zero.

14. Subsection (1)(b) allows the Scottish Ministers to modify an annual target once it has been set by order under section 4. Subsection (3) restricts this power so that an annual target may be changed only as a result of significant changes to the basis on which the annual target was first set.

15. Subsection (1)(c) enables the Scottish Ministers to modify any of the dates set out in section 4 (the dates of the batches of annual targets) and subsection (1)(d) allows modification of the criteria to which the Scottish Ministers must have regard when setting annual targets. Subsection (4) sets out that the Scottish Ministers may only exercise these powers if they consider it appropriate to do so.

16. Subsection (6) allows the Scottish Ministers to exercise the power to modify annual targets set by order only before the beginning of the year to which the target relates. This power may not be used to allow the target to exceed that set for the previous year.

17. Section 7 requires that all of these powers may only be exercised once the Scottish Ministers have requested advice from the relevant body defined in section 5(5) and the Scottish Ministers must publish a statement if the order differs from the recommendation of the relevant body.

Reason for taking power

18. The annual targets will be set in advance and are based on a range of criteria. Between the date when an annual target is set and the year to which it relates, circumstances may change significantly which require a re-evaluation of the annual target level. Subsections (1)(a) and (1)(b) allow this re-evaluation to occur. Over time, it may become apparent that annual targets need to be set further, or not as far, in advance. Subsection (1)(c) allows the date by which the annual targets are set to be changed. It is not possible to foresee the full range of criteria which need to be taken into account up until 2050. Additional criteria may become as important as the current list. Subsection (1)(d) allows the criteria to change.
Choice of procedure

19. As subsection (1)(a) allows an important percentage set in primary legislation to be modified, it is considered appropriate that affirmative resolution should apply. Subsection (1)(b) allows a change to a previous instrument subject to affirmative resolution, it is therefore considered appropriate that affirmative resolution should apply. As subsections (1)(c) and (1)(d) allow a change in primary legislation, it is considered appropriate that affirmative resolution should apply.

Section 9 - Greenhouse gases

Power conferred on: Scottish Ministers
Power exercisable by: order made by statutory instrument
Parliamentary procedure: affirmative resolution of the Scottish Parliament

Provision

20. Subsection (2) enables the Scottish Ministers to add gases to the list of greenhouse gases, for the purposes of the Bill, and to modify the description of gases. Subsection (3) places a restriction on the Scottish Ministers in so far as they may only modify subsection (1) to add a gas if it appears that an agreement or arrangement at European or international level recognises that such a gas contributes to climate change. Subsection (4) requires the Scottish Ministers to consult with the relevant body defined in section 5(5) before laying such an order.

Reason for taking power

21. As climate change science is an evolving science, it may become necessary in the future to add new gases to the list of those covered by the targets in the Climate Change (Scotland) Bill. Future European or international agreements may include these gases. It may also be the case in the future that such agreements describe existing greenhouse gases in different ways than they do currently. For example, hydrofluorocarbons and perfluorocarbons are families of gases, it is accepted practice to refer to them collectively but it may be appropriate in the future to describe individual gases within those families. Subsection (2) enables the Scottish Ministers to respond to these kinds of changes.

Choice of procedure

22. As this provision will enable the amendment of a core provision of the Bill, the greater degree of Parliamentary scrutiny provided by the affirmative resolution procedure is considered appropriate.
Section 11 – Baseline for additional greenhouse gases

Power conferred on: Scottish Ministers
Power exercisable by: order made by statutory instrument
Parliamentary procedure: affirmative resolution of the Scottish Parliament

Provision

23. Section 11 enables the Scottish Ministers to make provision as to how to determine the baseline year for an additional greenhouse gas added under section 9. In particular, they may designate a baseline year and provide that the amount of net Scottish emissions of that gas for that year is to be treated as the amount for that baseline year.

Reason for taking power

24. If a new greenhouse gas is added under section 9, a baseline year will need to be designated, alongside the quantity of emissions for that year in order for it to be added to the net emissions account for the purposes of targets for the Bill. Until it is known which gases will be added under section 9, it is not possible to designate baseline years or quantities of emissions for those gases on the face of the Bill.

Choice of procedure

25. As the baseline year and level of net Scottish emissions counted as having occurred in that year of any gas added under section 9 will have an important effect on the total amount of net Scottish emissions and, therefore, on efforts to reduce Scottish emissions in order to meet the Bill’s statutory targets affirmative resolution procedure is considered appropriate for orders made under section 11.

Section 12 - The net Scottish emissions account

Power conferred on: Scottish Ministers
Power exercisable by: regulations made by statutory instrument
Parliamentary procedure: On the first occasion, affirmative resolution of the Scottish Parliament. The second and subsequent regulations will be subject to negative resolution provided the amendments made are simply technical in nature. More detail is provided below.

Provision

26. Subsection (2) of section 12 enables the Scottish Ministers to make provision by regulations about how and in what circumstances carbon units are credited to and debited from the net Scottish emissions account.

Reason for taking power

27. Certain businesses in Scotland participate in the European Union Emissions Trading Scheme. It is possible that firms in Scotland may participate in other such trading schemes in the future. If the net Scottish emissions account is to take account of the units traded within such schemes, it will be necessary to define the terms by which this occurs. This power will also
This document relates to the Climate Change (Scotland) Bill (SP Bill 17) as introduced in the Scottish Parliament on 4 December 2008

enable the Scottish Ministers to create regulations covering the use of carbon units purchased or sold by Ministers themselves outside of specific trading schemes – for example, units generated by the Clean Development and Joint Implementation Mechanisms established under the Kyoto Protocol.

Choice of procedure

28. The initial regulations will set out how and in what circumstances carbon units are credited to and debited from the net Scottish emissions account which will be a key component of the operation of that account. Affirmative resolution procedure is therefore considered appropriate for the initial regulations. Subsequent regulations will likely involve technical amendments which are unlikely to be significant and, therefore, will usually merit negative resolution procedure. If, however, the second or subsequent regulations make provision to alter the amount by which a carbon unit reduces or increases the net Scottish emissions account, affirmative resolution will be required because of the significant effect this could have on the account.

Section 14 - Scottish share of emissions from international aviation and international shipping

Power conferred on: Scottish Ministers
Power exercisable by: order made by statutory instrument
Parliamentary procedure: affirmative resolution of the Scottish Parliament

Provision

29. International aviation and international shipping emissions are generally not directly emitted in a specific country. Subsections (1) and (2) allow the Scottish Ministers to specify by order how certain emissions from international aviation and international shipping are to be regarded as “Scottish emissions”. Subsection (3) requires the Scottish Ministers to seek advice from the relevant body defined in section 5(5) prior to making an order. Subsection (4) requires the Scottish Ministers to publish a statement if the advice of the relevant body is not followed.

Reason for taking power

30. As international aviation and international shipping emissions are generally not directly emitted in a specific country, it is necessary to specify how certain amounts of these emissions will be allocated to the Scottish emissions account. This allocation may also need to change over time, particularly if a European or international agreement makes such a change necessary in the future. There is no current international agreement on how to allocate these emissions to states.

Choice of procedure

31. As this is an issue of high interest and could significantly alter the calculation of “Scottish emissions”, and thereby the calculation of the net Scottish emissions account and future annual targets, affirmative resolution procedure is considered appropriate.
Section 15 - Scottish emissions and removals

Power conferred on: Scottish Ministers
Power exercisable by: order made by statutory instrument
Parliamentary procedure: affirmative resolution of the Scottish Parliament

Provision
32. Subsection (2) allows the Scottish Ministers to modify the definition of Scottish removals set out in subsection (1).

Reason for taking power
33. Scottish removals is defined in the Bill as removals of a greenhouse gas from the atmosphere due to land use, land-use change or forestry activities in Scotland. These are the current internationally-recognised methods of removing greenhouse gas emissions from the atmosphere. It is not possible to forecast the full range of possible methods of removals which may develop up until 2050. Subsection (2) enables these changing circumstances to be taken account of in the future.

Choice of procedure
34. As this is an issue which could significantly alter the calculation of “net Scottish emissions”, future annual targets, and act as a driver for significant methods of reducing emissions, affirmative resolution procedure is considered appropriate for any change.

Section 17 – International carbon reporting practice

Power conferred on: Scottish Ministers
Power exercisable by: order made by statutory instrument
Parliamentary procedure: negative resolution of the Scottish Parliament

Provision
35. Paragraph (b) of section 17 enables the Scottish Ministers to expand the definition of “international carbon reporting practice” for the purposes of this Bill.

Reason for taking power
36. This will enable the Scottish Ministers to add future European and international agreements and arrangements relating to climate change to the meaning of “international carbon reporting practice” which must be taken into account when acting under the provisions of the Climate Change (Scotland) Bill.

Choice of procedure
37. Any decision to change the definition of “international carbon reporting practice” from being the protocols of the United Nations Framework Convention on Climate Change (as specified in section 17(a)) would likely be taken as a result of one or more international agreements to use alternative carbon reporting practices. As the provision in section 17(b) is
simply intended to ensure that the definition of “international carbon reporting practice” used in the Bill can be kept up to date, negative resolution procedure is considered appropriate.

Section 18 - Carbon units and carbon accounting

**Power conferred on:** Scottish Ministers  
**Power exercisable by:** regulations made by statutory instrument  
**Parliamentary procedure:** On the first occasion, affirmative resolution of the Scottish Parliament. The second and subsequent regulations will be subject to negative resolution provided the amendments made are simply technical in nature. More detail is provided below.

**Provision**

38. Subsection (1) allows Scottish Ministers to create a scheme for the purpose of monitoring the use of carbon units, including registering them and keeping track of them. Subsection (2) allows existing schemes, which may or may not be established by the Scottish Ministers, to be adapted for the purposes set out in subsection (1). Subsection (3) allows the functions which may need to be carried out for the purposes of such a scheme to be conferred on persons or bodies and for powers to be conferred on the Scottish Ministers in relation to the operation of such a scheme.

**Reason for taking power**

39. It may be necessary to create a scheme to monitor the use of carbon units. The trading of units across borders can be complicated and it is not yet known whether such a scheme is necessary. However, if it does become necessary, these provisions allow such a scheme to be created.

**Choice of procedure**

40. The initial regulations will create schemes regulating the use of carbon units and will confer new functions on persons or bodies. Affirmative resolution procedure is therefore considered appropriate for the initial regulations. Second and subsequent regulations could involve amendments which may not be significant and, therefore, merit negative resolution procedure. If, however, the second or subsequent regulations make provision to specify a carbon unit of a kind not previously specified, affirmative resolution will be required because of the significant affect this could have on the net Scottish emissions account.
PART 2 – ADVISORY FUNCTIONS

Section 19 – Meaning of advisory body

Power conferred on: Scottish Ministers
Power exercisable by: order made by statutory instrument
Parliamentary procedure: affirmative resolution of the Scottish Parliament

Provision

41. Section 19(1) enables the Scottish Ministers to designate, by order, a body or person to carry out the advisory functions set out in the Bill. (In the absence of an order made under section 19(1), the Scottish Ministers will seek advice from the UK Committee on Climate Change established by the UK Climate Change Act 2008 (as set out in section 5(5) of this Bill).) Section 19(3) specifies what the advisory functions are and clarifies that these may include further advisory functions conferred under subsection (4). Subsection (4) also sets out certain conditions which the Scottish Ministers may place on the advisory body with regard to the advice it is to provide. There is a related provision in section 21 which provides that when an order made under section 19(1) comes into force, subsection (3) of section 8 ceases to have effect. This will remove the duty on Scottish Ministers to lay in the Scottish Parliament a response to the relevant body’s report on progress under section 8. Section 21(1)(b) also operates in conjunction with section 19 to ensure that, when the functions contained in sections 22 to 27 are conferred on the advisory body designated under section 19, the order made under section 19 may provide for these functions to be conferred in stages.

Reason for taking power

42. This power allows for flexibility in the future as to which body or person carries out advisory functions under this Bill, particularly as the Bill framework is designed to last for at least 40 years. It will enable the functions to be carried out by an appropriate Scottish body, either an existing body or the Scottish Committee on Climate Change established under section 20 of the Bill. The related provision in section 21 is intended both to enable the phased conferral of new functions on the body and to remove the duplication of a reporting duty placed on the Scottish Ministers in section 8 to respond to the relevant body’s report on progress. This latter provision is necessary because once section 24 comes into force an equivalent duty is placed on the Scottish Ministers in relation to the advisory body’s reports on progress.

Choice of procedure

43. As this section provides for orders to be made conferring further climate change functions on the advisory body and specifying additional requirements on the provision of advice by the body, the level of Parliamentary scrutiny afforded by affirmative resolution procedure is considered appropriate.
Section 20 - Scottish Committee on Climate Change

Power conferred on: Scottish Ministers
Power exercisable by: order made by statutory instrument
Parliamentary procedure: affirmative resolution of the Scottish Parliament

Provision
44. Section 20 enables the Scottish Ministers to establish a Scottish Committee on Climate Change for the purpose of exercising the advisory functions set out in the Bill.

Reason for taking power
45. Section 19 of the Bill allows flexibility in designating the person or body that will provide the statutory advisory functions. This allows the Scottish Ministers to determine where such functions best lie. The Scottish Ministers currently intend to utilise the UK Committee on Climate Change established by the UK Climate Change Act 2008. However, if, in the future, this is no longer considered to be an adequate arrangement, the Scottish Ministers may decide to use the powers in section 19 to confer these functions on an existing Scottish public body, an example being the Scottish Environment Protection Agency. Alternatively, if that is not considered the most appropriate solution, section 20 enables the Scottish Ministers to establish a Scottish Committee on Climate Change.

Choice of procedure
46. As this provision allows for the creation of a new public body, affirmative resolution procedure is considered appropriate.

Section 23 – Reporting on progress towards targets

Power conferred on: Scottish Ministers
Power exercisable by: order made by statutory instrument
Parliamentary procedure: affirmative resolution of the Scottish Parliament

Provision
47. Section 23(2) enables the Scottish Ministers to specify the first year for which the advisory body must prepare reports on the progress being made towards the targets established under the Bill. Section 23(4) specifies when the advisory body must lay this report before the Scottish Parliament but also enables the Scottish Ministers to amend this deadline to a later date.

Reason for taking power
48. The first year for which there will be an annual target will be 2010. However, the Scottish Ministers intend to seek progress reports from the UK Committee on Climate Change in the initial years for which annual targets will be set. This arrangement will be reviewed in the future and, if it is considered that the UK Committee on Climate Change is not providing advice and scrutiny suitable for Scotland’s unique requirements, the Scottish Ministers will be able to create or designate another person or body to carry out these functions. Even if this does turn out to be necessary, the timescales involved cannot be known at the time the Bill is introduced to the
Scottish Parliament. The power in section 23(2) therefore allows the Scottish Ministers to specify the first year for which the advisory body must prepare progress reports as and when the relevant timescales are known. The advisory body will be required to prepare reports for the first specified year and each year thereafter. The power to amend the reporting deadline to a later date is intended to provide flexibility should there be a delay, for whatever reason, in the availability and/ or reporting of the information (such as the disaggregated Scottish emissions data, for example) upon which the advisory body is required to comment.

Choice of procedure

49. Affirmative resolution procedure demonstrates the significance of the reporting and scrutiny framework established by this Bill.

Section 24 – Scottish Ministers’ response to reports on progress

Power conferred on: Scottish Ministers
Power exercisable by: order made by statutory instrument
Parliamentary procedure: affirmative resolution of the Scottish Parliament

Provision

50. Section 24(1) requires that the Scottish Ministers respond to the report prepared by the advisory body under section 23. Section 24(2) specifies the date by which this response is to be laid in the Scottish Parliament but also enables the Scottish Ministers to amend this deadline to a later date.

Reason for taking power

51. The power enabling the Scottish Ministers to amend the response deadline to a later date is intended to provide flexibility should the advisory body’s report under section 23 be delayed.

Choice of procedure

52. Affirmative resolution procedure demonstrates the significance of the reporting and scrutiny framework established by this Bill.

PART 3 – REPORTING DUTIES

Section 35 - Further provision about reporting duties

Power conferred on: Scottish Ministers
Power exercisable by: order made by statutory instrument
Parliamentary procedure: affirmative resolution of the Scottish Parliament

Provision

53. Section 35 allows further provision to be made imposing further reporting duties on the Scottish Ministers to report to the Scottish Parliament. Subsection (2)(a) enables additional information to be required in the statutory reports which Ministers must make; subsection (2)(b)
enables the period to be set in relation to which that information is to be provided; and subsection (2)(c) enables the period to be set within which that information is to be provided.

Reason for taking power

54. It is not possible to foresee all possible climate change reporting duties which may become necessary up until 2050 to ensure the Scottish Ministers are held accountable. The Scottish Ministers may, of course, report information on a non-statutory basis. However certain information may in the future be considered important enough for Scottish Ministers to be bound to report it rather than have discretion as to whether or not to do so. Section 35 allows additional reporting duties to be created.

Choice of procedure

55. As this will allow for an increased scope of requirements placed in primary legislation, affirmative resolution procedure is considered appropriate.

PART 4 – DUTIES OF PUBLIC BODIES RELATING TO CLIMATE CHANGE

Section 36 - Duties of public bodies relating to climate change

Power conferred on: Scottish Ministers
Power exercisable by: order made by statutory instrument
Parliamentary procedure: affirmative resolution of the Scottish Parliament

Provision

56. Section 36 enables the Scottish Ministers to impose duties relating to climate change, by order, on bodies or persons exercising functions of a public nature, referred to as “public bodies” for the purposes of this Bill. Subsection (3) allows the regulations to impose different duties on different public bodies. Subsections (4) and (5) state that the Scottish Ministers must consult with such associations of local authorities and such other persons as they consider appropriate before imposing a duty. Subsection (6) states that the Scottish Ministers must co-operate with the relevant public bodies to help them comply with duties imposed under this section.

Reason for taking power

57. Section 36 allows for flexibility in the future to help ensure bodies with functions of a public nature take action on climate change, including reducing emissions or adapting to the effects of climate change.

Choice of procedure

58. As this provision could place a burden on bodies or persons exercising functions of a public nature, affirmative resolution procedure is considered appropriate.
Section 38 – Reporting on climate change duties

Power conferred on: Scottish Ministers
Power exercisable by: order made by statutory instrument
Parliamentary procedure: negative resolution of the Scottish Parliament

Provision

59. Section 38 enables the Scottish Ministers, by order, to require relevant public bodies to report on how they are complying with climate change duties created under section 36. It also enables the Scottish Ministers to set out what reports must include, what format they must take and the time by which they must be submitted.

Reason for taking power

60. The power to require public bodies to report on compliance with climate change duties is intended to ensure that such duties are carried out in an open and transparent fashion.

Choice of procedure

61. Requiring public bodies to report upon climate change duties which they are required to carry out is not considered as significant a burden as the requirement to perform such duties in the first place. Negative resolution procedure is therefore considered appropriate.

Section 39 - Appointment of monitoring body

Power conferred on: Scottish Ministers
Power exercisable by: order made by statutory instrument
Parliamentary procedure: affirmative resolution of the Scottish Parliament

Provision

62. Section 39 allows the Scottish Ministers to designate persons or bodies to monitor whether relevant public bodies are complying with climate change duties created under section 36 of this Bill, or having regard to guidance given under section 37 of this Bill.

Reason for taking power

63. A wide range of bodies may be affected by the creation of new climate change-related duties under section 36 and guidance under section 37. It may be deemed appropriate with certain types of duties for monitoring arrangements to be established but this cannot be known until such duties or guidance are created. Until such time, it is not possible to determine the appropriate monitoring framework, including which body should be designated to carry out such functions.

Choice of procedure

64. As this provision enables the creation of a monitoring body which will have investigatory powers, the use of which could place a burden on a body or person exercising functions of a public nature, affirmative resolution procedure is considered appropriate.
PART 5 – OTHER CLIMATE CHANGE PROVISIONS

Chapter 1 - Adaptation

Section 46 - Variation of permitted times for making muirburn

Power conferred on: Scottish Ministers
Power exercisable by: order made by statutory instrument
Parliamentary procedure: negative resolution of the Scottish Parliament

Provision

65. Section 46 inserts a new section 23A into the Hill Farming Act 1946 (“the 1946 Act”). Subsection (1) of new section 23A of the 1946 Act provides the Scottish Ministers with an order-making power to specify dates before which, and after which, it is lawful to make muirburn in any year. Subsection (2) of the new section 23A of the 1946 Act clarifies the effect of an order made under the new subsection (1). The effect of such an order is to substitute for any of the dates specified in section 23(1) to (3) of the 1946 Act, the dates specified in the order. Subsection (3) stipulates that the Scottish Ministers may make an order under subsection (1) only if they consider it necessary or expedient to do so in relation to climate change.

Reason for taking power

66. The permitted times for making muirburn in Scotland have not changed since the 1946 Act came into force. Climate change in Scotland has altered our seasonal weather patterns. Future climate change scenarios suggest that annual temperatures will rise, winters may become wetter and summers generally drier. These climatic changes have impacted, and are likely to continue to impact, on the ability to successfully undertake muirburn. Where effective muirburn cannot be carried out, there is an increased risk of wildfire from dry or dead vegetation, which can result in the loss of valuable habitats and carbon stored in peat underlying the lands upon which this vegetation is found. The power to vary the permitted muirburn season will enable muirburn, and those engaged in that activity, to adapt to the effects of climate change by permitting the activity at times of the year which reflect optimal climatic conditions.

Choice of procedure

67. Subsection (5) of the new section 23A of the 1946 Act provides that an order made under subsection (1) of that section is subject to annulment in pursuance of a resolution of the Scottish Parliament. This power secures the continued effectiveness of an established activity already provided for in primary legislation. The order-making power can only be exercised where the Scottish Ministers are satisfied it is necessary or expedient to do so in relation to climate change, and the negative resolution procedure is considered to offer an appropriate balance between flexibility and the need for scrutiny for a provision of this nature.
Chapter 2 - Forestry

Section 47 - Power to modify functions of Forestry Commissioners

Power conferred on:  Scottish Ministers
Power exercisable by:  order made by statutory instrument
Parliamentary procedure:  affirmative resolution of the Scottish Parliament

Provision

68. Section 47 confers on the Scottish Ministers the power to modify the functions of the Forestry Commissioners in or as regards Scotland. Subsection (2) provides that this power may be exercised by the Scottish Ministers only where they consider it to be necessary or expedient to do so to comply with their duties under sections 1, 2 or 3(1)(b) of the Bill, or otherwise in relation to climate change. Subsection (3) provides that an order under this section could enable the Forestry Commissioners to form or participate in corporate bodies or trusts. Subsection (4) contains provisions orders to provide for allowing the Forestry Commissioners to delegate their functions to other persons.

Reason for taking power

69. The Forestry Commissioners have the general duty to promote the interests of forestry, the development of afforestation and the production and supply of timber and other forest products. In addition, the Forestry Commissioners have the function of managing land comprising the national forest estate. These functions have benefits in relation to the development of programmes, such as afforestation, which will assist with mitigation of climate change. The effects of climate change will continue to develop in the future. This power will ensure that the Forestry Commissioners can establish, participate in, or facilitate programmes to mitigate climate change without being prevented from doing so because of the limits set out in their current functions and duties which do not allow for them to form or participate in corporate bodies or trusts. The power will allow for flexibility to ensure that the Forestry Commissioners functions and duties can continue to be modified in future to meet the challenges posed by the continuing effects of climate change.

Choice of procedure

70. The affirmative resolution procedure is considered appropriate because of the breadth of the power and the fact that it may involve modification of primary legislation.
Chapter 3 – Energy Efficiency

Section 50 – Non-domestic buildings: assessment of energy performance and emissions

Power conferred on: Scottish Ministers
Power exercisable by: regulations made by statutory instrument
Parliamentary procedure: affirmative resolution of the Scottish Parliament other than where the regulations only make provision relating to recovery of costs incurred by an enforcement authority in which case the procedure is negative resolution of the Scottish Parliament.

Provision

71. Section 50 enables the Scottish Ministers to make regulations relating to the assessment of the energy performance of and the emission of greenhouse gases from non-domestic buildings. Subsection (1)(b) provides that the regulations may extend not only to the greenhouse gases emitted by non-domestic buildings themselves but also to greenhouse gases otherwise associated with such buildings and with the activities carried out in these buildings. Subsection (2) lists certain things which the regulations may, in particular, provide about. Subsection (3) states that the enforcement authority provided for in the regulations is to be a local authority or such other person or body as the Scottish Ministers consider appropriate. Subsection (4) enables the enforcement authority to levy charges to recover the reasonable costs incurred in exercising its functions under the regulations.

Reason for taking power

72. The aim of the provisions for improving the energy performance of existing non-domestic buildings is to raise the contribution that the existing non-domestic stock can make to mitigating climate change. Buildings account for over 40% of emissions and there is scope to reduce these levels. They are to be subject to an assessment of the emissions of greenhouse gases and energy performance, an enhanced form of energy performance certificate (EPC). The enabling powers in section 50 will allow the creation of the framework necessary for this.

Choice of procedure

73. As this provision may be used to create regulations which could place a significant burden on the owners of non-domestic buildings, affirmative resolution procedure is considered appropriate. However, where regulations are made only to make provision relating to the recovery of costs it is considered that such regulations would be needed to keep such provisions up to date and would involve technical amendments which are unlikely to be significant and, therefore, would merit negative resolution procedure.
Chapter 4 – Waste Reduction and Recycling

Section 52 - Waste prevention and management plans

Power conferred on: Scottish Ministers
Power exercisable by: regulations made by statutory instrument
Parliamentary procedure: affirmative resolution of the Scottish Parliament

Provision

74. Section 52 enables the Scottish Ministers, by regulations, to place a duty on specified persons to prepare waste prevention and management plans. The Scottish Ministers would prescribe in regulations the persons required to prepare a plan (or plans), as well as the matters to be included in a plan. It is intended that the plans can be required for a range of different matters. For example, the regulations might require a plan for an individual construction project. Alternatively, they might require a plan for waste generated by a business on an on-going, day-to-day basis (e.g. office waste). It is intended that these regulations would deal with measures to prevent as well as manage waste.

75. Should the preparation of waste prevention and management plans be made compulsory by regulations under this section of the Bill, a regime will need to be established to ensure that plans are drawn up, that they are sufficiently rigorous, and that they are followed. A body will need to be established, or nominated, to do this. Subsection (2)(e) to (h) and section 60 of the Bill grants powers enabling such a regime to be set up and to establish or nominate a body to operate the regime.

Reason for taking power

76. Minimisation of waste, better use of resources, and careful management of such waste as does arise all impact on climate change. They are also important for other environmental goals, such as landfill reduction and preservation of amenity. Avoidance of waste can also generate savings for businesses. In view of this range of gains, many businesses already plan for prevention and management of waste. Powers would be taken to ensure that performance across the economy met best standards, and that up-to-date approaches and techniques be adopted.

77. The range of activities encompassed by the plans, and the kind of waste with which they will need to deal, will be strongly influenced by economic activities and market conditions prevailing in future. All of these may change over time. Taking these powers allows a flexible response to prevailing conditions.

Choice of procedure

78. Regulations will provide the detail of any scheme which is to be enforced. It is therefore appropriate, for proper Parliamentary scrutiny, that affirmative procedure be adopted. This is particularly desirable given that regulations are likely to create new offences. The exception would be regulations dealing only with charges by the monitoring and enforcement body (see section 60(4)) which, in terms of section 64(5) and (7)(e), would be made by negative resolution.
Section 53 - Information on waste

Power conferred on: Scottish Ministers
Power exercisable by: regulations made by statutory instrument
Parliamentary procedure: affirmative resolution of the Scottish Parliament

Provision

79. Subsection 53(1) enables the Scottish Ministers, by regulations, to require specified persons to provide information to SEPA about the waste that they produce. Subsection (2) lists certain things which the regulations may, in particular, provide about, including the enforcement of duties imposed by the regulations and related offences for failing to comply with the requirements of the regulations.

Reason for taking power

80. It will be difficult to move to a zero waste society without much better information about the circumstances in which waste arises and its management, treatment and disposal in Scotland. Good, reliable waste data informs policy-makers when they are developing new ways of reducing and managing waste. It informs the private sector when it is seeking to invest in waste infrastructure as part of the move away from landfill, and also when looking to minimise waste, and thus costs. Such information would also help to meet the obligations of the Scottish Ministers under the Waste Statistics Regulation (2150/2002/EC)\(^1\). This establishes a framework for the production of Community statistics on the generation, recovery and disposal of waste. It requires Member States and the European Commission to produce Community statistics on the generation, recovery and disposal of waste. SEPA already collates waste statistics which are used to meet Scotland’s obligations under the EU Regulation. However, statistics on commercial and industrial waste are based on surveys for which the return rate is low.

81. Taking powers would enable the kind of statistics collected to be determined by developing needs. As an example, and without prejudicing any eventual use of the power, in future it may become possible and desirable to keep statistics relating to the greenhouse-gas-generating potential of waste.

Choice of procedure

82. Regulations will provide the detail of any scheme which is to be enforced. It is therefore appropriate, for proper Parliamentary scrutiny, that affirmative procedure be adopted. This is particularly desirable given that regulations are likely to create new offences.

---

\(^1\) OJ No L 332, 9.12.2002, p1
Section 54 - Recyclable waste: facilities for deposit etc.

Power conferred on: Scottish Ministers
Power exercisable by: regulations made by statutory instrument
Parliamentary procedure: affirmative resolution of the Scottish Parliament

Provision

83. Section 54 enables the Scottish Ministers to make regulations which may require receptacles to be provided by persons of the kinds specified for a broad range of types of waste. It is possible that, for example, supermarkets could be required to provide recycling facilities at or near tills for packaging which customers could use. Offices could be required to provide receptacles in which employees could recycle their own paper, as well as that of the workplace. This would not be a complete innovation: such facilities are already available in places. In practice, the Scottish Ministers would only prescribe types of waste if there was capacity to recycle that waste and a market for the resulting recyclate.

84. Regulations may also be used to require persons with the correct environmental authorisation to collect waste deposited in such facilities and to ensure so far as reasonably practicable that such waste is recycled. Charges payable to such authorised persons may be specified.

85. A monitoring and enforcement regime may be established to ensure that the facilities are provided, and used and operated correctly. Subsection (2)(f) to (i) and section 60 of the Bill grants powers enabling such a regime to be set up and to establish or nominate a body to operate the regime.

Reason for taking power

86. Improved provision of recycling facilities reduces the use of landfill and can also help to mitigate climate change. To improve recycling rates the producers of waste have to be given better opportunities to recycle, rather than dispose of the waste they produce; and waste has to be separated and kept uncontaminated to make recycling easier, or even physically possible. The provision of receptacles at convenient places, and which keep waste streams separate, achieves both these conditions.

87. The kinds of waste for which receptacles are provided are likely to change over time as recycling markets change or new products are developed. This will in turn affect judgements about the persons who should be required to provide and enabled to use these facilities. For this reason requirements are likely to need to be modified; and this power will permit this to be done.

Choice of procedure

88. Regulations will provide the detail of any scheme which is to be enforced. It is therefore appropriate, for proper Parliamentary scrutiny, that affirmative procedure be adopted. This is particularly desirable given that regulations are likely to create new offences. The exception would be regulations dealing only with charges by the monitoring and enforcement body which, in terms of section 64(5) and (7)(e), would be made by negative resolution.
Section 55 - Recyclable waste: facilities for deposit at events etc.

Power conferred on: Scottish Ministers
Power exercisable by: regulations made by statutory instrument
Parliamentary procedure: affirmative resolution of the Scottish Parliament (negative procedure for regulations dealing only with charging by enforcement authority)

Provision

89. Whereas section 54 is most likely to be used to require the provision of receptacles at more-or-less permanent locations, section 55 enables the Scottish Ministers to make regulations which confer power on local authorities to issue notices requiring receptacles to be provided for a broad range of types of waste at various events. The receptacles would be needed only for the duration of the event. This would not be a complete innovation: such facilities have already been made available at particular events. In practice, the Scottish Ministers would only prescribe types of waste if there was capacity to recycle that waste and a market for the resulting recyclate.

90. Those who hold sporting or cultural events could be placed under a duty to provide receptacles in which those attending could leave a range of waste – relevant examples could be plastic cups and programmes. The materials so collected could then be recycled. Regulations may also be used to enable local authorities to require persons with the correct environmental authorisation to collect such waste and to ensure so far as reasonably practicable that waste deposited in such facilities is recycled. Regulations may specify charges payable to such authorised persons.

91. A monitoring and enforcement regime may be established to ensure that facilities are provided, used and operated correctly. Subsections (2)(k) to (n) and section 60 of the Bill grant powers enabling such a regime to be set up and to establish or nominate a body to operate the regime.

Reason for taking power

92. As with the kind of receptacles in permanent locations envisaged by section 54, the aim here is to encourage recycling and thus the more efficient use of resources. The conditions for higher recycling rates are to be established by maximising collection and by keeping different types of waste separate for easy recycling. An additional benefit which may be achieved by the provision of recycling facilities at events is a reduction in littering.

93. The kinds of waste for which receptacles are provided are likely to change over time as recycling markets change or new products are developed. This may in turn affect judgements about which events should be potentially subject to notices. For this reason, requirements are likely to need to be modified; and this power will permit this to be done.

Choice of procedure

94. Regulations will provide the detail of any scheme which is to be enforced. It is therefore appropriate, for proper Parliamentary scrutiny, that affirmative procedure be adopted. This is particularly desirable given that regulations are likely to create new offences. The exception
would be regulations dealing only with charges by the monitoring and enforcement body which, in terms of section 64(5) and (7)(e), would be made by negative resolution.

Section 56 - Procurement of recyclate

Power conferred on: Scottish Ministers
Power exercisable by: regulations made by statutory instrument
Parliamentary procedure: affirmative resolution of the Scottish Parliament (negative procedure for regulations dealing only with charging by enforcement authority)

Provision

95. Section 56 gives the Scottish Ministers powers to require specified persons to ensure that particular things procured or constructed by them contain or include a certain proportion of recyclate.

96. Arrangements would be required to ensure that these obligations were observed. A body would have to be set up or nominated to do this. Section 56(3)(f), subject to section 60, contains provisions allowing such a regime to be developed.

Reason for taking power

97. A great deal of recyclate is already procured by a wide range of businesses and public bodies, which promotes resource efficiency, reduces the use of landfill and helps mitigate climate change. It is likely, however, that markets for recyclate, and with them economic activity in the waste processing sector, could be increased if such procurement were made compulsory. It would also help to counter the effects of what may be perceived as a stigma attached to recycled products.

98. The kind of recycled materials which should be procured would, however, depend on market conditions prevailing at the time, as would the type of organisation at which the powers would be aimed. Care would also have to be taken, for example, that any materials stipulated should be sufficiently widely available and readily traded to avoid market distortions. Powers therefore need to be flexible enough to allow modification, as envisaged in this section.

Choice of procedure

99. Regulations will provide the detail of any scheme which is to be enforced. It is therefore appropriate, for proper Parliamentary scrutiny, that affirmative procedure be adopted. This is particularly desirable given that regulations are likely to create new offences. The exception would be regulations dealing only with charges by the monitoring and enforcement body which, in terms of section 64(5) and (7)(e), would be made by negative resolution.
Section 57 – Targets for reduction of packaging etc.

Power conferred on: Scottish Ministers
Power exercisable by: regulations made by statutory instrument
Parliamentary procedure: affirmative resolution of the Scottish Parliament (negative procedure for regulations dealing only with charging by enforcement authority)

Provision

100. Section 57 enables the Scottish Ministers, by regulations, to set targets to reduce the amount of packaging used and to require specified persons to comply with those targets. Without prejudicing detailed provisions, it would allow Ministers to obtain information about a baseline volume of packaging on the market in Scotland and then set targets on retailers, for example, to reduce that amount year on year. The reduction might be expressed in ways other than absolute amounts: for example, targets could be set with reference to the relationship between volume of packaging put on the market by a retailer and its turnover. The forms of packaging for which targets might be set would be a matter for the regulations and could, obviously, be altered by further regulations.

101. A monitoring and enforcement regime may be established to ensure that information is properly collated and targets met. Subsection (2)(e) to (h) and section 60 of the Bill grants powers enabling such a regime to be set up and to establish or nominate a body to operate the regime.

Reason for taking power

102. There is already legislation regarding packaging, in the form of the Packaging (Essential Requirements) Regulations 2003 and the Producer Responsibility Obligations (Packaging Waste) Regulations 2007. These respectively set out the required specifications of packaging, and place responsibility on producers to recycle a proportion of waste packaging put on the market by them. Neither of these sets of regulations actually requires that the overall amount of packaging used should be reduced. The proposal in this Bill would complement existing legislation. Baseline information about packaging in circulation is needed before targets can be set, and the system is likely to require future revision in light of changing market conditions.

Choice of procedure

103. Regulations will provide the detail of any targets, to whom they apply, and how they should be enforced. It is therefore appropriate, for proper Parliamentary scrutiny, that affirmative procedure be adopted. This is particularly desirable given that regulations are likely to create new offences. The exception would be regulations dealing only with charges by the monitoring and enforcement body which, in terms of section 64(5) and (7)(e), would be made by negative resolution.

---

2 SI 2003/1941
3 SI 2007/871
Section 58 – Deposit and return schemes

Power conferred on: Scottish Ministers
Power exercisable by: regulations made by statutory instrument
Parliamentary procedure: affirmative resolution of the Scottish Parliament other than where the regulations only make provision relating to one or more of: charging by the enforcement authority, amount of deposits, form and content of notices or registration fees, in which case the procedure is negative resolution of the Scottish Parliament

Provision

104. Section 58 allows the Scottish Ministers to establish a deposit and return schemes, which are defined in terms of attaching a returnable element, called a “deposit” to the sale price of an article, which would be payable to the person returning the packaging associated with that item. The section allows the items which would be included in the scheme, and the persons involved, as well as the amount of any deposit, to be defined in regulations.

105. The section would permit a range of schemes to be developed, within that basic structure. At its simplest a scheme could merely require Scottish producers to establish their own deposit and return schemes. At the other end of the scale it could require the establishment of a “clearing house” system similar to that operating in Denmark and Norway, whereby relevant items are identified by the clearing house against payment of a fee by whomever puts them on the market. These fees are used to refund those who return the materials. The clearing-house can also take responsibility for recycling the materials collected: this is allowed for by the section.

106. A monitoring and enforcement regime may be established to ensure that materials subject to the requirements have a deposit attached to the sale price of the relevant items and this is properly refunded to those returning them. Monitoring and enforcement powers would be required. Subsection (7)(i) to (l) and section 60 of the Bill grants powers enabling such a regime to be set up and to establish or nominate a body to operate the regime. Section 58(5) contains provisions to set up a clearing house of the type described above.

Reason for taking power

107. While the 2007 Regulations described above do require the recycling of certain amounts of packaging this tends to be “back of store”. A deposit and return scheme could increase the return and the recycling of packaging which reaches consumers’ hands. Section 58(6) provides that Ministers may only make regulations where they consider this to be necessary or expedient in order to promote or secure an increase in the recycling of materials. Furthermore, by attaching a monetary value to items of packaging it could discourage the careless discarding of these materials – littering and fly-tipping – and reduce the concomitant amenity, and health and safety, problems.

108. A scheme could also encourage manufacturers to develop reusable forms of packaging. Those who operate existing deposit and return schemes do so to encourage reuse of packaging and thus keep their own costs down. It is likely that the types of product which are suitable for deposit and return schemes will develop along with markets and technology. The level of detail
required to establish properly functioning schemes is likely to be best left to subordinate legislation.

Choice of procedure

109. Regulations will provide the detail of any deposit and return schemes. It is therefore appropriate, for proper Parliamentary scrutiny, that affirmative procedure be adopted. This is particularly desirable given that regulations are likely to create new offences. The exceptions would be regulations dealing only with charges by the monitoring and enforcement body, the amount of the deposits, form and content of information notices for customers, and registration fees which, in terms of section 64(5) and (7)(d) and (e), would be made by negative resolution.

Section 59 - Charges for supply of carrier bags

Power conferred on: Scottish Ministers
Power exercisable by: regulations made by statutory instrument
Parliamentary procedure: affirmative resolution of the Scottish Parliament (negative procedure for regulations dealing only with charging by enforcement authority)

Provision

110. Section 59 will enable the Scottish Ministers to require suppliers of goods to charge for carrier bags. This may be done by reference to the type of goods sold, the type of supplier, turnover or other factors. The regulations would also define the carrier bags to which the charge applied and specify either the amount to be charged for each bag, or provide for how that amount is to be determined. The regulations would also be able to specify how the net proceeds are to be used, for example to ensure (if necessary) that the proceeds are applied to environmental causes which operate in Scotland.

111. Records will need to be kept about matters such as the number, type and tonnage of carrier bags for which a seller has imposed the charge. Section 59(2)(g) to (l), subject to section 60, enable the Scottish Ministers to appoint a body or bodies to monitor the accuracy of these records, and also to enforce the regulations, including ensuring that the proceeds were actually spent on the required good causes and to impose sanctions for failure to comply with the regulations.

Reason for taking power

112. Voluntary action has already significantly reduced the issue of carrier bags. However, reducing carrier bag use to a minimum may well require the imposition of a charge. Exactly what bags should be subject to such a charge, however, is likely not only to be a matter of detailed exposition, but also to be subject to variables, depending on – for example – life cycle analyses of various kinds of bag at any given time. Changes in the plastic reprocessing market, for example, could significantly affect the assessment of the environmental costs of plastic bags. Consumer shopping habits may change, and be reflected in the pattern of bag use associated with supermarkets on the one hand and boutiques on the other. It is therefore necessary for the power to set charges to be capable of modifying a range of details.
Choice of procedure

113. Regulations will provide the detail of any scheme which is to be enforced. It is therefore appropriate, for proper Parliamentary scrutiny, that affirmative procedure be adopted. This is particularly desirable given that regulations are likely to create new offences. The exception would be regulations dealing only with charges by the enforcement body, which, in terms of section 64(5) and (7)(e), would be made by negative resolution.

Section 67 – Commencement

Power conferred on: Scottish Ministers
Power exercisable by: order made by statutory instrument
Parliamentary procedure: no Parliamentary procedure

Provision

114. This section provides that the provisions of the Bill come into force on a day or days set by the Scottish Ministers by order. The exceptions to this are: section 67 itself and section 64 (which contains provisions governing the making of subordinate legislation). Those sections come into force on Royal Assent. Sections 22 to 27 (which relate to powers and duties in connection with the advisory body which may be designated under section 19) come into force in accordance with section 21.

Reason for taking power

115. This section addresses the administrative requirements necessary for commencing the Bill.

Choice of procedure

116. The decision on commencement is a matter for the Scottish Ministers, and as is usual, the Scottish Government considers that the commencement powers should not be subject to any Parliamentary procedure.

Schedule 1, paragraph 2(2) – The Scottish Committee on Climate Change

Power conferred on: Scottish Ministers
Power exercisable by: order made by statutory instrument
Parliamentary procedure: negative resolution of the Scottish Parliament

Provision

117. Paragraph 2(2) of schedule 1 provides that the Scottish Ministers may by order alter the number of members of the Scottish Committee on Climate Change.

Reason for taking power

118. Paragraph 2(1) of schedule 1 specifies that the Scottish Committee on Climate Change is to consist of a person as Chair with five to eight other members. These numbers are intended to ensure that the Committee’s membership is of sufficient size to ensure it contains an appropriate
range of expertise and experience but is not so large as to become unwieldy. Paragraph 2(2) is intended to ensure flexibility in the future should it become apparent that the Committee should operate with fewer than five or more than eight members, in addition to the Chair.

Choice of procedure

119. Changing the number of other members of the Scottish Committee on Climate Change is considered to be an administrative amendment. It is therefore appropriate that negative resolution be used for an order made under this section of the Bill.
Transport, Infrastructure and Climate Change Committee

2nd Report, 2009 (Session 3)

Stage 1 report on the Climate Change (Scotland) Bill

Published by the Scottish Parliament on 24 April 2009
INTRODUCTION

This report is the first stage report on the Climate Change (Scotland) Bill, which aims to set a legally binding 2050 target for Scotland to reduce its greenhouse gas emissions to a level at least 80% lower than 1990 levels. The Bill also sets interim targets for 2010-2020 and 2021-2030, and includes provisions for the governance of climate change and emissions targets.

The Committee has reviewed the Bill and made several recommendations to improve its effectiveness and alignment with Scottish Government strategies. These include:

- Recommendations for clarifying the roles and responsibilities of the Scottish Government, local authorities, and other public bodies.
- Suggestions for improving the visibility and transparency of progress towards meeting the targets.
- Advice on the need for greater emphasis on adaptation to climate change.
- Recommendations for enhancing the role of the Scottish Parliament in monitoring and scrutinizing climate change policies.

In conclusion, the Committee believes that the Bill is a significant step forward in Scotland’s efforts to combat climate change, but recommends further improvements to ensure its effectiveness and alignment with other key policies and strategies.

VOLUME 2

ANNEXE B: REPORTS FROM OTHER COMMITTEES
- Report from the Economy, Energy and Tourism Committee
- Report from the Finance Committee
- Report from the Rural Affairs and Environment Committee
- Report from the Subordinate Legislation Committee

ANNEXE C: ORAL EVIDENCE AND ASSOCIATED WRITTEN EVIDENCE

20 January (3rd Meeting, 2009 (Session 3))

Oral Evidence
- Philip Wright, Deputy Director Climate Change, Fiona Page, Head of Scottish Climate Change Bill Team, Andrew Henderson, Policy Officer Scottish Climate Change Bill Team, and Cameron Maxwell, Climate Change Policy Team, Scottish Government.

Written Evidence
- Scottish Climate Change Bill Team

Supplementary Written Evidence
- Scottish Climate Change Bill Team

27 January (4th Meeting, 2009 (Session 3))

Oral Evidence
- Professor John Mitchell, Director of Climate Science, Met Office;
- Professor Peter Smith, Professor of Soils and Global Change, University of Aberdeen;
- Phil Matthews, Senior Policy Advisor, Sustainable Development Commission Scotland;
- Dr Andy Kerr, Assistant Director of Scottish Alliance for Geoscience, Environment and Society, University of Edinburgh;
- David Kennedy, Chief Executive, and Katherine White, Economic Adviser, Committee on Climate Change.

Supplementary Written Evidence
- Met Office
3 February (5th Meeting, 2009 (Session 3))

**Oral Evidence**
- Richard Dixon, Director, WWF Scotland;
- Duncan McLaren, Chief Executive, Friends of the Earth Scotland;
- Dave Watson, Scottish Organiser, UNISON;
- Chris Hegarty, Advocacy Manager, SCIAF;
- Gavin McLellan, Head of Christian Aid Scotland, Christian Aid Scotland;
- Judith Robertson, Head of Oxfam in Scotland, Oxfam.

**Written Evidence**
- Friends of the Earth Scotland

**Supplementary Written Evidence**
- Stop Climate Chaos Scotland

10 February (6th Meeting, 2009 (Session 3))

**Oral Evidence**
- Chris Austin, Head of Public Affairs, Association of Train Operating Companies;
- Marjory Rodger, Director of Government Relations in Scotland, Confederation of Passenger Transport UK;
- Derek Halden, Director, DH Consultancy;
- Gordon Dewar, Managing Director, Edinburgh Airport, BAA Scotland;
- Robert Ashdown, Head of Technical Division, Chamber of Shipping;
- Gordon Wilmsmeier, Senior Research Fellow, Transport Research Institute, Napier University;
- Dr Alice Bows, Core Researcher, Tyndall Centre Manchester;
- Paul Tetlaw, Chair, Transform Scotland;
- Jeff Gazzard, Coordinator, GreenSkies Campaign;
- John Lauder, National Director for Scotland, Sustrans.

**Written Evidence**
- Association of Train Operating Companies
- BAA Scotland
- Confederation of Passenger Transport
- Chamber of Shipping
- Transform Scotland

**Supplementary Written Evidence**
- BAA Scotland:
  - Covering letter
  - Sustainable aviation CO2 roadmap
  - Non CO2 climate change effects of aviation emissions
  - Car parking additional information
  - Public transport additional information
- GreenSkies Campaign
- Derek Halden
24 February (7th Meeting, 2009 (Session 3))

Oral Evidence
Ken Gibb, Chair, Sustainable Scotland Network;
Councillor Alison Hay, Spokesperson for Regeneration and Sustainable Development, and Anil Gupta, Team Leader for Environment and Regeneration, COSLA;
John Stocks, Manager, Scotland, Carbon Trust;
Mike Thornton, Director, Scotland, Energy Saving Trust;
Chas Booth, Senior Press and Parliamentary Officer, Association for the Conservation of Energy;
Stephen Boyd, Assistant Secretary, STUC;
Anne Douglas, National Secretary, Prospect.

Written Evidence
COSLA and Sustainable Scotland Network
STUC

Supplementary Written Evidence
Prospect [Not reproduced, available on request from the Clerk]

3 March (8th Meeting, 2009 (Session 3))

Oral Evidence
Matthew Farrow, Head of Environment Group, CBI;
Brendan Dick, and Grant Hodges, Climate Change Business Delivery Group;
Jason Ormiston, Chief Executive, Scottish Renewables;
Colin Galbraith, Director, Policy and Advice, and Clive Mitchell, Strategy and Communications Manager, Scottish Natural Heritage;
Dr Chris Spray, Director of Environmental Science, and David Gorman, Head of Environmental Strategy, SEPA;
Geoff Aitkenhead, Asset Management Director, and Mark Williams, Business Strategy and Climate Change Manager, Scottish Water.

Written Evidence/Submissions to call for views
Climate Change Business Delivery Group
Scottish Renewables
Scottish Natural Heritage
SEPA
Scottish Water

10 March (9th Meeting, 2009 (Session 3))

Oral Evidence
Stewart Stevenson MSP, Minister for Transport, Infrastructure, and Climate Change, Philip Wright, Deputy Director, Climate Change, Fiona Page, Head of Scottish Climate Change Bill Team, Cameron Maxwell, Climate Change Policy Team, Madeleine Cusack, Climate Change Policy Team, and Kevin Philpott, Waste Regulation Senior Policy
Officer, Scottish Government; David Henderson-Howat, Policy Adviser, Forestry Commission Scotland.

Supplementary Written Evidence
Minister for Transport, Infrastructure and Climate Change

ANNEXE D: LIST OF OTHER WRITTEN SUBMISSIONS IN RESPONSE TO CALL FOR VIEWS FROM TRANSPORT INFRASTRUCTURE AND CLIMATE CHANGE COMMITTEE AND RURAL AFFAIRS AND ENVIRONMENT COMMITTEE

Transport, Infrastructure and Climate Change Committee

Remit and membership

Remit:

To consider and report on matters relating to transport, infrastructure and climate change falling within the remit of the Cabinet Secretary for Finance and Sustainable Growth.

Membership:

Rob Gibson
Charlie Gordon
Patrick Harvie (Convener)
Alex Johnstone
Alison McInnes
Des McNulty
Cathy Peattie (Deputy Convener)
Shirley-Anne Somerville

Committee Clerking Team:

Clerk to the Committee
Steve Farrell

Senior Assistant Clerk
Alastair Macfie

Assistant Clerk
Clare O'Neill

Committee Assistant
Lauren Spaven-Donn
INTRODUCTION

1. The Climate Change (Scotland) Bill sets targets for reducing greenhouse gas emissions in Scotland and introduces a framework for advice and reporting on climate change.

Aim of the Bill

2. The Policy Memorandum\(^1\) states that the key objective of the Bill is to create a statutory framework for greenhouse gas emissions reductions in Scotland by setting a reduction target of at least 80% by 2050.

3. The Policy Memorandum goes on to state that to help ensure the delivery of this target, the Bill requires that Scottish Ministers set annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050, as well as an interim target of a 50% reduction in emissions by 2030.

4. A briefing from the Scottish Parliament Information Centre was published on 15 January 2009 which provides further information on the provisions in the Bill.\(^2\)

The Committee’s approach

5. This report will first consider the proposal for an emissions reduction target of at least 80% by 2050. Second, the report will consider the methodology proposed for the measurement and assessment of emissions reduction targets in the Bill. Third, the report will examine the nature of the targets set by Scottish Ministers between 2010 and 2019 and the proposed 2030 interim target in the Bill.

---

\(^1\) Climate Change (Scotland) Bill. Policy Memorandum. Available at: [http://www.scottish.parliament.uk/s3/bills/17-ClimateChange/b17s3-introd-pm.pdf](http://www.scottish.parliament.uk/s3/bills/17-ClimateChange/b17s3-introd-pm.pdf)

Importantly, the report will then discuss the actions needed in order for the climate change targets in the Bill to be met and the process to be properly monitored.

6. The report will then discuss the framework in the Bill for advice and reporting on climate change. Finally, the report will conclude by discussing the other climate change provisions contained in Part 5 of the Bill.

CONCLUSION AND SUMMARY OF RECOMMENDATIONS

7. The Climate Change (Scotland) Bill is claimed to be one of the most important pieces of legislation to be introduced in the Scottish Parliament. It will establish a framework for reductions in greenhouse gas emissions which will last until 2050, and which will have major implications for all aspects of Scotland’s economy and the way we live our lives. The Committee recognises that this is an ambitious target. This report fully endorses the objective of tackling climate change and believes it is right that Scotland should set challenging targets for reductions in greenhouse gas emissions as its contribution to international efforts to tackle global climate change.

8. The Committee has therefore agreed to support the general principles of the Bill and the policy intention underpinning the legislation. However, in its scrutiny of the Bill at Stage 1, the Committee has been keen to ensure that the legislative framework for the emissions reductions targets is as robust and effective as possible. It is of vital importance that this very significant piece of legislation delivers an effective framework for addressing climate change. In this report, the Committee will highlight, in particular, two important areas where it believes that changes are needed for the Bill to meet the challenge.

9. First, the Committee has noted the scientific evidence that strong early action is needed in order to deliver the necessary reductions in greenhouse gas emissions. The Committee believes that the framework for emissions reductions targets set down for the period between 2010 and 2019 needs to be more robust. The Committee wishes to see the interim target brought forward from 2030 to 2020, in line with changes proposed by the UK Government in advance of international discussions due to take place in Copenhagen later in 2009.

10. Second, the Committee is concerned about delivery of the targets. The Bill will not, in itself, deliver reductions in greenhouse gas emissions. The Committee believes that we cannot wait for comprehensive plans to provide specific details of how emissions reductions will be secured or for perfect monitoring tools to be devised. Early action to change policies and shift resources is needed, together with strong and committed leadership to deliver the radical measures to make the required emissions reductions and persuade citizens of the need for action. The Committee calls on the Scottish Government to put before the Parliament at the earliest possible date a comprehensive strategy document outlining how it intends to achieve the targets set out in the Bill.

11. This report will discuss these key points in more detail, and will also make a number of other recommendations. The report will also highlight the significant dissatisfaction with the way the consultations on proposals in Part 5 of the Bill were carried out.
BACKGROUND

Pre-legislative scrutiny

12. The Committee began familiarising itself with the issues relevant to the Bill well in advance of its introduction. In February 2008, the Committee undertook fact finding visits to London and Brussels. The policy debate on climate change at both UK and EU level provided a variety of opportunities to develop the Committee’s awareness of legislative and policy developments in advance of the introduction of legislation in Scotland. The Committee met with MPs, MEPs, local authorities, and relevant non-governmental organisations.

13. In addition, in advance of the Bill’s introduction, the Committee organised a number of seminars with stakeholders on the Greenhouse Gas Regional Inventory Project, which is an energy emissions scenario tool that allows an operator to assess the carbon implications of different energy futures. The tool illustrated the nature and extent of mitigation measures that might need to be applied across the various sectors to achieve the significant reduction in emissions required to reach proposed government targets.

Introduction of the Bill

14. The Climate Change (Scotland) Bill was introduced by the Cabinet Secretary for Finance and Sustainable Growth, John Swinney MSP, on 4 December 2008.3 The Bill was accompanied by a Policy Memorandum and a Financial Memorandum.4 The Parliament at its meeting on 10 December 2008 agreed that the Transport, Infrastructure and Climate Change Committee be designated as the lead committee, and that the Bill should also be referred to the Rural Affairs and Environment Committee as secondary committee. The Economy Energy and Tourism Committee also took evidence on Part 5, Chapter 3 of the Bill.

15. This Committee agreed its approach to Stage 1 consideration at its meeting on 16 December 2008 and issued a call for views on the general principles of the Bill on 19 December 2008. The Rural Affairs and Environment Committee also issued a call for views on the Bill, specifically on section 47 on the role of the Forestry Commission.

Evidence

16. This Committee received 359 responses to its call for views on the Bill. In total, 69 organisations responded and 290 responses came from individuals. These responses are attached at Annexe D.

17. The Committee took oral evidence on the Bill from witnesses at its meetings of 20 January 2009, 27 January 2009, 3 February 2009, 10 February 2009, 24 February 2009, 3 March 2009 and 10 March 2009. The minutes of these meetings (which include details of the witnesses who gave evidence) are attached at

3 Climate Change (Scotland) Bill. Available at: http://www.scottish.parliament.uk/s3/bills/17-ClimateChange/index.htm
Annexe A. Extracts from the Official Reports of those meetings, together with associated written and supplementary evidence comprise Annexe C.

18. In addition to the written and oral evidence received as part of its consideration of the Bill, the Committee hosted a high-profile climate change event in the Chamber on 27 March 2009 which examined the international impact of climate change and Scotland’s role in reducing emissions in relation to the Bill. A transcript from this event is attached at Annexe E. The Committee would like to thank all those who provided written and oral evidence on the Bill.

Reports by other committees

Reports by the Rural Affairs and Environment Committee and the Economy, Energy and Tourism Committee

19. The Rural Affairs and Environment Committee reported to this Committee on Chapters 1, 2 and 4 of Part 5 of the Bill. The Economy, Energy and Tourism Committee reported to the Parliament and this Committee on Chapter 3 of Part 5 on energy efficiency. The issues raised by these committees are discussed later in this report. The reports of these committees are included at Annexe B.

Financial Memorandum

20. The Committee will discuss the Financial Memorandum accompanying the Bill when it considers the Finance Committee’s report later in this report. This report is included at Annexe B.

Report by the Subordinate Legislation Committee

21. The Committee notes the report of the Subordinate Legislation Committee, which considered the delegated powers provisions of the Bill and is included at Annexe B. This is considered further by the Committee later in this report.

Policy Memorandum

22. The Committee is satisfied that the Policy Memorandum factually describes the contents of the Bill. The Committee will comment in detail on the issues highlighted in the Policy Memorandum later in this report.

Equalities issues

23. The Committee has considered the section of the Policy Memorandum addressing the effects of the Bill on Equal Opportunities and notes its contents. The Committee ensured that it included within its call for views a question inviting comments on equalities issues arising from the Bill. The Committee also targeted its call for views at specific organisations with an interest in equalities issues such as the Equality and Human Rights Commission. No concerns with regard to equalities were raised with the Committee. The Committee notes that whilst the specific provisions in the Bill may not have immediate equalities implications, the future implementation of specific measures to help meet the targets for emissions reductions could potentially raise a number of equalities issues which the Scottish Government must consider. The Committee discusses later in this report the importance of engaging with members of the public and with all sections of the community when the Scottish Government is taking forward policy measures.
necessary to reduce emissions. It would, however, emphasise the importance of ensuring that equalities issues are fully integrated into the development phase of such policies.

Consultation

24. The Policy Memorandum outlines the consultation which took place on the provisions in the Bill. This process included a public consultation which principally covered Parts 1 to 4 of the Bill, which took place between 29 January and 23 April 2008 and which generated a total of 21,046 responses.

26. There appeared to be a general satisfaction among witnesses with the way this consultation had been carried out. Professor Peter Smith of the University of Aberdeen commented—

‘The Government has taken the necessary advice and has contacted the main players. As far as I am aware, no one in the scientific community has felt excluded from that process.’

27. Mike Thornton of the Energy Saving Trust called the consultation ‘helpful and informative’ and Richard Dixon of WWF Scotland and Stop Climate Chaos Scotland told the Committee that ‘our reading of the process is that, as a standard consultation, it was fairly well done’. Other largely positive comments were received from organisations including COSLA, the Confederation of Passenger Transport UK, Scottish Natural Heritage, SEPA and Scottish Water.

28. There was, however, significant dissatisfaction with the way that consultation on key provisions in Part 5 of the Bill was conducted. The Committee notes, for example, the comments of the Rural Affairs and Environment Committee in relation to the forestry positions on the Bill. The RAE Committee reported that—

---

‘Introducing a Bill in advance of the conclusion of consultations on its contents is not appropriate. Parliamentary committees should be afforded the right to undertake scrutiny of legislation with all of the relevant information at their disposal.’

29. The Committee will address these concerns in more detail later in this report.

THE 2050 TARGET

30. This report will first consider the appropriateness of the 2050 target. The Policy Memorandum accompanying the Bill explains the basis for the reduction target of at least 80%, indicating that—

‘This is commensurate with the Scottish Ministers’ desire to achieve close to the top end of the 50 to 85% reduction in greenhouse gas emissions as Scotland’s share of the reductions that the IPCC states in its Fourth Assessment Report is necessary, globally, by 2050 to limit average temperature rises to 2.0-2.4°C.’

31. A number of witnesses felt that the target of an 80% reduction in emissions was appropriate because it appeared to be based on current scientific advice. Matthew Farrow of the CBI indicated that—

‘The CBI's view was that we should consider what the Committee on Climate Change said: if its analysis of the science suggested a target of 70, 80 or 90 per cent, that would be what the target should be. From that point of view, the 80 per cent target for the Scottish bill mirrors the UK target, which seems appropriate.’

32. Chas Booth of the Association for the Conservation of Energy told the Committee that—

‘We think that a target of at least 80 per cent by 2050 is right for Scotland. That is in line with what the Intergovernmental Panel on Climate Change recommends.’

33. A number of witnesses commented that the 2050 target appeared to be ambitious. Professor Peter Smith of the University of Aberdeen told the Committee—

‘There are no more ambitious targets anywhere else in the world, although some other countries are also aiming for an 80 per cent reduction in
emissions by 2050. The targets are brave, bold and world leading in that respect.'

34. Jeff Gazzard of GreenSkies commented that ‘the bill is innovative and ambitious.’ Councillor Alison Hay, representing COSLA, expressed the view that the 2050 target in the Bill was ‘ambitious enough’ and commented ‘if we take into account what the United Kingdom Committee on Climate Change has suggested, 80 per cent is quite a tight target.’

35. Duncan McLaren of Friends of the Earth Scotland and Stop Climate Chaos Scotland felt, however, that Scotland may need to meet the 80% emissions reduction target in advance of 2050—

‘We have called for a reduction of at least 80 per cent. My reading of the climate science as it is moving—in particular, the advice that concentrations will need to be lower—suggests that 80 per cent will be only a staging point in a longer-term transition. The target might need to be achieved earlier than 2050.’

36. The City of Edinburgh Council expressed the view in written evidence that a target of 90% might be more appropriate. The Royal Society of Chemistry argued that some flexibility should be built into the legislation to allow the level of the 2050 to be amended if required, stating in written evidence—

“If an authoritative body, such as the Committee on Climate Change, concludes that there is a need for the GHG [greenhouse gas] emission reduction target of 80% to be amended then this should be possible within this proposed system.”

37. The Committee questioned witnesses on whether the 2050 reduction target was achievable, given the many challenges associated with securing such a large cut in emissions. John Stocks of the Carbon Trust responded—

‘I could not be certain yet. I am not sure that I can stack up the sums to say, "Yes—I can see an 80 per cent reduction being achievable." However, I see some very significant measures that together can start to produce very deep reductions.’

38. Stephen Boyd of the STUC told the Committee that he considered the targets to be ‘challenging, but achievable.’ This was also the general view of Professor

Colin Galbraith representing Scottish Natural Heritage. Mark Williams of Scottish Water commented—

‘Scottish Water believes that the targets are achievable, but we need a lot more clarity about the road map for achieving our aims. We need to understand exactly where we can most effectively spend our money in order to achieve the desired outcomes. However, that clarity is not there yet.’

39. The Committee firstly affirms its support for the proposal that six key greenhouse gases, and not just carbon dioxide, should be included within the scope of the emissions reductions targets in the Bill, and recognises that in time other gases may come to be of sufficient concern to be included in the targets. The Committee agrees with the general balance of opinion that the 80% emissions reduction target for 2050 is the minimum which is necessary. The Committee also notes the arguments in favour of Scotland and the UK adopting the same 2050 target, particularly one that is based on the scientific advice of the UK Committee on Climate Change. The Committee believes that it will be important that Scotland makes a substantial contribution to the meeting of the UK 80% target. Some witnesses suggested in fact that Scotland might be able to contribute a greater share due to its substantial natural resources and other geographic and economic factors.

40. The Committee agrees with the comments of Mark Williams from Scottish Water which highlight an important point in relation to the delivery of policies to address climate change. Although this Bill establishes a framework for the targets, the Committee believes that it is essential that effective policies are developed and implemented by government in order to meet the targets, and that these policies are supported by an appropriate level of investment. This is a major theme of this report and is something the Committee will return to later.

TARGETS – METHODOLOGY

41. It is essential that the targets in the Bill are constructed in such a way that they will be a useful and accurate tool for measuring whether Scotland has reduced its greenhouse gas emissions. In this section of the report the Committee will discuss the methodology used for the emissions reductions targets contained in the Bill. The Committee will then go on to discuss the specific targets in the Bill themselves.

Measurement of emissions

Time delay in obtaining emissions data

42. The Committee believes it is essential that reliable data is available on which to base the setting of emissions reductions targets, otherwise the main purpose of the Bill could be compromised. The Committee heard in evidence that there is currently up to a 20 month delay in emissions being emitted and then being reported in the Scottish greenhouse gas inventory.

---

43. Dr Andy Kerr of the University of Edinburgh highlighted the potential significance of this delay—

‘If Scotland does not achieve its 3 per cent cut by 2021, we will find that out only in 2023. By the time that we have done anything about that, it will be 2025 so, yes, you bet it makes a difference. Such delays create all sorts of problems with the whole principle of having annual targets as opposed to carbon budgets.’\(^{22}\)

44. Professor Peter Smith of the University of Aberdeen explained to the Committee the scientific reasons for the delay in obtaining accurate figures,\(^{23}\) and cautioned that although the delay could potentially be reduced from 20 months, a reduction to 12 months would be the maximum that could be achieved even if there was an instantaneous evaluation.\(^{24}\)

45. In a contribution during the Committee’s climate change event on 27 March 2009, Paul McAleavey of the European Environment Agency raised the possibility that data from the EU emission trading scheme could deliver faster, though less reliable, information—

‘A faster mechanism is available through the market. The emission trading scheme that has been established sends much quicker signals on emissions and the carbon price. We report on official data 18 months behind, but the market and some of the market institutions that deal with carbon trading make estimates that are, I would say, slightly less reliable but based on more recent market data. There might be scope for considering the way in which those two processes operate together.’\(^{25}\)

46. In giving evidence to the Committee, John Stocks of the Carbon Trust raised a further concern about procedures for gathering emissions data, commenting—

‘I see little detail of the reporting and data-gathering mechanisms and calculation methods that will be used. I am uncomfortable about saying that we know that they are sufficiently robust. I am particularly concerned about data gathering, an issue with which our clients routinely have difficulties.’\(^{26}\)

47. On the other hand, Ken Gibb of the Sustainable Scotland Network suggested that local authorities currently possess—

---

‘A fairly well-established system for and track record of recording, monitoring and, if necessary, reporting on our own emissions, so I am content that that aspect will not cause us any difficulties.’

48. The Committee understands that this is true with regard to electricity and gas consumption within council buildings. However work on reporting emissions from transport and waste management is at a much earlier stage of development amongst most Scottish local authorities. For example, Ken Gibb from the Sustainable Scotland Network told the Committee—

‘A number of authorities are struggling to get to grips with local authority transport fleet management and business mileage. We have recognised for some time that we need to get involved with that agenda.’

49. The Committee notes the evidence from Dr Chris Spray of SEPA who indicated that SEPA had expertise in this area—

‘We are keen to develop ideas on the science, the data from monitoring, regulatory aspects in which we can help, advice to business and communication.’

50. Another witness from SEPA, Dave Gorman, elaborated further, commenting—

‘Trying to understand the assumptions that should be made in complicated processes such as those at Grangemouth is meat and drink for certain of my expert colleagues, whose aim is to piece together the actual picture. We have expertise both in that work and in gathering and publishing data. We hinted in our evidence that SEPA might be one candidate for taking on more of that activity because we understand it.’

51. In evidence to the Committee, the Minister for Transport, Infrastructure and Climate Change explained—

‘There has not yet been any substantial progress in accelerating the timescale for annual reporting...It would certainly be possible for us to get information earlier, but it is more likely that that information would be subject to revision. We have to make a judgment about getting the balance right; it is not an absolute science. We are considering how we can accelerate the process, which at the moment takes about 18 to 20 months.’

---

52. The Committee is concerned that if data on emissions is almost two years old it could significantly compromise the framework by which the Scottish Government reports to the Parliament on its progress in meeting the annual targets. Potentially, by the time it is apparent that action is needed to address a missed target, the situation may have deteriorated even further. This could make the task of getting the trajectory of emissions reductions back on track even more difficult. The issue of obtaining accurate information is therefore of central importance to the success of the Bill. The Committee notes the written evidence of the Royal Society of Edinburgh which states that ‘unless this can be improved, annual setting of targets will be flawed and the assessment of the trajectory of change will be uncertain’.32

53. The Committee recommends that the Scottish Government increases its efforts to identify the means by which the 18 to 20 month reporting time can be reduced and keeps this Committee up to date with its progress in meeting this objective. The Committee notes the potential expertise offered by SEPA in the field of emissions monitoring and recommends that the Scottish Government considers how this could best be employed to support the Bill framework.

54. The Committee notes that it may be possible to obtain estimated emissions data quicker than the current 18 month timescale for the availability of final figures. The Committee therefore recommends that the Scottish Government investigates whether this preliminary data could be useful in informing Scottish Government policy on climate change in advance of the availability of the official figures. The Committee further recommends that the Scottish Government clarifies what emissions data it intends to place in the public domain in order to allow the Parliament and other interested parties to scrutinise its performance in meeting its targets.

55. The Committee believes that the Scottish Government should lead by example in conducting a prior assessment of the carbon impacts of its policies and programmes, an area of work which has most unfortunately been subject to delay. The most recent Scottish Government budget was not, for example, subject to any systematic evaluation as to its carbon impacts. This has been an area of interest to the Committee and was the subject of a recent committee report to the Finance Committee.33

56. In its report to the Finance Committee, the Committee recommended that a robust, credible and transparent system of carbon accountability is in place at the latest in time for the Draft Budget 2010-11 and Spending Review 2010. The Committee noted in its report that there will never be a single, perfect carbon assessment tool that will prescribe policy, but that there is a pressing need to adopt an evolutionary approach to developing a tool that is fully integrated with

31 The Royal Society of Edinburgh. Written submission to the Transport, Infrastructure and Climate Change Committee.

policy making. Incremental progress is needed in adopting carbon assessment so that all the main actors become familiar with assessing the carbon implications of policies and programmes as quickly as possible. The Committee also noted in its report that there may be merit in the Finance Committee considering how carbon assessment could form a statutory part of the Parliament’s consideration of other major expenditure projects.

57. The Committee recommended in its report to the Finance Committee that the Scottish Government provides the Committee with regular written updates on the progress of the development of its carbon assessment tool. The Committee welcomes the recent offer made by the Cabinet Secretary for Finance and Sustainable Growth to provide a briefing to the Committee on progress made so far on the development of the tool. This is an issue that the Committee will wish to return to during its scrutiny of future Scottish Government budgets. Especially in view of the time delay in obtaining emissions data, it is vitally important that assessment of the carbon impact of policies and programmes is incorporated, particularly at the policy planning and resource allocation stages. In the context of this Bill and its objectives, the Committee believes that the importance of developing a robust and effective carbon assessment mechanism to assist in policy development and implementation is absolutely crucial. We will return to this point later in the report.

Production versus consumption targets

58. The Committee notes that there has been some debate over whether targets should focus on those emissions produced in the geographical area of Scotland (‘production targets’), or whether all emissions associated with activity in Scotland should be included (‘consumption targets’). The targets in the Bill are production targets.

59. Phil Matthews of the Sustainable Development Commission Scotland voiced support for the approach taken in the Bill of using source-based emissions, but indicated that it would be useful to have an insight into Scotland’s wider carbon footprint.34 Professor Andy Kerr of the University of Edinburgh told the Committee ‘it would be great if such reporting could be done, but it will take a while before the standards of reporting around the world are appropriate.’35

60. Richard Dixon of WWF Scotland and Stop Climate Chaos Scotland told the Committee that he would like the Bill to contain provisions on parallel reporting of the impact of consumption. He explained his proposed approach further—

‘The reporting of consumption would not have a target, unlike the reporting of production, but every year the minister would tell you not only how many

---

emissions Scotland had produced directly a year or two ago but how many Scotland had been responsible for around the world.  

61. A representative of the Energy Saving Trust, Mike Thornton, also supported the idea of parallel reporting on consumption-based emissions, telling the Committee that—

‘The Welsh Assembly Government is proposing to report separately on Wales’s total consumption emissions. We float the idea that doing the same here might add to the picture that the Scottish Government gets of Scotland’s overall carbon footprint.’

62. The Minister for Transport, Infrastructure and Climate Change voiced concerns at the potential confusion which might arise from adopting a consumption-based approach, telling the Committee that ‘focusing on two measures simultaneously can lead to a real danger: confusing and conflicting messages can result.’ He went on to say that—

‘Figures on our consumption will deviate from figures on our net emissions. What we propose to do conforms to international practice, in particular to the United Nations Framework Convention on Climate Change. That is appropriate; that should be our focus. We have to focus on the things that we do in Scotland that are responsible for CO2 emissions.’

63. The Committee received a letter from the Scottish Government Bill Team on 13 February 2009 on the subject of Scotland’s ecological footprint. It stated that—

‘The Scottish Government is committed to measuring Scotland’s ecological footprint, with work currently underway investigating the development of Scottish economic-environmental accounts to improve the quality and transparency of footprint calculations. The output from this work will include a carbon footprint for Scotland which we expect to be available in 2010…

The Scottish Government is also considering the frequency for producing the ecological footprint indicator and, given the complexities of the indicator and the frequency of the data available to feed into the model, we anticipate recalculating Scotland’s ecological footprint every two or four years.

The frequency of reporting on the ecological and carbon footprint does not prevent the Scottish Government from reporting the latest position on the carbon footprint as part of the Scottish Ministers’ annual report on production-

---

based emissions performance required by the current Climate Change (Scotland) Bill provisions. 40

64. The Committee believes that the emissions reductions targets in the Bill should be based on those emissions generated in Scotland. The purpose of the Bill is to encourage Scotland to address its own domestic emissions and focus its policies on reducing emissions in Scotland. The Committee therefore believes that it is right that the targets in the Bill are production-based. However the Committee also considers that it is important that Scotland understands the volume of emissions it is responsible for around the world. The Committee recommends that a mechanism for reporting on consumption should be established which is in addition to, but separate from, the framework of targets set out in the Bill. One option is that this could form part of the reporting duties of Scottish Ministers set out in Part 3 of the Bill, to be developed as international agreements make consumption reporting easier to manage.

65. The Committee recommends that the arrangements for reporting on consumption should be flexible enough to take account of developing international understanding of the methodology for consumption reporting. In this context, the Committee is encouraged by the remarks of the Bill team that work is underway to assess Scotland’s ecological footprint and believes that this could form the basis of consumption reporting.

Reporting on cumulative emissions

66. The emissions reduction targets in the Bill are ‘point in time’ targets, which state that a particular percentage reduction in emissions has to take place by a certain date. An alternative approach would be to record the total cumulative amount of emissions in the atmosphere. This information is of significance because the level of cumulative emissions present in the atmosphere at any one time will impact directly on climate change. The level of cumulative emissions will either increase or decrease depending on the emissions reductions trajectory taken towards a final point in time target.

67. A number of witnesses indicated that it would be relatively straightforward to calculate Scotland’s level of cumulative emissions. 41 The Minister himself told the Committee that ‘reporting on what is happening will enable us to see how that is affecting cumulative emissions.’ 42

68. Duncan McLaren of Friends of the Earth Scotland and Stop Climate Chaos Scotland expressed the view that the setting of the point in time targets should take place in the context of the level of cumulative amount of emissions in the atmosphere—

‘Our suggestion is that, at a practical level, the cumulative budget approach can reinforce an annual-targets approach. A minimum target of at least 3 per cent a year would be set, targets would continue to be set in batches, and the advice from the advisory body and the duties placed on ministers in formulating the targets would have regard to the cumulative budget.’

69. The Minister told the Committee that ‘our focus is implicitly on cumulative emissions. I say that because we will set annual budgets, which will enable us to see what will be in the bank from Scotland’s carbon reductions’. He went on to say—

‘If people thought that we could be helpful by adding up all the numbers across the reports, and if people felt that such a total would better inform parliamentarians and wider Scotland, it would not be difficult for us to include it in our reporting. We would certainly be open to doing that.’

70. The Committee notes the significance of cumulative emissions in the atmosphere as a cause of climate change. The Committee also notes that the best way of reducing cumulative emissions is to take strong early action in order to cut emissions. The Committee discusses this key objective in more detail later in this report.

71. In relation to the framework for the Bill, the Committee notes, however, that a point in time target is likely to focus policy direction and efforts to reduce emissions in a way that targets based on cumulative emissions targets might not. The Committee therefore believes that the point in time approach in the Bill is the correct one in relation to the setting of targets in the Bill.

72. However, the Committee notes that data on cumulative emissions could readily be calculated and included within the Scottish Government’s annual reports to the Parliament on emissions. The Committee is attracted to a suggested approach in which data on cumulative emissions should form part of the reporting regime associated with the Bill, but be treated separately from the monitoring of progress on meeting the annual targets. The Committee recommends that the Scottish Government responds to this suggestion ahead of the start of Stage 2 of the Bill.

Flexibility of annual targets

Annual targets in Scottish Bill versus multi-year emissions budgets in UK Act
73. The Bill requires annual emissions reductions targets to be set for each calendar year from 2010 to 2050. These annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive. Subsequent batches will include five annual targets: 2023 to 2027, 2028 to 2032 and so on.

This approach differs from the approach in the UK Climate Change Act 2008 which introduced a system of carbon budgeting which constrains the total amount of emissions in a given time period. The carbon budget periods set out in the UK Act will last five years, beginning with the period 2008-2012, and must be set three periods ahead. In this context, carbon budgeting refers to the ‘budget’ for emissions over a certain number of years (ie the amount of emissions permitted within that period) rather than the financial process of allocating expenditure in the government’s budget to policy measures designed to reduce emissions.

The Royal Society of Edinburgh said in written evidence that—

‘There is much to be said for smoothing the assessment of emissions trends by making running mean estimates of emissions rather than using the last year’s data as the gauge of progress. Our principal concern should be to see trends rather than be over-influenced by strong annual fluctuations. A 3-year running mean might be most appropriate, which also argues for the timely release of emissions data’

David Kennedy, chief executive of the UK Committee on Climate Change, set out the arguments which were made at a UK level in favour of multi-year emissions budgets in the UK Act as opposed to a framework based on annual targets—

‘[The UK Act] does not include annual targets because they might not provide adequate flexibility, given the year-on-year changes in emissions because of the weather, for example—emissions rise in a cold winter because people use more heating and we must burn more coal in our power stations. Such factors can mean that reductions go off track from year to year, although they are not off track in the five-year context.’

The Committee received evidence from bodies such as Stop Climate Chaos Scotland arguing in favour of the provision in the Bill for annual targets, although Stop Climate Chaos Scotland argued in favour of 3% annual emissions reductions from 2010. This issue is discussed later in the report.

Some witnesses raised concerns about the lack of flexibility in the use of annual targets. Anil Gupta of COSLA, for example, explained—

‘Councils are concerned that unforeseen factors might result in our not being able to achieve reductions. For example, climate issues, such as a particularly cold winter, might cause problems. That is a reason for proposing a five-year rolling target. Councils would report every year, but the longer timeframe would enable the inevitable ups and downs to be averaged out.’

Matthew Farrow of the CBI argued that—

---

46 The Royal Society of Edinburgh. Written submission to the Transport, Infrastructure and Climate Change Committee.
‘I am not a big fan of annual targets because it is difficult to guarantee year-on-year falls. The yearly figure can bounce around and particular factors can affect it...The short-term trend is what matters—I think we all agree that we need early cuts...Our view is that the UK 2008 act takes a good approach.’

80. These concerns were, however, not shared by Jason Ormiston from Scottish Renewables who argued that ‘it would be a big mistake to use weather patterns as a justification for missing a target’. Chas Booth of the Association for the Conservation of Energy also told the Committee—

‘...We do not believe that that argument holds water because the variability that a cold winter would bring would not be sufficient to knock us out of the 3 per cent threshold. If the Government misses its 3 per cent target, it has to come back to Parliament and explain how that happened and how it will ensure that it gets back on track.’

81. The Scottish Government’s position on this issue was set out in the Policy Memorandum accompanying the Bill—

‘Multi-year emissions budgets would provide flexibility within the long-term emissions reduction trajectory. However, annual targets provide greater certainty as to the magnitude of emissions reductions that need to be made at any given time. A large number of the responses to the Bill consultation expressed a preference for annual targets.’

Banking and borrowing

82. Some witnesses suggested that the concept of banking and borrowing from previous or upcoming carbon budgets (or, in the case of the Scottish Bill, batches of annual targets, or year on year annual targets) might provide some flexibility in relation to the meeting of targets. The Committee notes that this concept of banking and borrowing is, however, absent from the Bill.

83. The Policy Memorandum explains the Scottish Government’s alternative position to banking and borrowing—

‘Where the net Scottish emissions account exceeds an emissions target, the Scottish Ministers are...required lay a report setting out the proposals and policies by which they intend to compensate for the excess emissions.’

84. This position was supported by Duncan McLaren of Friends of the Earth Scotland and Stop Climate Chaos Scotland who argued—

[References provided at the end of the text]
‘Banking and borrowing are not necessary. We support the proposal that the Scottish ministers should produce a remedial action plan and that, in the event of failure, the plan should involve new and additional measures.’\(^{54}\)

85. On the other hand, David Kennedy, chief executive of the UK Committee on Climate Change, suggested that banking and borrowing might bring useful flexibility to the Scottish framework—

‘Is it appropriate not to have banking and borrowing in Scotland? If Scotland has year-on-year targets, some flexibility is probably wanted to allow for such events. The committee might want seriously to consider allowing a little borrowing from future years.’\(^{55}\)

86. The Minister explained his views on banking and borrowing in evidence to the Committee—

‘Banking and borrowing is simply about the budgets; it is not necessarily about the action that is required to address the problem. Ministers would have an overdraft, in carbon terms, and it is not terribly easy to deal with that when you are working on an annual reporting cycle. Our approach is intended to be quite a challenging one for ministers and their teams to deal with, as it forces an immediate response.’\(^{56}\)

87. It is clear to the Committee that the UK and Scottish Governments have decided to take different approaches in relation to the flexibility built into their respective targets framework. The Committee notes that the Bill’s use of annual targets for emissions reductions rather than the multi-year emissions budgets proposed in the UK Act, and the absence of banking and borrowing arrangements, means that the regime adopted in Scotland will be more rigid that that in place elsewhere in the UK.

88. Whilst many witnesses have welcomed the Scottish Government’s adoption of this challenging approach in the Bill, others – including the chief executive of the UK Committee on Climate Change – have raised questions as to whether the proposals in the Bill allowed for sufficient flexibility. The Committee is satisfied with the approach in the Bill but recommends that the Scottish Government keeps its system of operation of annual targets under review.

**International credits**

89. The Bill as introduced allows for international credits gained from emissions trading to be counted towards Scottish targets, with no limits prescribed on this practice.

---

90. This is a different approach from that taken in the UK Climate Change Act 2008 where the legislation places a duty on the Secretary of State to set a limit on the 'net amount of carbon units' that can be credited to the net UK carbon account in each budgetary period. The UK Act also provides for the Secretary of State to take into account the advice of UK Committee on Climate Change before setting the limit.

91. Dr Andy Kerr from the University of Edinburgh commented—

‘If the committee wants to create a trajectory that guarantees that emissions from Scotland through to 2050 are below the curve and that cumulative emissions are at a set amount, it must impose limits.’\(^{57}\)

92. Dr Kerr suggested, however, that setting a limit on the face of the Bill might be counterproductive—

‘I have no doubt that once a figure is put in statute it will be used. There might be an argument for leaving things slightly more ambiguous, while ensuring that there will be a credibility gap for the Government if it has to buy credits. That might be a more powerful tool.’\(^{58}\)

93. Duncan McLaren of Friends of the Earth Scotland set out the views of Stop Climate Chaos Scotland on this issue—

‘Stop Climate Chaos Scotland would like a fairly tough limit to be placed on the amount of credits that can be purchased from international sources. By placing no limits, the account sets no standards for what sort of credits can be used. That is of grave concern.’\(^{59}\)

94. He went on to argue that an advantage of having a set limit is that it would ensure that investment would be encouraged in those technologies and sectors that could help make emissions reductions domestically, which would mean that Scotland could be one of the countries that could sell those technologies and that expertise, rather than one that subsequently had to import them.\(^{60}\)

95. Gavin McLellan of Christian Aid Scotland highlighted this issue as being of central importance if the Bill is to succeed. He suggested a 20% cap on emissions trading and commented—

‘We could make the bill a world leader in many respects. At present, it is potentially world leading: it is important that we make it so and that we give

international leadership by ensuring that we achieve 80 per cent of our reductions through domestic effort.\textsuperscript{61}

96. Brendan Dick of the Climate Change Business Delivery Group appeared to agree broadly with this line of argument, stating—

‘Although using credits might be in the mix on the journey, at the key staging points of 2030 and 2050, the ambition for the country ought to be genuinely to hit the 80 per cent target, not to hit 70 per cent and have bought 10 per cent. That is important, but it is going to be pretty challenging.’\textsuperscript{62}

97. In written evidence, the Scottish Association for Public Transport argued that without a limit on carbon credits ‘there is a risk that political factors and low prices for carbon will dilute the incentives for the steeper cuts in greenhouse gas emissions required in all countries’.\textsuperscript{63}

98. In relation to a potential approach to limiting international credits, Professor Peter Smith of the University of Aberdeen suggested a possible arrangement ‘to make the cap more stringent as time goes on—as will happen with the annual targets.’\textsuperscript{64}

99. In evidence to the Committee, the Minister confirmed that—

‘We cannot, as a matter of principle, discount the use of credits as part of the process of ensuring that we make our overall contribution. However...we must make actual reductions in greenhouse gas emissions if we are to play our proper part in achieving the 2050 target for the containment of the increase in the world’s temperature.’\textsuperscript{65}

100. The Committee notes the clear evidence which emerged during the course of its Stage 1 scrutiny in favour of setting a limit on the use of international credits on the face of the Bill. The Committee therefore welcomes an indication that the Scottish Government is planning to revisit this issue. A letter dated 18 March 2009 from the Minister states—

‘As it has always been Scottish Ministers’ intention to prioritise domestic emissions reductions, options are being considered for limiting the amount of carbon units which may be used to credit the net Scottish emissions account for any given period including when such limits may be introduced. This would restrict the amount of emissions which Scottish Ministers may offset, thereby placing greater emphasis in achieving emissions reductions within Scotland.’

\textsuperscript{63} Scottish Association for Public Transport. Written submission to the Transport, Infrastructure and Climate Change Committee.

Scottish Ministers are aware that this is a complex area, and that any limit on carbon unit use must be drafted in such a way that it does not interfere with the operation of trading schemes such as the EU Emissions Trading Scheme.\(^{66}\)

101. After considering the evidence it has received on this matter, the Committee is concerned that if the Bill does not provide for a limit to be placed on the level of international credits or specify a minimum proportion of emissions reductions to be achieved by domestic effort, the credibility of the Scottish Government’s performance in reducing emissions could potentially be diminished. Given also concerns about the robustness of methodologies that might be used in other jurisdictions to measure carbon saving, the Committee recommends that appropriate provisions are included on the face of the Bill to require a limit to be set by Ministers subject to the approval of Parliament.

102. The Committee notes the model which is applied in the UK Act which places a duty on the Secretary of State to prescribe a limit taking into account advice from the UK Committee on Climate Change. It envisages an approach being taken in Scotland which is broadly in line with the UK Act. The Committee welcomes the Scottish Government’s commitment to examine this issue further and looks forward to seeing developed proposals being brought forward at Stage 2 of the Bill scrutiny process.

### Sectoral targets

103. The Committee took evidence on whether there would be merit in the framework set out in the Bill setting specific targets for emissions reductions for different sectors of the economy.

104. Professor Peter Smith of the University of Aberdeen argued against this idea—

'It is useful to maintain the flexibility of not having sectoral targets at the outset because that allows the Government to choose the policy instruments that it feels are appropriate for each sector's prevailing economic situation.'\(^{67}\)

105. On the other hand, Duncan McLaren of Friends of the Earth Scotland and Stop Climate Chaos Scotland felt that a sectoral approach did have some merit—

'We are not arguing that there should be highly detailed, specified sector targets—that is not the general position of SCCS—but no one at this end of the table would disagree that all sectors must play their role and that the bill must include measures, targets, duties or other enabled powers to ensure

\(^{66}\) Scottish Government. Letter from the Minister for Transport, Infrastructure and Climate Change to the Convener of the Transport, Infrastructure and Climate Change Committee dated 18 March 2009.

that that happens. The bill includes such powers for the waste and energy efficiency sectors but not for the transport sector.  

106. The Royal Society of Edinburgh suggested that sectoral action plans should be considered and gave an illustration of what could be achieved in the area of energy efficiency stating—

‘It is important...that a suitable array of Action Plans is developed by the Scottish Government on a sector-by-sector basis for strategy implementation and that this is done in an integrated fashion to ensure convergence of purpose....

...There are early gains to be made in reducing emissions and it would be sensible and natural to pick off the “low hanging fruit” first. There should be increased focus on those immediate and cost-effective ways of reducing emissions, such as energy efficiency. Major energy efficiency measures for buildings must be the major priority if we are to maximise our chances of reducing carbon emissions rapidly.’

107. The Minister commented on this issue—

‘The setting of sectoral targets will become more possible over time....There is not information that would support the development of sectoral targets. The important point is that no one should think that they have been let off the hook and that they need not do everything they can just because another sector must make huge reductions.’

108. The Committee notes that the framework in the Bill does not provide for targets to be set for the expected contribution of each sector of the economy in meeting the emissions reductions targets. The Committee notes the view that if individual targets were rigidly defined in the Bill for every sector there would be methodological problems in capturing the contribution of each sector and a risk that the Bill might be unnecessarily rigid. However, the Committee believes that more must be done to drive forward emissions reductions in four key sectors: land use, energy generation, energy efficiency and transport. The Committee therefore recommends that the Scottish Government should be required, in setting out its approach to the meeting of the targets, to define and quantify how each of these four sectors is expected to contribute to overall emissions reductions. The Committee discusses this process in more detail later in this report.

---

69 The Royal Society of Edinburgh. Written submission to the Transport, Infrastructure and Climate Change Committee.
Aviation and shipping

109. The stated policy intention of the Scottish Government is to include the Scottish share of emissions of greenhouse gases from international aviation and international shipping in overall emissions reduction targets.71

110. The Committee notes, however, that this is not explicitly provided for on the face of the Bill. Instead, the Bill states that Scottish Ministers may make provision, by order, for a proportion of emissions from international aviation and shipping to be attributed to Scotland. The Committee questioned the Scottish Government Bill Team on the reason for this approach. An official explained—

‘The reason why we are suggesting that we bring those areas into the targets through regulations is simply to provide us with a flexible mechanism to adapt to international agreement in the future. Scottish ministers are obviously keen for other countries to follow their lead and take on board the need to tackle emissions from international aviation and shipping. We need a mechanism that we can use in the short term until we have an internationally agreed protocol.’72

111. This reassurance was welcomed by Richard Dixon of WWF Scotland and Stop Climate Chaos Scotland, and the proposal attracted support from organisations such as COSLA and the Sustainable Scotland Network. Richard Dixon argued, however, that the provisions should be included on the face of the Bill rather than in a separate order.

112. In a letter to the Committee of 18 March 2009, the Minister indicated that he was aware that concerns had been expressed that section 14(1) of the Bill does not, as drafted, commit Scottish Ministers to include greenhouse gas emissions from international aviation and international shipping. The letter went on to state that—

‘Scottish Ministers will therefore seek to amend the Bill at Stage 2 to remove any ambiguity that an order will be brought forward in this regard; and introduce a deadline by which the Scottish Ministers must lay the first order under section 14(1).’

Implications of including aviation and shipping in scope of the Bill

113. In evidence to the Committee, Gordon Dewar of BAA Scotland commented that ‘we certainly understand and welcome the leadership and commitment that the Scottish Government has shown in pursuing this critical [climate change] agenda’.73 However, he also highlighted his concerns about limiting aviation emissions in Scotland—

‘The unintended consequences that we are concerned about would make Scotland uncompetitive. Any measures that try to limit aviation or, indeed, to impose costs on aviation are likely only to move emissions from Scotland to somewhere else rather than reduce them overall.’

114. Gordon Dewar of BAA Scotland expressed particular concern about the implications for the tourism industry, and suggested that there was a risk that tourists would travel elsewhere if either costs or barriers to travelling to Scotland became higher than other destinations.

115. He went on to suggest that one way of managing emissions from aviation would be through participation in the EU emission trading scheme. He told the Committee—

‘By 2012, we will be in the European emission trading scheme. That will allow us to recognise in an efficient way the fact that our emissions are growing. To allow that to happen, we must fund research and the buying of credits from other people. We will therefore give all the other industries incentives to invest in the new technology that will start to drive down emissions overall, which is the point of the scheme.’

116. Robert Ashdown, representing the Chamber of Shipping, commented that including shipping emissions within the scope of the Bill ‘is not a question of desirability but of practicality’. He went on to argue—

‘It would of course be good if the Climate Change (Scotland) Bill was entirely holistic and dealt with every aspect of every sector. The problem is how that could be done. How can Scottish shipping be defined, and how can Scotland’s contribution to global international shipping emissions be taken into account?’

117. Robert Ashdown also urged caution over the degree to which shipping emissions could realistically improve in the short term due to the timelag in new shipping technology being rolled out.

118. Some witnesses took issue with the idea that aviation and shipping might be allowed to make less substantial cuts in emissions than other sectors as a result of emissions trading arrangements. Paul Tetlaw of Transform Scotland argued—

‘I am afraid that if we listen to the special pleadings from certain sectors in transport and there is business as usual, all of our emissions and more will be taken up by transport alone. Therefore, emissions in every other area of

---

society will have to be sacrificed so that there can be business as usual in transport. That is clearly untenable.\textsuperscript{79}

119. An accusation of ‘special pleading’ was also levelled against the aviation and shipping sectors by Chas Booth from the Association for the Conservation of Energy.\textsuperscript{80}

120. The Minister acknowledged that ‘if aviation does not play its part, everyone else has to pick up the slack’.\textsuperscript{81}

**Methodology for accounting for aviation and shipping**

121. Some witnesses highlighted the potential methodological difficulties in accounting for Scotland’s share of aviation and shipping. Professor Peter Smith of the University of Aberdeen explained—

‘It is difficult to attribute emissions from those sectors to individual countries...That is simply to do with the fact that ships sail all round the world and can be owned in one country and registered in another. There are issues to do with bunker fuels in shipping. Aviation raises similar issues, although they are perhaps slightly less intractable.’\textsuperscript{82}

122. Several witnesses highlighted the need for any methodology which accounts for aviation emissions to take account of the multiplier effect for radiative forcing which means that emissions at higher altitude are more damaging to the atmosphere. This impact was described by Richard Dixon of WWF Scotland and Stop Climate Chaos Scotland when he told the Committee—

‘Although aviation is a reasonably small contributor to our emissions today—about 3.5 per cent of emissions from Scotland come from international aviation—we are underestimating it if we do not use a multiplier to reflect the extra impact of forming clouds and producing gases at high level.’\textsuperscript{83}

123. In relation to shipping, Professor Peter Smith cautioned that work on allocating emissions ‘should probably be done at international level—at UNFCCC [United Nations Framework on Climate Change] level. We cannot take action unilaterally.’\textsuperscript{84}

124. Robert Ashdown from the Chamber of Shipping told the Committee ‘we have several ways of measuring emissions from shipping but, unfortunately, they are all inaccurate.’

125. David Kennedy, the chief executive of the UK Committee on Climate Change, drew a distinction between the allocation of emissions from aviation and shipping. Although allocating emissions from aviation would be challenging, he indicated that ‘there are methodologies that we are comfortable with.’ In relation to shipping, however, he suggested that the task was more problematic—

‘We were not satisfied that we could get a handle on the UK share of international shipping emissions...Although we have methodologies to apportion emissions, we were not comfortable that they actually represent our share of shipping emissions. That led us to conclude that we cannot tackle shipping emissions at national level, and that the only way to tackle it is at global level, with global agreement.’

126. David Kennedy went on to explain—

‘With that in mind, we are watching what the International Maritime Organization proposes to the United Nations Framework Convention on Climate Change by way of a global agreement later this year. That will be the key as far as shipping is concerned. It is difficult, however, to arrive at a meaningful number for shipping at UK level.’

127. Gordon Wilmsmeier from Napier University, however, cautioned that even intervention by the International Maritime Organization (IMO) might not offer a solution—

‘It is important to bear in mind that the IMO regulation might solve certain problems that we have in Europe, but many countries have not signed the IMO agreement, so we might just be pushing problems towards other regions of the world, which is not a solution.’

128. Some witnesses responded to these concerns by arguing that it would be better to proceed with an imperfect system for allocating shipping emissions than to do nothing. Chas Booth from the Association for the Conservation of Energy commented that the ‘measurement process might not be perfect, but it is better to have an imperfect process than no process’

129. The Minister responded to the concerns regarding the allocation of emissions from shipping in evidence to the Committee—

---

‘...We need internationally to understand how we measure the emissions. We have numbers that help to inform us, but they are simply bunkering numbers. For exactly the reasons that I mentioned in relation to aviation, there are difficulties.

The European Union is pressing the International Maritime Organization to address emissions from shipping and to develop a mechanism by which we can get sensible estimates. Of all the transport areas, shipping is probably the one in which least progress has been made.’

130. The Scottish Government also indicated in a letter to the Committee of 18 March 2009 that it proposes to lodge an amendment at Stage 2 of the Bill ‘to require the power to make subsequent orders under section 14(1) to allow the methodology for Scotland to be changed in line with any future international agreements on the apportionment of emissions from international aviation and international shipping.’

Conclusion on aviation and shipping

131. The Committee welcomes the Minister’s commitment to strengthen the wording of the Bill in relation to aviation and shipping and looks forward to amendments being brought forward to that effect at Stage 2. The Committee notes the potential methodological problems which have been identified in accounting for Scotland’s share of aviation and shipping emissions. In relation to aviation, it appears to the Committee that these problems, whilst challenging, can be overcome.

132. The Committee therefore recommends, as a first step, that the Scottish Government considers how the multiplier effect for radiative forcing can be incorporated into the data on aviation emissions, so that additional damage to the atmosphere that occurs when emissions take place at high altitude is taken into account. The Committee suggests that the Scottish Government requests advice from the UK Committee on Climate Change on how best to measure and incorporate these effects.

133. In relation to shipping, it is clear from the evidence that different methodological problems exist in relation to including Scotland’s share of emissions from international shipping within overall emissions reduction targets. The Committee is aware that some data has been published by the UK Air Quality Archive which may provide a starting point for the necessary calculations to be made, but the Committee has not received any firm reassurances from the Minister as to when production of accurate and meaningful data would be possible.

134. The Committee therefore requests clarification on the approach which the Scottish Government intends to take in relation to shipping emissions in advance of bringing forward an order under section 14 of the Bill. The Committee is keen

---

that any methodological problems in relation to shipping emissions do not delay the introduction of the provisions.

135. **The Committee recommends that there should be separate provisions covering aviation and shipping emissions in the Bill.** The Scottish Government has indicated its intention that the Scottish share of both aviation and shipping emissions should be included in overall emissions targets. The Committee suggests, however, that the means of doing this may need to vary because of the different methodological challenges involved and the need for international agreements in relation to shipping.

**THE INTERIM TARGET AND TARGETS TO 2019**

**The need for early action**

136. The Committee notes the importance of taking early action to address climate change. The *Stern Review: The Economics of Climate Change* argued that the sooner action is taken to reduce greenhouse gas emissions, the more likely it will be that a more sustainable track towards reducing global emissions can be reached.

137. The shape of the emissions reduction curve is of crucial significance in determining whether the 2050 target can be met. The steepness of the decline in emissions will determine the cumulative amount of greenhouse gases in the atmosphere, which is directly related to predicted temperature increases. A slow decline, followed by a rush to meet the 2050 target, will have a more damaging climate change impact than a sharp initial fall in emissions. In a graph showing emissions reductions over time, cumulative emissions are in the so-called ‘area under the curve’. Richard Dixon of WWF Scotland and Stop Climate Chaos Scotland argued—

‘The area under the curve that describes Scotland’s emissions will tell us about the total contribution that Scotland is making to the climate change problem around the world. It is important to think about that total amount, which is why it is important to define the shape of that curve tightly…’

138. The Committee notes that early action to cut emissions will reduce the level of cumulative emissions in the atmosphere and allow Scotland to get on the right trajectory to meet the 2050 reduction target. Dr Alice Bows of the Tyndall Centre for Climate Change Research explained that—

‘The important thing is the emission pathway that you travel down to get to your aspiration in the future—the 2050 target. The target is likely to change depending on how much emissions increase in the short term. If they increase more now than you think they will, the 2050 target has to drop.’

---

139. The Committee discusses the importance of putting policies in place to achieve early action to cut emissions later in this report.

**Approach in the Climate Change (Scotland) Bill (as introduced)**

140. One of the main provisions in the Bill to encourage early action on emissions reduction is the 2030 interim target. The Policy Memorandum accompanying the Bill states—

‘The Bill creates an interim target which requires that the Scottish Ministers ensure that the net Scottish emissions account for the year 2030 is at least 50% lower than the baseline. The 2030 interim target is intended to act as a milestone on the path to 2050, strengthening the requirement for early emissions reductions to be delivered in the run up to 2050.’

141. The Policy Memorandum also states—

‘From the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Like the mid-point 2030 target, this is designed to ensure early action is taken to reduce Scottish emissions. Prior to 2020, the Scottish Ministers will be expected to set annual targets which build towards delivering emissions reductions of at least 3% each year.’

**Approach in the UK Climate Change Act 2008**

142. The approach in the Climate Change (Scotland) Bill differs from the approach in the UK Climate Change Act 2008. The UK Act provides for reductions in greenhouse gases through action in the UK and abroad of at least 80% by 2050. It contains an interim target of a reduction in the UK carbon budget of at least 26% by 2020. The Climate Change Act 2008 establishes the principle of carbon budgets which place legally binding ceilings on the level of allowed UK emissions over five year periods.

143. The 2020 interim target was subsequently reviewed by the UK Committee on Climate Change to reflect the inclusion in the Act of all greenhouse gases and the increase in the 2050 target to 80% during the passage of the legislation. The outcome of this review was the publication of advice from the UK Committee on Climate Change on the level of carbon budgets for 2008-2012, 2013-2017, and 2018-2022 for the UK.

144. In proposing the level of carbon budgets, the UK Committee on Climate Change produced two sets of budgets: the Intended Budget, which should apply following a global deal on climate change anticipated to be reached in Copenhagen later in 2009, and the Interim Budget, to apply before a global deal is reached.

145. The Intended Budgets require an emissions reduction of 42% in 2020 relative to 1990. The Interim Budgets require an emissions reduction of 34% in 2020

---

94 Climate Change (Scotland) Bill. Policy Memorandum, paragraph 29. Available at: [http://www.scottish.parliament.uk/s3/bills/17-ClimateChange/b17s3-introd-pm.pdf](http://www.scottish.parliament.uk/s3/bills/17-ClimateChange/b17s3-introd-pm.pdf)

95 Climate Change (Scotland) Bill. Policy Memorandum, paragraph 31. Available at: [http://www.scottish.parliament.uk/s3/bills/17-ClimateChange/b17s3-introd-pm.pdf](http://www.scottish.parliament.uk/s3/bills/17-ClimateChange/b17s3-introd-pm.pdf)
relative to 1990. Both sets of budgets apply to all greenhouse gases rather than just CO₂.

146. On 22 April 2009, the UK Government announced in the 2009 Budget that the UK’s first three carbon budgets will be set at levels leading to a 34% reduction in greenhouse gas emissions with respect to 1990 levels by 2020.

2030 interim target in the Climate Change (Scotland) Bill (as introduced)

147. The Committee notes that there are two key questions in relation to the interim target in the Climate Change (Scotland) Bill. First, is the 2030 interim target an appropriate staging post, or would a 2020 interim target (as applies in the UK) be more suitable? Second, if a 2020 target is adopted in Scotland, what level of emissions reductions should be required by that date?

148. A number of witnesses suggested that the interim target for Scotland should be moved to 2020 and the level of emissions reduction should be the same as (or even more challenging than) the upper limit proposed by the UK Committee on Climate Change for the UK (ie 42%).

149. The Royal Society of Edinburgh, in written evidence, told this Committee that—

‘The Bill implicitly assumes, as do many other approaches to this issue, that early emissions reductions will be small and later ones large. We believe that it would be more appropriate to reverse these relationships by targeting early, strong reductions that start as early as possible…..

…the first part, of slow change, represents the time taken for policy instruments to come on-stream. The second part, of the fastest rate of emissions reduction, as one where we pick the “low hanging fruit”, with the final stage being one of relatively slow rate of reduction.

The endpoint target of an 80% reduction by 2050 is an irrelevance unless there are appropriate intervening milestones. The key target must be to minimise the aggregate emissions between now and 2050; in other words, to minimise the area under the emissions curve.

We strongly advocate that an interim strategy target should be defined for 2020. It should be a challenging target that encourages early action, and one that, because of its imminence, perennially impinges on Government perspectives no matter which party is in power.’

150. Phil Matthews of the Sustainable Development Commission Scotland told the Committee—

‘The cut that the Committee on Climate Change recommended as a potential target by 2020, which could be a cut of up to 42 per cent from 1990 levels, is a more ambitious target than what we have in Scotland. Obviously, Scotland

96 The Royal Society of Edinburgh. Written submission to the Transport, Infrastructure and Climate Change Committee.
151. Richard Dixon of WWF Scotland and Stop Climate Chaos Scotland argued that—

‘…The UK Government expects Scotland to do more, the aspiration of ministers appeared to be for Scotland to do more and, because of our natural resources—we have lots of renewables—we have the ability to do more. That is why a 50 per cent reduction by 2020 looks like the target that we should set.’

152. Grant Hodges, representing the Climate Change Business Delivery Group, indicated he was ‘very much in favour of a 2020 target.’ Support for an earlier interim target was also given by the Association for the Conservation of Energy, and by the Sustainable Scotland Network, whose representative told the Committee that ‘the bill sets an interim target for 2030, but we should probably think about setting a target for 2020, in line with existing legislation and international obligations.’

153. The chief executive of the UK Committee on Climate Change, David Kennedy, offered his perspective on the ambition of the Scottish proposals—

‘We have thought a little about the interim target and have some questions about how ambitious that is. We are not saying that it is not ambitious enough, but there is more thinking to be done about it and its implications for what must be done now.’

154. Other witnesses cautioned that achieving major early reductions in emissions will be challenging, because of the time required to put in place the necessary social, economic, and infrastructure changes. Dr Andy Kerr of the University of Edinburgh explained that because of the momentum in economies—

‘Emissions reduction will almost always take the form of an S-shape; almost all economies will reduce slowly to begin with, sharpen up in the middle and slow down again when they have to deal with the really challenging stuff at the end.’

155. This view was confirmed by Professor Peter Smith of the University of Aberdeen, who highlighted the need to—

---

‘Strike the right balance between taking the quick and easy options that we can identify and implement relatively quickly and tackling the inertia that we encounter in the system as we try to change things. Some of the changes that are required involve large changes to infrastructure.’

**Conclusion on the date of the interim target**

156. The Committee endorses the view which emerged during its evidence taking that an earlier, more challenging interim target is required in the Bill in order to encourage more immediate reductions in emissions. The Committee questioned the Minister on this point. He told the Committee in its final evidence-taking session on the Bill that—

‘It now appears that 2020 would be a more appropriate date for an interim target, so on that we are very likely to amend the bill. The 2020 target that we are likely to end up with on the basis of scientific advice—we have not yet come up with an exact figure—is likely to be more challenging than the 2030 target that we put as a minimum in the bill.’

157. When questioned on whether Scotland could be in a position to match any potential UK reduction in greenhouse gases of 42% by 2020, the Minister told the Committee—

‘It is not yet clear from the scientific advice exactly what steps would need to be taken to deliver a reduction in emissions of 42 per cent by 2020...We await further advice on the subject. If it can be demonstrated based on scientific advice that such a figure is right for Scotland, we will take account of that, but we cannot discount the European trading schemes and the effects of those schemes that will be superimposed on the UK and Scotland.’

158. The Minister confirmed in a letter to the Committee on 18 March 2009 that he intends to bring forward amendments to the Bill at Stage 2 to replace the 2030 target with a 2020 target. This letter indicated that Ministers are currently considering the level at which the 2020 target should be set. This work will be informed by advice from the UK Committee on Climate Change, the approach of the UK Government, and current and future international agreements on emissions reductions and the prospect of the EU adopting a 30% emissions reduction target for 2020 in the event of an international agreement being reached at Copenhagen.

159. The Committee welcomes the indication by the Scottish Government that it will bring forward the date of the interim target from 2030 to 2020. In particular it

---

welcomes the early response by Ministers to the views expressed in evidence to the Committee, as well as to the decision of the UK Government to bring forward its interim target in the context of international discussions due to take place at Copenhagen later in 2009.

160. The Committee supports in principle the general consensus that new interim targets should be brought forward to 2020 and made more challenging than previously. It welcomes the Minister’s statement that this is the Scottish Government’s intention. However there are likely to be significant resource implications involved in bringing this target forward and the Committee will wish to be given very specific details by Ministers which show that the adjustment has been properly considered in policy terms and that the government will make resource provision for it.

161. The Committee notes the recommendations provided by the UK Committee on Climate Change which provide for either an interim 34% or an intended 42% reduction in emissions by 2020 at a UK level, depending on international agreements. The Committee believes that these figures may be taken as the starting point for the debate about a suitable interim target for Scotland. The Committee discusses this further in the next section of the report.

Targets in the period to 2019

162. The SNP manifesto commitment was ‘to introduce a Climate Change Bill with mandatory carbon reduction targets of 3% per annum and also set a long term target of cutting emissions by a minimum of 80% by 2050’. Had the 3% commitment been introduced as promised in the manifesto, it would in theory have led to a 45% reduction in emissions by 2020. The Scottish Government’s intention now is that the introduction of the 3% targets will be delayed until 2020. As currently drafted, the Bill provides for—

- The annual target for the year 2010 being an amount which is less than the estimated net Scottish emissions account for 2009
- The emissions reduction targets for each year in the period 2011-2019 being an amount which is less than the target amount for the previous year
- In the period 2020-2050, the annual percentage rate of reduction in greenhouse gas emissions being driven by targets which must be at least 3% lower than the target for the previous year.

163. The Scottish Government has been willing to set precise quantified targets for the period 2020-2050 but reluctant to quantify targets in the period 2010-2019. Scientific evidence is clear that early reductions have the greatest benefit in reducing climate change and it is considered that the Scottish Government must have much more information on which to base projections on the expected effectiveness of initiatives to tackle climate change in the next ten years than it has for the three decades thereafter.

164. The first question to consider is what annual emissions reductions will be required between 2010 and 2019 in order to hit the new 2020 target. The answer
to this question will obviously depend on the reduction figure chosen for the 2020 target.

165. The second question to consider is whether the specific emissions reductions targets required between 2010 and 2019 should be set out in more detail on the face of the Bill than is currently the case, perhaps in a manner similar to the targets for the period 2020 to 2050 or whether bringing forward the introduction of the 3% target from 2020 to the earliest achievable date would be the most appropriate way of making progress towards the interim 2020 target.

Views provided to the Committee

166. Chas Booth of the Association for the Conservation of Energy argued that statutory annual targets of at least 3% ‘should be delivered from the very start’.107 Glasgow City Council argued in written evidence that the Bill ‘must establish year-on-year reduction targets of at least 3% from the start’.108 Duncan McLaren of Friends of the Earth Scotland explained the position of Stop Climate Chaos Scotland on this issue—

‘We want the statute to establish that there should be emissions reductions of at least 3 per cent year on year from the beginning, not from 2020. We think that such reductions are necessary to meet the requirement for early action and that they are entirely possible.’109

167. Other organisations felt that it was important that Scotland should be ambitious between 2010 and 2020, but were less clear on whether statutory action was required. Phil Matthews of the Sustainable Development Commission Scotland argued—

‘I still think that we can do more between now and 2020 than just move on from the business-as-usual case that we have at present, with cuts in emissions of about 1.25 per cent per annum. I do not know how it could be included in the bill, but it would be good to move more quickly than the bill suggests towards annual cuts of 3 per cent by 2020.’110

168. John Stocks of the Carbon Trust told the Committee—

‘There will be a time lapse before we get onto a trajectory of 3 per cent annual reductions, but I doubt that it needs to take until 2020 for us to get there.’111

169. This view was supported in written evidence from Tearfund which suggested that statutory minimum reductions of 3% could be established after 2012. The

108 Glasgow City Council. Written Submission to the Transport, Infrastructure and Climate Change Committee.
Royal Society of Edinburgh suggested in evidence that 3% year-on-year emissions reductions could be introduced earlier, for example from 2011.

170. The chief executive of the UK Committee on Climate Change, David Kennedy, explained—

‘Up to 2020, Scotland will be looking for reductions of at least 2 per cent, moving towards 3 per cent, to be consistent with the UK as a whole.’\footnote{Scottish Parliament Transport, Infrastructure and Climate Change Committee. \textit{Official Report}, 27 January 2009, Col 1397.}

171. In evidence, the Minister told the Committee—

‘We will set our annual targets based on auditable scientific advice from the UK Committee on Climate Change, which will be based on information that is available to us all. Our targets will balance science and achievability: they must be credible and deliverable, and we want to make the fastest possible progress. Our drawing forward of the 2030 target to 2020, and the implication that that will be more challenging than the 2030 target that we are setting, is evidence that our approach to targets and use of annual targets will drive early change.’\footnote{Scottish Parliament Transport, Infrastructure and Climate Change Committee. \textit{Official Report}, 10 March 2009, Col 1658.}

**Additional information provided by the Scottish Government**

172. Throughout its scrutiny of the Bill, the Committee has been keen to understand the scientific basis behind the Scottish Government’s decision not to proceed with statutory 3% annual reductions in emissions from 2010 to 2019. In a letter dated 18 March 2009, the Scottish Government provided information on the potential implications of 3% annual reductions to 2019 being included on the face of the Bill. The Committee welcomes this additional information as a helpful insight into Scottish Government thinking, but notes that it would have been even more helpful if this had been made available at the start of the Stage 1 process. It is also clear that additional work is required to develop these figures further.

173. The letter sets out the action which might be required if Scotland wanted to mirror either the UK Committee on Climate Change’s 34% interim 2020 target or its 42% intended target. The letter notes that a trajectory based on a 3% annual reduction in Scotland’s emissions from 2010 equates, roughly, to a 43% reduction in 2020 against 1990 levels. The Committee notes that this would have the effect of marginally exceeding the UK Climate Change Committee’s intended ‘optimistic’ UK target. The letter makes the point, however, that—

‘Given that emission reductions from the traded sector are, in effect, pre-defined at the level of the Interim Target (34%), for Scotland to achieve 3% annual reductions between 2010 and 2019 would require the bulk of the savings to come from the non-traded sector, by which we mean very
significant carbon savings from energy use in heating buildings, from transport, waste, agriculture or forestry.\textsuperscript{114}

174. The letter suggests that ‘emissions in the non-traded sector would need to be reduced by 4-5% each year, with emissions in 2020 needing to be around 12 MtCO\textsubscript{2e} [metric tons carbon dioxide equivalent] lower than in 2009’.\textsuperscript{115} The letter indicates that ‘much more radical measures in the non-traded sector’ would be needed with the potential for significant upfront costs and the likelihood remaining of a significant shortfall remaining in order to meet the targets. The letter states in relation to the supply side—

‘In most, if not all, carbon savings measures, there is the need to increase the capacity of the supply chain to deliver. This cannot happen overnight and it would be unreasonable to expect it to. There is little point in having targets that we fail in year one. An acceleration of effort is required but we need time to ramp up our efforts.’\textsuperscript{115}

175. In relation to the way forward for the setting of targets in the period to 2019, the letter from the Scottish Government states—

‘The CCC [UK Committee on Climate Change] recommended that, if there is an international agreement at Copenhagen later this year, then the UK should move to the Intended Target of 42%. The Scottish Government will review its position in light of any new international circumstances and advice that it receives.’\textsuperscript{116}

176. It is not clear to the Committee when it is intended that the level of the Scottish 2020 interim target will be set. It appears possible that the figure may not emerge until the outcome of the United Nations Climate Change Conference in Copenhagen in December 2009. It remains to be seen, therefore, how this position will be reflected in the amendment to the Bill at Stage 2 which sets the date of 2020 for the interim target; an amendment which will be discussed by the Committee before the outcome of the summit is known.

177. The Committee notes, for example, that in relation to the UK Act, a relatively low figure of a 26% reduction in CO\textsubscript{2} was included on the face of the Bill, with the prospect of it being revised upwards at a later date depending on scientific advice. As has been discussed above, it now appears that this figure will be in the order of 34% to 42%, and cover all greenhouse gases. This is potentially 16% above the interim target set out on the face of the UK Bill.

\textsuperscript{114} Scottish Government. Letter from the Minister for Transport, Infrastructure and Climate Change to the Convener of the Transport, Infrastructure and Climate Change Committee dated 18 March 2009.
\textsuperscript{115} Scottish Government. Letter from the Minister for Transport, Infrastructure and Climate Change to the Convener of the Transport, Infrastructure and Climate Change Committee dated 18 March 2009.
\textsuperscript{116} Scottish Government. Letter from the Minister for Transport, Infrastructure and Climate Change to the Convener of the Transport, Infrastructure and Climate Change Committee dated 18 March 2009.
178. In relation to the way forward for the setting of targets in the period to 2020, the letter from the Scottish Government concludes—

‘The Bill requires that we set our annual targets following receipt of advice from the “relevant body” which in the first instance is to be the Committee on Climate Change. This advice will be in the context of the 2020 interim target to be inserted into the Bill. The CCC has already shown that it will not shirk from recommending demanding targets. Crucially, though, their advice will be based on expert and independent analysis of real emissions abatement potential, and that seems the sensible way to go forward.’\(^{117}\)

**Conclusion on the level of the interim target and annual targets to 2019**

179. The Committee has heard a great deal of expert evidence emphasising the importance of taking early actions in order to reduce the overall level of cumulative emissions in the atmosphere and to increase the chances that the 2050 target will be met. **It is clearly vital that early progress is made in order to secure significant emissions reduction.** The Committee has received many representations suggesting that annual emissions reductions of 3% should be a new statutory requirement between 2010 and 2019 in order to promote early action. The Committee notes the estimates provided by the Scottish Government, which suggest that a 3% annual reduction in emissions would roughly equate to a 43% reduction in emissions by 2020. The Committee also notes that the approach of the UK Committee on Climate Change is based on two targets, a lower target of 34% if international and EU agreements cannot be arrived at and a higher 42% UK target deemed feasible in the context of international co-operation.

180. The targets in the initial 10 years covered by the Scottish Bill will have to be flexible enough to take account of international developments, which – as is acknowledged by the UK Committee on Climate Change – may significantly impact on our ability to deliver emissions reductions. If the government is now willing to set a challenging interim target for 2020, it must buttress that approach either by specifying percentage annual targets between 2010 and 2020 or by bringing significantly forward the date by which it expects Scotland to be on track with a 3% annual reduction in emissions.

181. The Committee’s view is the interim target must be challenging but feasible and its delivery must be properly planned for with milestones set along the way. As noted above, the Bill as introduced provides only that emissions should fall each year between 2010 and 2019. **The Committee therefore recommends that the Scottish Government should introduce more challenging provisions into the Bill for the period 2010 to 2019 in order to promote early action to reduce emissions.** A framework of targets linked to the proposed 2020 interim target in one or other of the formats set out above should be developed and incorporated into the Bill.

182. **There are a number of important unanswered questions in relation to the Scottish Government’s approach to the setting of the level of the interim**

\(^{117}\) Scottish Government. Letter from the Minister for Transport, Infrastructure and Climate Change to the Convener of the Transport, Infrastructure and Climate Change Committee dated 18 March 2009.
target and early annual targets. The Committee has identified the following key issues on which there is currently a lack of clarity—

- The process the Scottish Government intends to use to set the 2020 interim target.

- The specific emissions reduction level that will be set for 2020.

- The dates by which this decision will be taken by the Scottish Government and communicated to this Committee. The Committee recommends that the Scottish Government announces its proposed 2020 interim target, in the form of a percentage emissions reduction, in its response to this Stage 1 Committee report on the Climate Change (Scotland) Bill.

- Whether the Scottish Government intends to specify a figure for the interim target on the face of the Bill (as with the current 50% reduction by 2030 target in the Scottish Bill) or whether a figure will be specified on the face of the Bill of “at least XX%” with a more challenging target to be decided later (as appeared to be the case in respect of the UK Act).

- The relationship between the interim target which will be set by the Scottish Government and the targets for the period to 2010 to 2019 (specifically, any reductions which will be required during this period). If the Scottish Government decides the level of the interim target during the passage of the Bill, the Committee will expect this to be accompanied by an indication of the trajectory of annual emissions reductions required between 2010 and 2019.

- The scientific and policy advice which the Scottish Government is basing all these decisions on, the extent to which it has calculated the financial implications of the decisions and a robust appraisal of any impact on jobs.

183. The Committee therefore recommends that the Scottish Government provides specific further information in response to each of these points as a matter of urgency in advance of Stage 2 proceedings. As discussed above, the Committee supports a strengthening of the provisions in the Bill in relation to the 2010 to 2019 targets, and anticipates that the details of how this could be achieved will be outlined by the Government before Stage 2. The Committee would expect that consideration of these issues will be informed by the provision of the additional information sought from the Scottish Government in the points discussed above.
ACHIEVING THE TARGETS

Need for action to accompany target-setting

184. The Committee notes that the mere act of setting targets for emissions cuts will not in itself deliver the necessary reductions. David Kennedy, chief executive of the UK Committee on Climate Change, made the point that—

‘We have a good track record at UK level of adopting ambitious targets, but a less good track record of meeting those targets. The challenge will be to set the targets, but the bigger challenge will be to come up with the strategies, and to implement them across all the sectors to achieve big social transformation, such as changes in the way that we think about business or corporate culture.’\(^{118}\)

185. David Kennedy stressed that action was needed now, arguing that—

‘The next five, 10 and 15 years are key. We must take our lead from what we have to do in the longer term—that has implications for what we do now—but we must act now. We must take opportunities and put in place the necessary policies. If we do not, we will miss the boat on reducing the risk of dangerous climate change.’\(^{119}\)

186. Dr Andy Kerr of the University of Edinburgh agreed, arguing that ‘one of the key issues is delivery rather than the use of science to set targets in the first place’.\(^{120}\) Dr Kerr emphasised—

‘…The fact that radical changes will be needed in the next few years in the production and use of energy and the use of land. Whatever the trajectory is over the next 10 years, the key is to put in place the processes and policies that will deliver the cuts of 3 per cent and more that are required thereafter.’\(^{121}\)

187. The Royal Society of Edinburgh, in written evidence, suggested that—

‘As the trends of climate change and its actual and imminent impacts become clearer, the imperative to move towards a low carbon economy is becoming stronger. It is recognised that those countries able to develop and implement low carbon technologies and limit the use of carbon-derived energy will be well positioned economically to exploit a developing global trend…

188. Some witnesses were cautiously optimistic that the necessary technologies and policy initiatives to reduce emissions were available, and it was now a case of harnessing them to deliver change. Duncan McLaren of Friends of the Earth Scotland and Stop Climate Chaos Scotland told the Committee that—

“We are already between 10 and 20 years into the flat bit at the top of the S shape. Industry has explored solutions and scientists have done the research, so the technologies and solutions that are necessary to move us on to the fast descent part of the curve are generally available or are very nearly available.”

189. Mike Thornton of the Energy Saving Trust agreed, telling the Committee—

“In respect of saving carbon and reaching the targets in the bill, we do not need magic bullets: we need to apply consistently techniques, approaches and technologies that are already here, over the period for which the bill sets targets. If we do that we can achieve them.”

190. The Committee notes that the targets in the Bill are simply a starting point for Scotland’s efforts to reduce emissions. The Committee also notes that setting emissions reduction targets is a comparatively straightforward task: the real challenge is to meet them. In many cases it will not be possible simply to legislate to make this happen. Yet this non-legislative action will determine whether or not the targets in the Bill can actually be met, and so it is of crucial significance.

191. The Committee considers that more progress could have been made on the development of strategies to mitigate climate change, which do not require legislative change. The Committee has heard little evidence that climate considerations are driving policy choices in areas such as energy efficiency and transport where much more could have been done without waiting for climate change legislation. The recent announcement on the timings of the Scottish Government’s energy efficiency plan mean that it may not be published until 2010 and the similar delay in the transport carbon balance sheet which it was promised would be published in 2008 are all worrying signs that tackling climate change has not been addressed with sufficient urgency by successive administrations.

Engagement with the public

192. The Committee notes that there are several key challenges which must be overcome if Scotland is to have a chance of meeting its climate change targets. These include winning the support of the public to make the required lifestyle adjustments and to endorse the climate change agenda. This is the process of

---

122 The Royal Society of Edinburgh. Written submission to the Transport, Infrastructure and Climate Change Committee.
‘winning hearts and minds’. Many witnesses suggested that although this was an important objective, it was not yet happening.\(^{125}\)

193. Dave Watson of UNISON and Stop Climate Chaos Scotland argued—

‘We have not yet got people to come on board; we have not yet achieved the public engagement that was achieved on the issues of drink driving and the smoking ban. The bill will be important in that regard, but only if it drills down that engagement to the local level.’\(^{126}\)

194. Mike Thornton of the Energy Saving Trust emphasised—

‘Engagement is key. Public awareness of climate change and the need to do something about it by cutting carbon emissions is high, but engagement as a result of that awareness is relatively low.’\(^{127}\)

195. Dave Watson of UNISON and Stop Climate Chaos Scotland explained that it was difficult to legislate to promote public engagement in the Bill, because engagement would only come about if the public was genuinely interested in the climate change agenda. He argued—

‘I am more in favour of energising local communities and essentially getting them to set the targets for local politicians and other public bodies. If we get them interested, there will be no limit to the amount of public engagement that will follow.’\(^{128}\)

196. On the other hand, written evidence from the Church of Scotland highlighted the importance of personal responsibility and effective public engagement, arguing that—

‘If it is to be effective the Bill should include provisions to require the Scottish Government to promote public awareness about the legislation and its targets; and to promote public involvement and engagement in meeting those targets…

...it would be helpful for the legislation to embody a requirement for public bodies to engage with voluntary organisations in the delivery of this [public engagement] duty.’\(^{129}\)

197. In written evidence to the Committee, the Salvation Army made the point that—

\(^{129}\) Church of Scotland. Written submission to the Transport, Infrastructure and Climate Change Committee.
‘We…believe that if it is to be effective the Bill should include provisions to require the Scottish Government to promote public awareness about the legislation and its targets; and to promote public involvement and engagement in meeting those targets. The broad Third Sector also has a vital role in raising concern about climate change and taking action to reduce negative impacts.’

198. Marjory Rodger of the Confederation of Passenger Transport UK gave an example of how individual sectors needed to contribute to help persuade the public to make the individual lifestyle changes necessary to lower emissions—

‘The bill is a valuable tool and it can make a valuable contribution to winning hearts and minds, but it cannot do it on its own; it is up to the operators of all modes of transport to come to the table and make the product more attractive. We must make viable and attractive choices available to everyone if we are going to win hearts and minds.’

199. Matthew Farrow of the CBI also suggested that some businesses needed to become more fully engaged with the climate change agenda—

‘We find that some companies, although they are not opposed to acting on climate change, find it much harder to relate it to their business. I am thinking of a small media company or a small tourism company.’

200. The Committee was interested to hear the views of young people who participated in the committee event on 27 March 2009 who highlighted the challenge of engaging with people who might not normally take an interest in climate change issues. Sagan Turner of the Inverkeithing High School Energy Group told participants—

‘Even in my school, which does very well and which has a large eco-school committee, there are still not enough people who are aware of what is happening. Thinking about the rest of the country, how are we going to get the next generation more aware of the situation and how they can contribute?’

201. Liam Beattie of the Scottish Youth Parliament commented—

‘We need to raise awareness of global warming, whether through education or adverts, and we need to change people’s perceptions about climate change, including the idea that it is not happening or that it is not our

---

130 Salvation Army. Written submission to the Transport, Infrastructure and Climate Change Committee.
133 Scottish Parliament Transport, Infrastructure and Climate Change Committee event. Scotland and Climate Change – Getting It Right, 27 March 2009, Col 43
responsibility but the Government’s responsibility. Everything possible that can be done needs to be done now.’\textsuperscript{134}

202. These comments underline the challenges associated with winning public support for efforts to tackle climate change. Yet it is vital that effort is made to change the way that the Scottish public thinks about climate change. If Scotland is to meet its challenging climate change targets then individuals throughout Scotland may need to make lifestyle changes. Leadership and direction from government will be essential if public support for taking measures to tackle climate change is to remain high. Individual policies brought forward by government to reduce emissions must be explained in the context of meeting overall climate change goals, and this will be particularly important if these policies involve government taking difficult decisions which may not be universally popular. The Committee believes a public engagement strategy is vital if we are to succeed in reducing Scotland’s emissions to the extent envisaged by the targets being considered. \textbf{The Committee recommends that Ministers bring forward proposals for an engagement strategy as part of their implementation plan for the Bill, which is discussed further in a later section of this report.}

\textbf{Possible actions to reduce emissions}

203. A number of witnesses highlighted in evidence to the Committee examples of possible actions that could be taken to reduce Scotland’s emissions. Some of these possible actions are noted in this section. These are not exhaustive.

\textit{Energy efficiency}

204. Duncan McLaren of Friends of the Earth Scotland and Stop Climate Chaos Scotland told the Committee that ‘the easiest way to make significant reductions [in emissions] quickly is by reducing energy consumption’.\textsuperscript{135} He argued that—

‘A Scotland-wide home energy insulation package would provide work for plumbers, builders and carpenters as well as for scientists and energy specialists.’\textsuperscript{136}

205. The Committee notes that such a package could also provide a market from products such as recycled glass wool and paper as insulating materials.

206. Professor Peter Smith of the University of Aberdeen also mentioned the issue of energy efficiency commenting—

‘On the marginal abatement cost curve, energy efficiency is right down there as cost negative; it saves money and energy, so it makes a huge amount of sense. The question is why it is not happening.’\textsuperscript{137}

\textsuperscript{127} Scottish Parliament Transport, Infrastructure and Climate Change Committee event. \textit{Scotland and Climate Change – Getting It Right}, 27 March 2009, Col 43

207. The Committee notes the comments in the report of the Economy, Energy and Tourism Committee on the subject of energy efficiency, and in particular its views that—

‘The Committee considers that there is no room for complacency in respect to energy efficiency performance and the standards within the Scottish building stock, commercial, industrial, the public sector and, critically, the domestic sector.’

208. The Committee discusses the Economy, Energy and Tourism Committee’s recommendations in relation to energy efficiency in more detail later in this report.

Forestry
209. Professor Peter Smith of the University of Aberdeen highlighted the potential of the forestry sector in Scotland, noting that it could provide a carbon sink to remove carbon dioxide from the atmosphere.138

Workplace greening initiatives
210. Dave Watson of UNISON and Stop Climate Chaos Scotland noted the potential carbon impact of workplace greening initiatives.139

Transport
211. The Confederation of Passenger Transport UK, the Association of Train Operating Companies, and Derek Halden of Derek Halden Consultancy mentioned possible ways of encouraging shifts to low carbon transport modes.140 Derek Halden said—

‘I would like to think that, because of the more ambitious targets in Scotland and the fact that we are working to a shorter timescale, we can reach the point at which land transport produces zero emissions faster than elsewhere. However, that can take place only in the context of the electric future that we are talking about, which involves renewable or zero-carbon energy and people charging up cars and buses.’141

212. John Lauder of Sustrans noted the important role which walking and cycling could play in any emissions reduction strategy.142

Business initiatives
213. Representatives from the CBI and the Climate Change Business Delivery Group highlighted examples of best practice employed by businesses to reduce emissions, such as the use of staff carbon clubs.143

---

Public sector initiatives

214. Representatives from Scottish Natural Heritage, SEPA and Scottish Water told the Committee about examples of best practice in the public sector, such as cutting the numbers of UK flights taken by staff and increasing the usage of videoconferences.144

Leadership from government

215. It is clear to the Committee that a proper assessment needs to take place of initiatives which might cut Scotland’s carbon emissions and that decisions need to take place on which policies need to be pursued in order to meet our climate change targets. This is properly the role of government.

216. The Policy Memorandum states that ‘it is right that Scotland, a country which led the industrial revolution, should show leadership in legislating to reduce emissions of greenhouse gases’.145 The Committee believes that the leadership shown by the Scottish Government after the passage of the legislation will be of even greater significance.

217. Duncan McLaren of Friends of the Earth Scotland and Stop Climate Chaos Scotland made the point that the process of reducing emissions would be about more than just identifying the necessary technology to make the cuts. He argued that ‘the crux of the matter is how much leadership the Government shows’.146 In this sense, he suggested the challenge of climate change was as much about social science as it was about physical science.

218. Judith Robertson of Oxfam in Scotland reinforced this point, arguing that the Scottish Government must—

‘Take the hard decisions…talked about earlier and it must show leadership to the public. It must show that it has to engage in the matter, ask the public to engage in it, and take responsibility.’147

219. Paul Tetlaw of Transform Scotland suggested that government should provide a clearer steer as to the actions that would be needed in order to tackle climate change—

‘There needs to be a national framework. Whether it is part of the STPR or national planning framework 2 does not matter; nationally, we must set a

framework that states that this is where we are going with policy and cascades that down to local authorities.  

220. Grant Hodges of the Climate Change Business Delivery Group raised a similar point—

‘We need a road map that tells businesses which targets will be met from heat, and which will be met from renewables technology, and which gives them a steer on where the Government wants effort to be focused. That would naturally lead to the question whether we have the skills now, or whether we need to consider different sorts of training.’

221. Brendan Dick of the Climate Change Business Delivery Group reinforced this idea, arguing that the Scottish Government ‘must somehow find a way—the Carbon Trust is a good example—to get every business, public sector organisation and voluntary sector organisation to understand how to start the journey.’ He went on to suggest—

‘One thing that Government can do that is relatively unique is to enable cultural change, working with other organisations but acting as a catalyst itself.’

222. A representative of Scottish Natural Heritage, Clive Mitchell, gave an example of the type of information which government could provide to guide organisations and individuals in order to reduce emissions—

‘It might be useful to develop energy hierarchies for transport and electricity along the lines of the well-established waste hierarchy, which prioritises avoiding use, efficient use, low-carbon use and so on, as the basis of the interventions that are required. The Scottish climate change programme should include the comprehensive package of mitigation and adaptation measures that is required across the board.’

223. The Committee believes it is essential that the Scottish Government drives forward the climate change agenda with clear leadership.

224. The Committee notes, as an example, that the new US administration has announced policies that reflect a decisive shift towards the development of low carbon technologies.

225. The Minister told the Committee that—

‘We are already working on our strategic overview. The publication of our annual targets will be accompanied by a report in which we will detail our
progress. Under the bill, we have to report on the policy measures that we are delivering, which—of course—we will have to describe. That is our view at the moment, although we will continue to work in the spirit of engaging with people. On adaptation, our action plan will shortly be issued for consultation.152

226. The Minister elaborated further on the Scottish Government’s plans in a letter dated 18 March 2009—

‘A Strategic Overview project is underway which will deliver a high level discussion document for publication later in 2009. This will set out in broad terms the key sectors for abatement in the short, medium and long term and high level policy options around these, highlighting the key milestones in policy development and delivery and barriers to implementation. This work is a prerequisite for the more detailed statutory Report on Policies and Proposals (section 30), to be published in 2010, which will set out how Scottish Ministers will meet their annual targets over the period 2010 to 2022.’

227. It is clear to the Committee that individuals and organisations believe that more leadership from government is required in order to secure emissions reductions. The Committee believes it is essential that the ‘report on proposals and policies’ document delivers the required government leadership. This should represent a comprehensive Scottish Government climate change plan, setting out the specific proposals that the Government believes should be implemented and how they should be delivered. The Committee notes the comments of the chief executive of the UK Committee on Climate Change, David Kennedy, who told the Committee—

‘The message is that there are opportunities in all sectors in Scotland, none of which should be neglected. Scotland’s strategy should cover residential and non-residential buildings, transport, agriculture, waste and the power sector.’153

228. The Committee calls on the Scottish Government to ensure that its statutory ‘report on proposals and policies’ provides a comprehensive overview of the potential contribution of all sectors in society to achieving emissions reductions. It should provide clear statements of policy intent and the direction for policy development which will lead to the reductions required to meet the challenging targets set by this Bill. It should also outline those initiatives currently underway to tackle climate change, including the Government’s public engagement implementation plan.

229. The Committee also considers it to be essential that the strategy overview document that will inform this process is produced as quickly as possible to allow sufficient time for the content of this significant and potentially detailed report to be developed, prior to its publication in 2010. The Committee requests that the

Scottish Government provides a clear timescale for the production of the strategy overview discussion document, and an indication as to its contents, before Stage 2.

ADVISORY FUNCTIONS

230. The Policy Memorandum states that ‘Ministers will be required to seek expert, independent advice in advance of setting annual targets’.154 The Bill provides for advisory functions to be conferred on an existing organisation, or a new Scottish Committee on Climate Change. These advisory functions will be wide ranging and are set out in the Bill.

231. The Policy Memorandum explains that initially the Scottish Government intends to seek independent, expert advice from the UK Committee on Climate Change. In the longer term, the Scottish Government intends to take a view on the effectiveness of this advice in meeting Scotland’s interests. The Policy Memorandum states—

‘Should the Scottish Ministers determine that the UK Committee on Climate Change does not meet all the advice needs for Scotland, the Bill contains provisions which will allow the Scottish Ministers to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.’155

Views on the approach in the Bill

232. A number of witnesses supported the Scottish Government’s position on advisory functions in the Bill, including COSLA, the Sustainable Scotland Network,156 the Energy Saving Trust,157 and business leaders.158 Phil Matthews of the Sustainable Development Commission Scotland told the Committee that the position set out in the Bill was ‘extremely sensible’. He explained—

‘There is a great deal of expertise on the UK committee, which has just published a good report, but it is useful for Scotland to at least have the option to create a body that is separate from the UK committee if, for any reason, it is thought not to be providing all the information or evidence that is necessary to implement the bill.’159

233. This view was supported in written evidence from East Lothian Council, which argued that—

---

154 Climate Change (Scotland) Bill. Policy Memorandum, paragraph 33. Available at: http://www.scottish.parliament.uk/s3/bills/17-ClimateChange/b17s3-introd-pm.pdf
155 Climate Change (Scotland) Bill. Policy Memorandum, paragraph 34. Available at: http://www.scottish.parliament.uk/s3/bills/17-ClimateChange/b17s3-introd-pm.pdf
‘The UK Committee on Climate Change has considerable expertise which should be able to meet Scotland’s needs as well as provide a focus for the global challenge of climate change. Only if that does not work should a separate Scottish Committee be established.’

234. Written evidence from Glasgow City Council argued that if it became necessary to use a body other than the UK Committee on Climate Change, then existing Scottish bodies could take on these functions. The Council argued that ‘if necessary in the longer term it would appear that the existing bodies, e.g. SEPA, SNH, could advise, monitor and scrutinise the implementation of the Bill’.160

235. Professor Peter Smith of the University of Aberdeen argued that—

‘My view is that it is extremely useful to have a critical mass of expertise. If we can ensure that the Committee on Climate Change is able to provide everything that we need in Scotland, it will be the appropriate advisory body.’161

236. David Kennedy, the chief executive of the UK Committee on Climate Change emphasised to this Committee the independence of his Committee—

‘We report to Government and to Parliament, and what we say is transparent—everybody can see why we are saying what we are saying, and that it is all based on evidence and analysis. That is the foundation of our independence. We are not pulled by the political considerations of the day, and we demonstrate that by backing up our arguments with evidence and analysis.’162

237. Some witnesses did, however, express some reservations about the Scottish Government’s position. Dave Watson of UNISON outlined the position of Stop Climate Chaos Scotland—

‘Our view is that we need a distinctive body in Scotland. It should work constructively with the UK committee rather than being a competing committee; it should be a commission, if for no other reason than to differentiate between it and your committee; and it should report to Parliament, not the Government.’163

238. Stephen Boyd of the STUC said that—

‘There is a case to be made for a separate Scottish advisory body, given that there is a different legislative framework. A substantial part of the relevant policy is devolved and the public sector landscape is different in Scotland. If, as you suggest, the UK Committee on Climate Change were to provide the

---

156 Glasgow City Council. Written Submission to the Transport, Infrastructure and Climate Change Committee.
technical expertise, and a separate Scottish advisory body was established, we would look on that with interest.\textsuperscript{164}

239. The Committee notes alternative models which might be applied. For example, a panel of relevant experts could be set up, which could provide the knowledge of Scottish legislative arrangements, economic and social circumstances and policy considerations needed to supplement the advice from the UK Committee, in line with the suggestion made by the STUC. The Committee also notes that the Scottish Government could enter into discussions with relevant organisations, including local authorities and Audit Scotland to see whether climate change monitoring can be integrated into existing monitoring regimes.

Resources allocated to Scotland

240. Some witnesses cast doubt on whether the UK Committee on Climate Change had the necessary resources and expertise to reflect distinctive Scottish interests. Chas Booth from the Association for the Conservation of Energy told the Committee that—

‘…The initial report’s broad-brush approach suggests that that committee does not have the resources to give independent advice in Scotland. I also question whether the UK committee has sufficient insight into the Scottish situation. On energy efficiency, for example, Scotland’s building stock has a different profile. That means that the challenges are different in achieving the energy efficiency savings targets. We would prefer a separate Scottish committee.’\textsuperscript{165}

241. The chief executive of the UK Committee on Climate Change, David Kennedy, told the Committee—

‘It is fair to say that our work programme for Scotland and the other national authorities is in flux and is up for discussion.’\textsuperscript{166}

‘I will have to go back and discuss the issue, but I think that our committee would probably have the capacity to scrutinise and discuss issues relevant to the Scottish Government, just as we did on the UK carbon budgets.’\textsuperscript{167}

242. He went on to address the question of the resources which the UK Committee would dedicate to work on Scottish climate change issues—

‘At the moment, in our work with all the devolved Administrations, Katherine White is our only resource. She is on secondment from Scotland to the committee...Further discussion will be needed on how to make progress. We

will probably need at least one other person on our side; we are not talking about another five or 10 people, but at least another one.  

243. Richard Dixon of WWF Scotland and Stop Climate Chaos Scotland commented on the evidence from the UK Committee on Climate Change—

'I did not think that it was a terribly generous presentation. Some work needs to be done in that regard.'

244. A different perspective on the question of resources was offered in the evidence by Fiona Page of the Bill Team which commented on the cost savings which could be made if Scotland used the services of the UK Committee on Climate Change—

'I believe in seeking best value for money. Frankly, we get the services of that committee at a reasonable cost and we would have to pay much more money were we to set up a Scottish climate change committee in the future.'

245. The Finance Committee took evidence on the costs associated with the advisory functions in the Bill. The Scottish Government confirmed to the Finance Committee that its contribution to the funding for the UK Committee on Climate Change is expected to vary year on year. This is partly due to the inclusion in the 2008-09 fees of one-off start-up expenditure. The Scottish Government confirmed that additional funding is also expected to be required for analysis regarding the annual Scottish targets and trajectory. It was suggested that if this work requires, for example, an additional analyst and some additional research to build on the analysis work already undertaken by the Committee, this could be estimated to be in the region of up to £100,000.

246. The Minister reaffirmed his view that the UK Committee on Climate Change was the most appropriate source of advice to the Scottish Government—

'Unless the UK Committee on Climate Change becomes unwilling or unable to respond to the needs of this devolved Administration—and of the Wales and Northern Ireland Executives—it will be the best available source of independent advice for the Government.'

247. The Minister also countered suggestions that there was currently insufficient engagement between the Scottish Government and the UK Committee, telling this Committee—

---

Conclusions on advisory functions

248. The UK Committee on Climate Change has some expertise in assessing global climate change and it makes sense for the Scottish Government to tap into that existing expertise rather than attempting to replicate it.

249. Given that the UK Committee on Climate Change is in existence, it seems sensible for the Scottish Government to draw on it for advice on all matters where it has the appropriate expertise. The alternative suggestion of establishing a Scottish Climate Change Committee would potentially be costly, there would in all probability be the time delays whilst the committee was established and it would be difficult to replicate the full range of expertise the UK Committee can deploy.

250. However it is not clear that the UK Committee would be able to meet all Scotland’s requirements. In this context, this Committee notes with concern with the proposed level of resources to be allocated to Scottish interests by the UK Committee, which do not appear to be substantial at present. It is not clear whether existing resources will be adequate to provide the most appropriate level of expertise recognising the particular legislative, policy and geographic issues that are pertinent to Scotland.

251. This Committee notes that the Scottish Government has not yet formally requested advice from the UK Committee on Climate Change and so what types of advice it is best placed to deliver may not have been sufficiently assessed. This Committee therefore recommends that the Scottish Government enters into discussions with the UK Committee on Climate Change with a view to conducting a realistic analysis of the nature, level and frequency of the advice it is able to provide and the additional dedicated financial and human resources which might be required.

252. It is considered essential that the Scottish Government is in a position to provide this further information, together with an assurance that the UK Committee will be adequately resourced to provide the necessary advice, before the Bill is passed. This Committee therefore further recommends that this information should be made available to the Parliament prior to the beginning of Stage 2. If the UK Committee on Climate Change is not able to provide the necessary commitments in respect of its resources and engagement with Scottish interests, then the Scottish Government should consider what other models might be appropriate.

---

REPORTING DUTIES

253. Part 3 of the Bill requires that Scottish Ministers report regularly to the Scottish Parliament on Scotland's emissions and on the progress being made towards the emissions reductions target set in the Bill. The following reports are required to be produced—

- Annual reporting duty – if the annual emissions target is not met, the report should explain why
- Report and statement on proposals and policies designed to meet future annual emissions targets
- Report and statement on proposals and policies designed to compensate for exceeding annual emissions targets – this applies where the net Scottish emissions account exceeds an emissions target
- Final statements for 2030 and 2050.

254. Section 34 of the Bill requires that when the reports outlined above are laid, Scottish Ministers must make a statement on the reports in the Scottish Parliament. In addition, in relation to the report on the annual targets, section 34 of the Bill requires that Scottish Ministers must—

‘As soon as reasonably practicable after doing so, and in so far as reasonable practicable, meet with the persons who convene and chair such committees of the Scottish Parliament as are for the time being appointed by virtue of standing orders.’

Strength of the reporting duties

255. The Committee has discussed above some of the methodological challenges associated with gathering the emissions data required to report on the meeting of the targets in the Bill.

256. Other witnesses chose to comment on the strength of the framework established in the Bill for holding the Scottish Government to account for its actions in meeting the targets.

257. Professor Colin Galbraith of Scottish Natural Heritage noted—

‘There must be a reporting mechanism, which must be seen as part of the culture change that we must put in place. If targets are set without a requirement to report effectively, it becomes difficult to measure whether progress has been made. A mechanism to draw the information together must be established.’\textsuperscript{173}

258. Some witnesses suggested that these arrangements should be strengthened in the Bill. For example, Dave Watson of UNISON and Stop Climate Chaos Scotland argued—

‘...Other bodies should also have the opportunity to be involved. Probably, the Public Audit Committee should have a role in scrutinising that annual report by asking SEPA and other regulatory bodies to comment on the approach that had been taken.’\(^{174}\)

259. Some written responses to the call for views suggested that the Bill should contain more details of the way in which Ministers will be held to account for any failure to meet targets in the Bill. Responses from COSLA and the Association for Energy Conservation, for example, indicated that these should be the responsibility of the First Minister.

260. Paul Tetlaw of Transform Scotland suggested that more robust enforcement measures could be included in the Bill—

‘The bill should include mechanisms for enforcing emissions reduction targets. I have a water industry background, so I am familiar with all the improvements in water quality and waste water quality that have been brought about over the years.’\(^{175}\)

261. In evidence to the Committee, the Minister indicated that he did not support the use of financial sanctions to enforce the meeting of targets in the Bill because it could lead to a situation whereby government was effectively fining itself. He argued—

‘The effect would, therefore, be financially neutral. It is not clear to me that the proposal would deliver any benefit.’\(^{176}\)

‘We simply do not see how it makes much sense to remove money from a public body that is not making the necessary progress and then invite it to ask for that money back, which is one of the options.’\(^{177}\)

262. The Minister expressed the view that the provisions as drafted in the Bill would be appropriate—

‘...The bill states that ministers will be dragged to Parliament to account for their failures. We see that as the appropriate and proper way of proceeding...Annual reporting and the annual statement that must be made

to Parliament are pretty robust ways of ensuring that Parliament and the wider public are on the case of failure in this area.  

263. The Committee agrees with the Minister that a situation whereby the Scottish Government is required to fine itself could be seen as illogical. The Committee believes that it is right that the Parliament will have the central role in ensuring that the Scottish Government is held to account for its performance in meeting the targets in the Bill.

264. The Committee notes the requirement in the Bill for Ministers to provide a statement to the Parliament in particular circumstances, such as if an annual emissions target has not been met. The Committee considers that this provision is welcome, however, it notes that a requirement only to give a statement to the Parliament would not allow full and robust questioning of Ministers. Additional measures could include a requirement to hold a debate on the statement or to allow an extended opportunity for questions after the statement. Another option would be for the relevant committee to report to the Parliament after taking evidence from the Minister, which would inform a debate in the Chamber.

265. The Committee does not, however, think it appropriate to be prescriptive regarding the manner in which the Parliament scrutinises Ministers in the future, but nevertheless believes that additional requirements need to be imposed in the Bill to increase the level of detailed scrutiny and substantive debate. The Committee will reflect on these options further ahead of Stage 2.

266. The Committee discusses an additional method of enhancing the arrangements for this parliamentary scrutiny in the next section of the report.

Meeting with committee conveners

267. As noted above, there is a requirement in the Bill for Scottish Ministers to meet with committee conveners following the publication of the report on meeting annual targets.

268. Stop Climate Chaos Scotland raised concerns regarding the appropriateness of the Conveners Group as a forum for holding Ministers to account because it does not meet in public and ‘therefore lacks transparency and accountability’. Richard Dixon of WWF Scotland and Stop Climate Chaos Scotland argued during evidence to the Committee—

‘The proposal for ministers to meet the Conveners Group clearly shows the Government’s good intentions about bringing the Parliament up to speed and involving key committees in the process. However, as you pointed out, the

---

179 Stop Climate Chaos Scotland. Written submission to the Transport, Infrastructure and Climate Change Committee.
fact that the meeting will be off the record means that it will not form an appropriate part of the scrutiny of this very important legislation.\footnote{Scottish Parliament Transport, Infrastructure and Climate Change Committee. \textit{Official Report}, 3 February 2009, Col 1439.}

269. The Committee raised these concerns with the Minister. In response he said—

‘You are correct that the Conveners Group—on which I sat, from time to time, in a previous session of Parliament—meets in private...It is an offer that is genuinely made and which probably goes further than any that has been made in relation to any other legislation. If there is another way of achieving the same objective, we are entirely open to discussing it further.’\footnote{Scottish Parliament Transport, Infrastructure and Climate Change Committee. \textit{Official Report}, 10 March 2009, Col 1680.}

270. The Committee notes that the Bill does not specifically state that Scottish Ministers must meet with the Conveners Group, rather that they must meet with committee conveners. However, if this interpretation of this provision is taken, it is not clear from the provisions in the Bill what format such a meeting of conveners would take.

271. The Committee believes that the Conveners Group is not an appropriate forum for Ministers to meet with committee conveners due to its informal nature and the fact that it meets in private.

272. The Committee notes that the intention behind this provision is to ensure that conveners of all committees can scrutinise Scottish Ministers effectively on the cross-cutting issues contained in the Bill. The Committee welcomes this intention. However, there is a lack of clarity as to the mechanism which will allow for this additional scrutiny to take place.

273. \textbf{The Committee considers that a more appropriate option would be that a replacement provision is placed in the Bill requiring that Scottish Ministers make themselves available to attend a public meeting of the parliamentary committee (or committees) with climate change issues within its remit, to give evidence on their reports on meeting annual targets.} The wording of this provision should take into account the fact that committee names and remits can change from one parliamentary session to another. The Committee takes the view that this approach would strengthen and make more transparent the means by which Ministers would be held to account for their performance in meeting the targets. \textit{This Committee calls on the Scottish Government to bring forward an appropriate amendment addressing this issue at Stage 2.}

\section*{DUTIES ON PUBLIC BODIES}

274. The Bill contains a power to allow Scottish Ministers, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.
275. The Policy Memorandum explains—

‘The Scottish Government is committed to working in partnership with the public sector in reducing the target greenhouse gas emissions which affect climate change. But it is recognised that as emissions reductions become harder and more expensive to deliver, there may come a time when the Scottish Ministers have to ensure consistent and fair contributions to delivery across the public sector.’\(^{182}\)

276. A number of witnesses suggested that the Bill should be amended to provide for mandatory duties to be imposed on public sector bodies in relation to climate change. Dave Watson from UNISON and Stop Climate Chaos Scotland explained to the Committee—

‘The coalition’s position is very clear. We believe that hope is a wonderful thing, but a bit of statutory action gets things moving.’\(^{183}\)

277. Duncan McLaren of Friends of the Earth Scotland and Stop Climate Chaos Scotland stated in evidence—

‘The coalition strongly advocates that a general duty be placed on public bodies to reduce emissions in line with the national target. That would enable and encourage local authorities, health authorities and a range of other public bodies to start thinking about what people who live in their areas or who work for them could do. That would be one of the best ways to trickle down, or perhaps drive down, the impetus for engagement and behaviour change.’\(^{184}\)

278. This general position was supported by representatives from the Association for the Conservation of Energy\(^ {185}\) and Scottish Renewables.\(^ {186}\) Geoff Aitkenhead of Scottish Water suggested—

‘We are content for duties to be placed on public sector bodies…We might discuss further the detail of what the duties might be, but I believe that they should fall into two categories. One should be on direct emissions from public sector bodies, and the other should be on emissions from another body as a consequence of policies or regulation that a public sector body promotes.’\(^{187}\)

279. Paul Tetlaw of Transform Scotland made a similar suggestion—

---

\(^{182}\) Climate Change (Scotland) Bill. Policy Memorandum, paragraph 39. Available at: http://www.scottish.parliament.uk/s3/bills/17-ClimateChange/b17s3-introd-pm.pdf .

The bill should establish a duty on all public bodies to reduce emissions in line with the national targets. We certainly do not believe that it is right that politicians at a national level should shoulder all the responsibility.\textsuperscript{188}

280. Dr Andy Kerr of the University of Edinburgh commented that a duty to reduce emissions might already be applicable to public bodies—

‘If you are talking specifically about duties to reduce emissions, the UK carbon reduction commitment will impose reductions on all public bodies that use more than a certain amount of energy, so that will be captured anyway.’\textsuperscript{189}

281. David Kennedy, chief executive of the UK Committee on Climate Change made this point as well—

‘The main lever for reducing emissions in the public sector is the carbon reduction commitment, which provides a significant opportunity across public sector bodies...It is not immediately obvious to me that there is a need to go beyond that, but there may be scope for the Government and public bodies to do something on green procurement.’\textsuperscript{190}

282. In written evidence, a number of organisations highlighted potential duties which might be placed on public bodies. The Association of British Insurers, for example, argued that the statutory duty placed on local authorities to reduce flood risk should be extended to also include a wider duty on adaptation. Changeworks suggested that local authorities should promote measures that influence the behavior of the public by rewarding actions that reduce carbon.

283. The perspective of COSLA was provided in evidence by Councillor Alison Hay who suggested that the provisions in the Bill as drafted were appropriate—

‘COSLA is not opposed to duties per se, but in light of our current duties, such as the sustainable development duty that Ken Gibb mentioned, and the biodiversity duty—there are a number of duties in the environment field—it would be useful to examine and rationalise them all, rather than impose a duty right away. The proposed enabling powers are a good way forward.’\textsuperscript{191}

284. Councillor Alison Hay went on to argue—

‘As we indicated, although we do not oppose the imposition of duties in principle, it needs to be done in such a fashion that it takes into account

everything that we are doing at the moment. To impose a duty just for the sake of imposing a duty is not a good idea.\textsuperscript{192}

285. Evidence from COSLA and the Sustainable Scotland Network also highlighted the work already being carried out by local authorities in relation to climate change. Ken Gibb of the Sustainable Scotland Network told the Committee—

‘Alison Hay mentioned the carbon management plans that all councils are delivering with the Carbon Trust. I think that we are now in the sixth phase of a process that has been around for about five years. Over the piece, councils are reducing their emissions by the equivalent of 3 per cent per year. Over the period of the carbon management plans that are in place, that averages out at a 15 per cent reduction in emissions, which is an indication of our commitment.’\textsuperscript{193}

286. The Minister explained in evidence to the Committee on 10 March 2009—

‘Having powers in reserve in the bill is the right thing to do. At this stage, it is not terribly clear what we would force people to do, if we used powers to mandate. By having a general power to fall back on, we are more likely to get innovative and imaginative thinking in public bodies.’\textsuperscript{194}

287. However, in a letter to the Committee dated 18 March 2009, it seemed that the Minister’s position may have shifted to a certain extent. He stated—

‘You will be aware that there has been considerable discussion with Committee witnesses on whether the Bill should contain an explicit duty on public bodies rather than enabling powers. Scottish Ministers are considering options in this regard including linking a potential duty with sustainable development. This will be discussed further with COSLA whose support will be required.’\textsuperscript{195}

Conclusion on duties on public bodies

288. The Committee recommends that the Scottish Government should create a general duty on public bodies to take account of climate change in their activities, although the Committee is of the view that concerted action will be required in order to translate this general duty into meaningful action. In this context, the Committee notes that the complementary approach of encouraging public bodies to roll out more widely examples of good practice in addressing climate change which were highlighted in evidence to this Committee may be more effective in delivering early action.

\textsuperscript{195} Scottish Government. Letter from the Minister for Transport, Infrastructure and Climate Change to the Convener of the Transport, Infrastructure and Climate Change Committee dated 18 March 2009.
289. The Committee notes the indication that the Minister is considering creating certain specific climate change duties on public bodies, rather than merely establishing an enabling power. **However, the Committee is concerned at the lack of clarity over the nature of such duties, and considers that discussion of the details at Stage 1 would have given witnesses representing the public sector the opportunity to respond.**

290. The Committee notes that the imposition of specific new duties may also have funding implications which Parliament would take an interest in. The Committee notes, for example, the written evidence of Falkirk Council which stated—

‘Falkirk Council acknowledges the role that local authorities can and should play in reducing greenhouse gas emissions and also acknowledges that it is appropriate that national and international government commitments should be reflected by targets at local government level. The Council reiterates its request for additional funds to support such action.’

291. It is clear from the written evidence from Falkirk Council and other local authorities and public bodies that the creating of duties would have funding implications which may vary. The Committee looks forward to further dialogue with the Scottish Government about the specific duties it is considering in this regard. The Committee notes, for example, the possibility of specific duties on the subject of travel or green procurement.

292. The Committee finally notes the concerns of the Subordinate Legislation Committee which argued in its report to this Committee that the power in the Bill to impose climate change duties on public bodies ‘is extremely wide in its scope, in particular as neither the public bodies which may be subject to climate change duties nor climate change duties themselves are adequately and clearly defined.’

293. The Subordinate Legislation Committee recommended that this power could be mitigated to some extent by provision of a list of public bodies to whom the power is to apply along with a power to add to the list subject to affirmative procedure. This would be in line with the approach adopted to other regimes regulating public bodies such as freedom of information. **This Committee endorses this recommendation and seeks a response from the Scottish Government on this point ahead of Stage 2. The Committee recommends that full consultation should be carried out in advance of any affirmative subordinate legislation being brought to the Parliament under this section.**

**ADAPTATION**

**Adaptation programmes**

294. The UK Secretary of State is required, under the UK Climate Change Act 2008, to lay a report before the UK Parliament containing an assessment of the

---

187 Scottish Parliament Subordinate Legislation Committee. 2009 (Session 3) *Report on Climate Change (Scotland) Bill.*
risks for the UK of the current and predicted impact of climate change. The Bill requires that when this happens, Scottish Ministers must ‘as soon as reasonably practicable’ lay a programme addressing the risks in the report for Scotland, and more generally setting out the Scottish Ministers’ thinking in relation to adaptation to climate change, and from the second report on, for this to include as assessment of progress towards objectives set out in the previous programme. The first UK report must be produced by around the start of 2012, with a further report in 2017.

295. A number of witnesses who gave evidence to the Committee highlighted the importance of adaptation to climate change as an issue, including Professor John Mitchell of the Met Office197, Ken Gibb of the Sustainable Scotland Network198 and Richard Dixon of WWF Scotland and Stop Climate Chaos Scotland.199 Matthew Farrow of the CBI commented that ‘adaptation has been the Cinderella of the climate change debate for a long time, and politicians and business groups are all guilty of that.’200

296. Professor Colin Galbraith of Scottish Natural Heritage welcomed the inclusion of provisions on adaptation in the Bill—

‘The adaptation plan will be fundamental to the implementation of the bill. It is good to see that there is one, as it is unusual in the European context to see such a bill and plan together. That is an encouraging development.’201

297. A number of written submissions commented on the issue of adaptation. The Association of British Insurers argued, for example, that the Bill should set a series of targets to reduce flood risk across Scotland. Other written submissions argued that the Bill should provide for Ministers to be more accountable for their activities in relation to adaptation, including the suggestion that they should report annually to the Parliament on progress in relation to adaptation, and that a separate climate change impact report should be published for Scotland.

298. In evidence to the Committee, the Minister explained that ‘we will undertake a second consultation on adaptation, which will be based on what emerged from the first consultation and will play an important role in developing a way forward’.202

299. The Committee supports the provisions in the Bill in relation to adaptation to climate change and looks forward to considering the first report on this subject published by the Scottish Government under this Bill.

Muirburn

300. Muirburn is a mainly upland land management technique, and is the act of controlled burning of vegetation on open, treeless, semi-natural habitats (including muir or moorland) and involves the burning of gorse, heather and grass to stimulate new growth. Dates on which muirburn can take place are set down in statute (the Hill Farming Act 1946).

301. The provisions in the Bill allow Scottish Ministers to amend, by subordinate legislation, these dates to adapt to the effects of climate change as there is concern that, given changing weather patterns and rising temperatures, the ecology of these areas could now be compromised by burning within the currently permitted limits.

302. This provision was considered by the Rural Affairs and Environment (RAE) Committee as a secondary committee on the Bill and its conclusions were included in its report to this Committee.

303. The RAE Committee considered the muirburn provision during a roundtable discussion on 11 February 2009 and at an evidence session with the Minister for Environment on the same day. The Scottish Rural Property and Business Association commented during the discussion that its members had been anxious about supporting the proposal because it was unclear how the new power would be used. It reported that it had received insufficient information to make an informed decision about any changes to the muirburn dates.

304. The RAE Committee noted that the Minister for Environment had suggested that he had been surprised by the opposition expressed in some of the responses to the muirburn consultation and considered that the lack of detail in the Bill may have led to some overly cautious responses. He assured the RAE Committee that the power would not be used without full consultation with stakeholders and the power would only be used in such a way so as to allow muirburn practices to adapt to the impact of climate change.

305. In its report to this Committee, the RAE Committee reported that it appreciated the Minister’s reassurances that the Scottish Government will actively consult with all key stakeholders at an early stage in its deliberations on how to use this power.

306. The Minister stated in a letter dated 18 March 2009—

‘It is Scottish Ministers intention to bring forward an amendment to section 46 of the Bill (which contains a new section 23A of the Hill Farming Act 1946), so the order making power is subject to affirmative parliamentary procedure, and so that the power cannot be exercised so as to reduce the current number of days comprising the permitted muirburn season.’

---

307. **On the basis of the comments made by the Rural Affairs and Environment Committee, and following the Minister’s stated intention to bring forward an amendment to the muirburn provisions at Stage 2, the Committee is content with these proposals.**

**FORESTRY**

308. Section 47 of the Bill provides for subordinate legislation to allow Forestry Commissioners within the Forestry Commission Scotland to form or participate in corporate bodies or trusts. In addition, Commissioners would have the power to provide loans and act as an officer of a body corporate, or a trustee of a trust.

309. The detail of the proposals behind section 47 are described in the Policy Memorandum, which states that the Scottish Government is proposing two specific policies. The Forestry Commission would be allowed to enter into joint venture arrangements for renewable energy developments. Such provisions on joint ventures replicate provisions already in force in England and Wales. The second proposal is to release capital by leasing up to 25% of Forestry Commission Scotland land for up to 75 years with the intention of using the funding gained to implement measures to contribute towards mitigating climate change.

310. This issue was considered by the Rural Affairs and Environment (RAE) Committee.

311. The RAE Committee report considered in some detail the leasing proposals in the Bill and noted the concerns about the proposals identified in both written and oral evidence. The main conclusion reached in its report to this Committee is set out below—

‘The Committee appreciates that consultations should not have a preconceived outcome and is concerned that consultation was undertaken during Stage 1 on a proposal already contained in documents supporting the Bill. There is sufficient concern about the leasing proposal for the Committee to be unwilling to recommend that the Bill allow this proposal to go ahead.

As detailed below the leasing proposal is contentious for numerous reasons and the consultation process for this proposal is considered to be inadequate by key stakeholders.

The Committee recommends that the Government does not progress this leasing proposal and amends the enabling section in the Bill.’

312. The Minister for Environment subsequently wrote to the Convener of the RAE Committee in a letter dated 13 March 2009 providing the Scottish Government’s response to the consultation on the forestry provisions in the Bill and noted—

‘We do not intend to use the powers provided for in section 47 of the Bill to make an order allowing leases and cutting rights over parts of the national
This intention was confirmed in a letter to this Committee from the Minister for Transport, Infrastructure and Climate Change dated 18 March 2009.

314. In respect of the proposal in the Bill for Forestry Commission Scotland to enter into joint ventures with private companies for the development of sustainable energy, the RAE Committee stated—

‘The [RAE] Committee acknowledges that joint ventures may not generate the same level of funds as the leasing proposal, or generate funds to the same timescale. However given the notable support for the joint ventures policy the [RAE] Committee recommends that, in considering alternative approaches to leasing, the Government should explore the full potential of encouraging and supporting the establishment of joint ventures schemes.’

315. The Committee notes that the Minister for Environment’s letter to the Convener of the RAE Committee dated 13 March 2009 confirms that the Scottish Government plans to use these joint venture powers.

Conclusion on forestry

316. This Committee endorses the recommendations in the report of the Rural Affairs and Environment Committee and notes that the Scottish Government has recently changed its position on one of these recommendations – the leasing proposals. This Committee notes that further clarification may be needed on the implications of the Scottish Government’s policy change, particularly the status of the funding for the mitigation of climate change which was mentioned in the Policy Memorandum as resulting from this proposal. This is something which the Rural Affairs and Environment Committee may wish to pursue with the Scottish Government. This Committee comments on the consultation arrangements for the forestry and other provisions in the Bill later in this report.

ENERGY EFFICIENCY

317. This Chapter in Part 5 of the Bill contains three distinct sets of provisions. The first set of provisions require the Scottish Ministers to produce an action plan setting out their current and proposed measures to promote the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change towards energy efficiency.

318. The second set of provisions contain measures for assessing the energy performance of existing non-domestic buildings in order to raise awareness of the contribution that those buildings can make to mitigating climate change through reducing energy demand and thereby emissions of greenhouse gases.

---

204 Scottish Government. Letter from the Minister for Environment to the Convener of the Transport, Infrastructure and Climate Change Committee dated 13 March 2009.
319. The third set of provisions place a duty on the Scottish Ministers to take such steps as they consider appropriate to promote the use of heat from renewable sources.

320. The Economy, Energy and Tourism (EET) Committee considered these provisions in the Bill and made 17 recommendations to the Parliament and to this Committee. The recommendations are set out in full in the EET Committee's report.

321. The report included recommendations in relation to the improvement of energy efficiency and the take-up of renewable heat and micro-generation technologies, the extension of energy performance certificates to the non-domestic sector, and the production of an action plan to improve the take-up of renewable heat technologies in Scotland. Specifically, the EET Committee recommended that the Scottish Government—

- Takes all the necessary steps to ensure that efforts are made to improve and not just promote energy efficiency and the take-up of renewable heat and micro-generation technologies, and that the Minister brings forward amendments at stage 2 to maintain and extend the existing legislative provision in respect of living accommodation

- Clearly sets out how the monitoring and reporting procedures within this Bill will work and clarifies the roles of various bodies in this respect

- Adds the setting of targets for its energy efficiency and renewable heat initiatives to the relevant sections of the Bill and brings forward the necessary amendments

- Investigates and reports back to the EET Committee, if possible before Stage 2, on whether some form of rebate through local taxation systems to incentivise the take-up of energy efficiency, renewable heat and/or micro-generation technologies in the domestic and non-domestic sectors should be introduced, drawing on the experience and the success of such schemes in other parts of the UK

- Makes all efforts to ensure that the education and training sector in Scotland is well-prepared and can respond to the growth in employment opportunities by providing the right number of people with the right skills at the right time, and reports back to the Committee on this as soon as possible

- Ensures that energy efficiency projects are in a position to play a full and meaningful part in meeting the statutory targets for 2010 and thereafter

- Ensures that a revised financial memorandum be produced and we would expect the costs identified above to be covered within this

- Introduces, within a reasonable timeframe, an action plan to improve the take-up of renewable heat technologies in Scotland and to work with all the necessary parties to achieve progress in this area, and provides a clear
timetable from the Minister for the introduction of the heat plan before Stage 2 of the Bill

- Ensures that combined heat and power systems, preferably using sustainable energy sources, are a part of its action plans for renewable heat and energy efficiency

322. The Committee notes that the recommendations in the EET Committee's report are made directly to the Scottish Government, rather than this Committee as lead committee on the Bill. The Committee endorses many of the recommendations contained in the EET Committee's report. For example, like the EET Committee, this Committee would recommend that the Scottish Government provides clarity on its position in relation to the proposed Energy Efficiency and Micro-Generation (Scotland) Bill. The Committee also agrees that all the secondary legislation under sections 48-51 should be subject to affirmative resolution and agrees with the recommendation that the issue of the skills gap and employment opportunities is addressed by the Scottish Government, an issue which is covered elsewhere in this report.

323. The EET Committee recommended in its report that the Minister for Transport, Infrastructure and Climate Change ensures that energy efficiency projects play a full and meaningful part in meeting the statutory targets for 2010 and thereafter. The EET Committee indicated that it saw no reason why the action plan had to await the passing of the Bill and wished to see the Scottish Government publish a full draft of the action plan before Stage 2 of the Bill. The Minister for Enterprise, Energy and Tourism wrote to the Convener of the Economy, Energy and Tourism Committee on 3 April 2009 to provide an outline of the Scottish Government's Energy Efficiency Action Plan. This Committee notes that the Minister indicated that he anticipated that the Climate Change (Scotland) Bill would be passed in summer 2009 and that the Energy Efficiency Action Plan would be published thereafter.

324. This Committee notes the EET Committee's recommendation that the Scottish Government amends the Bill to include specific targets for energy efficiency and renewable heat initiatives. While the Committee does not believe setting specific sectoral targets is appropriate for all sectors, it regards land use, energy generation, energy efficiency and transport as the key sectors in which the Scottish Government should be required to define and quantify the expected emissions reduction. Setting targets for energy efficiency and renewable heat initiatives is consistent with that approach.

325. The EET Committee report recommends that various amendments are brought forward at Stage 2 in relation to the energy efficiency chapter of the Bill. This Committee will consider any amendments brought forward on this subject at Stage 2.

WASTE REDUCTION AND RECYCLING

326. Part 5, Chapter 4 of the Bill sets out measures aimed at improving waste reduction and recycling. The Bill gives powers to Scottish Ministers to make regulations in the following areas:
- waste prevention and management plans
- waste data
- deposit of recyclable waste
- procurement of recyclate
- reduction of packaging
- deposit and return schemes
- charges for carrier bags.

327. The Rural Affairs and Environment Committee considered these provisions in the Bill and recommended to this Committee that the Scottish Government should ‘have regard to—

- the urgent need to focus on reducing commercial and industrial waste being sent to landfill
- the need to address the lack of infrastructure available to implement the policy intentions in the Bill
- the need to consider issues raised by the Environment and Rural Development Committee in Session 2 on charging by sellers of goods for the supply of carrier bags
- the opportunity that current international market conditions could present for Scottish market development
- the need to ensure measures undertaken are in accordance with both the Government’s definition of ‘recycling’ and with the waste hierarchy set out in the Waste Framework Directive
- the benefits of the Government endorsing one method of measuring ‘carbon footprints’ and to establish criteria based on this reflecting which practice is more sustainable than another)
- the need to take into account any potential negative impact on social and economic factors, including in remote and rural areas, of aiming towards ambitious targets to reduce carbon emissions.’

328. This Committee endorses the conclusions of the RAE Committee’s report on the Bill and calls on the Scottish Government to respond in full to its recommendations. In relation to the specific issue of charging for the supply of carrier bags, the RAE Committee noted that it had received numerous written submissions opposing the policy behind this section of the Bill. This opposition was based on evidence which suggested that that proceeding with this policy is unlikely to deliver the intended environmental benefits and instead lead to
increased emissions. The RAE Committee noted the work conducted on this issue by the Environment and Rural Development Committee in 2006 in session 2 and commented—

‘The [RAE] Committee appreciates that there has been movement on this issue since the publication of the report in 2006, through the voluntary agreement with retailers and also by the cultural shift amongst the public towards bringing reusable bags to shops with them instead of using carrier bags once. However the considerable scrutiny undertaken by the previous committee should be used as a valuable assessment of the issue and this Committee draws the contents of the Stage 1 report to the attention of the lead committee on this basis.’

329. Matthew Farrow of the CBI commented in evidence to this Committee—

‘The carrier bag issue is endlessly rehearsed and is a symbolic issue, and to be honest I would say that the proposal for carrier bag charges is probably not the best way to increase diversion from landfill. The effort that would be put into that policy could be better expended elsewhere.’

330. Grant Hodges representing the Climate Change Business Delivery Group went on to say—

‘I suggest that the debate on carrier bags has moved on. A few years ago, the introduction of a tax on carrier bags would have been good, but many retailers have now come up with their own solutions. I wonder about the costs of enforcement and whether the tax is necessary now.’

331. In evidence to this Committee, the Minister for Transport, Infrastructure and Climate Change commented—

‘We are not minded at present to make any changes to section 59 as it is important for ministers to have the power to use in future.’

332. The Minister explained—

‘The provision has the potential to influence behaviours in ways that undoubtedly support the climate change agenda by reducing the consumption of what are perhaps unnecessary quantities of goods. That feeds into the reduction of the manufacturing carbon cost of the associated items and the transport costs of goods going from wholesalers and distribution centres to supermarkets.’

333. The Committee notes that there exists opposition to the inclusion of this enabling power within the Bill. The RAE Committee draws the attention of this Committee to the scrutiny its predecessor committee conducted on this issue in 2006. This Committee notes that the proposal in 2006 was subject to a separate and full bill scrutiny process, rather than being included as a piece of enabling legislation within a wide-ranging bill.

334. This Committee also notes the evidence that action is already being taken by some retailers in respect of charging for carrier bags, and that public attitudes in relation to recycling and reusing carrier bags appear also to have shifted within the last few years. The Committee recognises that either the current provisions or a separate Bill could provide the means to implement a carrier bag charging regime.

335. The Committee recommends that the Scottish Government reflects seriously as to whether its approach in relation to this provision is the correct one. The Committee is not convinced as to the value of this approach, and notes that the timing of the proposal may owe more to the availability of this Bill as a suitable legislative vehicle for introducing enabling powers rather than the powers being urgently required.

CONSULTATION ON PROVISIONS IN PART 5

336. The Committee notes that a full Scottish Government consultation process had not been completed for many of the provisions in Part 5 of the Bill by the date of introduction. Of the consultations run on the Part 5 provisions, only one, on energy efficiency, had been completed and the Scottish Government’s analysis of responses published, by the time of the introduction. This attracted criticism from the committees scrutinising these sections of the Bill.

337. The report of the Rural Affairs and Environment Committee stated—

‘Before commencing evidence taking on the Bill the Committee wrote to the Scottish Government to express its frustration at the late stage at which a number of consultations on the provisions were undertaken. The letter focused specifically on the forestry consultation which closed on 27 January. Given the need for this Committee to report to the lead Committee in advance of its evidence session with the Minister for Transport, Infrastructure and Climate Change as the final session of evidence taking at Stage 1, this Committee has had to scrutinise these provisions without copies of the responses to the Scottish Government’s consultation being available.

The Committee acknowledges that the Minister for Environment at that time, Michael Russell, offered an apology for the late introduction of the consultation, and the Committee also appreciates that the Government provided a preliminary analysis of responses to a short timescale. Regardless of this, introducing a Bill in advance of the conclusion of consultations on its contents is not appropriate. Parliamentary committees

---

209 Scottish Parliament Rural Affairs and Environment Committee. 2009 (Session 3) Report on Climate Change (Scotland) Bill.
should be afforded the right to undertake scrutiny of legislation with all of the relevant information at their disposal.

The Committee is also concerned that a number of areas of uncertainty remain about the specifics of the Government’s proposals that the Bill’s provisions would enable. Limitations in the accompanying documents and in the supplementary information provided by the Government creates a perception that the Government’s proposals are still evolving despite the Bill having been introduced a number of months ago.

The Committee wishes to express its frustration that it has been asked to scrutinise and potentially endorse broad enabling powers to a relatively tight timescale and with a lack of sufficiently detailed information at its disposal.210

338. The Economy, Energy and Tourism Committee raised similar concerns in its report to the Parliament and this Committee, commenting—

‘It is clear to the Committee that in relation to the provisions on energy efficiency (section 48), the energy performance in non-domestic buildings (section 50) and the promotion of renewable heat (section 51), an excessive amount of the policy detail remains unclear or is still subject to consultation either in Scotland or by the UK Government.’211

339. This Committee questioned the Minister for Transport, Infrastructure and Climate Change on the way that these consultations had been handled by the Scottish Government. He commented—

‘We would certainly prefer to have completed the consultations, wherever we can, not simply to inform the deliberations of committees, important though they are, but to give us a different basis for proceeding. I would prefer to avoid the situation that you describe… I made the point before…that we are willing to engage in further evidence sessions at stage 2 if that is felt to be assistance to the committee.’212

340. In the view of this Committee, the consultation arrangements for the provisions in Part 5 of the Bill were poorly handled by the Scottish Government. It is concerned that several consultations were not completed prior to the introduction of the Bill. In particular, it seems that the consultation process related to the forestry provisions of the Bill was badly out of sync with the introduction of the Bill. This meant that the Rural Affairs and Environment Committee, and a number of other interested parties, devoted time to scrutinising the leasing proposals in the Bill, only for them to be dropped once the outcome of the consultation was known. Whilst the Committee welcomes the fact that the Scottish Government was responsive to the results of this

210 Scottish Parliament Rural Affairs and Environment Committee. 2009 (Session 3). Report on Climate Change (Scotland) Bill.
particular consultation, the Committee considers it is unfortunate that Parliament’s
time and that of witnesses was in effect wasted in this way.

341. The Committee recognises that this Bill presents an opportunity to legislate
on matters which relate to tackling climate change. However, it is a concern that
the Scottish Government considered it appropriate to include several provisions on
the face of the Bill for which the policy development process was plainly
inadequate. The Committee therefore recommends that in future, where there
is a strong possibility that legislative proposals will be substantially altered
by the outcome of a consultation, they are only brought to the Parliament
once that consultation has been completed and the results properly
assessed.

FINANCIAL MEMORANDUM

342. Under Standing Orders Rule 9.6, the lead committee at Stage 1 is required to
consider and report on the Bill’s Financial Memorandum. In doing so, it is required
to consider any views submitted to it by the Finance Committee.

Report by the Finance Committee

343. At its meeting on 13 January 2009, the Finance Committee agreed to adopt
level three scrutiny in relation to the Bill.213 The Committee took oral evidence at
its meeting on 10 February 2009 from SEPA, the Federation of Small Businesses
(FSB) and from Scottish Government officials. The Scottish Government and the
FSB submitted supplementary written evidence after they gave oral evidence to
the Committee. The Finance Committee received ten additional written
submissions.

344. The Finance Committee’s report contains a summary of the costs outlined in
the Financial Memorandum and outlines the evidence received, which focused in
particular on the advisory functions provisions in the Bill and issues around
forestry, waste reduction and recycling.

345. The conclusions of the Finance Committee are as follows—

‘The Committee acknowledges the uncertainty over some of the costs
associated with the Bill, particular in relation to the performance of unproven
technologies and methods for reducing carbon emissions. The Committee
accepts that the Financial Memorandum adequately reflects these margins of
uncertainty.

The Committee notes the enabling nature of the Bill, particularly regarding
the provisions contained in Part 5. Significant concern was raised, however,
in evidence that not enough details have been made available on the likely
cost impacts of these possible, future regulations. The Committee considers
that the Financial Memorandum would have been stronger if modelling work
had been carried out on the potential financial impact of the measures on
businesses and public bodies. The Committee also considers that in a

213 Climate Change (Scotland) Bill. Financial Memorandum. Available at:
number of areas insufficient policy direction has been provided, which has made it difficult for local authorities and businesses to be able to assess the financial impact of the proposals.

The Committee notes that the Scottish Government is currently undertaking significant pieces of work to finalise some aspects of its policy, namely, the Scottish Government’s strategic overview project, an options review on the forestry proposals and the consideration of energy efficiency scenarios. The Committee considers that this work will provide vital indications of future costs. Given the significant implications of this work, the Committee would have preferred that it had been completed in time for its consideration of the Financial Memorandum to the Bill. As a result, the Committee expects to take an interest in scrutinising the financial impact of the outcomes of this work.

The Committee, nonetheless, welcomes the Government’s commitment that all substantive regulations will be accompanied by a fully costed regulatory impact assessment.

Where significant expenditure associated with a bill will only become apparent with subordinate legislation, the Committee has in the past noted that it will track the subsequent statutory instruments and seek to scrutinise the financial implications. The Committee gives notice that it may seek to do so for instruments arising from this Bill.

Given the long-term perspective of the Bill, and the wide range of policy streams that may contribute to its implementation, the Committee recommends that the Scottish Government should consider how it will monitor and control the cumulative costs of implementation.

Views expressed to this Committee

346. The views expressed to the Finance Committee regarding the uncertainty in relation to some of the costs associated in the Bill were reflected in evidence to this Committee. Councillor Alison Hay of COSLA commented, for example—

‘As I understand it, the bill is broad ranging. I agree that we need to know the cost...We talked about the need for a minister-led body that could examine the issue, including the gaps, the barriers and where new resource will be needed. Such a discussion needs to be led from the top, but we are happy to engage in it.’

347. The Committee also notes that there is a degree of uncertainty regarding the impact of the Bill on jobs. Stephen Boyd of the STUC commented—

‘We are supportive of that [climate change] agenda and believe that jobs can be derived from that. On balance, we expect that to be beneficial to Scotland. However, I do not think that the detailed work has been done that would

---

allow us to make a properly informed estimate of the net jobs impact. There are bound to be pluses and minuses, but it is difficult to give detail. 215

348. Stephen Boyd went on to comment that ‘we would support work on job impact evaluation’. 216 Grant Hodges of the Climate Change Business Delivery Group suggested that—

‘The potential exists for the creation of green jobs to result in a net positive. Many more jobs will arise from a sensible and well-thought-through programme that meets the targets. We are going through tricky economic times. The challenge is to ease the switch of jobs from the old economy to the new economy.’ 217

349. In relation to the impact of the Bill on jobs, the Minister for Transport, Infrastructure and Climate Change commented on a suggestion that it may result in 16,000 jobs. The Minister stated—

‘The figure is for 16,000 new jobs—I do not claim that it is a net figure. However, in industries that will have to make changes in response to the climate change agenda, there will be considerable work in conversion and adaptation, as we add technologies. There will be the potential for employment opportunities even in the industries in which the greatest amount of change takes place.’ 218

350. The Committee notes that this figure appears to derive from the UK Renewable Energy Strategy consultation document published in 2008 which estimates that there could be 16,000 jobs in energy-related opportunities in Scotland over the next decade. 219

351. In relation to the uncertainties contained in the Financial Memorandum, the Minister for Transport, Infrastructure and Climate Change told the Committee—

‘Will we update the financial memorandum? As a matter of course, we certainly expect to update it to reflect any changes that we make at stage 2. However, it is inevitable in such a bill that we are dealing with estimates. The figures are not undebatable and they cannot be made so. They give the best ranges of figures that we can give.’ 220

---

Conclusion on Financial Memorandum

352. This Committee endorses the conclusions contained in the report of the Finance Committee, and in particular its strong comments regarding the uncertainty of the figures contained in the Financial Memorandum. The Committee welcomes the intention of the Finance Committee to take an interest in the financial impact of the outcomes of the Scottish Government’s ongoing work on climate change, and the indication that it may scrutinise the financial impact of any subordinate legislation brought forward under the Bill. However, the Committee believes that the financial information provided is totally inadequate given the scope and importance of this piece of legislation and a revised financial memorandum is required before the Bill can be approved. This Committee therefore recommends that the Scottish Government prepare a revised financial memorandum in advance of Stage 3 consideration of the Bill.

353. The Committee is extremely concerned that the job implications of the provisions in the Bill have not been properly assessed. The Minister has indicated that 16,000 new jobs may be created in one particular sector, but there is no indication as to the net impact on jobs, both positive and negative, of the Bill proposals. The Committee notes that this unfortunate situation has arisen because the Bill sets framework for targets, but the specific policies needed to meet these targets have not yet been articulated.

354. The Committee is very disappointed that it is being required to consider a Bill whilst having little indication from the Scottish Government as to its impact on jobs. The Committee believes that this information must be included as an integral part of detailed plans brought forward by the Scottish Government for the meeting of the targets. The Committee therefore recommends that the Scottish Government provides, as a matter of urgency, details on how it intends fully to assess and present the job implications of plans it brings forward under this Bill. The Committee recommends that these plans must be developed in partnership with employers and trade unions to ensure that potential job losses can be avoided and job opportunities in sustainable industries are maximised.

SUBORDINATE LEGISLATION

355. The Subordinate Legislation Committee (SLC) considered the delegated powers provisions in the Bill at Stage 1. The SLC Committee submitted a report to this Committee as the lead committee for the Bill under Rule 9.6.2 of Standing Orders. A copy of the report can be found at Annexe B and the key conclusions are set out below.

Section 19 – Meaning of advisory body
Section 20 and Schedule 1: Scottish Committee on Climate Change

356. The SLC considered the delegated powers in sections 19, 20 and Schedule 1 to be acceptable. The SLC draws to the attention of the lead and secondary committees for the Bill (in relation to the effect of the delegated powers contained in sections 19, 20 and Schedule 1) that the Explanatory Notes with the Bill (paragraph 33) and the Policy Memorandum (paragraph 31) indicate that
Ministers will require to seek expert, independent advice from the advisory body, but the Bill provides –

(a) in section 19(1) and (5), that a designated advisory body may be any public body as Ministers consider appropriate, which may be a person or body with functions of a public nature (not necessarily independent of the Scottish Ministers or Government), and

(b) in Schedule 1, paragraph 2, that the members of the Scottish Committee on Climate Change shall be appointed by the Scottish Ministers.

357. The SLC acknowledged, however, that in relation to those statements in the Policy Memorandum and Explanatory Notes, “independent” is capable of having different meanings and does not necessarily refer to a body which is wholly independent of the Scottish Ministers.

Section 26 – Guidance to advisory body
Section 27 – Power to give directions to the advisory body

358. The SLC drew to the attention of the lead and secondary committees for the Bill the delegated powers conferred on the Scottish Ministers in sections 26 and 27 to issue directions and guidance to the advisory body given that the Explanatory Notes (at paragraph 33) and the Policy Memorandum (at paragraph 31) indicate that the advisory body shall provide independent advice to the Scottish Ministers.

Section 36 - Duties of public bodies relating to climate change

359. The SLC reported to the lead committee that the power under section 36(1) to impose climate change duties on public bodies is extremely wide in its scope, in particular as neither the public bodies which may be subject to climate change duties nor climate change duties themselves are adequately and clearly defined.

360. The SLC also recommended that this could be mitigated to some extent by provision of a list of public bodies to whom the power is to apply along with a power to add to the list subject to affirmative procedure. This would be in line with the approach adopted to other regimes regulating public bodies such as freedom of information.

Section 37 – Guidance to relevant public bodies

361. The SLC considered that the Scottish Government response did not aid its consideration of this power. The SLC concluded that it would be appropriate for the Parliament to have a role in scrutinising the guidance produced under section 37 because of its potential impact, and recommends that guidance under this section should be laid before Parliament for a period prior to implementation, and any resolutions of the Parliament made in respect of the draft guidance during that period taken into account.

Section 47 - Power to modify functions of Forestry Commissioners

362. The SLC drew to the attention of the lead committee that the power under section 47(1) to modify the functions of the Forestry Commissioners in or as
regards Scotland is, in the opinion of the SLC Committee, very wide in its scope as there is no limitation within the power on what may be done in exercise of the power beyond that it must deliver a climate change purpose.

Section 52(1), (2) and (4) - Waste prevention and management plans
Section 53(1), (2), (3) and (5) - Information on waste
Section 54(1), (2), (4) and (5) - Recyclable waste: facilities for deposit etc.
Section 56(1), (2), (3) and (6) - Procurement of recyclate - regulations

363. The SLC reports to the lead committee and to the Parliament that these powers are expressed in very broad terms and that there is nothing on the face of the Bill to restrict their application to purely commercial activity.

Section 57(1), (2) and (4) – Targets for reduction of packaging etc.

364. The SLC reports that the Parliament should be made aware that these powers are expressed in very broad terms and that there is nothing on the face of the Bill to restrict their application to commercial activity.

Conclusion on subordinate legislation

365. This Committee notes all of these recommendations and is minded, in particular, to support the call for the Bill to include a list of public bodies to whom the duties under section 36 will apply. The Committee recommends that the Scottish Government provides a written response to this Committee and the Subordinate Legislation Committee ahead of the start of Stage 2 which addresses the points raised in the Subordinate Legislation Committee’s report. Subject to the response from the Scottish Government, these are issues which this Committee may return to at Stage 2.

GENERAL PRINCIPLES OF THE BILL

366. The Committee has discussed in this report the significance of the Climate Change (Scotland) Bill in setting out a framework for delivering challenging reductions in greenhouse gas emissions in the years to 2050. The Committee welcomes the Bill and endorses its general principles.

367. The Committee believes, however, that the Bill as introduced can and should be improved, to ensure that it meets the aspiration of being a leading example of climate change legislation. The Committee has made a number of recommendations in this report on how this could be achieved, but highlights two in particular.

368. First, strong early action is needed in order to secure the necessary reductions in greenhouse gas emissions. The Committee recommends that, in order to achieve this, the framework set out in the Bill in respect of targets between 2010 and 2019 needs to be altered, with the Scottish Government specifying much more precisely what emissions reductions will be expected during this period. The proposed new 2020 interim target will directly influence the annual targets during this period and the Committee has made recommendations which suggest either bringing forward the date at which Scotland reaches the 3%
annual reduction or providing explicit percentage reduction targets for each year from 2010.

369. Second, the Committee recommends that the Scottish Government should focus its attention on how the reductions in greenhouse gases required by the Bill will actually be delivered. We are concerned to avoid drift in bringing forward strategies and implementation plans, at the lack of detail in the financial memorandum and at the lack of risk analysis in such an obvious area as job impacts and opportunities. Given the emphasis on early action we cannot wait for perfect assessment tools or for comprehensive plans. The Scottish Government must demonstrate its intent by action, by adapting its policies and budgets to meet the over-riding importance it claims tackling climate change should be given.

370. It is vital that the Scottish Government addresses these and other key recommendations in this report if the Climate Change (Scotland) Bill is to provide a framework which will deliver fully on the objective of contributing to the global efforts to reduce dangerous climate change. The Committee looks forward to further dialogue with the Scottish Government as the Bill progresses through the Parliament.
ANNEXE A

TRANSPORT, INFRASTRUCTURE AND CLIMATE CHANGE COMMITTEE

EXTRACT FROM THE MINUTES

25th Meeting, 2008 (Session 3)

Tuesday 16 December 2008

Climate Change (Scotland) Bill (in private): The Committee considered its approach to the scrutiny of the Bill at Stage 1.

TRANSPORT, INFRASTRUCTURE AND CLIMATE CHANGE COMMITTEE

EXTRACT FROM THE MINUTES

3rd Meeting, 2009 (Session 3)

Tuesday 20 January 2009

Climate Change (Scotland) Bill: The Committee took evidence on the Bill at Stage 1 from—

Philip Wright, Deputy Director Climate Change, Fiona Page, Head of Scottish Climate Change Bill Team, Andrew Henderson, Policy Officer Scottish Climate Change Bill Team, and Cameron Maxwell, Climate Change Policy Team, Scottish Government.

Climate Change (Scotland) Bill - witness expenses: The Committee agreed to delegate to the Convener responsibility for arranging for the SPCB to pay, under Rule 12.4.2, any expenses of witnesses on the Bill.

TRANSPORT, INFRASTRUCTURE AND CLIMATE CHANGE COMMITTEE

EXTRACT FROM THE MINUTES

4th Meeting, 2009 (Session 3)

Tuesday 27 January 2009

Climate Change (Scotland) Bill: The Committee took evidence on the Bill at Stage 1 from—

Professor John Mitchell, Director of Climate Science, Met Office;
Professor Peter Smith, Professor of Soils and Global Change, University of Aberdeen;
Phil Matthews, Senior Policy Advisor, Sustainable Development Commission Scotland;
Dr Andy Kerr, Assistant Director of Scottish Alliance for Geoscience, Environment and Society, University of Edinburgh;
David Kennedy, Chief Executive, and Katherine White, Economic Adviser, Committee on Climate Change.
Climate Change (Scotland) Bill: The Committee took evidence on the Bill at Stage 1 from—

Richard Dixon, Director, WWF Scotland;
Duncan McLaren, Chief Executive, Friends of the Earth Scotland;
Dave Watson, Scottish Organiser, UNISON;
Chris Hegarty, Advocacy Manager, SCIAF;
Gavin McLellan, Head of Christian Aid Scotland;
Judith Robertson, Head of Oxfam in Scotland.

Climate Change (Scotland) Bill: The Committee took evidence on the Bill at Stage 1 from—

Chris Austin, Head of Public Affairs, Association of Train Operating Companies;
Marjory Rodger, Director of Government Relations in Scotland, Confederation of Passenger Transport UK;
Derek Halden, Director, DH Consultancy;
Gordon Dewar, Managing Director, Edinburgh Airport, BAA Scotland;
Robert Ashdown, Head of Technical Division, Chamber of Shipping;
Gordon Wilmsmeier, Senior Research Fellow, Transport Research Institute, Napier University;
Dr Alice Bows, Lecturer in Energy and Climate Change, Sustainable Consumption Institute & Tyndall Centre;
Paul Tetlaw, Chair, Transform Scotland;
Jeff Gazzard, Coordinator, GreenSkies Campaign;
John Lauder, National Director for Scotland, Sustrans.
Climate Change (Scotland) Bill: The Committee took evidence on the Bill at Stage 1 from—

Ken Gibb, Chair, Sustainable Scotland Network;

Councillor Alison Hay, Spokesperson for Regeneration and Sustainable Development, and Anil Gupta, Team Leader for Environment and Regeneration, COSLA;

John Stocks, Manager, Scotland, Carbon Trust;

Mike Thornton, Director, Scotland, Energy Saving Trust;

Chas Booth, Senior Press and Parliamentary Officer, Association for the Conservation of Energy;

Stephen Boyd, Assistant Secretary, STUC;

Anne Douglas, National Secretary, Prospect.

Climate Change (Scotland) Bill: The Committee took evidence on the Bill at Stage 1 from—

Matthew Farrow, Head of Environment Group, CBI;

Brendan Dick, and Grant Hodges, Climate Change Business Delivery Group;

Jason Ormiston, Chief Executive, Scottish Renewables;

Colin Galbraith, Director, Policy and Advice, and Clive Mitchell, Strategy and Communications Manager, Scottish Natural Heritage;

Dr Chris Spray, Director of Environmental Science, and David Gorman, Head of Environmental Strategy, SEPA;

Geoff Aitkenhead, Asset Management Director, and Mark Williams, Business Strategy and Climate Change Manager, Scottish Water.
Climate Change (Scotland) Bill: The Committee took evidence on the Bill at Stage 1 from—

Stewart Stevenson MSP, Minister for Transport, Infrastructure, and Climate Change, Philip Wright, Deputy Director, Climate Change, Fiona Page, Head of Scottish Climate Change Bill Team, Cameron Maxwell, Climate Change Policy Team, Madeleine Cusack, Climate Change Policy Team, and Kevin Philpott, Waste Regulation Senior Policy Officer, Scottish Government; David Henderson-Howat, Policy Adviser, Forestry Commission Scotland.

Climate Change (Scotland) Bill: The Committee considered a draft Stage 1 report.

Climate Change (Scotland) Bill (in private): The Committee considered a draft Stage 1 report. The Committee agreed the report subject to minor amendments.

Economy, Energy and Tourism Committee

Remit and membership

Remit:

To consider and report on the Scottish economy, enterprise, energy, tourism and all other matters falling within the responsibility of the Cabinet Secretary for Finance and Sustainable Growth apart from those covered by the remits of the Transport, Infrastructure and Climate Change and the Local Government and Communities Committees.

Membership:

Ms Wendy Alexander
Gavin Brown
Rob Gibson (Deputy Convener)
Christopher Harvie
Marilyn Livingstone
Lewis Macdonald
Stuart McMillan
Iain Smith (Convener)

Committee Clerking Team:

Clerk to the Committee
Stephen Imrie

Senior Assistant Clerk
Katy Orr

Assistant Clerk
Gail Grant
The Committee reports to the Parliament and the Transport, Infrastructure and Climate Change Committee as follows—

BACKGROUND

1. The Climate Change (Scotland) Bill (“the Bill”) was introduced to the Scottish Parliament on 4 December 2008. The Bill was referred to the Transport, Infrastructure and Climate Change Committee as the lead committee, and to the Rural Affairs and Environment Committee as the secondary committee. Although it has not been formally designated as a secondary committee, with the agreement of the lead committee, the Economy, Energy and Tourism Committee took evidence on Part 5, Chapter 3 of the Bill as energy efficiency and renewable heat issues fall within the Committee’s remit.

2. In addition to the written submissions of evidence received, the Committee held three oral evidence-taking sessions as follows—

   Evidence from the Scottish Government’s Bill Team (4 February, 2009)

   Colin Imrie, Deputy Director, Energy Markets Division
   Sue Kearns, Head of Renewable Strategy and Onshore Renewables
   Jamie Hume, Deputy Director, Renewable Energy
   Gavin Peart, Assistant Head of Building Standards Division
   Alec Millar, Principal, Non-Domestic Energy, Building Standards Division
   Philip Wright, Deputy Director of the Climate Change Division
   Cameron Maxwell, Policy Adviser on Climate Change, Scottish Government

   Evidence from various interested organisations (4 February, 2009)

   John Stocks, Manager for Scotland, The Carbon Trust;
   Chas Booth, Senior Press and Parliamentary Officer, Association for the Conservation of Energy;
   Fergus Tickell, Managing Director, Northern Energy Developments Ltd;

---

1 Climate Change (Scotland) Bill, SP Bill 17, Session 3 (2008)
3. The Committee is grateful to all of those who gave both written and oral evidence to it. This information has proved to be useful in terms of preparing the Committee’s report. Copies of the written submissions, extracts from the minutes and from the *Official Reports* of the relevant meetings can be found in the annexes to this report.

**About the Climate Change (Scotland) Bill – Part 5, Chapter 3**

4. According to the Scottish Government, the main objective of the Bill is to set a long-term target to reduce Scotland’s emissions of Kyoto Protocol greenhouse gases by 80% by the year 2050. This long-term target will be supported by a framework of annual targets intended to drive the policies necessary for achieving this target. In the Scottish Government’s view, many of the policy measures required to meet these targets will not require legislation to implement them, but certain climate change mitigation and adaptation policies have been identified which do require legislation and the Bill contains provisions in Part 5 which will allow these to be taken forward.

5. For the Economy, Energy and Tourism Committee, it is the Bill’s provisions in Part 5, Chapter 3 that have been the sole focus of our evidence-taking and of this report. This Chapter contains three distinct sets of provisions. The first set of provisions in this Chapter require the Scottish Ministers to produce an action plan setting out their current and proposed measures to promote the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change towards energy efficiency. The second set of provisions contains measures for assessing the energy performance of existing non-domestic buildings in order to raise awareness of the contribution that those buildings can make to mitigating climate change through reducing energy demand and thereby emissions of greenhouse gases. The third set of provisions in this Chapter place a duty on the Scottish Ministers to take such steps as they consider appropriate to promote the use of heat from renewable sources.

---

2 Climate Change (Scotland) Bill, Policy Memorandum, SP Bill 17-PM, Session 3 (2008), p1.
3 Climate Change (Scotland) Bill, Policy Memorandum, SP Bill 17-PM, Session 3 (2008), p1.
6. The provisions in this section on energy efficiency are intended to cover how the Scottish Ministers will promote energy efficiency in Scotland, particularly in relation to how this will improve the energy performance of buildings in Scotland. The provisions require the Scottish Ministers to produce an action plan setting out current and proposed measures to promote the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

7. Currently, section 179 of the Housing (Scotland) Act 2006 ("the 2006 Act") requires the Scottish Ministers to prepare a strategy for improving the energy efficiency of living accommodation. Section 179(6) allows that strategy to be part of a strategy for improving energy efficiency generally. According to the Scottish Government, the proposals for an action plan in the Climate Change (Scotland) Bill will have that practical effect. The Scottish Ministers therefore propose to repeal section 179 of the 2006 Act to avoid duplication. In addition, the proposals in the Bill will, in the view of the Scottish Government, strengthen the existing statutory duty in the 2006 Act in terms of reporting and publishing. Bringing the duty in relation to living accommodation within the general duty in the Bill will, according to Ministers, ensure a consistent approach to tackling energy efficiency across all sectors, and will allow for better alignment of reporting on implementation and carbon savings, which can then be accounted against the overall target of this Bill.

8. The Scottish Ministers are required to report on the action plan annually, and to revise the action plan on a regular basis, but as a minimum every three years in line with the Spending Review process.

9. The Scottish Government notes that the action plan could be developed without the need for primary legislation, but the Scottish Ministers believe that a legislative requirement to develop, revise and report on an action plan will give it the weight which this issue requires. Furthermore, Ministers consider it will show the level of importance that these measures will play in tackling climate change and helping with rising fuel costs. It will also, in their view, be an important means for delivering a coordinated approach.

10. Section 49(1) requires the Scottish Ministers to lay the initial (energy efficiency) plan and any subsequent revised plan before the Scottish Parliament as soon as is reasonably practicable after it is published. Subsections (2) and (3) require Ministers to lay a report before the Scottish Parliament on what steps have been taken to implement the plan. The report must be laid within 12 months of the plan being first published and at least annually thereafter.

11. According to the Scottish Government, the aim of the provisions for improving the energy performance of existing non-domestic buildings is to raise the contribution that the existing non-domestic stock can make to mitigating climate change. This is supported by the Scottish Government's Energy Efficiency and Renewable Energy Strategy, which sets out a series of measures to improve the energy efficiency of buildings in Scotland. The provisions require the Scottish Ministers to produce an action plan setting out current and proposed measures to promote the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

4 Climate Change (Scotland) Bill, Policy Memorandum, SP Bill 17-PM, Session 3 (2008), p18-19.
5 Climate Change (Scotland) Bill, Explanatory Notes, SP Bill 17-EN, Session 3 (2008), p14.
6 Climate Change (Scotland) Bill, Policy Memorandum, SP Bill 17-PM, Session 3 (2008), p19-23.
climate change. Buildings account for over 40% of emissions and there is scope to reduce these levels. They are to be subject to an assessment of the emissions of greenhouse gases and energy performance, an enhanced form of energy performance certificate (EPC).

12. This is one of the areas of the Bill on which the Scottish Government is currently consulting. According to Ministers, the results of the ongoing consultation will inform the detailed route forward but could call on building owners or their delegated persons to draw up improvement action plans. These plans may include building work actions for owners to follow which lead to improved performance, and where appropriate could also include operational measures that building users may choose to act on. This would also apply to traditional and historic buildings, recognising that appropriate environmental improvements should be undertaken with due consideration to the historic character of the buildings in question.

13. As the policy memorandum notes, the provisions in this section of the Bill are enabling in nature and provide for regulations in a number of areas to be made in due course. This is particularly the case in relation to the content and form of assessment.

*Section 51*\(^7\)

14. Part 5 Chapter 3 of the Bill also places a duty on the Scottish Ministers to take such steps as they consider appropriate to promote the use of heat from renewable sources.

15. The Scottish Ministers have devolved responsibility for the promotion of heat from renewable sources. The Scottish Government’s policy aim is to build a commercially viable, diverse, renewable heat industry in Scotland. Renewable heat take-up across the UK is very low (<1%) and making progress on renewable heat will be crucial, according to the Scottish Ministers, if Scotland is to meet the EU 2020 target of 20% of final consumption of energy from renewable sources (which is made up of individual targets for electricity, heat and transport).

---

\(^7\) Climate Change (Scotland) Bill, Policy Memorandum, SP Bill 17-PM, Session 3 (2008), p23ff.
16. This section of the report sets out the key issues considered by the Committee in its scrutiny of Part 5, Chapter 3 of the Bill. These are set out on a section by section basis, following the numbering of the Bill itself, as well as looking at a number of more general issues.

General issues

The merits of a framework bill with enabling provisions

17. As noted by the Scottish Government itself, much of the Bill can be considered as ‘enabling’ giving the Scottish Ministers the power to take forward a series of initiatives, the detail of which will be part of consultations and which will be introduced through secondary legislation laid in the Parliament at a later date or through the issuing of documents such as the various action plans.

18. In the sections of the Bill of most interest to this Committee, namely sections 48 to 51 inclusive, this ‘enabling approach’ is especially apparent. As the Minister for Transport, Infrastructure and Climate Change (“the Minister”) told the Committee—

“The bill is a framework bill. The details of how its provisions will be implemented will largely be in secondary legislation. When the Government presents secondary legislation or policy documents, committees and parliamentarians generally will be able to probe the accompanying explanations and justifications, as is appropriate.”

19. However, this approach of presenting a ‘framework bill’ for which much of the detail on the planned implementation has yet to be published or is still subject to ongoing or further consultation once the Bill is passed, did receive some criticism amongst the witnesses giving evidence to the Committee.

20. For example, in relation to the proposed consultation on the energy efficiency action plan which follows the passing of the Bill, Chas Booth of the Association for the Conservation of Energy told the Committee that, “The Government has already consulted on the energy efficiency strategy, so I fail to see why another consultation on an action plan is needed.”

21. Similarly, when asked if it was necessary for the Bill to be passed before the detail of the energy efficiency action plan was published, Elizabeth Leighton of WWF Scotland said “There is no reason why it [the action plan] cannot go ahead now.”

22. Other sections of the Bill are also the subject of ongoing consultations to develop the detail of how the objective will be met. For example, as a Scottish
Government official noted in relation to the proposal to increase the proportion of heat generated from renewable energy sources, “the intention is to provide a market incentive that will work for individual householders. Exactly how that will work is the subject of the consultation.”

23. At the request of the Committee, the Minister provided further details setting out the current status of the various Scottish and UK consultations that are relevant to these sections of the Bill. These are set out in Tables 1 and 2 below.

---

24. The Minister also commented on the proposed ‘enabling approach’ when he gave evidence to the Committee and in particular on the balance that needs to be struck between such an approach and the need for parliamentary scrutiny at stage 1 of the legislative process. He said—

“…in every bill, there is a tension between what is contained in primary legislation and what is drawn forward in secondary legislation. It is quite proper that there is a debate on whether in any particular bill the right balance has been struck in that respect.”\(^{12}\)

25. Furthermore, the Minister indicated that he would be supportive of committees needing to take further evidence if required. On this he said—

“It is not unprecedented to hold further evidence sessions at stage 2, if that is appropriate. If that were the way to deal with some of the issues that we are not able to bottom out just now, the Government would be happy to co-operate and collaborate and to appear at that stage, if appropriate.”\(^{13}\)

26. He also said that, in relation to a timetable for the Bill after stage 1—

“It is not for me to speak for the Minister for Parliamentary Business, who represents our interest in such matters. However, I am interested in ensuring that, to the extent that it is possible, we flesh out any policy

27. In terms of the specific sections of the Bill, the Committee heard a number of concerns about the approach being adopted and also on the timetable for the eventual implementation of the various provisions. Firstly, concern was expressed that the time taken to enact the powers in sections 48 and 49 of the Bill and then conduct a further consultation and subsequently publish an energy efficiency action plan (after a period of up to 12 months) could prejudice the ability of the Scottish Government to meet its statutory targets for 2010 in part through its energy efficiency initiatives.

28. In response, a Scottish Government official told the Committee that it was the intention to publish “an outline of the plan in March [2009]” and that a “series of measures is already under way and to some extent the [energy efficiency action] plan will bring all that action together.”15 This was a point also made by the Minister when he appeared at the Committee.16 However, in his evidence to the Committee, Chas Booth of the Association for the Conservation of Energy said—

“The Scottish Government clearly has something drafted and ready to go. I understand that it does not want to publish it because it is worried that the plan will appear too weak, partly because of concerns about whether responsibility for energy efficiency is devolved or reserved and where the line between promotion and delivery lies. I share your view that 12 months is much too long—a couple of months are all that is needed.”17

29. The second main area of concern expressed by some of the witnesses giving evidence to the Committee related to the terminology used in the relevant sections of the Bill which, in certain respects, refer to a significant degree of latitude for the Scottish Ministers in terms of what they chose to do. For example, section 51(1) of the Bill as drafted – which deals with the promotion of renewable heat – states that, “The Scottish Ministers must take such steps as they consider appropriate [our italics] to promote the use of heat produced from renewable sources.”18 Similarly, in relation to non-domestic buildings, sections 51(1) and 51(2) as currently drafted give the Scottish Ministers the option of laying regulations and a series of possibilities on what “may” be contained therein.19

Devolved versus reserved powers

30. One of the difficulties cited by the Scottish Government in being more specific on the face of the Bill about how the objectives of the Bill in this Chapter

---

18 Climate Change (Scotland) Bill, SP Bill 17, Session 3 (2008)
19 Climate Change (Scotland) Bill, SP Bill 17, Session 3 (2008)
will be achieved, is the boundary between what is considered to be devolved and what is reserved to the UK Parliament.

31. The first example that arose relates to the ability of the Scottish Ministers to take steps to “promote” or to “improve” energy efficiency in Scotland. As the policy memorandum notes, “There are limitations on the actions that are within the legislative competence of the Scottish Government for promoting energy efficiency.”20 As the Minister stated in his evidence to the Committee—

“We must be conscious of competences, but I am entirely happy to put it on the record that the policy is to improve energy efficiency. The question whether we can incorporate the word "improve" in the legislation is simply to do with the devolved competence of the Parliament. I am entirely happy to ensure that we deal with and talk to colleagues at Westminster on that. We believe that we can, to an extent, make the change that is sought, but until I have further advice, I cannot give the committee a commitment to do so. We certainly understand the issue and we are seeking to deal with it.”21

32. This is believed to be the factor behind the decision to repeal section 179 of the Housing (Scotland) Act 2006, 22 which requires the Scottish Ministers to prepare a strategy for improving the energy efficiency of living accommodation. Section 179(6) allows that strategy to be part of a strategy for improving energy efficiency generally. According to the Scottish Ministers, repeal of this section and its replacement by the provisions in the Climate Change (Scotland) Bill will avoid unnecessary duplication and will have the same “practical effect”.23 In his evidence to the Committee on this point, the Minister for Transport, Infrastructure and Climate Change said—

“There is certainly no intention to dilute. The reason why we are having discussions is to ensure that we provide a legally binding response that ensures that no dilution is possible.”24

33. His view is not one shared by some of the organisations that gave evidence to the Committee. For example, Chas Booth of the Association for the Conservation of Energy said that “…there must be some way forward that ensures that section 179 of the 2006 act is not diluted.”25 Similarly, Elizabeth Leighton of WWF Scotland said—

“There is little doubt that “promote” dilutes the requirement in the Housing (Scotland) Act 2006 to “improve” energy efficiency. There must

---

20 Climate Change (Scotland) Bill, Policy Memorandum, SP Bill 17-PM, Session 3 (2008), p19.
23 Climate Change (Scotland) Bill, Policy Memorandum, SP Bill 17-PM, Session 3 (2008), p18.
be scope to maintain that and to import that language into the bill, rather than repeal the requirement, and to maximise, rather than minimise, devolved powers in that area.”

34. A similar issue relating to the boundary between devolved and reserved powers arose in relation to the promotion of micro-generation technologies such as micro-wind and solar thermal. A Scottish Government official told the Committee that Ministers consider the promotion of these technologies to be largely reserved and that is why the relevant initiatives would be part of any energy efficiency action plan and not on the face of the bill.

35. The central question for the Committee was whether the boundary between reserved and devolved competences placed any limitations on the ability of the Scottish Government to meet its various objectives. On this issue, the Minister told the Committee that—

“...energy efficiency is a shared responsibility for the Scottish Government and the Westminster Administration. I do not think that that sharing of responsibility should cause any great difficulties, as I have no indication that people are unwilling or unable to work closely together.”

36. Although no such indication was given by the Minister when he appeared before the Committee on 4 March to given oral evidence, in response to a further correspondence from the Committee, the Minister has now given a commitment to amend the Bill at stage 2 in respect of the issue of ‘promoting’ versus ‘improving’ energy efficiency. He said—

“It is proposed to seek to amend section 48(2) to replace the word “promote” with the word ‘improve’ to change this provision to “improve” the energy efficiency of living accommodation.”

37. The third, more general issue raised during the Committee’s evidence-taking is the setting of specific targets for the contributions that energy efficiency and renewable heat can play in meeting the overall targets within the Bill. For example, in relation to the proposed action plan on energy efficiency, Elizabeth Leighton of WWF Scotland said, “We recommend that it [the action plan] include targets for energy efficiency and that progress is reported, either in the annual report or as

---

part of an emissions reduction plan addressing demand reduction, energy efficiency and renewables.”

38. Her view was supported by Friends of the Earth Scotland in its evidence to the lead committee on the Bill, which states that “the reporting duties [in the Bill] should include detail on key measures such as energy demand reduction, and parallel consumption side reporting.”

39. In response to this issue, the Minister suggested that specific targets for energy efficiency and renewable heat were not required and that “all sectors of our economy and all elements of public, business and private life will need to make appropriate contributions [to the 2030 and 2050 targets set out in the Bill]”.

Incentivising investment in energy efficiency and renewable heat initiatives

40. The Committee also heard evidence more generally on how the Scottish Government might provide incentives to people and organisations to invest in energy efficiency and/or to consider renewable heat schemes or micro-generation technologies. One specific area which was explored was that of enabling local authorities to reduce the levels of council tax paid by householders who had made such investments. According to information received by the Committee, such a scheme is in place in Northern Ireland (via the system of rates) and in England and Wales (via the council tax).

41. In her evidence to the Committee, Elizabeth Waterson of the Energy Saving Trust told the Committee that “council tax incentives have, in theory, a big role to play in encouraging consumers to take action.” Furthermore, she said that “the level of incentive does not have to be that high” and that “talking to people about tax rather than energy efficiency is much more exciting for them and has a big impact.” Similarly, in relation to renewable heat systems in the domestic sector, Fergus Tickell of Northern Energy Developments Ltd., said, “There must therefore be innovative thinking about financial incentives, and in that respect, council tax rebates are interesting.”

42. This view was also shared by Scottish and Southern Energy in its submission to the lead inquiry which states that “all avenues should be explored, such as using local and national tax incentives to reward energy efficiency or microgeneration”.

31 Friends of the Earth Scotland. Written submission of evidence to the Transport, Infrastructure and Climate Change Committee.
36 Scottish and Southern Energy. Written submission of evidence to the Transport, Infrastructure and Climate Change Committee.
43. In his evidence to the Committee, the Minister was non-committal on whether this type of financial incentive would be taken forward in Scotland as it has been in other jurisdictions within the United Kingdom. He told the Committee that the Scottish Government was “quite open-minded” and was “happy to consider these matters.” However, he would not be drawn on the matter and indicated that, “We are considering other options, including loans and cashback offers. There is a variety of ways of proceeding on this agenda.”

‘Green jobs’ and skills gaps
44. One of the wider issues explored by the Committee is the potential to create employment opportunities through investments in energy efficiency and/or renewable heat initiatives. In an announcement made in February 2009, the Cabinet Secretary for Finance and Sustainable Growth outlined his plans to create up to 16,000 ‘green jobs’ over the next decade.

45. When questioned where these jobs would come from and also what proportion would be produced from the provisions set out in Part 5, Chapter 3 of the Bill, the Minister would only say in his written response that—

“The estimate of 16,000 new green jobs in Scotland by 2020 is based on the UK Renewable Energy Strategy consultation, which cited a figure of 160,000 new energy-related jobs in the UK by 2020. The estimate assumes that Scotland achieves a 10% share of jobs created across the UK. We consider, however, that the Scottish Government’s renewables targets, combined with Scotland’s natural resource, energy infrastructure and skills mean that we can go higher than this estimate.”

46. The Committee also sought to address whether the current education and training sector in Scotland is geared up to respond to the employment opportunities that may be provided through this Bill. According to Scottish Government officials, steps are already being taken in this respect—

“We are working on key elements of the renewable action plan and the heat action plan now, mapping out the critical powers, deciding what needs to happen between now and 2020 and beyond, and building on existing intelligence. Doing that hand in hand with industry is fundamental to our approach. We recognise that it is important to engage with industry, skills providers and potential employees—all the key stakeholders—in order to deliver.”

39 Scottish Government News Release, Green Jobs Blueprint, 2 February 2009
47. However, as Fergus Tickell of Northern Energy Developments Ltd, told the Committee, “Scottish Government ministers must realise that addressing the skills gap is a key part of the promotion of renewable heat and energy efficiency.” Similarly, John Stocks of The Carbon Trust said—

“...there are skills shortages throughout the supply chain, not just in renewables. There is a shortage of people who are skilled in ordinary energy efficiency. The Scottish energy officers network, which is the local authority energy managers meetings, is like musical chairs, only with more posts than people.”

48. The Minister also indicated that the skills gap was an issue in at least one respect. He told the Committee that—

“One general difficulty is the lack of skills in carbon assessment among planning officials. That has been a constraint, but work is being done to address it.”

The role of the Scottish Government in promoting energy efficiency in the public sector

49. During the course of our work, the Committee also took evidence from officials from Audit Scotland on that organisation’s recent audit of the energy efficiency performance in the public sector. This pointed to a range of areas where performance could be improved.

50. One of these relates to the ‘leadership’ role that can be played by the Scottish Government within the public sector in terms of the wider energy efficiency performance. When questioned on this, the Minister said in a written reply that “there is sufficient leadership shown at the higher levels of the public sector.”

Estimates of costs

51. A final, more general issue raised during the Committee’s consideration is that of the information set out in the Scottish Government’s Financial Memorandum for the Bill. This is also a subject matter that has been considered by the Parliament’s Finance Committee in its consideration of the Bill. In its overall conclusion, the Finance Committee stated that—

“The Committee notes the enabling nature of the Bill, particularly regarding the provisions contained in Part 5. Significant concern was raised, however, in evidence that not enough details have been made

---

available on the likely cost impacts of these possible, future regulations.”

52. Furthermore, the Finance Committee considered that—

“...in a number of areas insufficient policy direction has been provided, which has made it difficult for local authorities and businesses to be able to assess the financial impact of the proposals.”

53. Similar issues were raised in the Economy, Energy and Tourism Committee when taking evidence from the Minister. In his response, the Minister stated that—

“In the financial memorandum, we seek not to give false certainty about what is a framework bill that covers a long period of time but, rather, to give the best possible indication. As we approach many of the interventions, we will of course provide further financial information.”

54. He also indicated that he did not believe “that financial memorandums claim to be accurate” but that they were designed to be “estimates”. As a conclusion, the Minister stated that the Scottish Government would “continue to engage and to consider the financial costs that are associated with what is a framework bill to take us to 2050.”

55. Other matters relating to the costs of particular provisions, such as the proposed energy performance certificates, are covered in subsequent sections of this report.

Section 48 – Promotion of energy efficiency

General permitted development rights for micro-generation technologies

56. The issues of whether this section of the Bill should refer to a role for the Scottish Government to “promote” rather than “improve” energy efficiency, the possible contribution that an energy efficiency action plan will have to any targets for 2010, the use of council tax rebates and the issue of whether further consultation on an action plan is necessary, have all been considered in the preceding sections of this report. In addition, however, the Committee did take evidence on a number of issues relating to increasing the take-up of micro-generation technologies, including that of general permitted development rights for such technologies.

---

47 Finance Committee, Report on the Financial Memorandum of the Climate Change (Scotland) Bill, 4 March 2009, paragraph 75.
48 Finance Committee, Report on the Financial Memorandum of the Climate Change (Scotland) Bill, 4 March 2009, paragraph 75.
57. As stated above, the Scottish Government considers that the promotion of such technologies involves many issues that are reserved.\(^\text{52}\) As such, it has not provided any detail on its plans on the face of the bill. It is proposed that any such detail would be part of the energy efficiency action plan once published.

58. In its announcement in early February 2009, the Scottish Government stated that it would enable householders to install certain micro-generation equipment - such as solar panels, biomass systems and heat pumps - at their homes without requiring planning permission.\(^\text{53}\) However, as part of the same announcement, the Scottish Ministers stated that further work was needed to explore the feasibility of introducing such permitted development rights for air source heat pumps and wind turbines. The importance of such permitted development rights is that planning permission is granted as a right and there is no need to apply to the planning authority for consent.

59. In respect of the decision taken not to include certain technologies such as micro-wind and air source heat pumps for use in urban areas, Elizabeth Leighton of WWF Scotland said that her organisation was “hoping for a more positive approach to installation of microrenewables”.\(^\text{54}\) Her views were shared by Elaine Waterson of the Energy Saving Trust who told the Committee that, “Not only is it a hassle for consumers to have to go to the planning department and wait for a significant amount of time before they get planning permission, but there is a cost associated with that”.\(^\text{55}\) She also said that it made “sense for permitted development rights to be extended to community-scale developments.”\(^\text{56}\)

60. This view is also one shared by a range of organisations that gave evidence to the lead committee on this Bill. For example, Scottish Renewables said that it was necessary to “extend general permitted development rights for all microgeneration with sensible, evidence based limits included where appropriate”.\(^\text{57}\) Furthermore, Scottish and Southern Energy questioned whether the reference data and costs associated with ground source heat pumps used by the Scottish Government were out of date.\(^\text{58}\)

61. In respect of air source heat pumps, the Minister told the Committee that the omission was because of “…difficulties that we and the Westminster Administration are experiencing in getting an adequate definition of noise.”\(^\text{59}\) However, the Minister went on to say that additional work on air-source heat pumps and wind

---

\(^{58}\) Scottish and Southern Energy. Written submission of evidence to the Transport, Infrastructure and Climate Change Committee.

turbines is under way, which he hoped “will inform further changes that we could—I emphasise the word “could”—make later this year on permitted development rights.”

Section 50 – non-domestic buildings, assessment of energy performance and omissions

62. One of the main issues in relation to this particular section of the Bill was that of the precise approach to be taken by the Scottish Government to further develop the use of energy performance certificates (EPCs) in the non-domestic buildings sector and the costs associated with this.

63. The provisions in the Bill enable the Scottish Ministers to create regulations which could be used to place obligations on building owners, responsible authorities and other bodies for improving the energy performance of non-domestic buildings. In particular, the Bill allows for regulations to be created which will enable various approaches to be taken on the extent to which the enhanced EPCs are applied to the existing non-domestic building stock. How this might be achieved is outlined in the Policy Memorandum, which sets out seven possible options or scenarios and which vary, in part, in the level of compulsion on the part of the building owner to act on the recommendations made during the EPC process.

64. The Bill’s provisions in this respect were welcomed by the Association for the Conservation of Energy which thought EPCs were “useful” but that there should be “…some form of compulsion and that should go alongside finance—organisations should have a fund to which they can apply for investment in energy efficiency.” This organisation also called for an extension to the energy saving Scotland small business loans scheme as well as a domestic version of these grants.

65. In his oral evidence to the Committee, the Minister indicated that his preference was to move forward on the basis of option 2 as set out in the policy memorandum, namely enhanced EPCs on sale or rent for all buildings and all large buildings with additional guidance to promote uptake of recommendations and an increase in the frequency of certification. If this approach was not successful, he indicated he would be likely to pursue the extension of EPCs to all buildings, not just large buildings, and introduce compulsory uptake of recommendations. In short, he stated that “…compulsion will be necessary if the outcomes are not achieved.”

66. In subsequent written evidence to the Committee, the Minister went further and indicated that—

“...Stage 2 amendments are proposed to require, through secondary legislation, mandatory implementation of cost-effective improvements to existing non-domestic buildings. This SSI will be subject to affirmative resolution."\(^64\)

67. However, he also said in his letter that—

“It is not intended that this provision would be utilised immediately and as announced in the response to the consultation, a voluntary approach will be adopted initially to the implementation of cost-effective improvements to existing non-domestic buildings. This regulation making power is intended for future use if a voluntary approach is considered inadequate for delivering emission savings."\(^65\)

68. Whilst we welcome the further information provided by the Minister, the Committee is still not completely clear what is intended to be achieved and how, and we cannot judge at this stage whether the Scottish Government’s preferred option is likely to succeed.

69. Additionally, the Minister’s officials indicated that local authorities would be the enforcement bodies in respect of EPCs and that they would recover costs via penalty charge notices.\(^66\) On this particular issue, the Committee did not receive any submissions that indicated that this approach would be problematic. However, it is important to note that bodies such as the Convention of Scottish Local Authorities were not contacted specifically by the Committee for a view although it would have been free to submit evidence if it wished.

70. In addition to the direction of policy, the Scottish Government was also quizzed on the estimated costs for the various options for EPCs. In relation to the two likely scenarios suggested by the Minister (options 2 and 5), the estimates of the average annual costs to local authorities of the provisions relating to EPCs are £4.1m - £5.5m (option 2) and £27.7m - £37m (option 5).\(^67\) The potential costs for other bodies, individuals and businesses are £8.2m - £9.6m per year and £55.4m – £64.7m per year respectively.\(^68\) Finally, in relation to the costs for the Scottish Government, the ranges were a one-off cost of between £0.5m and £0.6m for options 2 and 5 respectively and an average annual cost of between £0.5m and £12.4m.\(^69\)

71. To provide greater clarity on the estimated costs, the Scottish Government has indicated that regulatory impact assessments (RIAs), with further cost estimates, will be produced, in due course, along with the secondary legislation to be laid in this area. However, such RIAs are not routinely provided to this

\(^64\) Scottish Government. Supplementary written evidence. Letter of 12th March, 2009. See the annexe to this report.
\(^67\) Climate Change (Scotland) Bill, Explanatory Notes, SP Bill 17-EN, Session 3 (2008), p37-39.
\(^68\) Climate Change (Scotland) Bill, Explanatory Notes, SP Bill 17-EN, Session 3 (2008), p37-39.
\(^69\) Climate Change (Scotland) Bill, Explanatory Notes, SP Bill 17-EN, Session 3 (2008), p37-39.
Committee when it considers draft Scottish Statutory Instruments. On this point, the Minister indicated that the Scottish Government “...will announce our definitive position, with the information that committees such as this one will need in order to make the necessary judgments.”70

72. A separate issue raised in relation to section 50 of the Bill was its focus only on the non-domestic sector. In evidence to the Committee, organisations such as the Energy Saving Trust and WWF Scotland called for the extension of such provisions to the domestic sector, the latter indicating that “...the [domestic] sector is responsible for more than a third of our emissions” and that “there is a gaping hole in the bill in that respect.”71

73. This was a view shared by Chas Booth of the Association for the Conservation of Energy who said that—

“We need considerably increased investment and powers to ensure that we bring [domestic] buildings with the poorest energy efficiency up to standard. If we do not make a real effort to do that, Scotland will be cursed with a group of people in the hardest-to-treat houses who will be permanently fuel poor.”72

74. Additionally, in its evidence to the Committee, the Energy Saving Trust called for enabling provisions for the domestic building sector to be included in the Bill.73 On this point, in supplementary written evidence provided to the Committee, the Minister said that—

“There are currently no plans to introduce requirements for further periodic energy assessments for the domestic sector other than the requirements for Energy Performance Certificates at sale or rent that have just been implemented. As outlined above, this is because we believe that we can continue to make progress in improving domestic energy efficiency within existing legislation.

The introduction of regulatory requirements for the energy efficiency of housing would, in any case, be likely to drive out CERT investment. This would be contrary to current policy which is to seek to maximise CERT activity in Scotland and means that many Scottish householders would be denied access to this support.”74

75. Finally, in relation to the current energy efficiency standards and the state of Scotland’s domestic and non-domestic building stock, the Committee heard

---

74 Scottish Government. Supplementary written evidence. Letter of 12th March, 2009. See the annexe to this report.
conflicting views. In response to a question from the Committee Convener, the Minister said—

“I would take issue if I may, convener, with the suggestion that we have the poorest standards. On the contrary, we have in many ways led many other jurisdictions to follow our example.”75

76. Furthermore, in relation to the Scottish Government’s recent announcement to set a 30% target for the reduction in emissions for both new housing and non-domestic buildings, he said that—

“At the moment, we are probably only marginally behind Finland, and our minimum standards for insulation are substantially better than those in Denmark, for example. Far from our standards being poor, by setting the target of 30 per cent on top of what we have already done, we are setting standards that are higher than anywhere else in the British Isles and in the majority of jurisdictions in Europe.”76

77. However, in its evidence to the lead committee for the Bill, the Energy Saving Trust stated that, “In the context of improving the energy efficiency of Scotland’s housing stock we therefore believe the Bill could and should go further” and that “it would seem sensible to include some provision within the Bill to make it easier for the Scottish Government to regulate energy performance improvements in the housing stock in the future.”77

78. This desire for additional action to be taken to improve the energy efficiency levels in existing domestic buildings was a prominent feature of much of the evidence that the Committee has received during its ongoing energy inquiry, especially when considering this issue of the current levels of fuel poverty in Scotland. For example, in the Royal Society of Edinburgh’s recent energy report, which it submitted to the Committee as part of this inquiry, it states—

“...we note that Scandinavian and German buildings are considerably more energy efficient than those in Scotland. Raising building standards in Scotland to the level in those countries could save approximately 20% of domestic energy consumption.”78

Section 51 – Renewable Heat

79. Some of the more general issues relating to the further development of renewable heat technologies, such as the possible use of financial incentives, have been addressed elsewhere in this report.

77 Energy Saving Trust. Written submission to the Transport, Infrastructure and Climate Change Committee.
80. However, one of the main points raised during the Committee’s deliberations on this particular section of the Bill was whether there should be an ‘obligation’ placed on Ministers to produce a renewable heat action plan and details on what a plan should contain.

81. Section 51(1) of the Bill, as currently drafted, states that Ministers must take such steps as they consider appropriate in relation to the promotion of renewable heat. This has been described by some members of the Committee as “a bit woolly.”\(^79\) In response, a Scottish Government official said that—

“At stage 2, we intend—subject to ministerial approval—to turn that into an obligation to produce an action plan and update it regularly. We need to do that to create a policy focus and keep the issue within that focus.”\(^80\)

82. However, when the Minister gave oral evidence, he stated only that—

“The process is slightly more complex than the minister simply issuing a fiat on the subject. The consultations on what we will introduce at stage 2 are in progress. I can assure the member that that is one of the issues that are being considered.”\(^81\)

83. On this point, one of Scotland’s leading developers of renewable heat systems, Fergus Tickell, told the Committee that—

“...the bill probably needs to be strengthened in respect of ministers’ obligation not just to promote but to deliver. That suggests that those of us who work at a practical level to deliver renewable heat and other forms of renewable energy projects have to be given the tools to do that.”\(^82\)

84. As can be seen above, although no such indication was given by the Minister when he appeared before the Committee on 4 March to give oral evidence, he has now provided further written evidence on the issue of whether there will be an ‘obligation’ on Ministers to produce an action plan on renewable heat. He said in his letter to the Committee that—

“It is proposed to amend the provision to introduce a commitment to produce an Action Plan and to update it regularly.”\(^83\)

\(^83\) Scottish Government. Supplementary written evidence. Letter of 12th March, 2009. See the annexe to this report.
CONCLUSIONS AND RECOMMENDATIONS

Background

85. Although not formally a secondary committee for the consideration of the Climate Change (Scotland) Bill, this Committee welcomes the opportunity to have taken evidence on the relevant sections of the Bill covering energy efficiency and renewable heat. The Committee is grateful to the lead committee – the Transport, Infrastructure and Climate Change Committee – for its understanding in this respect. The Committee places on record its desire for such collaborations between parliamentary committees to continue at stage 2 of the legislative process, given the highly cross-cutting nature of the Bill.

86. The Committee welcomes all the evidence received during its consideration of the Bill and is grateful to all the organisations that assisted us during our deliberations.

An ‘enabling’ bill, consultations and the legislative timetable

87. The Committee recognises that the Scottish Ministers always intended the Climate Change (Scotland) Bill to be a framework, which provides for a range of powers for the Scottish Government to take forward initiatives, such as an energy efficiency action plan and the promotion of renewable heat technologies, at a later date.

88. The Committee accepts that this approach will mean that there is always a balance to be struck between what is on the face of the Bill and what follows through secondary legislation if the Bill completes its legislative passage.

89. Furthermore, the Committee accepts that it is not unusual for the Scottish Government to continue to consult on certain provisions during the course of the consideration of a bill, particularly during this first stage.

90. However, it is clear to the Committee that in relation to the provisions on energy efficiency (section 48), the energy performance in non-domestic buildings (section 50) and the promotion of renewable heat (section 51), an excessive amount of the policy detail remains unclear or is still subject to consultation either in Scotland or by the UK Government.

91. The Committee was disappointed at the lack of detail provided by the Scottish Government’s officials when they appeared to give evidence at the Committee. It was because of this that the Committee felt it necessary to take additional, unscheduled evidence from the Minister in charge of the Bill. However, even after this, the Committee is still not in a position to have secured a detailed understanding of the policies and plans underpinning the relevant sections of the Bill.

92. This lack of clarity on the direction of policy makes it difficult for the Committee to fulfil its responsibility to scrutinise the policy and financial memoranda and to judge whether the measures in the Bill are adequate to meet the overall objectives.
93. The Committee believes that this is regrettable as it prevents the type of detailed scrutiny that we would ordinarily like to have subjected the Bill to. The Committee recognises that the Minister for Transport, Infrastructure and Climate Change has indicated that he will endeavour to provide committees with further detail – such as drafts of the various action plans and secondary legislation – and will be sympathetic to a revision of the timetable should the Bill be passed at this first stage.

94. The Committee recommends that the Scottish Government as a whole accepts the commitment given by the Minister in charge of the Bill that parliamentary committees must be afforded a reasonable amount of time to adequately scrutinise the Bill and works with lead committee and any other committee involved at stage 2 to set a realistic timetable going forward for this important, cross-cutting Bill. (RECOMMENDATION 1)

95. Furthermore, the Committee recommends that the Scottish Government agree to provide a revised financial memorandum, including more detailed and clearer cost estimates, for the sections of the Bill we considered. (RECOMMENDATION 2)

96. The Committee found it almost impossible to scrutinise adequately the provisions in relation to the use of energy performance certificates in particular, given the wide range of possible options that may be followed and the associated cost estimates.

97. Finally, the Committee believes that whilst the Climate Change (Scotland) Bill can be considered as a framework bill, we have reservations on the extent of the enabling powers and whether this gives too much discretion to the Scottish Ministers and insufficient powers to Parliament. We recommend that all the relevant secondary legislation proposed under sections 48-51 is subject, if they are not already, to affirmative resolution and that the Committee has the opportunity to see drafts of the instruments before they are laid. (RECOMMENDATION 3)

Reserved versus devolved powers

98. The Committee accepts that the ‘promotion’ of energy efficiency, renewable heat and micro-generation technologies is an area where both the Scottish and the UK Parliaments have an interest and legislative competence. We also believe that, in many respects, these are also areas where there are shared goals between the administrations.

99. The Committee does not consider the issue of what is reserved and what is devolved to prevent the Scottish Government from delivering on existing commitments to improving energy efficiency in co-operation with the UK Government and other parties.

100. The Committee recommends that the Scottish Government – at both official and ministerial level – continue to discuss matters of common interest with the UK Government and to report progress to this Committee in
respect of the subject matter of sections 48-51 of this Bill. (RECOMMENDATION 4)

101. The Committee welcomes the Minister’s recent change of policy and his commitment to introduce amendments at stage 2 to amend section 48(2) of the Bill to replace the word “promote” with the word “improve” to change this provision to “improve” the energy efficiency of living accommodation. **We recommend that the Minister takes all the necessary steps to ensure that efforts are made across the piece to improve and not just promote energy efficiency and the take-up of renewable heat and micro-generation technologies, and that the Minister brings forward amendments at stage 2 to maintain and extend the existing legislative provision in respect of living accommodation. (RECOMMENDATION 5)**

Targets

102. The Committee notes that the Scottish Government has stated a general policy against the setting of targets. However, this Bill does propose statutory targets for 2050 and interim targets, which we support. However, in respect to the contributions of energy efficiency and renewable heat, no such targets have been set.

103. **The Committee recommends that the Scottish Government clearly sets out how the monitoring and reporting procedures within this Bill will work and clarifies the roles of various bodies in this respect. (RECOMMENDATION 6)**

104. **Furthermore, the Committee recommends that the Scottish Government adds the setting of targets for its energy efficiency and renewable heat initiatives to the relevant sections of the Bill and brings forward the necessary amendments. (RECOMMENDATION 7)**

Financial and fiscal incentives

105. The Committee notes the calls made by many of the witnesses giving evidence to the Committee to introduce some form of financial or fiscal incentive to encourage people and organisations to invest in energy efficiency, micro-generation or renewable heat technologies.

106. **The Committee recommends that the Scottish Government investigates and reports back to the Committee, if possible before stage 2, on whether some form of rebate through local taxation systems to incentivise the take-up of energy efficiency, renewable heat and/or micro-generation technologies in the domestic and non-domestic sectors should be introduced, drawing on the experience and the success of such schemes in other parts of the UK. (RECOMMENDATION 8)**

Skills gaps and employment creation

107. The Committee is supportive of the efforts to create employment opportunities through the various energy-related provisions in this Bill. However,
the Committee is concerned at the evidence we have heard in relation to the potential skills gaps, including from the Minister himself. **The Committee recommends that the Scottish Government makes all efforts to plan accordingly and ensure that the education and training sector in Scotland is well-prepared and can respond to the growth in employment opportunities by providing the right number of people with the right skills at the right time, and reports back to the Committee on this as soon as possible. (RECOMMENDATION 9)**

**Specific recommendations in relation to sections 48, 50 and 51 of the Bill**

**Section 48 – contribution to the 2010 targets**

108. The Committee heard evidence that the production of an energy efficiency action plan has been underway since December 2004. The Committee also heard evidence that the time taken to pass the Bill, enact the various provisions and then consult and finally publish an action plan could impact markedly on the contribution that could be provided in meeting the 2010 emissions reductions targets by energy efficiency initiatives.

109. The Committee does not consider that it is necessary to consult further on its energy efficiency action plan and certainly not for a period of up to 12 months following the passing of the Bill. However, the Committee does welcome the statements made by the Minister that an outline plan will be published shortly. **The Committee recommends that the Minister ensures that energy efficiency projects are in a position to play a full and meaningful part in meeting the statutory targets for 2010 and thereafter. The Committee sees no reason why the action plan has to await the passing of the Bill and wishes to see the Scottish Government publish a full draft of the action plan before stage 2 of the Bill. (RECOMMENDATION 10)**

110. The Committee notes that the progress of the proposed Energy Efficiency and Micro-Generation (Scotland) Bill (a members bill) has been stalled due to the introduction of the Climate Change (Scotland) Bill and the indication from the Scottish Government that it intends to legislate in this area. The Committee also notes the recent announcements by the Minister providing for general permitted development rights to some micro-generation technologies but not, at this stage, to micro-wind or air-source heat pumps for use in urban areas.

111. The Committee notes that the Bill, as it stands, does not as yet take forward all of the main provisions that were to be part of the proposed Energy Efficiency and Micro-Generation (Scotland) Bill. **The Committee recommends that the Minister sets out the Scottish Government’s intentions in this regard during the stage 1 debate. (RECOMMENDATION 11)**

112. Furthermore, the Committee recommends that, subject to appropriate controls on noise etc., general permitted development rights are extended to micro-wind and air-source heat pumps for use in urban areas, as soon as possible. (RECOMMENDATION 12)
Section 48 - costs

113. The provisions in this section of the Bill put a duty in statute on the Scottish Ministers to produce a plan for promoting energy efficiency in Scotland. The action plan will provide details of the measures to improve energy efficiency and/or to promote micro-generation across all Scottish Government Directorates. This duty is part of current planned activity, is not expected to give rise to additional resources and will be met from within existing Scottish Government administration budgets.

114. The Committee understands why this particular form of words on costs is being made in the Financial Memorandum in that the ‘production’ of an energy efficiency action plan is not expected to be a costly exercise. However, we have serious reservations about the lack of detail at this stage on the costs of the measures that will be contained within the plan itself and we would question whether the overall climate change objectives can realistically be met without additional budgetary resources from within the Scottish Consolidated Fund. Whilst there may be an existing budget for publication of an energy efficiency action plan, the Committee believes that the successful passage of the Bill must result in the Government doing more than it is at present and we would be surprised if the initiatives in the action plan did not have cost implications.

115. The Committee has recommended above at paragraph 95 that a revised financial memorandum be produced and we would expect the costs identified above to be covered within this. (RECOMMENDATION 13)

Section 50 – recent announcements and extension of provisions to the domestic sector

116. The Committee notes that the Bill in section 50 currently applies only to the non-domestic sector. The Committee considers that there is no room for complacency in respect to energy efficiency performance and the standards within the Scottish building stock, commercial, industrial, the public sector and, critically, the domestic sector.

117. The Committee notes the recent announcements made by the Minister in response to the Sullivan Report to set a 30% target for the reduction in emissions for both new housing and non-domestic buildings. The Committee does not have sufficient evidence to make a judgement on this decision but we do want to see ambitious targets being set and we recommend that the Minister provides feedback on how the setting of a target of 30% is consistent with meeting the targets set within this Bill. (RECOMMENDATION 14)

118. Furthermore, despite our reservations on the ability to scrutinise the cost implications associated with the use of energy performance certificates, we welcome the provisions in this respect. However, we note the calls for similar enabling provisions to be introduced as part of this Bill to extend such ideas to the domestic sector and we recommend that the Scottish Ministers give consideration to this and outline their intentions during the stage 1 debate. (RECOMMENDATION 15)
Section 51 – an obligation to produce an action plan

119. As it is currently drafted, the Committee considers that the duties on the Scottish Ministers to take such steps as they consider appropriate to promote renewable heat are too vague. The Committee welcomes the additional written information provided by the Minister and his statement that he intends to amend the Bill at stage 2 to provide for a “commitment” to produce a heat plan. However, the Committee believes that this still does not go far enough and recommends that there should be an ‘obligation’ on the Scottish Minister to introduce, within a reasonable timeframe, an action plan to improve the take-up of renewable heat technologies in Scotland and to work with all the necessary parties to achieve progress in this area. Furthermore, we seek a clear timetable from the Minister for the introduction of the heat plan before stage 2 of the Bill. (RECOMMENDATION 16)

120. One area that we want to see progress being made is in relation to the use of combined heat and power (CHP), particularly in the industrial and commercial sectors and in urban areas for district heating. As part of our energy inquiry, we were impressed by the developments being taken forward by Diageo at Cameronbridge in Fife (a biomass-fired CHP plant) and by Aberdeen Heat and Power Ltd., tackling fuel poverty in municipal housing and public buildings. We want to see these initiatives replicated across Scotland and we will return to this issue, and that of capital support schemes, in more detail when we complete our energy inquiry in the coming months. At this stage, we recommend that the Scottish Government ensures that CHP systems, preferably using sustainable energy sources, are a part of its action plans for renewable heat and energy efficiency. (RECOMMENDATION 17)
ANNEXE A: EXTRACT FROM THE MINUTES

4th Meeting, 2009 (Session 3), Wednesday 4 February 2009

Present:

Ms Wendy Alexander  Gavin Brown
Rob Gibson (Deputy Convener)  Christopher Harvie
Marilyn Livingstone  Lewis Macdonald
Iain Smith (Convener)  Dave Thompson

Also present: Sarah Boyack and Nigel Don

Climate Change (Scotland) Bill: The Committee took evidence on Part 5, Chapter 3 of the Bill at Stage 1 from—

Colin Imrie, Deputy Director Energy Markets Division, Sue Kearns, Head of Renewable Strategy and Onshore Renewables, Jamie Hume, Deputy Director Renewable Energy, Gavin Peart, Assistant Head of Building Standards Division, Alec Millar, Principal Non-Domestic Energy, Building Standards Division, Philip Wright, Deputy Director of the Climate Change Division, and Cameron Maxwell, Policy Adviser in Climate Change, Scottish Government;

And then from—

John Stocks, Manager for Scotland, The Carbon Trust;
Chas Booth, Senior Press and Parliamentary Officer, Association of the Conservation of Energy;
Fergus Tickell, Managing Director, Northern Energy Developments Ltd;
Elaine Waterson, Strategy Manager, Energy Saving Trust;
Elizabeth Leighton, Senior Policy Officer, WWF Scotland.
8th Meeting, 2009 (Session 3), Wednesday 4 March 2009

Present:

Ms Wendy Alexander                Gavin Brown
Nigel Don (Committee Substitute)   Rob Gibson (Deputy Convener)
Christopher Harvie                 Marilyn Livingstone
Lewis Macdonald                    Iain Smith (Convener)

Also present: Sarah Boyack

Climate Change (Scotland) Bill (in private): The Committee agreed its lines of questioning.

Climate Change (Scotland) Bill: The Committee took evidence on the Bill at Stage 1 from—

Stewart Stevenson MSP, Minister for Transport, Infrastructure and Climate Change, Philip Wright, Deputy Director of Climate Change, Gavin Peart, Assistant Head of Building Standards, Sue Kearns, Head of Renewables Energy Policy Team, and Sarah Hart, Energy, Efficiency Policy Analyst, Scottish Government.

9th Meeting, 2009 (Session 3), Wednesday 11 March 2009

Present:

Ms Wendy Alexander                Gavin Brown
Rob Gibson (Deputy Convener)      Christopher Harvie
Marilyn Livingstone               Lewis Macdonald
Stuart McMillan                   Iain Smith (Convener)

Climate Change (Scotland) Bill (in private): The Committee considered an outline of a draft report to the Transport, Infrastructure and Climate Change Committee.

10th Meeting, 2009 (Session 3), Wednesday 18 March 2009

Present:

Ms Wendy Alexander                Gavin Brown
Rob Gibson (Deputy Convener)      Christopher Harvie
Lewis Macdonald                    Stuart McMillan
Iain Smith (Convener)              David Whitton (Committee Substitute)

Climate Change (Scotland) Bill (in private): The Committee considered a draft report to the Transport, Infrastructure and Climate Change Committee.
ANNEXE B: ORAL EVIDENCE

Scottish Parliament

Economy, Energy and Tourism Committee

Wednesday 4 February 2009

[THE CONVENER opened the meeting at 09:32]

Climate Change (Scotland) Bill: Stage 1

The Convener (Iain Smith): Welcome to the fourth meeting in 2009 of the Economy, Energy and Tourism Committee. We have a couple of guests with us this morning—Sarah Boyack and Nigel Don—who have a particular interest in the Climate Change (Scotland) Bill, and will be entitled to participate in the discussion.

I know that Wendy Alexander is running a little late this morning and will join us later. Also, a member of the panel is stuck on a train somewhere and will join us shortly.

The only item on the agenda is stage 1 of the Climate Change (Scotland) Bill. The committee is considering chapter 3 of part 5 of the bill, which deals with energy efficiency and renewable heat.

We have two panels this morning. The first panel is made up of members of the Scottish Government’s bill team—they rather outnumber us. Later, we will take evidence from a number of organisations with a particular interest in energy efficiency issues.

The bill falls within the remit of a number of committees. We have an understanding with the convener of the Transport, Infrastructure and Climate Change Committee, which is the lead committee, that we will comment specifically on the energy aspects in chapter 3 of part 5.

Lewis Macdonald (Aberdeen Central) (Lab): Convener, before you invite the members of the panel to introduce themselves, I would like to ask for clarification of one point. An aspect of the bill that we appear not to have been asked to consider relates to the privatisation of the forestry estate, which seems to be based on the proposition that it should be done in order to promote renewable energy. That clearly gives it an energy aspect. Which committee is considering that matter? Should this committee be asked to comment on the matter, as it involves energy?

The Convener: My understanding is that the Rural Affairs and Environment Committee is addressing that part of the bill.

Lewis Macdonald: Will that include the energy aspects?

The Convener: I presume that it will, but we will confirm that.

Lewis Macdonald: That would be helpful, because we might want to comment on energy-related issues at some point in the proceedings.

The Convener: Thank you for that.

I ask the panel members to introduce themselves briefly.

Philip Wright (Scottish Government Climate Change and Water Industry Directorate): I am deputy director, climate change division, which has responsibility for the bill as a whole. I and my colleague Cameron Maxwell can provide general context and background information if the committee wishes us to do so, and we can perhaps say something about the delivery of the bill and the duties that it contains.

Cameron Maxwell (Scottish Government Climate Change and Water Industry Directorate): I work with Philip Wright in the climate change division, which has responsibility for the bill. I and my colleague Cameron Maxwell can provide general context and background information if the committee wishes us to do so, and we can perhaps say something about the delivery of the bill and the duties that it contains.

Alec Millar (Scottish Government Directorate for the Built Environment): I am principal for non-domestic energy in the building standards division of the directorate for the built environment. I am examining the existing non-domestic building aspects.

Gavin Peart (Scottish Government Directorate for the Built Environment): I am assistant head of the building standards division, and I have a particular interest in non-domestic buildings.

Jamie Hume (Scottish Government Enterprise, Energy and Tourism Directorate): I am deputy director for renewable energy. I had hoped to be joined by my colleague Sue Kearns, who is our expert on heat, and the team leader within my division, but she is not here yet. The heat
aspect of renewable energy and the heat action plan sit within my division.

Colin Imrie (Scottish Government Enterprise, Energy and Tourism Directorate): I am the deputy director, energy markets division, and I am here to talk about the energy efficiency promotion measures in the bill.

The Convener: Perhaps someone from the Scottish Government could outline the purposes of the bill, particularly in relation to chapter 3 of part 5, and explain the provisions that it contains. I understand that there are some thoughts about amendments at stage 2, so it would be useful if panel members outlined them.

Philip Wright: I will briefly outline the background to the bill, and my colleagues will address the individual elements. The first four parts of the bill relate directly to climate change. Part 1 covers the setting of the targets, including the 80 per cent reduction in all greenhouse gas emissions by 2050, and the interim target of a 50 per cent reduction by 2030. Parts 2 and 3 cover the advice and reporting aspects, and clearly set out the requirements on, for example, annual reporting on different aspects of the bill, such as targets and performance. Part 4 covers the enabling powers to place duties on public sector bodies if the need should arise. Part 5 is an amalgam of various provisions that are linked to climate change and will help to support the delivery of the targets. Chapter 1 of part 5, on adaptation, is about placing a duty on ministers to report on the action that they plan to take to adapt to the impact of climate change, based on the United Kingdom-level risk assessment.

That is the general background. My colleagues will cover the individual provisions.

Jamie Hume: I will talk about renewable heat. It is fair to say that there is a UK-wide question about how renewable heat should be addressed in legislation. Ministers already have the ability to promote renewable heat, and the inclusion of renewable heat in the statute reflects its importance. The need to build a commercially viable renewable heat industry and to ramp up provision from the current estimate of less than 1 per cent of demand to the target—on which we consulted—of around 11 per cent of demand in order to meet the 2020 targets will, effectively, involve the development of a whole new industry. It is acknowledged that in order to do that, the main lever must come through a UK-wide mechanism—there must be a market lever and a regulatory mechanism. In February, the Department of Energy and Climate Change will issue a consultation on the renewable heat incentive.

We estimate that the renewables obligation for the provision of electricity from renewable sources is working effectively. According to 2007 figures, renewable electricity accounts for around 20 per cent of Scottish demand. The UK provisions will address the lack of any equivalent incentive for the production of renewable heat through the use of biomass heat pumps or solar thermal systems.

As committee members will be well aware, heat is important because it accounts for around 45 per cent of total energy demand; electricity accounts for around 26 per cent of demand. If we are to live up to the aspiration to meet 20 per cent of the total energy demand from renewable sources by 2020, it is clear that the step change on heat that I have mentioned will be necessary.

What is the current position? When it reported on renewable heat early last year, the forum for renewable energy development in Scotland recommended the introduction of a heat target. The analysis that we have carried out estimates that to meet the 20 per cent target, 11 per cent of heat would need to come from renewable sources, provided that we reached the targets of producing 50 per cent of electricity from renewable sources and running 10 per cent of transport on renewable resources. That is the figure in our consultation, and it was broadly supported by consultees.

The Scottish ministers and the Scottish Government have the power to prepare the ground for the broad, UK-wide regulatory mechanism and to do some of the softer things, such as providing information, encouraging heat mapping at local authority level, making available consumer information, examining skills needs, particularly around installation, and reviewing the building regulations. We propose to cover those elements and more in a renewable heat plan, which we will issue in the renewables action plan that we are due to produce by the end of June.

That is the background to the actions that we believe we can take to prepare the ground for the introduction of the UK-wide mechanism, which is expected to provide a significant market lever that will enable the renewable heat targets to be met on a UK-wide basis. As I have said, the inclusion in
the bill of provisions on renewable heat reflects the importance that the Scottish ministers attach to the issue and puts up front recognition of the step change that will be needed to meet the 2020 targets.

Colin Imrie: Shall I deal with the energy efficiency provisions?

The Convener: Yes, please.

Colin Imrie: The reason for including section 48, which will require the Scottish ministers to

“prepare and publish a plan for the promotion of energy efficiency in Scotland”;

is that energy efficiency will make a key contribution to meeting the carbon reduction targets that are set out in the bill. Section 48 will require ministers to prepare and publish the plan within a year of the section coming into force, and to review the plan at least every three years. It sets out that the plan

“must include provision about the promotion of the energy efficiency of living accommodation.”

It is proposed that the bill will repeal and replace section 179 of the Housing (Scotland) Act 2006, which requires the Scottish ministers to

“prepare a strategy for improving the energy efficiency of living accommodation.”

The energy efficiency plan that the bill proposes will cover living accommodation, but it will go wider than that; it will aim to be a comprehensive plan to promote energy efficiency across a range of areas.

09:45

We have committed to the publication by March of an outline of what the plan will contain. In general terms, it is expected that the plan will cover issues in the domestic sector, issues relating to the business sector and issues for the public sector, as well as issues concerning buildings specifically. It will cover the range of measures that are already in place, including advice networks, business loans schemes and the energy efficiency design awards, which were announced yesterday. We also expect it to cover microgeneration issues. When the outline is published, we will give a clear indication of what other measures will be included. We are working on that internally at the moment.

In terms of the drafting of section 48, I stress that the aim is to have a comprehensive plan that covers energy efficiency in its broadest sense. It is important to recognise that many powers relating to the regulation of energy markets, which have an influence on the way in which energy efficiency is delivered in Scotland, are the responsibility of the UK Government at Westminster. For example, the carbon emissions reduction targets scheme, which is an important obligation on companies to deliver energy savings, is regulated by UK regulations.

The important reason for being comprehensive in the approach, including in Scotland, is that the implementation of the scheme in Scotland has a major implication for the other measures that are designed to achieve energy efficiency. It is for that reason that the Scottish ministers are preparing a CERT strategy to increase the uptake of CERT in Scotland, to complement the measures that are being taken through the Scottish budget.

Alec Millar: Section 50 covers existing non-domestic buildings. The Sullivan report, which was published in December 2007, set out recommendations for the improvement of new buildings and existing non-domestic buildings, for which enabling powers could be included in the bill. Buildings account for more than 40 per cent of the emissions in the UK. However, as only 1 per cent of the building stock is replaced annually by new build, it will take a considerable time to achieve a significant improvement in the overall building stock. The aims of the provisions are to improve the energy performance of existing non-domestic buildings and to increase the contribution that such buildings can make to the mitigation of climate change. The provisions are required to enable the Scottish ministers to make regulations that provide for the assessment of the energy performance of non-domestic buildings and the emissions of greenhouse gases that are produced by or associated with such buildings.

A public consultation was opened in September and closed on 25 November. More than 500 invitations to respond were issued and we received 71 responses. The responses that could be published were published by the Scottish Government library on 22 January and were placed on the consultation website on 27 January. I have provided the committee with a link to that webpage. The report on the consultation is close to being finalised and is with the minister just now. We expect that we will be able to publish it very soon. We will send a copy to the committee.
We carried out an initial in-house analysis of the responses to the consultation, which indicated that the marker provisions in the bill—the assessment of the energy performance of existing non-domestic buildings and the assessment of emissions of greenhouse gases that are produced by or associated with such buildings—were strongly supported. The responses also indicated support for a database for non-domestic buildings. Proposals in that regard are being worked on.

The bill’s provisions will allow for action on various topics. The scope of energy performance certificates could be extended into assessments of carbon and energy performance. ACEPs will take account of operational ratings as well as asset ratings and could take account of embodied energy and carbon when a robust methodology is available. Such an approach would help to address the issue of historic and traditional buildings. The lifespan of assessments or certificates could be varied—EPCs currently have a lifespan of 10 years. Owners could be required to obtain ACEPs even when they are not renting or selling their properties, and they could be required to formulate and implement action plans to improve their building, as a result of the advice in ACEPs. Appropriate standards, for example on energy-efficient lighting, roof-space insulation or sub-metering, could be developed for such building work. Finally, local authorities or other bodies could be empowered to check ACEPs.

After the consultation report has been published we will develop options whereby the Scottish ministers can progress section 50 of the bill. That work will include consideration of whether the bill should be amended. Key areas in which respondents to the consultation were divided will need to be discussed with ministers. For example, respondents were divided on whether the cost-effective improvements for buildings that will be set out in ACEPs should be mandated through regulations. Respondents were also divided on whether there should be a wholly separate process for assessing the energy and carbon performance of historic and traditional buildings.

It is anticipated that the bill’s provisions will be implemented through regulations in a gradual, cost-effective manner. Regulations will be developed following detailed research, consultation and costing, and will be subject to the affirmative resolution procedure. The model will be similar legislation that was implemented gradually, such as the Disability Discrimination Act 1995.

The Convener: I thank the witnesses for their helpful opening remarks. This is a general question on a matter that is of concern to me and, I am sure, other members of the committee. Given how the bill has been formulated, we are being asked to take an awful lot on trust. Alec Millar has indicated that a number of provisions were still subject to consultation when the bill was introduced and might be significantly amended at stage 2. It is difficult for the committee to give the bill meaningful consideration at stage 1 if we do not know what shape it will take.

Is the approach that is being taken realistic? The options on EPCs have cost implications that range from £500,000 to £12 million for the Government, from £5 million to £65 million for businesses and from £2.5 million to £37 million for local government. Those ranges are big and reflect big differences in approach. Would it have been better to bring forward more detailed proposals in the bill? That would have enabled the committee comprehensively to consider the bill’s implications.

We must also wait for the results of the consultation before we find out what approach will be taken to renewable heat. To say that we have been given a pig in a poke might be to put it too strongly, but is it fair to say that we are being asked to take too much on trust?

Gavin Peart: We can provide a mock-up version of regulations, if that would help.

The Convener: It would help, but it would have been more helpful to explore such matters as part of our stage 1 consideration.

Jamie Hume: On renewable heat, we are not anticipating any great unanswered questions around cost implications for Government, local authorities or other stakeholders. The inclusion of section 51 reflects the importance that ministers attach to renewable heat. The detailed steps that will be taken towards meeting the target will be contained in the action plan to which I referred. The section is a sort of marker that flags up the issue. Heat is not mentioned anywhere in the Scotland Act 1998, so it is kind of devolved by omission. We have taken this opportunity to flag up the issue, given the importance of the heat sector in meeting the
Colin Imrie: As the briefing note states, in March to June 2007, there was a consultation on a draft energy efficiency and microgeneration strategy for Scotland. In June 2008, the Scottish Government published a consultation analysis, which summarised the points raised by respondents. The key difference in the bill is the intention to promote an action plan for energy efficiency rather than a strategy. The purpose is to focus on actions, but a clear statement has been made that the intention is to base the action plan on the results of the consultation that has already taken place—the consultation will feed into the action plan. The aim is to publish in March an outline of what will be in the plan.

Dave Thompson (Highlands and Islands) (SNP): I am particularly interested in how we deal with areas that are off the gas grid. At the moment, people in those areas use heating oil, liquid gas, coal and so on. Some 25 per cent of homes are off the gas grid; many are in the Highlands and Islands and have all sorts of other problems, too. The options that appear to be available, such as cavity wall insulation, would not be applicable to a lot of the housing in the north—traditional stone cottages, for example—which would not benefit from them. We need to consider external and internal cladding, which I believe is very expensive. Solar power, biomass, heat pumps and all the rest need to come into play, too. I understand that the current grant schemes are insufficient to stimulate demand for those things. I think that Jamie Hume said that the UK legislation will pick up on that and create incentives to stimulate demand for biomass and so on. Does he think that that UK legislation will be sufficient to deal with the problem and help develop biomass, solar power and so on?

Jamie Hume: Colleagues at Westminster recognise that those issues are fundamental, particularly for Scotland. I referred earlier to the difficulty of assessing the entire market and the issues that arise, measuring the extent to which solutions are being found and assessing how best to provide an incentive that works for consumers and which will benefit individuals in the circumstances that you describe.

My colleague Sue Kearns will keep me on track if I get any of this wrong, but the intention is to provide a market incentive that will work for individual householders. Exactly how that will work is the subject of the consultation. One option is that if someone were to install a renewable heat apparatus in their home, they would receive a benefit that would be paid for by a tariff on non-renewable heat providers—the utility companies and so on. Consideration is being given, for example, to whether it is possible to assess how much a particular appliance would generate over a period and provide an up-front cash payment to enable householders to install such equipment—that is one route that is being explored. Complications need to be ironed out. For example, if a householder who has installed such an appliance sells the property, where will the benefit go? How can the new occupants benefit?

Such issues are considered in the consultation, and it is very much the intention to address the kind of issue to which you referred, so that we not only take the action UK-wide that is necessary to meet the 2020 target but provide something for communities and individual consumers that is economically workable. Sue Kearns might want to add to what I have said.

Sue Kearns (Scottish Government Enterprise, Energy and Tourism Directorate): What Jamie Hume said is correct. We can take action at devolved level. For example, under the energy assistance package, which will be introduced in April to help alleviate fuel poverty, people will be able to get air-source heat pumps, if those are appropriate, in off-gas-grid houses. Through the Scottish biomass heat scheme we aim to help businesses in off-gas-grid areas and to encourage demonstrator district heating schemes. We are aware that in Scotland we must concentrate on opportunities for renewable heat in off-gas-grid areas.

Dave Thompson: It is encouraging to hear about what we can do at a devolved level. Have you explored other incentives for people who install such schemes, such as council tax reductions?

Jamie Hume: Our approach so far has been to agree that the renewable heat incentive is the right UK-wide mechanism to address the issue. Detailed questions are being considered as part of the consultation. There will be a lag, because the provisions will not come into force for 18 months or so. In the meantime, the action that is taken in Scotland will include action through the
grants schemes and support mechanisms to which Sue Kearns referred, and the action plan that we are producing will cover issues to which I referred, such as community awareness, skills needs in relation to installation and so on.

At this stage we are not considering incentives of the type that you suggest. I do not know what consideration has been given to such issues during the past few months, at either the UK level or the devolved level, but we can find out about that for you. Sue Kearns might know more of the history.

Sue Kearns: Dave Thompson’s suggestion has not come up. We consulted on the renewable heat action plan under the renewable energy framework, which is supportive of the production of a plan and a grants scheme. I think that people are thinking—they are right to think—that the main incentive will come from a UK regulatory mechanism. We do not know the details of that, so it is difficult to comment on whether additional incentives will be needed to make the approach work.

Lewis Macdonald: The bill will confer on the Scottish ministers a duty to “prepare and publish a plan for the promotion of energy efficiency”.

It is striking that the first thing that the bill does in that regard is to repeal a tougher law—the statutory requirement to “prepare a strategy for improving ... energy efficiency”, which is in the Housing (Scotland) Act 2006. Why is that?

Colin Imrie: It is proposed to focus on the promotion of energy efficiency in the general sense, which is consistent with the nature of devolved legislation. There is an expectation that what has been done in the context of the 2006 act will continue. There is no intention to undermine the current approach.

Lewis Macdonald: However, the bill will repeal section 179 of the 2006 act, which requires the Scottish ministers to prepare a plan for “improving”, rather than just promoting, energy efficiency. Do you accept that the approach in the bill dilutes the existing statutory provision?

Colin Imrie: That is certainly not the intention, but I hear what you are saying.

Lewis Macdonald: It might not be the intention, but is it the effect?

Colin Imrie: I do not have an answer to that. We can consider that point. It was certainly not the intention.

Lewis Macdonald: I am hearing both an answer and the absence of an answer to the question. The effect of the bill has to be our primary concern. Is it feasible to keep the new provision in the bill without repealing the existing provision in the Housing (Scotland) Act 2006?

Colin Imrie: The intention of the bill is to provide a comprehensive approach to energy efficiency. Therefore, it seems to make sense to include the housing provision in the bill. It was certainly not our intention to dilute the current approach and we will reflect on the point that you raised.

Lewis Macdonald: Do you recognise that it might be opportune to consider whether amendments could be lodged at stage 2 that would maintain the existing requirement to improve energy efficiency, rather than merely to promote it?

Colin Imrie: It is certainly the Government’s overall intention to improve levels of energy efficiency in Scotland across the board, and particularly in domestic accommodation.

Lewis Macdonald: That is helpful.

You talked about widening the effect of the requirements beyond the housing sector, which is covered by the existing legislation. What is additional in the promotion of energy efficiency sections of the bill, as distinct from the areas covered by your colleagues in relation to existing non-domestic buildings? I think that you mentioned the public sector in your introductory remarks. Is that the extent of the additional requirements under those sections?

Colin Imrie: The additional requirements relate to business and industry. They also relate to the public sector, in which a series of activities is already under way. The consultation on energy efficiency and microgeneration looked at a number of other areas, too, such as energy standards for equipment. Many of the issues are reserved or are subject to European legislation. An energy efficiency action plan has to recognise that we need to cover the approach in both reserved and devolved terms. A comprehensive approach is the best way to achieve progress.

Lewis Macdonald: You have described extending the provisions, limited though they may be, to a range of different buildings. How
do the provisions fit with the sections that Mr Millar has described in relation to existing non-domestic buildings? In other words, what is the application of the action plan for promoting energy efficiency in relation to existing non-domestic buildings? Is there duplication or a mutual reinforcement? What is the relationship?

Gavin Peart: Section 50 looks at the building itself. We are talking about the building fabric and the comfort factors of the building, rather than business energy use and that sort of thing.

Colin Imrie: On the business sector, one of the actions that we are undertaking is the setting up of a loan fund for small and medium-sized businesses to enable them to put in place improvements to their premises and to their activities as businesses. We are looking at that comprehensively. The aim is very much to ensure that the specific measures in section 50 and in the proposed action plan under section 48 are complementary and reinforce one another.

Philip Wright: I forgot to mention in my opening remarks what may be a relevant point on the advice that the Scottish Government will take from a body called the UK Committee on Climate Change, which was established under the UK Climate Change Act 2008. That committee produced its report, “Building a low-carbon economy—the UK’s contribution to tackling climate change”, in December, and energy efficiency is a key feature. The Committee on Climate Change views energy efficiency as playing a vital part in reducing emissions.

To pick up on Colin Imrie’s point about the need for complementarity between reserved and devolved issues, the UK Government will take from a body called the UK Committee on Climate Change, which was established under the UK Climate Change Act 2008. That committee produced its report, “Building a low-carbon economy—the UK’s contribution to tackling climate change”, in December, and energy efficiency is a key feature. The Committee on Climate Change views energy efficiency as playing a vital part in reducing emissions.

Colin Imrie: I mentioned a practical example in the form of the carbon emissions reduction targets scheme. The CERT scheme is run under regulations that are set out in the Energy Act 2008, which, although it was passed by Westminster, applies in Scotland just as much as it applies in England. However, it is generally accepted among energy companies and the Scottish Government, and more widely, that the way in which the scheme has been operated in the UK has tended to favour investment south of the border, rather than north of the border. The exact reasons for that are still being established and discussed in the context of the CERT strategy.

However, one reason is that the cheaper measures that the CERT scheme promotes, such as cavity wall insulation, cannot be undertaken in stone buildings, and there is a much greater number of those in Scotland than there is south of the border. Similarly, the nature of our urban tenement stock is different from that of housing stock south of the border. One of the current key priorities is, therefore, to ensure that the uptake of the CERT scheme in Scotland increases and that Scotland gets its fair share. The ability to tackle that in the energy efficiency action plan—even if it is not specifically the legislative responsibility of this Parliament—is a good reason to take a comprehensive approach.

Gavin Brown (Lothians) (Con): I begin by focusing on section 51, which relates to the promotion of renewable heat. Section 51(1) states:

“Ministers must take such steps as they consider appropriate”.

That seems a bit woolly, if I can put it that way. There is a clear obligation on ministers to produce and publish a plan in relation to energy efficiency. Given the importance of heat in reaching our carbon targets, why is there not an obligation to produce and publish a plan in relation to heat from renewable sources?

Sue Kearns: At stage 2, we intend—subject to ministerial approval—to turn that into an obligation to produce an action plan and update it regularly. We need to do that to create a policy focus and keep the issue within that focus.

Gavin Brown: So you intend to lodge an amendment to deal with that.

Sue Kearns: Yes.

Gavin Brown: Do you also intend to draw up a timescale? The timescale for the energy efficiency plan is 12 months. Will there be a timescale for the heat plan?

Sue Kearns: Yes. We have a renewable heat target for 2020; the indicative figure that has been discussed is for 11 per cent of heat to come from renewables by 2020. In order to reach that target, we will have to monitor progress, so we will need to produce a plan...
and update it regularly.

Gavin Brown: What timescale is likely to be set in the amendment?

Sue Kearns: We intend to produce the first renewable heat action plan this summer, and we will then work out a sensible interval for updating it. We are considering updating it once every two years.

Gavin Brown: I will move away from renewable heat and back to energy efficiency.

Given the amount of work that has been undertaken—to which Colin Imrie referred—on the consultation, and given the work that has been carried out for a number of years by organisations such as the Carbon Trust and the Energy Saving Trust, our level of knowledge is quite sophisticated.

Under section 48, the Government has a full 12 months to publish its plan for the promotion of energy efficiency—that is 12 months after the provision becomes enforceable, which is some time away yet. Let us imagine that the bill is passed just before the summer recess. Twelve months after that it will be summer 2010. However, legally enforceable targets will be set for 2010. Is it realistic to require the plan to be published more quickly, so that energy efficiency can make a meaningful contribution to the 2010 target? Many organisations that have given evidence to the committee put energy efficiency at the top of the chain—Friends of the Earth Scotland did that most recently.

10:15

Colin Imrie: The 12-month period was proposed in recognition of the importance of consultation in the preparation of the plan. A consultation will have to be carried out and responses will have to be analysed. We must ensure that the final version of the plan has been subject to that process and is as solid as possible.

However, it is important to take action straight away, as you said. For that reason, we propose to come up with an outline of the plan in March. In the context of statements that have been made recently, our expectation is that we will be able to publish the outline of the plan later this year, so that it can be subject to consultation, with the aim of ensuring that the plan can be in place as soon as possible.

Gavin Brown: I accept that consultation takes time. Is it the Government’s intention to take as much action as it can do before the bill is passed, so that energy efficiency can make a meaningful contribution to the 2010 target?

Colin Imrie: Yes, absolutely. A series of measures is already under way and to some extent the plan will bring all that action together. Discussions are going on about how to reinforce such measures in other areas. The reason for having an action plan is to ensure that the matter can be considered comprehensively, so that activity can be added in areas in which there are gaps.

Energy efficiency is already contributing, but if we are to meet the ambitious carbon targets it will have to contribute much more. Energy efficiency is one of the most cost-effective elements of carbon abatement. In many cases, measures pay for themselves in a relatively short time. However, the area is notoriously difficult, because it is about the behaviour of all individuals and businesses in society. That is a reason why the bill focuses on promotion.

Jamie Hume: I will add a couple of points about the timing of the action plan’s publication and about how quickly we can take effective action. It is worth noting that all European Union member states are required to produce by summer 2010 a renewables action plan that shows how they will meet the 2020 targets. The UK Government consulted on its renewable energy strategy in summer 2008 and is due to publish the final version of the strategy in summer 2009. It will then have a further 12 months in which to produce an action plan.

In the meantime, in recognition of the notorious difficulty of making progress on energy efficiency, which Colin Imrie mentioned, we are framing up an action plan for heat as part of the renewable energy action plan, focusing on the interim steps that we are taking. We are allowing ourselves a degree of flexibility to amend and update the plan as new information comes in. That is the approach that we are all taking to action plans on heat, energy efficiency and renewable energy more broadly. This is about focusing on what we can do immediately to make progress, rather than extending the planning period and attempting to capture everything that might happen during the next decade or so. We can revisit issues further down the line, when it makes sense to do so.
Cameron Maxwell: In light of the various measures that we have discussed around energy efficiency, buildings and renewable heat, it would be useful to set the overall context and explain some of the work that we are doing. We have the bill, the interim emissions reduction target of 50 per cent by 2030, the emissions reduction target of 80 per cent by 2050, and annual targets. As an important piece of the climate change work that we are doing, we are trying to set that work in the context of the short to long term to see where all the measures will come in. As has been mentioned, energy efficiency measures sit in the short to medium term, because it is cost effective to deliver a lot of energy efficiency measures. We are trying to identify where the key mitigating, carbon-saving measures will come in in the short, medium and long term, particularly to 2020, but also to 2030 and 2050, and the steps that we must take now to deliver them.

Sue Kearns and Jamie Hume mentioned the proposal for an 11 per cent renewable heat target by 2020. The advice, particularly from the Committee on Climate Change, whose report Philip Wright mentioned, is that if we do not do something about renewable heat now, we will not meet the target of decarbonising heat supply by 2050, which must be done if we are to meet our other targets. We must act now to push the market, encourage money to go into it, and encourage development to allow us to meet bigger targets later on. I thought it important to set all of that in context.

Marilyn Livingstone (Kirkcaldy) (Lab): I want to follow on from what Cameron Maxwell said about targets and the mitigating action that we need to take now. I have two concerns. First, as the convener said, there are big fluctuations in costs to local government. It has been said that the proposals will be self-financing, but I cannot see that happening; rather, I can envisage costs to local government being a barrier in the current financial climate. What do you have to say about that? Will you comment on non-domestic buildings in particular?

Secondly, various witnesses have said that there are skills gaps in technologies such as heat pumps rather than in standard energy efficiency work. Those skills gaps cannot be fixed in the short term, as programmes have to be planned, money must be spent, people must be found to be trained, and then they must go through the training programmes. If we want to invest in the new measures—which are welcome—but do not have the relevant skills in the domestic market, what provision will there be for fast-tracking? Will that be part of the energy efficiency action plan? Everybody says that that plan will be comprehensive but, like the convener, I would like to hear more at stage 1 about costs and planning for skills. We need that if we are to come anywhere near meeting our targets.

Gavin Peart: The intention is that the roll-out of the non-domestic buildings provision will be gradual. We are considering the regulations that will follow on from the primary legislation, which will be subject to regulatory impact assessments and the affirmative resolution procedure. Before those regulations are implemented, research will have to be done, and we will have to ensure that we get the best value and that the recommended measures are cost effective. The figures that accompany the draft regulatory impact assessment for the primary legislation have a wide range to provide a context for what are only enabling provisions.

Marilyn Livingstone: What is the timescale for the process?

Gavin Peart: It will take a number of years. People will get an initial assessment of their carbon and energy performance, after which an action plan will be worked up to give a timescale for implementation. As Alec Millar said, the consultation brought up the issue of whether the cost-effective recommendations should be mandatory. That issue might involve a stage 2 amendment, but we need to discuss the matter with our minister.

Jamie Hume: The skills gaps are a significant issue with different aspects. My perspective derives from having started work in the area only relatively recently. Several studies in recent years have considered the skills gaps and needs in renewable energy, the heat industry, energy efficiency and so on, and they have pointed to a challenge and an opportunity.

I mentioned earlier the possible focus of our Scottish action plan for the heat industry. It can certainly look at the skills needs and assess not just the numbers but how to deliver the skills, training courses and people to the industry. That points to an opportunity because our approach to the heat action plan, the renewable action plan and other activities is also about bringing economic benefits to Scotland. Skills gaps must be addressed in the heat industry, but that will create employment—there will be supply
chain opportunities for Scottish firms in the heat industry as well as in other parts of the renewable industry.

Our action plan must focus on not just assessing the numbers but taking the practical steps that have been described to ensure that we have people ready to do the installation work and other required tasks. That point links broadly to the announcement by the Cabinet Secretary for Finance and Sustainable Growth earlier this week on job opportunities in the renewables sector and the notion of a green-led recovery and green jobs for Scotland, to which we are alert.

Marilyn Livingstone: We have heard evidence over past months about the skills gaps. I presume that you consult people who work in the relevant areas, and I believe that much of the work has been done, so I am keen for best practice to be fast tracked. Like the convener, I am concerned about the woolly nature of things that we are asked to take decisions on. If we are to consider a skills action plan, the relevant work should be done now rather than in the future. I am concerned about timescales and cost implications.

Jamie Hume: I can offer a bit of reassurance. We are working on key elements of the renewables action plan and the heat action plan now, mapping out the critical powers, deciding what needs to happen between now and 2020 and beyond, and building on existing intelligence. Doing that hand in hand with industry is fundamental to our approach. We recognise that it is important to engage with industry, skills providers and potential employees—all the key stakeholders—in order to deliver.

Over the next month or two, we would welcome the opportunity to brief the committee in more detail on the renewables action plan and the emerging heat action plan—which we will take forward whether or not it comes through as a stage 2 amendment.

10:30

Sue Kearns: It might reassure committee members to know that there is a core skills group on renewables. It is led by the Scottish Further and Higher Education Funding Council and Skills Development Scotland, and it includes developers, colleges and a small heat installer. We are on the group, too. It is looking into what we can do to gain quick wins in filling the skills gaps in renewables—we are considering all forms of renewables, including microgeneration and heat—as well as the long-term measures that will have to be put in place.

Marilyn Livingstone: I am aware of that work. If we are going to train more people, there will be cost implications. Big discussions have been held in the Parliament on increasing the numbers of training places and modern apprenticeships. How will the action plan take those costs into account?

Jamie Hume: We will have to work out—more fully than has been done to date—a cost benefit analysis for all the proposals on renewables and low-carbon solutions. That analysis will be a key strand in the action plan, and the numbers for hardware, such as buildings and equipment, will have to be clear. Some renewables technologies will have infrastructure implications. We are developing our understanding of those implications and considering exactly what will be required in the long term—the investment that will be required and how it will feed through.

Earlier, we mentioned the regulatory mechanism that Westminster is proposing. Ultimately, measures will trickle through and impact on bills for domestic consumers. Whether we are talking about impacts on consumers, about skills and training costs, about the costs of large pieces of infrastructure or about the balance between public sector and private sector investment, they are all elements that will have to be considered in the renewables action plan and the heat plan within it.

The issues appear not to be fully understood yet, but they are being discussed. I was at the Renewables Advisory Board in London a couple of weeks ago, and we considered those very issues. They are acknowledged as a priority UK-wide, and they need to be explored and understood more fully.

Colin Imrie: Marilyn Livingstone mentioned the costs for local government. The bill will simply place an obligation on the Government to provide an energy efficiency action plan. No obligation to spend any money will flow on to local authorities or anyone else. The issues will have to be tackled on their own merits.

I will add to what Jamie Hume said. In Scotland, we could do a lot more work on energy efficiency in order to gain an economic benefit, which would apply to skills as well. It is assumed that putting in loft
insulation is not a highly skilled task, but developing an energy efficiency industry—an industry that is strong in the Scandinavian countries, for example—will require considerable skills, including entrepreneurial skills.

The energy efficiency industry is not a strong part of Scotland’s construction industry, but it should be, given the investment that will be required to meet our carbon targets. That is why the announcement was made this week on the importance of targeting economic benefits and jobs from the investments in renewables and low carbon. The various bodies involved will be working on that urgently. We have been in discussions with the Convention of Scottish Local Authorities about getting involved in the process, and we intend to cooperate with it to make progress.

Philip Wright: I apologise for making a further supplementary point, but I want to pick up on the costs to local government.

A new instrument is coming along—the carbon reduction commitment. It will apply to the non-energy-intensive sector, including retail and public sector bodies. There is a qualification threshold for inclusion within the carbon reduction commitment, and most local authorities in Scotland will qualify. In effect, a carbon trading scheme will operate between the different parties; local authorities will be part of that and will therefore be obliged to take action. It will encourage action that we know to be cost effective, so it should bring in savings rather than extra costs.

The Convener: For clarity, can you indicate where the instrument originates from?

Philip Wright: It is a UK-level instrument, although the issue is devolved. The Scottish ministers support it and are partners in it. It is a domestic commitment rather than being EU-driven, although it complements the EU emissions trading scheme.

Jamie Hume: I have spoken about analysing the costs and considering the cost benefits to which we have referred, and which Colin Imrie picked up on. We are heading towards an understanding of the commercial opportunities in heat, energy efficiency and renewables for Scottish firms in the supply chain. We need to develop a fully informed understanding that, although investment is needed, there are commercial opportunities in job creation and so on. We must get smarter about channelling resources in order to realise the maximum benefits for the Scottish economy.

Rob Gibson (Highlands and Islands) (SNP): To return to energy efficiency and microgeneration plans, can you give us a flavour of what your consultation has revealed about the ease or difficulty for people in taking up some of the options? What constraints on take-up have arisen in relation to permitted development rights and planning legislation? That is a starting point—I want to get a feel for the issue to understand why you have adopted such an approach in section 48.

Colin Imrie: We have acted on a key element of the consultation responses to the strategy that were published in May by establishing one-stop-shop advice centres for consumers. Those are now in place in the west, east and north of Scotland. Increasing the availability of advice is viewed as an essential element in the process of helping people to find ways to change their behaviour. That was one of the strongest points in the consultation responses, in addition to more general issues of raising awareness.

There was also considerable comment about building standards, in new buildings as well as in existing stock. As far as I can see, there is nothing specific on permitted development rights in the consultation responses, but we would be happy to come back with some information if it helped.

Rob Gibson: It would certainly help. Although the stated intention is generally welcomed, I am concerned about the difficulties of applying it.

We have heard about the difficulties in relation to skills. I am trying to tease out your sense of whether, once the bill is passed, we can make each of the provisions stack up so that people can get on practically with the job at an early stage. Do you have any further comments on that?

Philip Wright: I was going to make a point earlier on why we have included certain provisions with amendments trailed for stage 2. As much as anything, it is to get our ducks in a row so that we can deliver early action.

The Government is being pressed for early action. We took the opportunity last year to consult colleagues across the office to find out what action they felt needed to be taken and what powers they might want in order to ensure that the Government can deliver—as
Mr Gibson says—early action on the various commitments. The strategic overview that Cameron Maxwell mentioned is part of that package. It picks up all the action—not just the action that my colleagues have covered today but action across the Government, for which we already have the necessary powers.

The bill completes our legislative arsenal to address early action, and the strategic overview will bring out the extent to which that is possible. Our approach will also take account of the further advice that we will get from the Committee on Climate Change. We are taking a strategic view, and action will be taken in each of the relevant areas. When the Committee on Climate Change prepared its advice, it took account of the point about take-up that Mr Gibson referred to. One can take a theoretical view of what is possible by way of energy efficiency and what carbon savings might be, but one might not know what the take-up percentage will be, so it is necessary to make some assumptions. The thinking that has been done has taken that into account.

Rob Gibson: That is helpful.

The Convener: With Christopher Harvie’s forbearance, I will let Sarah Boyack come in at this point, as her question is on a similar issue.

Sarah Boyack (Edinburgh Central) (Lab): I want to follow up on Philip Wright’s comment about having all the equipment in one’s arsenal to tackle the issue quickly.

There are two specific gaps in the bill, the first of which is on incentives. Dave Thompson asked about fiscal incentives, particularly the incentive of taking money off people’s council tax bills. Evidence from England and Wales suggests that local authorities have used that mechanism highly successfully to promote energy efficiency. What are your views on that? There is a reasonable degree of cross-party support for a practical mechanism that gives householders an incentive and which allows partnerships to drive energy efficiency to develop between power utilities and local authorities. The Energy Saving Trust suggested its use after carrying out research several years ago and reinforced the proposal in its publication last June, but we do not have the legislative capacity for such a measure in Scotland; we need to amend legislation.

The second gap relates to planning. Rob Gibson asked a highly pertinent question about permitted development rights—which many people believe are a blockage to developing existing buildings—but my question is about new buildings. Nearly two years ago, the Scottish Government adopted a Scottish version of the Merton rule whereby, for all major new planning developments, developers must reduce their projected carbon emissions by at least 15 per cent through the use of on-site renewables. As well as being good from the point of view of householder renewables and renewable heat, the requirement helps to increase energy efficiency. What plans are there to extend its application? Do you intend to extend it to cover all new buildings? Rural areas are missing out because large-scale developments are less common there. Such a measure could be included in the bill.

Gavin Peart: We will have to come back to you on that as Scottish planning policy 6 is not in my policy area. We will take a note of what you have said and get back to you.

Sarah Boyack: Would it be possible to get an update on the impact that the Merton rule has had? I know that the authorities that are pushing its use are monitoring its effect.

Gavin Peart: I do not have any—

Sarah Boyack: I do not mean from you personally. Perhaps some information on its implementation could be provided after the meeting.

Gavin Peart: We can always ask.

Sue Kearns: That rule might not be such a panacea; in fact, it might have had some unintended consequences. Some developers have installed a biomass boiler when they could have used the gas grid, just so that they could tick the box and meet the obligation. When that has been done in urban areas, it has caused some air quality problems, and some local authorities in urban areas now view biomass in a fairly negative light. We are having to consider that, and guidance on air quality and biomass installations for urban authorities will be produced shortly. The rule can have unintended consequences.

Sarah Boyack: You talk about unintended consequences, but is it not the absence of clear emissions guidelines from Europe that has caused the uncertainty? I know that my local authority was forced to drop such proposals from its schools developments because there was uncertainty, but there is no evidence of health problems. Such
schemes are widely implemented south of the border and in rural areas. The unintended consequence is due not to the application of the planning policy but to the absence of clear guidance on standards from central Government.

10:45

Sue Kearns: We are catching up, in that we carried out research on air quality and biomass last year. The intention is that air quality colleagues will produce guidance for local authorities on how to site such kit appropriately. We need to ensure that there is appropriate siting and that abatement technology is put in place. The UK Government is catching up as well, in that it is also producing guidance. I certainly agree that we need to get up to date on that.

Sarah Boyack: However, to be clear, the requirement should be not for biomass but for any form of renewables on site.

Sue Kearns: Developers have opted for biomass because they know how to put boilers into developments. Biomass is easier for them because they just need to think about installing a biomass boiler rather than a gas boiler. The problem is that developers have not always thought properly about whether heat pumps or similar technology is more appropriate.

Sarah Boyack: My other question was about incentives, which Dave Thompson also asked about.

Jamie Hume: I cannot offer a particularly conclusive answer on that as we have not discussed the issue since I have been in post. Perhaps Sue Kearns will know whether previous consultations have considered it as a policy option.

Sue Kearns: The issue has never come up in the context of renewable heat.

Colin Imrie: However, the issue has come up in the context of discussions on proposed energy efficiency measures. We do not have a specific answer at this point, but I am happy to come back with more details on that, permitted development rights and the Merton rule.

The Convener: That would be helpful.

Jamie Hume: We will look at Sarah Boyack’s suggestion. We might be interested in taking the idea forward and considering how it might work. We will come back to the committee with our thoughts on that.

Christopher Harvie (Mid Scotland and Fife) (SNP): First, I want to ask for a definition of targets, which loom considerably in the bill. An American school of thought associated with the Chicago school—not of economics but of management studies—is highly sceptical of arbitrary numerical targets, or ANTs. How international are the targets? The British economy managed to maintain a fair degree of moderation of increase in emissions, but that can largely be put down to the abandonment of manufacturing. Manufactures have been imported from China, where there are no such inhibitions. Is there an element of avoidance of moral hazard in the selection of targets?

Jamie Hume: On our approach, I referred earlier to the need for engagement. As we discussed previously, it is notoriously difficult to achieve movement on some issues. Members might also be familiar with the support of our minister—Mr Mather—for John Seddon’s systems-thinking approach, which argues that a target-driven approach is not the way forward. As I said, the challenge is to produce an action plan that focuses clearly on what practical things need to be done, by whom and by when if we are to achieve progress. We want to focus on that to create enough of a centre of gravity around which all the different players can coalesce so that, by making visible what everyone is doing, we can move forward in an agreed way rather than just provide people with an arbitrary target.

You make a valid point, which was also picked up when we consulted on the proposed target of 11 per cent for renewable heat. We had some rather lengthy submissions arguing whether the target should be 11, 14 or 16 per cent. Given the magnitude of the step change that is required, a percentage point here or there is less material than whether we are able to generate the collective action that is necessary to move forward. In that sense, our action plans are clearly focused on the critical path of what needs to happen, by whom and by when so that we can start the ball rolling. Therefore, we are not necessarily thinking in a target-driven way, even though we might need to publish targets to make clear the direction of travel and our aspirations.

Colin Imrie: Jamie Hume is right that this is about changing the way in which we operate collectively. However, a small number of outcome-based targets can focus the mind. There is no doubt that the
European decision to go for getting 20 per cent of all energy from renewable sources has focused minds positively across Europe and the UK on the importance of renewable generation.

The European target on energy efficiency is to reduce energy use by 20 per cent by 2020, but no obligations are associated with the target. That is because energy efficiency is cost effective, but it is very difficult to do, which is why the primary focus is a combination of legislative and promotional measures.

Christopher Harvie: I want to elaborate on that. Most of our targets will have been made as a result of the enormous economic growth of the past decade. We are not going to see that growth in the next decade, even at our most optimistic.

One thing that we will see, and it has not been mentioned here much at all, is the human factor. Many people will be unemployed or underemployed as a result of the crisis that we are heading into. They are the potential insulators, energy reducers and the like, but there does not seem to be very much planning for that in the macro figures. One thinks of the very few people that one ever sees cycling in Scotland, or the huge amount of do-it-yourself that goes on that could surely be shifted towards low-energy characteristics with the proper appeal. Is that planning being undertaken, with a view to the likely employment situation during the next two or three years?

Jamie Hume: I echo what Colin Imrie said, and in that context, the Scottish Government's decision to go for the more ambitious 20 per cent target rather than the UK's target of 15 per cent, is significant and focuses minds in the way that Colin Imrie described.

We were talking earlier about the economic and employment benefits and about the supply chain opportunities for Scottish industry. In recognition of that and of the need to start thinking in totally different terms about how to approach the agenda, we are working closely on the potential opportunities with bodies such as Scottish Enterprise, Highlands and Islands Enterprise, Scottish Development International and local authorities. Whatever happens in the sector must not be isolated and driven by a targets mentality but must be real and must relate to the employment situation on the ground, including the opportunities that might be created by unemployment in other sectors.

Our ambition is to develop a cross-cutting action plan that picks up on economic opportunities and thinks differently about our approach. It is fair to say that that applies to our approach to the energy challenge and opportunities more broadly.

Philip Wright: I will answer Christopher Harvie's point from a more general, climate change point of view. You make good points about your short-term concerns, but it is essential that we keep an eye on the long term. That is why we have the 80 per cent target, which was informed by science and comes from the global situation. That is then reflected back to the EU and the individual countries. Yes, we have an economic recession. We will take our emission reductions from anywhere during this early phase, but we must keep our eye on the long-term goal—the 2020 European target, the 2030 target in the bill, and the 2050 target.

Christopher Harvie: And meanwhile, over the past 10 years, we have committed ourselves to a retailing policy that has led to the building of vast supermarkets across the country. These buildings not only have social implications but are associated with colossal heat loss and demands with regard to the mobility of freight and customers. How do we reverse that kind of development?

The Convener: That might be slightly outwith the scope of the bill, although I suppose that it could come under section 50.

Colin Imrie: As I stressed with regard to the energy efficiency action plan, energy efficiency must be promoted across the board. An essential element of that will be every town's big supermarket, and the various implications of such an approach will have to be considered. I do not envisage the energy efficiency action plan tackling such a fundamental planning issue, but it might well come up in other forums.

Philip Wright: Larger retail outlets such as Tesco and Asda will have to take action under the carbon reduction commitment. As Colin Imrie has made clear, the matter that Christopher Harvie raises is more of a planning issue, but I believe that my planning colleagues are taking it very seriously and are trying to reverse some past decisions.

Nigel Don (North East Scotland) (SNP): I thank the convener for allowing me to sit in on this morning's meeting. I have been wondering what interests I should declare. I do not think that I have any, although I...
suppose that, as a former member of the Institution of Chemical Engineers, I have an abiding interest in the laws of thermodynamics. In that context, I was struck by Alec Millar’s comment that 40 per cent of heat loss comes from buildings. I hope that I have got that right; if so, my first question is about where the other 60 per cent comes from.

**Gavin Peart:** No. More than 40 per cent of CO₂ emissions come from buildings. Domestic buildings contribute 25 or 26 per cent and non-domestic buildings about 17, 18 or 19 per cent.

**Nigel Don:** Okay. Do you know how much come from power stations?

**Gavin Peart:** I think that that is a different sector.

**Philip Wright:** It is quite difficult to answer that question. We can give you the statistics if you want, but I should point out that power generators supply the domestic sector, which means that, although power stations emit CO₂, the energy that is produced is used in homes. Direct CO₂ emissions from the domestic sector come from the use of solid fuel, while the electricity supplied by power stations is caught by the EU emission trading scheme. The relationship between power stations, home energy use and emissions is a tricky one.

**Nigel Don:** That is my very point. Energy efficiency anywhere is, of course, an important issue and surely the best way of reducing energy costs is simply not to use the energy in the first place. We need to recognise that a very large proportion of CO₂ emissions comes from power stations and I am slightly concerned about ensuring that the relationship between what is in front of us and the global target—by which I mean the target for the whole country—for reducing emissions is being properly addressed.

**Philip Wright:** A key part of the bill is the net Scottish emissions account, which we will use to report whether we are achieving our targets. Key to that is the EU emission trading scheme, which allows trading between EU countries. I can go into more detail on that, but I very much doubt that the committee will want me to do so. The emissions associated with the electricity used in the home are actually emitted from power stations, which effectively have an allowance. If a station exceeds its allocation, it has to buy allowances from another country, which is where the savings will be made. All we will take into account in the net Scottish emissions account will be the allocation to, say, Longannet power station. That is factored into the arithmetic that we will follow when we report on progress against the annual targets, which have still to be set. The relationship is very complex.

**Nigel Don:** I have no desire to get us into that complex relationship. Is it not possible that carbon capture and storage, for example, at Longannet could make far more difference than everything else that we are talking about added together?

**Colin Imrie:** I will answer that, as I am responsible for power generation in general. We are developing policies in parallel that envisage that, over time—by 2020 and then 2030—Scottish power generation will be predominantly low carbon. That will happen through a combination of promoting renewable generation and accelerating the introduction of carbon capture and storage in thermal plants. You are right that the introduction of carbon capture and storage will make a significant difference, as will the increase in renewable energy.

**Philip Wright** has explained that, because power generation is in the traded sector, the way in which it counts towards our emission targets is complex and needs to be understood. However, one reason why energy efficiency is a crucial part of the exercise—as well as heat—is that reductions in emissions from power generation alone will not allow us to meet our 80 per cent target. It is clear that, to meet the target, action must be taken across the board. The energy sector as a whole, including energy efficiency, power generation and renewables, is crucial, as is heat in its more general sense and, of course, transport, which is not being considered here.

**Cameron Maxwell:** I have a point that is partly about timescale and partly about cost effectiveness. Carbon capture and storage will have to go through a development phase, so there is a requirement to take up cost-effective energy efficiency measures now. We might have decarbonised electricity and heat in the long term but, in the short to medium term, we will not have those in sufficient quantities, so we should choose cost-effective energy efficiency options. In the long term, it is useful to compare the cost of saving energy with the cost of producing energy using carbon capture and storage,
because that will not be free.

Lewis Macdonald: Sarah Boyack’s proposed member’s bill, which she has discussed with ministers, covers microgeneration as well as energy efficiency. Why is there no direct reference to microgeneration in the Climate Change (Scotland) Bill?

Colin Imrie: The reason why the bill refers to energy efficiency and not microgeneration is that microgeneration is considered, in the context, to be a reserved matter and outwith the scope of the bill. However, as I said, it is our clear intention to cover microgeneration in the energy efficiency action plan.

Lewis Macdonald: The judgment that microgeneration is reserved raises wider questions about some of the other aspects of the bill. Nigel Don raised the issue of where emissions come from. The most recent Scottish Government figures that I have seen suggest that 45 per cent of energy is used for heat and about 26 per cent is used for electricity. The bill has provisions on renewable heat. The Government proposes a target of 11 per cent of heat coming from renewable sources but, in setting that target, what account is taken of electricity as an alternative to existing sources of heat?

Sue Kearns: We are certainly considering the impact that electricity-to-heat technologies will have on the grid. We have to factor that in and we are thinking about the issues, such as the use of heat pumps. Another aspect is that the move to electric vehicles will have implications for electricity generation.

Lewis Macdonald: Absolutely. That is what I want to understand. Much of the detail is not there at the moment but, hopefully, it will be by the time the bill gets to stage 2. The Government talks about 11 per cent of heat coming from renewable sources but, in setting that target, what account is taken of electricity as an alternative to existing sources of heat?

Sue Kearns: At the moment, it is biomass, solar and heat pumps. Part of the renewable electricity that is generated, the target for which is 50 per cent, will go towards the renewable heat target. That is how we are looking at it at the moment, but I agree that there is more thinking to be done.

Lewis Macdonald: Does that create a risk of having potentially conflicting targets or tracks of development? In other words, by seeking to promote renewable heat separately from renewable electricity, you must run the risk of missing the point.

Jamie Hume: I was talking about where the targets were derived from. It is about meeting the overall 20 per cent target for energy—electricity, heat and transport. There is flexibility within those three categories of usage. If we see a big shift towards electric vehicles, the energy will be renewable only if the electricity is from renewable sources. That is why it is important to track progress and make the necessary adjustments. I do not think that the targets are incompatible.

We are not going to have all the answers in a few months, but we will be further forward than we are now. Within the renewables action plan, we are seeking to do a cost benefit analysis by working out the benefits in terms of energy generation, carbon reductions and economic benefits, and balancing those against the cost.

The fact that we have activity on renewable heat and renewable electricity in a single place within the Government ensures that the link-up is made. It is fair to say that the whole bill has brought together these parts of the Government. We are working much more closely than happens in other areas of the Government. There is a degree of interconnection between officials and stakeholder groups. Bringing all those together and ensuring that this entire agenda moves forward in a coherent way is absolutely our focus.

Lewis Macdonald: On the energy efficiency action plan, I think that you said in response to Gavin Brown that there would be a need to consult again. Would such a consultation be the third in three years? It would certainly be the second. What do you expect to learn that you have not learned already before publishing a plan?

Colin Imrie: In publishing a plan, it is important that we ensure that it is up to date and reflects the developments since the previous consultation, which was in 2007. There will be a number of developments. I give the clear commitment that we will not seek to reinvent the wheel. What has already been learned through the previous consultations will be included in the document that is produced.

Lewis Macdonald: If I understand the bill correctly, the plan will be updated every 12 months in any case.

Colin Imrie: The intention is to provide a final version of the plan, following the consultation, within 12 months of the act coming into force and to review the plan at
least every three years.

**Lewis Macdonald:** Section 49(3) states that there should be a report on the plan within 12 months of its publication. If I understand the section, it also says that the plan should be updated every 12 months thereafter. Is that meant to be every three years? What does the 12 months in section 49(3) refer to?

**Colin Imrie:** Section 48(3) states that the plan must be published 12 months after the act comes into force. Section 48(4) states that the Scottish ministers must review the plan and, in effect, publish a new one. The maximum period of time set out is three years. Section 49 states that ministers must report to the Parliament every year on the implementation of the plan.

The Convener: That concludes questions from members. There are a number of areas on which officials have indicated that they will come back to us, and it would be helpful if they could do so as soon as possible—we are on a fairly tight timetable, as we must report to the lead committee. It strikes me, however, that there are a number of significant policy matters that still require to be clarified. It might be helpful for the committee to invite the minister to give evidence to clarify some of the policy issues, for example on whether or not there was any change in the statutory requirement to improve energy efficiency. There were also some further aspects to explore in relation to the energy action plan.

I would like clarification on the Government’s policy direction on energy performance certificates for non-domestic buildings. There are significant differences between the seven approaches that were referred to in the consultation document. There is also the question that Lewis Macdonald raised, right at the start, about whether or not there was any change in the statutory requirement to improve energy efficiency. There were also some further aspects to explore in relation to the energy action plan.

If the committee agrees, we should probably schedule an additional session and invite the minister in to update the committee on the thinking for what is likely to be introduced at stage 2.

Members indicated agreement.

The Convener: In the meantime, I thank the extensive panel of officials for their very helpful evidence this morning. We look forward to their further responses to the points that were raised.

11:11
**Meeting suspended.**

11:18
**On resuming—**

The Convener: We will now hear from our second panel on the Climate Change (Scotland) Bill. We have an opportunity to hear from a range of organisations about how content they are with the general principles of the bill and whether they want it to be amended. Should we toughen up the expectations of the Scottish ministers or, as we heard last week, introduce mandatory energy standards for new houses at national home energy rating 7 at least? I invite the witnesses to introduce themselves and to make brief opening remarks before I invite questions from members.

Elizabeth Leighton (WWF Scotland): I am senior policy officer with WWF Scotland and today I am representing Stop Climate Chaos Scotland, which is a campaigning coalition of more than 30 organisations.

Elaine Waterson (Energy Saving Trust): I work as a strategy manager for the devolved nations at the Energy Saving Trust. My job involves leading our policy work for Scotland, Northern Ireland and Wales. The Energy Saving Trust works to reduce carbon emissions in the household and road transport sectors. Through our network of advice centres, we advise around 130,000 people on energy efficiency every year.

Fergus Tickell (Northern Energy Developments Ltd): My name is Fergus Tickell, not Fegus, as it says on my name plate. The “r” has been thrown away, in the words of the Proclaimers song. I am managing director of Northern Energy Developments—a renewable energy company that specialises in bioenergy from wood. I am also on the board of Scottish Renewables and I have been a member of the FREDS bioenergy and renewable heat groups.

John Stocks (Carbon Trust): I am the Carbon Trust’s manager for Scotland and I head the trust’s activities with businesses and public sector organisations.

Chas Booth (Association for the Conservation of Energy): I am the senior press and parliamentary officer for the Association for the Conservation of Energy,
or ACE for short, which saves time. We undertake research and we campaign to reduce overall energy demand to ensure a secure and sustainable energy future. Our work reflects the interests of, and is largely funded by, our members, who are major manufacturers and installers of energy-saving equipment throughout the UK. ACE is a member of the Scottish fuel poverty forum and—as of last month—of Stop Climate Chaos Scotland. We are also a regular contributor to the energy debate in Scotland.

The Convener: I sympathise with Fergus Tickell; I am very used to getting one of the letters in my name dropped. I have not managed to train this committee not to do that.

Several of you listened to the evidence from officials about possible amendments at stage 2. Have you any comments on whether chapter 3 of part 5 might need amendment at stage 2?

Chas Booth: We share many of the concerns that members have expressed—in particular the convener’s concern that the bill is a work in progress with many gaps. We have heard that a lot of measures will be introduced at stage 2, but that might mean that they could be rushed through.

The previous panel was asked whether we have sufficient weapons in our armoury. Using that analogy, if we rely on the weapons that are currently in the bill, we have a couple of peashooters when what we really need are a couple of cruise missiles. The current weapons in the bill are insufficient to deliver the level of the Government’s ambition—the 80 per cent cut in emissions that is stated in part 1. We need a great deal more.

John Stocks: I will make a couple of points that relate to the conversation with the previous panel. It has been made clear in the past couple of hours that people understand what energy efficiency means. It is about ensuring that we get maximum benefit and utility from every kilowatt hour of energy we use.

The term “energy efficiency” is redefined in section 48(8). I think I understand why—it is something to do with devolution. However, energy efficiency and its importance are not defined in that section, which is an omission. I would like energy efficiency to be defined as a primary objective in the bill. I would also add consideration of clean, low-carbon energy sources and the carbon footprint of the goods and services that we all use.

The other thing that comes to mind—it came out in Lewis Macdonald’s questions about promotion and obligations—is that there is a distinct difference between promotion and regulation. That comes into sharp focus in the relationship between the Carbon Trust and the Scottish Building Standards Agency. Yesterday we presented our low carbon buildings award to three absolutely fabulous buildings that have carbon footprints that will cut the mustard in 2050 with a decarbonised electricity grid. They are the leaders.

There is an important role in ensuring that people understand that we can build such buildings today, and that they can be built for not much more than conventional buildings. If we can get that accepted and get people doing it now as the norm, it would allow the Scottish Building Standards Agency to raise the drawbridge behind the people who do not want to do it voluntarily. Regulation and promotion are both important, but are different.

Fergus Tickell: I will confine my remarks to renewable heat. I do not know nearly as much about energy efficiency as the others on the panel.

I welcome the provisions in the bill, and the recognition that renewable heat is vital in meeting the targets. However, the bill probably needs to be strengthened in respect of ministers’ obligation not just to promote but to deliver. That suggests that those of us who work at a practical level to deliver renewable heat and other forms of renewable energy projects have to be given the tools to do that.

I am bound to say, given officials’ earlier comments, that I am not totally convinced that the scale of the challenge of delivering the renewable heat targets—even at 11 per cent—is fully recognised. It is an immensely complicated area that involves the commercial and industrial sectors, which have been very much neglected in the renewable energy framework. There is no significant comment in the framework on the way in which the commercial and industrial sectors can help to deliver renewable heat and other forms of renewable energy projects have to be given the tools to do that.

Elaine Waterson: As others have said, it is great that the bill recognises the importance
of energy efficiency and renewable heat, but an area in which it could be strengthened is regulation of the domestic sector. The bill allows for some regulation in the non-domestic sector, but there is nothing on regulation in the domestic sector. Given that the domestic sector is responsible for about 34 per cent of Scotland’s energy demand, it would be useful to include provision for regulation of the domestic sector in the future. That is not to say that we want regulation now; rather, it is that promotion and incentives will take us only part of the way.

Elizabeth Leighton: I second Elaine Waterson’s remarks on the domestic sector. Given that the sector is responsible for more than a third of our emissions, there is a gaping hole in the bill in that respect. Regulation of the sector was recommended in the Sullivan report, “A Low Carbon Building Standards Strategy for Scotland”, which suggested that we should consider existing building standards, enhance energy performance certificates and keep an eye on the future direction of the European energy performance of buildings directive, which will strengthen energy efficiency requirements. I agree that we should have provision in the bill to enable or enhance EPCs.

The idea of exploring the potential to strengthen the language by changing “promote” to “improve” came up earlier. There is little doubt that “promote” dilutes the requirement in the Housing (Scotland) Act 2006 to “improve” energy efficiency. There must be scope to maintain that and to import that language into the bill, rather than repeal the requirement, and to maximise, rather than minimise, devolved powers in that area.

We welcome the fact that the action plan has finally been put on a statutory footing, and we look forward to its arrival. We have waited a long time for this: we urge its publication as soon as possible, as has been called for by several members of the committee. We recommend that it include targets for energy efficiency and that progress is reported, either in the annual report or as part of an emissions reduction plan addressing demand reduction, energy efficiency and renewables.

11:30

We need a broad range of incentives. We know that, even with 100 per cent take-up, the existing measures would take us only to a reduction in emissions of between 20 and 23 per cent. We need a full package that includes loans, local tax incentives and grants tailored to needs.

I concur with comments about renewable heat: we need a plan with targets and reporting. At the moment, the information that we have from the Government is rather sketchy. We believe that a target should be set based on good evidence, rather than using a subtraction method. Instead of saying, “This is what we are getting from the other sectors, so we will take the remainder for renewable heat,” we should assess the potential and set a target based on that.

My final point is linked to part 4 of the bill, which deals with the duties of public bodies. Targets for energy efficiency cannot be set from the centre—the public sector must be involved. Stop Climate Chaos Scotland believes that primary legislation should place a duty on public bodies to contribute to reduction of emissions.

The Convener: I ask Chas Booth to elaborate on the rearmament that we need to do to take us from peashooters to cruise missiles.

Chas Booth: Elizabeth Leighton has described the cruise missiles that are needed. The bill’s big gap is in respect of domestic energy efficiency. As Elaine Waterson said, domestic use accounts for about 34 per cent of final energy demand and about a third of emissions. Tackling domestic energy efficiency ties in with many agendas, including the carbon agenda. In the context of the bill, we are discussing statutory targets that will come into force this year, but there is already a statutory target for fuel poverty, which the committee discussed last week. At current rates of investment and with the current powers in our arsenal, the Scottish Government will not meet that target, which is to abolish fuel poverty by 2016. We need considerably increased investment and powers to ensure that we bring buildings with the poorest energy efficiency up to standard. If we do not make a real effort to do that, Scotland will be cursed with a group of people in the hardest-to-treat houses who will be permanently fuel poor.

Mention was made of the energy assistance package, which will target investment at the fuel poor. From April, for the first time, the package will include air-source heat pumps and solid-wall insulation. We warmly welcome that, but we do not think it goes far enough. Ground-source heat pumps, which could do even more to lift
people out of fuel poverty, have not been accepted into the programme. Admittedly, the cap on maximum investment has been raised, but only to £6,500. You cannot get both solid-wall insulation and an air-source heat pump for that money—it is one or the other. It is not reasonable to ask people who are in fuel poverty to make a choice between proper insulation and a decent heating source.

Fergus Tickell mentioned that he is not entirely sure that the Government recognises the scale of the problem: I wonder whether it recognises the urgency of the problem. Climate change is an urgent issue and we need to make quick, cost-effective cuts in our emissions. The quickest, easiest and cheapest way of doing that is to improve energy efficiency. In many ways, that has a negative cost, as was mentioned earlier. When insulation measures are installed, they pay for themselves very quickly. When officials talk about gradual implementation and consulting again on an energy efficiency action plan, we are frustrated, to put it mildly. We would like Government to get on with things.

Fergus Tickell: It is important to emphasise the urgency of the issue. As I said earlier, the apparent omission of the commercial and industrial sectors from the renewable energy framework and the approach to renewable heat means ignoring the lowest-hanging fruit in respect of the mass use of renewable heat.

Chas Booth talked about energy efficiency measures in the domestic sector as being the quickest way of achieving the greatest gains. I think the commercial industrial sector has the potential to do the same on the renewable heat side of the equation.

John Stocks: I am not sure that I totally agree with Fergus Tickell. The business sector is similar to the domestic sector, and energy efficiency is the easiest and quickest win. I agree with him that, particularly in Scotland’s national drinks industry, the waste streams of certain industrial processes are energetic. Initiatives around them, such as the one that Diageo is progressing at the Cameron Bridge distillery, represent a very big prize. Generally, however, I would argue that energy efficiency is the best, easiest and most cost-effective win for industry.

The Convener: As part of our energy inquiry, the committee visited the Cameron Bridge distillery to discuss the proposed biomass plant. I am aware of similar initiatives around Scotland, such as the one at the Quaker Oats plant in Cupar.

Rob Gibson: Earlier, I asked the civil servants about the state of the information they have. The frustration that you feel seems to be related to our having focused money to apply. We can make it easier to apply that money by having a clearer picture of current evidence, for example, on the ease or difficulty of the uptake of each of the methods of energy efficiency that we have been talking about, or the constraints that arise from permitted development rights. Is there a need for us to have a clear view of what is holding us back? If so, should we include in the bill provisions to deal with that or should we ensure that the following secondary legislation deals with such detail? Many of the things that you have talked about are things that need to be done, but we have to decide what should be included in this enabling bill.

Elizabeth Leighton: Enabling provisions on the domestic sector must be in the bill. We have waited a long time for the civil servants to arrange a consultation on existing homes and climate change. The intention was to have something ready that could go into the bill, but time has dragged on and, unfortunately, we are not in that position.

However, that is not to say that we should not include in the legislation enabling sections that would allow for secondary legislation to be brought in on the back of that consultation. The reviews of the energy efficiency grant schemes and microgeneration schemes have pointed to the approaches that should be taken. For example, we need loan schemes, a range of incentives based on need and so on. The information is at hand, but the Government has not yet introduced any proposals. I recommend that an enabling provision that would allow appropriate secondary legislation be included in the bill.

Rob Gibson: I think that the intention is to have many initiatives delivered by the means that you describe. Am I right in thinking that, apart from the issue around domestic buildings, which you would like to be included in the bill, there is nothing else that you think should be included?

Elizabeth Leighton: I think that Chas Booth wants to answer that.

Chas Booth: My concern is not just about what is missing in terms of which areas are not covered—the domestic sector is the big
one. I am also concerned about what is missing because measures that are included in the bill do not go far enough. For example, the provisions on non-domestic energy only give ministers the power to require a wider roll-out of energy performance certificates. We think that energy performance certificates are useful, particularly with regard to rented buildings, because they inform the tenant what their approximate fuel costs will be.

Recent research from Denmark, which has had an energy performance certificate scheme since 1996, suggests that the scheme makes no significant impact on carbon emissions from the buildings involved. The bill’s provisions on energy efficiency in the non-domestic sector therefore rely on a measure that some evidence suggests has a negligible effect. If I return to the analogy of weapons in our armoury, that suggests that we do not have the proper weapons.

We would like some form of compulsion and that should go alongside finance—organisations should have a fund to which they can apply for investment in energy efficiency. The small and medium-sized enterprises loan scheme, which used to be called loan action Scotland and is now called the energy saving Scotland small business loans scheme, is useful. That scheme was worth about £7 million—that figure has recently increased slightly. The SMEs to which we talk say that that scheme is fantastic, and its investment costs per tonne of carbon are really low. We would like that to be rolled out and we would like a domestic version of that scheme.

Two ways forward are possible for what the bill should require of people. The previous panel mentioned one option that was laid out in the Government’s consultation on non-domestic buildings last year, which involves the energy performance certificate. The certificate will list cost-effective improvements that a building owner could undertake. The Government proposed that some of those improvements should be mandatory—for example, the building owner would be required to undertake them within a year or a couple of years. That would be a useful and helpful way forward and it would not be a problem, as long as cost-effective finance was available.

Shortly after the Government’s consultation on non-domestic buildings was published, we ran a consultation event in conjunction with the Scottish Government, the Built Environment Forum Scotland and Third Wave Consultants Ltd. That event was attended by a number of people from the public sector and the private sector and by building owners, who agreed almost unanimously that some compulsion is needed. Their only caveat was that a level playing field must be provided and that compulsion should not apply to one sector but not another. The people who attended were in favour of the proposal, so I was greatly surprised to hear the previous panel say that the proposal is contentious. We think that such a measure would be favourable and that people would accept it.

The Convener: Does Rob Gibson want to follow that up?

Rob Gibson: No. The point has been made and we shall note it.

Marilyn Livingstone: You will hear no disagreement from me about the need to push on as quickly as possible. If we are to meet our targets, we must get serious. You might have heard me ask earlier about a couple of serious barriers. I think that Elizabeth Leighton talked about area-based initiatives. We have heard evidence about skills shortages in the Highlands and Islands, which do not have skilled people to install heat pumps—that is a huge skills gap. I want to hear your views on the skills and training agenda. With the best will in the world, even if our action plan is up and running and we have funding for it, if we do not have people to deliver measures, that is a huge barrier.

My colleague Sarah Boyack asked about planning. What are the panel’s views on that?

I agree with Chas Booth that the question is how we target action on the most fuel-poor people. My questions focus on that.

Elizabeth Leighton: One reason why area-based approaches are recommended is that they can achieve economies of scale. However, significant investment must be provided to create the demand, so that industry invests in Scotland and SMEs are kept in Scotland to develop skills and fill the skills gap. Then we can win the energy efficient economy that Colin Imrie talked about earlier—we can win those jobs. If we do not have the right level of investment linked to the right amount of regulation, that cannot happen. Provision will be too spotty and there will be a scatter-gun approach such as we have now across Scotland—a stop-go approach.
On the second question, on permitted development regulation, I was interested to hear that the first panel of witnesses could not say what happened to the consultation on that. There was consultation on that and we were hoping for a more positive approach to installation of microrenewables, but that has not been forthcoming. I would be interested to hear that panel’s response on that. Clearly, there is much room to make it easy for people to install microrenewables—instead of telling them that they cannot have a solar thermal panel on the south side of their building because somebody might have to look at it, but that they can have it on the north side. That is not very helpful. I agree that there are still significant blockages that are preventing people from installing microrenewables when they want to do so.

**John Stocks:** I disagree with Marilyn Livingstone: there are skills shortages throughout the supply chain, not just in renewables. There is a shortage of people who are skilled in ordinary energy efficiency. The Scottish energy officers network, which is the local authority energy managers meetings, is like musical chairs, only with more posts than people. We need energy managers who are trained in ordinary energy efficiency as well as people who can install renewables technologies.

We need to look across the whole range. Yes, we need installers, but we also need to train the building services engineers and the architects who design our buildings so that they understand what a low-carbon building is and the importance from day one of designing low-carbon buildings. There is a shortage of such training among the full range of professionals, from engineers through to the people who carry out the installation work, and across the board, from energy efficiency to all the renewables technologies.

**Marilyn Livingstone:** How far away are we from knowing where the gaps are?

**John Stocks:** A long way, I suspect. My evidence is anecdotal; it is not hard evidence. I have heard of people changing jobs, and vacancies just sit there. People have come to me to ask whether I know of anybody who can fill a post. I know that there are gaps, but I do not have hard, numerical evidence of that.

**Fergus Tickell:** Skills are a major issue. The fundamental point is that people are not going to skill up to install and maintain renewable heat systems unless there is demand for those systems. Especially in difficult times, businesses do not spend money speculatively in the hope that some Government policy will work in the relatively short term. That is a fundamental issue, and the two things must go hand in hand. Scottish Government ministers must realise that addressing the skills gap is a key part of the promotion of renewable heat and energy efficiency.

There are a range of different technologies for renewable heat, which require different skills. For example, a different set of skills is required to install a biomass heat system in a house from the skills set that is required to install a ground-source heat pump. In the course of the FREDS renewable heat discussions, the pertinent point was made that having a scattering of one technology throughout the whole off-gas area, with one installation here and one installation there, does not promote the development of local skills to support those installations. It is, therefore, important to cluster installations as far as possible. For example, the installation of a cluster of biomass boilers in a particular area will support a local business that can both install and maintain them. Also, that business will be able to deliver a much better quality of service to the individuals or businesses that want to install such systems, thereby reducing the risk and encouraging more people to install them.

**Elaine Waterson:** I echo the point that Elizabeth Leighton made about permitted development and the importance of microgeneration technologies having permitted development status. Not only is it a hassle for consumers to have to go to the planning department and wait for a significant amount of time before they get planning permission, but there is a cost associated with that.

Permitted development is important not just from the householder’s perspective but from the community’s perspective. Communities that are looking at a distributed energy scheme, whether that is powered by a wind turbine or something else, really struggle with the planning process, so it makes sense for permitted development rights to be extended to community-scale developments.

**Chas Booth:** I want to make a quick comment on skills. I disagree slightly with John Stocks. On manufacturing energy efficiency equipment, our industry has a lot of
capacity at the moment because of the downturn in new build, which has dropped off dramatically. One of our members has mothballed one of their factories in England, and another has put on hold the development of a new factory where insulation materials were to be manufactured. At the moment, we have capacity.

Obviously, I primarily represent the industry that manufactures insulation materials, but we are in touch with the people who install those, and I have also heard of those companies laying off staff recently. That is happening partly because of the drop in new build, but also because the CERT scheme, which is the main funder of energy efficiency improvements, is very stop-go by nature. One minute the energy companies are installing lots of cavity wall insulation; the next minute, they stop that because they have reached their quota. There is a lot of frustration in our industry.

Fergus Tickell spoke about our ability to plan for the long term, and that is what we would like from Government. We can best achieve that if sectoral targets are set. For example, the energy efficiency target could be to improve the general level of energy efficiency in Scotland by 20 per by 2020, which is the same as the European target. That would give our industry something that it could use to plan investment, upskilling and training.

I certainly agree that skills are a key issue that we need to keep a close eye on. However, at the moment, the industry has capacity.

Christopher Harvie: I want to raise one bogeyman that has not appeared so far: methane. Various statistics show enormous increases in the production of methane, which is a highly toxic substance. Its impact, in association with ozone, is reckoned to be up to two thirds of the impact of carbon dioxide. A lot of methane comes from human and animal waste. All those cows grazing quietly in a field are economically more pernicious than Jeremy Clarkson.

There are positive ways in which methane can be used as a fuel. Despite its considerable toxic menace, we ought to consider the possibility of leaching it off from the 45 per cent of supermarket food that is uneaten, discarded and left to rot in landfill sites, and converting it into power. Coming up from London on the train yesterday, I noticed a landfill site near Peterborough that was tapped for methane production. What are the options?

Elizabeth Leighton: You bring up a valid point; we need to look at land use across the board, whereas the bill tends to focus on forestry. However, your point is outwith the scope of today’s discussions.

The Stop Climate Chaos Coalition would be supportive of the production of energy from organic waste. Some supermarket chains are already setting up facilities to produce energy from organic waste, and we are seeing the onset of green gas, as well as green electricity, which is a good thing. However, we would be wary of any proposal that would send us in the direction of burning waste for energy when the waste could be recycled, because that approach is not sustainable.

Fergus Tickell: I think that almost all the large landfill sites in Scotland, and probably almost all in the UK, now capture methane from landfill gas for electricity generation. I will not comment on the contribution of cattle, but it is clearly substantial. Vegetarianism is probably the only answer for us in that regard.

The future of biogas is important. One of the real problems in delivering renewable heat is that some of the greatest opportunities for doing so are in urban and suburban areas that are on the gas grid. The gas network presents an infrastructural opportunity for the mass delivery of renewable fuel in the form of biogas. I am conscious that considerable work is going on to identify biogas opportunities and how biogas might be introduced into the gas network. Centrica is probably rather nervous about all of that at the moment, but it is clear that there is an opportunity for that type of delivery to be developed.

Lewis Macdonald: I have a couple of questions that follow on from our earlier evidence session.

A number of witnesses will be aware that the Government officials simply did not have an answer to my question about the effect of replacing the requirement to improve energy efficiency, which is in the Housing (Scotland) Act 2006, with the proposal in the bill, which is merely to promote energy efficiency. Do the witnesses have a view on what the effect of that would be? The officials said that there was no intent to dilute the existing provision.

Elizabeth Leighton: As I said earlier, I think that the effect of repealing section 179
of the 2006 act and having a requirement simply to promote energy efficiency would be a dilution. From my discussions with civil servants, I understand that they have difficulties in that area as a result of trying to understand exactly where the line between devolved and reserved matters is drawn. However, surely it is not beyond the wit of civil servants to sort that out, maximise our powers and make it clear that the bill should include a requirement to improve energy efficiency. If there are issues outwith that, they could be noted. I would prefer that approach rather than going to the lowest common denominator and saying that we want to promote energy efficiency, because promotion is, after all, more about words than action. Improving involves a commitment to action.

Chas Booth: I agree with Elizabeth Leighton and Mr Macdonald that the effect would be to dilute the provision in the 2006 act. I understand that the reason for repealing the provision is that it is thought that there would be an overlap, but does that matter? I do not know. Perhaps it does, but surely there must be some way forward that ensures that section 179 of the 2006 act is not diluted.

I wonder whether the revitalised Calman commission might want to consider the matter. Perhaps that is a slightly cheeky comment, but there is certainly a grey area between the responsibilities of the Scottish Government and those of the Westminster Government on energy efficiency. Lawyers have told me that it is okay for the Scottish Government to promote energy efficiency, but not to deal with delivery. That seems unsatisfactory.

Lewis Macdonald: It strikes me that repealing the provision in the 2006 act is unnecessary and that the two provisions could comfortably live together if the officials’ description of the bill as building on existing legislation is accurate. Is that the view of the witnesses, too, or has someone come across a legal obstacle to that?

Chas Booth: I can see no legal obstacle.

Lewis Macdonald: My next question is about another issue that was raised earlier: incentives, primarily for householders, but also for community schemes.

I think that Elizabeth Leighton talked about the potential for providing loans, grants and local tax rebates. From your knowledge of the experience of organisations that operate south of the border, what is your view of the effectiveness of the arrangements that apply there? Could they be readily applied in Scotland?

12:00

Elizabeth Leighton: My understanding is that the arrangements have been effective in incentivising the take-up of insulation measures and in attracting CERT funding by creating partnerships of local authorities, energy companies, utilities and local community groups. Additional incentives could make Scotland a more attractive funding environment for the CERT scheme. The funding environment is one of the reasons why we do not have our fair share—in inverted commas—of CERT funding.

Elaine Waterson: I agree with Elizabeth Leighton that council tax incentives have, in theory, a big role to play in encouraging consumers to take action. We at the Energy Saving Trust did a huge amount of consumer research a number of years ago in which we explored the idea of council tax incentives with consumers across the UK. A key finding was that the level of incentive does not have to be that high. Talking to people about tax rather than energy efficiency is much more exciting for them and has a big impact. That approach has a big marketing advantage as well. As Elizabeth Leighton said, many of the schemes down south have been particularly successful and have incentivised significantly greater numbers of people to take action than would have been the case if just the CERT scheme had been available.

Fergus Tickell: The previous witness panel mentioned the provision of grants through the community and householder renewables initiative, the biomass support scheme and so on. Those grants are welcome as a way of getting something going in the heat sector, but they are inefficient as a way of delivering support. They tend to be challenge funds to which people must apply in almost a competitive way to secure funding. They also tend to be irregular, so there is no continuity and the skills base is not developed. I therefore welcome consideration of a renewable heat incentive.

I talked earlier about scale, and the figures that I got from Scottish Renewables suggest that, in the domestic sector, about 1,500 renewable heat systems are installed in Scotland every year. To put that in context, if the 11 per cent target is to be met from the
domestic sector, as is implied in the renewable energy framework, we must increase the number of renewable heat systems that are installed to 25,000 a year. There must therefore be innovative thinking about financial incentives, and in that respect, council tax rebates are interesting.

There are major challenges around the development of the energy supply companies that might run district heat schemes or deliver energy to commercial or non-domestic developments. One of the big challenges is the lack of indemnity. Such systems often have only one customer, or a relatively small number of customers. Customers can disappear and may not be replaced by others that have exactly the same demand profile for heat. Distilleries, which I think John Stocks mentioned earlier, are a good example in that regard. Many distilleries are off-gas and use heavy fuel oil to heat their stills. They also tend to be a long way from anywhere else and have a nasty habit of shutting down for periods. Despite Diageo’s development in Fife, many distilleries are not particularly interested in becoming energy generators. There is therefore a big opportunity to encourage energy service companies to develop so that they can service that market. However, ESCOs cannot get funding in such situations because they cannot indemnify themselves against a distillery or any other heat user shutting down for a period. A project cannot be financed on that basis. Government must consider other, innovative ways of encouraging different types of renewable heat delivery.

Elizabeth Leighton: On tax incentives, the whole package is needed. We deal with a range of technologies and installations. Jamie Hume suggested earlier that we do not need to consider council tax incentives because the renewable heat incentive will come on stream, although not for 18 months or so. However, that incentive will not apply to the many householders who simply want to do up their loft or have cavity wall insulation. Even solid wall insulation will not be covered. We need a range of measures that will fit the range of needs for the range of houses.

Chas Booth: I have a brief comment on council tax discounts. Last month, the Northern Ireland Executive announced that it is introducing rate rebates—it has rates, rather than the council tax. Under that scheme, houses that are renovated to the highest energy efficiency standard will receive a five-year rate rebate, which is a substantial incentive. It is disappointing that, yet again, Scotland is being overtaken and another devolved nation in the UK is taking the lead.

Mr Macdonald referred to energy efficiency loans. We would point to the German energy efficiency loans scheme, which has been running for some time. The Germans invest about €1.3 billion per year in the scheme, the idea of which is that householders can apply for a low-interest loan for whole-house renovation. People can apply for up to €50,000 at a time, which is about £30,000. The cost of the scheme is about €17 per person per year. Introducing the same scheme at the same rate in Scotland would cost about £70 million per year, which is possibly too much to fit into this year’s budget, but we hope that Governments will consider it in future.

The Convener: I was not aware of the Northern Ireland scheme. It would be worth while for the committee to have more information on that. However, the danger with that approach is that it is non-targeted. With a five-year rebate for houses that achieve the best energy efficiency rating, the ones that are nearest to achieving that already will get the rebate fairly easily, but people for whom that is hard to do will not necessarily be able to afford it. Does such a scheme target resources where they are most needed, which is the hard-to-heat and hard-to-insulate housing?

Chas Booth: I do not accept that houses that are already fairly energy efficient are necessarily easier to get to the zero carbon level. Your colleague Rob Gibson was one of the MSPs who engaged in the MSP home energy challenge that we ran with Friends of the Earth Scotland last year. At the start of the year, Mr Gibson’s house was the most energy efficient, but there was a limited number of measures that he could install to make it better. He could not take any insulation measures, because his house was already fully insulated, and his options were limited to microrenewables. On the other hand, Mr Harper, who won the prize, achieved that by topping up his loft insulation, replacing his rather ageing boiler with a more energy efficient one and installing draught-proofing. Therefore, it might not be easy to get houses that are already energy efficient to the zero carbon level.

My understanding of the Northern Ireland
scheme is that it is graded. People who achieve a certain energy efficiency level receive a six-month rebate, and those who achieve a better level receive a year’s rebate—and so on, up to the maximum of five years. I can research the scheme a bit more and provide information to the committee, if that would be useful.

The Convener: I will resist the temptation to say that I am disappointed that Mr Harper’s house was so badly insulated.

Lewis Macdonald: In much of what has been said, there is a suggestion that part of the reason for the deficit in CERT spending in Scotland is precisely a result of the absence of such schemes. Are there any other opportunities in the bill that will help to ensure that more CERT money is spent north of the border? Are there any opportunities that are not taken in the bill to improve the attractiveness of Scotland for energy company investments?

Chas Booth: To clarify, Scotland does not get its fair share of CERT money. Under the predecessor to CERT, which was called EEC—the energy efficiency commitment—Scotland received about 7 per cent of the funding, yet we have 9 per cent of the homes. If those proportions are still the same, we are clearly not getting our fair share. On how the issue should be addressed, I welcome the Scottish Government’s establishment of a CERT strategy group, through which it is discussing with the energy companies how they can ensure better investment in Scotland.

I suggest that the group’s programme needs to change, however. This is a Westminster issue. At the moment, if loft insulation is installed in Kirkwall, that saves a lot more carbon than if the same loft insulation is installed in Cornwall, but the CERT scheme does not recognise that. There is a blanket carbon allowance no matter where the insulation is installed. If we had regional grading that more accurately reflected the carbon that would be saved through the installation of such measures in Kirkwall, for example, that would be the easiest way to ensure that Scotland got its fair share. At the moment, energy companies are not investing in Scotland because it is more costly to deliver a carbon saving here compared with the south-east of England. If the scheme more accurately reflected the carbon saving, that issue could be addressed.

Lewis Macdonald: And that would presumably help to address Iain Smith’s question, too.

Chas Booth: Yes.

Elizabeth Leighton: I will respond on what might be done in the bill to encourage greater investment through the existing CERT scheme as it is run now. One approach would be to ensure that there are clear targets and a clear reporting procedure on the energy efficiency action plan—perhaps with a view to improving it. If it is clear what the targets are, it will be clear to industry what direction is being taken—there will be annual reporting and scrutiny, and that will drive more investment.

On the public sector duty, if local authorities had a clear duty to contribute to the agenda, they could drive more area-based approaches, which could develop across Scotland. That would provide a good funding environment and good economies of scale for the CERT scheme.

Gavin Brown: John Stocks said that there should be a definition of energy efficiency in the bill. Will you, either now or by way of a written submission, give the committee more detail on what ought to be included?

My second question is to the panel in general. It is a question on renewable heat that I asked the Government officials earlier. In my view, the obligation that has been placed on the Government in relation to renewable heat is not very onerous, so I was comforted to hear that amendments will be lodged. Those amendments are not just desirable; they are imperative if the bill is to have teeth in this regard. What else is required? What other provisions ought to be included in section 51 that cannot wait for further regulations and so on? I think Fergus Tickell will have views on this.

John Stocks: It would be a challenge to draft some words for the bill on the hoof, so I will hang back and submit something in written form. Primarily, there must be an obligation on us all to get the absolute maximum utility from every unit of energy that we use in a building. That would be a reasonable definition of energy efficiency. I would like to revisit the point, however.

If we reduce demand, we reduce the amount of renewable energy that is needed to achieve a certain percentage of carbon reduction. We also reduce our call on the earth’s resources, we reduce our bills, and the investments that we make can generally be much more cost effective, easy and
reliable, even if "insulation" does not have the same ring to it as "wind turbine". Investments in those important areas will deliver the goods. I will leave renewable heat to Fergus Tickell.

Fergus Tickell: It is a difficult question, in that we do not know what might emerge at stage 2. There needs to an absolute commitment to finding an effective financial mechanism to support the installation of systems. There has to be clarification at some point in the progress of the bill that the intention is to promote renewable heat in all its forms and for all its uses. The lack of recognition of the commercial potential for renewable heat is a major problem.

12:15

John Stocks disagreed with me slightly when I said that that was the low-hanging fruit. Energy efficiency is important for business—it is not an either/or situation. At the moment, there is some support for renewable heat through the renewables obligation; there is banding within the obligation to give additional benefit to combined heat and power. That is important, but it does not do the whole job. Fifty per cent of the heat that we use in Scotland goes to commercial and industrial activity and 50 per cent goes to domestic activity. There is a huge opportunity. Industry is leading the way in large-scale deployment of renewable heat in Scotland. I refer to projects such as those of UPM-Kymmene at Irvine, Diageo, Balcas—which is investing at Invergordon—and Tullis Russell. However, there are many more opportunities. I would like ministers to make a firm commitment not to rely just on the domestic sector to deliver the targets that they have set for renewable heat.

I am not sure that I have answered the question, but I have given an overview of what I think needs to be achieved. I am much more concerned about what we can achieve through the bill than about what is said in it specifically.

Elizabeth Leighton: My point relates to the definition of energy efficiency. We need to keep our eyes on the prize, which is to reduce emissions and, therefore, our energy demand. Often we focus on energy efficiency, but that will not necessarily lead to a reduction in energy demand. An AAA-rated fridge that is big enough for someone to walk into it does not lead to a reduction in demand. We need to keep an eye on that issue in the action plan. We must understand how improvements in energy efficiency can lead to reductions in demand, and what they mean for reductions in emissions.

John Stocks: I agree. Demand should be included somewhere in the definition of energy efficiency, as we need to minimise demand for our activity.

The Convener: You are welcome to have a stab at an amendment in writing and to send that to the committee.

Gavin Brown: The energy efficiency plan has been touched on. I questioned the Government on whether a 12-month period was needed between the activation of section 48 and publication of the plan. That is important, because if the plan does not come into force until the middle of 2010, it will not have a big impact on the 2010 figures. If we fail at the first hurdle in 2010, we will have further to go to catch up, which could have a detrimental effect on momentum and motivation. I appreciate that consultations take time, but how quickly do you think a plan could be pulled together, once section 48 has been activated?

Chas Booth: We were first promised an energy efficiency strategy on 7 December 2004, so we have waited quite a long time for it. As recently as November last year, the Scottish Government committed to setting “out in 2008 our Energy Efficiency and Micro-generation Action Plan, outlining the actions we are taking and plan to take across Government.”

The Scottish Government clearly has something drafted and ready to go. I understand that it does not want to publish it because it is worried that the plan will appear too weak, partly because of concerns about whether responsibility for energy efficiency is devolved or reserved and where the line between promotion and delivery lies. I share your view that 12 months is much too long—a couple of months are all that is needed. The Government has already consulted on the energy efficiency strategy, so I fail to see why another consultation on an action plan is needed.

Elaine Waterson: Although some energy efficiency issues are devolved, others are reserved, and much of what Scotland needs to do to deliver on its plan will have to build on what is happening at Great Britain or United Kingdom level. That means that, to some extent, the Scottish plan will have to wait for the UK Department of Energy and Climate Change to finalise and publish its action plan and wider strategy, because that
will give Scotland a better sense of what policies will be delivered in the country under reserved powers and what it will need to add under its devolved powers.

Elizabeth Leighton: We could get into something like the iterative phase of consultation, with things simply going on and on. The Government could publish what it knows now; after all, a lot of research and reviews have been carried out and I, too, have been at meetings where we have been told, “This is just around the corner”. Something must be sitting on a computer somewhere.

The longer we wait, the more money the economy is losing. Businesses are waiting for clear direction. The DECC consultation is due to be launched this month, which means that the action plan will not be published for many months. The bill provides the opportunity to review and amend the energy efficiency action plan based on what happens at UK level, so Scotland should go now with what it has.

The Convener: Does the action plan have to wait for the legislation to be passed, or can it be developed in parallel?

Elizabeth Leighton: There is no reason why it cannot go ahead now.

Chas Booth: I absolutely agree.

The Convener: A couple of comments in the financial memorandum struck me as being quite strange. For example, with regard to the renewable heat and energy efficiency provisions, the Government claims essentially that no additional costs will fall on the public purse. Is there any point in having an energy efficiency action plan that does not result in additional costs to the Scottish Government?

Chas Booth: I have not read the financial memorandum in detail—

The Convener: There is no detail in it.

Chas Booth: The Government might be driving at the fact that energy efficiency has a negative net cost. In other words, you get back the money that you invest as a result of, for example, lower fuel bills. However, there will need to be some public sector investment to deliver the carbon savings set out in the bill.

The Convener: I think that you are being rather optimistic. If that was the case, the financial memorandum would have given some indication of the costs and likely return on investment.

Chas Booth: I might have misunderstood the question.

The Convener: The financial memorandum states that the duty to promote an energy efficiency action plan “is part of current planned activity, is not expected to give rise to additional resources and will be met from within existing Scottish Government administration budgets.” A similar comment is made about the renewable heat provisions.

Fergus Tickell: As I understand it, the suggestion in the DECC consultation is that, as with the renewables obligation, the cost of a renewable heat initiative would ultimately be recovered from the consumer.

Lewis Macdonald: Does that mean that the incentive funds that we have discussed might well be implicitly ruled out before the plans are even published?

The Convener: I suppose that the question is whether the Government should be building into the financial memorandum some up-front funding for all of this, even if it ultimately gets the money back.

Elizabeth Leighton: Even if the Government does eventually get its money back, incentives such as the loans scheme that we talked about would, like the small business loans scheme, involve some up-front provision.

We have also discussed what sort of capacity building would be involved so that area-based schemes could carry out the street-to-street work. Obviously, CERT will not pay for all of that, so we need a real upscale in investment. WWF Scotland has estimated that the current investment in the domestic sector, including CERT, private investment, household investment and Government investment, needs to be doubled.

Finally, going back to our discussion about the use of the terms “improve” and “promote”, I note that paragraph 183 of the financial memorandum says that chapter 3 of the bill “aims to improve the energy performance of non-domestic buildings and improve energy efficiency generally across Scotland.”

Chas Booth: I think I misunderstood the question about resources. Were you referring to resources within Government to deliver the energy efficiency action plan?
The Convener: Yes.

Chas Booth: There is a question about that. I have heard that publication of the energy efficiency action plan has been delayed partly because the Scottish Government’s energy efficiency team is very small. They are dedicated and hard-working and do fantastic work, but they must be underresourced if they are, say, having to brief ministers for budget negotiations with the Greens and negotiations with Sarah Boyack over her bill, and to produce an energy efficiency action plan, all at the same time. Surely they should have the means to chew gum and walk at the same time—or whatever the phrase is. As a result, internal resources in the Scottish Government might well be an issue, especially if—as the previous panel made clear—energy efficiency will be a key delivery mechanism for cutting carbon.

John Stocks: There are number of successful loan funds, including the central energy efficiency fund, which operates in the public sector in Scotland, the Salix fund, which operates with Scottish money in the higher and tertiary education sector, and the small business loans scheme we and the Scottish Government operate. Although those schemes are self-financing, they have had to receive up-front public money. Any thoughts that we might have harboured of getting private sector money to bolster our own loans scheme have been temporarily put on ice with the current situation in financial markets.

The Convener: That concludes questions. I thank the witnesses very much for a very informative and helpful session that will, I am sure, inform our report. If any other points come to mind after you leave, please feel free to send them in writing to the clerks.

At next week’s meeting, we return to our energy inquiry with evidence from the Office of Gas and Electricity Markets and others on issues such as the remit of the regulator and transmission charging.

Lewis Macdonald: We agreed earlier to take evidence from ministers on the matters that we have just discussed. Is it the intention to decide on further steps following that evidence?

The Convener: Yes. We have to prepare a report for the lead committee within the timescale that has been set out, but the clerks and I will discuss how to fit an evidence session with the minister into our programme.

Meeting closed at 12:28.
Scottish Parliament

Economy, Energy and Tourism Committee

Wednesday 4 March 2009

[THE CONVENER opened the meeting in private at 10:04]

10:18

Meeting suspended until 10:33 and continued in public thereafter.

Climate Change (Scotland)

Bill: Stage 1

The Convener (Iain Smith): Colleagues, I open the public part of the eighth meeting in 2009—and the second meeting this week—of the Economy, Energy and Tourism Committee. Today’s main item of business is evidence on the Climate Change (Scotland) Bill from the Minister for Transport, Infrastructure and Climate Change. I welcome him for what is probably his first appearance before this committee. I ask him to introduce his team and to make any brief opening remarks.

The Minister for Transport, Infrastructure and Climate Change (Stewart Stevenson): Convener, I do not intend to make any opening remarks. I am sure that committee members will be able to fill the time with questions.

Members have a list of the officials who are with me. I intend to do the majority of the speaking, but I will draw on my officials for any technical or legal explanations that are required. I am happy to move straight to questions.

The Convener: As the minister will know from the Official Report of our previous meetings, members were concerned about some lack of clarity on the policy direction of the bill. We have asked the minister to come before us today to clarify some of those issues. I ask Wendy Alexander to kick off the questioning.

Ms Wendy Alexander (Paisley North) (Lab): Good morning, minister. As people will be aware, the witnesses who joined us to discuss the energy efficiency provisions in the bill—in chapter 3 of part 5—were concerned that there are no targets on energy efficiency. Chapter 3 contains no provisions on how performance on energy efficiency will be measured, on how progress will be reported or on what contribution energy efficiency might make to the emissions reduction targets for 2030 and 2050. Why was that deemed to be the right approach?

Stewart Stevenson: Sorry, let me write down all those points—although I will be happy to be reminded if I miss out any of them.

We are in a slightly difficult area in relation to the mix of devolved and retained powers, in that energy efficiency is a shared responsibility for the Scottish Government and the Westminster Administration. I do not think that that sharing of responsibility should cause any great difficulties, as I have no indication that people are unwilling or unable to work closely together.

The member asked why the bill does not identify the contribution of a particular sector to our 2030 and 2050 targets. The important thing to say is that all sectors of our economy and all elements of public, business and private life will need to make appropriate contributions. Given that 2050 is a very long time out, successive Administrations—and, I imagine, successive ministers, as I am targeted to be 104 in 2050—will need to develop responses over the period. Clearly, those responses will be driven by the available scientific advice, which must be the key thing that drives us. The moment that we start to impose political decision making that runs at odds with the scientific advice, we go down a very dangerous route that risks damaging the consensus that I hope we will achieve on the principles. Of course, there will continue to be engagement, debate and challenge on matters of detail.

We are doing a number of things on energy efficiency. As members will be aware, building regulations have recently been introduced that will require from 2010 a 30 per cent carbon reduction for domestic and non-domestic buildings. In that respect, we are setting targets for new builds. However, I am quite prepared to acknowledge that current estimates suggest that about 60 per cent of buildings that will be in use for domestic purposes in 2050 will be buildings that have already been built. We will need to develop strategies for those as well.

Ms Alexander: I ask the minister to remain at the highest level in explaining why the bill contains no targets, performance measurements or reporting requirements on
energy efficiency. He seems to have offered the reason that energy efficiency is an area of shared responsibility or competence. Undoubtedly, the European Union has shared competences with national Governments and devolved Governments, but the EU has set a target for improving energy efficiency by 20 per cent by 2020. Let me probe the minister on his implication that the impediment is that energy efficiency is a shared responsibility. Was there any direct discussion with the United Kingdom Government on setting a target, such as the 20 per cent reduction that the EU has adopted?

Stewart Stevenson: Let me go back just a little bit before responding directly to the member’s question.

The bill will require us to produce an energy efficiency action plan, on which we will be required to lay a report before Parliament every year. There is some work there.

I am simply making the rather obvious point that we have some shared responsibilities. Have there been discussions at official level? Yes, of course. Officials work closely with Westminster because approximately—one third of activity in Scotland that will matter to the climate change agenda is the responsibility of Westminster and two thirds is the responsibility of the Scottish Government. It is natural and necessary that we should work together, and indeed that we should work with Europe. We have provided input on a number of European initiatives. Thus far, we have found ourselves in agreement with the responses of the Westminster Administration in that regard.

Ms Alexander: The minister mentioned the energy efficiency action plan. He will have noted some anxiety among witnesses about the timetabling of the action plan. I want to press the minister for clarity on that.

As he will be aware, licensing is a topical issue this week. The secondary legislation arising from the Licensing (Scotland) Act 2005 will not be implemented until autumn 2009. Further, the secondary legislation arising from the Planning etc (Scotland) Act 2006 will not be implemented until at least the end of 2009. What are the precise implications of the phrase “no later than 12 months after the day on which this section”?

section 48—

“comes into force”?

When—roughly—does the minister expect the bill to complete its parliamentary passage? That will be followed by a period before royal assent is granted, then followed by the commencement of provisions, which might be later if the provisions require secondary legislation. Can the minister clarify whether section 48 will come into force following the commencement of secondary legislation, and does he anticipate that that will be at least three years’ hence, which has been the case with the Planning etc (Scotland) Act 2006 and the Licensing (Scotland) Act 2005?

Given that the energy efficiency action plan was first envisaged in 2005, it might be helpful if the minister committed to a date rather than tying its publication to an indeterminate point in the future. Can he offer us any clarity on when we are likely to have the action plan? Is it possible that it could be three years after the discussions in Parliament?

Stewart Stevenson: The member asked me a range of questions. It would be presumptuous of me to anticipate Parliament’s meeting a timetable that I might have in mind for the Climate Change (Scotland) Bill. I would certainly like the bill to be passed around the middle of the year, but I am in the hands of Parliament on that. The co-operation and collaboration of the members present and those elsewhere would be welcome.

We plan to publish the energy action plan shortly after the passage of the bill, and to outline some proposals in that regard without waiting for the passage of the bill. The member can therefore take substantial comfort that the period of three years that she suggested is entirely disjoined from what the Government plans.

Ms Alexander: Why cannot the minister simply put a date on it? This is an executive action; why do you not simply name a date now?

Stewart Stevenson: I come back to the fact that the provisions of the bill as passed will to some extent determine the way forward. It would be presumptuous of me, as a minister—and I think that I would attract some criticism—if I took for granted the parliamentary process. If, on the other hand, the members present, perhaps representing the majority of the members of Parliament, can give me an absolute date for when the
Economy, Energy and Tourism Committee, 3rd Report, 2009 (Session 3) — Annexe B

10:45

Gavin Brown (Lothians) (Con): The time set out for publication of the energy efficiency action plan is 12 months from the date of commencement of section 48. Even in the best-case scenario—if the bill follows your desire and is passed quickly—we could be into the middle or indeed near the end of 2010 before the plan is in place. Given that carbon emissions targets have been set for 2010, I am concerned that if no plan will be in place until the middle or the end of that year, energy efficiency will not make the contribution that it can make to cutting emissions. At our previous meeting, a range of bodies provided good evidence that, because a lot of the work has already been done, 12 months will not be needed to put the plan in place; indeed, it has been suggested that only three months will be required. Is there any way of speeding up the process to ensure that energy efficiency can make a meaningful contribution to the 2010 target?

Stewart Stevenson: We plan to publish our outline proposal in the next few weeks; I cannot give you an exact day at the moment, because a number of processes still have to be gone through. In any case, the proposals will be published very shortly and, as I have said, the plan will be published after the bill’s passage.

The Convener: Before we turn to questions on specific sections, I have a general question that is relevant to the three areas that the committee is considering, including energy efficiency and other energy aspects. Is the Parliament being asked to take too much on trust with the bill? Although an awful lot of work will put flesh on some of the bill’s bones, most of it will be carried out after the committees complete their stage 1 consideration. For example, you mentioned the outline of the energy efficiency action plan, which officials at a previous meeting said would be produced by March.

With regard to the non-domestic sector, the consultation on energy performance certificates closed in November. However, although the report on the consultation was due to be finalised, the committee has not yet received it. We would be interested in finding out the results of the consultation, as they will presumably affect the direction of policy.

As I made clear at the previous meeting with officials, the scenarios outlined in the financial memorandum are vastly different in their costs to local government, central Government and businesses. The committee will not be able to scrutinise any of that properly simply because we do not know the policy direction that the Government will take. In addition, with regard to renewable heat, the renewables action plan will not be published until June.

We are being asked to pass the bill before we see any of that detail. Is that not too much for the committee and the Parliament to take on trust? Should we not have more detail about the Government’s policy direction before we are asked to reach a view at stage 1?

Stewart Stevenson: Let me begin by accepting a pretty obvious point: in every bill, there is a tension between what is contained in primary legislation and what is drawn forward in secondary legislation. It is quite proper that there is a debate on whether in any particular bill the right balance has been struck in that respect.

Given the 2050 target, the Climate Change (Scotland) Bill probably looks further forward than any other bill that the Scottish Parliament has dealt with. Within that timescale are a number of timetables for targets, which have been driven by the scientific advice. The Parliament has processes for dealing with secondary legislation, and that will be the right time to engage with such matters. It would be useful if the specific concerns of committees and committee members were drawn out at stage 1. To be consensual, we will wish to examine what comes out of stage 1 and consider how we might respond at stage 2.

The draft renewables action plan was published as part of the renewable energy
framework at the end of last year. That provides some visibility of what there will be in relation to renewable heat. The committees of the Parliament always have the right to look at anything in advance.

It is not unprecedented to hold further evidence sessions at stage 2, if that is appropriate. If that were the way to deal with some of the issues that we are not able to bottom out just now, the Government would be happy to co-operate and collaborate and to appear at that stage, if appropriate. I would not like to compromise the timetable unduly, but we could certainly appear at that stage.

Of course, the whole point of the bill is to produce a statutory framework to reduce emissions on a long-term basis. There are specific proposals in part 5 of the bill, but we need a lot more than that.

The Convener: The Finance Committee’s report on the financial memorandum states:

"The Committee also considers that in a number of areas insufficient policy direction has been provided, which has made it difficult for local authorities and businesses to be able to assess the financial impact of the proposals."

That is the point that I am trying to make. If there is no clear policy direction, it is difficult for committees to assess whether there are issues. In essence, we are being asked to provide not a blank cheque but a cheque on which we are not quite sure where the decimal point goes in relation to some of the areas, which is a major concern. It is difficult for us to know whether the proposals, such as those on energy performance certificates, will be adequate or whether they will be overburdensome, because we do not know in which policy direction the Government is going. We have not even seen the report on the consultation that we were promised. Do you accept that more detailed work on the policy direction should have been completed before you introduced a bill that gives ministers fairly open-ended powers?

Stewart Stevenson: Energy performance certificates are already part of the landscape. We might be talking about further provisions that will come forward later. I can never remember what ACEP stands for. Will someone remind me?

Gavin Peart (Scottish Government Directorate for the Built Environment): It is the assessment of carbon and energy performance, which builds on the existing system of energy performance certificates.

Stewart Stevenson: We have gone some of the way in drawing forward some of the measures.

In the early stages, one of the interesting things about improving the energy efficiency of buildings is that, for many owners of buildings, there will be quick returns on their investment. When you reduce the energy consumption of a building, whether a domestic or non-domestic building, you reduce the bills that have to be paid for consuming energy. There are a lot of low-hanging fruit out there, which means that there is substantial enthusiasm for improving energy efficiency, regardless of Government policy or legislation.

It is certainly the case that more will come forward. The decimal point is a pesky little thing in certain circumstances. In the financial memorandum, we seek not to give false certainty about what is a framework bill that covers a long period of time but, rather, to give the best possible indication. As we approach many of the interventions, we will of course provide further financial information.

The Convener: I have a final question before we look at the individual sections of the bill in more detail. You said that it is open to committees to take evidence at stage 2 if they feel that it is necessary. Will you give us an assurance that the Government will co-operate with the timetable for stage 2 to ensure that if committees feel the need to take additional evidence at that stage, there will be sufficient time for them to do so?

Stewart Stevenson: It is not for me to speak for the Minister for Parliamentary Business, who represents our interest in such matters. However, I am interested in ensuring that, to the extent that it is possible, we flesh out any policy initiatives that we take and give Parliament the maximum possible understanding of the implications of anything that might be done. Like previous Administrations, the current Administration seeks to support committees’ efforts to understand anything that we do at stage 2.

Gavin Brown: I will follow up one of the convener’s questions. Will the obligations under section 50 fall on the landlords or the tenants of non-domestic buildings?

Stewart Stevenson: The owners will be responsible.

Gavin Brown: You say that people will get money back right away, but, if the tenants pay the cheaper energy bills from saving energy, the owners will not receive a return.
**Economy, Energy and Tourism Committee, 3rd Report, 2009 (Session 3) — Annex B**

**Stewart Stevenson:** To an extent, that will depend on the commercial arrangements between the owner and the tenant. In business life, I as the owner of an asset adopted the general principle that I wanted investments that I made to be reflected in revenue. In any event, investment in improved energy efficiency creates an asset that is more valuable in the long term. It is for owners to ensure that they have contracts with their tenants.

**The Convener:** Rob Gibson will ask about section 48.

**Rob Gibson (Highlands and Islands) (SNP):** Good morning, minister. We are interested in the suggestion in the evidence from the Carbon Trust that energy efficiency should be defined as a primary objective in the bill. What is your response to that?

**Stewart Stevenson:** The bill's objective is to reduce carbon and carbon dioxide equivalent gases—the greenhouse gases. Diluting that by establishing other primary objectives would create difficulties, because an energy efficiency objective might be pursued in competition with the 80 per cent target that we are setting for 2050. Such matters are of value and merit and should be judged in the context of how they enable us to progress to the 80 per cent reduction. I am prepared to accept that even the 80 per cent reduction is indirect, since we are actually trying to contain the increase in the temperature on the earth to no more than 2° to 2.4°C from the baseline figure. If we keep moving objectives up, we distort policy making.

**Rob Gibson:** In that case, why do you not consider introducing provisions in the bill that would require energy efficiency measures and improvements as the starting point for your discussion? I am surprised that, at this stage in your discussions with London, the issue has, to date, not been clarified.

**Stewart Stevenson:** There are certain issues. We do not have competence on energy matters as such. However, in the creation of a legal framework, we will work with colleagues at Westminster. After all, we share a common purpose with Westminster, which has increased its carbon reduction targets, based on advice and a consideration of the situation. Westminster's targets encompass what we do, so it is in the UK Government's interests to support the efforts that we will make in Scotland. We are discussing the issue with the UK Government. I believe that we will find a way in which to support the UK Government's objectives and therefore, simultaneously, our objectives. When we have completed those deliberations, the outcomes will feed into the energy efficiency action plan.

**Rob Gibson:** Will we have clarity before we reach stage 2?

**Stewart Stevenson:** Um—yes. The reason why I hesitate is simply that I do not want to anticipate the exact nature of the agreements and outcomes that we will reach with Westminster. I am absolutely convinced that there is good faith on both sides. Both parties want to ensure that we get the outcome that we need and I have a high degree of confidence that we will do so. That might be by persuading Westminster to take action within its competence or by establishing with Westminster what we might do within our
competence that is consistent with its views. We can resolve the problem in a variety of ways, but please accept that we are engaged extremely strongly in ensuring that we do so.

Rob Gibson: It would help us at stage 2 if the issue was clear, as that would reduce the amount of questions that need to be asked.

Stewart Stevenson: We are actively engaged on the matter. I cannot commit another party in the discussions to a particular timetable, but I, too, want the issue to be resolved within that timescale.

Lewis Macdonald (Aberdeen Central) (Lab): I want to pursue the issue. It is a month since we raised the matter with your officials, who assured us that there was no intention to dilute the existing law, although they said that they would have to get back to us on the effect. However, the supplementary evidence that we have received from the Government again refers to intention, but not to effect. There is concern, which was reflected in Rob Gibson’s questions, about the uncertainty. Do you accept the view of many of the witnesses who gave evidence a month ago that your proposal to publish a plan for the promotion of energy efficiency is a dilution in relation to housing, compared with the existing law in the Housing (Scotland) Act 2006?

Stewart Stevenson: There is certainly no intention to dilute. The reason why we are having discussions is to ensure that we provide a legally binding response that ensures that no dilution is possible.

Lewis Macdonald: You will be aware that, when Malcolm Chisholm took the Housing (Scotland) Bill through Parliament, the wording was not raised as a difficulty. Have Westminster ministers directly raised a difficulty with you on that?

Stewart Stevenson: We have identified a potential difficulty and it is agreed that the subject should be discussed with Westminster. I am highly confident that we will achieve a satisfactory outcome. The policy objective is to ensure that we provide no opportunity whatever—I could not put it more strongly—for dilution of what Malcolm Chisholm successfully took through the Parliament. We are simply trying to deal with technical issues and not trying to deviate from the policy in any sense.

Lewis Macdonald: Have you discussed the issues with ministers at Westminster to try to resolve the concerns?

Stewart Stevenson: The discussion is at official level, just to be clear.

Lewis Macdonald: So it is being discussed at that level. Thank you very much.

The Convener: The change is that, in section 48(2), the word “promotion” is used in relation to living accommodation instead of “improve”, which is the wording in the 2006 act. Section 48(2) concerns only a part of the overall plan for the promotion of energy efficiency, so is it not possible simply to repeat the words of the Housing (Scotland) Act 2006 in it, rather than dilute the provision? If we had the competence to include the wording in the 2006 act, surely it is competent to have exactly the same wording in the bill.

Stewart Stevenson: It is certainly our objective to achieve that, but the mechanism by which we protect what has already been passed will need to await the conclusion of discussions. I am not turning away in any sense the concern about the use of one word in one piece of legislation and the use of another word in a different piece of legislation. It is precisely because we accept that a point is properly being raised on that issue that we seek to ensure that we deal with it appropriately, and I am confident that we shall.

Lewis Macdonald: Do you understand that the concern about the wording is merely a reflection of the wider concern about the lack of targets and the lack of precision on what will be included in the energy efficiency action plan?

Stewart Stevenson: I think that I covered that in my previous remarks, but I acknowledge what Lewis Macdonald says.

Marilyn Livingstone (Kirkcaldy) (Lab): Given the important and effective contribution that microgeneration can make to reducing emissions, why has the Scottish Government not included targets on it? I will frame that with a question on fuel poverty. Increased use of microgeneration technologies, such as air-source heat pumps and solar panels, would particularly benefit the 30 per cent of the population who are off the gas supply and who pay really high prices for inefficient oil heating systems. How much of the proposed member’s bill on microgeneration will be taken into account? That proposal has been put on hold until we see what happens with the bill.

Stewart Stevenson: I am not able to
respond in detail on Ms Boyack’s proposed bill because it has not been published. When that bill is introduced, I will be able to make detailed responses on it. However, on the substantive question, power generation is a reserved matter, so we cannot deal directly with it. However, we can remove the inhibitions that make it difficult for people to install microgeneration technologies, and the work that we are doing on permitted development rights is geared to that. It is enabling work.

I am personally entirely familiar with fuel poverty and off-gas heat: fuel-oil heat, in essence. Because we had half a metre of snow, my wife managed to have a day without any fuel, which she did not enjoy much. However, we are changing the fuel poverty programme from April 2009 to allow microgeneration in a new energy assistance package. We are proactively seeking to engage people in that way.

Marilyn Livingstone also referred to air-source heat pumps. We have not yet included those in the changes in permitted development rights because of difficulties that we and the Westminster Administration are experiencing in getting an adequate definition of noise. In the countryside, such noise is probably not a big issue, but in urban settings it could be more significant. Additional work on air-source heat pumps and wind turbines is under way, which I hope will inform further changes that we could—I emphasise the word “could”—make later this year on permitted development rights.

Marilyn Livingstone: I may want to come back to that, but my next question is on skills. We have heard that 16,000 jobs are going to be created, but previous witnesses have told us that there would be skills gaps if we were to move to use of air-source heat pumps. If there are already skills gaps in the industry, how are you working with other departments to ensure that the required skills will be available across the industry?

Stewart Stevenson: The Scottish Higher and Further Education Funding Council has set up a renewables core skills group, which is dealing with that issue. That group includes representatives from the sector skills councils, Skills Development Scotland, the higher and further education sector and the power companies—Scottish and Southern Energy, Scottish Power and Scottish Renewables. In addition, the sector skills councils are doing research for the Government on long-term sectoral needs, which covers all the issues that the member has raised, from installation of microgeneration to wind farm maintenance and marine energy contractors. We are certainly engaged on the issue and working with partners.

Marilyn Livingstone: In the evidence that we have taken, one of the main issues that has been raised with us across the board is the concern around the lack of skills. Something urgent needs to be done on that. What discussions have you and your department had with the bodies that you mentioned in order to press that point?

Stewart Stevenson: I have just spoken of the action that is being taken right now, which is drawing to the table the appropriate people. It is a question of striking the right balance between the increasing demand for the skills and the number of installations, and of getting the timetables synchronised. We expect the number of renewables installations to rise, although it will not rise like a cliff face the moment that permitted development rights are changed, but will ramp up over time. The action that we are taking right now is likely to be fit for purpose in that sense. The skills for the renewables sector will be included in the renewables action plan, which will be published no later than the end of June.

Sarah Boyack (Edinburgh Central) (Lab): I want to pursue the point about the development of microgeneration. I am conscious that, although we have national renewables targets, we do not have any householder renewables targets. The minister might want to consider that such targets would be a sensible way of driving the industry and driving the agenda for all Government agencies. It is now two years since Scottish planning policy 6 was introduced, which is about driving householder renewables and combined heat and power systems for new developments, but no research has been undertaken to monitor the implementation of that policy, nor do we have any research on retrofitting of microgeneration and householder renewables. Would a Scottish Government target help to push the agenda? Do you have an estimate of the contribution that microgen could make to achieving the Government’s aspirations on energy efficiency and renewables?

11:15

Stewart Stevenson: I will step back to a
relatively high level and make a rather obvious point. Microgeneration is one contributor to improving the energy efficiency of dwellings and non-domestic buildings but, of course, it is not the only one. To an extent, we will achieve best success if we set targets for energy efficiency rather than mandate particular interventions that people must make.

That said, SPP 6 seeks to aid delivery of a 15 per cent reduction in CO\textsubscript{2} or other greenhouse gases. Such a reduction should be part of the material considerations in the planning process. Last year, we also issued guidance in planning advice note 84, which is entitled “Reducing Carbon Emissions in New Development”. One general difficulty is the lack of skills in carbon assessment among planning officials. That has been a constraint, but work is being done to address it.

Microgeneration is part of an overall policy framework. It is a key part of the considerations in the planning system.

Sarah Boyack: I know that the minister is enthusiastic about the agenda, so my question is meant to be helpful.

Stewart Stevenson: I will treat it as such.

Sarah Boyack: As one of the authors of SPP 6, I know that our political intention was to drive energy efficiency and use of whatever microgeneration, small-scale renewables or combined heat and power system was appropriate at the time. Two years on, I understand that implementation of the policy is not monitored. Do you even have a sense of how many local authorities have put the policy in their local plans? A survey by Friends of the Earth Scotland identified that hardly any local authorities had made progress.

The technology is well established and is moving ahead in the rest of the UK. The Department of Trade and Industry estimated that we could obtain 30 to 40 per cent of our electricity from such technologies. Do we have an opportunity to set national targets—the Government’s policy intention suggests that we do—for everybody to introduce such measures and to take a much more proactive approach in order to encourage local authorities to sign up to the agenda?

Stewart Stevenson: It is suggested that only eight of the 34 planning authorities are fully engaged in implementing SPP 6. I mentioned some of the difficulties, but we expect the policy to be implemented much more widely.

In a sense, we must be technology blind and not imagine that we can second-guess the developments in a range of microrenewables technologies. Debate continues about whether wind turbines in urban settings have a net carbon benefit—in rural settings, they probably do. On the other hand, it is pretty broadly accepted that photovoltaics and water heating from solar energy take a short time to provide a return on investments—I mean that in financial and carbon terms.

We must support the efforts to develop technologies. There will be technologies in, for the sake of argument, 2030 of which we know nothing today, which is why it is important that we create frameworks within which we can respond.

The challenge is for building designers, particularly in relation to new buildings, to choose what is appropriate for the building and design it to be energy efficient. For example, we know that a building that is a perfect cube offers less surface area for heat to escape than a long, low, single-storey building of equivalent volume does. Many compromises need to be made in building design. It is important that those who are responsible for that have opportunities to be innovative, and that we do not do things that can stifle innovation but create the wherewithal to show what requires to be done, and allow others to determine the appropriate technologies with which to do it.

The Convener: I wonder whether it is hip to be square, then.

Stewart Stevenson: It is now, convener.

The Convener: We need to move on to consider section 50, which is on the energy performance of non-domestic buildings. The Government has announced its intention is respect of building regulations to change the consultation’s target for new build carbon emissions reduction from 50 per cent to 30 per cent. Can the minister outline why the Government has decided on a lower target than was originally intended?

Stewart Stevenson: One of the key things that the Sullivan report said in that regard was that further work should be done on the costings. That work has been done and it informed our conclusion that we should at this stage consider a 30 per cent target for 2010. It may be useful if I quote something that we received in the past few days from Lynne Sullivan, who chaired the panel. She said:
“I’m pleased that the Scottish Government is acting on our report and has undertaken the ‘costings’ research recommendations. Since the Panel met over a year ago, the building and property industry throughout the UK is in a different financial position. The Minister’s announcement of a 30% reduction in emissions for both new housing and non-domestic buildings is still an exemplary outcome, showing leadership in this vital area.”

When she refers to the “exemplary outcome”, she is of course highlighting the fact that we have the most challenging standards. I think that that is welcomed. It is simply a question of getting the right balance in working with the industry on its delivery capability. We would except to see further requirements for improvement in energy standards in subsequent updates of building standards over the three-year cycle.

The Convener: I hear your answer, minister, but does it not suggest a lack of ambition in what we seek to achieve, given that the standards that we are trying to improve are among the poorest in the world? Certainly, compared with Scandinavia, our standards for domestic and non-domestic buildings are pretty poor.

Stewart Stevenson: I would take issue if I may, convener, with the suggestion that we have the poorest standards. On the contrary, we have in many ways led many other jurisdictions to follow our example. One of the interesting things about the panel that was brought together for the Sullivan report was that we brought people from Scandinavia and Austria to participate in it. Interestingly, they were astonished at how much ahead of them we were in certain respects. We had expected much more of a one-way street in that they would be informing us of their progress—they made a substantial contribution—but all three people on the panel took away substantial experience from Scotland. At the moment, we are probably only marginally behind Finland, and our minimum standards for insulation are substantially better than those in Denmark, for example. Far from our standards being poor, by setting the target of 30 per cent on top of what we have already done, we are setting standards that are higher than anywhere else in the British Isles and in the majority of jurisdictions in Europe.

Ms Alexander: Given that this is the only opportunity to legislate on the matter that is likely to arise in the current session of Parliament, should enabling provisions be included in the bill to increase energy efficiency in the domestic sector as well as in non-domestic buildings?

Gavin Peart: Do you mean for existing dwellings?

Ms Alexander: Yes—in relation to section 50.

Stewart Stevenson: I think that we have within our competence the necessary powers to go forward.

Ms Alexander: So, in the Government’s view, the standard is appropriate for non-domestic buildings but inappropriate for domestic buildings.

Stewart Stevenson: Sorry?

Ms Alexander: I am probing the distinction between domestic and non-domestic buildings.

Stewart Stevenson: We have set the same targets for both.

Gavin Peart: That is for new buildings.

Ms Alexander: Yes, but I am talking about the retrofitting of existing buildings.

Stewart Stevenson: We believe that we can make the necessary progress under the existing legislation. Nonetheless, I am always happy to be advised if there is a particular inhibition in our legislative competence or powers that we have not spotted. I would be happy to hear now or later from Wendy Alexander or the committee on that subject. It is certainly not my intention to deprive myself or my successor ministers of powers to take necessary action.

Lewis Macdonald: I have a follow-up question on the separation of domestic and non-domestic buildings in relation to general permitted development rights. You have drafted a provision—albeit a limited one—in relation to the domestic sector, but you intend to address the non-domestic sector separately. Can you explain why? What are the differences that, in your view, justify a separate process for the non-domestic sector?

Stewart Stevenson: Lewis Macdonald must remember that non-domestic buildings will be on a different scale from domestic buildings—and that is, inevitably, a very general statement—and a different process will be needed to make a substantial contribution to changing their energy efficiency. For example, the retail distribution centres in West Lothian are immense, and that would probably be something that we would want to pursue through the normal
planning system. There are successful examples: for example, rainwater recovery systems have successfully gone through the planning system in West Lothian, and the Michelin factory in Dundee has wind turbines that are substantially larger than we would allow through permitted development rights, which have successfully gone through the planning system. A range of things can be done.

To be candid, the scale of what can be done under it makes the provision that we have drafted for domestic buildings of limited value in relation to non-domestic buildings. I am open to ideas about the matter, although we might cross an important line if we were to open up the process to non-domestic buildings. We are seeking to allow people, without their having to go through the planning system, to make changes that will generally not be regarded as a problem by neighbours, or in terms of their visual impact. The things that people might want to do for larger non-domestic buildings would probably fail that particular test.

11:30

Lewis Macdonald: If I understand the answer correctly, it is less encouraging than I had hoped it would be. I had expected you to address the differences and suggest that you would provide general permitted development rights in certain respects for non-domestic buildings, but you seem to be saying that you do not see a case for general permitted development rights for them, at all.

Stewart Stevenson: No—I am just saying that there is less scope for that.

Lewis Macdonald: In some senses, you seem to be implying that there is more scope, because a renewable unit at a large non-domestic building clearly has a much greater carbon-saving impact than one at an individual house.

Stewart Stevenson: I am absolutely happy to accept that point, because it is self-evidently true. If you can cover the south-facing roof of a large warehouse with a photovoltaic array or solar water-heating apparatus, that will make a substantial contribution, and is something that we would wish to encourage. I am simply dealing with the narrow point of whether that should be covered by the planning system or by permitted development rights. I am not in any sense trying to deny that that would be a good thing to do. I absolutely accept that it would be.

The Convener: Turning to my hobby-horse topic of the enhanced energy performance certificates, is the minister in a position to give us an indication of the policy direction of the Government in relation to EPCs? The seven scenarios that are included in the documentation with the bill range from having a fairly limited enhanced EPC that would accompany the sale or rent of larger public buildings, with additional guidance, through to enhanced EPCs for all non-domestic buildings, with compulsory uptake of recommendations. That is a fairly broad scope. Could you give us an indication of what level the Government intends to go for?

Stewart Stevenson: We expect to publish the response to the consultation next week. In the early years, we are likely to think in terms of option 2. However, if we do not make the appropriate progress, we think that a policy that follows the lines of option 5 is likely to be pursued. We are making progress.
in that regard.

**The Convener:** So, if insufficient progress is made under a regime that involves increased guidance and the promotion of the uptake of recommendations for larger buildings, the intention is to move over time to a regime under which there would be compulsory uptake of recommendations for all buildings.

**Stewart Stevenson:** We will be driven by the outcomes that we achieve. In other words, compulsion will be necessary if the outcomes are not achieved. That is rather self-evident. However, this agenda is so important that we would not wish at this stage to rule out for ever and absolutely the use of compulsion.

**Marilyn Livingstone:** Who would police that? Who would the enforcement body be?

**Gavin Peart:** The bill leaves it open, but we have certainly had some dialogue with the Convention of Scottish Local Authorities on that point, and there has been a lot of support for local authorities being involved in the enforcement side of things.

**Marilyn Livingstone:** What would be the cost of that? Has that been discussed?

**Gavin Peart:** We are considering a system of penalty charge notices, which would mean that the cost would not affect local authorities too much, as they could recoup the costs of the actions that they took.

**Stewart Stevenson:** To make the obvious point, until we bring forward a proposal, we are not formally making any response on the issue of costs. However, it is not our intention to create burdens for local authorities that they would be incapable of bearing. That would run entirely against the spirit of the Government's desire to work as equal partners with local government.

**The Convener:** You say that you are considering going for scenario 2. The explanatory notes say that the average annual cost to the private sector of that option could be as much as £9.6 million, and would cover

"the commissioning of building surveys, calculating energy and carbon performance of buildings, formulating action plans and carrying out building work."

Under scenario 5, that cost could rise to £64.7 million. What are the differences that account for that rise? Is the difference to do with additional bureaucracy, or does it involve additional work being done on buildings, which would, presumably, result in better energy efficiency?

**Gavin Peart:** It comes from the work that would be done on the buildings.

**The Convener:** So you would get more bang for your buck from scenario 5 than scenario 2.

**Stewart Stevenson:** Well, you clearly get more bucks for your bang.

In engaging with the issue in detail at this stage, we are attempting to anticipate what we will bring forward. Our position does not represent a commitment on where we will end up. However, it is proper that we inform people of our direction of travel. As I said, we will publish the results of the consultation process next week, and you will then have an opportunity to read what has been said on the subject. The issue of the costs for all the parties concerned will be an important part of determining what direction we end up taking.

**The Convener:** We would welcome seeing a copy of the responses to the consultation, but we would also like to see the impact assessments that have been done and an indication of what energy efficiency improvements you would expect to be made in non-domestic buildings as a result of each of the scenarios in the explanatory notes. It will be hard for us to judge whether the Government’s decision to go for scenario 2 is correct if we do not know how it compares to the other scenarios in terms of improvements to energy efficiency, which is what the bill is about.

**Stewart Stevenson:** As I said, the explanatory notes reflect our thoughts at the moment. In due course, we will announce our definitive position, with the information that committees such as this one will need in order to make the necessary judgments.

**The Convener:** With respect, that information will be necessary if we are to make a realistic judgment about whether what is in the bill is adequate for it to complete stage 1.

**Stewart Stevenson:** Sorry, was that a question?

**The Convener:** It was a statement with an implied question mark at the end of it. Do you accept that we need that information to be able to judge whether section 50 is adequate?

**Stewart Stevenson:** I return to a point that I have made before. The bill is a framework...
The Convener: With respect, it is for the Parliament to decide whether what is in the bill at stage 1 is adequate. An indication of where secondary legislation is likely to go is a key aspect of any stage 1 consideration of a bill.

Stewart Stevenson: I add a tiny wee point. I should have said earlier that we plan to provide the lead committee with a range of draft secondary legislation at stage 2. That is one reason why I said that it would not be a great surprise if there were further committee engagement at stage 2.

The Convener: I repeat the point that the Government has to get the bill past stage 1 before it can get to stage 2.

Christopher Harvie (Mid Scotland and Fife) (SNP): I want to ask about non-residential buildings, with special reference to supermarkets and the bundle of energy issues connected with them. Scotland has seen a revolution in its retail landscape over the past decade. Large out-of-town supermarkets have been reported to contribute more than 5 per cent of Scotland’s energy emissions.

When you consider such buildings, will you be considering only the buildings? These are buildings that have to be warmed and cooled at the same time, but they are also at the centre of a system that emits a great deal of carbon, with freight transport going in and motor car traffic going in and out. Will you be considering alternative methods of organising retail so that it has a less deleterious impact on the atmosphere?

Stewart Stevenson: Today’s evidence session is about particular parts of the Climate Change (Scotland) Bill. I am sure that the member, and other committee members, will have noticed our intention to include international shipping and aviation in our considerations. Clearly, that will address part of the freight issue. We are also investing substantially in the railway network. Continuing the policies of the previous Administration, we have a range of freight grants. If I recall correctly, no Administration so far has been able to spend its entire budget for freight grants. We are therefore encouraging people to come forward with more and better applications.

The member asked about the location of supermarkets and about travel to them. The challenge is undoubtedly large. As far as we are able, we want to ensure that public transport to out-of-town shopping centres is improved.

The member also mentioned heating and cooling, which are taken into account in the national calculation methodology, which has to implement the European Union directive on the subject.

The member has raised some pretty big issues, but he should be content that they are on the radar and come within the range of what we are trying to do.

Christopher Harvie: An almost analogous situation is the consumption of energy in defence establishments. I was recently in St Andrews and heard a tremendous racket coming from the air base at Leuchars, which was a jet engine being tested—God knows what the carbon consequences of that were. With large defence establishments in Scotland, the buildings probably account for only a fraction of the energy use, given the energy demands of transportation to and from the establishments and the testing of equipment. To what extent are you capable of influencing that?

Stewart Stevenson: The carbon reduction commitment applies to defence establishments. Therefore, notwithstanding the potential for matters such as Crown immunity to come into play, at UK Government level—I am not responsible for what goes on in defence establishment territory in general terms—the subject is inside the tent of the broader agenda that is being pursued. I suspect that we might be travelling slightly away from where the committee hopes to go, but I am happy to respond in those terms.

The Convener: It might be encouraging for Christopher Harvie to know that at least the fuel for the Royal Air Force base at Leuchars comes in by train and is then piped into the base. That is one positive aspect.

We will move on to section 51.

Gavin Brown: When the committee considered the bill previously, the issue of council tax rebates for renewable heat and
other efficiency measures was raised. There has been success south of the border with that type of initiative. At that previous meeting, the Government’s position was that the council tax was to be replaced by a local income tax, on which there was to be a great announcement a week later. Given the content of that announcement and the fact that the council tax will remain, certainly for the parliamentary session, will the Government revisit the issue of a council tax rebate?

Stewart Stevenson: We have indicated that we seek to freeze the council tax for the duration of the parliamentary session. The freeze is a huge contribution to the domestic economies of the houses concerned. The member is right that our proposals for a more equitable, income-based way in which to fund local government are merely deferred and not abandoned. It is worth saying that stakeholders have not raised the issue with us. There is a plan to produce a renewable heat incentive, which is probably an easier and more appropriate approach.

Gavin Brown: The council tax freeze is welcome, but it is not linked directly to energy efficiency or renewable heat. The issue has been raised by stakeholders, which is why the Government, via Colin Imrie, the deputy director of the Government’s energy markets division, responded to the committee directly on the matter. I take issue with the point that the matter has not been raised. Given the success south of the border, will the Government at least examine the results there and reconsider the possibility of a council tax rebate?

Stewart Stevenson: I am always happy to consider these matters and work with my ministerial colleagues on the subject. However, the member should accept that, for the time being, we are focusing our efforts on a council tax freeze. The important point is to support people who wish to make their houses more energy efficient or to install micrenewable technologies. We already have a range of measures in place through the Scottish community and householder renewables initiative, the Scottish rural development programme, the energy saving Scotland network, small business loans and the public sector central energy efficiency fund. There are also broad enabling powers in the Energy Act 2008 to establish a renewable heat initiative, and further work is being undertaken on that.

Lewis Macdonald: The Energy Saving Trust has done research that has shown the effectiveness of council tax rebates. Surely you are not saying that because you have accepted a delay in your plans on local government taxation, the opportunity to promote energy efficiency through fiscal incentives should simply be abandoned.

Stewart Stevenson: We can promote energy efficiency in a positive way by supporting changes that can be made. We are considering other options, including loans and cashback offers. There is a variety of ways of proceeding on this agenda. We are quite open-minded but, within a constrained financial position, we have to come to conclusions about which intervention will deliver the biggest bang for the buck, to use a phrase that has already occurred in the meeting.

Lewis Macdonald: The minister will be aware that Northern Ireland has followed England and Wales in going down that track. They clearly regard it as a positive and effective way to promote and incentivise people to take up renewables, micrenewables and energy efficiency.

Stewart Stevenson: It is for each Administration to take its own view. I will look with great interest at what happens in other jurisdictions. From time to time, I meet other ministers and, more often, I discuss with other ministers what approach they are taking.

Lewis Macdonald: It is completely understood that decisions on local government taxation in the next parliamentary session will be taken in the context of that session. In the meantime, would it not show a degree of urgency in promoting energy efficiency to follow the route, for the next few years, that has been taken by those other Administrations in the United Kingdom for the foreseeable future?

Stewart Stevenson: We will look with interest. We have other interventions.

Lewis Macdonald: That does not sound terribly urgent.

Stewart Stevenson: I do not think that I have more to say.

Sarah Boyack: Without great hope or expectation of getting a different answer from the minister after those detailed questions, I ask him to consider the fact that, last week, we had a very good presentation from his officials at the cross-party group on renewable energy and energy efficiency.
Their ideas for the energy efficiency work that will be funded by the Scottish Government look similar to work that is being done by the power companies and local authorities south of the border, which have flexibility to choose from a range of options, including council tax rebates. Will the minister consider giving us similar flexibility here? It would require primary legislation to give local authorities that opportunity. When I consulted on the issue for my member’s bill, I received a strong response from local authorities in favour of having that flexibility and the option of working with power companies. That is, in a sense, a plea to the minister.

I go back to Lewis Macdonald’s point. Primary legislation now would not prejudge any changes that a future Government wanted to make to the taxation system. We have an opportunity to do something now. It would be worth while for the minister to consider the evidence submitted by those organisations that argue that the issue should be on his agenda.

**Stewart Stevenson:** We are pursuing a substantial range of options. This minister, by instinct, is a copyist—if there is a good idea elsewhere, I will grab it with both hands, and both feet as well if that is necessary.

**The Convener:** Section 51(1) says:

> “Ministers must take such steps as they consider appropriate to promote the use of heat produced from renewable sources.”

One of my colleagues described that—perhaps rather kindly—as “a bit woolly”. In response, the official, who is here again today, said that the Government intended, subject to ministerial approval,

> “to turn that into an obligation to produce an action plan and update it regularly.”—[Official Report, Economy, Energy and Tourism Committee, 4 February 2009; c 1541.]

Has the minister approved such an amendment at stage 2?

**Stewart Stevenson:** The process is slightly more complex than the minister simply issuing a fiat on the subject. The consultations on what we will introduce at stage 2 are in progress. I can assure the member that that is one of the issues that are being considered.

**The Convener:** That answer is almost as woolly as section 51(1).

**Stewart Stevenson:** It is the best answer that I am able, procedurally, to give you at this stage.

**The Convener:** I would be grateful if you could update the committee on that as soon as you can. It would be helpful for any recommendations that we wish to make on the matter.

I have a final question, which might or might not relate to this section—I am slightly confused. The issue of combined heat and power does not appear in the sections that we are discussing. Does it fall into those sections, or should one of the duties of the Government under the bill be to promote combined heat and power, whether from renewable resources or otherwise, given the greater efficiency and reduction in carbon emissions that it can provide?

**Stewart Stevenson:** Again, we return to the word “promote”. Of course, energy, as such, is not within our competence. We are engaged with the issue of biodiesel—or biofuels generally. We have been supportive of a number of initiatives, which we expect to see reflected in our action plans.

**The Convener:** I am not sure that that answers my question.

**Lewis Macdonald:** On Monday, the committee visited the Aberdeen combined heat and power plant and saw the benefits for users. That is extremely positive, but an issue that arises is the lack of capital to extend the approach to other areas that did not have the foresight that Aberdeen had six or seven years ago, when the plant was established. In the context of which action plan does the minister expect further steps to be taken in that regard? Will that include a commitment of resources by the Scottish Government to make that possible?

**Sarah Hart (Scottish Government Business, Energy and Enterprise Directorate):** We are currently consulting jointly with the UK Government on heat and energy saving, which includes the issue of combined heat and power. The renewable heat action plan will also look at the renewable heat element. On the steps that we need to take—we are not quite at that stage—as part of the action plan we are considering where we need to go to mainstream that sort of technology where possible.

**Lewis Macdonald:** That is helpful. On the capital funding of schemes and setting resources aside, will there be some adjustment to the financial memorandum to reflect the commitment to put Government
support behind schemes of that kind?

Stewart Stevenson: This is not the time or place for me to anticipate the cost of outcomes or to make any commitments in that regard, but if what we bring forward by working with the UK Government—it is important that there is partnership working on that—has financial implications, of course we will have to share them with Parliament.

Ms Alexander: I want to ask the minister about the accuracy of the financial memorandum. I appreciate fully that the bill is in many respects an enabling piece of legislation, but might there be merit in revising the financial memorandum? The memorandum states currently that the duty to promote energy efficiency in its wide sense is “part of current planned activity” and, as such, “is not expected to give rise to additional resources”.

It seems to me that that sentence is completely incompatible with the number of plans that we expect to be forthcoming in the coming months. We have had a meaningful debate about whether there should be duties in the bill or whether it is appropriate to put those in secondary legislation. However, whichever route is taken, the statement in the financial memorandum that the Government has laid before Parliament that the duty to promote energy efficiency is “part of current planned activity” is incompatible with the evidence that we have heard today.

It would be in the interests of Parliament if you would produce a revised financial memorandum, acknowledging that there are areas that cannot yet be specified but stating that there are actions that will have financial consequences, given the number of new action plans that we envisage. Otherwise, the financial memorandum process is simply a nonsense. As a convener of the Finance Committee in the previous session, I do not think that any of us has an interest in having a financial memorandum that states the situation as it does currently. I invite the minister to go away with his officials and reflect on whether a revised financial memorandum might be appropriate—it might lack specificity, but it would at least be accurate in identifying that future costs would be forthcoming.

12:00

Stewart Stevenson: I do not want to trade words, but I do not think that financial memorandums claim to be accurate. They claim to be estimates, which is a rather different thing. Accuracy is what we see from outcomes. Inevitably, financial memorandums are an attempt to look forward to the implications of what is done. There is judgment, but they are not absolutist. I just make the general point that financial memorandums give the best available figures, or they should do. I am happy to continue to engage.

In general terms, the comment that is being made is simply that there are no costs associated with the development of the action plan. That is all that we are saying. If any costs derive from the implementation of the action plan, we will of course identify them and bring them forward for the usual financial scrutiny. In a strict sense, one is supposed to produce a revised financial memorandum in response to changes that are made to the bill, rather than in response to changes to the view. However, I am entirely comfortable with the idea that we should continue to engage and to consider the financial costs that are associated with what is a framework bill to take us to 2050.

I return to the point that financial memorandums always give us the best available estimates, and in many cases a range of possible outcomes. To pretend that they tell us exactly what the numbers will be when we review them after the event—in this particular case, and probably in the generality—is a little optimistic.

The Convener: When we started the meeting some time ago, I suggested that Nigel Don, who is substituting for another member today, is a utility player. He will take the role of sweeper on the issue.

Nigel Don (North East Scotland) (SNP): Utilities might be fairly close to where I am coming from.

When the bill is done and dusted and our grandchildren are reflecting on what we did, they will see an act of Parliament sitting on the shelf, on bits of paper—maybe we will not even be using paper by then. It seems to me that what they will see around them are structures that were built with less energy, structures that are better insulated, and energy utilities that are more efficient. I will take those things in order.

First, what I heard this morning is that
building regulations are being tightened up to reduce the amount of energy that is used in the process and, presumably, to improve insulation. Am I right in thinking that what you are working on affects both domestic and non-domestic buildings in that regard?

**Stewart Stevenson:** Yes.

**Nigel Don:** Secondly, are you aware of any inhibitor in the current regulations that prevents people from insulating either domestic or non-domestic buildings in a sensible way?

**Stewart Stevenson:** Well, I cannot write a blank cheque on that, because, for example, listed buildings and buildings in conservation areas are subject to particular regulations. In the generality, however, the answer is no. There are no inhibitions that are material. That is a rather qualified answer, but deliberately so.

**Nigel Don:** Thirdly, I return to a point that Lewis Macdonald made. We saw Aberdeen’s combined heat and power system, which has the huge advantage of being a vastly more efficient process thermodynamically. The minister will be well aware of that. Does the bill contain any inhibitions to the development of such systems? Given that I do not think that there are, what does the Government propose to do to maximise the thermodynamic efficiency of our heat generation, in so far as it is within its gift to do so? I recognise that energy production is a reserved matter.

**Stewart Stevenson:** We already have grants for district heating schemes through the community grants scheme, and we have the Scottish business heat scheme. The issues that arise from having power and heat generation close to domestic dwellings are simply environmental ones that are dealt with in the normal way through the planning process. If emissions are closer to domestic dwellings and indeed offices, there are issues that might not be present when they are much further away.

**The Convener:** I am conscious that the minister is constrained by time as he has a flight to catch—I hope that he has paid the carbon offset.

**Stewart Stevenson:** We have.

**The Convener:** I am glad to hear that.

**Stewart Stevenson:** I would prefer to take the train, but on this occasion I cannot.

**The Convener:** We have not been able to get to one or two questions. I presume that the minister would be happy to take those in writing and to get back to us on them as quickly as possible.

**Stewart Stevenson:** Absolutely. I am grateful for your co-operation—my meeting in London is at 3.30.

**The Convener:** You will struggle to get back for decision time.

I thank the minister and his team for their attendance. The committee will continue to take an interest in the bill as it goes through the parliamentary process. We will have a short suspension to allow the minister’s team to depart.

12:05

*Meeting suspended.*

12:08

*On resuming—*

**The Convener:** If members have any outstanding questions that they want me to put to the minister, they should let the clerks have them as soon as possible. I will ask for a single sheet from the Government outlining all the consultations that are currently taking place and the papers that have been produced by the Scottish and UK Governments.

**Ms Alexander:** I would like a matrix diagram. I tried to produce one myself last week with little boxes but failed miserably.

**The Convener:** I was going to say that we might ask for a Jim Mather mind map, but that might be too complicated for all of us.

**The Convener:** I was going to say that we might ask for a Jim Mather mind map, but that might be too complicated for all of us.

We will ask the Scottish Government to outline the timescales for both the UK and Scottish Government consultations, so that we can have a clear picture of what exactly is going on out there, which will also help for our energy inquiry. Please pass any other questions to the clerks.
ANNEXE C: WRITTEN EVIDENCE

WRITTEN EVIDENCE SUBMITTED TO THE LEAD COMMITTEE

In addition to the written evidence set out below, the lead committee for consideration of the Bill – the Transport, Infrastructure and Climate Change Committee – received a number of submissions of written evidence that are relevant to sections 48-51 of the Bill. These can be found at—

LETTER FROM COLIN IMRIE, SCOTTISH GOVERNMENT (DATED 9 FEBRUARY, 2009)

At the evidence session on 4 February 2009, I agreed to provide the Committee with clarification over a number of points which had been raised in relation to the energy efficiency and renewable heat provisions contained within the Climate Change (Scotland) Bill.

Q1: Mock regulations for the non-domestic building energy efficiency regulations

A mock up for regulations for Section 50: Energy Performance of non-domestic buildings will be provided for Stage 2 of the Bill.

Q2: Section 179 Housing Act

The Committee asked for clarity as to why it was necessary to remove this existing provision which is believed to be stronger than the general promotion duty contained within the Climate Change Bill. The aim of the energy efficiency provision is to promote energy efficiency across all sectors in Scotland, not only housing. This provision will cover policy and actions across all Scottish Government directorates. The reason for the choice that the Bill would “promote” rather than “improve” was due to initial concerns raised over the Government’s legislative competence to “improve” energy efficiency across all areas, as this may stray into the reservations set out in the Scotland Act.

It was never the intention that the repeal of section 179 of the Housing Act and its replacement by section 48 of the Climate Change Bill would remove the commitment to “improve” the energy efficiency of living accommodation. This can be discussed further prior to Stage 2, to ensure that the new provision continues to support the improvement of the energy efficiency of living accommodation.

Q3: Why have permitted development rights not been given for non-domestic buildings?

As announced in the parliament by Stewart Stevenson today, the relevant Amendment Order [the Town and Country Planning (General Permitted
Economy, Energy and Tourism Committee, 3rd Report, 2009 (Session 3) —
Annexe C

Development) (Domestic Microgeneration) (Scotland) Amendment Order 2009] was laid before the Scottish Parliament on Friday 6th February 2009. It will now be considered by the Subordinate Legislation Committee and the Local Government and Communities Committee.

Priority is being given to domestic buildings but the intention is to consider non-domestic buildings next. The variety of non-domestic building types, plus the large size of many non-domestic buildings and the consequent scale of microgeneration equipment, indicate that different issues may need to be considered compared to domestic buildings.

Q4: Scottish Planning Policy 6 / Merton Rule

The committee asked:

How is SPP6 being applied on the ground in Scotland?

The policy in SPP6 expects measures to reduce carbon dioxide emissions to be incorporated into building design before the planning application is submitted to the planning authority. Advice has been issued to help applicants do this (see Planning Advice Note 84 Reducing Carbon Emissions in New Development) but applications and decisions are not monitored centrally. It is for planning authorities in their determination of planning applications to apply the SPP policy, taking account of other material considerations. Some authorities apply their own policies to reduce emissions, and these do not necessarily follow exactly the wording used in the SPP.

Q6: Are there any plans to extend the requirements of SPP6? (e.g. to cover developments below 500 m2 or by increasing the 15% CO2 emissions reduction using Renewable Energy)

SPP6 already provides that planning authorities should use the process of preparing their development plans to consider whether local circumstances justify going beyond 15%, below the 500 sq metre threshold, and whether higher standards can be secured for particular developments. The policy target of 15% on-site renewables in SPP6 founds on the 2007 Building Standards and so a review will be necessary anyway when they are revised.

The Scottish Government is rationalising the current series of Scottish Planning Policies, including SPP6, into a single document. This is not a review of established national planning policy but will rationalise policy, expressing it in more concise terms, providing clarity and greater certainty of intended outcomes. This will require a different approach to expressing and explaining national planning policy but the policies will not be altered unless, for an individual topic, some adjustments are considered necessary.

The energy efficiency of all new buildings is addressed through the building standards system, which limits both carbon dioxide emissions and energy demand. Scottish standards are currently the most demanding in the UK. A further review of these standards is presently underway, investigating
improvements recommended in The Sullivan Report – ‘A low Carbon Building Standards Strategy for Scotland’. Research to support the current review indicates that, in the majority of cases, low and zero carbon technologies (including microgeneration) will be essential to meet the next revision to the energy standards.

Q7: Renewable Heat

The issue of Council Tax rebates and other financial incentives for renewable heat was raised. Under current local government legislation, councils in Scotland do not have the same level of discretionary powers to offer council tax discounts as councils in England. To give Scottish councils similar powers would require primary legislation. The Scottish Government is fully committed to the abolition of the Council Tax and therefore this proposal does not sit with our policy intentions. Following the recent consultation exercise, we will outline shortly how we intend to take forward our plans to introduce a fairer local tax for Scotland.

We already offer financial incentives through the Scottish Community and Householder Renewables Initiative, the Scottish Rural Development Programme, the Energy Saving Scotland small business loans and the public sector Central Energy Efficiency Fund. Broad enabling powers are in place in the Energy Act to establish a Renewable Heat Incentive (RHI). The Department for Energy and Climate Change, in consultation with the Devolved Administrations is conducting further analysis on how effective different structures for the RHI might be in encouraging more renewable heat generation. This work will form the basis of a consultation to be launched later this year on the design and delivery of the scheme. It is important therefore that we understand the detail of how the incentive will work before considering whether additional regulatory or financial measures will be required in Scotland.

Colin Imrie, Deputy Director, Energy Markets Division, The Scottish Government

LETTER FROM STEWART STEVENSON MSP, MINISTER FOR TRANSPORT, INFRASTRUCTURE AND CLIMATE CHANGE (DATED

I refer to your letter requesting additional information as a follow up to my appearance before the Economy, Energy and Tourism Committee on 4 March 2009.

The questions and their responses are contained in Annex A. I have also taken the opportunity to provide additional information for the Committee on Stage 2 amendments for Chapter 3 of the Bill and this information is contained in Annex B.

I do hope this information is helpful. I am also copying this letter to Patrick Harvie of the Transport, Infrastructure and Climate Change Committee.

Stewart Stevenson

</thead>
</table>
| General (1)        | What do you consider to be reserved and what is considered to be devolved and where are the boundaries in terms of the policies you wish to pursue? | Energy Efficiency – Sections 48 & 49  
The Scotland Act 1998 devolves powers to the Scottish Ministers concerning “the encouragement of energy efficiency other than by prohibition or regulation”  
Energy efficiency as it relates to energy markets is a reserved matter. This includes demand management/greenhouse gas mitigation measures such as the Carbon Emissions Reduction Target (CERT) and the Climate Change Levy and the proposed Community Energy Savings Programs.  
These programs provide the primary support for households and businesses in the UK to undertake energy efficiency improvements. The Scottish Government’s approach is to maximise action from these schemes in Scotland by deploying its own funds to leverage greater action on the ground. The Scottish Government considers that this is the most cost effective way to make important progress in improving the energy efficiency of existing homes in relation to a reserved area. |
|                    |                                                                          | Energy performance of non-domestic buildings – Section 50  
The regulation of building standards and the assessment of the carbon and energy performance of buildings are devolved matters.                                                                                   |
|                    |                                                                          | Renewable Heat – Section 51  
There is no reference to heat in the Scotland Act 1998. It is considered a devolved area and therefore Ministers have the powers to promote renewable heat.                                                                 |

Energy performance of non-domestic buildings – Section 50

Because it is considered that the regulation of building standards and the assessment of the carbon and energy performance of buildings are devolved matters, activity in these general areas is not considered to be
restricted by the reservations in the Scotland Act 1998.

Renewable Heat – Section 51

The Renewable Heat Action Plan will cover measures where Ministers have devolved powers, including: awareness raising and consumer information; skills needs, and encouragement.

A regulatory incentive (i.e. an obligation on fuel suppliers) is being developed by the UK Government following the passage of the Energy Act 2008. That Act contains provisions which cover devolved matters. These were subject to a Legislative Consent Motion to enable Scotland to benefit.

</tr>
<tr>
<td>The estimate of 16,000 new green jobs in Scotland by 2020 is based on the UK Renewable Energy Strategy consultation document, which cited a figure of 160,000 new renewable energy-related jobs in the UK by 2020. The estimate assumes that Scotland achieves a 10% share of jobs created across the UK. We consider, however, that the Scottish Government’s renewables targets, combined with Scotland’s natural resource, energy infrastructure and skills mean that we can go higher than this estimate. The UK estimate is based on an analysis of the potential expansion in centralised renewable electricity generation, renewable microgeneration and domestic biofuel feedstock and refinery activities necessary to meet the EU renewable energy transport targets.</td>
<td></td>
</tr>
<tr>
<td>General (5)</td>
<td>Can the Minister outline what are the expected contributions from energy efficiency, non-domestic buildings and renewable heat in terms of meeting the various targets set out in the bill?</td>
</tr>
<tr>
<td>Through the Strategic Overview project, the Scottish Government is working to build up a picture of how and when emission reductions might take place over the next 40 years, setting out in broad terms the key sectors for abatement in the short, medium and long term identifying where the major carbon savings could be made, highlighting the key milestones and actions in delivering the these savings and the barriers to implementation. A discussion document covering these issues is planned for publication in the summer of 2009.</td>
<td></td>
</tr>
<tr>
<td>Section 48 Question (1)</td>
<td>Apart from living accommodation, which other policies and actions will be covered by the requirement to promote energy efficiency? Will it be necessary to restrict the policy areas covered by the action plan in order not to stray into reserved matters?</td>
</tr>
<tr>
<td>It is envisaged that the Energy Efficiency Action Plan will include Government policies and actions to promote energy efficiency across all sectors. Whether or not it will be necessary to restrict the policy areas covered by the action plan will depend on the exact nature of the policy or action. Further information on the Energy Efficiency Action Plan will be detailed in the forthcoming outline.</td>
<td></td>
</tr>
<tr>
<td>Section 48 Question (2)</td>
<td>What is the expected added value of the consultation on energy efficiency before the preparation of the plan for the promotion of energy efficiency is published?</td>
</tr>
<tr>
<td>------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>A series of energy efficiency measures are already being delivered by the Scottish Government, while others are being developed. The Energy Efficiency Action Plan will bring all these measures together. Consultation is important to ensure that these measures can be considered comprehensively, so that activity can be added in areas in which there are gaps. In addition, consultation will ensure that the final version of the action plan has been subject to critical appraisal from stakeholders.</td>
</tr>
<tr>
<td>Section 48 Question (3)</td>
<td>Whether, in light of the recent decision of the Public Audit Committee to refer Audit Scotland’s report on energy efficiency to this Committee, the Minister thinks there is sufficient leadership shown at the highest levels for energy efficiency in the public sector?</td>
</tr>
<tr>
<td></td>
<td>The Scottish Government considers that there is sufficient leadership shown at the higher levels of the public sector. The Scottish Government’s Leading by Example High Level Groups, and its forthcoming Energy Efficiency Project Board, will raise the profile of energy efficiency in the public sector and enable senior level buy-in. The Scottish Government has provided funds through the Central Energy Efficiency Fund to enable action to happen on the ground. CEEF has provided local authorities, NHS Boards and Scottish Water with £20 million in interest-free loans for capital investment in energy efficiency measures. A further £4 million has been provided to the further and higher education sectors for similar energy efficiency support.</td>
</tr>
<tr>
<td>Section 48 Question (4)</td>
<td>Does the Minister believe there are any conflicts between the regulations and legislation covering social housing and his plans for energy efficiency investments as part of the action plan, such as an emphasis on budgets and resources within investment packages for social housing that are not related to energy efficiency improvements?</td>
</tr>
<tr>
<td></td>
<td>The Scottish Government does not believe that there are any conflicts between the regulations and legislation covering social housing and our plans for energy efficiency investments as part of the Energy Efficiency Action Plan.</td>
</tr>
</tbody>
</table>
| Section 50 | Question (1) | The Climate Change (Scotland) Bill will introduce an important new duty on Scottish Ministers to prepare and publish a plan for the promotion of energy efficiency across all sectors in Scotland. The Plan will highlight the range of Scottish Government policies and programmes that will continue to deliver significant improvements in the energy efficiency of the domestic sector within the existing legal framework. This will include recent announcements on funding for a major area-based home insulation scheme and a commitment to bring forward proposals for a significant loan scheme. New legislation to bring forward these measures is not required.

The Climate Change (Scotland) Bill seeks to introduce a legal framework for the introduction of energy assessments for existing non-domestic buildings. However, the industrial, business and public sectors are used to working within a range of obligations that protect their employees and wider society (e.g., in respect of health and safety, accessibility, fire safety, etc) that do not apply to the domestic sector.

There are currently no plans to introduce requirements for further periodic energy assessments for the domestic sector other than the requirements for Energy Performance Certificates at sale or rent that have just been implemented. As outlined above, this is because we believe that we can continue to make progress in improving domestic energy efficiency within existing legislation.

The introduction of regulatory requirements for the energy efficiency of housing would, in any case, be likely to drive out CERT investment. This would be contrary to current policy which is to seek to maximise CERT activity in Scotland and means that many Scottish householders would be denied access to this support. |

| Whether the Minister has any views on the omission of the domestic sector from the Bill and whether enabling provisions should be introduced to tackle energy efficiency in the domestic sector as well as in non-domestic buildings? |
**Section 50 Question (2)**

<table>
<thead>
<tr>
<th>In light of the Scottish Government’s announcement on building standards on 27 February, whether the Minister has any intention to introduce tougher, statutory building regulations in non-domestic sector, e.g. (i) introducing tougher mandatory building standards for new-builds mandating low- or zero-carbon rating within a decade, or (ii) legislating for energy efficiency in both social housing (introducing a Social Housing Quality Standard) and also in the private rental sector (requiring investments in energy efficiency to be made by landlords at the point of sale etc)?</th>
</tr>
</thead>
</table>
| (i) We have the ambition of low-carbon and eventually zero-carbon buildings. After this current review of energy standards in Scottish building regulations there will be at least a further two reviews. These will both occur within the ten years that follow and significant progress will be made in respect of our ambition.  

(ii) Social housing already has the best energy efficiency standards of any housing sector with two thirds of homes receiving a “good” rating on the National Home Energy Rating scale. A Scottish Housing Quality Standard (SHQS), similar in nature to the Decent Homes standard in England, was introduced in February 2004, though the energy efficiency requirements are more stringent to compensate for more extreme weather in Scotland. Whilst this is not a legislative requirement, social landlords are expected to meet the SHQS by 2015 which will help to further drive up energy efficiency standards in this sector.  
While energy efficiency standards are generally lower in the private rented sector than in the social sector, a number of factors should assist in improving standards within existing legislation and these are set out below.  

- An EPC showing the energy efficiency of the property must now be provided to prospective tenants before a house is let. EPCs should raise awareness of energy efficiency among tenants as well as giving them more information, and landlords should be encouraged by this to upgrade their properties to make them more marketable.  

- Landlords and agents accredited by Landlord Accreditation Scotland (LAS) are required to meet the Scottish Core Standards for Accredited Landlords, one of which relates to energy efficiency, insulation and heating.  

- We are also working with private landlords and their representative bodies to promote greater awareness of new and existing incentives to improve the energy efficiency of the private rented sector. |
efficiency of the homes they rent out.

- These incentives include:
  - Tax relief available under the Landlord Energy Saving Allowance.
  - Provision of loans under the Energy Saving Scotland – Small Business loans scheme.
  - Opportunities under the Carbon Emission Reduction Target scheme.

| Section 51 Question (1) | What steps the Scottish Ministers plan to take to promote the use of heat produced from renewable sources? What forms of renewable heat will be promoted and for what uses (domestic, commercial etc.)? | The measures will include: awareness raising and consumer information; addressing skills needs particularly for installation; highlighting building regulations; and the encouragement of heat mapping at a local authority level.

All forms of renewable heat technologies will be promoted, including: biomass combustion, heat pumps (air, ground and water source), solar thermal, wind to heat, anaerobic digestion, and geothermal. All scales will be promoted from individual households, level to large scale industrial. |

| Section 51 Question (2) | How the Scottish Ministers intend to ensure the delivery of the use of heat from renewable sources, especially in the context of the challenges posed by different types of building? | The introduction of the renewable heat incentive (RHI) at a UK level will play a key role in helping to stimulate the sector in the important period of early growth. The measures taken at a Scottish level will complement the RHI. Therefore activity at the Scottish and UK level should ensure we can meet our target of 11% heat demand from renewable sources by 2020. |
### Economic, Energy and Tourism Committee, 3rd Report, 2009 (Session 3) — Annexe C

<table>
<thead>
<tr>
<th>Section 51 Question (3)</th>
<th>What support will there be for promoting the use of renewable heat? Whether the Scottish Government have any intentions to increase the support available through the Community and Householder Renewables Initiative and the Scottish Biomass Support Scheme?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Financial support for installation of renewable heat technologies and feasibility studies is available from a number of grant programmes, including: Scottish Community and Householder Renewable Initiative, Scottish Biomass Heat Schemes; Scottish Rural Development Programme, and Climate Challenge Fund. In addition the Renewables Obligations support biomass CHP plants. The Scottish Government tripled funding on microgeneration and community renewables. We also announced funding of £2 million for the biomass heat scheme.</td>

A number of amendments are planned for Part 5 Chapter 3 of the Bill.

### Energy Efficiency

- It is proposed to seek to amend section 48(2) to replace the word “promote” with the word ‘improve’ to change this provision to “improve” the energy efficiency of living accommodation.

- For information the action plan will aim to promote energy efficiency, having particular regard to improving the energy efficiency of housing.

### Energy Efficiency of Non-Domestic Buildings

- Following the conclusion and analysis of the consultation on the proposals for improving the energy performance of non-domestic buildings, Stage 2 amendments are proposed to require, through secondary legislation, mandatory implementation of cost-effective improvements to existing non-domestic buildings. This SSI will be subject to affirmative resolution.

- It is not intended that this provision would be utilised immediately and as announced in the response to the consultation, a voluntary approach will be adopted initially to the implementation of cost-effective improvements to existing non-domestic buildings. This regulation making power is intended for future use if a voluntary approach is considered inadequate for delivering emission savings.

- Draft regulations for this will be provided for the Transport, Infrastructure and Climate Change Committee to consider before Stage 2 of the Bill process begins. These draft regulations will also be shared with the Economy, Energy and Tourism Committee.

### Renewable Heat

- It is proposed to amend the provision to introduce a commitment to produce an Action Plan and to update it regularly.
Finance Committee

Remit and membership

Remit:

1. The remit of the Finance Committee is to consider and report on-

   (a) any report or other document laid before the Parliament by members of
   the Scottish Executive containing proposals for, or budgets of, public
   expenditure or proposals for the making of a tax-varying resolution, taking
   into account any report or recommendations concerning such documents
   made to them by any other committee with power to consider such
   documents or any part of them;

   (b) any report made by a committee setting out proposals concerning public
   expenditure;

   (c) Budget Bills; and

   (d) any other matter relating to or affecting the expenditure of the Scottish
   Administration or other expenditure payable out of the Scottish
   Consolidated Fund.

2. The Committee may also consider and, where it sees fit, report to the
Parliament on the timetable for the Stages of Budget Bills and on the handling of
financial business.

3. In these Rules, "public expenditure" means expenditure of the Scottish
Administration, other expenditure payable out of the Scottish Consolidated Fund
and any other expenditure met out of taxes, charges and other public revenue.

(Standing Orders of the Scottish Parliament, Rule 6.6)

Membership:

Jackie Baillie (Deputy Convener)
Derek Brownlee
Linda Fabiani
Joe Fitzpatrick  
James Kelly  
Jeremy Purvis  
Andrew Welsh (Convener)  
David Whitton

**Committee Clerking Team:**

**Clerk to the Committee**  
Mark Brough

**Senior Assistant Clerk**  
Lewis McNaughton

**Assistant Clerk**  
Allan Campbell

**Committee Assistant**  
Jennifer Bell
Introduction

1. The Climate Change (Scotland) Bill (“the Bill”) was introduced in the Scottish Parliament on 4 December 2008. The Transport, Infrastructure and Climate Change Committee has been designated as the lead committee on the Bill at Stage 1, with the Rural Affairs and Environment Committee being designated as secondary committee. In addition, the Economy, Energy and Tourism Committee considered certain aspects of the Bill.

2. Under Standing Orders Rule 9.6, the lead committee at Stage 1 is required, among other things, to consider and report on the Bill’s Financial Memorandum. In doing so, it is required to consider any views submitted to it by the Finance Committee (“the Committee”).

3. At its meeting on 13 January 2009, the Committee agreed to adopt level three scrutiny in relation to the Bill. The Committee took oral evidence from the Scottish Environment Protection Agency (SEPA) – who also provided written evidence – the Federation of Small Businesses (FSB) and from Scottish Government officials, at its meeting on 10 February. The Scottish Government and the FSB submitted supplementary written evidence after they gave oral evidence to the Committee.

4. The Committee also received written evidence from—
   - Aberdeen City Council
   - East Ayrshire Council
   - Glasgow City Council
   - Fife Council
   - Confederation of Forest Industries
   - East Lothian Council
   - Highland Council

1 Information on the Committee’s three-level system of scrutiny for Financial Memoranda is available at: http://www.scottish.parliament.uk/s3/committees/finance/financialMemo.htm
5. All written evidence received is published as the Annexe to this report. The Official Report of the oral evidence session on 10 February can be found on the Parliament’s website.²

THE BILL

6. The Bill sets a long-term target to reduce Scotland’s emissions of Kyoto Protocol greenhouse gases by 80% by the year 2050. This target will be supported by a framework of annual targets intended to stimulate policies necessary for achieving the long-term target. Many of the policy measures required to meet these targets will not require legislation to implement them. Certain climate change mitigation and adaptation policies have been identified which do require legislation and the Bill contains provisions in Part 5 which will allow these to be taken forward.

7. The Bill is separated into five Parts—
   - Part 1 creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050. To help ensure the delivery of these targets, the Bill also requires that Scottish Ministers set annual targets, in secondary legislation, from 2010 to 2050.
   - Part 2 allows Scottish Ministers to establish a Scottish Committee on Climate Change, or to designate an existing body, to exercise advisory functions.
   - Part 3 requires Scottish Ministers to report regularly to the Parliament on Scotland’s emissions and progress towards the targets set in the Bill.
   - Part 4 allows Scottish Ministers, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.
   - Part 5 is divided into four chapters—
     - Chapter 1 contains provisions relating to adaptation to the impact of climate change. It requires Scottish Ministers to produce a report setting out their objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced. It also contains an enabling power for the Scottish Ministers to vary the permitted times during which muirburn may be made.
     - Chapter 2 allows modification by regulations of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change.

Chapter 3 requires Scottish Ministers to produce an action plan setting out their current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change in regard to energy efficiency. It also contains measures for improving the energy performance of existing non-domestic buildings in order to raise the contribution that those buildings can make to mitigating climate change through reducing energy demand and thereby emissions of greenhouse gases. It also places a duty on Scottish Ministers to promote the use of heat from renewable sources.

Chapter 4 enables Scottish Ministers to make regulations addressing various issues in moving towards a zero waste society, and securing a more sustainable use of resources, thereby limiting the emissions of greenhouse gases which contribute to climate change.

SUMMARY OF COSTS OUTLINED IN THE FINANCIAL MEMORANDUM

8. The Financial Memorandum contains substantial cost information, and explanation of policy background and assumptions underpinning the cost estimates. The nature of the Bill means, however, that the cost information is not presented in a way that allows identification of clear total one-off or recurring costs associated with the Bill’s implementation.

Part 1 – Emissions reduction targets

9. Based on a range of research, the Financial Memorandum estimates that the overall cost to Scottish Government, local authorities, public bodies and Scottish businesses of delivering an 80% reduction in emissions by 2050 would be in the region of 1%-2% of GDP in 2050. In 2006, 1%-2% of Scottish GDP would have been equivalent to £1 billion - £2 billion. These costs would apply across the whole of the Scottish public sector and all business sectors.

10. The exact cost depends on the particular policy measures used to contribute to meeting the target. The Financial Memorandum points out that it is extremely difficult to cost sub-sets of options. However, it outlines one assessment of a set of measures which may, in the year 2050, cost the equivalent of £1.7 billion at 2005 prices.

11. These overall figures do not assess the wider economic costs from implementation or the proportions of costs likely to fall on producers, consumers or taxpayers. However, the Financial Memorandum points out that research estimates the cost to society if no action is taken to alleviate climate change to be 5%-20% of global GDP.

12. The Financial Memorandum states that costing delivery of the 2030 target is also difficult as a straight line reduction trajectory is unlikely. Rather, some more significant emissions reductions are expected to result from step changes in approach.

13. The Bill does not specify the means by which the annual targets are to be delivered, and the costs and efficiencies will depend on many inter-related factors.
Future emissions also depend, at least in part, on the general level of economic activity. Ministers will be required to seek advice on the most cost-effective reductions available when setting annual targets. The periodic statutory instruments prescribing annual targets (which will be instruments subject to the affirmative procedure) will be accompanied by a Regulatory Impact Assessment which details the likely cost implications.

14. In the event of failing to meet an annual target, the Bill includes powers to address this by purchasing carbon units. The cost of this would depend on the extent of any failure and the market price of units (estimated to be at least £15-£30 per tonne of carbon dioxide equivalent), and would represent a transfer of funds from Scotland to the country generating the carbon credit.

15. The Bill allows for the establishment of a carbon tracking and accounting scheme, with an estimated cost on the Scottish Government or a designated public body of £60,000 per annum.

Part 2 – Advisory functions

16. The Bill requires Ministers to seek independent expert advice before setting annual targets. At present, the Scottish Government is committed to providing £275,000 in 2008-09 to part-fund the UK Committee on Climate Change, established under the UK Climate Change Act 2008. The Financial Memorandum states that this is regarded as the most cost-effective option for obtaining advice. In the event that Ministers decide to exercise the Bill’s power to establish a Scottish Committee on Climate Change, the Financial Memorandum estimates a cost of around £2.5 million per annum. In that event, there may be some potential for savings on payment to the UK Committee for work in relation to Scotland.

Part 3 – Reporting duties

17. Various reporting requirements set out in the Bill are estimated to cost a total of £17,000 per annum, with this cost to be absorbed within existing administration budgets.

Part 4 – Duties of public bodies

18. The Bill provides for the possibility of imposing a duty on public bodies to ensure consistent and fair contributions to delivery across the public sector. The cost of doing this will depend on the circumstances. The Financial Memorandum does not outline any estimates, stating that imposing the duty would be part of the cost of meeting the various statutory targets. It states that, if an order was proposed to impose such duties, a Regulatory Impact Assessment would be produced.

Part 5 – Other climate change provisions

Chapter 1 – Adaptation

19. The Bill requires that, where the Secretary of State has laid a report on the impacts of climate change (under section 56 of the UK Act), Scottish Ministers must lay a programme before the Parliament setting out proposals for adapting to
these impacts. The Financial Memorandum estimates staff costs of £30,000 in
each year in which such a programme is required (within three years of the UK Act
coming into force, and thereafter at least every five years).

Chapter 2 – Forestry
20. The Financial Memorandum states that the power to modify the functions of
the Forestry Commissioners in respect of Scotland is intended in the first instance
to allow the Forestry Commission Scotland (FCS) to enter into joint ventures for
renewable energy development, and to let timber cutting rights to fund climate
change activity. Initial costs of establishing joint ventures are estimated at £0.5
million per annum for 2009-10 and 2010-11, to be met from current FCS budgets.
It is estimated that the potential net annual income from joint ventures could reach
£10 million by 2012 and £30 million by 2020.

21. Initial costs of establishing contracts for letting cutting rights are estimated at
£0.2 million per annum for 2009-10 and 2010-11, to be met from current FCS
budgets. No estimate of potential income is given. A Regulatory Impact
Assessment would be prepared for any secondary legislation to pursue this.

22. Initial costs of pursuing the option of establishing an additional body to
pursue woodland creation are estimated at £0.3 million per annum for 2009-10
and 2010-11 – again to be met from current FCS budgets – although detailed
proposals have yet to be developed.

23. For all the forestry initiatives, the Financial Memorandum suggests that, after
the first two years, running costs will be funded from income generated.

Chapter 3 – Energy efficiency
24. The Financial Memorandum states a range of cost scenarios that may arise
from provisions to improve the energy performance of non-domestic buildings.
The total cost to the Scottish Government depends on a number of variables, and
the Financial Memorandum states that detailed estimates cannot be developed
until the Bill is enacted and new responsibilities agreed. The menu of preliminary
estimates results in scenarios with one-off costs ranging from £0.3 million to £0.6
million, and average annual costs ranging from £0.3 million to £12.4 million.

25. The potential costs on local authorities are similarly wide-ranging. The
Financial Memorandum estimates the average annual costs of the scenarios to be
from £2.6-£3.5 million to £27.7-£37 million. Scenarios for the costs on other
bodies, individuals and businesses range from average annual costs of £5.3-£6.2
million to £55.4-£64.7 million. Again, any secondary legislation will be
accompanied by a Regulatory Impact Assessment.

Chapter 4 – Waste reduction and recycling
26. The Financial Memorandum states that this chapter of the Bill contains
enabling powers to introduce a wide range of secondary legislation. The costs
and efficiencies arising as a result of the proposals will vary widely according to
how and when they are implemented and it is, therefore, not possible to provide
exact costings for the proposals which will come forward in secondary legislation.
All secondary legislation will be accompanied by a Regulatory Impact Assessment.
27. The Financial Memorandum includes a table which summarises the potential estimated costs of the provisions in this chapter of the Bill (see Table 8 on page 51).

SUMMARY OF EVIDENCE

Specific issues

Advisory functions (Part 2)

28. Evidence from the UK Committee on Climate Change (UKCCC) supported the assumptions in the Financial Memorandum relating to its advisory functions. It agreed that future Scottish annual contributions to the Committee are likely to be in line with that made in 2008-09, i.e. £275,000. Also, the UKCCC considered that additional funding may be required where it is commissioned to provide advice and the cost of that task is particularly expensive. In fact, the UKCCC considered it likely that such additional funding would be required, but noted that specific costs and the timing of any required funding were yet to be established.

29. SEPA referred to the provision in the Bill to establish a Scottish Committee on Climate Change which would provide the advisory function currently carried out by the UKCCC. SEPA acknowledged that at this stage it was difficult to comment on the scale of additional charges relating to a Scottish advisory function. SEPA expected, however, that the costs of carrying out such a role would be substantial; requiring expertise in climate change science and environmental technology, economic assessment and modelling and understanding of social impacts.

30. In supplementary evidence, the Scottish Government confirmed that its contribution to the funding for the UKCCC is expected to vary year on year. This is partly due to the inclusion in the 2008-09 fees of one-off start up expenditure. Moreover, the Government confirmed that additional funding is also expected to be required for analysis regarding the annual Scottish targets and trajectory. It was suggested that—

"if this work requires, for example, an additional analyst and perhaps some additional research to build on the analysis work already undertaken by the Committee, this could be estimated to be in the region of up to £100,000."

31. The Government also confirmed that the UKCCC is currently considering the resource implications of work in support of the Bill, in addition to reviewing its funding requirements for 2009-10 with the UK administrations.

32. In relation to the estimated cost of establishing a Scottish committee on climate change, the Scottish Government provided further details of how it had arrived at its estimated annual cost of £2.5m. Against the UKCCC’s annual cost of £2.7m, the Government identified a number of possible savings: through an information sharing arrangement with the UKCCC; employing a slightly smaller secretariat; lower remuneration for committee members; and reduced accommodation costs as a result of co-location. In response to the views expressed in evidence to the Transport, Infrastructure and Climate Change
Committee\(^3\) that the cost of a Scottish Committee would be less than estimated in the Financial Memorandum, the Government stated that—

> “While we acknowledge that our estimates are not precise sums, we remain convinced that the figures [presented in the Financial Memorandum] indicate the scale of the cost difference between contributing to the UKCCC and establishing a Scottish Committee.”

**Forestry (Part 5, Chapter 2)**

33. In written evidence, the Confederation of Forest Industries (ConFor) considered that insufficient information is available in the Financial Memorandum to be able to assess the likely impact of the proposals on joint ventures and leasing rights.

34. ConFor stated that there is no information publicly available on which to judge the accuracy of the cost estimates for income from joint ventures. It said that, without specifying the areas proposed to be leased and the terms of the lease, it is not possible to estimate the potential income available, the impact of spending this income on planting new forests, or of the impact on wood processing businesses. ConFor acknowledged, however, that further details on joint ventures and leasing arrangements would be provided alongside forthcoming secondary legislation and that at that point, an understanding of the cost impacts would be better known.

35. In evidence to the Committee, Scottish Government officials provided some explanation of the likely costs under the forestry provisions. Regarding joint ventures for renewable energy projects, officials suggested that the estimated income was based on a 150MW wind farm delivering around £3m per year.

36. In relation to the letting of timber cutting rights, officials indicated that the level of income generated depended upon the area that is let and the terms of the lease. They said, however, that any lease arrangement would have a reserve price that would take into account the value of the assets to the FCS and any additional costs that might be associated with leasing, such as paying grants to the lessee. Subject to these factors, officials suggested that the option of a 75-year lease of 100,000 hectares, as mentioned in the Financial Memorandum, could be expected to generate an income in the region of £150m-£200m.\(^4\)

37. The Government also confirmed that the consultation on the forestry provisions in the Bill has just concluded and that it is collating the responses. In parallel, officials have undertaken work on an options review, on which they will report to Ministers by the end of February 2009. It is understood that the review will provide financial analysis of joint ventures, the leasing of forest land and details of costs associated with setting up a membership-led body to which cutting rights receipts could be transferred.\(^5\)

---

Concern was raised in evidence to the Committee about the wide-ranging nature of the enabling powers in the Bill relating to enhanced Energy Performance Certificates (EPCs). In supplementary written evidence, the FSB considered the scope of the Government action to be unclear which, it said, made it difficult to ascertain the potential impact of the Bill. It referred to the seven scenarios for enhanced EPCs as “having severe cost and practicality implications” for business and public bodies (the potential cost to businesses ranges from £5.3m to £64.7m p.a.).

A similar point was made regarding the potential costs to local authorities, which the Financial Memorandum states could range from zero (paragraph 193) to £37m p.a. (Table 6 on page 39). Glasgow City Council criticised the Financial Memorandum and suggested that it did not enable an authority the size of Glasgow, which has in excess of 1000 buildings, to accurately compile the increased level of spending and resources that will be required. In relation to the information that will be included in future secondary legislation and a fully costed RIA, East Ayrshire Council stated that—

“it is not until this information is available that local authorities will be able to comment on whether any financial implications are reflected and whether the costs associated with the Bill can be met or made self-financing through the levy of penalty charges.”

In other evidence, SEPA recognised that the enhanced EPC provisions in the Bill would likely be a much bigger issue for local authorities, due to the size of their building stock compared with that of SEPA. On the cost estimates themselves, SEPA stated that it was difficult for it to comment on the accuracy of the figures given that it does not get involved in areas such as building regulation.

The Scottish Government acknowledged that the seven scenarios for the energy performance of non-domestic buildings covered a wide range of possibilities, which could have significant financial impacts on public bodies, local authorities and businesses. Government officials confirmed that no policy decision had been taken to exclude any of the seven scenarios and highlighted the various factors on which the costs were based. They said that they were currently taking advice on the responses received to their consultation on the different scenarios (which closed on 25 November 2008) with the intention of reporting back to Ministers, and hoped to find a way forward for the next stage of the Bill.

The Government also confirmed its intention to address all costs associated with the chosen policy on enhanced EPCs in a detailed RIA, which would accompany the regulations. It was stated that there is every possibility that the regulations will be included within the first 10 years of annual targets and could come in shortly after the end of the current spending review period which ends in 2011. In addition, the Government explained that it would carry out a rigorous
review of these regulations (within 10 years of the introduction) to assess their impact.

Waste reduction and recycling (Part 5, Chapter 4)
43. SEPA’s view was that, as a first cut, the costs relating to the provisions on waste reduction and recycling (presented in Table 8 on page 51 of the Financial Memorandum) are a reasonable set of assumptions. Despite this, however, SEPA accepted in written evidence that “the cost of the waste provisions cannot be fully anticipated because it is not yet known whether the voluntary agreements will be sufficient, thus rendering the provisions unnecessary.”

44. Other evidence was more critical of the information contained in the Financial Memorandum. The FSB referred to inconsistencies in the presentation of costs in the Financial Memorandum and suggested that it would have been helpful if all of the costs had been calculated to give a total figure for businesses across Scotland.10 (The costs given in relation to waste prevention and management plans refer only to the cost of preparing an individual plan.) Whilst the FSB imagined that it would be asked to contribute to modelling work for any future RIA on these proposals, it stated that it would much rather that the Government had already done this work.11

45. Also, the FSB noted the different types of plans that could be required under the regulations for waste reduction and management plans. The Policy Memorandum describes them as ranging from plans for an individual construction project to plans for waste generated by a business on an ongoing, day-to-day basis (e.g. office waste).12 The FSB considered the cost implications of these options to vary considerably and suggested that until the Government was clear about its chosen approach, it was difficult to be able to judge the likely cost impact of the proposals in the Bill.13

46. Glasgow City Council also found the lack of detail contained in the Financial Memorandum to be problematic. The Council referred to the information on carrier bags, deposit and return schemes and waste management plans and stated that it was difficult for the Council to assess the likely cost of widespread introduction of these initiatives.

47. Other evidence queried certain specific cost estimates contained in the Financial Memorandum. SEPA considered the enforcement costs relating to duties to provide recycling facilities (estimated at £15 per hour) to be insufficient and suggested that a more senior member of staff would be required for such a task. East Ayrshire Council made a similar point in relation to the estimated staff costs of registering waste prevention and management plans (estimated at £15 per plan).

48. Fife Council questioned the appropriateness of the £3.5m p.a. cost of enforcing carrier bag charges on the basis that many large retailers already implement such schemes on a voluntary basis. It also, along with the FSB,

12 Climate Change (Scotland) Bill, Policy Memorandum, paragraph 119.
suggested that Victoria Quay was not a particularly helpful example to use as an indicator of the cost of providing recycling facilities in business premises across Scotland.

49. In relation to the provisions on recycling, the FSB commented on the omission of “the inevitable cost implications to local authorities of providing the necessary infrastructure to support additional recycling.” It suggested that if local authorities – as the main bodies that collect waste from small businesses – do not have the facilities to cope with that task then small businesses will not be able to save money through increased recycling.14

50. In written evidence, the Scottish Retail Consortium (SRC) expressed concern that the waste and recycling provisions would have a very serious impact on the operational costs for retailers in Scotland, irrespective of size or location.

51. The Scottish Government acknowledged that the enabling powers in the Bill relating to waste reduction and recycling could have a potentially significant financial impact on public bodies, local authorities and businesses. However, as officials explained, the Government hopes that voluntary work might achieve a lot of the outcomes sought by the Bill, in which case these powers might not need to be implemented.15 Officials explained that it was conceivable that the backstop of potential secondary legislation (and the related duties that would fall on public bodies and businesses) could encourage people to think more carefully about taking voluntary action to reduce waste. The Government confirmed that if it is decided that regulations are required then the associated financial issues that they raise will be addressed in a supporting RIA.

General issues

Adequacy of cost estimates

52. The Financial Memorandum recognises that, in relation to the action necessary to meet the various emissions reduction targets, there is considerable uncertainty about the cost implications of the Bill. It suggests that where these costs will fall and how they will impact on output by sector will depend upon the paths chosen to deliver the emissions reductions.16

53. SEPA told the Committee that, as far as it could see and given the available information, the cost estimates contained in the Financial Memorandum are appropriate and reflect the likely range of uncertainty associated with the proposals—

“We think that the financial memorandum is a reasonable first stab at some of the costs, bearing in mind that the actual costs will depend on the detail. The devil will be in the detail of how the measures are framed, the scope of the duties and powers, and the enforcement regime that is put in place. With

---

16 Climate Change (Scotland) Bill, Financial Memorandum, paragraph 148.
all that in mind, we think that the Scottish Government made a good attempt.”

54. Whilst SEPA recorded a slight hesitation about some of the costs which it considered to be underestimations (relating to carbon accounting and enforcement duties relating to the provision of recycling facilities), it was comfortable that greater clarity would be achieved at the regulation stage.

55. A number of local authorities acknowledged the statement in the Financial Memorandum that the cost assumptions cannot be accurately predicted at this time and that many uncertainties exist. Dundee City Council, for example, considered that it had no basis on which to disagree with the figures.

56. Other evidence from local authorities – whilst recognising the inherent difficulties in making such long-term cost estimates – suggested that the information contained in the Financial Memorandum did not go far enough. For example, Fife Council said that it appreciated the difficulty in making cost projections in the face of changing markets and behaviours and unproven technologies, but called for the Scottish Government to provide more detailed and robust estimates. East Lothian Council highlighted what it referred to as the broad brush approach of the Financial Memorandum and added that it required clearer guidance from Government.

57. Aberdeen City Council went further and described the cost estimates provided in the Financial Memorandum as “too vague” and “merely a best guess based on uncertainties”. The Council also suggested that “the costs are difficult to trust since they are only proxy figures based on disaggregating UK costs” and called for greater transparency in the methodologies used to make the projections.

58. Other evidence highlighted the fact that some of the measures, such as carbon capture and storage (CCS) technologies, would require significant investment in the short term with savings periods not being achieved until later. SEPA stated that many of the technological improvements necessary to head towards a lower carbon infrastructure will bring costs and noted that the Financial Memorandum does not include anything on invest-to-save or funding for the promotion of reduced carbon emissions programmes for public sector bodies. It suggested that this omission could discourage organisations from taking necessary, timeous action.

59. A number of councils considered that the investment required in, for example, carbon reductions projects, would be challenging when other competing priorities and service needs also have to be met. For example, East Lothian Council considered it to be problematic that some of these technologies will not have financial pay back until several years beyond the current council budget and election cycles making it difficult to approve long-term projects.

---

19 Highland Council, Glasgow City Council, Dundee City Council
60. Fife Council called on the Government to take a more realistic approach and suggested that some of the costings be revised to separate efficiency savings from anticipated outlay costs. The Council referred to CCS technologies and advocated a more cautious approach to the potential savings that could be derived from them until their value in meeting the annual targets has been proven.

61. In relation to their particular circumstances, Glasgow City Council and Highland Council considered that they could experience greater challenges and costs in meeting the Bill’s targets. Glasgow City Council considered that the predicted impact on Scottish GDP of the Bill would have a disproportionate impact on Glasgow. Highland Council suggested that its unique geography, climatic conditions and transient population could lead to higher costs.

62. In evidence to the Committee, Scottish Government officials stated that they have taken a macro approach to the Bill, but accepted that “this only takes us so far and we are now looking to put in place secondary legislation and a more detailed analysis”.20

63. Officials confirmed that, whilst the costings for delivering the 2050 emissions reductions targets are based on UK figures, work is underway – in the shape of a strategic overview – to consider whether they are appropriate using Scotland-specific data.21 They considered that—

“Many pieces of information are part of the jigsaw, and it is difficult for us to leap-frog over things that are not yet in place. That is why it is a challenging task for the committee to consider the financial memorandum as it stands. We will be more informed as things progress. When the strategic overview is finished and we know what the UK emissions budgets will be, we will have a much clearer idea of the pace of activity that will be needed. We will be able to add another level when we bring forward our annual targets, which we hope will be put in place through regulations in June 2010.”22

64. In response to some of the concerns raised by local authorities about the lack of financial detail in the Bill, officials confirmed that “local authorities will have a contribution to make, but we do not quite know what form that contribution will take.” They said that Part 5 of the Bill, without being overly specific, sets out some of the policies that might in future contribute to reducing emissions.23

65. Government officials also responded to the suggestion that Ministers report to Parliament on the impact of the Bill on GDP. They said that because GDP figures are generally UK based it is difficult to extrapolate to obtain Scottish GDP numbers. They also referred to a further difficulty that could arise in attempting to define (in legislation) exactly what is meant by UK and Scottish GDP.24

---

66. The Bill confers various regulation-making powers on the Scottish Ministers, particularly in relation to the provisions contained in Part 5. The Financial Memorandum states that such regulations will be supported by a fully costed RIA.

67. In evidence to the Committee, the FSB said that it was primarily concerned about the nature of secondary legislation enabled by the Bill. In its supplementary written evidence it stated—

“We of course appreciate the benefits of using secondary legislation, however, this should be of a supporting nature; the intention of the legislation having been set out in the primary legislation. We believe that the measures currently outlined are extremely wide-reaching and the scope of government action unclear. This means it is very difficult to ascertain the potential impact of these measures.”

68. The FSB asserted that—

“With some of the proposals having severe cost and practicality implications... for both business and public bodies, we do not think it is appropriate for Parliament to be asked to vote to allow Ministers such a wide range of legislative powers without more detailed intentions and costings.”

69. As well as seeking clarity of approach from the Government to enable judgements to be made on the costs involved, the FSB considered that “better regulation” would allow an opportunity to design a regime that has the most streamlined impact. It suggested that such an approach would increase efficiency, simplify compliance and mitigate the impact on small businesses and other vulnerable groups. The FSB explained that, as the Bill is set out, those opportunities have not been fully exploited—

“For example, if all business premises are to have energy performance certificates—if that is the option that the Government goes for—and waste management plans, that will be an opportunity to consider streamlining such regulations for business premises. In the waste and energy efficiency sections of the Bill, I have counted about six or seven regimes that would require enforcement, paperwork and record keeping. As drafted, the Bill makes it extremely costly both to business and to the public purse.”

70. Other evidence reflected some of the issues raised by the FSB. For example, East Lothian Council commented that it was difficult to comment on the costs of the proposals in the Financial Memorandum ahead of the detailed secondary legislation. Also, Dundee City Council said that it was not possible for it to quantify the likely costs to be contained within secondary legislation.

71. SEPA, however, told the Committee that it was reasonably comfortable for some of the costs to be firmed up by the regulations and accompanying RIAs. It referred to its experience of implementing European legislation and stated that “it

---

is not unusual for us to narrow down on costs as time goes on.” SEPA also confirmed that it is reasonably confident that, as progress is made towards the detail of the RIAs, there will be ample opportunity to establish (with the Scottish Government) what the costs might be and to carry out any modelling that might be required.

72. In evidence to the Committee, Scottish Government officials confirmed that the Bill provides a framework and essentially represents the introduction of enabling powers. They stated that it is not possible at the moment to state with precision the cost implications for local authorities and others as this depends on the exact nature of the regulations that may be made 10 or 20 years down the line, if they are made at all.

73. Officials considered that as it becomes more difficult to meet the emissions reductions targets in the next 30 or 40 years, “we might have to turn to more regulatory measures and enforcement action to squeeze out the necessary carbon to achieve the 80% reduction.”

CONCLUSIONS

74. The Committee acknowledges the uncertainty over some of the costs associated with the Bill, particular in relation to the performance of unproven technologies and methods for reducing carbon emissions. The Committee accepts that the Financial Memorandum adequately reflects these margins of uncertainty.

75. The Committee notes the enabling nature of the Bill, particularly regarding the provisions contained in Part 5. Significant concern was raised, however, in evidence that not enough details have been made available on the likely cost impacts of these possible, future regulations. The Committee considers that the Financial Memorandum would have been stronger if modelling work had been carried out on the potential financial impact of the measures on businesses and public bodies. The Committee also considers that in a number of areas insufficient policy direction has been provided, which has made it difficult for local authorities and businesses to be able to assess the financial impact of the proposals.

76. The Committee notes that the Scottish Government is currently undertaking significant pieces of work to finalise some aspects of its policy, namely, the Scottish Government’s strategic overview project, an options review on the forestry proposals and the consideration of energy efficiency scenarios. The Committee considers that this work will provide vital indications of future costs. Given the significant implications of this work, the Committee would have preferred that it had been completed in time for its consideration of the Financial Memorandum to the Bill. As a result, the Committee expects to take an interest in scrutinising the financial impact of the outcomes of this work.

---

77. The Committee, nonetheless, welcomes the Government’s commitment that all substantive regulations will be accompanied by a fully costed regulatory impact assessment.

78. Where significant expenditure associated with a bill will only become apparent with subordinate legislation, the Committee has in the past noted that it will track the subsequent statutory instruments and seek to scrutinise the financial implications. The Committee gives notice that it may seek to do so for instruments arising from this Bill.

79. Given the long-term perspective of the Bill, and the wide range of policy streams that may contribute to its implementation, the Committee recommends that the Scottish Government should consider how it will monitor and control the cumulative costs of implementation.
ANNEXE: SUBMISSIONS RECEIVED

This annexe contains submissions from—

- Aberdeen City Council;
- Confederation of Forest Industries;
- Dundee City Council;
- East Ayrshire Council;
- East Lothian Council;
- Fife Council;
- Glasgow City Council;
- Highland Council;
- Scottish Retail Consortium;
- SEPA;
- UK Committee on Climate Change;
- The Scottish Government (supplementary – dated 18 February 2009);
- The Scottish Government (supplementary – dated 25 February 2009); and
- The Federation of Small Businesses (supplementary).

SUBMISSION FROM ABERDEEN CITY COUNCIL

Consultation

1. Did you take part in the consultation exercise for the Bill, if applicable, and if so did you comment on the financial assumptions made?

   Yes, Aberdeen City Council submitted a formal response to the Climate Change Bill Consultation in April 2008.

2. Do you believe your comments on the financial assumptions have been accurately reflected in the Financial Memorandum?

   No, the financial implications were not readily investigated within the original consultation document. Instead there was a greater focus on carbon trading.

3. Did you have sufficient time to contribute to the consultation exercise for the Bill?

   Yes.

Costs

4. If the Bill has any financial implications for your organisation, do you believe that these have been accurately reflected in the Financial Memorandum? If not, please provide details.
The Financial Memorandum document has taken certain issues further than in our original consultation response. For example the issues of waste, energy performance certificates, and ensuring compliance were not previously discussed in great detail.

Also the costs to a Local Authority have been mentioned in the Financial Memorandum but again, not in sufficient detail. For example, it is worth considering that in the future Local Authorities may incur penalties and fines for not meeting legislation e.g. Energy Performance Certificates.

5. Are you content that your organisation can meet the financial costs associated with the Bill? If not, how do you think these costs should be met?

At this time, Aberdeen City Council are uncertain whether the financial costs can be met due to the vague methodologies used and immeasurable financial uncertainties in the document.

Plus, it is stated that it is not possible to predict cost profiles in the period leading up to 2050. Surely this is the most important and most costly period for any organisation given the level of work required to meet the 2050 target of an 80% carbon reduction.

6. Does the Financial Memorandum accurately reflect the margins of uncertainty associated with the estimates and the timescales over which such costs would be expected to arise?

The figures given relating to Scotland’s associated costs are difficult to rust since they are only proxy figures based on disaggregating UK costs.

The estimates provided in the document are vague and the assumptions made are merely a best guess based on uncertainties. There is also very little transparency of the chosen methodology.

Wider Issues

7. If the Bill is part of a wider policy initiative, do you believe that these associated costs are accurately reflected in the Financial Memorandum?

No, Aberdeen City Council believes that the associated costs are too vague and not accurately reflected in the Financial Memorandum.

8. Do you believe that there may be future costs associated with the Bill, for example through subordinate legislation or more developed guidance? If so, is it possible to quantify these costs?

Yes, Aberdeen City Council believe that there will be future costs associated with the Bill, as the role of ensuring compliance and enforcement often falls to Local Authorities. Therefore there will be costs associated with this.
Questionnaire

1. Did you take part in the consultation exercise for the Bill, if applicable, and if so did you comment on the financial assumptions made?

   A. The recently introduced measures for forestry - joint ventures and leasing on the National Forest Estate - were not contained in the original consultation.

2. Do you believe your comments on the financial assumptions have been accurately reflected in the Financial Memorandum?

   A. Not appropriate.

3. Did you have sufficient time to contribute to the consultation exercise?

   A. Not appropriate, so far as the consultation on the original Bill is concerned, but the time allowed for consulting on the newly introduced Sections relating to Forestry Provisions was insufficient, particularly as the period spanned the Christmas holidays.

Costs

4. If the Bill has any financial implications for your organisation, do you believe that these have been accurately reflected in the Financial Memorandum? If not, please provide details.

   A. There may be implications for private sector companies who enter into a joint venture or lease with the Forestry Commission, and there could be an impact on wood processing companies from a change in management of 100,000 hectares of the NFE, but it is not possible to make any estimate of that given the limited information currently available.

5. Are you content that your organisation can meet the financial costs associated with the Bill? If not, how do you think these costs should be met?

   A. As referred to in the answer to the previous question, there is too little information available on which to make any meaningful estimation.

6. Does the Financial Memorandum accurately reflect the margins of uncertainty associated with the estimates and the timescales over which such costs would be expected to arise?

   A. The figure for income from joint ventures is presumably based on information from the Forestry Commission. There is no publicly available information on which to judge the accuracy of the sums quoted, and no mechanism for estimating the impact on private sector businesses.
There is no income figure given for the leasing proposal, simply a recognition that this would depend on a range of factors. Without specifying the areas proposed to be leased and the terms of the lease, it is not possible to make any estimation of the potential income available, the impact of spending this money on increased new planting of forests or of the impact on wood processing businesses.

**Wider Issues**

7. *If the Bill is part of a wider policy initiative, do you believe that these associated costs are accurately reflected in the Financial Memorandum?*

A. The forestry element of the Bill is potentially significant within the context of the future growth and development of Scotland’s forestry and wood using businesses and the role they can play in helping to deliver a low-carbon economy in Scotland.

The sector contributes nearly £1 billion a year to Scotland’s economy, provides employment for 20,000, in particular in rural areas, and has capacity for growth. The sector is one of the few in Scotland that can boast that the more it expands the greater carbon benefit it provides.

The proposal to raise income from joint ventures and leasing of public forests could, at best, provide an important stimulus to the sector, and, at worst, reduce investment in wood processing businesses. Much depends on whether any income raised is spent on supporting new planting of forests and whether effective safeguards are put in place to ensure that the current security of supply provided by the Forestry Commission is retained effectively in any leasing proposal.

If security of supply was ensured and income raised recycled into new planting then there would be no cost to private sector businesses, and indeed the opposite would be the case as the stimulus would deliver greater activity.

If security of supply was not ensured and income raised was not recycled into forestry then there would be a negative impact on wood processing businesses and a likely reduction in investment.

There may be a cost to the Forestry Commission, but this would depend on whether it retained any income from joint ventures or whether leasing income was realised annually and a portion retained by the FC. Present financial information provided is very brief (Forestry Commission Scotland Annual Report and Accounts) and this makes any interpretation of business performance on the national Forest Estate difficult for any outside organisation. Greater transparency and more detailed management cost information would be helpful, and necessary if the further very significant

---

30 cebr report for the Forestry Commission and ConFor (2006)
sums of money which might be generated through the Bill’s forestry provisions are to accrue in the accounts of FCS / FES.

8. Do you believe that there may be future costs associated with the Bill, for example through subordinate legislation or more developed guidance? If so, is it possible to quantify these costs?

A. It is understood that the forestry proposals would be delivered through secondary legislation and further detail on leasing and joint ventures would be prepared. At this point an understanding of the impacts would be better known.

Other information

The forestry related proposals contain insufficient information on which to determine their impact on Scotland’s forestry and wood-using businesses. ConFor would wish to reiterate the central message from its response to the consultation, that:

- there is benefit in delivering increased new planting;
- this could be delivered by a variety of mechanisms and requires improvements to the Scottish Rural Development Programme;
- ConFor is keen to utilise both its and its membership’s expertise in developing a way forward that addresses legitimate concerns raised.

In terms of delivering new planting we would note that good information is available on where and how best to establish new forests to maximise carbon sequestration while securing other economic and environmental benefits. Current sustainable management standards provide a firm basis for Scotland to really begin to achieve a target of 25% forest cover.

ConFor recognises the benefit of delivering this within the context of a broad land-use policy. However, there is land currently available and planting a very small part of this now while developing a policy to guide future activity is vital to help secure jobs in the sector at a time of economic downturn.

Internationally agreed climate change targets focus on 2050. If Scotland planted 15,000 hectares a year with 9,000 ha being productive softwood forests then it would deliver the Government’s target of 25% forest cover by 2050 and provide significant, additional carbon benefits - up to 33.5 MtC.

**TABLE**: Estimated carbon sequestration for additional productive and broadleaf forest under new planting regimes of 10,000 ha/yr and 15,000 ha/yr from 2010 to 2050

<table>
<thead>
<tr>
<th>Planting regime over period 2010-2050</th>

<td>New planting (ha/yr)</td>
<td>Carbon sequestration (MtC)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
NB On a sustainably managed basis, at 10,000 ha/yr, the total additional forest would continue to sequester 1.1MtC/yr after 2050, and 1.6MtC/yr on a 15,000 ha/yr planting regime.

Such a planting programme would secure significant jobs and investment benefits. For productive softwood forests this is estimated at around 180 new jobs in planting and up to 900 for harvesting, transport and wood processing. Current investment in the sector is running at £100m a year and this would increase significantly.

**Increased use of Scottish wood**

Wood products are low energy materials that can save significant amounts of carbon when substituted for other building materials. Research shows that average savings of 0.8tCO2e can be achieved by replacing 1m3 of concrete/bloc/bricks with 1m3 of sawn timber. Long-term wood products also provide a benefit through their potential storage capacity, estimated at 0.9tCO2 in 1m3 of wood.

ConFor calculates that over the period to 2050 the additional productive forest area achieved from planting 9,000 ha/yr of productive softwoods could provide, based on current proportions, an additional 33.5M m³ timber available to the construction market. This then gives the potential for substitution of materials delivering emissions savings of 27mtCO₂. This would be a tremendous resource for Scotland.

Wood can also be used to generate renewable energy. ConFor has campaigned for this to focus on wood that currently has no market, and to promote its use locally and in generating heat. It has also noted that carbon and jobs benefits are higher in solid wood products, not least because these can be used and re-used, and then be made available to generate energy at the end of their useful life. There is a danger that current and evolving public policy could provide such large incentives to burn wood that jobs are lost and the carbon emissions potential of wood is not fully realised.

**Scottish broadleaves and softwoods**

ConFor represents people who own and work with broadleaf woods. We support efforts to manage broadleaf woods sustainably and to develop markets for hardwoods. It is important, however, when talking about climate change mitigation, jobs and investment to recognise the scale and potential of Scotland’s diverse forest and wood-using businesses.

---

32 Dr A Fruhwald, Hamburg University in CEI-Bois (2006) Tackle Climate Change: Use Wood
Including Scots Pine, Scotland produces over 6 million tonnes of softwood each year, while hardwood production, including non-native species, is just over 400,000 tonnes for the whole of the UK with the majority of this estimated to be in England.

Scotland is internationally competitive in growing softwoods and producing wood products that have a large market and where there is scope for significant growth. The businesses in the sector are mainly Scottish owned or headquartered.

The sector is unusual in that it combines successful, modern manufacturing with land management that is governed by environmental standards that are second to none.

The sector suffers from an image hang-over from the planting of last century, driven by the FC which did not deliver the multi-purpose forests that are being established today. Those single-species, forest blocks are now being restructured to improve their biodiversity and visual impact. Using lessons learnt from the past there is scope now for a modern forestry and wood-using sector that all Scotland can be proud of.

Unfortunately Scotland’s broadleaf woods are largely unmanaged and provide limited amounts of timber for wood fuel and for small businesses that produce furniture, flooring, etc. The potential for use in construction is limited by the lack of quality trees and the established, highly competitive operations on mainland Europe that dominate the hardwood market. This will not change in the near future as hardwoods take up to 150 years to grow (against 40 for softwoods).

There is scope for development of the broadleaved resource and of hardwood markets, but by far the largest opportunity for sustainable growth and climate change mitigation sits with the softwood resource, and public policy and its delivery must reflect that.

Jamie Farquhar
National Manager for Scotland
ConFor
February 2009

SUBMISSION FROM DUNDEE CITY COUNCIL

Consultation

1. *Did you take part in the consultation exercise for the Bill, if applicable, and if so did you comment on the financial assumptions made?*

   Comment: Dundee City Council responded to the Scottish Government consultation on 'Proposals for a Scottish Climate Change Bill' in April 2008. No comments were made on financial assumptions.
2. Do you believe your comments on the financial assumptions have been accurately reflected in the Financial Memorandum?

Comment: N/A

3. Did you have sufficient time to contribute to the consultation exercise for the Bill?

Comment: Yes, although limited knowledge curtails detailed comments.

Costs

4. If the Bill has any financial implications for your organisation, do you believe that these have been accurately reflected in the Financial Memorandum? If not, please provide details.

Comment: The Bill has financial implications for local authorities but there is no basis for disagreeing with the figures in the Memorandum or identifying the likely impact on Dundee City Council.

5. Are you content that your organisation can meet the financial costs associated with the Bill? If not, how do you think these costs should be met?

Comment: Local authorities are currently struggling to balance budgets with the level of Scottish Government funding available and any further statutory responsibilities will inevitably lead to savings requirements in other budgets unless further Scottish Government funding is made available.

6. Does the Financial Memorandum accurately reflect the margins of uncertainty associated with the estimates and the timescales over which such costs would be expected to arise?

Comment: The Council has no basis for disagreeing with the estimates and timescales included in the Memorandum.

Wider Issues

7. If the Bill is part of a wider policy initiative, do you believe that these associated costs are accurately reflected in the Financial Memorandum?

Comment: The Council has no basis for disputing whether the costs of a wider policy initiative are accurate or not.

8. Do you believe that there may be future costs associated with the Bill, for example through subordinate legislation or more developed guidance? If so, is it possible to quantify these costs?
Comment: It is to be assumed that there will be future costs through subordinate legislation but it is not possible for Dundee City Council to quantify these costs.

SUBMISSION FROM EAST AYRSHIRE COUNCIL

Consultation

1. Did you take part in the consultation exercise for the Bill, if applicable, and if so did you comment on the financial assumptions made?

Yes – financial assumptions were made in relation to carbon budgeting rather than monetary units.

2. Do you believe your comments on the financial assumptions have been accurately reflected in the Financial Memorandum?

Not applicable.

3. Did you have sufficient time to contribute to the consultation exercise for the Bill?

Yes

Costs

4. If the Bill has any financial implications for your organisation, do you believe that these have been accurately reflected in the Financial Memorandum? If not, please provide details.

It is difficult to comment fully as the memorandum itself states that costs are not fully available due to uncertainty surrounding the exact amount of annual targets, who will be responsible for enforcement, and a lack of evidence to accurately identify what the costs associated with the terms of the bill are likely to be. For example under the provisions relating to “improving the energy performance of existing non-domestic buildings” the estimated costs to local authorities range from £3.4m to £37m depending on how the menu of provisions contained within the Bill is assembled within secondary legislation. Such secondary legislation will be accompanied by a costed regulatory impact assessment. It is not until this information is available that local authorities will be fully able to comment on whether any financial implications are reflected and whether the costs associated with the Bill can be met or made self-financing through the levy of penalty charges.

5. Are you content that your organisation can meet the financial costs associated with the Bill? If not, how do you think these costs should be met?

As per comment under question 4.
6. Does the Financial Memorandum accurately reflect the margins of uncertainty associated with the estimates and the timescales over which such costs would be expected to arise?

Yes - the memorandum does reflect the margins of uncertainty associated with the estimates and the timescales over which costs would be expected to arise.

Wider Issues

7. If the Bill is part of a wider policy initiative, do you believe that these associated costs are accurately reflected in the Financial Memorandum?

In terms of the Council’s ability to meet the financial costs with regards to mitigation and adaptation measures encompassed within the Bill, it is necessary to determine whether there are any resource implications arising. These can only be costed once service departments have established actions to fulfil these obligations.

The Council would contest the accuracy of the costings contained within section 219. By assuming that a full time employee works 2,000 hours per annum, the memorandum fails to account for the employees statutory and annual leave. Further, once on-costs are subtracted from the average salary, the take home wage is unlikely to be commensurate with employees level of responsibility.

8. Do you believe that there may be future costs associated with the Bill, for example through subordinate legislation or more developed guidance? If so, is it possible to quantify these costs?

Given the scope and range of activities contained within the Bill it likely that there will be future associated costs. Again, until these measures are specified it is not possible to accurately quantify potential costs.

SUBMISSION FROM EAST LOTHIAN COUNCIL

Consultation

1. Did you take part in the consultation exercise for the Bill, if applicable, and if so did you comment on the financial assumptions made?

   East Lothian Council sent a consultation response. Officers from the Council were involved in some of the consultation workshop events. There were no specific comments made on the financial assumptions.

2. Do you believe your comments on the financial assumptions have been accurately reflected in the Financial Memorandum?
3. Did you have sufficient time to contribute to the consultation exercise for the Bill?

Yes within the limited knowledge available to the Council on a very complex topic.

Costs

4. If the Bill has any financial implications for your organisation, do you believe that these have been accurately reflected in the Financial Memorandum? If not, please provide details.

Clearly the bill has financial implications for the Council. The substantive matter in the Bill is setting the 2050, 2030 emission reduction targets and providing the framework for annual targets. Other than stating a broad brush approach of 1-2% GDP expenditure (across the Scottish Economy, including local authorities) to meet climate change the financial memorandum is not particularly helpful to local authorities.

East Lothian Council does not know what its costs will be in meeting the proposed emissions reductions. We are working through the Carbon Trust Carbon Management Programme which will assist that process for the Council’s own emissions in the short term, but longer term is an unknown. The memorandum itself makes frequent reference to the uncertainties of predicting costs for example:

“It is not possible to accurately predict when technologies will be introduced or the rates of reductions that will occur from changing behaviours and shifting demand. Overall with all these factors in play, it is impossible to accurately predict what will happen and when. That is why it is not possible to predict cost profiles during the period of change in the years out to 2050. (para 147)”

Council’s require clearer guidance from government than this.

5. Are you content that your organisation can meet the financial costs associated with the Bill? If not, how do you think these costs should be met?

The Council cannot say it can meet these costs. Clearly some costs will be met through existing budgets, but significant investment will be required in energy efficiency measures, renewable energy development, waste management etc to deliver the bill objectives. This will either require a re-alignment of Council budgets to the potential detriment of other Council Services, or increased public expenditure and associated tax increase.

In addition there is uncertainty about the implications of the Carbon Reduction Commitment for Councils – as well as having to find money to invest, some Council’s may also be penalised.
A significant issue for local authorities is that many carbon reduction projects, e.g., renewable energy investment, have financial payback periods several years beyond current Council budget and election cycles, which means that Councils will find it very difficult to approve these longer-term projects which will have to compete with the annual pressures of paying for existing public services within the already tight public finance settlement. This situation is not going to get any easier within the current economic downturn and uncertainties about future public finance settlements.

Investment in Climate change mitigation (and adaptation) is as much about political and societal choices as financial ones.

6. Does the Financial Memorandum accurately reflect the margins of uncertainty associated with the estimates and the timescales over which such costs would be expected to arise?

While there is clearly an imperative to act, and the cost of not acting now will be considerably higher in the future (Stern), there remains considerable uncertainty about estimated costs and timescales for action as identified in the memorandum (see also comment 4 above), other than identify that uncertainty the memorandum is not particularly helpful to Councils in framing financial implications.

Wider Issues

7. If the Bill is part of a wider policy initiative, do you believe that these associated costs are accurately reflected in the Financial Memorandum?

It is not clear what wider policy initiative is being referred to. If it is assumed that this refers to the sections in the Bill about waste management, energy efficiency etc then there will be implications for Councils and local businesses in particular. It is difficult to comment on the costs of the proposals in the financial memorandum ahead of the detailed secondary legislation required to introduce the measures.

8. Do you believe that there may be future costs associated with the Bill, for example through subordinate legislation or more developed guidance? If so, is it possible to quantify these costs?

There are more than likely to be other unidentified costs, but what they are is an unknown at the moment, particularly in terms of broader societal consequences of climate change impact and response.

David Evans
Environment
East Lothian Council
Consultation

1. Did you take part in the consultation exercise for the Bill, if applicable, and if so did you comment on the financial assumptions made?

Fife Council responded to the Government Consultation in April 08, but did not highlight financial implications. We are currently compiling a response to the Transport, Infrastructure and Climate Change Committee’s Call for Views (deadline 27 February), and will highlight financial implications.

2. Do you believe your comments on the financial assumptions have been accurately reflected in the Financial Memorandum?

N/A

3. Did you have sufficient time to contribute to the consultation exercise for the Bill?

The deadline of 2 February for comments on the Financial Memorandum necessitates brief input, as our understanding of financial implications will be further informed through the compilation of input to the policy Call for Views by 27 February.

Costs

4. If the Bill has any financial implications for your organisation, do you believe that these have been accurately reflected in the Financial Memorandum? If not, please provide details.

No, costs that appear to be omitted include:

- The Bill refers to requirements for secondary legislation and regulations throughout, all of which will have cost implications.

- The Financial Memorandum seems to focus on costs incurred by the Scottish Government, for instance referring to the analysis of reports, to the exclusion of the costs associated with the scrutiny, measurement and reporting incurred by those made responsible for compiling reports. Fife Council urges the consideration of full costs associated with the Bill, and not rely on market changes or efficiencies savings making it possible for public bodies (or others) to cover the costs incurred in execution, monitoring and compilation of the reports to be analysed by the Scottish Government.

- The Financial Memorandum contains numerous references to areas of costs which are not possible to predict. While Fife Council appreciates the difficulties in cost projections in the face of changing markets and behaviours, and unproven technologies, we encourage an attempt to include fuller costings, and
a realistic view of technologies such as Carbon Capture and Storage, which will incur considerable costs in advance of any financial savings achieved.

- Inconsistent levels of cost estimates are used across chapters. For example the apparent omission of transportation costs related to carbon emissions reduction, use of standardised costs in energy, and then very detailed (yet not full) costs related to waste. Fife Council requests that such inconsistencies be addressed to provide clarity and consistency across all areas.

- Fife Council also questions the priorities that the Financial Memorandum could be seen to suggest. Again referring to the waste costs, table 8 on page 51 suggests £3.5m for the enforcement of carrier bag charges, while many large retailers are already implementing such schemes voluntarily. Moreover, the emissions reductions to be achieved by such efforts, would not necessarily merit the level of investment proposed, considering the assertion made in paragraph 146 that “the Scottish Government intends to use the cost information… ie 1-2% of GDP in 2050”.

- Implementation costs are excluded from the Financial Memorandum. In meeting the requirements for mitigation, adaptation, monitoring, scrutiny and reporting related to the Climate Change Bill, local authorities face substantial costs, and it is unlikely that any gain from efficiencies will be achieved at a time, or sufficient level to compensate for such costs even if in some cases whole life costs are reduced. The Scottish Government could consider spelling out clearly that tackling climate change cannot be achieved at no cost, even though the cost of inaction will be substantially higher.

- Fife Council is concerned that some costs quoted may underestimate the true costs that would be incurred by Scotland. For example, the waste reduction and recycling costs in paragraph 210 appear to be based on very limited experience of a single office complex in Edinburgh that is unlikely to be representative of the facilities to which this provision may apply. Significantly more work is required to provide credible cost estimates in this area.

5. Are you content that your organisation can meet the financial costs associated with the Bill? If not, how do you think these costs should be met?

The memorandum does not provide sufficient information to assist Fife Council in estimating the costs that it may incur. Accordingly we ask that the Scottish Government provides more detailed and robust estimates to enable the Council to form an objective view on this.

6. Does the Financial Memorandum accurately reflect the margins of uncertainty associated with the estimates and the timescales over which such costs would be expected to arise?

While the Financial Memorandum does make numerous references to areas of costs that cannot be predicted, it excludes consideration of costs incurred should
named technologies not meet the targets yet to be set. For example, referring to carbon capture and storage in paragraph 140 in relation to the decarbonisation of the power sector, assumes that once the technology is developed, trials are undertaken and a monitoring is reviewed, that this will be successful. While Fife Council would support the trial and monitoring of carbon capture and storage once required technology is developed, and support the implementation of such technology once its value is proven, we advocate a more cautious approach to such assumptions.

Similarly, the implementation of efforts to reduce carbon emissions and achieve efficiency savings in related energy costs would require upfront investment. The Financial Memorandum currently appears to omit such costs as would be applied across energy, waste and transport to mitigate climate change. Therefore Fife Council encourages the Scottish Government to revise the assumption of finance ‘freed’ by efficiency savings.

Fife Council highlights the Stern Report’s identification of the cost of inaction, and the necessity of accepting the need for actual investment. While we welcome a range of methodologies to meet the financial costs associated with the Climate Change Bill, Fife Council encourages full and transparent consideration of alternative methods of financing the Climate Change Bill. For example, while it may be financially desirable to promote self-financing carbon reduction schemes, such as the proposed leasing of forestry, other associated costs and impacts may make the financial bottom line less acceptable.

Wider Issues

7. If the Bill is part of a wider policy initiative, do you believe that these associated costs are accurately reflected in the Financial Memorandum?

As mentioned above, Fife Council does not believe that the costs which will be incurred by Scotland’s public bodies, businesses, and citizens in the efforts to meet the requirements of the Climate Change Bill are fully reflected in the Financial Memorandum. The Scottish Government has not yet issued guidance on climate change adaptation, and it is anticipated this will include a new set of roles and reporting for local authorities, all incurring costs and unlikely to lead to efficiencies savings at least in the short to medium term.

8. Do you believe that there may be future costs associated with the Bill, for example through subordinate legislation or more developed guidance? If so, is it possible to quantify these costs?

Fife Council believe there may be considerable costs associated with the subordinate legislation and future guidance related to the Climate Change Bill. However based on the information currently available, we are unable to quantify such costs and would rely on the Scottish Government’s continued efforts with COSLA to redress this.

Sustainability Team
SUBMISSION FROM GLASGOW CITY COUNCIL

Consultation

Question 1 - Did you take part in the consultation exercise for the Bill, if applicable, and if so did you comment on the financial assumptions made?

Glasgow City Council (GCC) took part in the consultation for a Scottish Climate Change Bill responding in April 2008 but did not make any comments relating to possible financial implications. It should be noted that the Bill should contain enabling powers to allow Local Authorities to take specific action on Climate Change.

Question 2 - Do you believe your comments on the financial assumptions have been accurately reflected in the Financial Memorandum?

Not applicable

Question 3 - Did you have sufficient time to contribute to the consultation exercise for the Bill?

Yes, The City Council’s officers attended Scottish Government and SSN’s workshops prior to submitting a response. There was however limited time to respond to these questions on the financial memorandum. Given the lack of detail in the Memorandum it would have been useful if guidance through workshops or briefing sessions had been provided.

Costs

Question 4 - If the Bill has any financial implications for your organisation, do you believe that these have been accurately reflected in the Financial Memorandum? If not, please provide details.

The Bill will definitely have financial implications for GCC. Although the Financial Memorandum attempts to provide the likely costs to Local Authorities these are generic estimates and while it is appreciated that this in itself is a difficult exercise, these do not enable an authority the size of Glasgow to accurately compile the increased level of spending and resources that will be required.

Two examples of this relate to the requirement for enhanced Energy Performance Certificates and the possible introduction of a charge for carrier bags. A number of the other estimates detailed in the memorandum such as those of deposit and return schemes and waste management plans lack detail to afford GCC the ability to assess the likely cost of widespread introduction of these initiatives. This includes those actions envisaged as cost neutral.
The implication of the predicted impact on GDP is also of concern to Glasgow. Given the contribution the City makes to the Scottish GDP any reduction is likely to have a disproportionate consequence for Glasgow. This needs to be taken into account in considering financial implications.

**Question 5 - Are you content that your organisation can meet the financial costs associated with the Bill? If not, how do you think these costs should be met?**

Like all Scottish Local Authorities, the Council is currently facing a significant overspend. The implications of the current economic climate will make it extremely difficult to introduce City wide measures of the kind specified in the Bill and the financial memorandum without additional funding.

The costs associated with the forthcoming Carbon Reduction Commitment are currently being calculated on the basis of incomplete information. Without funding support the range of measures and estimated costs detailed in the memorandum will exert a further severe budget pressure. If these measures are to be implemented then central government funding will be required if cuts to essential services are to be avoided.

**Question 6 - Does the Financial Memorandum accurately reflect the margins of uncertainty associated with the estimates and the timescales over which such costs would be expected to arise?**

The Financial Memorandum notes the uncertainty associated with the 2050, 2030 and annual targets. This is reflected in the lack of precise financial detail in how the targets will be achieved. Glasgow City Council will have difficulty in utilising the current information to establish the likely costs of such a process.

For example, for an authority the size of Glasgow with well in excess of 1,000 properties the memorandum, although providing the indicative expenditure of different scenarios, does not allow the Council to calculate the likely cost of an extension of the current Energy Performance of Buildings requirement.

Furthermore, although it was prudent to provide a range of possible costs, such as £3.5 million for the introduction of carrier bags charges, at this early stage it is difficult to calculate the burden of this overall cost to Glasgow, the second largest retail city in the UK.

**Wider Issues**

**Question 7 - If the Bill is part of a wider policy initiative, do you believe that these associated costs are accurately reflected in the Financial Memorandum?**

Additional information would be required as to the nature or direction of the policy initiative referred to before a response to this question could be provided. It was assumed that the Bill would be the umbrella policy vehicle (enabling legislation) under which other policies would be introduced. Additional policy and regulation is likely to be required and, as such, result in additional costs.
Question 8 - Do you believe that there may be future costs associated with the Bill, for example through subordinate legislation or more developed guidance? If so, is it possible to quantify these costs?

GCC are of the opinion that there will be unavoidable future costs associated with the Bill but also the potential for cost saving if introduced in an effective manner, reflecting the main financial observation contained in the Stern Report. Although attempts must be made to quantify these costs, we suggest that this will be an extensive exercise both for the Scottish Government and local authorities.

SUBMISSION FROM HIGHLAND COUNCIL

Consultation

1. Did you take part in the consultation exercise for the Bill, if applicable, and if so did you comment on the financial assumptions made?

The Highland Council did provide a consultation response to the Bill. Reference was made in the consultation response for the need to take account of economic and social impacts when considering areas including international credits and setting budget periods to develop infrastructure. No direct commentary on financial assumptions was made in the response.

2. Do you believe your comments on the financial assumptions have been accurately reflected in the Financial Memorandum?

Not applicable.

3. Did you have sufficient time to contribute to the consultation exercise for the Bill?

The Highland Council considered the consultation period designated for the Bill to be appropriate.

Costs

4. If the Bill has any financial implications for your organisation, do you believe that these have been accurately reflected in the Financial Memorandum? If not, please provide details.

The Financial Memorandum is largely drafted on the basis of estimated costs on a macro-economic basis. As the Memorandum acknowledges, how these costs will impact on individual organisations, and the profile over years, cannot be accurately predicted at this time.

While there will clearly be financial implications, at this time the Highland Council is not in a position where at this stage it could easily estimate the financial implications of the Bill. One aspect that will be critical for the implementation of the Bill is recognition of the local factors that will have a significant bearing on relative costs of addressing the Bill. In Highland, the
geography, climatic conditions and transient population will all have a bearing on costs relative to other Councils, for example in comparison to urban-based authorities.

5. Are you content that your organisation can meet the financial costs associated with the Bill? If not, how do you think these costs should be met?

The financial costs of the Bill will be challenging for all organisations, and as highlighted in the previous question, Highland’s unique geography and other local factors may result in even greater challenges and cost. Financial support from Central Government, whether direct financial support or through incentivisation, will be critical. While investment should lead to reduced cost, or avoided cost, payback periods can be considerable and therefore the front-loaded investment necessary will be challenging when other competing priorities and service needs also have to be met.

6. Does the Financial Memorandum accurately reflect the margins of uncertainty associated with the estimates and the timescales over which such costs would be expected to arise?

Yes, the Memorandum is clear on the uncertainty that relates to the estimated costs.

Wider Issues

7. If the Bill is part of a wider policy initiative, do you believe that these associated costs are accurately reflected in the Financial Memorandum?

The Financial Memorandum acknowledges that the likely cost and resource implications of the Bill for local authorities are presently difficult to estimate as they will be dependent on secondary legislation. Both the Bill and Memorandum outline potential areas of impact for local government including imposition of duties, improving energy performance, waste reduction and recycling. Costs for the Highland Council are likely to be significant in reduction of greenhouse gases through its role in climate change as a manager of its own estate and practices; as an employer; as a service provider; as a community leader and in partnership with other statutory, voluntary and private sector organisations.

Additional key areas of impact include implementation of the Council’s renewable energy strategy; promotion of higher design standards internally and externally, supporting healthier and environmental transport options, how the Council procures its goods and services and can influence the procurement practices of others and adherence to the Carbon Reduction Commitment (CRC). The projected costs associated with the CRC scheme in particular will have clear implications for the targets and delivery of the Councils Carbon Management Strategy. Based on current figures the Council will have to purchase approximately £500 000 of allowances for each of the first fixed price years of the scheme. Further implications associated with the CRC include the risks associated with failing to meet
targets in the form of financial penalties and the requirement to purchase extra allowances and the removal of fixed price allowances after year 3 of the scheme to coincide with the introduction of the open market auctioning process.

8. Do you believe that there may be future costs associated with the Bill, for example through subordinate legislation or more developed guidance? If so, is it possible to quantify these costs?

There is a considerable amount of uncertainty around costs. The memorandum acknowledges that how the costs will impact on individual organisations cannot currently be accurately predicted. It is likely that further costs may apply. It is not possible to take a view on these costs at this time.

SUBMISSION FROM THE SCOTTISH RETAIL CONSORTIUM

Further to your letter of 15 January 2009 requesting that the SRC complete the Committee’s questionnaire in relation to the scrutiny of the Climate Change (Scotland) Bill, we are happy to provide comments as detailed below. Our comments are limited to the provisions of the Bill that where consulted on as part of the Scottish Government ‘Consultation Paper on Potential Legislative Measures to Implement Zero Waste’ (July 2008).

QUESTIONNAIRE

BACKGROUND:

The Scottish Retail Consortium (SRC) is the lead trade association representing the whole range of retailers in Scotland, from the large multiples and department stores through to independents, selling a wide selection of products through centre of town, out of town, rural and virtual stores.

Retailers are making huge strides in reducing the environmental impact of their operations. The retail sector has, for example, committed to sending less than 50 per cent of waste to landfill by 2013. Retailers recognise their part in achieving a zero waste society but cannot accomplish this in isolation. It is crucially important that Government and customers play their part as well.

Consultation:

1. Did you take part in the consultation exercise for the Bill, if applicable, and if so did you comment on the financial assumptions made?

The SRC took part in the consultation exercise and commented on the financial assumptions (‘Costs and Benefits’) made in relation to the ‘Potential Legislative Measures to Implement Zero Waste’ (July 2008).
In general, the SRC welcomed the positive nature of the consultation, the aspirational quality of the ideas as well as the aim to address the fundamental issue of how the nation regards its waste and resources, and the ambition to achieve a zero waste society.

However we believe that some of the assumptions upon which proposals have been based are flawed, especially in relation to costs to the sector and environmental impact.

2. Do you believe your comments on the financial assumptions have been accurately reflected in the Financial Memorandum?

See above response.

3. Did you have sufficient time to contribute to the consultation exercise?

Yes, however we had a number of concerns on the approach taken by the consultation as follows:

a. Packaging amounts to only 1.5% of total waste to landfill yet the majority of the zero waste consultation proposals focus on packaging.

b. Packaging regulations already exist. If they are not working they need to be addressed rather than introducing new legislation.

c. The proposals seem driven by weight rather than net environmental impact of materials and associated supply chains. For example the impact of minimizing packaging without incorporating food waste into the equation.

d. The consultation fails to assess and address the greatest waste streams in Scotland.

e. The consultation does not feature, as a major proposal, the need for societal education (led by Government) on waste.

f. The impact assessments, as they were presented in their partial state, do not reflect the impact of the proposed measures on the retail sector.

Costs:

4. If the Bill has any financial implications for your organisation, do you believe that these have been accurately reflected in the Financial Memorandum? If not, please provide details.

The provisions of the Bill as they relate to waste (Chapter 4, Waste Reduction and Recycling) will have substantial impact on retailers, large and small.

The impact assessments (and associated costs) as set out in the consultation contained very limited information on which to comment. Furthermore, the ‘Costs and Benefits’ section did not adequately reflect the impact of the proposed measures on the retail sector.
For example, the assumption was made that if targets on retailers in relation to packaging reduction and information were laid down in regulations, there would be no costs to retailers in relation to this proposal and in fact there could be cost savings to retailers. We strongly disagree with this assumption. The ‘Costs and Benefits’ analysis also states that the introduction of waste prevention plans and specifying recyclate would either represent a cost saving to business or would be of no significant cost. Once again we strongly oppose the assumptions upon which these judgements have been made.

5. Are you content that your organisation can meet the financial costs associated with the Bill? If not, how do you think these costs should be met?

If all the provisions of the Bill relating to waste reduction and recycling were brought forward, there would be a very serious impact on the operational costs for all retailers in Scotland, irrespective of size or location.

6. Does the Financial Memorandum accurately reflect the margins of uncertainty associated with the estimates and the timescales over which such costs would be expected to arise?

No. See above response.

Wider Issues:

7. If the Bill is part of a wider policy initiative, do you believe that these associated costs are accurately reflected in the Financial Memorandum?

See above responses.

8. Do you believe that there may be future costs associated with the Bill, for example through subordinate legislation or more developed guidance? If so, is it possible to quantify these costs?

There will undoubtedly be further costs associated with the Bill, however will limited scheme data it is extremely hard to quantify what these costs are likely to be.

Fiona Moriarty
Director
Scottish Retail Consortium

SUBMISSION FROM SEPA

Consultation

1. Did you take part in the consultation exercise for the Bill, if applicable, and if so did you comment on the financial assumptions made?
SEPA provided a full response to the consultation which is available on our website 33 but did not comment directly on the Financial Memorandum.

2. **Do you believe your comments on the financial assumptions have been accurately reflected in the Financial Memorandum?**

3. **Did you have sufficient time to contribute to the consultation exercise?**

The 12 week consultation process provided ample opportunity for SEPA to consider the Bill. SEPA organised several internal seminars to discuss the Bill and its implications; SEPA’s response was also considered by the SEPA Board in April 2008.

**Costs**

4. **If the Bill has any financial implications for your organisation, do you believe that these have been accurately reflected in the Financial Memorandum? If not, please provide details.**

5. **Are you content that your organisation can meet the financial costs associated with the Bill? If not, how do you think these costs should be met?**

The Bill has the potential to have significant financial implications across many, if not all, of SEPA’s business activities. It is not yet precisely clear what additional responsibilities SEPA will have, however some of the estimated costs in the Memorandum do not concur with SEPA’s own experiences and estimates. With that in mind SEPA welcomes the commitment to a fully costed RIA for any new duties. Examining the constituent parts of the Bill suggests the following cost implications.

**Cost of meeting SEPA’s own targets and introducing lower carbon technologies**

Many of the technological improvements necessary to head towards a lower carbon infrastructure will bring costs – sometimes significant costs for SEPA (and for other public or private sector bodies). There appears to be nothing extant in the financial memo on invest-to-save or funding for the promotion of reduced carbon emissions programmes for public sector bodies. This may discourage organisations to take necessary, timeous action.

As an example, SEPA is participating in the local authority carbon management programme for 5 years from 2006-2007 to 2011-2012 and has published a 25% reduction target for CO2. To achieve this target it is necessary to invest heavily in lower carbon technologies e.g. more efficient boilers and plant as well as retro-fitting e.g. insulation on older buildings. SEPA’s strategic implementation plan (SIP) (see table 1), intends to invest

---

£790k over five years to reduce CO2 emissions by 537 tonnes annually by 2012. This investment has to come from within existing budgets and is expected to generate savings of c.£62k per year.

There are also costs associated with calculating Energy Performance Certificates (EPC) for non-domestic buildings. These certificates have to be produced by third parties using specialist software. In addition the buildings with lower scores have to be improved over time. The Memorandum only says (at 186 p36) that the Bill will clarify the role of who pays and goes on to suggest seven different future scenarios for EPCs.

**Potential Advisory Role**

The Bill makes provision for additional Scottish advisory functions if required. Clearly at this stage it is difficult to comment on the scale of additional charges that might result for such a future decision.

It is also not clear which existing body might be deemed suitable for advisory functions to be given to, though an obvious candidate may be SEPA. SEPA has not had any formal discussions with the Scottish Government on this point, but if asked to carry out such a function, it would expect the costs to be substantial, requiring expertise in climate change science and environmental technology, economic assessment and modelling, and understanding of social impacts.
Carbon Accounting

SEPA warmly welcomes the establishment of the carbon accounting scheme for tracking carbon units and maintaining a database. The costs given on page 28 in the Memorandum, although perhaps a little low, do appear to be of the right order of magnitude.

However SEPA believes that a more fundamental point is the need to establish a more detailed, faster and more accurate picture of emissions of climate change gases within Scotland. SEPA believes that this will need to involve both increased physical monitoring and assessment of some gases (e.g. nitrous oxide) and an increased capacity to assemble, verify and publish data. SEPA has not assessed these costs in any detail, but considers that they could be considerable.

Waste regulation

The cost of the waste provisions cannot be fully anticipated because it is not yet known whether the voluntary agreements will be sufficient thus rendering implementation of the provisions unnecessary. For the same reason, the Scottish Government has not estimated enforcement costs. However, should enforcement be necessary, the Government anticipates that enforcement will be carried out by existing public bodies.

As a first cut SEPA believes the costs presented in table 8 on page 51 are a reasonable set of assumptions.

Scottish Ministers will be enabled to make regulations to require businesses and public bodies to provide information to SEPA about the waste that they produce. The cost to government and local authorities of providing this information is considered to be marginal. However, there may be additional costs for SEPA should enforcement be required and costs to other bodies, individuals and businesses will depend on the detail of the regulations. The Policy Memorandum states that “it will be difficult to move to a zero waste society without much better information”. In addition, the Government and SEPA “currently lack reliable data” to assess compliance with elements of Article 11 of the Revised Waste Framework Directive.

Offices could be required to have facilities to collect paper etc. Section 55 empowers local authorities to issue notices requiring organisers of temporary public events to provide recycling facilities. Both sections require the waste collected to be, as far as practicable, recycled. There will be costs involved for providing the receptacles and for ensuring that the waste is collected and recycled. However, the Financial Memorandum states that costs will “benefit society through the more efficient use of resources and a reduction in waste disposed of by landfill”. Again, should legislation be required there will be enforcement costs for SEPA.

Please note that the staffing costs used in table 8 do not reflect those of SEPA.

6. *Does the Financial Memorandum accurately reflect the margins of uncertainty associated with the estimates and the timescales over which such costs would be expected to arise?*
In general, on the specific policy measures discussed, SEPA believes that the Memorandum reflects the likely range of uncertainty associated with the proposals.

However, based on SEPA’s experience of full cost recovery, it would appear than many of the adopted numbers could lead to a modest underestimate of the costs. For example, for enforcement, SEPA would use a more senior member of staff than that allowed for at £15/hr.

**Wider Issues**

7. *If the Bill is part of a wider policy initiative, do you believe that these associated costs are accurately reflected in the Financial Memorandum?*

There will clearly be implementation costs arising from existing and new policy initiatives required to implement the Bill’s targets. These will arise for the Scottish Government, public bodies, businesses, private organisations and individuals. SEPA is aware of some planned initiatives, but understands that the Scottish Government intends to publish a Strategic Overview in due course, setting out policy costs in more detail. SEPA is also aware of published material that sets out some of these costs in more detail.34

It is important to bear in mind that in addition to direct and policy costs on society, there would be costs arising from not taking action to address climate change. These costs are set out in the reports mentioned above. In addition, SEPA believes that there are clear benefits to Scottish society from taking early action to address climate change- protecting the environment, reducing the costs of adaptation, maintaining biodiversity and ecosystem services, and business benefits from reducing waste and energy use, and seizing opportunities in the green technology and climate change mitigation sector.

8. *Do you believe that there may be future costs associated with the Bill, for example through subordinate legislation or more developed guidance? If so, is it possible to quantify these costs?*

SEPA believes that there are likely to be additional costs depending on its role. The uncertainty of the role and the activities necessary to achieve that role make accurate costing problematic. The fully costed RIA would provide an accurate indication of the most likely cost and SEPA welcomes the Scottish Government’s commitment to using this to quantify and inform funding of any addition to SEPA’s duties.

Consultation

1. Did you take part in the consultation exercise for the Bill, if applicable, and if so did you comment on the financial assumptions made?

The Committee on Climate Change did not take part in the consultation exercise for the Bill; it was operating in shadow form at the time of the consultation.

2. Do you believe your comments on the financial assumptions have been accurately reflected in the Financial Memorandum?

Not applicable.

3. Did you have sufficient time to contribute to the consultation exercise?

Not applicable.

Costs

4. If the Bill has any financial implications for your organisation, do you believe that these have been accurately reflected in the Financial Memorandum? If not, please provide details.

The Financial Memorandum recognises that in order for the Committee on Climate Change to fulfil the advisory functions ‘additional funding may be required if the Committee are commissioned to provide advice and the cost of that task is particularly expensive’. This is likely to be the case, though the costs to the Committee on Climate Change and the timing of any funding required have not yet been established.

5. Are you content that your organisation can meet the financial costs associated with the Bill? If not, how do you think these costs should be met?

The Financial Memorandum identifies that the Scottish Government may be required to supply additional funding to cover the financial costs to the Committee on Climate Change associated with providing advice and analysis relating to the Scottish targets.

6. Does the Financial Memorandum accurately reflect the margins of uncertainty associated with the estimates and the timescales over which such costs would be expected to arise?

Future contributions are likely to be in line with Scotland’s contribution in 2008-09, exclusive of any additional funding required to support the delivery of the advisory functions in the Climate Change (Scotland) Bill.

Wider Issues
7. If the Bill is part of a wider policy initiative, do you believe that these associated costs are accurately reflected in the Financial Memorandum?

No comment.

8. Do you believe that there may be future costs associated with the Bill, for example through subordinate legislation or more developed guidance? If so, is it possible to quantify these costs?

No comment.

SUPPLEMENTARY SUBMISSION FROM THE SCOTTISH GOVERNMENT, DATED 18 FEBRUARY 2009

Part 2 - In written evidence, the UKCCC suggested that it would be likely that additional funding would be required for Scottish-commissioned research and advice. How likely is it that the Scottish Government’s annual contribution of £275k to the UKCCC will be exceeded in future years?

The Scottish Government’s annual contribution to the funding for the UK Committee on Climate Change is expected to vary from year to year. For example, the costings of £275k cover work under the provisions of the UK Climate Change Act and include an element of initial start-up expenditure which is not expected to recur in future years. For information, the Committee is currently reviewing its funding requirements for 2009-10 with the UK administrations as its work programme develops.

As noted in the Financial Memorandum to the Bill, additional funding may be required for the Committee in respect of the Scottish Bill if the Committee is requested to provide advice and the cost of providing that advice is particularly expensive, for example, because the Committee requires to recruit more staff or commission external research in order to develop the advice. Analysis related to the annual Scottish targets and trajectory can be anticipated to give rise to additional work for the Committee and additional expenditure is therefore expected. If this work requires, for example, an additional analyst and perhaps some additional research to build on the analysis work already undertaken by the Committee, this could be estimated to be in the region of up to £100k. The Committee is currently considering the resource implications of work in support of the Scottish Bill.

Evidence received by the Transport, Infrastructure and Climate Change Committee suggested that the cost of establishing a Scottish committee would be less than the FM suggests, i.e. £2.5m p.a. How does the Scottish Government respond to this?

The Scottish Government believes that establishing a Scottish Committee would require considerable funding. The £2.5m estimate for the potential annual costs of a Scottish Climate Change Committee is based on the following assumptions:
A Scottish Climate Change Committee could be expected to have six members (the same number as the UK Committee on Climate Change) – additional members would be anticipated to increase costs beyond those provided in the Financial Memorandum.

A Scottish Climate Change Committee could be anticipated to manage with a slightly smaller secretariat – 20 persons instead of 25.

The nature of the advice required and the range of expertise necessary suggests it would be difficult to save costs by adopting a significantly scaled down operation for Scotland.

The UK CCC conducts a wide range of climate change analysis which would need to be replicated for Scottish purposes. The Scottish Government estimate allows for some scope for efficiencies from an information sharing arrangement and is based on the following considerations:

- The UK CCC has detailed sectoral expertise to address specific economic questions, commission and peer review detailed econometric modelling frameworks and synthesise this work into an economy wide analysis.
- The UK CCC has already built up significant understanding while operating in shadow format and in preparing their initial report, published in December 2008.
- A Scottish Committee secretariat would need to replicate this understanding and further develop models and frameworks to address Scottish specific issues without direct input from the UK CCC.
- The range of sectoral issues is significant and would include energy and power generation, transport including international aviation and shipping, the technology path to the 2050 target, business opportunities, climate change impacts, competitiveness issues, demand side responses, social research and development of modelling and methodologies.
- It would be important also to consider the international dimension including likely future climate change agreements, market developments (financial and carbon), international aviation and shipping negotiations and technology transfer scenarios.

The scale of fees generally paid to Scottish NDPB members is lower than the current rate for the Committee on Climate Change therefore some efficiencies can be anticipated in terms of remuneration for members of a Scottish Committee.

Accommodation costs could be reduced by locating a Scottish Committee on the government estate.

The Scottish Government has concluded that utilising the expertise of the UK Committee on Climate Change is likely to be the most cost effective option for obtaining expert advice on climate change for the Scottish Ministers, but would reconsider the arrangement if it should be demonstrated otherwise.

While we acknowledge that our estimates are not precise sums, we remain convinced that they indicate the scale of the cost difference between contributing to the UK Committee and establishing a Scottish Committee.
Part 5 - Considerable costs will be associated with subordinate legislation under the Bill, which will have significant financial impacts on public bodies, local authorities and businesses. How does the Scottish Government intend to monitor the costs arising from the large number of future regulations?

The two subject areas in Part 5 which could have significant financial impacts on public bodies, local authorities and businesses are considered to be the waste provisions and the non domestic energy efficiency provisions. In terms of the waste provisions, costs will arise only if subordinate legislation is actually enacted under the powers in the Bill, and then the nature of those costs, and the bodies on whom they will fall, will depend on the regulations themselves. As is always the case with regulations, the financial issues they raise, including monitoring would be addressed in a Regulatory Impact Assessment (RIA) specific to those regulations.

In respect of the non domestic building energy efficiency provisions, the costs associated with subordinate legislation will also be addressed in a detailed RIA specific to the regulations. A rigorous review (in the form of a Review RIA) will be carried out within 10 years of the introduction of the regulations and will consequently be able to provide an accurate assessment of the impact.

It may be helpful to take this opportunity to clarify that the one-off costs for the Scottish Government for the non domestic building energy efficiency provisions include staff costs to develop secondary legislation, impact assessments and guidance, media campaigns to create public awareness, training and research and vary depending on the scope of the secondary legislation. There are no one-off costs envisaged for local authorities as enforcement is intended to be self financing based on penalty charges.

The average annual costs for Scottish Government, local authorities and other bodies, individuals and businesses are identified in respect of implementation of the policy - i.e. commissioning of building surveys, calculating energy and carbon performance of buildings, formulating action plans and carrying out building work. The wide variation in the annual costs relates to the type and size of buildings covered, whether operational ratings are included, the trigger points for assessments, the lifespan of the certificates and whether implementation of the recommendations is discretionary or mandatory.

Philip Wright  
Deputy Director  
Climate Change Division

SUPPLEMENTARY SUBMISSION FROM THE SCOTTISH GOVERNMENT,  
DATED 25 FEBRUARY 2009

Advisory body – Can the Scottish Government clarify its earlier comment on deriving efficiencies?
My earlier letter referred to the estimates of the potential costs of operating a Scottish Climate Change Committee allowing for 'some scope for efficiencies from an information sharing arrangement'. The UK Committee on Climate Change (UK CCC) built up significant understanding while operating in shadow form to December 2008 and continues to develop this now that it has constituted statutorily. If a separate Scottish Committee on Climate Change were to be established in the future we envisage that arrangements may be made whereby the Scottish Committee could draw on the UK CCC’s knowledge of data and research sources, modelling methodologies and analytical output. The precise arrangements for information sharing would, of course, have to be agreed with the UK Committee and the other sponsor administrations at the appropriate time.

The extent to which information sharing would aid a Scottish Committee would also depend on the nature of the issue as well as the structure and approach of a Scottish Committee. It is therefore not possible to place precise estimates on the extent of efficiencies. For example, a Scottish Committee could be helpfully informed by any analysis undertaken the by the UK CCC on what is an appropriate global climate objective. Beyond specifics, it can be expected that information sharing would also be useful more broadly.

Forestry – Can the Scottish Government confirm whether the options review on forestry will include financial information on joint ventures?

The options review on forestry will include financial information on both joint ventures and the leasing of forest land, but with more detail on the latter issue.

Energy Efficiency – can the Scottish Government confirm if local authorities will be given enforcement duties in respect of the non-domestic building energy efficiency provisions?

In terms of Section 50 (3) of the Bill, no decision has been taken yet as to whether enforcement will be carried out by local authorities or “such other person or body”.

Philip Wright  
Deputy Director  
Climate Change Division

SUPPLEMENTARY SUBMISSION FROM THE FEDERATION OF SMALL BUSINESSES

Thank you for allowing the FSB in Scotland the opportunity to present our concerns about the Financial Memorandum of the Climate Change Bill to the committee. As discussed at the evidence session, we are pleased to provide some additional written evidence. I hope you find these comments helpful.

As outlined at the committee meeting, the FSB in Scotland is primarily concerned about the nature of the secondary legislation enabled by the bill. Issues relating to waste, recycling and energy efficiency are clearly of interest to a large number of our 20,000 members.
We of course appreciate the benefits of using secondary legislation, however this should be of a supporting nature; the intention of the legislation having been set out in the primary legislation. We believe that the measures currently outlined are extremely wide-reaching and the scope of government action unclear. This means it is very difficult to ascertain the potential impact of these measures. With some of the proposals having severe cost and practicality implications (e.g. Energy Performance Certificate options range from £6.7m pa to £64.7m pa) for both business and public bodies, we do not think it is appropriate for parliament to be asked to vote to allow ministers such a wide range of legislative powers without more detailed intentions and costings.

In addition to our concern about the nature of the legislation, please find below comments on the Financial Memorandum.

1. Impact Assessment
   The development of the Regulatory Impact Assessment (RIA) alongside the Financial Memorandum would have been helpful. The partial RIA was completed at the time of the government’s consultation, however it would be a useful tool to aid scrutiny and development of the legislation. We would also like to see some mention of the use of the Business Impact Assessment (BIA) as recommended by the Regulatory Review Group. Where differences appear in information in both the Financial Memorandum and RIA, it is unclear which is the most up-to-date. References to costs which, in the absence of any detail, vaguely conclude ‘benefits are likely to outweigh costs’ are simply unhelpful in a Financial Memorandum.

2. Assessing Costs
   Costs to business are assessed under the ‘agencies, other bodies’ section of the Financial Memorandum. Since SEPA is a key agency, much of this section focuses on costs to SEPA and there is not enough focus on costs to business. For example, the summary cost table relating to waste data returns lists £250,000 under the ‘other bodies’ section, but this only relates to costs to SEPA. Using more case studies would be a helpful way to illustrate the impact of proposals. While we appreciate the intention and understand it is representative of a large office complex, Victoria Quay is probably not representative of most business premises in Scotland and is therefore not the ideal example with which to illustrate costs of providing recycling facilities to staff.

   We do appreciate the difficulties involved in estimating cumulative costs, however this is key to understanding the impact on business. Where a number of different regimes are mentioned (and currently there is potential for at least six different sets of paperwork, monitoring and inspection with no mention of cost recovery through fees), it would make sense to look at the potential to streamline regimes thereby increasing efficiency and simplifying compliance. If we are to achieve better regulation, discussion of these ideas at an early stage is important e.g. if waste plans and energy efficiency plans are both required for business premises, why not have one combined plan? If there is to be improved waste data returns from business, can the existing regime be removed to prevent duplication? The
differentiation of roles between SEPA and local authorities has clearly yet to be decided – here too there are opportunities to ensure duplication and overlap does not occur.

There is also little reference to the difference between policy and administrative costs in the Financial Memorandum. In assessing costs, it is important to understand where there are opportunities to reduce administrative costs, as outlined above, and where there are unavoidable policy compliance costs.

3. Infrastructure & Resources

As discussed at committee, we see no reference in the Financial Memorandum to the inevitable cost implications to local authorities (and to private waste industry who require certainty of government intentions if they are to invest) of providing the necessary infrastructure to support additional recycling. In the 2007 mapping exercise into local authority provision of recycling services to SMEs, carried out by SEPA, lack of resources was frequently cited as the main reason for not improving services to small businesses. At that time there were still four local authorities offering no recycling services to business. This clearly presents difficulties if we are looking at legislation which will place duties to recycle on businesses. In addition, a threat to the financing of existing kerbside recycling schemes has been highlighted by many in relation to the introduction of a deposit and return scheme – this cost implication should be reflected in the Financial Memorandum.

Andy Willox OBE
Scottish Policy Convener
FINANCE COMMITTEE

EXTRACT FROM THE MINUTES

4th Meeting, 2009 (Session 3)

Tuesday 10 February 2009

Present:

Jackie Baillie (Deputy Convener) Derek Brownlee
Joe FitzPatrick James Kelly
Alex Neil Jeremy Purvis
Andrew Welsh (Convener) David Whitton

The meeting opened at 2.03 pm.

Climate Change (Scotland) Bill: The Committee took evidence on the Financial Memorandum of the Climate Change (Scotland) Bill from—

Dave Gorman, Head of Environmental Strategy, Scottish Environment Protection Agency;

Susan Love, Scottish Policy Manager, Federation of Small Businesses;

Scottish Parliament
Finance Committee
Tuesday 10 February 2009

[THE CONVENER opened the meeting at 14:03]

Climate Change (Scotland) Bill: Financial Memorandum

The Convener (Andrew Welsh): Good afternoon and welcome to the Finance Committee's fourth meeting in 2009, in the Scottish Parliament's third session. I ask everyone to turn off mobile phones and pagers.

Agenda item 1 is oral evidence on the financial memorandum to the Climate Change (Scotland) Bill. The committee agreed to adopt level 3 scrutiny of the memorandum, which means that, as well as seeking written evidence, we will take oral evidence from affected organisations and the Scottish Government's bill team. The written evidence forms paper FI/S3/09/4/2.

I welcome Dave Gorman, the head of environmental strategy at the Scottish Environment Protection Agency, who forms the first of three panels of witnesses. He will make a short opening statement.

Dave Gorman (Scottish Environment Protection Agency): Thank you for the opportunity to give evidence. I remind members that SEPA is the national environmental regulator for Scotland. We do two principal tasks. We monitor and report on the state of the Scottish environment, and we use our regulatory powers, along with our submissions to the planning system and support to businesses, to protect and improve the environment. As part of that, we have an interest in climate change.

The Convener: I invite questions from members. Alex Neil and David Whitton have been designated to lead on the bill, but other members are of course welcome to ask questions.

David Whitton (Strathkelvin and Bearsden) (Lab): Mr Gorman, were you responsible for the written submission from SEPA?

Dave Gorman: Yes—I produced it along with my colleagues.

David Whitton: That is fine—that makes life a lot easier, because you will know what is in the submission.

SEPA's written evidence says that the financial memorandum contains nothing on invest-to-save programmes or funding to promote programmes to reduce carbon emissions. Is that a startling omission?

Dave Gorman: We thought that it would be useful to describe in our submission some of the plans that we have in place, so we provided figures on what we are doing. However, that work is not driven by the bill. SEPA feels that it needs to lead by example, so we have joined the Carbon Trust’s local authority carbon management programme. Our evidence shows the targets and costs that result from that.

I am not sure whether we are saying that a huge problem exists, but we wanted to draw the issue to people's attention. Much of the investment to drive down carbon emissions makes sense for energy costs, too. Sometimes, the issue for us—we do not know whether it applies to other organisations—is finding enough money as quickly as we would like to invest to make such savings.

We are not necessarily saying that a big problem exists; we are simply pointing out that, for organisations such as ours, the numbers that we are talking about are fairly chunky.

David Whitton: It could be argued that if SEPA cannot set an example for the rest of Scotland, no one can.

Are the costs that you mention those that are detailed in table 1 of your submission for activities such as replacing roof insulation and cavity wall insulation in your buildings?

Dave Gorman: That is right. We call that our direct environmental impact, which we are trying to find ways to reduce. As you say, if we cannot do that, we are not in a position to lecture others. The costs are for reducing our own carbon emissions.

David Whitton: SEPA's evidence says that some estimated costs—for carbon accounting and so on—do not concur with its experience. Will you say a bit more about that? How far out are the figures?

Dave Gorman: We said that the figures look reasonable, as far as we can tell and given the difficulties of making firm estimates at this stage. However, our experience is of being responsible for implementing several regulatory regimes under the Government's policy of fully recovering from business the costs of operating those regimes. We point out that the costs in the memorandum look like a modest underestimate—some of the figures look like marginal costs rather than full cost recovery.

David Whitton: How do you react to Aberdeen City Council’s submission that the memorandum is “vague” about costs, East Ayrshire Council’s comment that cost estimates are needed for secondary legislation and East Lothian Council’s comment that the memorandum is not helpful?
Dave Gorman: I can give our view, which is that the memorandum is helpful. The difficulty for the Scottish Government is that the bill sets out the framework, but the annual targets have not been finalised. The pathways and some of the policies that are needed have also not been finalised. It is reasonable to have first-cut estimates as part of the financial memorandum.

David Whitton: So you are a wee bit out of step with some other organisations, whose evidence talks about vagueness.

Dave Gorman: I think so, but perhaps that is because we have a lot of experience of implementing European legislation that comes to the United Kingdom and Scotland, when the devil is often in the detail. The costs of different approaches to implementing regulation can be wide ranging. Only as the approaches are narrowed down over time do we produce reasonable cost estimates. It is not unusual for us to narrow down on the costs as time goes on.

David Whitton: The financial memorandum estimates the cost of administering a carbon accounting scheme at about £60,000 per annum. Is that estimate still reasonable, or should it be higher or lower?

Dave Gorman: We have gone out on a limb slightly in that regard—the Scottish Government might want to comment on that. We think that the estimate is a little on the low side, although it is not extraordinarily out of sync with what we would expect. We tried to be helpful by pointing out that some of the costs look a little on the low side. However, the issue is marginal in the scheme of things. Given that we are talking about 1 per cent of gross domestic product, the estimated costs are in the right ballpark.

David Whitton: I think that the £60,000 per annum is a figure for a salary as much as anything else—you will correct me if I am wrong about that. Will no costs be associated with the carbon accounting task other than the salary of the person who does the work?

Dave Gorman: I am sure that the Scottish Government will have more detail. We tried to be helpful on that, too. In our experience, associated costs, such as software costs, are often needed when systems are set up. As I said, the estimate looks a little on the low side, but it is not outrageously low.

The Convener: We are considering 2050—that is futurology. Who knows what will happen next year, never mind in 2050? Are we talking about margins of uncertainty or margins of certainty? Vagueness and uncertainty are surely in-built in the bill, by its very nature.

Dave Gorman: You are right. I alluded to that. I understand that although we have targets for 2030 and 2050, the pathways whereby we will meet the targets have not yet been set. Much of the discussion at macro level is about the right balance between early expenditure and early cost. I understand that the Scottish Government must do much more work to get a handle on some of the costs.

We are not alone in Scotland and the UK in trying to understand the costs; reports that try to do that are constantly coming out. However, there is so much uncertainty about the technology that will prevail, for example, that it is difficult to look forward and decide that one option will be better than another. You are quite right, convener.

David Whitton: I might be putting you on the spot by asking you this. Does Scotland need an independent scrutiny facility? Could not that be done through the UK?

Dave Gorman: What aspect of scrutiny do you mean?

David Whitton: It is suggested that either we get advice from the UK Committee on Climate Change or we set up a Scottish committee. There is a huge difference in cost between opting to be part of the UK set-up and establishing our own committee. The financial memorandum says that being part of the UK committee would cost us £275,000 per annum, whereas setting up a separate Scottish committee would cost £2.5 million per annum.

Dave Gorman: We do not have a direct relationship with the UK committee, but we have been impressed by the quality and thoroughness of its work and by its publications to date. We have seen nothing that suggests that anything is wrong with the process. It is for other people to decide whether the advice that they are getting is adequate for the purposes of the bill, but from our point of view the UK committee has made an impressive start.

The Convener: There are different demographic factors in Scotland and there could be a problem with ensuring that the UK committee can take account of Scottish conditions. Can you guarantee that there will be adequate Scottish input to the UK committee?

Dave Gorman: It is not for SEPA to give such guarantees. The advice will come through the Scottish Government. SEPA can consider what comes in and make a judgment on it privately, but the responsibility for commenting on the adequacy of the advice lies with the Scottish Government. You would have to ask the Government about that.
**Alex Neil (Central Scotland) (SNP):** East Ayrshire Council said that the lack of detail in the financial memorandum is problematic and referred to the wide range of estimates of the potential cost to local authorities of improving energy efficiency. Will you comment on that?

Although energy efficiency measures require up-front investment, after a period the investment starts to pay for itself, because energy costs are saved. That is a major benefit. Have you estimated the net impact on costs, or the net benefits, over a five or 10-year period?

**Dave Gorman:** Your second question is easier for me to answer because we have put such information in our evidence about the local authority carbon management programme, which we have joined. The Carbon Trust runs that scheme. The name gives away the fact that it is principally aimed at local authorities, but we were able to join it. It provides a structured way of considering the opportunities and balancing the costs against the benefits. We considered the measures that we could take on the SEPA estate to get our energy costs down, assessed their cost effectiveness and feasibility and came up with an action plan—which you have—that outlines which actions look feasible and how quickly we can deliver them. We absolutely agree that there are substantial energy efficiency opportunities. If SEPA cannot show leadership in that regard, we should be concerned.

It is much more difficult for me to comment on the first point, as my local authority days are behind me—for the moment, at least. SEPA has 30 buildings if it is lucky, but local authorities may have 500 or more, so managing the direct building stock is clearly a much bigger issue for them than it is for us.

**David Whitton:** I will take you back a step to the climate change-related duties of public bodies. The bill provides for the Scottish Ministers to impose such duties on public bodies and to identify an appropriate body to monitor whether the duties are being fulfilled. Should SEPA be the monitoring body? If it was, would it require additional funding?

**Dave Gorman:** We have not given that specific question a lot of thought, to be honest. We found it helpful that the Scottish Government’s consultation last year outlined three levels of scrutiny. The first was advice on what the targets and pathway should be. The UK Committee on Climate Change currently provides that. The second level was the reporting on, analysis of and bringing together of physical data. We certainly thought that SEPA could have a role in that regard, and we commented on that. The third role was the assessment of performance. We are less certain that we are the right body for that work because we may be subject to some of the duties that we would be asked to report on.

**David Whitton:** If you are not sure about that, I guess that I might get the same answer to the question whether SEPA should be the body to monitor whether organisations are achieving their waste reduction and recycling targets.

**Dave Gorman:** The answer to that question is probably much closer to yes. We might be in the frame for such activity. Although I started out in the waste industry some years ago, it is a while since I was directly involved in it, so I might need to write to you with a bit more detail. Certainly, SEPA has a lot of experience in waste of setting up systems, reporting on data and inspecting and taking enforcement action.

**David Whitton:** How difficult would it be for local authorities and other organisations to set up monitoring of their waste management plans?

**Dave Gorman:** It would not be too difficult. As I understand it, the purpose behind the plans is to try to make bodies think through the consequences of, for example, big construction projects in which they might engage. The trick is to include environmental consideration up front. When we do that and people look for the opportunities up front, the costs and difficulties are often not as great as they would be if such aspects were not considered until later in the process.

We do not envisage huge difficulty in putting waste management plans together. The trick will be ensuring that they have an impact as they are written.

**David Whitton:** Glasgow City Council reckoned that doing away with free plastic bags would cost £3.5 million. How would you monitor whether a local authority was doing away with free plastic bags?

**Dave Gorman:** I find it difficult to comment on that specific point. The general point is that SEPA has a fair amount of experience of trying to find ways to require businesses that have duties on them to meet those duties, often through education and support. Yes, things have been made statutory and therefore people need to comply, but often the best starting point is to make people aware of the requirements, to publicise them and to try to make people think about them early in their decision making rather than after the event.

**David Whitton:** Under the various powers in the bill, all sorts of regulations are to be introduced for waste prevention and management, recycling facilities, deposit return schemes, waste data
returns, reduced packaging, carrier bag charges and so on. I return to Aberdeen City Council’s point that the financial memorandum is "vague" on the costs of introducing all that stuff. I think I am right to say that every local authority that provided evidence is worried about the possible future financial implications. Do you really think that the Government has got the financial memorandum right?

Dave Gorman: I can only give SEPA’s point of view, which we tried to make explicit in our submission. We think that the financial memorandum is a reasonable first stab at some of the costs, bearing in mind that the actual costs will depend on the detail. The devil will be in the detail of how the measures are framed, the scope of the duties and powers, and the enforcement regime that is put in place. With all that in mind, we think that the Scottish Government made a good attempt.

We would be concerned if we could not home in on the detail at the regulation stage, but our experience has been that, as we move towards the regulation stage—as opposed to looking at what is in the statute itself—some costs will be firmed up by the regulatory impact assessments. At present, we are reasonably comfortable. As far as we can see, the estimates are good ones, given the available information.

The Convener: You said that the financial memorandum is a reasonable first stab at the costs, but the bill will involve extra monitoring, enforcement and other duties. How well equipped is SEPA for the role in terms of staff and resources? Do you have any thoughts about the resources that will be required for the extra duties that you will be given? Have you estimated the costs that will arise for your organisation if you take on those duties?

Dave Gorman: I am not trying to dodge the question, but again it is difficult to comment without knowing the detail. There are two ways in which SEPA recovers its costs. One way is through the grant in aid that we get from the Scottish Government, but the more common way in the case of regulatory regimes is through the setting up of a charging scheme. There is a process to be gone through at that stage to establish what the costs might be. That usually involves a discussion between SEPA and the Scottish Government about what we think we will need to deliver the measure and whether the costs will be acceptable to the businesses that will pay them. That is a well-understood process that ends up with Scottish ministers approving the charging scheme.

We are reasonably confident that, as we move into the detail via the regulatory impact assessments and then to a charging scheme, that will give us ample opportunities to argue our case.

Jeremy Purvis (Tweeddale, Ettrick and Lauderdale) (LD): Given that the Government has decided to confer on SEPA responsibility for carrying out some of the regulatory functions, have you done any modelling of potential charging frameworks?

Dave Gorman: We have not done so yet, but that will certainly be the next step for us.

To give a specific example, we are the enforcing authority for the pollution prevention and control regulations. Whenever a new process or industry is added to those regulations, we go through a pretty detailed financial modelling exercise to work out what we think the costs might be. There is subsequently a consultation on those costs, and a charging scheme is put together for ministers’ approval.

There is a whole process to be gone through. The problem for us at this stage is that it is difficult to do anything to that level of detail without knowing exactly what our duties and the design of the systems will be.

Jeremy Purvis: The reason why I ask is that it does not seem from the financial memorandum that SEPA has done any modelling. It seems that the Government does not have many options for the regulatory body, unless it wishes to establish a new climate change regulatory body. The role can be performed by SEPA, by the local authorities or by the Government itself. With previous legislation, indicative levels have been provided at the financial memorandum stage, but in this case it seems that we are doing unnecessary work, because we are told that all the information will be in the regulatory impact assessments, which will not come to the Finance Committee.

Has the Government asked SEPA to do any work? A range of costs is provided for the options that are laid out, but it does not seem to be informed by information that SEPA has provided as a result of modelling work that it has carried out.

Dave Gorman: I would need to check with my waste colleagues exactly what conversations they have had with the Scottish Government, but I know that extensive discussions have been held. We commented on last year’s consultation, and in preparing our submission we talked to waste colleagues. Do the figures look like a reasonable first assessment? In our view, they do. Have we done a lot of modelling at this stage? No. However, I reiterate that if, in due course, the duties in question become our responsibility, we will carry out modelling at that stage.
Jeremy Purvis: I have a specific question on SEPA’s interesting point about energy performance certificates. In your submission, you say that the Government should “clarify the role of who pays” for the costs associated with the production of energy performance certificates. My question is about the range of costs in the financial memorandum. You refer to paragraph 186 of the financial memorandum and identify some of the on-going costs, in which there are huge variations. Depending on the option, the potential cost to the Scottish Government—the cost to the Administration, not the cost to those who will pay the charges—ranges from £0.3 million to £12.4 million. Were you involved in the work that the Government did to produce those figures? There is a colossal variation in the annual cost, which, over the first 10 years following the bill’s implementation, could amount to more than £100 million.

Dave Gorman: The simple answer is that we tend not to have direct involvement in building regulation, so we have not done any work on that.

Jeremy Purvis: But we are talking about the cost to the Scottish Government of the administration of an assessment regime. You do assessment work for the issuing of licences and you also do checks, so you have the infrastructure for operating a charging regime. As I understand it, the part of the financial memorandum that we are discussing deals with cost of the administration of an inspection regime, rather than with the costs that could be charged to building owners.

Dave Gorman: Although we can comment on issues that we are familiar with, such as the waste provisions, SEPA does not get involved in areas such as building regulation. Local authorities are responsible for planning and the building warrants system, and the Scottish Government is responsible for the building standards side. It is therefore difficult for us to comment on whether the figures in question are right.

However, you are correct to say that our submission hints at the fact that, as one moves out of areas that we understand, such as waste, to the costs associated with energy performance certificates, there is a great deal of variation in the costs, as the local authorities said. That needs to be considered.

The Convener: We might ask the bill team whom it consulted. That would help.

You are almost off the leash now, Mr Gorman. Do you wish to make any final comments?

Dave Gorman: I have one final comment. I have said several times that the devil will be in the detail. That is the key point for us.

I do not need to tell the committee that the case for taking action is clear. At present, we are still at the framework stage. There will be much greater clarity as we move into the next round of the process, which will involve the setting of pathways, targets and policies. At that stage, organisations such as ours will come back with much clearer information. We have done our best to give you our sense of the financial memorandum, but it has been difficult.

The Convener: The committee knows only too well that the devil is indeed in the detail. We look forward to finding out more of that detail. Thank you for your written and oral evidence and for attending the meeting.

We will have a short suspension to allow the next witness to take her seat.

14:30
Meeting suspended.

14:31
On resuming—

The Convener: I welcome Susan Love, Scottish policy manager with the Federation of Small Businesses. I believe that you wish to make a short opening statement.

Susan Love (Federation of Small Businesses): For the committee’s understanding, it might be helpful if I clarify that our primary interest in the bill is in part 5, chapters 3 and 4, which relate largely to what will be secondary legislation.

David Whitton: It certainly simplifies matters if you want to be asked only about part 5, chapters 3 and 4. Before I get there, however, I have a general question. Do you share the concerns that have been expressed in the written evidence about the vagueness of the estimates of the costs of the bill?

Susan Love: I am happy to take wider questions about the bill but, from a small business perspective, it is only the practical implications of chapters 3 and 4 on which we are able to comment.

I am not sure whether the committee has had sight of our response to the Scottish Government’s consultation last year, particularly on waste. We made some critical comments about the information on costings that was provided at that stage. We are disappointed with the subsequent level of information that is in the financial
memorandum. It is inconsistent, not enough attention is given to the impact on business, I am not sure where partial regulatory impact assessment feeds into it because there appear to be differences in the two sets of information given, and I do not see a separation between policy and administration costs. I am sure that we will go into those points in more detail but, generally, we felt that a lot more could be done at this stage.

David Whitton: I am sure that you heard Mr Gorman’s evidence about how SEPA is putting its own house in order on the environment front. How much of that will your members do? I assume that any small business will be trying to keep its energy bills as low as possible and will be doing things such as insulating its premises. That sort of thing is not included in the costs, is it?

Susan Love: Absolutely. It is important to understand that most small business people try to act in their business in the same way that they do in their home. As citizens, they are keen to do that. Our most recent survey evidence suggests that 40 per cent of our members have changed the operation of their business in recent years as a result of climate change. When asked about motivations for making environmental change to their business, the biggest factor that was cited was care for the environment, rather than penalties or regulation. It is clear that there is motivation to change among businesses. You can already see change happening in several areas that are covered in the bill, for example carrier bags.

David Whitton: I am not sure that I share your view that most of your members are doing it because they care for the environment—perhaps that is the kind of box that they tick when they get a wee survey because it looks good on paper. I would have thought that the bottom line is of more interest to any small business than caring for the environment.

Did the earlier evidence that you mentioned say anything about the likely impact on your members of caring for the environment, such as the potential costs of building surveys and calculating their energy performance and so on?

Susan Love: We made the general comment that, until the Scottish Government decides exactly what it wants to do, it is difficult to come up with exact costs. Until we have a policy proposal on the table, it is hard to start examining the different options for different sectors. The bill proposes waste management plans. That appears to refer to site waste management plans, which are primarily for construction—that is the example that is most frequently given in the financial memorandum, whose costings relate to the option that is in force down south.

However, according to the policy memorandum, that could be anything from construction-managed site management plans to complete waste management plans for all business premises. Clearly, those are two completely different things, with hugely varying costs, so until the Government indicates to us which one it wants to go for, it is hard to come up with a precise cost. If the Government goes for the latter option, and every business premises in Scotland has to have a waste management plan, it then has to decide whether it will enforce the recommendations in the plan. Obviously, there are different implications for different groups of our members.

David Whitton: That would bring in the issue of extra regulation. I imagine that you have misgivings about the quantity of new regulation that may flow from the introduction of the provisions in the bill.

Susan Love: That is one of our major concerns about the bill. We would like the Government to be clear about its intentions for regulations for small business, and business generally. That would allow us to design a regime that has the most streamlined impact. What we sign up to is better regulation. We want to ensure that if the Government has a commitment that is in everyone’s interests in Scotland, we introduce it in a way that mitigates the impact on small businesses and other vulnerable groups.

As the bill is set out, those opportunities have not been fully exploited. For example, if all business premises are to have energy performance certificates—if that is the option that the Government goes for—and waste management plans, that will be an opportunity to consider streamlining such regulations for business premises. In the waste and energy efficiency sections of the bill, I have counted about six or seven regimes that would require enforcement, paperwork and record keeping. As drafted, the bill makes it extremely costly both to business and to the public purse.

David Whitton: Do you think that the bill is good or bad for business?

Susan Love: It is good for business to think about how it can approach environmental issues. Waste is a key issue for us. We would support any drivers that helped and encouraged small businesses to recycle. The problem is that there is no point in introducing the stick unless there are ways for small businesses to comply with the legislation. One of the major problems associated with many of the duties to recycle is that the facilities simply are not there.

I have been involved in other evidence sessions on the bill, and the consistent message is that unless resources are put into tackling the major
infrastructure issues for waste, particularly in local authorities, which are a major waste source for small businesses, there is nothing that small businesses can do. You can give them a duty to recycle, but they will not save money if they cannot do it. Infrastructure costs relating to waste do not appear to be mentioned anywhere in the financial memorandum.

**David Whitton:** Will you give us a flavour of your membership’s experiences of waste collection and management across the country?

**Susan Love:** The evidence that we have suggests that most small businesses’ waste streams are fairly similar to households’ waste streams. Most small businesses are not throwing out toxic or hazardous waste; they tend to throw out small amounts of fairly run-of-the-mill general waste and paper. Our evidence suggests that about 80 per cent recycle some of their waste. That figure was 40 per cent four years ago, so there has been progress. The evidence also suggests that local authorities are still key, because they are the main bodies that pick up waste from small businesses. That is a critical point. I know that local authorities are keen to get out of it, but the bottom line is that they are the only ones who will pick up waste from small businesses. If they do not have the facilities to cope with that, I do not see how small businesses can recycle.

**David Whitton:** In its evidence, the Scottish Retail Consortium was concerned that the waste reduction and recycling provisions would have a serious impact on operational costs for retailers, which reinforces what you have said. From your previous answer, it is clear that the FSB shares the Scottish Retail Consortium’s concerns about whether you can offset some of those costs, for example.

**Susan Love:** My reading of the SRC’s evidence is that it has particular concerns about the packaging aspects of the bill, which I suppose is obvious, given its perspective. We have a slightly different take on that. We are not as concerned about packaging in relation to the production and sale of the goods. Most of our members buy in goods that are already packaged, so there will not be the same supply chain-pressure issues for them.

The issues for our members in retail in particular are to do with the practicalities of measures such as requiring all businesses to supply recycling receptacles for customers and employees. I am thinking particularly of small grocers who are already going to have to change their premises because of licensing and tobacco measures and who will now also have to find room for different recycling receptacles in their shop.

**David Whitton:** If you could make one suggestion to the Government about the bill, what would it be?

**Susan Love:** My suggestion would be that it should just decide what it wants to do. There has been a lot of consultation on various options, particularly in relation to waste. It should just decide which options it wants to take, put them into the bill and ensure that the assessment is done so that parliamentarians know what they are voting for and what the costs will be. If it does that, decisions can be taken and everyone can move forward together.

**The Convener:** I am well aware that small businesses are, by definition, cost and time sensitive and that they are wary of extra burdens being placed on them. How can small businesses play a positive part in climate change measures? What strength can they add to such measures?

**Susan Love:** Small businesses can do a lot, but they will need support. Many small businesses will come up with the technology that would help other businesses. I know of many businesses that are keen to trial microgeneration of renewable energy. They are also keen to play their part in recycling, but the infrastructure is not always there to enable them to do so. We have worked closely with our members over the past few years to encourage them to play their part. We have produced an energy toolkit for small businesses to take around their business premises and consider how they can become more resource efficient. Small businesses can do a lot and they are interested in playing a role. However, all policy that is directed at the public and small businesses has to be manageable.

**Jeremy Purvis:** I see that the information on estimating the cost of drawing up a waste management plan is based on information from the Department for Environment, Food and Rural Affairs. Was the FSB consulted, in advance of the Government drawing up the financial memorandum, about the potential costs to businesses of drawing up a waste management plan?

**Susan Love:** No, although we work closely with officials in the relevant department.

14:45

**Jeremy Purvis:** The Government information appears to show that the indicative cost of between £350 and £1,600 per waste prevention and management plan is the same no matter whether the Government, a local authority or a sole trader draws up the plan. That is patently absurd. To me, table 8 on page 51 of the explanatory notes looks like a cut-and-paste exercise. What are your thoughts on it?
Susan Love: On the table as a whole or on that point?

Jeremy Purvis: The Government appears to have taken the information from DEFRA. It says that cost depends on project size. How then can the cost estimate for businesses and the Government be the same?

Susan Love: It is fairly obvious that the costs are purely indicative. The table shows costs for three different sizes of building project. Clearly, the size and complexity of the project will affect the development costs.

Jeremy Purvis: Every business may be required to have a standing waste prevention and management plan and not simply to draw up a plan for individual construction projects. One can understand the need for such a plan in the case of major construction projects—indeed, I think that SEPA requires that for some projects. Has the Government given you an indication of the form that these plans might take?

Susan Love: No. As I said earlier, all that we know is what the Government has said in the bill. The duty may apply only to construction-related projects or it may be a general duty on all business premises. My understanding of the costs in the table is that they relate only to site management plans in England and Wales. I understand that no estimate has been done of the cost of requiring all businesses to draw up a general waste management plan. Again, the costs involved in doing that would vary hugely, given that we are talking about businesses that range from a one-person small business to one with numerous and complex sites.

Jeremy Purvis: I guess that the figure could be extrapolated by taking the average cost and multiplying it by the number of businesses in Scotland. How many members does the federation have?

Susan Love: There are 20,000 members in Scotland.

Jeremy Purvis: We would therefore multiply by 20,000 the average cost of between £350 and £1,600 per plan. Surely the total would represent a colossal sum for small businesses.

Susan Love: A cumulative cost for Scotland is given for some but not all items in the table. For example, there is only a cost per business for waste prevention and management plans, which you mentioned; no simple calculation has been done from that of the cost for all businesses. That is what I meant when I spoke about inconsistencies. It would be better if we were to look at the cost for each of the measures across Scotland.

Jeremy Purvis: But the Scottish Government has neither carried out that work nor asked the federation to become involved in modelling costs across the country.

Susan Love: No, but I imagine that we will be asked to contribute to the regulatory impact assessment. However, I would much rather that the Government had already done that work. If it had done that, the committee could have considered the detailed evidence before reaching its judgment.

Jeremy Purvis: It is too late for that.

I turn to chapter 3 on energy performance. Again, we do not know whether the Government will place the requirement on all non-domestic buildings. In table 7 in the financial memorandum, which is entitled, “Potential costs for other bodies, individuals and businesses for each energy performance scenario”, the average annual cost varies between £5.3 million and £64.7 million. That is a fairly extraordinary difference. Has the Government told you which scenario is most appropriate for businesses?

Susan Love: No. We have had signals that de minimis exemptions may apply on some measures. We were told that it may not be worth while for small businesses to be included in some of the measures—the benefits may not outweigh the costs. In our view, option 5 of the seven options for environmental performance certificates is the only one that covers all businesses. Most of the other options are for large businesses. I cannot say where the cut-off is; I have not been asked.

The Convener: You may want to follow up in writing on some of the more specific questions.

Susan Love: Sure.

The Convener: Do you want to make a final statement?

Susan Love: No. I may reflect on some of the points that were raised and give the committee a further written response. I think that that might be helpful to the committee.

The Convener: That would be excellent. I have a long-standing interest and connection with small businesses. I thank you for your attendance at committee and for your evidence.

Susan Love: Thank you.

14:51

Meeting suspended.
On resuming—

**The Convener:** Our third and final panel of witnesses is made up of members of the Scottish Government’s bill team. The panel is larger than normal, which reflects the wide-ranging nature of the bill. I welcome to the committee Philip Wright, Fiona Page, Jonathan Dennis, Alec Millar, Colin Imrie, Kevin Philpott and David Henderson-Howat.

I invite Philip Wright and Fiona Page to make opening statements.

**Philip Wright (Scottish Government Climate Change and Water Industry Directorate):** The main aim of the bill is to introduce a target to reduce Kyoto protocol greenhouse gas emissions by 80 per cent by 2050. Part 1 of the bill introduces the 80 per cent target and an interim target and establishes a framework for annual targets to be brought forward in secondary legislation. Parts 2 to 4 cover the advice and reporting aspects and provide a power to apply duties to the public sector. Part 5 covers a number of adaptation and mitigation topics that would benefit from new and updated legislation.

Jonathan Dennis, Fiona Page and I are involved in the central climate change policy area, so we will deal with questions on parts 1 to 4; David Henderson-Howat will respond to questions on forestry provisions; Colin Imrie will respond on energy efficiency and renewable heat; Alec Millar will answer questions on non-domestic building provisions; and Kevin Philpott will respond to questions on waste provisions.

Before we take those questions, however, given the interests of this committee, I will say something about the financial and economic aspects of the bill.

There is a need for climate change to be tackled at a number of levels. First, there is a need for continued global action at an international level. We are awaiting the agreement that we hope will be reached in Copenhagen later this year, which will set the scene for future emission reduction efforts and set the pace for action by developed countries. We hope that that agreement will bring in the countries that are not covered by the Kyoto protocol and its emissions reduction targets.

Secondly, as part of the UK, Scotland is bound by what is happening at the European Union level and the measures that the EU introduces to drive forward action to reduce emissions. That is a key issue for the committee to take into account, and we will probably refer to it later in our responses. For example, the EU emission trading scheme is a key part of our regime for reducing emissions as it covers up to 50 per cent of our CO$_2$ emissions.

Thirdly, we are partners in the Climate Change Act 2008, which requires effort by the UK Government and the three devolved Administrations to reduce emissions.

Finally, we have the Climate Change (Scotland) Bill, on which we are focusing today. The bill represents Scotland’s opportunity to drive forward the actions that we need to take to meet the Scottish Government’s ambitious target to reduce greenhouse gas emissions by 80 per cent. That will involve effort at different levels by central Government, local government, individuals and, as you heard in the previous evidence-taking session, small businesses. It is important that there is interaction between the EU, the UK, the Scottish Government, local government, the public sector and individuals.

It is important to bear it in mind that parts 1 to 4 of the bill contain a framework for future action. It is obvious from the earlier panels’ evidence that a lot of detail still needs to be filled in, but we are happy to do what we can to help.

**The Convener:** Does Fiona Page wish to add anything?

**Fiona Page (Scottish Government Climate Change and Water Industry Directorate):** I think that Philip Wright covered it all.

**The Convener:** Thank you for your assistance in organising your responses according to subject responsibilities and expertise.

**David Whitton:** I presume that Mr Wright will answer this question. How do you respond to the comments in the submissions from Aberdeen City Council and others about the vagueness of the estimates of the costs that they will face?

**Philip Wright:** To be frank, I was surprised by Aberdeen City Council’s response. There is a more balanced view in the other local authorities’ responses, and a better appreciation of what we are setting out to do with the general provisions of the bill. Climate change is a complex area. When you ask us specific questions about the costings and the economics, we will address those, but I do not think that Aberdeen City Council’s response was helpful.

**David Whitton:** To be fair to Aberdeen City Council, it is not alone. East Ayrshire Council, East Lothian Council, Glasgow City Council and Fife Council, which are not all under the same party’s control, all made much the same comment that things are a bit vague.

**Philip Wright:** I was certainly not making a political point. I agree that some other local authorities picked up on the point about detail, but a number of them had a general appreciation of the complexity that is involved in providing detailed
costings for the implementation of the general provisions of the bill.

**David Whitton:** What steps is the Government taking to try to alleviate the local authorities’ concerns?

**Philip Wright:** We are taking a number of steps. We now have the Committee on Climate Change’s advice, which came out in December. That relates to the UK act, but it will help to inform our contribution. That committee identified a range of abatement options, considered their cost effectiveness and examined a range of other factors in coming forward with its advice.

We also commissioned research from a firm of consultants to identify the abatement options that will be available to Scotland in the next 40-odd years. That report is now in the public domain. Using it as a starting point along with the Committee on Climate Change’s advice, we are producing what we call a strategic overview of the available abatement options in Scotland. However, we also recognise that contributions will come from EU and UK policies. The process is under way.

15:00

**David Whitton:** When will the strategic overview be available to local authorities?

**Philip Wright:** We hope that it will be available towards the end of the first half of the year—around about June or July.

**David Whitton:** This year?

**Philip Wright:** Yes.

**David Whitton:** I am sure that you are aware that the Parliament will debate the local government settlement tomorrow—it might or might not get through; who knows?

**Joe FitzPatrick (Dundee West) (SNP):** Is that a threat?

**David Whitton:** No, no, far from it.

In their submissions, Glasgow City Council mentioned the contribution that Glasgow makes to Scotland’s GDP, and Highland Council said that the unique geography and climatic conditions of the Highlands might give the council more problems. How will the various costs on local authorities be accommodated in their funding allocations?

**Philip Wright:** Do you mean in the context of the bill?

**David Whitton:** Yes.

**Philip Wright:** I cannot give specific information. We have not considered the issue at such a level of detail. For parts 1 to 4 of the bill, we have tended to consider the macro level, with the exception of some points of detail on additional costs.

**David Whitton:** That explains why local authorities are a wee bit worried. If they do not know what assistance they will get from central Government, they will be reluctant to follow procedures that you are laying down.

**Philip Wright:** You are focusing on local government, but there will be a broad sweep of measures and not only local authorities but the power sector and the manufacturing sector will contribute to reducing emissions. Local authorities will have a contribution to make, but we do not quite know what form that contribution will take. In part 5, we set out some policies that might in future contribute to reducing emissions, but there is nothing overly specific in the bill.

Highland Council commented in its submission that the carbon reduction commitment would cost £0.5 million. Other councils mentioned such costs, too. However, that is only part of the story. The carbon reduction commitment is an interesting measure in that it is fiscally neutral. Highland Council might pay out £500,000 for allowances, but there is every possibility that the council will recover that a year later, when it has performed on energy efficiency and achieved emissions reductions. The approach could be cost neutral to the likes of Highland Council.

**David Whitton:** You said that the strategic overview will be available in June or July. Have the costs of delivering the 2050 target been revised in light of the overview?

**Philip Wright:** We are working on the matter with colleagues throughout the Scottish Government, given that there will be an amalgam of abatement effort in the energy, transport and agriculture sectors. Work is in progress and the overview will be published by the summer.

**Jonathan Dennis (Forestry Commission Scotland):** It is fair to say that, so far, we have tried to consider the bigger picture first. We accept that considering the macro level takes us only so far and we are looking to put in place secondary and more detailed analysis, such as the work around the AEA Technology report, which Philip Wright mentioned, and other pieces of work. We are considering more detailed costings, but we thought that it was important first to try to box in the probable costs in a macro sense and then to consider more detailed information as we go forward.

**The Convener:** We have been told that the estimated costs are only proxy figures, which are arrived at by disaggregating UK figures. In studies that you have done, how do your figures compare with the estimated costs of meeting the 2050
target, which are based on disaggregating UK costs?

Jonathan Dennis: It is fair to say that the work is based on UK figures. The Stern review considered costs in the global context. Work that has been undertaken at UK level has considered UK aggregates, as you said. Beyond that, we instigated a couple of pieces of research on Scotland-specific data. We realise that, in certain policy areas, such as transport, housing stock and agriculture, there are significant differences in Scotland. So far, we have undertaken two pieces of work that examine Scotland-specific data. Both of those have been published and further work is now under way to consider in more detail not only the 2050 target but the mid-range targets around 2030.

It is all part of a jigsaw. We considered whether the costs look okay from a UK perspective and then whether they are appropriate from a Scottish perspective. Now we are undertaking more detailed work on costs using Scotland-specific data.

The Convener: The trouble with the forward planning is that, as we get closer to the reality, we do not want to continue with figures that do not appear to fit into the Scottish pattern. However, getting a better picture for Scotland will depend on whether you can roll out other figures. I presume that that work is under way.

Philip Wright: I will fill in some of the detail again. The bill sets out the general trajectory through to 2050, but a key provision is the requirement on the Scottish ministers to introduce annual targets. If the bill is passed, ministers will be required to do that by some point next year. When we produce those annual targets and that work is under way to consider in more detail not only the 2050 target but the mid-range targets around 2030.

The Convener: The trouble with the forward planning is that, as we get closer to the reality, we do not want to continue with figures that do not appear to fit into the Scottish pattern. However, getting a better picture for Scotland will depend on whether you can roll out other figures. I presume that that work is under way.

James Kelly (Glasgow Rutherglen) (Lab): I have questions on the figures that are in the financial memorandum and the work that is being done on the strategic overview. Has the Government made any projections of the likely energy mix between now and 2050 and the likely costs per megawatt hour?

Jonathan Dennis: The work that has been undertaken on the likely 2050 energy mix has now been published, and we are happy to point the committee towards that information. That work involved the consideration of various options for the renewable energy strategy, such as carbon capture and storage and the place of coal and gas in the energy mix, as well as the potential additional costs of introducing more renewables or carbon capture and storage.

Having had that overarching consideration, we are now trying, as part of the strategic overview, to drill down into the specifics of the options to identify how deliverable and achievable each is and the timescale under which it could be delivered. As part of the bill process and the production of the annual targets, it is important to know when the options might come on stream.

James Kelly: Are there different scenarios in the energy mix projections, or do you have a specific set of energy mix targets for the run-up to 2050?

Jonathan Dennis: Two complementary reports have been published. One, which is more specifically about energy, examined the range of options from heavy coal to heavy renewables and the introduction of carbon capture and storage. It tried to capture the range of energy mixes that are available to us. We did not focus deliberately on one scenario but considered the range of options.

James Kelly: To be topical, how did nuclear power feature in that?

Jonathan Dennis: We included the existing nuclear power stations to the end of their lives. From that point onwards, no additional nuclear capacity was included; after the end of their lifespans, the existing nuclear power stations were replaced with renewables and carbon capture and storage. We tried to capture the realities and consider the longer-term picture of the energy mixes.

James Kelly: I appreciate that it is a complex matter. You said that a couple of pieces of work are going on. How has that work fed into the calculation of the cost of delivery as £1.7 billion at 2005 prices?

Jonathan Dennis: That costing relates to a piece of research that was undertaken and which has now been published. We considered all sectors in the Scottish economy—not just energy, but agriculture, transport, housing and so on—so that we could start to drill down and consider whether what has been widely proposed in the UK context is achievable in a Scottish context, what the cost might be and how everything might come together to deliver the wider targets in the bill. That overview exists; in the strategic overview that we are undertaking we are moving on from initial costings to the next level, to ascertain whether what is proposed is achievable and whether the costings are appropriate.

James Kelly: I want to be clear about this. The £1.7 billion figure in the financial memorandum was derived from a particular piece of work, but
other work is going on and the figure will be updated as that work develops.

Jonathan Dennis: That is the case. The financial memorandum reflects the most up-to-date published work that we had when the bill was introduced. The strategic overview will give us a finer level of detail and will provide a credibility check on the costings in the financial memorandum. We will consider whether the costings are appropriate and whether there are alternative options.

Fiona Page: Mr Kelly made a valid point. Much work is going on. The Scottish Government has been leading on a number of studies, which Jonathan Dennis and Philip Wright talked about. We have also been waiting for the publication of key reports and advice, such as the report of the UK Committee on Climate Change. That report was published in December and is a very important empirical piece of work, which will set many of the ground rules, not just for the UK legislation but potentially for what we do in Scotland.

It is a case of getting everything lined up. First, we needed a number of things, such as the UK committee’s report. We need the UK Government to respond to the report and to agree the emissions budgets to which it will sign up under the Climate Change Act 2008. Work on our strategic overview builds on the report that we published in November. That report, which is referenced in the financial memorandum, is where the £1.7 billion figure came from.

Many pieces of information are part of the jigsaw, and it is difficult for us to leap-frog over things that are not yet in place. That is why it is a challenging task for the committee to consider the financial memorandum as it stands. We will be more informed as things progress. When the strategic overview is finished and we know what the UK emissions budgets will be, we will have a much clearer idea of the pace of activity that will be needed. We will be able to add another level when we bring forward our annual targets, which we hope will be put in place through regulations in June 2010.

The Convener: You describe challenging work, which is being approached in logical steps.

Joe FitzPatrick: David Whitton talked about the allegations of vagueness in the financial memorandum. Susan Love told the committee that the FSB would have preferred details on waste to be in the bill rather than in secondary legislation. By how long would the bill’s introduction have been delayed if there had been an attempt to include all the secondary detail on that huge area?

Kevin Philpott (Scottish Government Environmental Quality Directorate): I do not know, but the delay would have been considerable. There are things in the bill that are not without precedent. For example, on waste data, there are currently regulations in secondary legislation; site waste management plans exist in England and are based on secondary legislation; and there are deposit and return schemes elsewhere—one in Denmark was introduced in 54 pages of secondary legislation, doubtless written in deathless Danish prose. It would not be proper to reproduce such stuff in the bill, and doing so would have delayed the bill’s introduction considerably.

The other point to make is that we are not doing things once and for all. Regulations on waste provision, for example, will have to be amended from time to time. Also, if markets for recyclates improve, we might be able to add more of them to plans. It would be inconvenient—to say the least—to have to take such action through primary legislation every time. We need the power to do it through secondary legislation.

Fiona Page: On the climate change targets, we would probably have had to delay the bill by about 18 to 20 months if we wanted to bring forward the annual targets at the same time as the bill. At the very earliest, you would have received the bill in September or October 2010.

15:15

Joe FitzPatrick: Would that have made it difficult for us to achieve the 2050 target?

Fiona Page: It would, but we are talking about a longer-term trajectory. Through the bill, we are trying to set the long-term framework and to recognise that the Scottish Government is serious about climate change and wants to have specific Scottish legislation on it. We could just have sat back, given that we are covered by the UK Climate Change Act 2008 through the legislative consent motion that was agreed in the Parliament about 14 months ago. It is a bold step to introduce Scottish legislation that goes further than the UK act in recognising the important role of international aviation and shipping emissions.

More important, we are getting the legislation on to the statute book and getting you talking about climate change. We hope that that will get the public more engaged, because climate change is a very serious issue for you and for future generations. Introducing our own legislation gives us the opportunity to open up the debate, have the discussions that we need to have and acknowledge that we all have to play our part in tackling climate change.
Philip Wright: I want to reinforce something that I said at the outset. This is a difficult time for us to introduce the bill, because the global position is in a state of flux. We are waiting for an international agreement to be reached at Copenhagen. The EU has already committed to a 20 per cent reduction in emissions across the EU. If agreement is reached at Copenhagen, that will increase to 30 per cent.

That is reflected in the advice from the Committee on Climate Change, which offers two budgets: an interim budget and an intended budget. One is based on the 20 per cent target and the other is based on the 30 per cent target, and they reflect the measures that will be developed at EU level to deliver either a 20 per cent or 30 per cent reduction. That will impact on the UK and on Scotland. The level of ambition at EU level is key to the level of effort that will be required in the UK and Scotland. For example, transport emissions are problematic. We will rely on car technology standards to bring about emissions reductions—the main reductions will come from that area. Product standards are EU driven. We need the EU to deliver the potential transport emissions reductions.

The Convener: We are seeking islands of knowledge in a sea of complicated uncertainties.

Derek Brownlee (South of Scotland) (Con): We all appreciate the uncertainties that you are dealing with and understand the difficulties that you faced in drawing up the financial memorandum. Obviously, we face the converse difficulty, as we are trying to scrutinise the financial memorandum. The most material number is the impact on GDP—the £1.7 billion, or whatever it is. In drawing up the bill, did you consider regular reporting on the impact of its measures on GDP?

Fiona Page: That is a fair question. We have set out in detail in the bill the kind of information that ministers would want to be reported on, which generally is performance driven in relation to reducing greenhouse gas emissions and related activities around energy and electricity. We did not consider regular reporting on the impact on GDP because it is quite difficult to determine Scottish GDP. My economist friend Jonathan Dennis will be able to keep me on track with this, but GDP figures are generally UK based, and it is very difficult to extrapolate to obtain Scottish GDP numbers. I suppose that it would be possible to measure Scottish GDP, which is what we would report on and refer to, but I think that our solicitors would be worried about placing an obligation on the Scottish ministers in primary legislation to report on it, because we would have to define exactly what we meant, given that UK GDP would be different from what we would view on the Scottish side.

I do not know whether Jonathan Dennis wants to say anything about the challenges.

Jonathan Dennis: No, the challenges are fair. The Committee on Climate Change will examine the impact of emissions on GDP as part of its annual report, and we will rely heavily on its advice. We have seconded an economist to work with the committee to input into the Scottish elements. Undoubtedly, we will look to the committee to see the impact in a UK sense, but we will also seek to identify whether the impact is likely to be different in Scotland.

Fiona Page: We will have the power through some of the provisions to amend what ministers are obliged to report on. If it were felt in future that it would be beneficial to assess the impact on GDP, ministers could bring that forward.

Derek Brownlee: I appreciate that it is technically difficult to produce the figures, but if the impact on GDP is the largest cost of the bill, and if it is difficult to extrapolate the data for reporting purposes, it is difficult to assess the potential impact of the bill. We need a methodology for extrapolating the data in the first place. We have all the very laudable reporting regimes for carbon units, which are fair enough, but if we do not try to measure the bill’s impact on GDP, it will be difficult to form a view on whether we are pursuing the most cost-effective way of reducing carbon emissions or whether we are missing opportunities.

It is difficult to measure the potential cost to the economy. By your own admission, the biggest impact will be on GDP. This is not an academic exercise; it is relevant to the cost of the bill to Scotland plc and the private and public sectors. Should not the impact on GDP be part of the reporting mechanism, even if we are only taking a best stab at it? Should we not at least try to measure the impact not only of carbon emissions but of the year-on-year costs of reducing them?

Philip Wright: I will try to answer that. When we set annual targets, which will be the subject of a statutory instrument under the affirmative procedure, part of the process will involve a set of policies to deliver those targets. When we come to look at the targets in a bit more detail, we will give more information about costs, which will give a much better picture of the cost implications, certainly for the first 10 years. After that, the path is still open, although we will have started to narrow it down. A lot more information will be available between now and 2020, but the picture will be fuzzier after then, because the pathway is not clear. However, you will have a lot more information about costs after summer 2010.

Fiona Page: It is important to recognise that section 4(4) details all the key criteria that the
Scottish ministers will have to be aware of when setting the annual targets. Many of those criteria are fiscal and economic, but they go further and require ministers to take account of, for example, Scotland’s special circumstances, such as our remote and rural communities, which go far beyond what the rest of the UK experiences. The criteria include a wide range of circumstances and ministers will have to take account of them. As a result, the advice and expert guidance that ministers will be required to obtain before they set the annual targets will have to consider those criteria.

Jeremy Purvis: I want to go back to some of the information that we received from previous witnesses. I was struck by the information about energy efficiency and waste management, and some of the requirements on local authorities and businesses. Just so that I am clear in my mind, when did the consultation conclude and when did you start making policy decisions about what was going to be in the bill?

Fiona Page: The consultation on parts 1 to 4 ran between January and March 2008. If I recall correctly, we published the analysis of the responses around 20 August and ministers published their response to the consultation with their views of what was likely to be in the legislation on something like 27 October.

Jeremy Purvis: I am looking at the seven scenarios for the EPCs and the scenarios that will affect waste management—

Fiona Page: I am sorry to interrupt, but I should let you know that there were separate consultations on the provisions that you are about to talk about. A consultation on the energy efficiency of non-domestic buildings was run separately from the consultation on the bill. There was also a zero waste consultation, which again was separate from the consultation on the waste provisions in the bill. If you would like to know the dates of those consultations, my colleagues can give them to you.

Jeremy Purvis: It would be helpful to know when they were concluded.

Alec Millar (Scottish Government Directorate for the Built Environment): The consultation on improving the energy performance of existing non-domestic buildings was opened on 2 September and closed on 25 November last year. The report is being completed, and we are currently analysing the responses.

Jeremy Purvis: So nothing would have been held up if further work had been carried out with the Federation of Small Businesses, for example, on the cost to small businesses. The Government has not actually concluded its work, so it is a bit of a red herring to say that further work would have delayed the bill considerably.

Fiona Page: It depends on what you are asking. If you are asking us to engage more with stakeholders on a specific provision, such as the energy efficiency of non-domestic buildings or the waste provisions, that work would be separate from further work on parts 1 to 4, which contain the main targets and purpose of the bill. There will be opportunities for further engagement when we get the additional advice and finish the strategic review, when we know what we are doing under the UK emissions budget, which we are part of, and when we propose our annual targets.

Jeremy Purvis: This committee is considering the financial implications of the bill. The bill presents seven policy options with hugely variable costs, without any modelling having been carried out of the potential impact on the economy or the efficacy of the options in relation to the environment. There are seven policy options, but no policy decision has been taken about whether any of them could be excluded.

Fiona Page: You mean the seven scenarios for the non-domestic building energy efficiency provision in chapter 3 of part 5.

Jeremy Purvis: Yes. As I understand it, the provisions on waste prevention and management plans could apply to every business in Scotland annually or they could exclude almost all businesses in Scotland in perpetuity. The secondary legislation provisions are so broad that there seems very little point in them being in the bill. However, I want to return to the huge variation in the seven policy options, because they have caused local authorities and businesses considerable concern.

Alec Millar: The costs that were established in the consultation and brought in to the financial memorandum were prepared by the Building Research Establishment for those scenarios that we set out. They cover the one-off costs to the Scottish Government of setting up each scenario, but they also cover the annual costs, which depend on the scenarios. The scenarios range from covering only larger buildings to all public buildings or all buildings. They also cover the variation between carrying out certificate assessments and just recommending measures that could improve building performance or making the uptake of those recommendations compulsory. The scenarios cover quite a wide range of possibilities, and they gave those whom we consulted a broad picture of the alternatives. We are taking advice on what we got back and reporting to ministers on how we should progress. We are hoping to find a way forward for the next stage of the bill.
Jeremy Purvis: Was the information provided by the Building Research Establishment public, and was it provided to all local authorities and business organisations?

Alec Millar: It was placed in the partial regulatory impact assessment within the consultation document.

Jeremy Purvis: Was it the full information?

Alec Millar: Yes.

Jeremy Purvis: So why did businesses feel that they were not consulted on the potential impact and the variations? No modelling was carried out for businesses on the variation in costs, which, depending on the policy position that the Government takes, range from £5.3 million to £64.7 million.

15:30

Alec Millar: That is correct—the information was in the partial regulatory impact assessment.

Jeremy Purvis: I have one further question on the information that has been presented on the potential secondary legislation on waste prevention and management plans. I presume that the secondary legislation will clearly state which body will act as the enforcement authority.

Kevin Philpott: Yes, it will. With regard to the waste prevention and management plans—and all the waste provisions—not only have we not decided on the exact form that the regulations will take, we have not yet decided whether they will be made at all. The cabinet secretary, Richard Lochhead, made that point at the Rural Affairs and Environment Committee last week. At this stage, we hope that voluntary work might achieve a lot of the outcomes that we seek. At present, Scottish planning policy 10 encourages people to make site waste management plans, although the uptake so far seems to have been disappointing.

It is conceivable—the cabinet secretary was quite open about this—that the backstop of potential secondary legislation will encourage people to think more carefully about voluntary action. If we make regulations, they will establish which body will act as the enforcement authority.

Jeremy Purvis: So the proposed secondary legislation is, in effect, a threat.

Kevin Philpott: I would not use that word.

Jeremy Purvis: Part of our work involves considering the impact of the bill on the public purse and on those whom it will affect. There might as well be a blank cheque, given that one aspect could relate to every business or no business in Scotland, and another major aspect might never happen at all. We have been asked to scrutinise the bill and its financial memorandum. I am sure that we could have used our time for other activities, given that the legislation might not actually be used at all.

Kevin Philpott: I agree that it might not be needed at all, but if it is not, it will be because voluntary action has succeeded. If voluntary action does not succeed, we will need to do something, which is why we need the powers. It is no good for us to say in five or 10 years' time, "We need the powers—where is the bill?"

Jeremy Purvis: Would that not be for Parliament to decide at that stage?

Kevin Philpott: It is certainly for Parliament to timetable its bills, and Parliament has timetabled the Climate Change (Scotland) Bill. I think that most people accept that waste and resource use is closely linked to climate change, and the bill is therefore an appropriate vehicle to take forward waste provisions. There is not, at present, another vehicle that can take forward the type of waste provisions that we might need.

Jeremy Purvis: Mr Wright, do you really believe that local authorities have a full and accurate estimate of the cost that will fall on them when the bill is enacted?

Philip Wright: Considering the bill as a whole, and the response that you have received from the panel so far, you would probably be correct in thinking that I do not. The cost depends on the exact nature of the regulations that may be made 10 or 20 years down the line, if they are made at all.

We know for a fact that towards the end of the 40-year period it will be much more difficult to squeeze carbon out of the system. We will go for the easy and cost-effective hits over the first 10 or 20 years, but as we move towards 30 and 40 years it will become more difficult. We might have to turn to more regulatory measures and enforcement action to squeeze out the necessary carbon to achieve the 80 per cent reduction. The bill provides a framework and some building bricks that we might use in the future, but it is not possible at the moment to state with precision the cost implications for local authorities and others, because we are introducing enabling powers.

Fiona Page: It is also fair to say that the bill should not be the only thing that drives forward action in public bodies, local authorities, businesses and homes across Scotland. At the individual level, people can change their behaviour and take simple energy efficiency steps, which, frankly, they should be doing now. The bill may act as a stimulus and encourage people to do those things, but action will need to be taken at different levels in the future.
Local authorities are busy bodies, and I have full confidence that they have asset management plans in place, that they take facilities management seriously and that they will develop upgrade plans for certain equipment, where necessary. For example, they could introduce low-carbon technologies and invest in better boilers when they need to replace them. That kind of thing can be done now, at very little cost, and does not require primary legislation.

It is important that we take early action on climate change now. Besides setting the targets, the bill contains a number of other measures that make part 5 quite long and protracted. I appreciate that it is difficult for everybody to consider the bill to the level of detail at which we would like it to be considered. We are introducing measures now to address certain things that we hope will happen voluntarily but which may not. We will probably need a powerful stimulus at later stages, when things become harder to do, which is why the bill contains the waste provisions that Kevin Philipott talked about and the public sector duty provisions. It is all part of the big picture and aims to ensure that everybody plays a fair part. Nevertheless, Mr Purvis raises some reasonable questions.

The Convener: I presume that there is no model that you can follow in the work that you are doing. The same problems that arise at the Scottish level and at the UK level would be faced by anybody who tried to deal with the complexities that you are addressing.

Fiona Page: Absolutely. We are learning and will be part of the UK model through the emissions budgets approach. However, we are going a step further in Scotland. Frankly, we are doing something an awful lot harder and much more challenging for ministers. We are setting annual targets that are much more challenging and that we are much less likely to achieve if we do not ensure that the right things happen. We will learn from what is happening at the UK level—we will take the same steps as the UK and be bound by the UK Climate Change Act 2008—but we will have to do additional things in Scotland, because we are taking a slightly different and, frankly, more demanding but potentially more successful approach.

The Convener: Can you give us an approximate timetable for the implementation of the energy efficiency measures?

Alec Millar: Once the bill is enacted, subject to ministerial approval we will produce regulations covering particular types of buildings, which will be based on research to ensure that the regulations are robust. We will then give the organisations whose buildings are affected around two years to obtain an assessment certificate and then perhaps a further two years to implement any measures that the certificates require. Such measures will be mandatory rather than recommended. We are probably talking about four years. Time is of the essence.

The Convener: Will those measures be included in the first batch of annual targets, in 2010, and will they be funded through the current spending review?

Philip Wright: It is intended that the first of the annual targets will kick in in 2010. There is every possibility that, if ministers decided to proceed with the regulations on non-domestic buildings, they would be caught within the first 10 years of annual targets. The targets would reflect the emissions reductions that we expect from buildings, and the regulations would be part of that package. The current spending review continues to 2011, and the measures would come in shortly after that.

David Whitton: In case you thought that your afternoon had been wasted, Mr Henderson-Howat, I would like to turn to forestry. I believe that you are the forestry expert.

The financial memorandum refers to transfers from the Forestry Commission. On joint ventures, the estimated costs are £0.5 million this year and £0.5 million next year, with a potential net income of £10 million by 2012 and £30 million by 2020. I am sure that you have seen the evidence from the Confederation of Forest Industries, which questions those income figures. Will you give us a bit more detail on how you reached those estimates?

David Henderson-Howat (Forestry Commission Scotland): At present, the Forestry Commission has power to lease land only for renewable energy projects. At current gross bundled electricity prices, a 150MW wind farm could deliver about £3 million of income per year, if 7 per cent of the gross income was paid on the lease. A lot of research has been carried out into the potential use of Forestry Commission land for renewables developments, particularly for wind farms, but also for hydro. It is reckoned that, at present, about 1.3GW of developments are either committed or subject to option agreements and that there is scope for considerably more development. That is the basis of those numbers.

The point about leasing versus joint ventures is that, as I said, at present, we can only lease land and we do not have powers to set up joint ventures. Our colleagues south of the border in England and Wales can set up joint ventures, which means that, when they are in negotiations with developers, they have more strings to their bow, as they have the option of leasing or a joint venture. At present, developers know that we can only go down the leasing route.
David Whitton: The financial memorandum refers to the intention to release capital from the forest estate by letting timber-cutting rights, the income from which would depend on a variety of factors. As paragraph 180 points out, one option that is being evaluated is a 75-year lease of 100,000 hectares. Will you clarify how much of the £850 million of national forest estate it is intended will be released for timber cutting?

David Henderson-Howat: As you will be aware, a consultation exercise on the forestry provisions in the bill has just concluded. Many representations have been made to the Scottish Government about the terms and conditions that might be included in such a lease. Clearly, the income from a lease will, to an extent, depend not only on the area that is let but on the terms of the lease and other issues, such as what might or might not be said about future timber marketing agreements. Another factor affecting the value of a lease, if leasing were to go ahead, would be the lessee's anticipation of future timber revenues or development values. As with anything looking ahead, there is a degree of uncertainty. Subject to those factors, we are talking about a sum in the range of £150 million to £200 million.

David Whitton: Has a business plan been prepared by the Forestry Commission on that?

David Henderson-Howat: Ministers launched the consultation exercise on 4 November. In parallel, we were asked to carry out what they call an options review, on which we will report to ministers by the end of this month. As part of that exercise, Forest Enterprise has considered in detail the sort of areas that might be suitable for leasing, bearing in mind that the intention was to identify areas that had relatively less value for recreation and conservation but good commercial value. The process has identified about 100,000 hectares or so in Argyllshire and the south of Scotland. That is being considered as part of the options review.

David Whitton: I am a bit confused. Is there a business plan or is it just an options review?

David Henderson-Howat: The options review will include the type of financial analysis that one would expect in a business plan.

David Whitton: So we should see some hard numbers on expected income from such a lease.

David Henderson-Howat: As I said, the problem with expected income from a lease is that we are always in the realm of uncertainty. If someone takes on a lease for 75 years, the amount that they are prepared to pay for it depends on their expectations of timber prices over the period. One need only look at how timber prices have moved even in the past five years to see how much they fluctuate.

David Whitton: Does the options review predict what such a lease would do to the Forestry Commission's financial viability?

David Henderson-Howat: The need to take a view on that is an important element in considering a lease. Before entering into any lease, it would be essential to set a reserve price, which would be the bottom line. In effect, we would set that by valuing how much the assets are worth to the Forestry Commission at present and factoring in additional costs that might be associated with leasing, such as paying grants to the lessee.

15:45

David Whitton: The financial memorandum also says that consideration is being given to "transferring cutting rights receipts to a membership-led body".

but that you have not yet developed any detailed proposals. Do you have any further information on the consultation that is taking place on that?

David Henderson-Howat: That is part of the consultation exercise that I mentioned. I cannot recall any consultees who gave unconditional support for the idea of a trust.

David Whitton: No, indeed. I suppose that the options review will include any associated costs of setting up such a body.

David Henderson-Howat: That is right.

David Whitton: Sorry, but will you remind me when you are expected to get back to ministers? Is it the end of this month?

David Henderson-Howat: The deadline for the options review is the end of the month.

The Convener: I will draw the proceedings to a conclusion. We have rightly covered in detail a substantial range of topics. Any issues that have not been covered can be followed up in writing. Do our witnesses have any final comments?

Fiona Page: I have no specific comments, but I want to thank the committee. I appreciate that the financial memorandum is particularly challenging for you. It has taken us into a new arena. I thank members for their patience in taking us through the questions.

The Convener: The committee likes a challenge. I thank all the witnesses for their expertise and evidence.

I suspend the meeting for a moment to allow our witnesses to leave.

15:47

Meeting suspended.
The Scottish Parliament

RURAL AFFAIRS AND ENVIRONMENT COMMITTEE

Stage 1 report on the Climate Change (Scotland) Bill

The Committee reports to the Transport, Infrastructure and Climate Change Committee as follows—

Introduction

1. The Rural Affairs and Environment Committee (“the Committee”) specifically requested that it be appointed as secondary committee on the Climate Change (Scotland) Bill\(^1\) to scrutinise provisions which fall within the Committee’s remit, namely forestry (section 47), waste recycling and reduction (sections 52 to 61) and muirburn (section 46).

2. The Committee would wish to begin by thanking all those who provided written evidence or gave oral evidence to the Committee on these provisions in the Bill.

3. Before considering each set of provisions in turn below, the Committee wants to highlight some issues on the enabling nature of this legislation, the content and timing of the Bill and its impact on parliamentary scrutiny.

Parliamentary scrutiny

4. Before commencing evidence taking on the Bill the Committee wrote to the Scottish Government to express its frustration at the late stage at which a number of consultations on the provisions were undertaken\(^2\). The letter focused specifically on the forestry consultation which closed on 27 January. Given the need for this Committee to report to the lead Committee in advance of its evidence session with the Minister for Transport, Infrastructure and Climate Change as the final session of evidence taking at Stage 1, this Committee has had to scrutinise these provisions without copies of the responses to the Scottish Government’s consultation being available.

---

\(^1\) Climate Change (Scotland) Bill (as introduced). Available at: [http://www.scottish.parliament.uk/s3/bills/17-ClimateChange/index.htm](http://www.scottish.parliament.uk/s3/bills/17-ClimateChange/index.htm)

5. The Committee acknowledges that the Minister for Environment at that time, Michael Russell, offered an apology for the late introduction of the consultation, and the Committee also appreciates that the Government provided a preliminary analysis of responses to a short timescale. Regardless of this, introducing a Bill in advance of the conclusion of consultations on its contents is not appropriate. Parliamentary committees should be afforded the right to undertake scrutiny of legislation with all of the relevant information at their disposal.

6. The Committee is also concerned that a number of areas of uncertainty remain about the specifics of the Government’s proposals that the Bill’s provisions would enable. Limitations in the accompanying documents and in the supplementary information provided by the Government creates a perception that the Government’s proposals are still evolving despite the Bill having been introduced a number of months ago.

7. The Committee wishes to express its frustration that it has been asked to scrutinise and potentially endorse broad enabling powers to a relatively tight timescale and with a lack of sufficiently detailed information at its disposal.

8. Furthermore the Committee is concerned that a number of the Bill’s provisions provide for new powers that are notably broad. This is not the first time that enabling powers have been proposed within primary legislation with the intention of the detail being provided within subordinate legislation. However, some of the powers, while limited to dealing with climate change, might still be seen as broad enough to be used in a different way to those proposed by the current administration. This concern is exacerbated when the specific proposals, such as the leasing of Forestry Commission land, are proving contentious.

9. This committee or its successor would of course have the opportunity to scrutinise the necessary subordinate legislation required to allow Scottish Ministers to use these powers. However there are limitations to the scope of the Parliament to scrutinise secondary legislation. For example the timetable for consideration once laid is considerably shorter than for most bills (40 days) and once laid committees are unable to amend this form of legislation.

10. There are a number of provisions where, although the powers have been criticised for being too broad, the policy direction behind these powers has received wide support from stakeholder groups, such groups are relatively relaxed about subordinate legislation being used to flesh out the detail of these proposals following passage of the Bill.

11. However, for the most controversial proposal, specifically the forestry leasing proposal as detailed in the Policy Memorandum, it is clear to
the Committee that the principle behind the provisions does not have a body of support, the Committee’s preference would be that this proposal should not be permitted by the wording of the Bill.

12. Notwithstanding paragraph 11 relating to leasing, in addition the Committee invites the Government to give serious consideration to amending the Bill to place limitations on the scope of secondary legislation stemming from it where powers are particularly broad. The Committee has flagged up specific suggested amendments to this end later in this report.

13. The Committee also considers that all secondary legislation stemming from these broad enabling powers should be subject to ‘super affirmative’ procedure. This effectively provides the committee likely to be referred the relevant instrument additional time to scrutinise it by allowing the committee to view it in draft. Importantly, scrutinising an instrument in draft affords the Committee the opportunity to take evidence on its provisions and to propose amendments to it before it is laid before Parliament. To allow committees maximum opportunity to take evidence on these draft instruments the Scottish Government should notify committees at the earliest opportunity that any such instruments are approaching a state of readiness to be laid before Parliament.

Forestry

14. Section 47 of the Bill provides for subordinate legislation to allow Forestry Commissioners within the Forestry Commission Scotland to form or participate in corporate bodies or trusts. In addition Commissioners would have the power to provide loans and act as an officer of a body corporate, or a trustee of a trust. The detail of the proposals behind section 47 are described in the Policy Memorandum, which states that the Government is proposing two specific policy areas. The Forestry Commission would be allowed to enter into joint venture arrangements for renewable energy developments. Such provisions on joint ventures replicate provisions already in force in England and Wales. The second proposal is to release capital by leasing up to 25% of Forestry Commission Scotland land for up to 75 years with the intention of using the funding gained to implement measures to contribute towards mitigating climate change. In this context the Committee agrees with successive governments’ stated objective of increasing the acreage of forestry in Scotland, within the context of an integrated land use policy.

Themes arising from evidence

15. The Committee issued a call for evidence on the forestry provisions. The Committee then held a roundtable discussion involving: Stuart Goodall, Chief Executive, Confederation of Forest Industries (ConFor); Allan Mackenzie, representative of Forestry Commission Trade Unions; Dr Calum Macdonald, Forestry Commissioner and Chairman of the
National Committee for Scotland, Forestry Commission Scotland; Lisa Duggan, Landscapes Manager, Loch Lomond and the Trossachs National Park Authority; Angus Yarwood, Convener of the Woodland Task Force, Scottish Environment LINK; Janice Cassidy, Policy Officer, Scottish Rural Property and Business Association; and Gavin Ellis, Director, Scottish Tourism Forum.

16. This session was immediately followed by evidence from the Minister for Environment at that time, Michael Russell MSP, and his accompanying officials Anne Cairns, Solicitor, Rural Affairs Division, Scottish Government, Jo O'Hara, Head of the Natural Heritage Management Team, Scottish Government, Bob McIntosh, Director, Forestry Commission Scotland, and David Henderson-Howat, Policy Adviser, Forestry Commission Scotland.

Leasing
17. All of the submissions received in response to the Committee’s call for written evidence that commented on the leasing proposal either opposed the proposal or raised concerns about it.

Consultation
18. ConFor suggested that the timescale of the development of the proposal has been challenging stating that—

“It would have been ideal to have had a longer timescale and an opportunity to consider how forestry can contribute to tackling climate change in the context of a wider land use policy and the wider benefits that forestry provides.”

SE LINK added that—

“…we would like a longer discussion and more opportunity for all the stakeholders to get involved. We would prefer it if a later legislative opportunity was taken to introduce specific powers, once it has been determined what they should be.”

Loch Lomond and the Trossachs National Park Authority supported this position stating that—

“Although we support providing more land for forestry, there has been limited consultation on the proposals in the climate change action plan, so we have not explored other mechanisms for doing

---

that...We are just concerned about how quickly the proposal is going through.”

19. The Minister argued that the consultation on the forestry proposals was a genuine consultation and that on that basis alternatives to the leasing proposal were welcome. The Minister was also clear in evidence that the timing of the consultation is not ideal but that it is imperative that the Government acts at the earliest opportunity on climate change, and that this Bill makes provision for this to happen.

20. The Committee appreciates that consultations should not have a preconceived outcome and is concerned that consultation was undertaken during Stage 1 on a proposal already contained in documents supporting the Bill. There is sufficient concern about the leasing proposal for the Committee to be unwilling to recommend that the Bill allow this proposal to go ahead.

21. As detailed below the leasing proposal is contentious for numerous reasons and the consultation process for this proposal is considered to be inadequate by key stakeholders.

22. The Committee recommends that the Government does not progress this leasing proposal and amends the enabling section in the Bill.

Funding

23. On the issue of how any funding generated by this policy would be used, Dr Calum Macdonald from Forestry Commission Scotland stated that—

“...I would be keen for any money that is raised from joint ventures or by the commission to be spent on achieving forestry strategy targets.”

24. ConFor stated that its members were concerned that there had not been definitive reassurances from the Government that the money raised from the leasing proposal would be channelled back in to forestry based measures to improve carbon sequestration as opposed to being redirected into other Government initiatives to mitigate climate change. The Committee notes however that the Policy Memorandum does specify that funding generated would be used for woodland creation.

25. The SRPBA raised concerns from its members that any organisation or organisations leasing land could access funds from the Scotland Rural Development Programme which is already considered to be insufficient to support existing organisations and difficult to access funding from.

---

The SRPBA also suggested that, if there were only one or two leases, a company or companies with a large proportion of the land could “outcompete” all of its members.

26. The Committee is aware that one of the appeals of the leasing proposal is the potential to provide the Government with a substantial sum of money up front as opposed to over a prolonged period, as is likely to be the case with the release of funding from joint ventures proposals. Members also raised concerns with the Minister that, should the leasee tap into SRDP funds at a rate of £2m per annum then over a 75 year lease £150m of support would be provided, leaving the Government with a net profit over that time of £50m. This figure of £50m does not reflect any loss of income or expenditure to the Forestry Commission Scotland and assumes that £200m is still the market value of the lease once the Bill is enacted.

27. If the Government proceeds with the leasing proposal in the Bill the Committee considers that it should clarify, before the end of Stage 1, how it envisages the mechanism for allocating funding released towards woodland creation working in practice, and to what extent the leasee will be able to call upon SRDP funds. The Government should also provide further detail on the calculations upon which the proposal’s viability has been assessed.

28. Finally, the Committee recommends that the Government should provide, as part of its reporting duties under Part 3 of the Bill, details to Parliament on which budget lines the funding generated from the leasing of land has been allocated to and for what purpose.

29. Concern was raised by some witnesses that, if the most profitable parts of the forest estate are leased off, there may be funding issues regarding the delivery of multi purpose and climate change benefits in the remaining 75%, which would by definition, be less profitable. Suggestions were made that the most profitable 25% would remove around a third of the commercial income of Forestry Commission Scotland.

30. If the Government proceeds with the leasing proposals, the Committee considers that detailed costings showing the economic viability of the remainder of the national forest estate should be provided to Parliament.

31. The Bill and Accompanying Documents contain little information on a proposed not for profit trust, with the Financial Memorandum stating:

“Detailed proposals have yet to be developed, and will include consideration of State Aid issues”
32. The Minister\(^9\) in evidence seemed sceptical about the idea, stating:

“Although the proposal for a trust is interesting and would offer certain advantages, I see little overall advantage. It might be overbureaucratic. That is my personal view, although I have not come to a final view on all the submissions on the subject. However, very few submissions were in favour of the trust.”

33. The Committee notes and shares the Minister’s reservations on a not-for-profit trust. Should the proposal for a trust proceed by way of secondary legislation, the Committee requests that an explanation of potential state aid issues be made available to Parliament, as well as a convincing justification for the inclusion of such a proposal.

Employment

34. Forestry Commission Trade Unions\(^10\) oppose the leasing proposal, in evidence Allan Mackenzie explained that—

“…our opposition is focused first and foremost on the effect that leasing might have on staff members who are transferred from the public to the private sector. Staff are frightened about issues such as their future employment prospects and long-term pension provision.”

35. Members raised concerns that forestry workers were coming to them on a private basis saying that when they attend workshops they are being told that if they do not accept the proposed transfer they will be deemed to have resigned and will not receive redundancy payments. The Minister assured the Committee that there would be no compulsory redundancies and that the Government would seek to ensure that affected employees are offered alternative employment.

36. The Committee expresses its concern at this interpretation of the Government’s message that there will be no compulsory redundancies. The Committee seeks assurances from the Government that if employees refuse to transfer to the private company leasing the land, that this will not impact on their employment rights and therefore they should not be deemed to have resigned.

37. The Committee also seeks assurances from the Government and the Forestry Commission that there will be no compulsory redundancies and that they will seek to secure that transferred employees’ contractual obligations include conditions of service

---

equivalent to those adopted by the Forestry Commission. Finally, the Committee seeks assurances that the Government and Forestry Commission will take steps to ensure longer term security for affected staff, improving on the short term security provided by TUPE regulations.

**Conditions attached to the lease**

38. The possibility of writing into the lease conditions for the private company leasing the land to adhere to was regularly raised in written submissions. Essentially such conditions would seek to ensure that, as far as possible, a private company would perform many of the functions currently undertaken by the Forestry Commission Scotland.

39. ConFor suggested that the leasing conditions would need to be suitably robust to ensure that the use of the land by any private company would incorporate measures to mitigate climate change. For example, it should be required to give consideration to planting particular types of trees in particular areas to achieve maximum carbon sequestration. As noted above, funding is available via the SRDP for forms of planting which are sustainable but not necessarily self-financing, such as planting native broadleaf forests. Presumably without Government funded support or stringent conditions attached to the contract a private company would be more likely to plant more productive species of trees to maximise return.

40. A number of submissions made to the Committee raised concerns that the Forestry Commission’s valuable current role of ensuring supply to sawmills and other industries reliant on timber is maintained regardless of the market value of such timber and would not be carried by a private company with financial motivations. If sawmills are not assured of a steady supply of timber they may not be prepared to invest in expensive new infrastructure and may be vulnerable during downturns in the market. Stuart Goodall, ConFor\(^{11}\) acknowledged in evidence that—

“...the Forestry Commission provides long-term production forecasts, which it is pretty good at meeting. The private sector is not able to do that in quite the same way.”

41. In evidence Gavin Ellis, Scottish Tourism Forum\(^{12}\), raised concerns about the potential conflict of interest “that is inherent in the commercial realities of private enterprise” and praised the role the Forestry Commission has taken in integrating recreation, health and education benefits with Scotland’s forests. A number of written submissions also highlighted the value of the Forestry Commission’s focus on managing its land in a sustainable way, including promoting biodiversity.

\(^{11}\) Scottish Parliament Rural Affairs and Environment Committee. *Official Report, 11 February 2009, Col 1436*

42. Lisa Duggan, Loch Lomond and the Trossachs National Park Authority\textsuperscript{13} added, in relation to access to land within the Park, that the welcome onto private land that visitors get is not as positive as on Forestry Commission land—

“…they are told ‘if you want to come in, you can. We are not going to lock the gate.’ That contrasts with the Forestry Commission approach, which is one of saying, ‘you are welcome to walk here. These are the signs for you to follow. Here is what we have put in place for camping’.”

43. Stuart Goodall, ConFor\textsuperscript{14}, noted that the private sector already works closely with the Forestry Commission and has set standards which it self-polices. For example, he explained that the private sector is currently working with the Forestry Commission to produce a standard that takes account of carbon stating “that is not a principal concern about the effect of private sector planting on carbon capture. It is minor." He later added that “We have spent a lot of time over the past 25 to 30 years developing standards and ways of identifying where to plant to avoid a flow country situation.”

44. Members presumed that even if the private sector does not self-police in this and other respects conditions could be attached to the lease and raised questions on possible conditions with the Minister. The Minister\textsuperscript{15} responded in relation to whether current requirements on the Forestry Commission would be placed on the private company stating that—

“There are statutory protections that the Forestry Commission observes and which a private owner would have to observe too…conditions will have to be attached to the lease, and they will refine the planting carried out by the private sector.”

45. The Committee appreciates assurances from the Minister on the importance the Scottish Government would place on contract conditions for any private company leasing land. However placing restrictions on the private investor would reduce the attractiveness of the lease and the likely income available from it. If the proposal goes ahead, the Committee believes that Parliament must have the opportunity to view and comment on the draft contract or a summary of its requirements before it is finalised.

Capping scope of subordinate legislation

46. As the powers within the Bill which would allow leasing to take place are so broad witnesses suggested there was a need to refine the scope of these powers on the face of the Bill. SE Link\(^\text{16}\) stated that—

> “…the powers in subsection (1) and (2) are very broad. We support the Subordinate Legislation Committee’s suggestion that the nature, scope and extent of the modification powers should be restricted.”

47. The written submission from Jean Balfour suggested that the 75 year lease period sat awkwardly with planting cycles. Stuart Goodall, ConFor\(^\text{17}\), suggested there is no ideal length of lease as—

> “We are talking about 100,000 hectares of Forestry Commission land, not all of which will have the same planting periods. It will always be the case that for some forests, two rotation periods will be involved whereas for others, only one will be involved. Almost any period could be chosen.”

48. The Minister was clear in evidence that this length of time was set as an upper threshold for the length of lease and that he or his successor may well be amenable to an amendment to the Bill that reflects this upper threshold. The Minister suggested that the Government could also be receptive to the idea of an upper threshold on the proportion of forestry commission land that could be leased at any one time to 25%.

49. At present the provision in section 47 of the Bill would enable both leasing and joint ventures but does not specifically refer to either policy intention. The specifics of the Government’s intended uses for the powers in section 47 are detailed in the Policy Memorandum. The Minister confirmed in evidence that the enabling nature of the existing provisions would not preclude amendments to the Bill to restrict the maximum length of the lease or the proportion of land leased. The Committee appreciates that in order to amend the Bill in these ways the express intention to lease land would need to be referred to on the face of the Bill. The Committee considers that having the policy intention explicitly referred to in the Bill would also aid Parliamentary scrutiny as it would aid members of Parliament seeking to lodge amendments on this matter.

50. **Should legislating for this policy in this Bill remain the Government’s position, the Committee recommends that the Bill be amended to cap the scope of the powers provided to reflect the specific policy proposal behind these powers. In doing so, the Committee recommends that the Bill be amended to make the distinction between provisions enabling joint ventures and**

---

provisions enabling the leasing proposal, as at present the same provision enables both proposals.

51. The Committee specifically recommends that an upper threshold on the length of the land lease should appear on the face of the Bill as should a maximum threshold for the proportion of land to be leased at any one time.

Community leasing

52. In the Minister’s opening statement Michael Russell noted that wide support has been given in consultation responses to the idea of leasing Forestry Commission Scotland land to communities as opposed to private interests. The Committee supports community leasing as a concept but understands that community leasing proposals could not necessarily be put on the face of the Bill perhaps without skewing the proposal to angle it towards potential benefits from community leasing that would mitigate climate change. It would seem more sensible to include provision for community leasing in future legislation which can take into account the social benefits and other environmental benefits stemming from community leasing.

53. The Committee recommends that the Scottish Government incorporates provisions to allow for community leasing in future legislation.

Joint ventures

54. All of the written submissions received supported the idea of the Forestry Commission Scotland entering into joint ventures with private companies for the development of sustainable energy such as wind farms and hydroelectric infrastructure. A lack of detail on the specifics of such proposals within accompanying documents was raised as an issue in a number of these submissions but the general principle of pursuing joint ventures for this purpose received wide support.

55. Members of the Committee explored the possibility of funds released from joint ventures being sufficient to remove the requirement for the leasing proposal considered above. Janice Cassidy from the SRPBA\(^\text{18}\) stated that—

“Our members’ view is that joint ventures would generate enough money without having to introduce leases, which would be complex and very long term. Our members felt that they did not receive sufficient information about the leases to back them as they stand. They thought that joint ventures would produce sufficient benefits.”

56. In response to the same line of questioning, specifically whether he accepted that the potential income stream from joint ventures would be

---

sufficient to meet the Government’s planting objectives, the Minister stated—

“I do not dispute it. Both possibilities are desirable, and the short-term imperative makes it necessary to do both. However, the situation is not certain. Much will depend on what happens with the renewables market, and much will depend on the Forestry Commission’s ability to enter into sustainable joint ventures. I do not dispute what you suggest, and I do not want to fall out with you about it.”

57. The Committee is well aware that the joint ventures proposals are not just intended to generate funding, they would have other benefits including allowing the Forestry Commission Scotland to take a more strategic overview and control of developments such as wind farms on Commission land.

58. The Committee is keen, given the wide support for this method of harnessing renewable energy, that the full potential for income from joint ventures should be explored. The Committee recommends that joint ventures be encouraged. However the Committee appreciates from the Minister’s evidence that there is an issue about the timing of funding generated, with joint ventures beginning to generate funds in 5 to 10 years as opposed to potentially £200m being generated within two years for the leasing proposal.

59. The Committee also appreciates that beyond requiring the powers in the Bill to be enacted to enable such joint ventures, receiving the relevant planning permission and meeting the environmental regulation criteria set out by SEPA is also a requirement for such renewable energy developments and this can be a time consuming and potentially unsuccessful process. There are therefore practical issues to be considered when estimating the likely potential income and timing of realising that income from joint ventures.

60. The Committee acknowledges that joint ventures may not generate the same level of funds as the leasing proposal, or generate funds to the same timescale. However given the notable support for the joint ventures policy the Committee recommends that, in considering alternative approaches to leasing, the Government should explore the full potential of encouraging and supporting the establishment of joint ventures schemes.

Power to modify functions of the Forestry Commissioners

61. Section 47, which enables both leasing and joint ventures, includes a subsection which provides Scottish Ministers with the power to modify

---

the functions of the Forestry Commissioners where they consider it expedient or necessary in meeting the targets set out in sections 1 to 3 that aim to mitigate the effects of climate change. To use this power would require subordinate legislation to be approved by Parliament under the affirmative procedure.

62. The Committee questioned in evidence whether this power could be used to remove over-arching duties imposed upon the Forestry Commissioners in other pieces of legislation, for example the duty to further the conservation of biodiversity in the exercise of their functions in the Nature Conservation (Scotland) Act 2004. The new Minister for Environment, Roseanna Cunningham MSP, provided written clarification on this issue following this session confirming that the Government does not consider that the duty in the Bill could override duties imposed in other legislation.

63. The Committee considers that there may be other legal interpretations of how widely this power could be used but appreciates that the Parliament will have the opportunity to scrutinise any Government proposals to use section 47 (2) within secondary legislation.

Waste reduction and recycling

64. The provisions on waste reduction and recycling are intended to contribute towards the Scottish Government’s zero waste policy. The Policy Memorandum says that zero waste is about—

“...reducing the unnecessary use of raw materials, sustainable design of products, preventing waste, and recovering value from products and materials when they reach the end of their lives through recycling, composting or energy recovery.”

65. The Government has capped the extent to which certain techniques can be used to contribute towards the achievement of zero waste. For example, no more than 25 per cent of municipal waste should be treated as energy-from-waste by 2025.

66. The Government expects that the amount of waste sent to landfill will reduce as a result of the policy levers currently in place. These levers are various voluntary agreements, for example, on reductions in packaging and in the use of plastic carrier bags, and fiscal measures such as the Landfill Tax accelerator. In addition, as noted in evidence to the Committee, the noticeable cultural shift towards practices such as recycling municipal waste and reusing carrier bags has aided efforts to reduce waste sent to landfill.

67. The Cabinet Secretary wrote to the Committee in response to a request for information on the likely timescale for subordinate legislation on each of the waste provisions. The response is annexed to this report. The Government anticipates that should any of the
measures in the Bill be implemented then this could increase the rate of reduction and therefore the Government could use all of the enabling powers in the Bill on waste reduction and recycling. However, when asked whether the Government would not use the provision on plastic carrier bag tax unless voluntary agreements did not work the Cabinet Secretary replied “That is fair comment. I would not expect to use the provisions if we achieved the same objective outwith legislative routes.”

68. The Scottish Government took the requirements of the EU Revised Waste Framework Directive into account when considering the waste provisions in the Bill. The Bill does not transpose the Directive (which must be transposed into domestic legislation by 12 December 2010). The Directive requires that all EU countries must recycle 50 per cent of their household waste and 70 per cent of construction and demolition waste by 2020. The Directive also re-iterates the waste hierarchy, which is a priority order for waste prevention and management legislation in member states. The hierarchy is a) prevention, b) preparing for re-use, c) recycling, d) other recovery e.g. energy recovery, and e) disposal.

Policy intention section by section

69. Section 52 would enable the Scottish Ministers to make provisions requiring certain persons to prepare plans for the prevention, reduction, management, recycling, use and disposal of waste produced by or otherwise associated with their activities. The Policy Memorandum cites the construction industry and general office-type businesses as being likely to be affected by this section.

70. Section 53 would enable Scottish Ministers to make regulations to require businesses and public bodies to provide information to SEPA about the waste that they produce. The cost to government and local authorities of providing this information is considered to be marginal. The Policy Memorandum states that ‘it will e difficult to move to a zero waste society without much better information.’

71. Sections 54 and 55 are intended, according to the Policy Memorandum, “to encourage recycling by providing people with opportunities to deposit waste for recycling when they are not home”. The Explanatory Notes state that section 54 could be used to require offices to have facilities to collect paper etc. Section 55 empowers local authorities to issue notices requiring organisers of temporary public events to provide recycling facilities. Both sections require the waste collected to be, as far as practicable, recycled.

72. Section 56 would give Scottish Ministers the power to set binding requirements on businesses and public bodies so that specified items procured or constructed by them must include or contain a certain amount or proportion of recyclate. The Financial Memorandum states that this provision is unlikely to add additional costs to government, public bodies or businesses because the type of materials likely to be
specified are traded widely, likely to be priced competitively and that the replacement of virgin materials with recycled ones is unlikely to increase costs.

73. Section 57 would give the Scottish Ministers powers to set binding targets for overall reductions in packaging. The Policy Memorandum states that the duty is likely to fall primarily on retailers but may also fall on those who supply packaged goods to retailers. There are a number of different ways of achieving a reduction in packaging and the Policy Memorandum suggests a number of them, including encouraging the use of refills, buying in bulk or supplying concentrated products.

74. Section 58 would give the Scottish Ministers powers to set up a statutory deposit and return scheme. The Financial Memorandum cites the experience in Denmark and Norway as an indicator of costs to bodies (other than for local authorities and government) individuals and businesses and estimates the costs at £15-20 million per annum. The Financial Memorandum states that costs would have to be recovered, for example, via deposit fees and the sale of recyclate. In addition, the Policy Memorandum states that any scheme may have financial benefits by reducing the amount of waste that local authorities are required to handle.

75. The purpose of section 59 is to reduce the number of carrier bags in circulation by making regulations about charging by sellers of goods for the supply of carrier bags and for requiring that the net proceeds of such charges be applied to environmental good causes. This is an area where there is already a voluntary agreement in place with many major retailers for carrier bag reduction initiatives. It is estimated that the cost of enforcement of regulations requiring charges would be in the region of £3.5 million per annum. Depending on the nature of the regulations, income is estimated at £8.14 million whilst publicity campaigns would cost in the region of £750,000.

76. The Bill also details the penalties which could be used in the enforcement of the waste provisions within subordinate legislation. These penalties are set out in section 61 of the Bill. Local authorities and SEPA could therefore incur costs if appointed as enforcement bodies.

Evidence taking
77. The Committee heard evidence from three panels of witnesses on the waste proposals. The panel on 28 January involved Professor Jim Baird, Glasgow Caledonian University; Pauline Hinchion, Chief Executive, Community Recycling Network Scotland; Susan Love, Policy Manager, Federation of Small Businesses in Scotland; and Dirk
Hazell, Chief Executive, Scottish Environmental Services Association\textsuperscript{20}.

78. A further panel on 4 February involved John Ferguson, Unit Manager, Sustainable Energy and Resources, SEPA; Iain Gulland, Director, WRAP Scotland; Dr Colin Clark, Head of Waste Management, COSLA\textsuperscript{21}. This panel was immediately followed by evidence from Richard Lochhead MSP, Cabinet Secretary for Rural Affairs and Environment and his accompanying officials Kim Fellows, Deputy Director for Waste and Pollution Reduction, Louise Miller, Solicitor, Food and Environment Division, Kevin Philpott, Waste Regulator Senior Policy Officer, and Simon Stockwell, Waste Strategy Team Leader, Scottish Government\textsuperscript{22}.

\textit{Issues emerging from evidence taking}

Zero waste

79. The Committee discussed whether zero waste was achievable during both of its evidence sessions on the waste reduction and recycling provisions. All witnesses agreed that zero waste was desirable and a number of witnesses noted that there were encouraging statistics emerging to suggest that in the future it may be achievable. For example, Iain Gulland, WRAP Scotland\textsuperscript{23}, stated that “there is growing evidence that more than 90 per cent of what is in the waste stream can be recycled.” The Cabinet Secretary acknowledged the ambitious nature of the target in evidence stating that “a zero-waste policy is an ambitious policy. It is also an aspiration.”

80. It would appear to the Committee, from representations made to it and in response to the Scottish Government’s zero waste consultation, that stakeholders do not contest that the policy directions set out within sections 52 to 61 of the Bill will contribute towards achieving zero waste, with the possible exception of the proposal on carrier bags in section 59. To what extent these policies contribute to achieving this depends upon the progress made under voluntary agreements, the timing and approach to using the powers in the Bill, and if need be their effective enforcement.

Infrastructure

81. One of the main barriers to making good progress towards zero waste highlighted to the Committee was a lack of infrastructure, particularly

\textsuperscript{23} Scottish Parliament Rural Affairs and Environment Committee. \textit{Official Report}, 4 February 2009,
for use by small to medium sized businesses. Susan Love, FSB, stated that—

“The FSB has been involved in the issue of recycling waste for several years, investigating possible further options for small and medium sized businesses, but we keep coming back to the same problem that there are no facilities for SMEs to use...it will not be remotely possible to implement many of the bill’s measures unless we make progress with facilities.”

82. Dirk Hazell, SESA, noted that, irrespective of the aspiration to achieve zero waste, there is an issue with meeting existing targets—

“...there is nowhere near enough waste infrastructure anywhere in the United Kingdom to comply with existing European obligations. We need to accelerate our transition from a disposal to a recycling society but to do so requires more infrastructure.”

83. John Ferguson, SEPA, also noted the need for improvements in existing infrastructure and entirely new developments but noted that the rate at which infrastructure will require to be developed to meet the various Government targets will be a “challenge to the planning system”.

Carrier bags

84. This Committee has received numerous written submissions opposing the policy behind this section of the Bill. This opposition is in large part based on evidence to suggest that proceeding with this policy may not necessarily deliver the intended environmental benefits. A similar proposal was considered by the Environment and Rural Development Committee in Session 2 during its scrutiny of the Member’s Bill introduced by Mike Pringle MSP entitled the Environmental Levy on Plastic Bags (Scotland) Bill. That Committee noted that “the net environmental impact of the proposed levy is an issue of considerable dispute in a range of areas”. The conclusion section of its Stage 1 report reflected the complexity of the issues raised by the Bill (reproduced at annexe A). The report’s final conclusion was as follows—

“The Committee reiterates its support for the Bill’s stated objectives. To achieve these objectives, the Committee urges the Executive to include ambitious measures to address plastic bag use in its waste prevention strategy. The Committee is not persuaded that the levy as currently proposed in this Bill is an effective means to achieve

these objectives. The Committee, therefore, recommends that the Parliament does not agree to the general principles of the Bill.”

85. Following publication of the Stage 1 report the Bill was withdrawn by the Member. The Committee appreciates that there has been movement on this issue since the publication of the report in 2006, through the voluntary agreement with retailers and also by the cultural shift amongst the public towards bringing reusable bags to shops with them instead of using carrier bags once. However the considerable scrutiny undertaken by the previous committee should be used as a valuable assessment of the issue and this Committee draws the contents of the Stage 1 report to the attention of the lead committee on this basis.

Current market conditions

86. A number of witnesses explored the idea of the current market downturn representing an opportunity to develop certain waste based markets in Scotland. For example Iain Gulland, WRAP\(^\text{27}\), noted that—

“When I met people seven months ago to talk about market development, they were interested in this country but, as long as the Chinese were paying high prices, materials were going straight from local authorities, through brokers, to the far east. It was difficult for Scottish industries to gain a foothold in the marketplace, because they could not compete. Now the markets are depressed and the Chinese are no longer offering the same prices—so there is a great opportunity for us to build an industry in Scotland for the future.”

Non-municipal waste

87. A clear theme arising from evidence taking was the need for commercial and industrial waste to be subject to the same legislative requirements as municipal waste. For this reason the provisions in the Bill requiring businesses and public bodies to provide information to SEPA about the waste that they produce were very much welcomed as measuring the extent of the problem was seen as the first step to addressing it.

88. SEPA and WRAP went further than the Bill’s existing provisions suggesting that commercial and industrial waste, such as biomass, should be banned from being sent to landfill. Dr Clark from COSLA\(^\text{28}\) noted the anomaly between the requirements for the limitation of municipal waste sent to landfill and commercial and industrial waste stating—

“A huge rump of commercial waste just gets landfilled. It is outwith the context of the landfill directive, but if I landfill it, I am subject to that directive...The municipal waste data are excellent, because the concentration has been on municipal waste, of which there is less than 4 million tonnes in Scotland. Commercial and industrial waste has been left to blow in the wind, frankly.”

**Definition of recycling**

89. Dirk Hazell, SESA, suggested in evidence that the definition of “recycling” adopted in the Bill differs from that specified in the Directive as the Bill definition includes forms of re-use and other processes that the Revised Waste Framework Directive does not define as recycling. Mr Hazell suggested that this definition makes the targets easier to achieve. In response to this criticism the Cabinet Secretary clarified in a letter to the Committee that the basis for the definition of recycling being used as more of an umbrella term under the Bill was for drafting purposes. The Committee notes both sides of this argument and considers that the key point is that Government policy direction under the Bill, including those outlined within subordinate legislation should always seek to align with the waste hierarchy as set out in the Revised Waste Framework Directive.

**Social and economic factors**

90. Some unintended consequences of prioritising lowering carbon emissions, including in remote and rural areas, were highlighted to the Committee. Pauline Hinchion CRNS29 gave the following example—

“We have members in Shetland who collect, recycle and reprocess glass into really nice glass awards. Theirs is a small business, but Shetland is a small place and they do great work. Under the bill, it would probably be better for the climate if they just put the glass on to a ship and sent it down to Alloa to be processed. We have to be careful that the powers do not become too instrumental and that some of the other factors that may have to be taken into consideration are not ignored.”

**Deposit and return and kerbside collection**

91. Dirk Hazell, SESA, suggested that the establishment of deposit and return schemes could detract from local authority efforts to establish kerbside collection and may be confusing for the public who have only recently adapted to this form of collection. Members of the Committee appreciated this point but suggested that in remote and rural areas of Scotland, and in certain forms of accommodation such as tenements, there was no scope for kerbside collection.

---

92. Pauline Hinchion, CRNS, suggested that there would be carbon emissions from people driving to central points to return packaging or bottles for reuse, although it was also noted that these sites are usually near supermarkets or other large outlets in an attempt to ensure that people can return items when on journeys to undertake other tasks.

93. The Committee considers that the two processes have merit and that if recycling and reuse rates are to increase the public should ideally have both options at their disposal. It would be undesirable for the establishment of one process to hamper the functioning of the other.

94. Dirk Hazell\(^{30}\) also noted an underlying issue, namely that ways of establishing what the most sustainable method of reducing or recycling waste is central to ensuring that the correct practices are adopted by the public, local authorities and businesses alike—

“The Organisation for Economic Co-Operation and Development...tried to get internationally agreed measures of sustainable conduct...We need robust international—or European at least—agreed measurements of sustainability. That which would make this sort of bill much easier to implement.”

95. Pauline Hinchion\(^{31}\) added that—

“...the issue is how we ensure that we measure in the same way and are not comparing apples with pears. There are therefore problems around data quality, the type of data that are collected and, more important, how we measure data—I think that that was Dirk Hazell’s point. Instead of everybody using their own carbon accounting tool we must get agreement on how we measure data.”

96. The Committee notes the importance of establishing a standard approach to measuring carbon and then producing standard indicators as to what extent different practices are sustainable so that the public can make informed choices about whether to re-use or recycle. Recycling or reuse schemes should be as clear and accessible as possible for the public.

**Packaging**

97. As noted above, the first measure listed in the Waste Directive hierarchy for waste management is prevention. The discussion during the evidence session on 28 January acknowledged that whilst preventing waste by minimising packaging was desirable, without the necessary packaging products such as food can become damaged and become unnecessary waste. For example, Pauline Hinchion suggested that Tesco’s spoilage rate for food that had no packaging was in the

---

region of 30% and that this waste then produces methane gas which contributes to greenhouse emissions.

98. The Committee also heard evidence that progress was being made towards reducing the amount of unnecessary packaging and consideration was being given to the most sustainable types of packaging to be used by producers and retailers. The Committee also heard of the Courtauld commitment, a voluntary agreement between WRAP and major UK grocery organisations which in 2008 has led to zero growth in packaging despite increases in sales and population.

Anaerobic digestion

99. Anaerobic digestion is a managed biological process in which biodegradable waste is broken down by naturally occurring microorganisms. This process can be used to treat waste, including food waste. The process produces biogas and this, in turn, can be used to generate energy. Other outputs from anaerobic digestion are fibre which can be used as a soil conditioner and liquor which can be used as a liquid fertiliser.

100. In his statement to Parliament on 24 January 2008 the Cabinet Secretary stated that—

“We are proposing that, by 2025, no more than a quarter of municipal waste...should be treated by energy-from-waste plants. Of course, the cap of one quarter will include anaerobic digestion, if it is used to treat mixed waste.”

101. The Committee would appreciate further information from the Cabinet Secretary as to how food waste will contribute to the targets for recycling and composting and whether energy from food waste will be counted as contributing towards the cap on energy-from-waste.

Conclusions on waste

102. The Committee recommends to the lead committee that, in taking forward the waste reduction and recycling provisions in an effort to achieve zero waste, the Scottish Government should have regard to the following—

- the urgent need to focus on reducing commercial and industrial waste being sent to landfill;

- the need to address the lack of infrastructure available to implement the policy intentions in the Bill;

- the need to consider issues raised by the Environment and Rural Development Committee in Session 2 on charging by sellers of goods for the supply of carrier bags;
the opportunity that current international market conditions could present for Scottish market development;

the need to ensure measures undertaken are in accordance with both the Government’s definition of ‘recycling’ and with the waste hierarchy set out in the Waste Framework Directive;

the benefits of the Government endorsing one method of measuring ‘carbon footprints’ and to establish criteria based on this reflecting which practice is more sustainable than another; and

the need to take into account any potential negative impact on social and economic factors, including in remote and rural areas, of aiming towards ambitious targets to reduce carbon emissions.

Potential stage 2 amendments

103. The Committee requested supplementary written information from the Cabinet Secretary on amendments to the waste provisions that the Government is already aware of. The Cabinet Secretary’s response, annexed to this report, details amendments focusing on the deposit and return scheme. Specifically, the Government will be proposing amendments to allow for the establishment of a new body to co-ordinate or perform a “clearing-house” function, levying deposits and such like. The Committee thanks the Cabinet Secretary for his informative response and notes that there may be considerable cost attached to the establishment of this new organisation.

104. The Committee recommends that the Scottish Government should provide specific costed proposals for such an organisation to Parliament well in advance of the relevant instrument of subordinate legislation being laid to afford the relevant committee the opportunity to fully scrutinise the proposals.

Muirburn

105. Muirburn is a mainly upland land management technique, and is the act of controlled burning of vegetation on open, treeless, semi-natural habitats (including muir or moorland) and involves the burning of gorse, heather and grass to stimulate new growth. Dates on which muirburn can take place are set down in statute (the Hill Farming Act 1946). The provisions in the Bill allow Scottish Ministers to amend, by subordinate legislation, these dates to adapt to the effects of climate change as there is concern that, given changing weather patterns and rising temperatures, the ecology of these areas could now be compromised by burning within the currently permitted limits.

Themes arising from evidence
106. The Scottish Government’s analysis of consultation responses on provisions relating to muirburn dates found that, of the 56 responses 28 agreed with the proposed power (6 of which qualified this answer). Conversely 24 of the responses did not agree and the majority considered there was a lack of evidence to suggest that such a power was needed, and were concerned that the overall length of the burning season could change. The area of consensus as far as there was one appeared to be that any changes to the permitted dates should be based on a rigorous evidence base.

107. The Committee incorporated a discussion on the muirburn provision into its roundtable discussion and into its evidence session with the Minister on 11 February. The SRPBA\textsuperscript{32} commented during the discussion that its members had been anxious about supporting the proposal because it was unclear how the new power would be used stating that “[our members] felt that they were given insufficient information to make an informed decision about any changes to the dates”.

108. The Minister suggested that he had been surprised by the opposition expressed in some of the responses to the muirburn consultation and considered that the lack of detail in the Bill may have led to some overly cautious responses. He assured the Committee that the power would not be used without full consultation with stakeholders and the power would only be used in such a way so as to allow muirburn practices to adapt to the impact of climate change.

109. The Committee appreciates the Minister’s reassurances that the Government will actively consult with all key stakeholders at an early stage in its deliberations on how to use this power.

Conclusions

110. The Committee wishes to highlight the above issues to the lead Committee, for raising with the Minister for Transport, Infrastructure and Climate Change and/or incorporating into its Stage 1 report as its members see fit:

- concerns with the level of detail available in the Bill and accompanying documents for certain proposals; the inclusion of important proposals within subordinate legislation only (which impacts on the potential for full parliamentary scrutiny); and concerns with the timing of some of the consultations for the Bill’s provisions;
- the negative reception from stakeholder groups that the provisions on leasing Forestry Commission Scotland land to release capital has received and the Committee’s recommendations in

\textsuperscript{32} Scottish Parliament Rural Affairs and Environment Committee. \textit{Official Report, 11 February 2009, Col 1444}
response to this - including potential amendments to the Bill should the leasing proposal remain on the face of it; and

- the likely challenges faced by the Government, local authorities and others in implementing the waste reduction and recycling provisions in an effort to eventually achieve the zero waste target including insufficient infrastructure.
Conclusions of the Environment and Rural Development Committee’s supplementary Stage 1 report on the Environmental Levy on Plastic Bags (Scotland) Bill (2006, Session 2)

The Committee stated in its previous report that it wishes to see firm action to tackle resource use and waste management issues. Mike Pringle’s Bill has been valuable in raising awareness of the issues and provoking debate about how environmental benefits and culture change in resource use can be achieved. The Committee very much welcomes that and wants to see that important debate continue and develop.

The likely extent to which plastic bag use may be reduced by a levy (estimates of approximately 90% were given in evidence) does make it a potentially powerful tool. Putting a value on an item can change people’s behaviour and, in at least some instances, there is a place for statutory regulation being used to achieve that. A levy does have the potential to reach virtually every citizen immediately and could cause them to reconsider their resource use decisions. The Committee is, therefore, sympathetic to the aims of the Bill and considers that positive steps are required to achieve these aims.

However, as the Committee stated in its previous report, the evidence it has considered has made it clear that there are a number of complex interacting implications of a levy which make it very difficult to judge whether this particular levy scheme is an appropriate one that will achieve its desired effect.

The Committee welcomes the clarification from HM Treasury (supplied by the Minister in his further evidence) on the application of VAT to the levy. This removes some of the confusion around the administration of a levy.

However, after considering the further evidence received, the Committee remains of the view that there are a number of unintended consequences that appear likely to be connected with using the proposed levy to achieve a large reduction in the number of single-use plastic bags issued at checkouts. The net environmental impact of the proposed levy is an issue of considerable dispute in a range of areas.

The Committee considers that it remains impossible to be definitive about the likely environmental impact of the Bill and the arguments about whether this will be a net positive benefit are very finely balanced. The Committee considers that, on its own, the Bill cannot achieve the obvious and unequivocal benefits that it intends.

While the Committee previously noted that the Executive did not take a formal position on the Bill, at that time it welcomed the Minister’s statement that he
had an open mind on the potential inclusion of a range of measures to reduce bag use in the proposed waste prevention strategy.

However, having considered the further evidence, the Committee maintains its belief that a levy which focuses on one relatively small area of resource use has the best prospect of real success and real net environmental gain if it is integrated within a comprehensive package of measures. That would ensure that public education messages associated with the levy were clear and consistent with those accompanying other waste initiatives. It would also give the best prospect of any unintended consequences or contradictory effects being ironed out.

The Committee also notes that the debate has moved on over the period that the Bill has been under consideration. Some supermarket groups have introduced customer incentives and other schemes to reduce plastic bag use. Integration of the aims of the Bill into a wider waste prevention strategy by the Executive would encourage further development of such initiatives throughout the retail industry. It would also help to ensure that the management of plastic waste is developed comprehensively in accordance with the waste hierarchy (reduce, reuse, recycle).

The Committee notes that the final waste prevention strategy has not yet been published. However, the Committee is disappointed that the Executive has not, to date, responded more robustly to its request to consider integrating the aims of the Bill into its strategy. The Committee considers that a levy has most potential as part of a strategy, and considers that the Executive has the power to promote measures which would achieve the impact of the Bill without the unintended consequences.

The Committee reiterates its support for the Bill’s stated objectives. To achieve these objectives, the Committee urges the Executive to include ambitious measures to address plastic bag use in its waste prevention strategy. The Committee is not persuaded that the levy as currently proposed in this Bill is an effective means to achieve these objectives. The Committee, therefore, recommends that the Parliament does not agree to the general principles of the Bill.
ANNEXE B: ORAL AND ASSOCIATED WRITTEN EVIDENCE, AND EXTRACTS FROM THE MINUTES

28 January 2009 (3rd meeting, Session 3 (2009))

John Scott (Deputy Convener)      Bill Wilson

Apologies were received from Karen Gillon.

The meeting opened at 10.02 am.

**Climate Change (Scotland) Bill:** The Committee took evidence on the Bill at Stage 1 from—

Professor Jim Baird, Glasgow Caledonian University;

Pauline Hinchion, Chief Executive, Community Recycling Network Scotland;

Susan Love, Policy Manager, Federation of Small Businesses in Scotland;

Dirk Hazell, Chief Executive, Scottish Environmental Services Association.

**Climate Change (Scotland) Bill (in private):** The Committee reviewed the evidence heard earlier in the meeting.
SUBMISSION FROM CRNS

1. Introduction

The Community Recycling Network for Scotland (CRNS) was established in 2004 to provide support and information for community led organisations involved in recycling, reuse, composting, reduction and waste education activities.

The CRNS is a membership body for community recycling organisations throughout Scotland. We provide information, advice and support to both existing and emerging community recyclers.

Mission Statement

The CRNS exists to build a stronger community recycling sector in Scotland which can create real social, environmental and economic benefit within our local communities.

Values

These are the underlying principles that guide the work of the CRNS) The CRNS is:

• Committed to the principles of Zero Waste and sustainable development.
• Committed to and directly accountable to the Membership.
• Committed to local communities delivering local recycling solutions.
• Committed to carrying out all of its activities with trust, integrity and openness.
• Committed to social and environmental justice.

Objectives

Our current objectives are:

• To build more robust organisations
• To assist the sector to maximise the recycling, reuse, composting and waste prevention opportunities available to it
• To provide networking opportunities and information exchange to allow the sharing of best practice
• To represent and raise the profile of the sector
• To provide an accessible portal and range of advice to sustainable communities on recycling opportunities
• To improve Membership services and benefits

Impact of Sector

The size and impact of the community recycling sector in Scotland was mapped by the CRNS in 2006. The mapping study found that there were;

• diverted almost 73,000 tonnes of materials from landfill
• had a turnover in excess of £26 million
• employs 1,100 full time equivalent staff
• offers over 950 training places and over 3,200 volunteering opportunities
• helps over 68,000 people

2. Overview
The CRNS welcomes the opportunity to respond to the consultation document. Our response focuses not only on answering the questions posed by the Scottish Government in the consultation, but also an overview of the impact that any proposed legislation may have on the community recycling sector as well as some of the opportunities that the proposed legislation presents.

We have assumed that the proposals that have been included in the consultation have been set out because the progress in these areas has not happened to date through market forces, voluntary codes and other guidance and therefore the role of legislation in driving these issues forward needs to be further investigated.

It is also interesting to note the impact that the publication of the consultation has already had with some of the major supermarkets announcing more robust waste prevention plans as well as trials of reverse vending systems.

As you are aware, the CRNS is fully committed to the goal of Zero Waste. The Zero Waste philosophy focuses on the redesigning of our one-way industrial system into a circular system, similar to the successful strategies found in nature where waste becomes an asset rather than a liability. Products that cannot will simply be designed out of the system (prevented). Waste would then cease to exist in its current form and the waste management industry would be replaced by a resource re-utilisation sector led by empowered community organisations that would realise the value of the assets flowing through their communities for local economic and social gain. This is surely a fundamental part of sustainability in the truest sense.

Zero Waste should therefore not only be seen as a function of waste management, but as a new economic system for Scotland with all policies and strategies coming from the Scottish Government benchmarked against whether they move us towards and away from a Zero Waste society. The CRNS would therefore like the legislation to reflect the fact that it will be part of the solution on the journey towards a Zero Waste society within the Zero Waste philosophy as outlined above.

In support of these principals the CRNS has responded to the questions in the consultation as requested in an attempt to shape waste policy in the direction of sustainability which embraces social and economic goals as much as environmental ones and seeks to address waste as a resource which when managed locally can lead to a positive impact on communities and the environment.

3. Responses to the Consultation Questions
3.1 Proposal 1: Duties on public bodies and businesses to provide recycling facilities

Proposal
To further encourage recycling by giving a power to the Scottish Government to make regulations which would impose duties on public sector bodies and businesses to provide recycling facilities for customers, staff and, where appropriate, members of the public. The regulations would specify which bodies and businesses were to be subject to this duty and the nature of the recycling facilities that would be required.

Response to questions
1. Do you consider that legislation should be made in this area?
2. If so, what form should that legislation take?

Comments
Of the options outlined the CRNS would propose Option 1

Given that over 80% of waste arisings are from commercial and industrial sources and that targets are going to be increasingly hard to meet, it is no longer the time for the commercial sector to be given the option of a voluntary Code of Practice. The CRNS believes that recycling, reuse and composting should be obligatory particularly where the services and infrastructure are available.

The criteria for determining which bodies and businesses would be subject to this legislation needs to be very clear. Factors to consider should include number of staff, customers, members of the public that access the bodies or business, the amount of waste they currently generate etc.

Where appropriate and depending on the size and nature of these bodies and businesses they should be required to have onsite composting.

In addition steps should be taken to move from a volume/frequency of collection charging system to a weight based charging system to allow direct cost savings to be made through waste prevention. Furthermore the cost of collecting residual waste for disposal should be much higher than the cost to collect recyclates.

These bodies and businesses also need to have access to guidance, support and resources to help them minimise their waste (see Proposal 4 Waste Prevention Plans) This may be delivered through existing bodies including the Scottish Waste Awareness Group, Envirowise, the Business Environment Partnership and Scottish Enterprise.

The Scottish Government should also give consideration as to whether this legislation could be broader to include wider measures to reduce the carbon footprint and climate change impact including energy use, water and utility use and transport.

This also links to Proposal 6 about mandatory waste data returns

3.2 Proposal 2: Packaging
Proposal
To encourage waste prevention by giving powers to the Scottish Government to make regulations on packaging which would set statutory targets on retailers for packaging reductions. Response to questions
1. Do you consider that legislation should be made in this area?
2. If so, what form should that legislation take?
Comments
Of the options outlined the CRNS would opt for Option 1
There are already challenging targets within existing packaging legislation and the work being undertaken by WRAP and the major retailers and supermarkets through the Courthald Commitment has seen some significant progress made in this areas.
In addition the work of packaging compliance schemes such as Valpak are also making good progress in this area, including raising awareness amongst consumers and the public about the role of packaging and the progress that has been made to date.
There is a need to encourage further lightweight and best in class approaches across a wider range of packaging as well as increasing the amounts of recycled materials in packaging and greater levels of reusable packaging in particular in the transit and secondary packaging areas.
Could also investigate the possibility of variable VAT rates for materials with greater levels of recycled content and where reusability I recyclability is linked to VAT rates.
3.3 Proposal 3: Specifying recyclate
Proposal
To encourage recycling by taking powers to enable the Scottish Government to place a duty on public bodies and businesses to specify a minimum percentage of material made from recyclate in procurement contracts.
Response to questions
1. Do you consider that legislation should be made in this area?
2. If so, what form should that legislation take?
Comments
Of the outlined options the CRNS would propose Option 3
Page 6 of 14 Community Recycling Network for Scotland
Response to Proposed Legislation on Zero Waste — October 2008
3.4 Proposal 4: Waste Prevention Plans Proposal
To encourage waste prevention and recycling by taking powers to enable the Scottish Government to place a duty on public bodies and businesses to have waste prevention plans. Response to questions
1. Do you consider that legislation should be made in this area?
2. If so, what form should that legislation take?
3. What public bodies and businesses should be covered?

Comments

Of the options proposed the CRNS would opt for Option 1

Substantial quantities of organic waste could be diverted from the waste stream if appropriate incentives are put in place to encourage public and commercial organisations to compost garden and food waste on site or have their compostable waste collected, if a collection service exists in their area. This is particularly important for hospitals, offices with canteens, schools or hotels generating large quantities of food waste, and equally important, in terms of reducing carbon emissions, for the hospitality industry in remote, rural locations of Scotland.

Obviously this could not be made obligatory at this stage as organic waste collections do not exist in many areas and not all commercial and public sector premises have the suitable space for on-site composting. On-site composting could range from one or two home composters or green cones to small-scale in vessel composters depending on the size and type of organisation. In vessel composting on site is a labour intensive process which needs significant staff time especially in the start-up phase. As the regulations stand the site would also have to have room for the use of the finished compost unless they have the compost (reduced in volume) uplifted as a waste product.

As outlined in the CRNS response to the Better Waste Regulation Consultation in June 2007, there is an urgent need for the current Waste Management Licensing Regulations to be amended to allow non-household premises to compost their own meat-included food waste on site under an exemption or low level permit as currently a Full Waste Management Licence and a Certificate of Technical Competence is required, costing £3348 in Year 1 and £2073 per annum thereafter, plus on average £2500 for a COTC. At present meat-excluded waste can be composted under an exemption by these premises but the segregation of the meat component from the food waste stream discourages participation and reduces the amount of waste that can be diverted.

If the CRNS goes ahead with the Compost Doctors Programme trained community sector employees will be able to assist a number of public and commercial sector Organisations each year in selling up their on site composting operations.

Promotion of the benefits of on-site composting including potential cost savings and where to find information need to be promoted to the public and private sectors. Incentives to compost on site could include the waiving of VAT on composters, extending the current Big Hanna type government type deals such as reduced price in-vessel composters to companies purchasing them via LA (this has the advantage of LA’s recording what companies are using the deals and targeting training or expertise to those companies to make sure they are doing the work. This would also link to Proposal 6 about
mandatory waste data returns) Alternatively offering direct discounts subsidised by the government (such as have been offered through WRAP to householders).

In terms of the bodies and businesses the criteria for identifying them should be very clear but should include the tonnage of materials generated by these bodies and businesses and the extend to which they

All Scottish Local Authorities and non-governmental departmental bodies should be required to have a Waste Prevention Plan. However, rather than targeting individual companies perhaps make encourage industry bodies to have waste prevent plans in place for their industry. Not only would this take some of the pressure from small companies to undertake them but it would allow for smaller resources to be directed towards these bodies to roll out initiatives. Initially those bodies which could have the biggest impact such as the Tourism Industry should be targeted firstly perhaps rolling out to other industry bodies in the longer term. As per comments on Proposal 1 existing organisations should be further resourced and partnered with those bodies to develop Waste Prevention Plans in addition these could be linked to wider sustainability/climate change/carbon footprint action plans. Finally, it would allow for an industry wide waste data returns system which might see better data returned.

3.5 Proposal 5: Deposit and Return
Proposal
To encourage recycling and reuse by taking powers to enable the Scottish Government to introduce deposit and return systems.
Response to questions
1. Do you consider that legislation should be made in this area?
2. If so, what form should that legislation take?
3. Your views on the practicalities of such schemes in Scotland?
Comments
Of the three options outlined I prefer Option 1

3.6 Proposal 6: Mandatory Waste Data Returns from Business
Proposal
To ensure more effective planning and policy making on commercial and industrial waste by taking powers to make regulations requiring businesses to send waste data returns to SEPA. Responses to questions
1. Do you consider that legislation should be made in this area?
2. If so, what form should that legislation take?
3. Do you have any views on the kind of businesses to be covered?
Comments

Of the three options outlined the CRNS opts for Option I although criteria for choosing businesses should be based on more than just size and should relate to amount of waste generated. Consideration should also be given to undertaking this action in the short to medium term on an industry body basis as outlined in proposal 4 comments above which might improve the quality of data returns.

Any mandatory waste data returns should be rolled out in such a way that it is linked to environmental risk and volume of waste. As such it should be based on amount of waste specific businesses generate in particular hazardous waste and bio-degradable/organic waste.

The collection of data is crucial but any systems introduced need to ensure they are not too onerous on businesses, especially if an individual business approach is adopted as against a industry body approach. If so a simplified version of the Waste Data Flow system should be used bearing in mind that a lot of these companies are not waste management companies so support must be available from SEPA/Government to assist initially in completing a data flow, perhaps having an online support resource.

Perhaps we should also focus on the quality and quantity of waste data that is currently collected and ensuring that this is good data by requiring waste management companies to provide more details to businesses and to government/SEPA about the quantities and types of materials that they collect.

3.7 Proposal 7: Other measures to encourage waste prevention, including action on single-use carrier bags

Proposal

The Scottish Government would also welcome other ideas on legislation which could help to prevent waste.

Responses to questions

1. Do you consider that legislation should be made in this area?
2. If so, which areas should these powers cover?
3. Are there are any other areas, not covered by this consultation, where legislation could be made to increase recycling and promote waste prevention?

Comments

The CRNS would like to suggest a tax on high-impact products such as bottled water in plastic bottles and more public awareness raising on the impact of such products and their waste materials (especially in areas of tourism, as raised at the Cairngorms Forum).

Single use carrier bags — the current definition is not clear as to what these bags are as many products/consumer goods come in single use carrier bags (potatoes, toilet roll etc.) and therefore any definition has to be extremely clear.
Landfill Bans—the Government may want to consider banning certain products/goods from landfill particularly focusing on those products/materials that either has a market value or has a recycling or reprocessing route. Again any definitions used need to be very clear in order that there is minimal room for interpretation. Furniture should be banned from landfill as should clothes, textiles and all wood/wood derived products.

Variable VAT on environmentally/recycling friendly products and packaging

CRNS
October 2008
SUBMISSION FROM FSB

Introduction

The Federation of Small Businesses is Scotland’s largest direct-member business organisation, representing around 20,000 members. The FSB campaigns for an economic and social environment which allows small businesses to prosper.

FSB Scotland has consistently highlighted the need for the Scottish Government to examine how waste disposal options for small businesses can be expanded, to allow Scotland and business to benefit from the opportunities offered by increased business recycling.

We recognise the role that business must play in achieving a more sustainable Scotland and we believe that small businesses have demonstrated their commitment to this in recent years; however small businesses require support to change, particularly in the current financial climate. While we support the government’s aim to take action in relation to improving business (including public sector) recycling, we strongly believe that offering carrots, instead of, or in addition to, sticks would be a more beneficial way to progress.

Small Businesses and the Environment

We have always been happy to share data on environmental performance of small businesses with the Scottish Government. We previously carried out a membership survey on waste disposal in late 2004. At that time we learned that 43% of our members recycled some waste. The majority did not have hazardous waste streams, mainly disposing of paper, cardboard, and food waste (similar to household waste). Most businesses had their waste collected by their local authority.

Recent survey work with FSB members suggests that Scottish businesses have made progress and have a commitment to environmental improvement. Initial data (not yet published) shows that 40% of our members have changed the operation of their business as a result of climate change.

In examining the most important catalyst for future improvements, the main factor cited was a general concern for the environment — fines and penalties were less important as motivation for change.

Data gathered in early 2008 for the biennial FSB membership survey. Data referred to is based on 708 Scottish responses.

Waste

This recent data also shows that 84% of small businesses are now recycling some of their waste — a substantial improvement on the 2004 survey data. Responses also underline the ongoing importance of local authorities in small business waste disposal in Scotland, particularly when compared with other areas of the UK. The majority see local authorities as the main source of advice on environmental legislation and Scottish respondents are most likely in the UK to recognise that their local authority offered business kerbside recycling at a charge. 63% and 68% report that they use local authority facilities to recycle cardboard and paper respectively.
We remain concerned that some of the persistent problems relating to recycling are still a factor. Many businesses still feel that no facilities are available for recycling (21% felt no recycling was available for catering waste for example) and cost was cited as the main barrier in waste disposal. Overall only 43% were satisfied with the level of recycling offered by their local authority, perhaps suggesting a frustration at current limitations.

**Moving Forward**

We believe that evidence from our members shows that progress has been made in improving recycling amongst small businesses, as well as strong indications of support for environmental improvement. The fact that we have made such dramatic progress suggests that a legislative approach is not the right way to improve and risks alienating the goodwill that clearly exists in the small business community.

Yet again we see evidence of the key role played by local authorities in waste disposal for small businesses in Scotland. We understand the concerns of local authorities regarding pressure of landfill targets but we reiterate our view that developing recycling services and facilities for local businesses would help increase valuable recyclate collected by local authorities and reduce the small business contribution to municipal landfill. We are pleased that many local authorities have made progress in recent years but this issue cannot be ignored and local authorities must recognise this if we are to make progress as a nation.

In considering the evidence we are concerned that the Scottish Government should not proceed with plans to force all businesses to recycle, or offer facilities to do so to their customers, until cost-effective, facilities are in place to cope with increased demand. We do not believe that appropriate infrastructure or services exist at present.

If the Scottish Government wishes to set specific standards for parts of the public sector — and the evidence for facilities at certain public amenities is convincing - then small businesses should be specifically exempted at this stage. In the main this is because a large number of small businesses are not customer-facing (i.e. not shops or cafes open to public) and have hardly any employees (93% of all businesses have less than 10 employees). Therefore, legislation aimed at providing facilities for employees and customers would unfairly impact on the majority of small businesses.

Finally, we are disappointed that the consultation paper lacks detailed proposals, particularly since these proposals are likely to feature in primary legislation. The consultation paper is well structured and ambitions for legislation are clear but we reiterate our opposition to vague, enabling’ legislation. Some of the measures proposed have the potential to affect anywhere between a number of prescribed public sector premises, to tens of thousands of businesses. Clearly there is a vast difference in the cost and practicality of such extremes. To proceed to primary legislation without options which have been subjected to an effective business impact assessment would be both unwise and contrary to the Scottish Government’s support for the principles of better regulation. As a first step, when citing examples from other EU member states, the Scottish Government should, as a matter of course,
also obtain relevant impact assessment information from the member state (down to costs per business, where available) to inform discussion of the practicalities and costs of such options.

Questions

PROPOSAL 1: DUTIES ON PUBLIC BODIES AND BUSINESSES TO PROVIDE RECYCLING FACILITIES

As outlined above, we do not believe the case has been made to place a duty on small businesses to offer facilities to customers and staff. Such a duty imposed on businesses would likely impact on the majority when in fact it aims to provide facilities in some specific locations and premises as an obvious first step to improving availability of recycling facilities. This is not a sound basis on which to impose a cost on businesses and we therefore welcome the reference to only applying this duty to units over a certain size.

If such a duty is placed on public bodies (particularly local authorities), we hope this might build capacity by encouraging greater thought about the availability of uplifts and facilities for recycling which could also be used, at a later stage, for small businesses.

PROPOSAL 2: PACKAGING

There is little doubt that there is a growing public mood against excessive packaging. The problem lies in identifying those with influence and responsibility to reduce packaging — most small businesses have no clout whatsoever in terms of supply chain pressure.

The suggestions for legislation tend to suggest that retailers will be expected to provide a lot of paperwork on excess packaging when they are not the main source of the problem. We cannot see what will be gained by placing a further reporting burden on small retailers.

PROPOSAL 3: SPECIFYING RECYCLATE

We see the need to continue to support the use of recycled material in, say, construction contracts and to extend this where appropriate to other spend by the public sector. We must, however, be careful to ensure this duty does not contradict wider aims of sustainable procurement, particularly the benefits of buying from local sources. We cannot see any relevance to purchasing by small businesses and recommend they be exempted from such a duty.

PROPOSAL 4: WASTE PREVENTION PLANS

We support the Scottish Government’s aim to place greater emphasis on commercial and industrial waste. We recognise that having a forward strategy for dealing with waste will be a key factor for many organisations, particularly large parts of the public sector involving many different complex services and premises. For the majority of small businesses who probably operate from one premises, have few employees, and straightforward waste streams, we cannot see the benefit of such plans outweighing the bureaucratic burden. We do support, however, an increase in advice and aware-raising for small businesses about the benefits to the business of reducing, re-using and recycling waste but we must be careful not to raise expectations — many
businesses would like to recycle more waste but simply do not see practical, affordable options.

PROPOSALS: DEPOSIT AND RETURN

We agree that there is a history of operating deposit and return schemes in Scotland; therefore it may be easier to encourage public participation in such a scheme. There are clearly a number of issues which would need to be addressed and which cause particular concern for small businesses. We agree that a working party to help develop such proposals would be an effective way to proceed. We note the likelihood of exemptions for small businesses not being available however we think it would be worth exploring phased introduction, should the government decide to proceed with deposit and return. This could result in a pilot project (perhaps voluntary?) as a first step, followed by rolling out to larger stores in the first instance.

We will gather more detailed views from smaller retailers regarding practicalities of such a scheme however in the meantime the concerns for small businesses would include:

• Practicality of storing cans/bottles — consider fire and health and safety aspects
• An increase in paperwork and costs associated with running the scheme, particularly clarity of deposit money for accounting purposes
• Enforcement — would local authorities be best-placed to interact with local businesses?
• Fees — businesses should be encouraged to participate, therefore imposing a fee/licensing structure would not be helpful
• Reverse vending — we support the use of technology to facilitate the scheme but will this be possible or affordable for small businesses?
• Support - in rolling out such a scheme it is likely small businesses would require some kind of source of information and advice
• Impact on existing kerbside recycling by local authorities

Lastly, since this proposal is based on two existing schemes, it would be helpful (in advance of any working group) to gather relevant information from those countries regarding the practicalities for businesses of: separation, storage and collection of the goods; any impact on existing waste collection and additional costs on business; and, bureaucratic and accountancy implications for business.

PROPOSAL 6: MANDATORY WASTE DATA RETURNS FROM BUSINESS

While we accept that it is clearly necessary to have information on waste streams in order to plan and build appropriate infrastructure, we would nonetheless like to see more explanation of which specific information is required and for which policy purposes. This justification would make it clearer where information requirements should be targeted and there would then be a clearer proposal for legislation or working with particular sectors to develop a plan for gathering more comprehensive data (with the threat of legislation). We also believe that there must be scope to improve the sharing of data
gathered through different licensing procedures and/or government agencies. We welcome SEPA's indication that they will address this - surely, this should be completed before any legislation is discussed?

At present, we are not convinced that the small amounts of non-hazardous waste from most small businesses require blanket legislation potentially forcing them to complete paperwork which would be of little value.

If any data requirement legislation is introduced, it must be combined with a review of other environmental data gathered from businesses so that some kind of streamlining or reduction can be achieved.

PROPOSAL 7: OTHER MEASURES TO ENCOURAGE WASTE PREVENTION, INCLUDING ACTION ON SINGLE-USE CARRIER BAGS

The FSB's response to legislative measures to reduce the use of plastic carrier bags is well documented. We believe that previous proposals were likely to impact most severely on small, non-food retailers — who we suggest are least likely to be perceived as the main perpetrators' of excess use of carrier bags. We believe that focusing on carrier bags has been a distraction from more substantial issues regarding business recycling — some of which have been discussed in this document.

RIA

We welcome the work initially carried out for the partial RIA but would encourage the Scottish Government to incorporate the use of the Business Impact Assessment, as recently recommended by the Regulatory Review Group in Scotland. We do feel that some of the conclusions reached regarding costs to business are perhaps rather optimistic.

Further detailed information (particularly looking at costs) from other countries would help develop the RIA further and would then help the Scottish Government determine which proposals are viable on the basis of excessive cost and practicality implications for businesses (and the public sector).

FSB
October 2008
SUBMISSION FROM SESA

- SESA is the trade association representing Scotland’s waste and secondary resource industry.
- Driven by EU environmental law, we are a leading partner in Scotland’s transformation from a disposal to a recycling society: since Devolution, we have helped Scotland’s household recycling rate to increase more than five fold to above 32%.
- Two out of every three voters in Scotland believes the waste collection, recovery and management service our Members provide in partnership with local authorities is the most valued local service.
- Our Members provide one third of the Country’s renewable electricity.

Preface

Law relevant to recovery, recycling and management of waste is overwhelmingly governed by EU law. As a general principle, it is therefore particularly important that Scotland’s laws are demonstrably consistent with EU law and use definitions wholly consistent with, for example, the Waste Framework Directive (2008/98/EC). To give one example, we believe references in the Bill to “recycling” - when their meaning is much closer to “recovery” as defined by the Directive - are an unhelpful recipe for confusion;

We have no objection to Scotland seeking to be more ambitious than EU law when there is a clear justification for - and route map to - such ambition, but Scotland’s law should still be framed in a way that is manifestly consistent with relevant EU law;

Further, we note that the Bill proposes very wide powers for Ministers through regulations. We would prefer to see greater clarity and detail in the primary legislation to inform the democratic process. Unlike an EU Directive which permits flexibility within a Member State as to how prescribed outcomes are achieved, such imprecision in the Bill is clearly not aimed to deliver subsidiarity across Scotland but instead seeks wide executive powers where the likely character of such execution remains opaque.

Clause 52: waste plans

We would greatly welcome good, clear plans for the management of waste, with clear targets for recycling and recovery of waste and how these targets are to be achieved. It would be more helpful if Clause 52(1) reflected the terminology used in the Waste Framework Directive setting out the five tier hierarchy and the distinction between recovery and disposal;

We also recognise that Scotland should reflect reference in the Waste Framework Directive to minimisation of waste. However, this must not distract from the need to provide infrastructure to recover value from existing volumes of wastes diverted from landfill. A legal requirement for site waste management plans for construction and demolition projects is one example of a useful approach to adopt;
We advise against the definition of “recycling” proposed in Clause 52(4): it is not consistent with the EU law with which Scotland must comply.

- **Clause 53: waste data**
  Clause 53(1) is an example of a Clause providing such wide-ranging powers for Ministers as to make the primary law almost meaningless. For example, the primary law ought to indicate how and on whom the burden of the law is likely to fall;

  Our industry has long recognised the need for better and more relevant and timely data on waste. We believe this requires significantly better capture of data from waste producers and from sites exempted from waste management licences;

  Data from our industry should generally be required by regulation and the requirement should avoid being framed in terms that require duplication of effort. In addition, this is an area where there should be consistency across the UK to avoid, for example, the need to replicate computer systems.

- **Clause 54: recovery facilities**
  This Clause reflects a presumption in the Waste Framework Directive in favour of recovery over disposal of waste and, again, should be both couched in such terms and provide sufficient detail in the primary legislation to give an indication as to what in practice the law is likely to mean;

  In broad terms, we welcome the general provision of the polluter pays principle at Clause 54(2)(e) provided SEPA and other relevant authorities are adequately resourced to enforce zero tolerance of fly-tipping across Scotland;

  Notwithstanding current turbulence in global commodity markets, we believe the Landfill Tax escalator and other drivers will over a relatively short period suffice to promote higher levels of recovery of business waste and that an unduly prescriptive regime for this waste stream may not provide the best possible results.

- **Clause 55: facilities at events**
  Subject to comment already made, this provision seems sensible.

- **Clause 56: green public procurement**
  We warmly welcome the prospect of greener public procurement as a stimulant for markets in recycled materials. Frankly, however, public authorities across the UK should now be able to provide far more detail than the generic framework offered by Clause 56.

- **Clause 57: packaging targets**
It is important not to disrupt the functioning of existing producer responsibility obligations, transposing the EU Packaging Directive, placed on the packaging sector;

The Producer Responsibility Obligations (Packaging Waste) Regulations, applicable in Scotland, England and Wales, already provide a direct incentive for those using packaging to reduce its use. Further regulation on this matter may be seen to be redundant;

Also, the Packaging (Essential Requirements) Regulations already require that packaging weight and volume must be reduced to the minimum necessary for safety, hygiene and consumer acceptance of the packaged product. More robust policing of existing law might be preferable to new law.

- **Clause 58: deposit and return**
  Statutory deposit and return schemes appear to work well in a number of EU Member States;

  However, given the scale of investment in infrastructure required to enable Scotland to comply with relevant EU law, it is important that there is a measure of consistency in Scottish official policy extending beyond the ebb and flow of specific administrations. We simply note that this proposal represents a change of policy since the Strategic Waste Fund provided resources for collection infrastructure: there is potential for deposit and return schemes to conflict with investment assumptions behind such investment in infrastructure and this could mean, for example, that the Scottish taxpayer might not secure the best value for money;

  We would invite the Scottish Parliament to probe the Scottish Government on the evidential base behind its current proposal and to give a very precise indication as to why it is believed to offer better prospects than the rapid increase in recycling and public participation rates in recycling being secured through the model of investment in collection infrastructure.

- **Clause 59: carrier bags**
  We do not consider this to be a priority;

  Far more important is the need to extend general awareness of broader waste management issues such as the need to segregate materials for recycling and the pressing need for new facilities to recover value from waste.

- **General points**
Much of the 22 million tonnes of waste produced each year in Scotland is potentially either a recyclable material or a renewable, decentralised source of energy providing a net carbon benefit and making a significant contribution towards Scotland’s carbon reduction targets. Appropriate waste laws in Scotland can therefore deliver both compliance with EU waste laws and also an opportunity to reduce net CO2 emissions at no additional marginal cost;

It would clearly be easier for public authorities to determine optimised policies for waste in a context where there were internationally accepted, relevant and robust indicators of sustainability. SESA’s Members are filling a vacuum by compiling methodology which will enable specific waste facilities to benchmark their carbon footprint against those of other such facilities. We hope to conclude this work in 2009.

Scottish Environmental Services Association
22 January 2009
Climate Change (Scotland) Bill: Stage 1

The Convener: Item 5 is stage 1 consideration of the Climate Change (Scotland) Bill. Our focus today is on sections 52 to 61, which deal with waste reduction and recycling. Although we are a secondary committee on the bill, we are the only committee to take evidence on this chapter.

I welcome the panel: Professor Jim Baird of Glasgow Caledonian University; Pauline Hinchion, chief executive of the Community Recycling Network Scotland; Susan Love, policy manager of the Federation of Small Businesses in Scotland; and Dirk Hazell, chief executive of the Scottish Environmental Services Association.

Given that panel members do not represent one set of interests, members should make it clear to whom their question is addressed. Equally, if any panel member wants to contribute to a question that is addressed to another panel member, they should indicate and I will bring them in.

SESA has provided a submission to the committee and we have responses to the Scottish Government’s consultation on waste management from the Community Recycling Network Scotland and the FSB, so we will move straight to questions from members. I come first to John Scott.

John Scott: Thank you, minister.

The Convener: Minister?

John Scott: Convener.

Bill Wilson (West of Scotland) (SNP): You are rising rapidly, convener.

John Scott: Everyone has zero waste as an objective, but is it doable? Can we achieve it in the real world?

The Convener: I guess that all the witnesses will have something to say about that.

Professor Jim Baird (Glasgow Caledonian University): Zero waste has its origins largely in New Zealand and Australia, where many of the initiatives started. Its purpose is to decouple waste growth from economic growth and to move us away from dependency on landfill and incineration. The debate often focuses on whether we should send waste to landfill, but zero waste is properly defined as trying to reduce consumption and the production of waste, followed by recycling, so that, in effect, society does not produce waste in the first instance. Zero waste is quite an emotive term and people tend to be polarised on the question of whether it is doable, but everyone acknowledges that we should aspire to achieve it.

I mentioned New Zealand and Australia because they often present themselves as leading the way on zero waste, but I was there in September and was able to unpick some of their figures. Some of the major states in Australia are performing just slightly better than us on recycling, with figures of 38 or 40 per cent, as against the Scottish average of about 32 per cent. Although other countries portray themselves as leading on zero waste, Scotland is doing rather well. Zero waste is an aspiration—the real challenge is consumption in society—and it is unlikely that we will ever reach the point of zero landfill.

Pauline Hinchion (Community Recycling Network Scotland): I see zero waste as achievable. The CRNS has tied its colours to the mast of zero waste but, if that is to be achievable, we must move away from the notion that it is about managing waste and recognise that it has implications for the whole economic system—it is about how we design, produce and consume our products. If we look at zero waste in a comprehensive sense, it is achievable, but in Scotland the concept is seen as being about preventing landfill, which reduces its ability to make a significant contribution and to be achievable.

Susan Love (Federation of Small Businesses in Scotland): It is important to make the point that the owners of most small businesses are just people who share the environmental concerns of the public at large. There is a general desire among businesspeople to reduce their businesses’ carbon and environmental footprints, but zero waste is a concept that does not seem particularly realistic to many small businesses. We have suggested that a more helpful approach with small businesses is to promote the resource efficiency angle of waste reduction.

Dirk Hazell (Scottish Environmental Services Association): Scotland is already falling short of meeting its obligations to divert a certain amount of biodegradable municipal waste from landfill by 2010, and the European Union waste framework directive that was put in place at the end of last year will apply further specific recycling targets to Scotland. In that context, it is probably more helpful to focus directly on the European target, certainly in legislation, than on a phrase such as zero waste, which has a slightly different meaning as used by the Scottish Government from the meaning that environmentalists originally gave it.

I agree strongly with what Pauline Hinchion said about product policy: if we want to get long-run amounts of waste back into the productive economy, products must be better designed in the first place. Realistically, however, some waste will...
always have to go to landfill—for example, if committee members were unlucky enough to have to go to hospital, I do not think that they would want to see recycled syringes being used.

10:45

**John Scott:** Is the current waste infrastructure sufficient to meet current and future waste policy?

**Dirk Hazell:** There is nowhere near enough waste infrastructure anywhere in the United Kingdom to comply with existing European obligations. In Scotland, we need to accelerate our transition from a disposal to a recycling society, but to do so requires more infrastructure. It also requires much stronger green public procurement to give an impetus to recycling markets—there is a bit of provision for that in the bill, but it is anaemic.

**The Convener:** Does anybody else want to comment on that aspect? You do not all have to.

**John Scott:** The question is whether current waste infrastructure is sufficient to deliver for the future.

**Pauline Hinchion:** I agree with Dirk Hazell that the current infrastructure is insufficient and, ironically, that is probably particularly the case outside the municipal waste stream. There has been a focus on that infrastructure at the expense of construction, demolition and private-sector waste, but wider public sector bodies have invested insufficiently in managing and reducing their waste. I welcome the Waste and Resources Action Programme anaerobic digestion grants for food waste in particular because there is no doubt that the methane produced when organics are put into landfill has a significant effect on greenhouse gas emissions. We need to get to grips with that aspect, which has been a poor relation up to now.

**Professor Baird:** Let me respond to SESA’s comment about the zero waste concept being unhelpful. Any waste is a measure of inefficiency in society, whether it comes from a small business, a home or a big business, and when we attempt to deal with that, it means that we are all engaged in the process. When we try to communicate policy initiatives that have been introduced by the current and previous Administrations, it is useful to engage the public through the concept or brand of zero waste, which I think is a helpful device. The Cabinet Secretary for Rural Affairs and the Environment has set targets that go beyond the European waste framework directive, which means that, in many ways, we lead the UK and Europe in setting demanding drivers on waste.

**Susan Love:** The FSB has been involved in the issue of recycling waste for several years, investigating possible further options for small and medium-sized businesses, but we keep coming back to the same problem that there are no facilities for SMEs to use. The committee will see that point running through our written response. It will not be remotely possible to implement many of the bill’s measures unless we make progress with facilities, and the local authorities’ comments about why their waste services for businesses are limited bring us back to the lack of resources for infrastructure. Unless that central problem can be solved, we fail to see how parts of the bill can be implemented.

**Rhoda Grant (Highlands and Islands) (Lab):** We have heard that the zero-waste initiatives target the end product rather than the start of the process. We have also heard, from producers, that if we do not use packaging we will end up with more waste because more products will be damaged. Is there a balance that needs to be struck?

**Professor Baird:** Packaging exists for a reason: it protects products and ensures that, for example, our fruit and vegetables arrive in the shop safely. If we were simply to bundle apples into a big box, more would get bruised and subsequently thrown away. We fully accept, therefore, that there is a role for packaging.

Through the Courtauld commitment with retailers, we are trying to drive down the amount of packaging by 25 per cent over the next couple of years. That should result in, for example, ready-made meals coming with a little watchstrap of cardboard around them rather than a full cardboard box. Attention is being paid to design, which is resulting in reductions in the packaging that is used. You are right to suggest that we need to balance a reduction in the use of packaging with the need to maintain product integrity.

**Pauline Hinchion:** Tesco would argue, rightly, that there is a spoilage rate of about 30 per cent in food that has no packaging and, given what we were just saying about methane being dangerous for greenhouse gas emissions, we have to take cognisance of that.

Like Jim Baird, I suggest that we need to think about the type of packaging that is used. Do we need many layers of packaging made up of plastic, cardboard and foil around one item? Could we simplify the packaging so that it is more readily recycled? People have not got to grips with the notion of refills. How do we encourage people to reuse their packaging so that, instead of buying new containers of Fairy Liquid, they refill their old container? It is too simplistic to say that we will be able to do away with packaging or that having no packaging is best for the environment.

**Elaine Murray:** Last October’s European Union waste directive indicated that there should be a
hierarchy of ways of dealing with waste, with prevention being the most desirable method, followed in descending order of desirability by reuse, recycling, energy production and landfill. Do you agree with ministers that the bill takes sufficient cognisance of the EU framework, which will come into legislation in the next two years?

Local authorities have decided how to deal with municipal waste without having had regard to the framework. Some areas are considering autoclaving waste, while others are introducing power-from-waste plants. The local authority that covers my constituency recycles a certain amount of waste but uses quite a lot of the paper and plastics to produce power. I am concerned that our local authorities might be going in a direction that the EU has now abandoned. Do you think that the EU framework has an impact on local authority policies?

Dirk Hazell: The bill clearly does not take sufficient cognisance of the EU framework.

There are two fundamental issues about the bill. One is that it proposes extremely wide powers for ministers, and ministers have not explained to Parliament exactly what those powers will mean in practice. For example, in sections 52, 53, 54, 56 and 57 the Parliament is asked to confer on ministers powers to turn unspecified classes of people into criminals on whom unlimited fines can be imposed. That is a question for the Parliament, and it will be interesting to see what scrutiny you apply to the minister on that point.

Secondly, I have a more general point about terminology—there is some disagreement between Professor Baird and me on this. It is one thing to use terminology for the purposes of public presentation; it is quite another to use it in a bill. It is extremely unfortunate that the bill does not reflect the terms of the waste framework directive. References in the bill to recycling do not address Scotland’s duties under article 11 of the waste framework directive, which is specific on recycling. The definition of “recycling” in the directive is different from the definition in the bill. The fact that the Scottish Government does not have the courage to advocate energy from waste is not a reason to include unhelpful terminology in the law. If the Scottish law means “recycling” it should say “recycling”; if it means “general recovery” it should say “general recovery.”

Your question had a number of components, but I should let other witnesses comment.

Professor Baird: There is an interesting point in that, although Governments and Administrations have tended to focus on challenging local authorities to deliver on recycling, this bill tries to address the other major part of the waste stream, which is commercial and industrial waste. It also picks up on fairly innovative ways in which we can move towards the aspirational, longer-term, 70 per cent recycling target. As members know, the bill is an enabling bill, so at some point the Administration will have to come back to the Parliament to define other measures.

When clear signals are sent to producers and the waste sector about what is expected or required of them, they will deliver. We have sent clear messages about landfill tax, and strong messages have been sent to councils and the retail sector about reducing packaging. When such messages are sent, people sit up and respond. The bill is trying to send innovative signals to producers and the waste sector about how Scotland wants to deliver on ambitious targets. I broadly support the approach, which is quite innovative for Scotland.

The Convener: Do you take issue with Dirk Hazell’s comment about the Scottish Government’s lack of courage?

Professor Baird: SESA is making a point about capping energy from waste. A dash for incineration would be the simplest solution for all of us, but when we start to consider how to drive forward recycling and waste prevention, we might be right to temper our enthusiasm for energy from waste.

Elaine Murray: Is that not in accordance with the view in the waste directive, which puts recovery of energy in fourth place out of five approaches to waste?

Professor Baird: Indeed. We are talking about a hierarchy, and we should focus on prevention, reuse and recycling. The current Administration has taken a policy decision on capping energy from waste.

Dirk Hazell: I do not want to monopolise the discussion, but I want to ensure that what I have said is clear. The bill should use the term “recycling” in the same way that the waste framework directive uses the term. The WFD gives a precise definition of “recycling”: putting material back into the economy for productive reuse. The word should not be a cover for other things that are not recycling, as using a very wide definition of so-called “recycling” softens the target for the Scottish Government. Scotland is twinned with Bavaria, which has a recycling rate of around 75 per cent. In that context, we are not being ambitious.

11:00

Alasdair Morgan: Am I right in thinking that the waste framework directive does not have to be transposed until 2010? Are you saying that if we pass the bill in its current form, we would be in
breach of that directive, which was finalised only in October?

Dirk Hazell: My point is simple. European law is a statement of what states such as Bavaria—with which Scotland is twinned—achieved some time ago. European law sets a waste target that is difficult for us to reach because waste has been ignored for generations. We have had cheap landfill for a long time and we must make huge investment in infrastructure.

As I say, my point is simple. Because European law is the driver, Scottish law ought to reflect our obligations under European law. Compliance with European law ought to be made as simple as possible in Scotland, particularly as, I suspect, the context is one in which the Scottish Parliament and the Scottish Government will not devote vastly more generous resources to dealing with waste than are thought to be absolutely necessary to achieve compliance.

Susan Love: I want to pick up on a couple of points that Dirk Hazell made in his first comments, in case we do not return to them. They are quite important from our perspective.

First, it is important to mention again the powers in the bill. I represent the FSB on the regulatory review group. The bill takes massive enabling powers, which, from our perspective, is extremely unhelpful if we are trying to work out what the potential impact of the legislation might be. Consider, for example, waste prevention plans. On the one hand, the Government might be looking at bringing in waste prevention plans for construction sites, which is quite logical; we can see the point of that. However, the bill also gives the Government the power to require waste prevention plans for all business premises in Scotland. There is a vast difference between those two objectives, but all of that can be achieved under one section. We do not think that that is a helpful way to draft legislation if we are keen on having better regulation.

My second point is about local authorities' plans. Local authorities are critical from the SME perspective. Municipal waste includes a lot of business waste. Local authorities have invested money in recycling facilities for the public, but they will, in some circumstances, still pick up from business mixed waste that is not segregated. That seems to us to be utter madness. It is important to bear it in mind that municipal waste includes SME waste.

Liam McArthur: I would like to return to the point that has been made about infrastructure, which is relevant to Susan Love's point about uncertainty arising from the enabling nature of the bill. Obviously, we have come quite a way from being extremely far behind in our recycling rates—

I think a current rate of around 30 to 32 per cent has been suggested. I am interested in whether that kind of percentage is locked in. I refer to SESA's evidence on section 58, which is on deposit and return schemes. There is a suggestion that, under the bill, the Government might take decisions on deposit and return schemes that will divert infrastructure investment and that any gain may come at the expense of losses in other areas. Could decisions result in zero-sum games? I am interested in Mr Hazell's comments and those of the rest of the panel on that.

Dirk Hazell: That is a very pertinent question. From an appallingly low base—lower even than that of England, which was quite difficult to achieve—there has been a 500 to 600 per cent increase in recycling in Scotland since devolution. That is a very short time, and the increase has been achieved much more quickly than anything that has been done elsewhere in Europe. It has been achieved on the basis of some investment and some assumptions. By and large, the strategy has been to try and persuade most householders to think of themselves as recyclers and, through their collection system, to increase recycling progressively.

It is an undeniable fact that deposit and return works very well in a number of European countries. Our point is that we cannot keep chopping and changing. Whatever Scotland goes for must remain stable between Administrations. If we superimpose deposit and return on infrastructure that has already been put in place for home-based collection systems, that will not bring about the best value for money for the infrastructure that is already in place. It can be confusing for the public if they keep getting different signals. The public want to know how to recycle. Most people want to be recyclers now, which is a much better situation than before devolution. There needs to be consistency between Administrations.

I have looked through the deposit and return briefing that the committee has received, and there is not one word of justification in it for changing to such a system. It is incumbent on the ministers who come before you to say why, exactly, they think that it would provide a better model than the model that has been employed in Scotland so far, which has raised recycling levels at a record rate. Why do they think that deposit and return is better? Where is the life-cycle analysis? Where is the cost benefit analysis? You have not been given one fraction of a sentence on any of that.

Pauline Hinchion: There are concerns about that proposal. I can see deposit and return schemes impacting on kerbside collection, with people making additional journeys to return
containers because of the financial incentive. That could undermine the kerbside recycling schemes that have been set up.

There is a driver behind the idea, however. There are concerns on the part of reprocessors—the Confederation of Paper Industries and O-I, the glass people, for example—that the quality of the stuff that comes from kerbside collections is just not good enough. You will have read about the matter in the papers over the past couple of weeks, including in The Observer last weekend. Unless kerbside collection is done well, by which we mean that it is source separated at the kerbside, reprocessors get mixed-colour glass, which can only go for cullet in road making. If it is not properly sorted, it cannot go back into the reprocessing and manufacturing process. It would not surprise me if a large number of deposit and return schemes are being punted because a better quality of return might result. As long as materials are commingled, quality suffers. As a result, reprocessing opportunity suffers.

Susan Love: We were relatively relaxed about the deposit and return idea when it was first being discussed by the Government. The more we consider the evidence, however, the more we are becoming concerned that it might not be an appropriate approach, particularly because we are trying to push the message that the schemes that have worked for households have involved making recycling as easy and accessible as possible for people. Some elements of deposit and return seem to reverse that. It does not seem to make a great deal of sense.

The Convener: I wonder how easy and accessible householders think the various schemes are, and are becoming. I have seen some very complicated calendars for various pick-ups, and it is easy to understand why people have become confused and fed up with the whole process. I wonder what would happen if we went even further with separation at the household level—I wonder what kind of resistance we might start to hit. That in itself might become a barrier.

Pauline Hinchion: When local authorities roll out new kerbside services, there is rarely an intensive awareness-raising campaign. People might get something through their doors to say that the council is now picking up paper fortnightly on Tuesdays, for instance, but that misses the point that behavioural change is difficult to achieve. People need consistency, and there needs to be a relentless effort to get them to appreciate what is being done.

A good example was recently provided by the Welsh Assembly Government. One local authority in Wales actively engaged with people, knocking on their doors and telling them about the scheme. People will get the message that way, but councils cannot just come up with a commingled or three-bin system and expect people to understand why it has been introduced. Not enough attention is paid to awareness raising and giving out information. Having a website is not enough; it requires resources and knocking on people’s doors. However, when people get it, they really get it.

John Scott: The system in South Ayrshire works very well; the council is second-top of the league for recycling and the complicated planners that the convener mentioned seem to work. Here in Edinburgh, however, I do not quite know how to go about recycling. I am an avid recycler, but I do not know how to do it here.

Dirk Hazell: Susan Love and Pauline Hinchion have made entirely valid points, but it is necessary to be pragmatic, rather than dogmatic. Different collection systems will work well in different places. What works in an urban area where there are tenements will be a very different collection system from what might work well in suburbs, where people have front gardens and live on quiet roads.

Pauline Hinchion made one important point that I must rebut. She said that commingled collections result in poor-quality materials for recycling. Given the amount of investment that is going into material recycling facilities—MRFs—that is not in fact the case.

I will not be rude about The Observer, which is usually on the side of the angels on green issues, but you should not believe what you read in the Rothermere press. The photographs that were shown of bales of paper that were allegedly stranded at a London facility two Sundays ago did not tell a true story. That paper was in fact going on for further reprocessing. It is important to make the point that SESA’s members are still placing materials for recycling, based on commingled collection, for further use on international and domestic markets, even in the heart of one the worst and most rapid falls in commodity prices. That material is being used. One should not be too dogmatic about commingled and separated collection.

Professor Baird: I return to the point about undermining the existing infrastructure. One of the challenges for Edinburgh, for example, is that only 100,000 households can get a box collection service. Another 100,000 at least—perhaps 130,000—cannot. Much of that is to do with property types. We want measures to be introduced to make it easy for all of us to engage in recycling. I would not wish to deny people living in flats and multirose premises the opportunity to recycle. If they can go along to their local Tesco or Asda and use a deposit and return system, that is great, and that should be welcomed. Recycling on the go, at events and so on, should be in place, too.
My only slight concern about deposit and return is about how it sits with attempts to drive through change using existing packaging regulations. How could Scotland go it alone in that regard?

The Convener: We need to move on. We have done quite a lot on that subject, and we need to get through some more.

Peter Peacock: I wish to hear some comments from Pauline Hinchion and Professor Baird on the point that Dirk Hazell and Susan Love have covered, about the sections of the bill that deal with waste—sections 52 to 59—and the extensive enabling powers that are being sought. Is that the right way to proceed, as a matter of principle? Do you have concerns about that? Do you see any disadvantages in that approach? Dirk Hazell and Susan Love have already made known their points of principle in that regard.

Then perhaps everybody could answer this second question. If you have concerns about the provisions, what is the alternative? What are you suggesting? Do we await the next primary legislative slot? Perhaps Professor Baird and Pauline Hinchion could start on the first point.

11:15

Professor Baird: I cannot comment on the parliamentary process and, therefore, the benefits of taking significant powers and introducing secondary legislation later. We have focused on municipal waste in the past, but we also need to target business, commercial, industrial and other waste streams. We acknowledge that our data and ability to target those waste streams are a little bit restricted because of limited policy levers. I broadly support the fairly ambitious and innovative steps that are proposed, particularly if they target waste prevention. One reason for encouraging businesses to measure their waste is that if they cannot measure it, they cannot manage it; measuring it is the first step in trying to reduce and recycle business waste more effectively.

Pauline Hinchion: In one sense, the bill is really ambitious. It gives people powers finally to take control of the situation. Ultimately, if we are to achieve an 80 per cent reduction, somebody has to manage the process. In that sense, it is good. However, there is a danger that everything will become instrumental and the concerns of small businesses or householders will be ignored. When people are given so much power, it can become all about delivering on the powers, the control and actions.

I will give an example. We have members in Shetland who collect, recycle and reprocess glass into really nice glass awards. Theirs is a small business, but Shetland is a small place and they do great work. Under the bill, it would probably be better for the climate if they just put the glass on to a ship and sent it down to Alloa to be processed.

We have to be careful that the powers do not become too instrumental and that some of the other factors that may have to be taken into consideration are not ignored. That is what I would be concerned about, if that makes sense.

Alasdair Morgan: I did not understand that point. You said that, under the bill, it would probably be better if the people in Shetland shipped the glass to Alloa. Are you saying that their net use of energy would be less if they shipped it to Alloa?

Pauline Hinchion: Yes.

Alasdair Morgan: That is nothing to do with what the Government says; it is just a fact.

Pauline Hinchion: No—I am sorry, I meant that it would probably be easier to achieve an 80 per cent reduction if they just shipped the glass to Alloa than if they continued to collect and reprocess it, but there is a job creation and social side to that activity as well.

Professor Baird: Some work that we have done at Glasgow Caledonian University shows that, if we move towards the levels of recycling targets that we are talking about and crack waste prevention, the waste sector could contribute around 6 per cent of the 80 per cent reduction that you want for 2050. That is a significant contribution towards achieving the carbon reductions.

Susan Love: I am sceptical, because I have yet to see many powers that have been taken not subsequently being used when Governments want to make annual reports and show that they have taken action. The Federation of Small Businesses in Scotland is nervous about powers being taken with the assurance that they might not be used.

I also have concerns about the level of scrutiny for secondary legislation. Legislation that affects business is often made through secondary legislation and, in our view, the development process for it simply does not attract the level of scrutiny and attention that primary legislation does. It is also harder to change secondary legislation.

My third point is about timing. All through the policy memorandum, there are phrases saying that the Government has to take powers now or might as well take them now, but I do not understand the justification for that. Why is there a sudden rush to confer all the powers now, as if there would be no further opportunity in future? It is not as if the problem will go away.

The Government should simply decide what it wants to do. I am not saying that there is no
ambition, but the bill speaks to me of hedging your bets. The Government suggests throughout that it will probably not need to include small businesses in these provisions or that there may be a de minimis route for that; if so, why is the bill not drafted to say that provisions will apply only to public bodies or large businesses? The same point applies to recycling options. After all the public bodies or large businesses? The same drafting to say that provisions will apply only to minimis route for that; if so, why is the bill not in these provisions or that there may be a de.

should have a clearer idea of what it wants to do and should draft the bill accordingly.

Dirk Hazell: I agree with much of what Susan Love said. We warmly welcome what we assume to be the principal intent of the bill. Our industry is about helping to make the planet more sustainable. We exist only because of regulation—our job is to provide what is safe for the environment and human health. However, as Susan Love said, the bill is very imprecise; it has not been thought through in the way in which one would have wished. If we as an industry are to be on the receiving end of some of the powers that are being sought, we would like to know that at the primary legislation stage, so that we can demonstrate outside. It is much more difficult to do that at secondary legislation stage.

Section 56 is on the procurement of recyclate. Any Government in the European Union ought by now to be coming up with pretty tangible figures for green public procurement. There are some in Scotland, but they are not very ambitious. In construction and demolition, such figures make a lot of sense. Our members in the Netherlands are getting 99 per cent reuse and recycling from construction and demolition; with the right regulatory framework, that is easy to do.

I turn to section 53. Our industry has said for years that we really want better information on waste. The Government needs more data to inform its policy on both household and business waste; we welcome the recognition of that need. However, under section 53 the Government will have the power to create a criminal offence with unlimited financial liability. On whom will that offence fall? If it falls on our members, we will have a problem, because we do not necessarily know what is in the waste that our customers provide; we rely on the waste producers, especially those on the business waste side, to tell us that. Susan Love and I may not agree on the specific point of who should assume liability for waste data, but we agree that there is a political issue to be resolved, and that it should be addressed in primary legislation.

The Convener: Some organisations have indicated to us that they object to the use of enabling powers—they want powers to be enacted through the bill. You appear to take the opposite view—you would be even unhappier about that than about the inclusion of enabling powers in the bill.

Dirk Hazell: As an industry, we would be happy with clear regulatory powers for collection of data that applied on a level playing field—which is more than we have at the moment—and were enforced. That is our basic position. Our secondary position—this is where Susan Love and I part ways—is that the primary duty should be on the waste producer, rather than the waste manager.

The Convener: At this stage, we are talking at a slightly higher level. The bill includes enabling powers that may or may not subsequently result in subordinate legislation. I take on board Susan Love’s scepticism and her suggestion that if the Government can do something, it will. However, I suspect that if she were to look at some of the legislation that we have passed over the past 10 years she would find that that is not the case. Some organisations have lobbied against the use of enabling powers that would allow us to do one or another or everything that the bill mentions at a future date; they say that we should do those things right now. Do you not want that, either? Dirk Hazell appears be saying that the bill is flawed to the extent that none of the enabling powers should be enacted in the way in which they are being presented at the moment.

Dirk Hazell: I am saying that, if we want to create new criminal offences with unlimited financial liability, the primary legislation should say who the guilty people will be.

The Convener: So you do not want the powers to be enacted as they are in the bill.

Dirk Hazell: The bill should say who the guilty people will be.

The Convener: Right—you do not want the powers to be enacted as they are at present.

Dirk Hazell: We want more precision.

Susan Love: We do not want them to be enacted because the bill does not say exactly what the Government wants to do. The proposed powers are so wide that it would be hard to say what we would be putting into legislation if we enacted the bill as it stands. That is the problem.

The Convener: So you would rather not have to wait for the subordinate legislation—you want the details to be in the bill.

Susan Love: If we are to have an argument about whether the provisions on waste plans will apply simply to construction sites or to every business premises in Scotland, I would rather that the Government was clear about its view and that we had a debate among our members, rather than have me fight it out with an official behind closed doors.
Pauline Hinchion: I have concerns about enacting the powers as they are drafted, because, as Dirk Hazell pointed out, the term “recycling” is used in the bill for recovery and reuse. Reuse should be higher up the waste hierarchy. It seems that many processes have been concertinaed into the term “recycling”. That will not allow for the infrastructure that is required for reuse or for the way in which re-usable material is procured compared, for example, to the procurement of recyclate.

Professor Baird: I am broadly supportive of the measures. If we are challenging ourselves to deliver more and better reuse, waste prevention and recycling, the powers in the bill are the kind of powers that we should take. The bill is written in a language that is so broad that it is difficult to understand where the responsibilities will fall. However, I broadly accept that that is the way in which Government legislation works. The broad powers are taken and then there is a debate and argument about how they are delivered. I hope that several of the measures will be taken at the earliest opportunity.

The Convener: We need to move on. Elaine Murray has some questions, although she may feel that some of the issues have been covered.

Elaine Murray: Yes. Dirk Hazell touched on the media coverage of piles of recyclable material sitting in warehouses. On the news last night there was another item showing vast stores of recyclable paper and plastic. Strangely, a UK Government adviser implied that the carbon footprint of recycling means that it is not worth doing and could actually have a deleterious effect. Will you say a bit more about the current economic situation? Will you also talk about the science and the arguments on whether some things that we do when we attempt to recycle do not do as much good as we hope they do?

The Convener: I will add a point that follows on from Elaine Murray’s question. A personal bugbear of mine is that an awful lot of recycling is predicated on people loading stuff into their cars and then driving it to a central point. When I have queried that in the past, I have found that nobody ever factors that into the equation. That takes us back to points that Pauline Hinchion made earlier.

Dirk Hazell: If I may say so, you have hit on one of the most important points underlying the debate. Every time we talk about the environment, we are in the area of theology as much as substantive science. It is difficult for you as public leaders to do the job that you are asked to do without knowing what the most sustainable route is. The Organisation for Economic Co-operation and Development—an international organisation that is based in Paris and which the UK is a member of—has for years tried to get internationally agreed measures of sustainable conduct. The typical pattern is that a particular Government says to the OECD, “We want these figures, because they make us look really sustainable.”

As a reaction to that, various sectors are developing their own measures of sustainability, although that is not as satisfactory as international public agreement. Our sector is doing precisely that. We are not entirely satisfied with the indicators that the regulators have come up with throughout the UK, so we are developing our own robust measurement to show the carbon footprint of individual facilities, which we hope will be done by the end of 2009. That will enable people to compare the carbon footprint of one facility with that of another, which will enable benchmarking and raise overall standards. However, I do not pretend that that is as good as having robust analysis. WRAP has produced no end of stuff, some of which is quite good, but it is not scientific analysis that shows exactly, for example, how recycling something is by far the best thing to do; it is just a collection of other people’s work, by and large. We need robust international—or European, at least—agreed measurements of sustainability. That would make this sort of bill much easier to implement.

11:30

Susan Love: I will let the experts next to me comment on the science. On the economics, though, the situation has deteriorated significantly since we started talking about the bill. We have made the point to the Scottish Government that, given the potentially vast costs to businesses of certain provisions in the bill, we do not think that this is the time to send out the bill’s message to business.

Pauline Hinchion: To me, there are two sides to the question. One side, with reference to section 53, is about data quality and how we standardise the various accounting mechanisms that are in place. Every time I go on to the internet there seems to be a new carbon accounting tool. The issue is how we ensure that we measure in the same way and are not comparing apples with pears. There are therefore problems around data quality, the type of data that are collected and, more important, how we measure data—I think that that was Dirk Hazell’s point. Instead of everybody using their own carbon accounting tool, we must get agreement on how we measure data.

The other side of the question is the quality of recyclate. The campaign for real recycling, whose members are recyclers and reprocessors, and the Confederation of Paper Industries have said in the past few weeks that there are good prices for good-quality material. However, the media
bombard us with the incorrect perception that, in the recycling world, nobody is selling recyclate to anybody. We are not selling poor-quality stuff, which I would argue with Dirk Hazell comes largely from the commingled approach, and there are good prices to be had, as two reputable bodies have said. Ironically, the article on recycling in The Observer was about somebody following their basket of recycling to its logical conclusion. The interesting point is that because the London Borough of Hackney Council does source-separated recycling, the collected bottles, plastic, cardboard and paper are recycled in the UK. It is clear that our reprocessing industry needs quality material. The situation looks worse than it is, but we must have quality material.

Professor Baird: I have two points: one on environmental impacts and the other on paper. Through the remade Scotland programme, which the Government funds, we did some work with the Convention of Scottish Local Authorities on the drop in prices since August. There has been a significant drop, but material continues to flow. In particular, in local markets for recycle such as glass, which is largely dealt with in Scotland and in the UK, prices have held up. Prices have also held up for materials flowing into the compost market. Paper prices have partly held up because we have domestic demand for it, but we ship some paper to China and other places overseas. Because there have been collapses in some areas, we have a fragile economy that is trying to establish itself. It is a little bit vulnerable, but material is still flowing. It is therefore a pity that the media choose to present it in a negative way.

We can take two approaches to considering environmental impact or sustainability. To make my argument, I will take carbon as a surrogate for sustainability. We can take a life-cycle analysis or an inventory analysis. Unfortunately, countries take an inventory analysis. If we ship bauxite over here from Australia to make aluminium, Australia picks up the tab on the bauxite production side, and we pick up the tab when we melt the bauxite or process it into cans. Issues arise because of countries owning inventories.

Life-cycle analysis considers the broader, global perspective. It has been said that with the bill, Scotland will take a more holistic, global point of view. We see that happening on the issues of air transport and shipping emissions. Although I am not sure how it will work, we have to think globally on those issues.

Dirk Hazell is right to say that there is no nationally or internationally agreed approach. My views are based on every study that I have worked on, reviewed or learned about.

There are four elements to recycling. The first is the collection process, which includes taking materials in vehicles to collection centres. The second is reprocessing and sorting the materials for particular markets. The third is the displacement of aluminium from our recycled aluminium. The fourth is landfill. From the studies, it is clear that the impact of the first two elements—which include people taking their cars to the local civic amenity site—is small in relation to the environmental impact of methane from landfill sites. Unquestionably, there are gains to be made from substituting raw materials with recycled materials. Even if lots of trucks are running around to collect materials, the impact is insignificant when compared with the gains that can be made elsewhere. The difference is huge.

The direction in which we are going, and the measures that are being proposed, are contributing to reducing Scotland’s greenhouse gas emissions.

Elaine Murray: I want to ask about the reliance on voluntary agreements. We are probably achieving the targets that were set for last year, but future targets are pretty ambitious. At the moment, things are being left to local authorities. However, in the same way as issues arise internationally, issues may arise to do with the way in which local authorities count their contributions towards reducing their greenhouse gas emissions. People in local authorities sometimes consider issues in silos and say, “Once we give it to somebody else, it doesn’t really matter.”

Will it be possible to achieve the 80 per cent target without using more of a stick? Landfill fines have been suspended, so there is not much of a stick there at all. Will we need more of a stick in later years so that we can meet the targets?

The Convener: I will ask Susan Love to answer that one.

Susan Love: From a grass-roots business perspective, I cannot see any point in a stick being used if there is nothing that businesses can do. You cannot force businesses to recycle if no recycling facilities are available.

Elaine Murray: I was thinking more about the responsibilities of local authorities in achieving the targets.

Susan Love: I am sure that COSLA will give you a good response to that next week.

Professor Baird: In 2003 and 2004, I worked with most Scottish local authorities to help them to decide how to spend the strategic waste fund that was available at the time. I remember sitting down with many councils and trying to figure out what recycling could be achieved for the available money. At that time, we were planning for 25 or 30 per cent. We are now going through another
exercise with councils, and this time we are thinking about achieving 52 or 54 per cent.

A cultural shift has taken place in the way in which people think about recycling. I stood in Tesco in Wishaw the other day with my daughter, and we saw just how many people there now bring their own bag; and I go to my local civic amenity site, and I see people engaging in the whole idea of recycling. There has been a cultural shift.

If you had asked me four or five years ago where we would be today in terms of recycling, I would have said, “Nowhere.” If you asked me now, I would say that 60 per cent could be delivered. If you asked me again in five years’ time, I would say that perhaps 10 years from now, 70 per cent could be achieved. There is a shift in how we as a people are responding to the issue.

Dirk Hazell: I agree with both the previous speakers. We believe that the landfill tax is proving to be quite a good driver, and we think that by 2011, when the tax reaches £48 a ton, it will begin to be quite an effective driver of business behaviour in particular. The tax works on the polluter-pays principle, and it sends a long-term, clear signal. All our leading members believe that it will drive higher levels of recycling within the business community.

There is a caveat, in that the higher the landfill tax rises, the greater incentive there is for criminals to bypass the regulatory system altogether. There have been quite serious problems with that in Scotland, and we need to ensure that the white van tendency is regulated out of business. We welcome the establishment of specialist procurators fiscal, and we have asked for the Scottish Environment Protection Agency to be given additional resources to capture criminals in the first place.

We support putting up the landfill tax, probably to well above £48. We think that a long-term, clear signal will suffice—particularly with regard to business waste—to change behaviour. However, some of that landfill tax revenue must be used to protect the landfill tax revenue by providing resources for extra procurators fiscal on the environment side so that cases are brought to court, and extra resources for SEPA on the prosecuting side so that it can capture criminals in the first place. Those two things cannot be separated.

Pauline Hinchion: I agree with Elaine Murray—once we get beyond the easy hits on recycling, and we talk about a figure of 80 per cent, significant cultural and societal change is necessary. We all think that it will be enough simply to increase recycling, but it will not: it will require much more than that. One of the great things about the bill is that it includes aviation, which is an area in which we will require big cultural and societal changes.

My concern is that we use the stick all the time. I would like a bit more carrot to be used, particularly on a smaller scale. We need to encourage people and reward them for being citizens and taking proper responsibility for their environment.

John Scott: Some of the submissions have suggested that there may be policy divergence between Scotland and England. What might be the impact of the possible divergence in waste policy in Scotland from the policy in the rest of the United Kingdom?

Susan Love: I suspect that you would get a different answer from us than from the Confederation of British Industry Scotland. Most of our members operate within Scotland, so they would not be subject to two different regimes. The issue arises of putting businesses at a competitive disadvantage if they are required to comply with more onerous regulations—and their associated costs—than are businesses south of the border.

The other issue is that in developing a regime with carrots and sticks, I suspect that the Government south of the border will introduce fiscal incentives to accompany some of the options to reduce waste. We do not have such a package in Scotland, so our approach might have to be slightly different from that south of the border.

John Scott: Coca-Cola, for example, has concerns about there being different policy in that area in different parts of the United Kingdom.

11:45

Dirk Hazell: I agree with Pauline Hinchion’s final comment—we need a cultural change. In particular, we need stronger laws on producer responsibility: there is a generic provision in the new waste framework directive for extended producer responsibility. When you talk about waste policy, you are talking about European Union law and global markets for materials.

Going back a few years, one distinguishing feature of the UK was that waste was cheap, therefore there was no incentive to be criminal. Also, the whole country was run as an island. In effect, devolution has put us into exactly the same position as any other mainland European member state—we face the same issues.

The cost of waste treatment in Scotland should be broadly the same as the cost in England. There should be roughly the same standard of enforcement of regulation—in other words, zero tolerance for environmental crime—in Scotland as in England. If we are to get the best possible value, we will need to put in place broadly
compatible regulations. For example, in terms of requirements on data collection, it makes no sense to require one part of the European Union to collect data in one way and for another part to have to do things differently. It makes even less sense for that to happen where there is a common land boundary, as is the case with the Irish Republic and Northern Ireland, and Scotland and England.

The last thing that we want is for waste to be moved around the country as a result of regulatory arbitrage between England and Scotland. The EU directive contains a broad statement on the proximity principle. As a general rule—certainly, for the initial treatment stage—we should stick to that principle. We need to make life as difficult as possible for the criminals.

Professor Baird: Under English law, provision is made for site waste management plans that cover construction sites. England has chosen to go it alone on that one.

I agree that there are concerns. We have to be mindful of the impact of competition on the bill. I am thinking of deposit and return schemes and how the new measures will sit with existing packaging regulations.

In principle, dealing locally with waste and providing services at the local level should not affect competition south and north of the border or how business functions across borders.

John Scott: It is all very well for us to talk about comparing the situations in England and Wales and in Northern Ireland and southern Ireland, but what about comparing the UK or England and France? Will there be uniformity, or could we be putting retailers at a disadvantage? For example, will international retailers buy into what we are doing in Scotland as opposed to what is being done in France, Italy or wherever?

Professor Baird: We have struggled to get consistent product labelling from retailers at the international level. Challenges lie ahead in that respect. Europe is coming at the issue slightly differently from the way in which Scotland is doing things. Europe has an established mix of energy from waste, recycling and landfill. Given that Scotland has less of an appetite for energy from waste, we have to compensate by focusing on the recycling and recovery side. That said, in fairness to Europe, it is pushing hard on recycling.

There is uniformity in the ways in which waste is dealt with—global markets are involved. That said, a large element of waste will always be dealt with using local solutions. For example, a huge amount of organic material will only ever be dealt with by means of composting, anaerobic digestion and food treatment systems.

Dirk Hazell: There will not be uniformity through the European Union. When the waste framework directive was being negotiated, countries made clear their national interests. For example, Germany has gone for a high-end, value-added process, but there is no realistic prospect that any Government of any party in any part of the United Kingdom will go down that route.

In broad terms, the various parts of the UK are trying to align economic and environmental sustainability—they are trying to get the best environmental results as cost effectively as possible. That is a slightly different approach from that which Germany and some other EU countries have adopted.

Public policy has been right in this country. I disagree slightly with what Professor Baird said on the matter. Given that we started from such a low base, with so much landfill, public policy was right to put the initial emphasis on high levels of recycling, so we did not go straight into energy recovery. The next phase will need to include more energy recovery, so in that respect there will be more uniformity.

The real point is—as it is for any mainland European member state—that when there is devolution of the policy area that we are considering, we must be mindful not to create arbitrage between England and Scotland, because criminals and others will exploit significant regulatory and price variations. As a general rule, it is sensible for the regulators to speak to each other, even though the matter is a sovereign area for Scotland. I think that the regulators are starting to speak to each other more.

The Convener: I thank you all for coming. There will be another evidence session on the bill on 4 February, when the cabinet secretary will join us. Some of the issues that we have discussed will come up then. If any of the four witnesses wants to forward further evidence to us as a consequence of our discussions, please do so, bearing in mind that we need such information quickly, because the next evidence session will take place next Wednesday morning. We would appreciate further written evidence being provided as timeously as possible.
Comparison between Shetland’s glass being processed in Cunningsburgh, Shetland and transported to Alloa, Clackmannanshire for processing.

Introduction:

Below is the detail requested by the Committee in relation to my appearance at the Committee meeting on Wednesday 28th January 2009. In addition information about Enviroglass is also attached.

The information below has been provided by Enviroglass and has notes at the bottom outlining some of the assumptions made.

The Enviroglass example is used to highlight how a very narrow instrumental approach to counting carbon emissions can have an adverse effect on local economic and social issues, especially in smaller communities.

Scenario –

This estimation is based on 500 tonnes glass per annum arriving at SIC yard in Lerwick. The glass is received from kerbside collection, SME collection and bring sites in Shetland. At this point there would be two options; 1 transport by road to Enviroglass plant in Cunningsburgh, 20km away or transport by sea to Aberdeen and then by road to Alloa.

1. Glass processed in Shetland:

Travel road: 20km = 500t x 20km x 48gCO2/t = 0.48 tCO2
Operation of Enviroglass – electricity consumption = 5 tCO2
Total = 5.48 tCO2 per annum for production of glass cullet from glass collected in Lerwick by Enviroglass, Cunningsburgh

2. Glass processed in Alloa:

Travel: Ferry: 350km = 500t x 350k x 11gCO2/t = 1.925 tCO2
Travel Road: 120km = 500t x 120km x 48gCO2/t = 2.88 tCO2

However the carbon impact of the additional transport would be zero, as there is significant spare capacity in shipping of freight from Shetland to Aberdeen. Moreover, the haulage companies delivering to Shetland (such as Northwards) operate from bases in the central belt, so there is also spare capacity to Alloa glass recycling plant. Therefore the additional journey would be the diversion from the A9 to Alloa, which is 14 kms

Travel road: 500t x 12km x 48gCO2/t = 0.288 tCO2
Operation of O-I glass crushing plant = (estimated) 1 tCO2
Total = 1.288 tCO2 per annum for production of 500t glass cullet by O-I, Alloa
3. Carbon impact of not producing glass cullet in Shetland:

If glass cullet were not to be produced in Shetland there would be a need to import 200t of cullet, as 40% of the glass cullet produced at Enviroglass is sold for shotblast at the Sullom Voe oil terminal. Glass would also need to be imported for other uses (landscape gardening and aggregate replacement in pathers), though since Enviroglass exports about as many tonnes of these products as it sells on Shetland the impact could be regarded as neutral. Even if the cullet was sourced from O-I in Alloa, these 200 tonnes of shot blast represent 2.142 tCO2 per annum.

4. Cost of shipping the glass from Shetland

The cost of shipping 500t of uncrushed glass to Aberdeen has been quoted at £50,000 (by a Lerwick Shipping Agent). The cost of shipping 200t glass cullet from Aberdeen to Lerwick would be lower per tonne (because cullet is more dense than bottles), approximately £5,000 per annum.

5. Summary

If narrow view of carbon footprint was taken, it could appear that the transport of glass to Alloa, largely using empty ‘back-fill’ freight, would produce about 60% of the carbon footprint of crushing the glass in Shetland.

However when the consequent requirement to ship glass cullet to Shetland (for use at Sullom Voe as shot blast, which is a major outlet for Enviroglass cullet) is taken into account, the carbon footprint of crushing the glass locally is an order of magnitude smaller.

The economic value of three full time equivalent jobs to the Shetland economy is significant, probably in the region of £100,000.

Finally, whilst the carbon impact of transporting the glass to the mainland and returning with 200t of shot blast is effectively zero, there is a significant financial cost, estimated at £55,000 per annum from Aberdeen alone, excluding the cost of road transport to and from Alloa.

______________________________

Notes:

1. Freight by road uses DEFRA data: 48 gCO2/tkm

3. Freight by shipping uses DEFRA data: 11 gCO2/tkm
4. Carbon Footprint of crushing glass in Alloa:
Alloa handles c. 200,000t of glass per annum. The carbon footprint of
crushing the glass in the Alloa plant is therefore significantly smaller, per
tonne of glass crushed, than the Shetland plant. Accurate figures are
awaited, but it is estimated at 2 gCO2/t, therefore for an equivalent 500t, = 1 t
CO2.

Community Recycling Network
30th January 2009
The Federation of Small Businesses in Scotland also gave evidence to the Committee on 28 January. Following that meeting their representative, Susan Love, submitted a copy of a report of survey responses on local authority trade waste practices published by SEPA in 2007 entitled Business Waste Framework. This report was presented to the Committee with SEPA’s permission.
Present:

Roseanna Cunningham (Convener) Rhoda Grant (Committee Substitute)
Liam McArthur Alasdair Morgan
Elaine Murray Peter Peacock
John Scott (Deputy Convener) Bill Wilson

Apologies were received from Karen Gillon.

The meeting opened at 10.00 am.

Climate Change (Scotland) Bill: The Committee took evidence on the Bill at Stage 1 from—

John Ferguson, Unit Manager, Sustainable Energy and Resources, SEPA;

Iain Gulland, Director, WRAP Scotland;

Dr Colin Clark, Head of Waste Management, COSLA;

Richard Lochhead MSP, Cabinet Secretary for Rural Affairs and Environment, Kim Fellows, Deputy Director for Waste and Pollution Reduction, Louise Miller, Solicitor, Food and Environment Division, Kevin Philpott, Waste Regulator Senior Policy Officer, and Simon Stockwell, Waste Strategy Team Leader, Scottish Government.

Climate Change (Scotland) Bill (in private): The Committee reviewed the evidence heard earlier in the meeting.
SUBMISSION FROM SEPA

Proposal 1: Duties on Public Bodies and Businesses to Provide Recycling Facilities.

Question 1: Do you consider that legislation should be made in this area?

SEPA does not consider that a Voluntary Code of Practice on Recycling outwith the home would on its own deliver a zero waste society. We therefore believe that legislation would be beneficial in this area. Significant quantities of recyclable materials exist in waste streams outside the home within both public spaces and work facilities that could usefully be recovered.

Question 2 If so, what form should that legislation take?

Legislation could be based on a revised form of a number of existing regulatory systems such as:

- Producer responsibility
- Duty of Care
- Building regulations
- Event licensing process
- The Planning System

Town and Country Planning legislation could be a useful vehicle to deliver appropriate requirements. The Town and Country Planning General Development Procedure Order could potentially be amended to require all qualifying new development to provide details of recycling and composting provision when submitting a planning application. The planning application would not therefore be registered as “valid” without this information, in a similar manner to requesting details of drainage and road access. Amending planning legislation would ensure developers took this requirement on board at the earliest design stage where the facilities and any land area required can be properly considered. Failure to consider this at the planning application stage may result in applications subsequently being submitted for Building Warrant where the layout would have to be changed to provide recycling facilities, materially affecting the entire development. This would then, in some cases, result in the developer having to submit a revised planning application so delaying the development process. Separate legislation would be required to enforce this requirement retrospectively.

Legislation should address a range of specific issues including:
- the type of waste, for example, cans, glass, paper, batteries, household hazardous wastes and plastics to be recycled
- facilities should be appropriate to the location and types of waste likely to arise
- powers should enable material collections systems and capacities to be specified based on the type of location in question
The following issues must also be addressed:
• assess and resolve the availability of UK reprocessors and end markets.
• establish the dependence on overseas markets and assess any long term risks in dependence on such markets
• address how geographical issues will be considered such as remoteness from markets, collection systems and the related cost implications for businesses and public sector bodies in remote or rural areas?
• demonstrate that reuse has been explored (especially for furniture and WEFE) before materials are recycled

The legislation should apply to all public sector bodies and commercial businesses (especially retail, fast food, travel and entertainment centres) which attract large numbers of members of the public; or in buildings with more than 50 employees, or part of a national chain or franchise that are frequented by the public.

Other Issues to be considered:
• Resources for enforcement of legislation.
• How to assist developers with any costs with “retrofitting” existing sites/developments, for example, through local business rate relief or some similar mechanism.
• Importance of guidance being prepared on what type of provision is to be made for different scales/types/thresholds of development.
• That materials recovered in public spaces would count towards local authority recycling targets irrespective of who owns the collection system or undertakes the collection. Materials collected from businesses not designated as public spaces would be considered as commercial and industrial waste.

Proposal 2: Packaging.

To encourage waste prevention by giving powers to the Scottish Government to make regulations on packaging which would set statutory targets on retailers for packaging reductions.

Question 1: Do you consider that legislation should be made in this area?

SEPA considers it important that the specific application of any such measures are clear in their intent. SEPA does not support the introduction of new measures on recovery (one way of reducing packaging waste) due to the risk of introducing inconsistencies or tensions in the existing UK regulatory systems for packaging. These may not be perfect but they are beginning to work. The cross UK nature of retailing would make this complex and probably highly unpopular.

There is adequate data from statutory returns from compliance schemes at a UK level to evaluate progress in packaging recovery, re-use and dematerialisation. However this is difficult to interpret in a purely Scottish context.
SEPA would suggest the following approach:
• an increased obligation on wholesalers and retailers acting in Scotland to provide improved data on the packaging material entering the consumer market in Scotland — this would improve our data as this tends to be produced at a UK company level and is therefore hard to partition into Scottish data.
• improved measures to penalise excess packaging — probably via a revised Essential Requirements Act in Scotland. This has proved to be an ineffective regulatory system and if designed appropriately would act to place pressure on packaging manufacturers, packer fillers and retailers to further reduce packaging.
• powers to enforce take back of specific packaging materials. This has proved highly effective in some Scandic countries for aluminium packaging for example. If we propose this we should seek for them to be general ‘take back’ and ‘deposit return’ powers as it would be useful in other non-packaging areas such as batteries and some HHW materials (see Proposal 5).
• consideration could also be made for retailers above a certain size to have deposit facilities either in or within the vicinity of their premises to enable packaging materials to be deposited for recycling. This is to some extent linked to the issues raised in Proposal 1.

Proposal 3: Specifying Recyclate.

Question 1: Do you consider that legislation should be made in this area?

SEPA would support legislation in this area to require public bodies to procure goods with a minimum specified recycled content.

Public bodies have significant procurement powers to influence the supply of products with higher recycled content. More effort needs to be made in closing the recycling loop, rather than just focussing on simply increasing recycling targets.

SEPA would have concerns as the practicability and resourcing implications of imposing such a requirement on businesses. It would be more practical to implement this through the manufacturers selling into the UK/EU market via existing producer responsibility powers. In SEPA’s view this would need to be achieved at an EU level. However positive promotion of the benefits of green procurement to business should be ongoing and with increased commitment.

Consideration should be given to imposing a requirement on any private bodies that supply goods or services to the public sector. This supply chain pressure would be one practical way to influence businesses directly.

There is a need to continue support towards recyclate quality via ISO or PAS or British Standards to ensure that the use of recyclate does not diminish quality standards. There is similarly a need to undertake significant awareness
raising to overcome current perceptions that recycled products are inferior quality.

**Question 2: If so, what form should that legislation take?**

- The legislation should lay down the nature of the materials and the contracts to which the duty would apply (including exemptions and whether the requirements would not apply to contracts below a certain value) with a particular focus on paper and paper products (towels and tissue); container-packaging glass; a wide range of plastic consumable goods; building works; grounds and road maintenance contracts. A similar obligation should apply when refurbishing offices and buildings. There is potential for enactment through Building Regulations for new build projects. Refurbishment contracts should also demonstrate that reuse of existing furniture and WEEE has been explored before new products are bought.

- The legislation should be developed in partnerships with experts in sustainable procurement rather than solely from a waste angle. The legislation would need to be based on a clear life cycle analysis of the various product areas to be addressed. Price comparisons would need to be made to quantify the cost to the public sector. Similarly procurement methods should be investigated which would act to reduce the costs of such a requirement through high volume purchasing contracts.

Key elements of any such legislation would include:
1. Type/definition of organisations to be covered.
2. Key product areas to be targeted.
3. Product standards specifying the minimum recycled content.
4. Monitoring and record keeping requirements for verification.
5. Any necessary enforcement powers.

SEPA recommends that consideration should be given to the implementation of such a requirement via a Scottish wide Agency based on some existing body with a national procurement function.

**Proposal 4: Waste Prevention Plans.**

*The responses to the following questions are taken as a whole below:
Question 1: Do you consider that legislation should be made in this area?*

*Question 3: what public bodies and businesses should be covered?*

*Question 2 : If so, what form should that legislation take?*

SEPA considers that legislation is required in this area but largely only for public bodies and larger companies. Public bodies are readily controlled within the wider public estate and as such should be required to demonstrate best practice and best value by driving down the costs of waste management within the public estate.
In general SEPA does not agree that such a requirement should be placed on smaller business for the following reasons:

• The administration of such a scheme would be burdensome on both business and the administering authority

• The operation of the market with disposal costs rising sharply should be trusted to change behaviour with the support of well targeted resource efficiency programmes. In tandem to this carbon and emission trading schemes will act to focus attention on resource efficiency.

SEPA however sees two specific areas where we would support the implementation of waste prevention plans on business:

• We would support an extension of the powers under Pollution Prevention & Control (Scotland) Regulations 2000 to address waste prevention in currently regulated industries.

• In addition to the above, consideration could be given to extending this duty to other large companies in Scotland (delineated by either turnover or employee number) with these powers integrated with those set out above in proposal 3 on specifying recyclate. This may then filter down the supply chain as these companies seek to improve supplier performance. This avoids the implementation of such a duty on SMEs which due to their number would require disproportionate efforts to both monitor and administer and would probably raise questions on the benefits of such regulation in an era of less and better regulation.

• We would support the mandatory implementation of Site Waste Management Plans (SWMP5) with the enforcing body identified. As a national organisation SEPA could be a suitable body to fulfil this enforcement role, helping to ensure the creation of a level playing field. In addition, SEPA already regulates or has an established relationship with many of these industries. SWMP development and enforcement should also be linked to Health and Safety legislation as they also regulate construction sites.

**Site Waste Management Plans:**

• Site Waste Management Plans should mirror what is happening in England where any new development (costing more than £300,000) to submit a Site Waste Management Plan at Planning Stage.

• Implementation of the SWMP legislation in England should be fully assessed in order to ensure that any legislation in Scotland is as effective as possible

**Proposal 5: Deposit and Return.**

*Question 1: Do you consider that legislation should be made in this area?*
SEPA considers that legislation should be made in this area. Such mechanisms are powerful consumer behavioural change drivers. More research is however required into the barriers which prevent businesses from introducing this type of system so that this can be addressed in the future.

**Question 2: If so, what form should that legislation take?**

- SEPA would suggest the development of general powers that would place a take back responsibility on retailers of specific products or powers to implement a deposit refund scheme on retailers of specific products.

**Question 3: Your views on the practicalities of such schemes in Scotland?**

- A deposit system would work but for recycling not return for re-use. Re-use containers tend to have double transport miles (to the retailer and back), increased use of raw materials (need to be more robust) so more lorries to transport (because they are heavier) and increased use of detergents and water (need to be cleaned).
- Full life cycle analysis would have to be undertaken to ensure that the measures were contributing to improving the environment impact of products. We should seek to understand why a once strong deposit and return system on bottles died out. What were the business reasons for these measures not continuing?
- The scheme would have its major applications in non-packaging areas (perhaps with the exception of aluminium containers due to the very high energy savings). Products such as batteries, small electrical items and some HHW products would in our view benefit from deposit refund schemes.
- We believe the public would respond well to such schemes and this would greatly assist recovery in these areas some of which produce problematic wastes.

Careful consideration would need to be given to the structure of any deposit refund system. This requires a central collection agency to hold deposit funds and allocate funds based on returned products. This could prove costly to administer. However a number of working models exist that could form the basis of an options assessment.

**Proposal 6: Mandatory Waste Data Returns from Business.**

**Question 1: Do you consider that legislation should be made in this area?**

SEPA strongly supports a statutory requirement on waste producers to provide data on waste arisings. Increasingly with the complexity of global resource pressures a far clearer perspective on what materials are flowing through the Scottish economy which then arise as waste materials is needed.

An improved understanding of this would assist in identifying a more rapid response to specific resource pressures. Such a measure would also act to focus business on its resource use and provide opportunities for cost savings.

The following applies:
• The principal area where waste data is still lacking is for the waste produced by business, as there is currently no way to collect this directly. A limited amount of information on business waste arisings is available through Special Waste Consignment notes and through the returns for the Scottish Pollutant Release Inventory (SPRI).

• The information on business waste arisings is needed to:
  — aid national policy development;
  — aid in the assessment of capacity needs for the tertiary treatment of residual wastes and in improving technology choices for such treatment;
  — support policy development in organisations such as local authorities, enterprise agencies and others;
  — monitor change and policy impact;
  — help the development of the new National Waste Plan;
  — provide data for planning applications and investment in waste infrastructure;
  — identify potential benefits for businesses
  — and meet internal and external reporting requirements including the Waste Statistics Regulations.

• Currently SEPA does not have sufficient, detailed data to adequately satisfy a number of these. There is a need for information on the type of waste, the quantity of waste, the geographical origin of the waste and the Standard Industrial Classification (SIC) code of the business producing the waste.

• SEPA has attempted to fill this lack of information in two ways; first, directly, by carrying out national business waste surveys and second, indirectly, by using information gathered by the quarterly licensed/permitted waste management site returns. Both have their drawbacks.

  (1) The principal issue with the survey is that it does not provide sufficiently accurate data for SEPA’s needs and those of its stakeholders. For example the 2006 survey showed that the total business waste produced in Scotland in 2006 was estimated to be 7.64 million tonnes with a 95% confidence interval of 2.60 to 13.42 million tonnes. This was mainly because of the poor response from businesses to the survey. A portion of Scottish businesses, about 29,800, were surveyed and there was a usable response rate of 10.8% (3,232). This represented only 2.3% of all businesses in Scotland. It was clear from the survey that some businesses who replied had little knowledge of their waste. The cost of a survey would be about £80,000 at present values.

  (2) The information collected by the quarterly licensed/permitted site returns is good but only deals with the waste managed. It does not collect any information on the producer of the waste and only limited information on its geographical origin. Because of possible double counting issues is also not possible to get completely accurate figures for the waste produced.

• Whilst it would be unfair to place too much pf a burden on business it does not appear unreasonable to require businesses, particularly larger ones, to have a knowledge of their waste and to report this to SEPA. . This would
complement the good work already carried out by Scottish local authorities in increasing waste recycled and reducing waste to landfill. Businesses are part of Scottish society and should be expected to contribute towards a zero waste Scotland. They contribute over two thirds of the annual waste arisings in Scotland.

• There are a number of ways that the reporting burden could be reduced. For example:
  — There could be a de minimus limit under which businesses would not be required to report: of the 148,000 businesses in Scotland in 2006 only 6,680 had 50 or more employees and over 82,500 had less than five. Another approach would be to set a limit based on annual turnover in a similar way to the packaging waste obligations. The limit could be set to balance the need for information with the need to keep the burden on industry to a minimum.
  — SEPA is currently developing an online data collection system for statutory returns, through the Operator Data Returns project. Businesses could potentially use this system for reporting data to SEPA, eliminating the need to create a new data collection system.
  — An alternative approach for collecting the information could be to carry out compulsory business waste surveys on a third of all Scottish businesses annually. This would provide sufficient information for SEPA’s needs.
  — A further alternative would be to undertake a root and branch review of the Duty of Care system and implement it effectively.

• SEPA does not consider such a duty to be a burden to business. Businesses themselves are likely to benefit in a number of ways from this statutory reporting including:
  — identification of cost reduction opportunities through waste minimisation and increased recycling;
  — benchmarking their performance against others in their sector;
  — an enhanced image and reputation by being able to prove good environmental practice;
  — and improved dialogue with the Government and SEPA;
  — more aware of potential future resource pressures (and risks) arising from a rapidly globalising economy;
  — access to education materials/initiatives associated with this obligation.

SEPA believes that placing a statutory duty on businesses to report on the waste they produce would provide the information needed by SEPA and its stakeholders, and more importantly help progress towards a zero waste Scotland, ultimately improve the environment and make Scottish business more profitable and robust in terms of future resource pressures.

• SEPA recognises that the introduction of a new system comes with challenges. There will be a need for a promotional campaign aimed at publicising the benefits to business. Guidance (written and verbal) will need to be available for businesses and ongoing support will need to be provided. There may be initial problems with the quality of returns and with non-returns. However, from the SEPA Waste Data team’s experiences in introducing and
operating the quarterly licensed/permit ted waste management site returns these can be overcome relatively quickly by supporting the businesses.

• DEFRA is currently consulting on a proposal to add the requirement to report the SIC code of the waste producer to the waste transfer note. If this requirement was introduced the SIC code could be requested by a licensed/permit ted site when waste is transferred for recovery or disposal. This would be reported in the returns made by licensed waste management facilities to the Environment Agency.

• This type of system could work in Scotland but would increase substantially the workload on both SEPA and the waste management industry, Its main strength is that it builds on an established system but there may be some reluctance from the waste management industry. SEPA’s Waste Data team believes that this methodology could provide the information required but that it removes the need for businesses to have knowledge of and be responsible for the waste they produce.

Proposal 7: Other Measures to encourage Waste Prevention, including action on single-use carrier bags.

Are there any other areas, not covered by this consultation, where legislation could be made to increase recycling and promote waste prevention?

SEPA considers that consideration should be given to the following additional areas for potential regulatory powers:

A local tax or levy on disposable and single use products should be considered when there are alternatives e.g. disposable picnic ware, razors, nappies, and cigarette lighters. This could include single use plastic or paper bags. However in this latter case SEPA believes we should see how the voluntary code of conduct agreed with national retailers is working prior to implementing any such action on carrier bags;

• Reduced VAT on products that have a high content of recyclate;
• Consideration should be given to encourage products to have a built in 5 year warranty to encourage repair rather than planned obsolescence. We again note that this would not be a devolved matter with significant implications at an EU level;
• Repair services should be VAT free;
• The implementation of landfill bans. SEPA however notes this can be addressed with existing powers;

SEPA considers that resource management is ultimately about materials management. As such powers should be developed that could be used to require specified materials to be managed in ways that represent the Best Practicable Environmental Option (including carbon management benefits).
General Comments

Whatever legislation is developed there needs to be a communication plan and guidance linked to it. The more engagement and guidance provided the better the legislation will be implemented.

SEPA is disappointed to see that the proposal for direct variable charging for waste has been withdrawn from proposals. Householders should equally apply to the Polluter Pays principle and be more aware of the impact that their wasteful activities have. It seems to be more of political decision to pull this option, which is concerning when some difficult and often unpopular political decisions need to be made if we are to seriously move Scotland towards a Zero Waste society. It is difficult in SEPA’s view to justify the challenging recycling targets placed on municipal authorities without the requisite powers to change public behaviour.

The resourcing implications of enforcing legislation also need to be given careful consideration and, where possible, SEPA would support the review of similar legislation with the other UK administrations that could result in consistency of UK legislation and greater environmental benefits.

SEPA
3 October 2008
Climate Change (Scotland) Bill: Stage 1

10:01

The Convener: Item 2 is evidence on waste reduction and recycling, which is included in the Climate Change (Scotland) Bill. We are the secondary committee on the bill and we are scrutinising the provisions on waste, forestry and muirburn. Today’s evidence session is the second and final session on the waste provisions, which are contained in sections 52 to 61 of the bill.

I welcome the first panel of witnesses. We have John Ferguson, unit manager of sustainable energy and resources at the Scottish Environment Protection Agency; Iain Gulland, director of WRAP Scotland; and Dr Colin Clark, head of waste management at Highland Council.

Dr Colin Clark (Convention of Scottish Local Authorities): I am sorry to interrupt, convener, but I am here as chairman of the Convention of Scottish Local Authorities waste network, not as the head of waste management for Highland Council.

The Convener: Okay. That is duly noted.

SEPA’s submission to the Scottish Government’s consultation on waste provisions has been circulated to members as paper RAE/S3/09/4/6. We are not taking opening statements; we will go straight to questions. I think I am right in saying that Alasdair Morgan will open the questioning.

Alasdair Morgan (South of Scotland) (SNP): Dr Clark, does what you just said change anything that you were going to say today?

Dr Clark: No.

Alasdair Morgan: I have a question for WRAP Scotland. SEPA and Highland Council are probably more familiar to members. I notice from the website that WRAP is fully funded by Government. Mr Gulland, will you explain briefly what WRAP does and what its relationship with Government is?

Iain Gulland (WRAP Scotland): WRAP is a United Kingdom organisation that is funded by the four Governments—the UK Government, the Scottish Government, the Welsh Assembly Government and the Government of Northern Ireland. Our role is primarily as a delivery partner. We have now established our Scottish office, which I head up, to deliver a number of programmes to increase the amount of material that is recycled or reused—it is prevented from becoming waste. We work with a range of stakeholders, primarily households or businesses.
We look at opportunities for businesses to reduce the amount of waste that they produce.

We carry out market development exercises to look at what we can do here in Scotland with the material that is coming out of the waste stream, so that we turn it back into products that can be used or put it back into the supply chain. That might involve glass or plastics going back into producing glass and plastic bottles. We work with retailers throughout the UK to help them to reduce their impact in terms of packaging waste, and to minimise food waste in their supply chains and in the food that householders take home.

We tend to work right round what we call the resource efficiency loop. Waste prevention is our principle objective, working with businesses, consumers and the construction industry. We then look at where waste is produced, and the infrastructure for collection and recycling. We are very much involved in looking at the processing of waste materials for onward market development once they have been collected. Finally, we focus on market development, and primarily on considering the opportunities. WRAP Scotland is trying to address those opportunities in Scotland to make use of the materials and turn them into an economic benefit for our country.

Alasdair Morgan: Are any targets set for you, either internally or by Government?

Iain Gulland: We have targets. WRAP Scotland produced a business plan last year in partnership with the Scottish Government. Our target over the next three years—this year and the following two years—is to divert 600,000 tonnes of waste from landfill, which is equivalent to about 400,000 tonnes of carbon savings. That will include an economic benefit—there is potential for £18 million of savings for business if we divert those tonnes. With regard to market development opportunities, our target in economic terms is £20 million-worth of increased turnover.

Alasdair Morgan: Do all three witnesses think that zero waste, as defined—or as described—by the Scottish Government, is achievable?

Dr Clark: Zero waste is, in my view, an interpretation of the European waste hierarchy—no more and no less. The only difference between the waste hierarchy and zero waste happens to be the targets that the Scottish Government has set in relation to the zero-waste concept.

You asked whether zero waste is achievable. I think that pretty much anything is achievable if one tries hard enough. On the continent, Austria is probably the best performing nation at present—its percentage figures for recycling are in the mid-60s, and it has lots of energy from waste to deliver heat and power.

We are looking at a 17-year timeframe to reach a target of 70 per cent. It is not unachievable, although it will be very difficult to achieve, if we consider the maths. I do not necessarily agree with the current interpretation of the 70, 25 and 5 per cent targets, but COSLA hopes to discuss that with the Scottish Government in due course.

Alasdair Morgan: Is that the 25 per cent energy-from-waste target?

Dr Clark: Yes.

Iain Gulland: I think that it is achievable. We are much more aware now of what is achievable in a technological sense. When I got involved in waste management more than 15 years ago, there was an arbitrary idea that we could recycle only 50 per cent within the waste stream. There is growing evidence that more than 90 per cent of what is in the waste stream can be recycled, so we need to focus on the remaining smaller percentage. Throughout the world, it is evident that other nations and provinces are working towards zero waste, as they know that it is now technically possible to achieve that.

Increasing recycling in the European states is, as Colin Clark said, a long-term vision and a journey, but we can now view it as something that can be achieved. There will be many years of issues for us to overcome, but it is technically possible to get to zero waste.

John Ferguson (Scottish Environment Protection Agency): Zero waste is a difficult concept to pin down and define, and there is a lot of variability throughout the world in how people interpret it. It is a good aspirational environment to work in, with regard to trying to derive value from all materials. One could say that waste consists simply of certain materials in the wrong place at the wrong time, with a different economic perspective taken on their value.

Waste management is really about materials management, and about recognising that materials flow through the economy for a range of reasons. Waste is simply a different kind of material in terms of its economic utility. We have to focus on waste more as its component materials, rather than as the complex mix of materials that we tend to deal with in relation to mixed municipal waste or mixed commercial and industrial waste. We can derive value from that through the recovery of materials or the production of energy—those are the two major products. In trying to derive that value, we must understand how the system operates and how we can make it more efficient.

Zero waste is a good aspiration and it helps us to focus on deriving value from all materials, which is important in an increasingly globalised economy, notwithstanding the current economic
difficulties. There is increasing resource pressure—our economy needs resources in order to manufacture—and we must be clear about the resources that are critical to the Scottish economy. Therefore, a strong focus on material value recovery under the auspices of a zero-waste aspiration is a good thing.

Alasdair Morgan: Dr Clark said that a potential 25 per cent limit on the proportion of energy that can be produced from waste might make a zero-waste economy more difficult to attain. Do you agree?

John Ferguson: Sorry, could you repeat that?

Alasdair Morgan: Dr Clark said that the Government's idea of a cap of 25 per cent on the proportion of energy that can be produced from waste would make zero waste—however we define that idea—much more difficult to attain. Do you think that that is the case?

John Ferguson: No, I do not, personally. The cap is quite a smart instrument that recognises public concern about incineration. There is an argument that, in burning mixed waste, we waste raw materials that have no energy value but which have an economic utility as materials. The cap helps us to focus on the need to push prevention, to drive waste out of systems and to recycle more. Pragmatically, it helps us to recognise that, if we have a need for energy recovery, we should focus that energy recovery on appropriate types of waste—those that have an energy value—to displace fossil fuel in the system. I think that the cap is quite a good idea.

Iain Gulland: There is obviously an argument about the compatibility of producing energy from waste and the achievement of zero waste. If we do not have any waste, we cannot get any energy from it. As to how it fits into the strategy, we are on a journey to eradicate waste in Scotland and, as John Ferguson says, it is about minimising the use of resources at source. Does the production of energy from waste have a part to play in that? I am not sure.

The Convener: Perhaps Dr Clark would like to elaborate on his concerns in respect of the 25 per cent cap.

Dr Clark: I do not have too many concerns, but I think that the cap is too prescriptive. I am not advocating that Scotland should move from landfill to incineration. However, Highland Council is running a trial on the Black Isle whereby we have achieved 70 per cent diversion from the kerbside in a very small and specialised trial. I want to use the waste hierarchy to achieve zero waste, but I recognise a pragmatic argument for producing energy from waste.

The situation may be different in different parts of the country, and stating that 25 per cent is the absolute maximum proportion of energy that we should produce from waste is a bit too dogmatic for my liking. Increasing that figure a little bit when it is economically and environmentally appropriate would give Scotland a degree of leeway in meeting its targets and would not diminish the aspiration to achieve a recycling rate of 70 per cent. When energy is produced from waste, material from the front end—metals and so on—is diverted back into the recycling bag and the ash at the back end can be used for road construction and so on. Essentially, that material is recycled in a rounded, integrated process. Saying that only 25 per cent of energy should be produced from waste is a bit too dogmatic for Scotland.

The Convener: It is not the principle of the cap that you object to; it is simply where it is placed.

Dr Clark: It is the principle of the cap.

The Convener: So, you do not want any cap.

Dr Clark: I can see the value in having a cap, but a range would be more appropriate.

10:15

John Scott (Ayr) (Con): May I help you? Might it be because the cap has been set arbitrarily and it is the flexibility in and around that figure—

The Convener: Before we jump to the conclusion that the cap is arbitrary, it would be interesting to discover the basis on which it was set.

Dr Clark: If the 25 per cent cap were set arbitrarily, I would be concerned.

Bill Wilson (West of Scotland) (SNP): It has been suggested that a large level of incineration tends to take materials away from other recycling uses, thereby reducing the potential for recycling. You are not concerned about that, which I suspect is related to the cap.

Dr Clark: The evidence from Europe contradicts that, especially those nations that have been getting to grips with recycling over the past two and a half decades. The problem in Scotland, and in the UK, is that we are so far behind our major competitors and colleagues in Europe. They have been through what we are going through now and they have achieved 50 to 60 per cent recycling targets. They also have an integrated network of energy-from-waste plants that provide heat and electricity to their communities on an integrated basis. I am concerned that I am starting to be labelled as the energy-from-waste man—I do not want that. I am devoted to recycling, but more important, to waste prevention. EFW in the UK has
had a bad press for historical reasons that are fairly easy to explain.

**Rhoda Grant (Highlands and Islands) (Lab):** What are your views on the capacity of the current waste infrastructure?

**Dr Clark:** We have not got much of a waste infrastructure, quite frankly. Up until 2003-04, which was the point at which the strategic waste fund took off, we were married to landfill. We are slowly making the move away from landfill, but as I said previously, it has taken a very long time to do that and it will continue to take many years to get an integrated infrastructure that can deliver what we need. We are a long way from that.

We are short of pretty much every tool that we need to divert waste from landfill. One of the problems with the recylcate market in Scotland, as far as COSLA is concerned, is that there are few materials recycling facilities here and very few in the hands of local authorities. All the recylcate in Scotland is funnelled through very few MRFs.

**The Convener:** What are MRFs?

**Dr Clark:** Materials recycling facilities—people who have to use them to divert waste can be held to ransom. We have a considerable way to go. We need EFW, in-vessel composters, materials recycling facilities and possibly anaerobic digesters. We need the full panoply, but we do not have it at the moment.

**John Ferguson:** The early focus on recycling from 2003 was a good thing, because it allowed us to make major progress rather than focus on the post-recycling residual treatment systems that we needed.

I would have preferred it if we had started to make progress on building infrastructure perhaps two years ago; we are a little behind the game now. However, the Scottish Government is strongly focused on the need for the new infrastructure that Colin Clark identified. The rate at which the infrastructure will have to be developed is a challenge to the planning system.

One of the top 10 significant risks of the past 10 years has been the planning system’s ability to deliver land use decisions for infrastructure development. However, there is a significant opportunity for investment in building capital infrastructure during the economic downturn. We need that infrastructure for the long term and it is probably coming at a good time to help to drive economic stimulation. That has been the risk, but if we can get going and make investments in the right way, we have an opportunity. Colin Clark is absolutely right that we need that infrastructure urgently.

**Iain Gulland:** We at WRAP are working to develop the waste infrastructure in Scotland. The focus of our business plan is to support the development of local authority and private sector collection infrastructures for householders and small and medium-sized enterprises. We work alongside businesses that are interested in developing recycling collection services.

We are engaged in a number of capital grant projects in partnership with the Government, which is putting up money to invest in infrastructure, particularly for anaerobic digestion and in-vessel composting to meet the needs of the requirement to take food waste out of the waste stream. Recently, the cabinet secretary made an announcement about a £5 million investment in plastics processing in Scotland. A lot is on the table to be taken forward to meet the needs of the zero-waste strategy. It is happening; there is activity on the ground.

Private investment is needed, as well as public sector and community sector investment. We are involved in a partnership project with the Community Recycling Network for Scotland to deliver funding for infrastructure that is being run by the community sector. A lot is happening with regard to meeting the needs of the strategy, but it takes time to get some of the kit on the ground. There are planning and investment issues when we look for private sector investment to match the funding that the Government has made available. We face challenges, but we are actively involved in the delivery of the infrastructure.

**Rhoda Grant:** Last week we heard evidence from small businesses that are concerned about their place in the process. Domestic waste is recycled by councils, and large companies have the ability to do their own recycling, but no one has considered how the waste could be collected from small businesses.

**Iain Gulland:** A couple of years ago, our organisation ran a programme to develop small business recycling facilities. We ran a number of pilots and invested in collection infrastructure across the UK, including some facilities in Scotland. The aim was to show that it could be done, and to learn best practice so that we could create a toolkit or best practice guide that we could make available to other businesses.

The problem is that other businesses or local authorities need to come forward to say that they want to run such services and to look at the economics of doing so. We continue to work with businesses, but we do not have a specific programme for that at the moment. We ran our programme for a couple of years, and we might consider running it again. I am well aware that the issue has never been addressed properly, and that there are geographical problems with businesses that are located in remote areas in the Highlands, for example, and which cannot access
recycling services. They rely on the local authority
to do recycling—Colin Clark can answer that
question.

The Convener: I will decide who answers
questions.

Iain Gulland: I am sorry, convener.

We continue to work with businesses that are
interested in developing collection infrastructure
for SMEs. We provide them with as much support
as we can, and with little bits of funding where
required, but it is about finding the entrepreneurs
out there who want to progress such services.

The Convener: We need to make progress.

Elaine Murray (Dumfries) (Lab): Last week, we
discussed the revised European waste framework,
which introduces a hierarchy. Total prevention
of waste is the most desirable; disposal is the least
desirable.

The bill is written in terms of recycling, including
reuse and recovery. The minister has argued that
that is really for convenience of drafting, and it will
not prevent the introduction of the requirements of
the European Union directive. On the other hand,
Dirk Hazell from the Scottish Environmental
Services Association expressed concern that that
was a way of dodging the difficult discussions
around energy recovery, and that, within the terms
of the bill, burning paper and plastics that could
have another use would be rated the same as, for
example, anaerobic digestion, which means
removing methane produced by organic materials
from the atmosphere. Will the different definitions
have an impact? Are you concerned that the bill
does not seem to recognise those differences?

John Ferguson: The term “recycling” is used as
a de facto replacement for the hierarchy, so I do
not think that the bill implies that the hierarchy is
not important. The bill also has a strong focus on
waste prevention and waste minimisation powers.

I am not quite sure where Dirk Hazell’s concerns
came from. Perhaps he was more concerned that
there was not a stronger focus on the role of
energy from waste, given that the Environmental
Services Association that he represents has a
large number of members that are interested in
incineration, particularly in England and Wales. I
think that the perspective that he brought to that
discussion did not accurately reflect the true
meaning of the Scottish bill.

Iain Gulland: To be honest, it stands out that
the bill includes energy recovery under the
auspices of recycling, whereas the waste
framework directive makes a clear delineation.
Arguably, it would be better to clarify that so that
the two pieces of legislation are aligned. However,
I thought the opposite from Dirk Hazell, who
seemed to me to be almost arguing against

himself. If his industry wants to present energy
recovery as part of the solution to climate change,
he probably should not have highlighted that
issue. That is my personal view, not the view of
WRAP. However, I can certainly see his point. I
am not a legal expert on how bills and directives
are written, but I can see that some clarity on the
definitions would be useful.

Dr Clark: If the parliamentary draftsmen and the
Parliament’s lawyers are happy and content that
the provisions cannot be misconstrued in a legal
sense, I think that I am happy with the wording. I
used to deal with regulation and so forth many
years ago, so I tend to like acts and regulations to
state explicitly what they mean in some depth so
that there is clarity for everyone. The more that
interpretation is permitted, the more likely it is that
there will be far more interpretation than people
might have wanted.

The Convener: I advise members that I do not
want to spend the next 15 minutes talking about
the drafting of bits and pieces of language.

Elaine Murray: The point that I want to follow up
with Dr Clark is that the previous emphasis on the
prevention of landfill, which was stimulated by the
landfill tax and so on, resulted in local authorities
having a variety of different approaches across
Scotland. Some local authorities went for recycling
and reuse, whereas others went for energy
recovery. In terms of the hierarchy, will those local
authorities that chose a different path now face a
problem, given that under the hierarchy some
methods are more desirable than others? Might
that present a difficulty for local authorities?

Dr Clark: Individual authorities that have
invested in a particular technology to a larger
extent than the targets would now suggest is wise
might have some problems.

However, on waste prevention, local authorities
are pretty limited in what they can actually
achieve. The tools that local authorities can apply
to prevent householders and communities from
generating waste in the first place are pretty
limited, to be perfectly honest, despite the panoply
of tools—some of which are included in the bill—
that are available. If the crude question is whether
local authorities can significantly prevent waste
from arising by means other than the promotion of
waste awareness, the answer is that we are pretty
limited in what we can do.

On reuse, we can do something. However, in
our operations in Highland—to use that just as an
example—the proportion of waste that we can
refurbish, repair and reuse is actually quite small
in comparison with the whole.
10:30

**Peter Peacock (Highlands and Islands) (Lab):**
Sections 52 to 59 provide for an extensive suite of eight key powers that ministers could use to take future action in secondary legislation. At last week’s meeting, one witness said that they were entirely relaxed about that approach, but others expressed concerns about it, one of which was that it would be better to specify the powers in question in the bill than it would be to wait for secondary legislation. Another view was that the future use of the truncated procedure of a statutory instrument was not the right way to enact such significant powers, and that it would be far better to deal with them in primary legislation. Do you have views about the advantages or disadvantages of using secondary legislation? The bill will give ministers a suite of powers to take action in the future.

**Iain Gulland:** I am not an expert on that but, at the moment, we are quite comfortable with the proposed approach. We are talking about enabling legislation. As part of its zero-waste policy, the Scottish Government has, as we have seen, set out some extremely ambitious targets that will be challenging to meet. The bill is challenging, too, and sets out a clear direction for Scotland. The enabling provisions do the same. They set out the course that we are on and the issues that are being thought about, and enable the Government to reserve the right to come back with more specific legislation.

It is clear that some issues are still being worked on, so it is not a case of saying, “Let’s sit back and see what happens.” My organisation is working on a range of areas to do with the bill. We are working with retailers, businesses and the packaging industry, and we are looking at recycling on the go. There is a lot going on. There is a sense that we have turned a corner on recycling on the go. There is a lot going on. There is a sense that we have turned a corner on resources, not just in Scotland, but on a global scale.

Following the Stern report, businesses and individuals are waking up and looking to see what they can do. They want to come together. Our work with the retailers on the Courtauld commitment has shown that people from quite a diverse sector can get round the table, examine the challenges that their sector faces and start to work out some of their objectives and the journey that they need to go on as an industry. Enabling legislation helps that along. It is almost a way of nudging people in the right direction and keeping them on track. It lets them know that the Government is thinking about such issues, is keen to take action and wants to work with people, but that, ultimately, it can introduce specific secondary legislation if it does not think that progress is being made quickly enough.

**John Ferguson:** In an ideal world, a Scottish waste management bill would have been a better vehicle, but we do not live in an ideal world. There is significant pressure on parliamentary timetables. The pragmatic decision was taken to use the Climate Change (Scotland) Bill as a carrier bill. It does something extremely useful in that it links waste to climate change, the connection between which is strong. In addition, it gives us the flexibility to define secondary legislation according to a separate timetable, as and when we need it.

I have some issues with specific measures, which we might come to in later questioning, although we made the relevant points in our consultation response.

**The Convener:** We have 27 minutes left, so I am not sure that we will have time for that.

**Dr Clark:** Just briefly. I pretty much concur with my colleagues. I would be heartened to see new waste legislation in any way, shape or form, as it is long overdue. However, I would prefer a root-and-branch review of all waste legislation to be carried as soon as possible.

**Peter Peacock:** Thanks for your comments. Given what you have said about the relative priority that should be attached to the various provisions in sections 52 to 59, are there one or two areas on which you would like progress to be made first?

**Dr Clark:** Yes. I could talk about that for ages.

**The Convener:** Don’t!

**Dr Clark:** I will not. I have concerns about most of those areas, but there are two that I think we should get motoring on as quickly as possible. My first priority relates to the information on waste. The municipal waste data are excellent, because the concentration has been on municipal waste, of which there is less than 4 million tonnes in Scotland. Commercial and industrial waste has been left to blow in the wind, frankly.

**The Convener:** Literally.

**Dr Clark:** Aye, literally. Commercial and industrial waste should have been tackled a long time ago. We need good-quality data on that. Perhaps I should not say that we need to force it to go down the same road as municipal waste, but “force” may be the right term.

My other priority is procurement of equipment and apparatus that contain some recycled material. There is no reason why the public sector generally should not procure in that way.

**John Ferguson:** I agree strongly with my colleagues’ view that the procurement process could be used to significantly greater effect and
that having data is essential. In addition, deposit-and-return powers should be extended beyond packaging because that type of instrument engages the consumer more. I am concerned that there is no incentive to collect products such as fluorescent light bulbs, which will come into the waste stream in millions. That type of problem waste is hazardous and will put a lot of mercury into landfill sites. A lot of embedded plastic, electronic material, glass and chemicals can be recovered. We need to stimulate the public's engagement with recovery systems. In that respect, I would extend deposit-and-return powers to encourage the public to take more responsibility by paying for something that they then return.

**Elaine Murray:** I have a question on how the provisions should be enforced. What will be the impact on SEPA in particular of having to undertake additional duties when the Flood Risk Management (Scotland) Bill and the Climate Change (Scotland) Bill are eventually enacted? There may also be an impact, though a lesser one, on local authorities in that regard.

**John Ferguson:** As you know, SEPA has a primary responsibility as a regulator and data collector. SEPA's responsibility for the waste strategy in Scotland started in 1996, when it was established. It had that responsibility until a couple of years ago, when the powers switched to ministers. We published the national waste plan in 2003, so we have a legacy of engagement and staff competence in waste strategy issues. Those people are used more frequently in the regulatory framework to improve how we regulate. SEPA's better waste regulation project is closely aligned to the review of the national waste plan to ensure that we regulate in accordance with the objectives and targets that are set by Scottish ministers. We engage and work closely with the Scottish Government and its officials to ensure that our regulatory functions dovetail closely with wider waste objectives in Scotland.

**Dr Clark:** When I read through the briefing papers, the enforcement bit caught my eye. Every paragraph suggested that significant enforcement duties were likely, which concerns me somewhat. The suggestions about how many hours it would take to enforce duties are wildly optimistic. Anybody who has had to take a case to procurators fiscal under the current criminal environmental law will know that it is difficult to get them to take such cases. I shudder to think what a procurator fiscal will think if cases concerning the enforcement duties start to roll in, given the length of time that it might take to get to court and what might happen in court. I am concerned about that aspect, even though I quite like enforcement.

**The Convener:** So enforcement is all very well if it can be done, which depends on its nature.

**The Convener:** So enforcement is all very well if it can be done, which depends on its nature.

**John Ferguson:** There is a strong emphasis in the bill on voluntary engagement and producer responsibility initiatives, which is a good way to go. We should say to industry sectors in particular that, if they come up with solutions, there will not be a regulatory environment. It is wise to have a primary process of voluntary engagement, which obviates the need for strong regulatory enforcement. Ultimately, however, we must have a sanction if we want to change things.

**Liam McArthur (Orkney) (LD):** There was some disagreement among local authorities that responded to the consultation over whether new statutory powers were required or whether voluntary agreements were a more useful vehicle for achieving improvements in recycling rates. Can or should the Government introduce other positive instruments to improve rates? There is debate over whether this is the best of times or the worst of times in which to take forward the waste agenda but, from your evidence, I detect the view that it is the best of times. You indicate that there is a mood to derive more value from waste and that we have an opportunity to put in place the necessary infrastructure—something that has lagged until now. However, a robust market for recycled materials is needed if that is to happen. What are your observations on the state of the market? What is likely to happen over the next couple of years or so?

**Iain Gulland:** There is a lot in those questions. Colin Clark alluded to the fact that there has been a drop in the overall price that is paid for recyclates that are collected in the UK and across the globe. That is due primarily to the bite of the recession. However, although markets are at a low level, they are stabilising. Material is still moving from Scotland to those markets, some of which are in the far east and some of which are here in the UK.

I am not in a position to forecast what the situation will be in future, but stability is key. The prices that people received for materials six months ago were very high—some would say unsustainably high—and a fall in the prices of those commodities was due. However, the materials still have a value. There is certainly an environmental value to taking them out of the waste stream, as part of the climate change agenda, whereas a liability is associated with putting them into landfill. We can still get value from them by using them to produce energy from waste, through incineration. There is still an economic model for waste; the majority of processing industries in the UK have been able to adjust to the situation.

**The Convener:** I do not mean to be rude, but you talk a lot about the UK. However, it would be a fundamental issue for all of us if we thought that...
we were shipping stuff hundreds of miles to somewhere else. Can we think about recycling in the context of Scotland, rather than the UK market?

Iain Gulland: The problem has been that in Scotland there is a limited market for materials, apart from glass and organics. The majority of our paper leaves Scotland and goes to other parts of the UK and abroad. I refer to the UK because that is the market. Even now, our home-grown market is not as large as we would like it to be.

The Convener: So developing a market more locally is an issue.

Iain Gulland: Exactly. WRAP Scotland is keen to develop such a market—that is our focus. It is a bit like all the other issues that relate to climate change. If we can be more self-sufficient, we will be much more resilient as a nation in situations like the global downturn that we are now experiencing. If such a downturn were to happen again—hopefully, we will have many hundreds of years in front of us before it does—we would be much more resilient if we could deal with matters in this country. That is what we are trying to do, by building up markets for waste.

In the current situation, there is a huge opportunity. I have been in my job for seven months, but it has changed radically in that time, simply because of what has happened in the markets. When I met people seven months ago to talk about market development, they were interested in this country but, as long as the Chinese were paying high prices, materials were going straight from local authorities, through brokers, to the far east. It was difficult for Scottish industries to gain a foothold in the marketplace, because they could not compete. Now the markets are depressed and the Chinese are no longer offering the same prices—that is basic economics—so there is a great opportunity for us to build an industry in Scotland for the future.

I turn to the issue of waste savings. During the boom, industry focused on profit, but now it is focusing on the bottom line. Resource efficiency is about the bottom line as well as the environment—it is about savings. We are working hand in hand with the construction industry in Scotland, which is keen to attend meetings and seminars to hear about resource efficiency and how to minimise waste, simply because that is about savings. Anything that can impact on its bottom line is significant at the moment. The construction industry is engaged in the process, as are many other industries. This is an excellent time to build the resource-efficient economy that we are looking for in Scotland.

10:45

John Ferguson: The issue is cyclical; we have had it before and we will have it again. The previous comment was on infrastructure. We need to be flexible in our infrastructure. For example, when the recycling markets for paper fall, we should be able to displace into energy markets.

We need more indigenous markets, because we have the potential for economic development. That dovetails well with the emerging work that we are doing with Scottish Enterprise on developing in the environmental technology sector. Waste is a strong element of that wide and diverse sector.

To stimulate more recycling, I think that we are going to have to bite the bullet of charging the public for their waste. It is a complex issue. I would not call it direct variable charging; I would call it direct variable savings. I would incentivise the public to save money. In most countries in Europe, charging works well to drive recycling rates up. I know that it is unpopular, but it is important.

The Convener: That can work only where it is possible to uplift the material, but there are huge parts of Scotland where physical reasons prevent that.

John Ferguson: It is horses for courses. Instruments can be designed to work in different ways in different geographies and different socioeconomic areas. Europe has rural areas too.

The Convener: Perhaps Dr Clark will come in on this point. I can speak from experience of Perth and Kinross Council, which cannot uplift separated waste from 10,000 households. The areas where the houses are cannot physically be accessed—I know, because I live in one of them. As a result, there is undifferentiated waste. You could not fine those households.

John Ferguson: Agreed.

The Convener: I wonder whether Dr Clark will comment. My guess is that the problem is much greater in the Highlands and Islands than it is in a place such as Perth and Kinross.

Dr Clark: I am not an advocate of pay-as-you-throw, for a whole raft of reasons.

The Convener: There are too many areas in which to throw at 2 o’clock in the morning, without paying.

Dr Clark: I make no criticism of my colleagues, but the debate constantly comes back to municipal waste—the stuff that local authorities pick up. As I have said before, that amounts to less than 4 million tonnes. That includes commercial waste, which is a whole other debate. A huge rump of commercial waste just gets landfilled. It is out with the context of the landfill directive, but if I landfill it, I am subject to that directive.
I want to respond to issues that Mr McArthur raised. Recycling to high levels takes more than infrastructure; it also takes time. If we created all the infrastructure tomorrow, we would not immediately get 60 or 70 per cent recycling. It takes time. Europe has taken that time, but we decided to ignore completely the landfill diversion debate until only a very few years ago. That is partly why we are now rushing to get infrastructure. Recycling has come to the fore partly because the Chinese and other markets have closed off.

Because we have been in such a rush, we have often gone for the cheapest options. As a result, the quality of the recyclate that we have collected has perhaps not been all that it should have been. Those are self-inflicted wounds. What we started five years ago, Europe started 30 years ago. We have to play catch-up, because of the landfill directive—particularly, the landfill directive targets for 2013.

John Scott: A moment ago, the convener mentioned the possibility of Scotland taking a different approach from that of the United Kingdom. Would the witnesses care to talk a little more about that?

The Convener: Is there a difference between Scotland and the rest of the UK in terms of waste reduction? If so, what is it?

Iain Gulland: The situation is the same—the challenges are the same. Householders in England and in Scotland are all trying to reduce waste.

The Convener: If everybody is trying to achieve the same aim, is avoiding divergence important? Given where we start from, is that possible? Does Scotland diverge from the rest of the UK? Do Scotland and the rest of the UK diverge from the rest of the EU? The issue is different approaches.

Iain Gulland: The targets in Scotland are higher, but that is not a problem—Scotland is leading on that in the UK. Other people in the UK and Europe are looking at that. Somebody must lead and push the envelope.

The Convener: I am sorry—perhaps we are not framing the questions in the right way. Having different approaches opens up the possibility of folk saying, “It’s easier for us if we ship our stuff off to them.” That raises cross-border issues, particularly for people such as Elaine Murray, who represents a constituency that borders England. If we have a different set-up from England, whoever has the more attractive set-up might be inundated. That goes, too, for the whole of the EU.

Iain Gulland: Yes—I guess that that is an issue. It is obvious that retailers that operate throughout the UK look for UK-level agreements. If they aspire to achieve targets, they want what they are asked to do in England, Scotland and Wales to be similar. It is beneficial to have a common approach. However, it is encouraging that Scotland has set higher objectives, to try to bring England or other parts of the UK up to its level, with the support of retailers.

The opposite is also true. As far as I know, waste from Northern Ireland is still coming into Scotland, because landfill is cheaper here than it is there. Such activity is happening already. There are issues that need to be considered.

The Convener: What about the EU scenario? The same issue applies to the whole of the EU.

Iain Gulland: Absolutely. However, recycling is undertaken for economic and environmental reasons, which means that distances are important. It is not economic or environmental to truck organic waste over long distances or even out of Scotland—that defeats the purpose. The drivers for recycling are not just costs but sustainability and climate change. People will not be allowed to drive materials all over the country, because that will not add up for the climate.

The Convener: What does “People will not be allowed” mean? I am not sure how people will be prevented from doing what you describe. That takes us back to the enforcement issue.

Iain Gulland: Forcing people is not the way to proceed. If we are challenging people to buy locally and ethically and thinking about such things as ecological clauses in public procurement, that will drive people to think of local solutions and local pragmatic approaches to doing stuff. That will swing the pendulum away from people trucking green waste all over the country simply because that is the most economic way to operate, which I do not think that it will be, given the cost of petrol and diesel.

John Ferguson: Cross-border consistency is important, but it is not a reason not to do things differently, when that is justified. The transboundary movement of waste is carefully regulated by legislation. As Iain Gulland said, moving waste involves a cost. Increasingly, that cost pressure will reduce the movement of waste over illogical distances.

The Convener: We have had no difficulty in shipping material to China.

John Ferguson: Let us be clear. If we are to import China’s goods, China needs the raw materials to produce those goods, but I am not talking specifically about China. The trade in goods is international, as is the trade in raw materials. That is not to say that we should not try
to develop indigenous markets and economic development potential and to manufacture more in this country, but trade in goods is international, as are commodity movements. We must recognise that reality of the globalised economy.

The Convener: We have a couple of minutes left. We have talked about differences between countries. Equally, differences exist between local authorities, so I have a question for Dr Clark. Does COSLA have a view on the impact of differences between local authority recycling collection schemes? Has COSLA discussed introducing consistency across local authority boundaries? We have talked about consistency across legislative boundaries, but starting with local authority boundaries might be useful.

Dr Clark: You are right that there is not a great deal of consistency in how local authorities collect waste, what they collect and the frequency with which they collect. The reasons for that are historical—different local authorities started off at different points. Some have been recycling for years, whereas others have not been doing it for very long. Some authorities had facilities to start with, whereas some had no infrastructure and had to scrape it together quickly to put recycling services in place. However, I am not particularly concerned about how the waste is physically collected, because that is not the critical point in the process. I return to my earlier point about infrastructure. The critical issues arise once we have collected the waste: what are we going to do with it and where are we going to do it? We still do not have the necessary infrastructure, although that is understandable because we have just started.

Iain Gulland talked about local infrastructure. He knows that grass, other green waste and food waste are being chucked throughout Scotland because there is little in the way of infrastructure for in-vessel composting and other measures. We have a fair old way to travel to make the infrastructure local. However, I emphasise that we have a real opportunity—

The Convener: Are discussions on-going in COSLA about consistency across boundaries, or is that conversation just not having had?

Dr Clark: A conversation is taking place between officers. We know what everybody is doing and we can tap into that. For example, if a new collection service for tenements needs to be set up, we know who is doing that and we know the problems and attractions of the various systems. However, there is not a conversation about a one-size-fits-all approach for all local authorities.

The Convener: I have a quick question for all three witnesses. If you could put one more measure in the bill, what would it be? Is there anything that is not in the bill that you think should be in it?

John Ferguson: We should ban sending biomass from commercial and industrial waste to landfill.

Dr Clark: We should make commercial waste subject to the same legislative requirements as those to which municipal waste is subject.

Iain Gulland: My immediate reaction was to think along the same lines as John Ferguson. We should consider banning particular waste streams from going to landfill.

The Convener: I thank all three witnesses. We probably could have taken three times as long but, unfortunately, the timetable for stage 1 does not permit us to do that. If anything occurs to you when you go away, you can get in touch with us. The clerks are always happy to hear from witnesses even after they have given evidence. Equally, if anything occurs to us, we might get back to you and say, “We should have asked you this”, so be prepared for that. You are welcome to sit in the public gallery to listen to the next evidence, which will be from the Cabinet Secretary for Rural Affairs and the Environment.

I welcome, 15 seconds ahead of schedule, the second panel of witnesses: Richard Lochhead, the Cabinet Secretary for Rural Affairs and the Environment; Simon Stockwell, the waste strategy team leader; Kim Fellows, the deputy director for waste and pollution reduction; and Kevin Philpott, the waste regulation senior policy officer. Is Louise Miller coming?

11:00

Kevin Philpott (Scottish Government Environmental Quality Directorate): We think that she is, but she does not appear to have arrived yet.

The Convener: So she may show up—okay, there is no problem.

There is a letter from the cabinet secretary on the table, which members received this morning. We will move straight to questions for the cabinet secretary.

John Scott: Good morning, cabinet secretary. What progress is being made in reviewing the national waste plan?

The Cabinet Secretary for Rural Affairs and the Environment (Richard Lochhead): It is a pleasure to be here to discuss an important issue for the environment in Scotland.

We are making progress with the national waste plan. The provisions that we will discuss today are
just one piece of a much bigger jigsaw in tackling waste and protecting Scotland’s resources. Much of the other work that we are undertaking will be taken forward in the national waste plan. We will launch a consultation in June, and we hope to have the final version of the new plan by early next year. The steering group that will help us with that plan will meet on 12 February to work up the consultation document.

John Scott: What is your response to concerns that the current waste infrastructure will not support the implementation of a zero-waste policy?

Richard Lochhead: A zero-waste policy is an ambitious policy. It is also an aspiration. Since we announced our zero-waste policy, it has attracted support from local authorities and private sector organisations throughout Scotland, as well as from members across the Parliament. Such an ambitious aspiration requires infrastructure to be in place for recycling, recovery and other measures, and a lot more infrastructure will be required if we are to meet our zero-waste target in the coming years. We have some infrastructure in Scotland, but we have nowhere near enough to meet our targets for 2013 and beyond. We are addressing that in our discussions with local authorities.

John Scott: How do you propose to deliver the greater volume of infrastructure that will undoubtedly be needed?

Richard Lochhead: Many local authorities are working on their infrastructure plans for the future. As zero waste is also an economic opportunity, there are private sector proposals for facilities that are either being built or proposed for various parts of Scotland. It is an issue for both the public and the private sector.

We have allocated part of our zero-waste fund to local authorities to help them with their infrastructure plans, which many of them are working on just now, and we will allocate more resources for that in the next financial year. We are also discussing with COSLA how we can ensure that that funding is used for infrastructure.

Rhoda Grant: Concerns have been raised with us about waste from small businesses—not so much municipal waste as waste from the private sector. The infrastructure to deal with that waste does not appear to be in place, especially for small businesses that cannot deal with it themselves. What plans does the Government have to address that? Does it have a vision?

Richard Lochhead: As you know, local authorities currently take a lot of commercial waste; there are private sector routes for commercial waste, too.

We have to address the issue from two angles. First, we have to work with businesses to reduce the amount of waste that they produce, which I am sure we would all agree is the number 1 priority in the waste hierarchy. It is in their economic interests as well as their environmental interests for businesses to do more in that regard.

Secondly, on infrastructure, we have listened carefully to the submissions to our consultation on the bill and to the evidence given to the committee by small business representatives, and I am considering how we can help small businesses with some of the challenges they face. I noticed that there are calls for exemptions for small businesses from some of the bill’s provisions—we will have to consider whether that is feasible. We do not want to say that small businesses do not have a role in tackling waste in Scotland, but nor do we want there to be a disproportionate impact on small businesses, which produce smaller amounts of waste compared with much larger commercial operations. We have to strike a balance.

John Scott: The elephant in the room discussed by the previous panel is the fact that commercial and industrial waste is not addressed adequately. Will you talk about your plans for that?

Richard Lochhead: Thanks to the efforts of previous Administrations, supported by the work of this Administration, Scotland has made huge progress on municipal waste and household recycling. We have gone from recycling less than 6 per cent of our waste before devolution to recycling more than 32 per cent now. The signs are that the rate will continue to rise, which is great news.

The Government believes that we must now concentrate a lot more on commercial and industrial waste, which accounts for 85 per cent of Scotland’s waste mountain. That will be addressed by the national waste plan and by some of the provisions in the bill. As I hope that the committee has noticed, there is a pretty big emphasis on commercial and industrial waste in the bill. An issue that we have to fix at the beginning of the process is ensuring that we get accurate information—one of the provisions in the bill addresses that. Although much of the 85 per cent of waste that comes from the commercial and industrial sectors is already reused or recycled, we need better information, and we need to focus more on that in future. We are addressing that through the provisions that the committee is discussing today. The national waste plan will put a lot more emphasis on industrial and commercial waste, particularly construction waste.

The EU waste framework directive sets out targets for construction, industrial and commercial waste. We have a lot more work to do in Scotland
with regard to our own targets for that sector, but the EU directive is already before us. The big issue of bringing that sector in from the cold will be at the heart of our future plans.

**Peter Peacock:** The bill provides for significant enabling powers, an approach that has given rise to both favourable and negative comment. What is the rationale for using that approach? Are there specific measures that are not yet policy ready, or is there some other reason?

**Richard Lochhead:** There are several reasons. First, I have been tackled many times by members of all parties who have called for much more ambitious measures to be taken to tackle Scotland’s waste problem. We now have a zero-waste policy in place, which requires much more radical and ambitious proposals, and we need the tools at our disposal to reach the targets that we have set.

Waste contributes to climate change—2.5 per cent of greenhouse gas emissions in Scotland come from waste. Last week, the committee heard from Professor Jim Baird from Glasgow Caledonian University, who reckons that about 6 to 8 per cent of our 80 per cent target for reducing emissions by 2050 would be met by tackling waste management in Scotland.

**The Convener:** That is 6 to 8 per cent, not 68 per cent.

**Richard Lochhead:** I wish it was 68 per cent, as then we would know how to reach the target.

The bill gives us an opportunity to provide for enabling powers to introduce secondary legislation if it is needed in future. The alternative is to do nothing in the bill and waiting for a slot in the legislative timetable, whether it is in this or the next session—it is unlikely to be this session—for a waste bill. That would lead to further delay, and I think that we would all agree that there is a degree of urgency in implementing some measures. The bill is therefore a good vehicle for introducing enabling powers.

The nature of some of the provisions in the bill means that we require to do a lot of work to ensure that we put the best provisions in place if we go down the route of secondary legislation. Some of the provisions will take more time than others. For example, it could take several years to get a blueprint for the best deposit-and-return system for Scotland. By using the opportunity presented by the bill, we can start that work now, but it might take some time to introduce the secondary legislation.

The other dimension is that we are not sitting doing nothing. A lot of voluntary agreements are now in place, and my preference is for the voluntary route to deliver results as soon as possible. There are some signs that that might happen, but it is clear that the prospect of legislation helps to concentrate minds and encourages many of the various players to cooperate with the Government and Parliament in achieving some of our ambitious targets. It is worth having the backstop of the legislative route, in case it is required at some point in the future.

**Peter Peacock:** It is helpful to have that on the record.

Last week, we heard evidence from the Federation of Small Businesses and from at least one other witness that, notwithstanding what you have said, it is not appropriate to use secondary legislation for some of the provisions because their impacts could be substantial for small businesses and other parts of the business sector and that the better way would be to use primary legislation, on which there can be fuller debate and scope for amendments. What is your comment on that?

The other criticism that we have heard—to the extent that there has been any criticism—is that you might never use the enabling powers in the bill but some people will want you to use them very quickly. What timescales are you thinking about for the use of those enabling powers? I recognise that you cannot be absolutely precise about that.

**Richard Lochhead:** Your first question relates to the role of secondary legislation. I hope that we have made it clear that we intend to have a full consultation process on the secondary legislation and that there will be ample opportunity for parliamentary committee scrutiny. The secondary legislation will be affirmative, so I will have to come before the committee, which will have the opportunity to scrutinise—

**The Convener:** From a process point of view, if anything is brought before us during this session of Parliament, the committee is likely to want to treat it as if it was a bill at stage 1 and therefore to schedule evidence sessions. We will therefore need the longest possible notice of anything happening. Can you commit to giving us that?

**Richard Lochhead:** I can commit to that, and I welcome your comment, convener, because it helps to reinforce the assurance that we want to give to small businesses and other sectors that the Scottish Government will conduct a proper consultation. Taking the secondary legislation route will allow the committee to scrutinise our proposals in detail.

For the reasons I have already outlined, having enabling powers in the first place will help us to achieve our targets. I am introducing secondary legislation under the Animal Health and Welfare (Scotland) Act 2006, in which there are enabling powers. The committee will have the opportunity to scrutinise that, and lots of consultation will be
done on the various measures. That is similar to what will happen under the Climate Change (Scotland) Bill. I hope that I have reassured the committee. We aim to give you ample notice of what will happen under the Climate Change legislation, there is only the possibility of accepting it. Although there is an obvious role for enabling legislation, there is a degree of urgency about it so, although I cannot give a strict timetable at this point, that is another provision that will probably come ahead of some others.

I have already used the example of the deposit-and-return schemes, which will require a lot of detailed work. The feedback from the consultation process, the parliamentary parties and wider Scotland, as well as the response at the time of our announcement of the consultation, shows that there is a lot of support for deposit-and-return schemes. However, it is a complex, detailed area. Other countries have deposit-and-return schemes that work, but Scotland is not the same as other countries so we will have to put a lot of work into ensuring that we can produce a scheme that works in Scottish circumstances. That will require a lot more work and will be further down the road.

11:15

Peter Peacock: You just happen to have listed the three things that are dealt with in the first three sections of the chapter of the bill that we are discussing—sections 52, 53 and 54.

Richard Lochhead: There was no intention in that.

Peter Peacock: Can the committee take it that the order of the sections in the bill alludes to some sense of policy priority, or is that coincidental?

Richard Lochhead: It is entirely coincidental. When I gave you those examples in response to your question, I was not aware that that was the order in which they appear in the bill.

Elaine Murray: I have a question on the use of secondary and primary legislation. Although there are mechanisms by which ministers and committees can work together to ensure the maximum scrutiny of secondary legislation, and although there is an obvious role for enabling legislation, there is only the possibility of accepting or rejecting secondary legislation—there is no possibility of amending it.

A lot of secondary legislation on puppies, kittens and various other things is currently coming through under the Animal Health and Welfare (Scotland) Act 2006, but the contentious issue of mutilations and tail docking was included in the original bill, which gave members the opportunity to amend the legislation at stages 2 and 3. Is there not an argument for putting in this bill some of the more contentious measures that it is proposed to introduce through secondary legislation? That would allow members to lodge amendments at stages 2 and 3.

Richard Lochhead: That is always an argument when the choice is between enabling powers and detailed provisions in primary legislation, but I emphasise the urgency with which we need to tackle the waste situation in Scotland and its contribution to climate change. As WWF Scotland is always saying, we are using resources as though we have three planets rather than just the one, and other political parties are constantly asking for action on packaging and other issues to tackle waste in Scotland. The enabling powers in the bill, which are partly a response to those demands, will allow us to make some progress.

Let me speak briefly about contentious provisions. One of the potentially contentious provisions is for deposit-and-return schemes. As I said earlier, I detect widespread support for them, but there is some nervousness about such schemes among the business community. Our approach will be to set up a working group that includes businesses that have strong feelings about the schemes to ensure that we have the right schemes, that they are delivered to the right timescales and that they are suited to Scottish circumstances. I hope that any secondary legislation that is introduced—even prior to the consultation—will result from input from the relevant bodies in Scotland.

The Convener: You have talked quite a bit about the provision for deposit-and-return schemes. Is it your view that it might be the most contentious provision in the bill? If it is not, which one might be?

Richard Lochhead: I think that they are all worthy of support.

The Convener: That is not what I asked, cabinet secretary. I asked which provision is the most contentious.

Richard Lochhead: I know what you are asking. It is a difficult question to answer because it would depend on whom you spoke to. I have listened to the evidence that you have received.
**The Convener:** You have also been sent all the written submissions.

**Richard Lochhead:** Yes. The business community has strong feelings on the proposed measures that will impact on business. The Scottish Environmental Services Association has views on future infrastructure, as its members build infrastructure and have an interest in it. Environmental non-governmental bodies are supportive of all the proposed measures because they will help Scotland’s environment. I am sure that several of the provisions will be contentious to certain sectors in Scotland, but I am not in a position to rank how contentious the proposals are.

If we want to reduce the amount of waste that is produced in Scotland and increase the reuse and recycling of the waste that we produce, we must be ambitious and radical. I look at what other countries in Europe are doing and achieving, and I see that they are managing. When I consider where Scotland is starting from, my view is that we have to be more ambitious and radical.

**The Convener:** The issue arises from the possibility of putting something very contentious in the bill. I am trying to discover whether any issue obviously stood out as being the most contentious and therefore amenable to the treatment that Elaine Murray suggested. I do not know whether your officials have a view on that. Obviously not.

We have dealt with the order of priority for implementing the provisions and such matters. Elaine Murray wants to talk about voluntary agreements.

**Elaine Murray:** The minister has touched on the importance that he places on voluntary agreements, and we have discussed in the chamber being able to reach the ambitious targets that are coming over the horizon. What impact are the current policy levers and voluntary agreements having on reducing waste? How is that impact being measured so that you can ensure that you achieve the targets that you wish to achieve in future years?

**Richard Lochhead:** We have, since we came into office, put a lot of effort into voluntary agreements. There are a few new voluntary agreements—a few firsts—and others have built on previous voluntary agreements and taken them a stage further.

The voluntary approach is working and is making progress. You may recall that we had a supermarket summit last year—around November, I think—which the First Minister chaired and at which I was present. One outcome of that summit was the voluntary agreement to reduce use of carrier bags in our supermarkets by 50 per cent by spring this year. The signs are that progress has been made towards that target. We will, of course, find out in due course the extent to which progress has been made. Since then Tesco, for instance, has decided not to display carrier bags on its counters—they are kept below the counter. Other practices have also changed in our supermarkets.

Therefore, there is evidence of progress as a result of voluntary agreements. A voluntary agreement has also been struck with the construction industry to reduce its waste. I think that that was a first—I see my officials nodding. The voluntary route is clearly the preferred route, but given the importance of the issue, we must be able to pass legislation if required.

**Elaine Murray:** What you have said is useful. How has the reduction in the use of plastic bags been measured? The bill’s provisions could result in secondary legislation that would introduce a plastic bag tax. Is that your stopgap? Is that the stick if the voluntary agreement does not work? Are you laying in place a number of sticks that can be used?

**Richard Lochhead:** We must say to the business community and the wider community that we are serious about our ambition to move towards being a zero-waste society. Many examples exist of how other countries are achieving their ambitions in a range of ways. The enabling powers and provisions in the bill and the debate that is now taking place show that the Government and Scotland are serious about the future.

I have said that a lot of progress has been made on carrier bags with retailers coming on board, but time will tell how successful the measure has been. Of course, the UK Government decided to put the provision that we are discussing into its Climate Change Bill and asked me whether we want it to apply to the whole of the UK, but my response was that we have our own bill in Scotland and our own voluntary agreement, which was signed in November—and has, of course, since been adopted by the rest of the UK—so it made sense for us to decide on the provision in Scotland. That is why it is before the committee today as a proposal for inclusion in our bill.

**Elaine Murray:** For clarification, you would not expect to use the provision in question unless voluntary agreements did not work.

**Richard Lochhead:** That is fair comment. I would not expect to use the provisions if we achieved the same objective outwith legislative routes. However, we are not at that point and it is important that Parliament and the Government have the wherewithal to achieve our objectives for Scotland.

**Alasdair Morgan:** Do you have a particular figure in mind that would mean that the agreement...
on carrier bags was not working? In other words, what is your target?

Richard Lochhead: We have to take one step at a time. The national waste plan is still to be consulted on. It will examine the bigger picture, and people will present their views on a wide range of issues. We might decide at that point that the provisions will have a greater role in the future in response to a new waste plan or whatever. I will ensure that the committee is kept up to date with progress on the current voluntary agreement. I cannot until spring 2009 make a judgment on the carrier bags agreement with the retailers.

Alasdair Morgan: I will, if I may, press you a bit. You must have some idea about what would constitute success in reducing carrier bag use. We are not going to eliminate them entirely, but at what point could we decide that we do not even need to think about legislating?

Richard Lochhead: We have to consider that one step at a time with regard to the voluntary agreement. If the voluntary agreement were not delivering and not achieving the target by spring 2009 I would—following further discussions with the retailers on why that was the case—take the view that there might be a case for legislation.

The Convener: The target is a 50 per cent reduction by spring 2009.

Richard Lochhead: Yes.

The Convener: If you get to 45 per cent, you might say "Well, okay, we're just about there", but if only a 20 per cent reduction is achieved, you might say, "Hang about—".

Richard Lochhead: We need to be reasonable and proportionate. We would consider the results.

Liam McArthur: You have reflected on the progress in improving recycling rates, as initiated under the previous Government. We would all accept that although it was very welcome, it started from a very low base and it started very late, in comparison with our European counterparts. Furthermore, it took place in economic good times, whereas we now face an economic storm. I have been reflecting on the points that Elaine Murray and Alasdair Morgan have made about the amount of bite that voluntary agreements have. What impact will the current economic situation have on the zero-waste strategy? Do you expect voluntary agreements to operate as they have done hitherto?

Richard Lochhead: That is a very interesting question—I look forward to reading the committee's views on that when you report.

The answer has two or three dimensions to it as there are several ways in which the economic downturn could impact on our zero-waste plans and on the provisions that we are discussing today. We will wish to consider the impact on the economy and on the business community of any provisions that we make in the future. Secondary legislation will not be made in the immediate few months from now, so we will have to monitor the economic situation, but I can assure the committee that we will be sensitive to the impact of any provisions on the business community and the economy in general. That applies right across Government; it is not confined to the bill.

There are two key areas that we are monitoring closely and in which there is a direct impact on our targets. I cannot give the committee a definitive answer on the exact situation just now, but the first of those two areas is the market for recyclates, which is clearly influenced by the economic situation, not just in this country but internationally. Many of the markets for those materials are international markets. We are monitoring the situation—markets in which recycled collections are of good quality seem to be holding up. In other cases, storage is being considered by local authorities and other bodies, and SEPA is helping to co-ordinate storage of materials until the markets get better.

The second issue is the impact on landfill. Ironically, our landfill targets might be assisted by the economic downturn, in that less waste is produced when there is less economic activity, which illustrates how the impact of the economic downturn might be that it helps with some targets. Other targets, for instance those for recycling, might become more challenging, although there is no evidence of that at the moment. It depends on how the markets respond to the economic downturn.

11:30

Liam McArthur: As you said, some people say that this is the worst time to be taking forward the strategy and some say that this is precisely the moment to do so—for example, John Ferguson at SEPA and Iain Gulland at WRAP told us that they believe that there are opportunities to make strides in the current economic climate. Is the Government considering positive incentives that could be implemented quickly, rather than going down the route of introducing the statutory requirements that are alluded to in the bill?

Richard Lochhead: An important dimension of this debate involves the opportunities that are available to people. For example, businesses can cut costs by cutting waste. Households can do the same thing, so we have put some effort into our food-waste campaigns, which pass on simple tips to help household budgets by reducing food waste. The feedback from some of the companies that are involved is that their services are in quite
high demand, which suggests that companies are interested in cutting waste as a way of cutting costs.

**Liam McArthur:** Most of the positive incentives in that area seem to be in the form of awareness-raising and information-spreading initiatives.

The previous panel talked about there being an opportunity to introduce infrastructure that should have been introduced before now. Are you considering positive incentives in that regard?

**Richard Lochhead:** That is an important point. The wider response of the Government to the economic downturn involves efforts to stimulate economic activity in our communities. We have been discussing with the Convention of Scottish Local Authorities ways of using resources such as those that have been made available through transfer of money from the zero-waste fund to local authority budgets in order to implement infrastructure projects as quickly as possible. That will not only help with councils’ zero-waste targets, but will stimulate economic activity as people will be employed to construct that infrastructure. We have already taken action to transfer money to local authorities for the next financial year, and are discussing with COSLA the levels of resources that will be transferred for the subsequent financial year. That will give local authorities a good lead-in to the infrastructure projects.

**Bill Wilson:** You referred to the possibility that there will be some reduction in landfill waste because of the downturn in economic activity. I would like an assurance that, when we are recording those levels, we will not confuse the results of our attempts to deal with waste with the results of the economic downturn. There is always the possibility that we will take our eye off the ball and that, when economic activity recovers, the waste levels will bounce back as well.

**Richard Lochhead:** I totally agree. I assure you that we are not taking our eye off the ball. One of the benefits of creating the infrastructure to which I just referred is that it will ensure that we are going down the road towards becoming a zero-waste society. Irrespective of the impact of the economic downturn on landfill, we will not take our eye off the ball in terms of the wider environmental objectives. The levels of waste are measured, and SEPA and others will publish information about landfill rates in due course.

**Bill Wilson:** There is always a chance that businesses might seek to gain competitive advantage by not complying with voluntary agreements. What level of non-compliance would concern you and what action would you take?

**Richard Lochhead:** I cannot give you a simple answer to that question just now. Clearly, that will depend to a great extent on the detail of secondary legislation, which will set out exactly what is required of various people, including the business community.

With secondary legislation or other legislative tools, agreements must be enforced in a way that ensures that businesses that are taking action to cut their waste and help the environment are not disadvantaged. That is why, in all legislation, penalties are available.

**Bill Wilson:** If you exempt some of the smaller businesses from provisions in the legislation, they might gain a competitive advantage. Would that be of concern to you?

**Richard Lochhead:** All legislation has to be proportionate. If there were a case for exempting small businesses, it would involve the creation of a level playing field for the small businesses. You are never going to get a level playing field between small businesses and massive multinational companies—I am not sure that you can approach the issue in terms of small businesses versus bigger businesses. What is important is that, if there is an exemption for small businesses, we correctly determine the level below which businesses are exempt, and ensure that that is proportionate.

**The Convener:** I have a question about amendments at stage 2, but before I ask it, I will give other committee members an opportunity to ask further questions of the cabinet secretary. Does anyone have a question? It seems not. You are getting off very lightly today, cabinet secretary.

**Richard Lochhead:** Please do not say that, convener; it will just stimulate people.

**The Convener:** I would like to return to the discussion that we were having about potentially contentious elements and so on. It would be useful for us to know whether there is any intention to lodge stage 2 amendments in respect of waste management. I should say that, when we asked a similar question when we were considering the Flood Risk Management (Scotland) Bill, we got a helpful and useful answer.

**Richard Lochhead:** I might ask officials to contribute in a second or two, because there is a lot of discussion about stage 2 amendments at the moment.

**The Convener:** I realise that it is still early days.

**Richard Lochhead:** I can give you an assurance that I shall write to the committee in the very near future to outline potential stage 2 amendments.

We have been considering stage 2 amendments in relation to deposit-and-return schemes. We do not have the power to set up a deposit-and-return clearing house. In other countries, because not
every company would have the wherewithal to operate its own deposit-and-return scheme, clearing houses operate for whole sectors and put in place all the necessary arrangements. We would require enabling powers to give us the ability to set up such a clearing house. Kevin Philpott will say a little more.

The Convener: I realise that this is early in the process, but I am seeking an indication of whether there are going to be stage 2 amendments relating to waste management. Obviously, there are.

Kevin Philpott: The only stage 2 amendments that we are considering at this point relate to deposit-and-return schemes and are, as the cabinet secretary indicated, to do with setting up a body to fill the clearing-house role. Specifically, we need to be able to set up that body and tender its functions.

The Convener: That is the situation at the moment, but that does not rule out the possibility that other amendments might emerge.

Kevin Philpott: Time is ticking, but you are right to say that that possibility is not ruled out.

The Convener: I thank the cabinet secretary and his officials. I see that Louise Miller appeared—I am sorry, I did not register that you were there.

If anything occurs to us, we will be in touch with you in short order. I think we are seeing you again in connection with forestry.

Richard Lochhead: You will see Mike Russell.

The Convener: Okay.

As we are running a little ahead of schedule, I suspend the meeting.

11:38

Meeting suspended.
SUBMISSION FROM HIGHLAND COUNCIL

Highland Council has made a parent submission to the Transport, Infrastructure and Climate Change Committee.

APPENDIX 1

CONSULTATION ON FORESTRY PROVISIONS IN THE SCOTTISH CLIMATE BILL - RESPONSE BY THE HIGHLAND COUNCIL

GENERAL COMMENTS

1. This consultation is to be welcomed. It strongly argues the role of forestry in helping to combat climate change and it is important that that role be fully maximised as well as gaining the support of the Scottish people. The Minister for Environment is to be applauded in bringing forward this debate and the crucial role for forestry.

2. The proposal to offer leases and cutting rights over parts of the national forest estate, has however resulted in a vigorous debate both within and outwith the forest industry, not to mention Commission employees themselves. The proposal represents a fundamental sea-change in the way the estate is managed. It is of concern that such a significant proposal has “come out of the blue” and is perhaps premature given that FCS is currently undertaking a wider options review of the national forest estate.

3. For FCS to pursue any significant programme of woodland creation will be dependent on the availability of suitable and affordable land. This is seen as a potentially major constraint and perhaps puts the argument for incentives (existing and additional) to be mainly placed with existing land owners and occupiers.

4. It is reported that leasing some 25% of the national forest estate could provide some £200M for reinvestment. It is not clear if the current economic downturn has been factored into the above assumptions. Timber prices have fallen some 25% in the past six months and are likely to fall further.

5. There is no guarantee that all sums raised would necessarily go into forestry related climate change activities. In the event that £200M was made available, it is unlikely that the forestry industry would be able to spend such a sum in one financial period.

6. The annual net cash cost of FCS is around £90M (08/09). Timber receipts are crucially put against that cost. These amounted to some £43M in 08/09. The potential, very significant loss of receipts (estimated in the order of a third and perhaps more given likely sawlog content) places real concern over the ability of FCS to continue its present function and the delivery of multiple benefits to the Scottish people.

7. It is not clear if any lease and cutting rights agreement will require the timber to supply Scotland’s wood processing sector or if it will be available for export.
RESPONSE TO SET QUESTIONS

Question 1: What are your views on allowing the Forestry Commissioners to enter into joint ventures with the intention of participating in renewable energy programmes on the national forest estate?

Response: The Highland Council (THC) warmly welcomes the opportunity for the Forestry Commissioners to enter into joint ventures with developers and local communities and subject to the following considerations;

- Secure and maximise opportunities to benefit from joint ventures, including an equity stake in investments.
- Joint ventures that involve community ownership.
- Extend range of joint ventures to include biomass, especially wood fuel.
- Appraisal process requires to consider development on peat and carbon flux issues.
- Public Sector Reform Bill may offer a wider use and benefits from joint ventures.
- Working with Carbon Trust (‘Partnership for Renewables’) to develop and manage on site renewable energy projects.
- Opportunity for partnerships with LA’s in providing heat and power for local communities.

Question 2: What are your views on allowing Scottish Ministers and Forestry Commissioners to offer leases and cutting rights over parts of the national forest estate?

Response: THC has very strong reservations over these proposals and does not support them. A criticism of the consultation paper is that it offers limited detail, and no business case to underpin the proposals. THC main concerns are as follows;

- Lack of business case – to demonstrate overall public benefit and forestry’s contribution to climate change.
- Scale of proposals and control retained by one party.
- Impact on the function and funding of the remaining part of the national forest estate.
- Loss of regional presence.
- Impact on the stability and development of timber markets as presently underpinned by FCS.
- Impact (immediate and longer term) on FCS employees and the communities they live in.
- Loss of community acquisition opportunity through the National Forest Land Scheme.
- Loss of a wider range of non-market benefits as provided through FCS and which will be greater than provided through any lease arrangement.
• No guarantee that funding raised will be placed specifically to forestry related climate change measures.
• Potential for further leases.
• Member states of the E.U. have generally supported and protected their national forests.

Question 3: What are your views on (i) transferring the proceeds from leases and cutting rights to a not-for profit trust for investment in woodland creation; (ii) transferring the landlord’s interest in this land to a not-for profit trust; and (iii) Ministers stipulating the constitution of such a not-for profit trust.

Response: Please refer to the response to Question 2.

• What problem does the Trust resolve – option of increased accountancy flexibility to FCS?
• How will it operate – membership, structure and powers?
• How do you guarantee that Trust reflects public interest?
• Results in reduction of other Government funding?

Question 4: Are there other actions which need to be taken, or are there other changes in legislation which need to be made, in order to allow the public and private forestry sector to contribute to Scotland’s target of reducing emissions by 80% by 2050? If so, please outline what these are.

Response:
• Fully maximise opportunities for joint ventures.
• Consideration of only cutting rights over a greatly reduced scale and range of sites.
• Opportunities for some considered and limited expansion of the ‘Repositioning Programme’.
• Early and significant refinement of SRDP, including simplified application and approval process.
• Targeted funding (e.g. Locational Premiums).
• Early revisit of fiscal support to encourage increased investment level and industry confidence.
• Active encouragement of agricultural sector to plant trees and use wood fuel.
• Proven benefits of communities and FCS working together to deliver a wide range of rural benefits (Sunart Oakwood Initiative).
• Woodland creation partnerships with other public agencies and land based organisations (e.g. SNH, MOD, Scottish Water, National Trust, RSPB, Woodland Trust).
• Audit of public land suitable for woodland creation.
• Maintaining and enhancing carbon stocks in trees or soils through longer term management and role of unmanaged woodland.
- Redistribution of Government spending to forestry.
- Carbon Trading.
- Opportunities of ‘Futures Market’ in raising funds at this time.
- Urgent need for an integrated Land Use Policy.
- Early update of Indicative Forestry Strategies with a clear promotion for woodland creation.

Highland Council
February 2009
Consultation paper on potential legislative measures to implement Zero Waste

Proposal 1 – Duties on Public bodies and businesses to provide recycling facilities

To further encourage recycling by giving a power to the Scottish Government to make regulations which would impose duties on public sector bodies and businesses to provide recycling facilities for customers, staff and, where appropriate, members of the public. The regulations would specify which bodies and businesses were to be subject to this duty and the nature of the recycling facilities that would be required.

Question 1: Do you consider that legislation should be made in this area?

Proposals to specify certain businesses to have recycling facilities for certain materials is probably not essential. Market forces will increase the amount of recycling available in public areas as landfill costs increase and recycling infrastructure improves. Also the public expectation to recycle more will add pressure to provide recycling facilities.

The alternative of a code of practice would be a better start. The implications to require large retailers to provide recycling facilities in their car parks will help in recycling the vast majority of packaging, but may reduce the amount of material collected by local authorities and reduce LA recycling rates. A realignment of targets should reflect any drop occasioned by such action.

Question 2: If so, what form should that legislation take?

Not Applicable

Proposal 2 – Packaging

To encourage waste prevention by giving powers to the Scottish Government to make regulations on packaging which would set statutory targets on retailers for packaging reductions.

Question 1: Do you consider that legislation should be made in this area?

The Producer Responsibility Regulations and Packaging (Essential Requirements) Regulations have been in place for a while, but there has been few cases brought forward on excess packaging. The PRN system may have
helped improve market prices but does not seem to have little impact on the volume of packaging produced. The targets are such that most of the obligations can be met with back door recycling from retailers.

The main issue with packaging is although manufacturers are reducing the overall weight the recyclability of products particularly grocery products remains difficult in some instances particularly where laminate or composite materials are used. Re-design of the packaging or the product may help but so too would recovery capacity in Scotland. The growth of internet shopping could potentially have an effect on the generation of more packaging which previously was not created. This could be difficult to legislate for, given the global nature of the market and more mundanely if Scotland takes a different stance to the rest of the UK.

**Question 2: If so, what form should that legislation take?**

Applying statutory packaging targets on retailers may reduce the amount of waste generated as the existing legislation does not seem to encourage a change in design of unnecessary packaging. Regulation of the targets may be problematic as it is not obvious which organisation would be responsible.

**Proposal 3 – Specifying recyclate**

To encourage recycling by taking powers to enable the Scottish Government to place a duty on public bodies and businesses to specify a minimum percentage of material made from recyclate in procurement contracts.

**Question 1: Do you consider that legislation should be made in this area?**

The key issue relating to the recyclable content of products is the performance of the product compared with a similar product made from virgin materials. There is little doubt that where large quantities of recycled plastics are used in some products, performance suffers. It is therefore possible that where a minimum percentage of plastic is specified and used without first assuring the market of the performance of the product public bodies will be compelled to purchase less well performing goods which may ultimately cause greater consumption rather than less. Thus where any such duty is proposed the emphasis should be on the specification of performance and quality of product.

**Question 2: If so, what form should that legislation take?**

Not Applicable

**Proposal 4 – Waste Prevention Plans**

To encourage waste prevention and recycling by taking powers to enable the Scottish Government to place a duty on public bodies and businesses to have waste prevention plans.
Question 1: Do you consider that legislation should be made in this area?

See Proposal 1. Market forces will compel public bodies and businesses to reduce and recycle waste without the need for further legislation.

Question 2: If so, what form should that legislation take?

Not Applicable

Question 3: What public bodies and business should be covered?

Not Applicable

Proposal 5 – Deposit & Return

To encourage recycling and reuse by taking powers to enable the Scottish Government to introduce deposit and return systems.

Question 1: Do you consider that legislation should be made in this area?

Deposit and return systems have been in place before and are widely used in Europe and North America. There are schemes whereby an additional tax is added to certain packaging which can be redeemed at certain outlets. The majority of the public do not claim the levies back and it is left to “binners” going round the streets to pick up cans etc to claim back the money.

Alupro have run a cash for can scheme for years to encourage groups and individuals to collect aluminium cans, but this seems to have been superseded by other incentive schemes.

Other reverse vending schemes where supermarkets take back various bottles etc and the member of the public receives a discount on their shopping would encourage more re-use on suitably designed containers. In the case of plastics these may have to be made more durable and heavier than existing designs to withstand several uses.

Supermarket return schemes could also divert tonnage away from local authority schemes and potentially reduce the local recycling rates. As recycling targets rise there may be an issue where Local Authorities may not be able to reach the 60 or 70% recycling rates without some system to reward any tonnage collected through reverse vending at supermarkets to be credited to the relevant local authority. There are already incidents at some supermarkets in England & Wales where these systems are being trialled, but the retailer is not providing tonnages figures unless the local authority is rewarding them financially with recycling credits.
**Question 2: So what form should that legislation take?**

A levy or tax on packaging products which are not easily re-usable or a deposit for more durable packaging which can be refilled more easily. Essential these are the same but there is a different mechanism for collection of the tax/deposit.

**Question 3: Your views on the practicalities of such schemes in Scotland?**

These type of schemes work in many countries in Europe and individual States/Provinces in North America and Australia. There is no reason to why they would not work in Scotland.

**Proposal 6 – Mandatory waste data returns from business**

To ensure more effective planning and policy making on commercial and industrial waste by taking powers to make regulations requiring businesses to send waste data returns to SEPA.

**Question 1: Do you consider that legislation should be made in this area?**

The voluntary scheme run by SEPA last year asking businesses to return information on the amount of waste and types of bins they used turned out to be unsuccessful. Annual waste transfer notes should contain most of the information required and further information will just add to the administrative burden. SEPA already collate enough data without having to deal with more. The quarterly data returns submitted by waste management licence holders probably takes up a huge amount of time already without asking for similar information from every business.

**Question 2: If so what form should that legislation take?**

Not applicable

**Question 3: Do you have any views on the kind of businesses to be covered?**

Not applicable

**Proposal 7 – Other measures to encourage waste prevention, including action on carrier bags**

The Scottish Government would also welcome other ideas on legislation which could help to prevent waste.
Question 1: Do you consider that legislation should be made in this area?

The issue of plastic carrier bag use has now been the subject of wide debate for several years. Several of the largest retailers have already changed the way in which they offer single use plastic bags to shoppers without the need for legislation. It would also seem that the public have in general responded well to the changes by adopting different habits. This would therefore seem to be one area where voluntary measures have and will continue to make a real difference. Therefore the Council can see no need for specific legislative measures to be taken but would support further and continuing publicity on the simple measures which shoppers can take to reduce the impact of single use plastic bags.

Question 2: If so, which areas should these powers cover?

Not Applicable

Question 3: Are there any other areas, not covered by this legislation could be made to increase recycling and promote waste prevention?

Not Applicable

Highland Council
February 2009
Executive Summary
WRAP Scotland welcomes the opportunity to respond to the Climate Change (Scotland) Bill, launched by the Scottish Government.

In summary, our three key points are as follows:

- WRAP Scotland welcomes the introduction of a section dedicated to waste management in the Climate Change (Scotland) Bill. We applaud the decision of the Scottish Government to link resource efficiency and waste management with the climate change agenda.

- We would like to take this opportunity to refer back to the previous consultation responses that WRAP Scotland submitted to the Scottish Government, which can be found in the annex to this response.

- We would like to highlight that the Scottish Government might need to introduce legislation in order to ensure the creation and smooth implementation of the enforcement authority in charge of monitoring the deposit and return scheme, as stated in paragraph 58(7)(i) of the Climate Change (Scotland) Bill.

Introduction to WRAP & WRAP Scotland

1. WRAP (the Waste & Resources Action Programme) is a not-for-profit UK company providing recycling and resource efficiency programmes for Defra, the Scottish Government, the Welsh Assembly and the Northern Ireland Assembly. The organisation was formed in 2000 to implement a number of the actions set out in the Government White Paper Waste Strategy 2000.

2. WRAP works in partnership to encourage and enable businesses and consumers to be more efficient in their use of materials, and to recycle more things more often. This helps to divert waste from landfill, reduce carbon emissions and improve our environment.

3. Since its creation, WRAP’s work has contributed to reductions in greenhouse gases (CO2, but also methane), by decreasing the amount of waste going to landfill, promoting recycling, creating markets for recycled materials and encouraging waste minimisation.

---

4. Consistent with the adoption of the Zero Waste Policy by the Scottish Government, WRAP has established a specific WRAP Scotland team to lead and develop dedicated programmes in Scotland to support the Government, local authorities, businesses and community sector in the delivery of increased waste prevention, recycling, reuse and composting infrastructure and services.

5. This consultation is, therefore, highly relevant to our work.

GENERAL COMMENTS ON THE CONSULTATION

6. WRAP Scotland welcomes the introduction of a section dedicated to waste management in the *Climate Change (Scotland) Bill*. We applaud the decision of the Scottish Government to link resource efficiency and waste management with the climate change agenda.

7. We would like to take this opportunity to refer back to the previous consultation responses that WRAP Scotland submitted to the Scottish Government, which can be found in the annex to this response.

9. We believe that this previous response gives a comprehensive picture of WRAP Scotland’s position on the management of waste in Scotland in respect to the areas highlighted in the proposed Climate Change (Scotland) Bill.

10. WRAP Scotland would like to confirm that any proposed Scottish deposit and return scheme, as outlined in paragraph 58(2)(b), will return the full deposit to the customer. To our knowledge there are a number of schemes around the world which only a proportion of the deposit is returned to the consumer thus allowing income to be generated to cover the costs of administering the scheme.

11. Finally, we would like to highlight that the Scottish Government might need to introduce legislation in order to ensure the creation and smooth implementation of the enforcement authority in charge of monitoring the deposit and return scheme, as stated in paragraph 58(7)(i) of the *Climate Change (Scotland) Bill*.

CONSULTATION ON PROPOSALS FOR A SCOTTISH CLIMATE CHANGE BILL: A CONSULTATION DOCUMENT

Response from WRAP
(Waste and Resources Action Programme)

Executive Summary
WRAP welcomes the opportunity to respond to the Consultation on Proposals for a Scottish Climate Change Bill, launched on 29 January 2008 by the Scottish Government.

Our response focuses on the environmental benefits of recycling and waste minimisation activities, and suggests that these should be considered as important elements of the response to the challenge of climate change.

Introduction to WRAP

1. WRAP (the Waste & Resources Action Programme) is a not-for-profit UK company providing recycling and resource efficiency programmes for Defra, the Scottish Government, the Welsh Assembly and the Northern Ireland Assembly. The organisation was formed in 2000 to implement a number of the actions set out in the Government White Paper Waste Strategy 2000.2

2. WRAP works in partnership to encourage and enable businesses and consumers to be more efficient in their use of materials, and to recycle more things more often. This helps to divert waste from landfill, reduce carbon emissions and improve our environment.

3. In particular, WRAP Scotland supports the Zero Waste Agenda of the Scottish Government to create a zero-waste, resource-efficient society. To achieve this, WRAP is working in collaboration with several Scottish delivery bodies.

4. Since its creation, WRAP’s work has contributed to reductions in greenhouse gases (CO₂, but also methane), by decreasing the amount of waste (and, in particular, biodegradable waste) going to landfill, promoting recycling, creating markets for recycled materials and encouraging waste minimisation. WRAP is in the process of setting up CO₂ reduction targets for

---

each of our programmes, to start from June 2008, when our next Business Plan comes into operation.

5. This consultation is, therefore, highly relevant to our work.

**General Comments**

6. WRAP welcomes the creation of a Scottish Climate Change Bill as a key commitment from the Scottish Government to tackling the effects of climate change. Also, we applaud the challenging targets proposed, and the Scottish Government’s commitment to creating and enabling new means of reducing emissions.

7. We note that the Scottish Government intends to review the National Waste Plan, as well as to consult separately on legislative measures to include in the Scottish Climate Change Bill. However, we would like to take this opportunity to comment on the measures identified in the Scottish Climate Change Bill.

8. The draft Scottish Climate Change Bill focuses greatly on energy efficiency as the main method of cutting CO₂ emissions. However, we believe that there should also be a strong focus on having a sustainable waste strategy in place, as well as resource efficiency and sustainable consumption, and production policies and measures.

9. To illustrate how important is to have a good waste strategy, it is worth noting that, according to WRAP and Defra calculations, current levels of recycling in the UK save more than 18 million tonnes of CO₂ a year through avoided primary material production – equivalent to the annual use of five million cars, or 14% of UK transport sector emissions³. In the case of Scotland, municipal waste recycling saved 1.2 million tonnes of CO₂⁴, which is equivalent to taking 395 000 cars off the road for one year in Scotland, or 18% of cars in Scotland.

10. Regarding resource efficiency, over-consumption will result in higher-than-necessary greenhouse gas emissions, regardless of the efficiency of production and transportation. Therefore, an effective climate change strategy needs to address resource efficiency and demand measures, as well as supply efficiency measures.

11. A range of new and existing techniques can be used to address non-energy and non-CO₂ greenhouse gas emissions. In particular, measures to improve resource efficiency can have a high impact on CO₂ and non-CO₂ emissions savings. We have highlighted three of these below:

- Waste minimisation
- Recycling; and
- Food waste minimisation.

---

Waste minimisation

12. The top rung of the waste hierarchy is waste minimisation or waste reduction, where actions are taken to stop waste from arising in the first place. Actions during a product’s life cycle can result in greenhouse gas emissions at the point of extraction, processing, transportation, manufacture, use and disposal. If a product is used only once or is used inefficiently, the energy and greenhouse gas emissions from the preceding and following steps will be sub-optimal.

13. Given that, on average, one tonne of finished product requires the extraction from the ground of around ten tonnes of material\(^5\), the material savings to be made through waste minimisation are obvious. However, what is perhaps less obvious is the embedded energy associated with finished products – in other words, the energy it took to produce them – and the potential that waste minimisation has to save this embedded energy.

14. As an example, the manufacture of one tonne of primary aluminium requires 55 gigajoules (15,400 kilowatt hours) of energy\(^6\). Now if, through waste minimisation activities (such as eco-design), the lifetime of an aluminium product could be doubled, this would cut the waste of embedded energy by 50% over the lifetime of the new, longer-life product.

15. The sustainable design and use of products can provide significant benefits across all sectors of society. The manner and rate of resource consumption can be addressed through Government initiatives (e.g. the phasing-out of conventional light bulbs), legislation and taxation policies.

16. WRAP has worked with 112 local authorities in England and Scotland to provide over 1.6 million home composting bins since 2004. As a result, more than one-third of English and Scottish households are now composting at home, thanks in part to WRAP support. And each person who composts at home saves not only the embedded energy in the compost they would have otherwise had to buy commercially, but also avoids the emissions of methane (a greenhouse gas 23 times more powerful than CO\(_2\)) that their organic waste would have generated in a landfill site.

Recycling

17. In May 2006, WRAP published *Environmental Benefits of Recycling\(^7\)*, a specialist review of international studies which shows how increased recycling is helping to tackle climate change. The report shows that in the vast majority

\(^5\) See, for example, The Strategy for Sustainable Farming and Food: Facing the Future (Defra, 2002), page 11 (in relation to food production).

of cases, the recycling of materials has greater environmental benefits than incineration or landfill.

18. As mentioned in paragraph 9, the current recycling figures for Scotland are equivalent to taking 18% of cars off the road in Scotland. In the case of the UK, the current rates of recycling these materials saves 18 million tonnes of CO₂-equivalent greenhouse gases per year⁸, which equates to taking 5 million cars off UK roads⁹.

19. The message of this 2006 study is unequivocal. Recycling is good for the environment, saves energy, reduces raw material extraction and combats climate change. It has a vital role to play as waste and resource strategies are reviewed to meet the challenges posed by European Directives, as well as in moving the UK towards more sustainable patterns of consumption and production, and in combating climate change by reducing greenhouse gas emissions.

20. As recycling rates increase, the CO₂ savings will also increase as a result. According to a recent Defra report, every UK household could reduce CO₂ emissions by 540 kg per annum through increased recycling¹⁰. WRAP’s work on increasing the number of committed recyclers should help households to move towards this target.

Food Waste Minimisation

21. Savings can also come from avoided food waste, reduced energy consumption and reduced demand for raw materials. These savings are typically higher than recovering energy through incineration or other means, as they conserve the embedded energy (and greenhouse gases) represented by the materials.

22. Regarding food waste, WRAP estimates that the 6.7 million tonnes of food waste produced by householders in the UK every year is responsible for 30 million tonnes of CO₂ equivalent over its life¹¹. Even assuming that half of this food waste is inedible (e.g. bones), the potential exists to avoid 15 million tonnes of CO₂ equivalent.

23. In Scotland, WRAP’s internal research¹² estimates that around 650,000 tonnes of food waste are produced by Scottish households every year. This is the equivalent of 2.9 million tonnes of CO₂ emissions a year. WRAP’s Love

---

¹⁰ DEFRA (2008) A Framework For Pro-environmentalBehaviours

¹² WRAP estimate based on 19% food waste calculated for England.
Food Hate Waste campaign\textsuperscript{13} highlights the environmental costs of the food wasted in Scotland.

24. Reducing this wastage, as well as food wasted in commerce and industry, can have a significant impact on emissions of nitrous oxides and methane, the two main greenhouse gases other than CO\textsubscript{2}.

25. Eunomia’s report \textit{Dealing with Food Waste in the UK}\textsuperscript{14} stresses that the best environmental option is to have a separate collection of food waste coupled with anaerobic digestion. As well as producing energy, this option contributes to reducing the tonnes of waste that go to landfill.

\textbf{Conclusion}

26. There is a danger that when discussing how to tackle climate change, the most obvious areas, such as energy efficiency measures, become the focus of the discussion.

27. Resource efficiency measures can also contribute directly to the mitigation of the UK’s greenhouse gas emissions. Research has shown that activities such as recycling, reduction of food waste and waste minimisation have a clear and direct impact on the total emission of CO\textsubscript{2}, methane and other gases that contribute to climate change.

28. We would therefore urge the Scottish Government to ensure that the Scottish Climate Change Bill’s remit is wide enough to consider the wider resource efficiency and sustainable consumption and production agendas in taking its work forwards.

CONSULTATION ON POTENTIAL LEGISLATIVE MEASURES TO IMPLEMENT ZERO WASTE

Response from WRAP

(Waste and Resources Action Programme)

Executive Summary
WRAP welcomes the opportunity to respond to the Consultation Paper on Potential Legislative Measures to Implement Zero Waste, launched on 25 July 2008 by the Scottish Government.

In summary, our three key points are as follows:

- WRAP welcomes the efforts that the Scottish Government is making to move towards a Zero Waste society and to implement the necessary measures to achieve this goal.

- WRAP operates at the top end of the waste hierarchy, which gives priority to reducing waste at source, reusing products and recycling materials.

- WRAP believes that the decision to introduce legislation in the seven areas highlighted is for the Scottish Government to decide. However, WRAP strongly encourages making every single effort to reduce the waste our societies produce, recycle as much as possible and minimise our greenhouse gas emissions.

Introduction to WRAP

29. WRAP (the Waste & Resources Action Programme) is a not-for-profit UK company providing recycling and resource efficiency programmes for Defra, the Scottish Government, the Welsh Assembly and the Northern Ireland Assembly. The organisation was formed in 2000 to implement a number of the actions set out in the Government White Paper Waste Strategy 2000.\(^{15}\)

30. WRAP works in partnership to encourage and enable businesses and consumers to be more efficient in their use of materials, and to recycle more things more often. This helps to divert waste from landfill, reduce carbon emissions and improve our environment.

31. In particular, WRAP Scotland supports the Zero Waste Agenda of the Scottish Government to create a zero-waste, resource-efficient society. To achieve this, WRAP is working in collaboration with several Scottish delivery bodies.

32. WRAP operates at the top end of the waste hierarchy, which gives priority to reducing waste at source, reusing products and recycling materials. One of the major programmes within our current business plan aims to address waste reduction issues as they arise in the food sector. WRAP introduced the Courtauld Commitment in July 2005 as a means of securing the commitment of major retailers to concrete actions to address packaging waste reduction.

33. Since its creation, WRAP’s work has contributed to reductions in greenhouse gases (CO₂, but also methane), by decreasing the amount of waste going to landfill, promoting recycling, creating markets for recycled materials and encouraging waste minimisation.

34. This consultation is, therefore, highly relevant to our work.

General Comments

35. WRAP welcomes the efforts that the Scottish Government is making to move towards a Zero Waste society and to implement the necessary measures to achieve this goal. We applaud the challenging measures proposed as a key commitment from the Scottish Government to tackling some of the causes of climate change.

36. WRAP notes that a Zero Waste society does not only emphasise the reduction of the use and consumption of resources. Actions during a product’s life cycle can result in greenhouse gas emissions at the points of extraction, processing, transportation, manufacture, use and disposal. If a product is used only once or is used inefficiently, the energy and greenhouse gas emissions from the preceding and following steps will be sub-optimal.

37. Given that, on average, one tonne of finished product requires the extraction from the ground of around ten tonnes of material ¹⁶, the material savings to be made through waste minimisation are obvious. However, what is perhaps less obvious is the embedded energy associated with finished products – in other words, the energy it took to produce them – and the potential that waste minimisation has to save this embedded energy.

38. As an example, the manufacture of one tonne of primary aluminium requires 55 gigajoules (15,400 kilowatt hours) of energy ¹⁷. Now if, through waste minimisation activities (such as eco-design), the lifetime of an aluminium product could be doubled, this would cut the waste of embedded energy by 50% over the lifetime of the new, longer-life product.

¹⁶ See, for example, The Strategy for Sustainable Farming and Food: Facing the Future (Defra, 2002), page 11 (in relation to food production).
PROPOSAL 1: Duties on Public Bodies and Business to Provide Recycling Facilities

Question 1.1 Do you consider that legislation should be made in this area?

39. WRAP believes that the decision to introduce legislation in this area is for the Scottish Government to decide. However, WRAP strongly encourages small and large businesses to have recycling schemes and to have separate materials collections on their premises, since it has been proven to have many benefits, not only for the environment, but also for the reputation of the businesses.

40. WRAP’s SME Recycling Feasibility Trials Evaluation Report concluded that 97% of those who work for an employer that started a recycling scheme on its premises are satisfied with the scheme mainly because it is easy to maintain and implement. Additionally, over a third of businesses involved said recycling had improved their reputation within the local community. Furthermore, recycling was perceived as a cost-effective method of dealing with the business waste, simply because it was often cheaper when compared with general waste disposal. In many cases, businesses were able to save money on services like paper recycling. Finally, 36% explained that another benefit of recycling at work was the general feel good factor from doing something useful and worthwhile.

1.2. If so, what form should that legislation take?

41. WRAP has no views on this issue.

PROPOSAL 2: Packaging

2. 1. Do you consider that legislation should be made in this area?

42. WRAP has no opinion on the need to introduce legislation in the field of packaging in order to encourage packaging waste prevention. However, WRAP has played a major role in introducing the Courtauld Commitment, a voluntary agreement between WRAP and major UK grocery organisations, aimed at working towards creating less packaging. The Courtauld Commitment is a powerful vehicle for change, and in 2008, has led to zero growth in packaging despite increases in sales and population.

43. As regards packaging, we believe that there are significant opportunities to promote the use of packaging technology as a means of achieving further packaging reduction whilst, at the same time, helping the public to consume more of the food that they buy, thus wasting less of it.

http://www.wrap.org.uk/downloads/SME002_-_final_evaluation_report_-_web_version_-_11_03_08.603a0c3d.5154.pdf
2. 2. If so, what form should that legislation take?

44. WRAP has no views on this issue.

**PROPOSAL 3: Specifying Recyclate**

3. 1. Do you consider that legislation should be made in this area?

45. WRAP supports any scheme that provides reliable and up-to-date information to the consumer, so that he or she is empowered to make informed decisions. Consequently, WRAP would welcome the proposals to require the specification of a minimum percentage of recyclate material.

46. WRAP is currently working, under the auspices of the Courtauld Commitment, in order to develop consistent labelling that informs consumers how widely packaging items are recycled.

3. 2. If so, what form should that legislation take?

47. WRAP has no views on this issue.

**PROPOSAL 4: Waste Prevention Plans**

4. 1. Do you consider that legislation should be made in this area?

48. WRAP strongly believes in working on the top of the waste hierarchy, waste minimisation or waste reduction, where actions are taken to stop waste from arising in the first place. Consequently, WRAP welcomes any waste reduction measures that implement changes in the way our society creates waste.

49. For example, the sustainable design and use of products can provide significant benefits across all sectors of society. The manner and rate of resource consumption can be addressed through Government initiatives (e.g. the phasing-out of conventional light bulbs), legislation and taxation policies.

50. However, we consider that it is for the Scottish Government to decide whether making legislation is the most effective way to achieve the desired outcomes.

4. 2. If so, what form should that legislation take?

51. WRAP has no views on this issue.

4. 3. What public bodies and businesses should be covered?

52. WRAP has no views on this issue.
PROPOSAL 5: Deposit and Return
5.1. Do you consider that legislation should be made in this area?

53. WRAP believes that it is for the Scottish Government to decide. WRAP’s\textsuperscript{19} report on refillable packaging and refill systems concludes that such systems have the potential to:
   - Divert a significant quantity of discarded packaging from landfill each year;
   - Provide significant savings for the retailer; and
   - Provide added value to the customer.

54. Refills are well established in the UK for stationery products such as pens, ink cartridges and toners. Some household cleaners and laundry products are also available in refills.

55. However, there is a significant opportunity to expand the refill product range in the UK, provided that social attitudes can be changed with good point-of-sale literature/advertising. Many food and non-food products in the UK could utilise a refill system if suitable pack technologies were available.

5.2. If so, what form should that legislation take?

56. WRAP has no views on this issue.

5.3. Your views on the practicalities of such schemes in Scotland?

57. WRAP has no views on this issue.

PROPOSAL 6: Mandatory Waste Data Returns from Business

6.1. Do you consider that legislation should be made in this area?

58. The availability of detailed data would be welcomed, but we believe that it is for the Scottish Government to decide.

6.2. If so, what form should that legislation take?

59. WRAP has no views on this issue.

6.3. Do you have any views on the kind of businesses to be covered?

60. WRAP has no views on this issue.

\textsuperscript{19} WRAP (2008) Potential Refill Solutions for the Food and Non-Food Retail Sectors – Feasibility Study \url{http://www.wrap.org.uk/downloads/Refills_06_food_and_non_food_Report.2db5be7.5518.pdf}
PROPOSAL 7: Other Measures to Encourage Waste Prevention, Including Action on Single-Use Carrier Bags

7. 1. Do you consider that legislation should be made in this area?

61. WRAP believes that there are many measures that can be introduced to encourage waste prevention. For example, promote the repair of electronic equipment or support the use of reusable nappies.

62. Regarding carrier bags, we believe that it is for the Scottish Government to decide if legislation should be introduced. WRAP would like to see a substantial reduction in the environmental impact of free single-use carrier bags. Recent developments show that there is now clear momentum from retailers, although more clearly work needs to be done.

63. In February 2007, WRAP, the UK Governments and 21 of the UK’s leading high-street and grocery retailers reached an agreement to reduce the environmental impact of carrier bags by 25% by the end of 2008.

64. One year on, interim results indicate a 14% reduction in the environmental impact of carrier bags as measured by the use of virgin plastic. The total number of bags used by the signatories was reduced by one billion bags from 13.4 billion to 12.4 billion. However, performance had been very variable, with retailers reporting activity ranging from a 70% reduction in virgin plastic use to an increase of 22% in one case.

65. The carrier bag agreement between retailers and Government highlights valuable examples of ways forward, such as the maximum amount of reuse for carrier bags, the widespread adoption of bags for life and the use of recycled content in bags.

7. 2. If so, which areas should these powers cover?

66. WRAP has no views on this issue.

7. 3. Are there any other areas, not covered by this consultation, where legislation could be made to increase recycling and promote waste prevention?

20 Asda, Boots, Co-operative Group, Debenhams, DSG Retail Ltd (Dixons and Currys), Early Learning Centre, E H Booths & Co Ltd, Halfords plc, Home Retail Group, John Lewis Partnership (John Lewis and Waitrose), Marks & Spencer, The Musgrave Group plc, Next Group plc, Nisa Todays, Primark Stores Ltd, Sainsbury's Supermarkets Ltd, Somerfield Group, Spar (UK) Ltd, Tesco, Travis Perkins (Wickes), Wm Morrison Supermarkets plc

21 WRAP (2007) Joint Statement on Reducing the Environmental Impact of Carrier Bags
http://www.wrap.org.uk/retail/about_us/carrier_bags.html
WRAP (2008) Carrier Bag Statement
67. There are many areas where more could be done. WRAP would be happy to support the Scottish Government with any measure that is taken forward.

9 October 2008
RURAL AFFAIRS AND ENVIRONMENT COMMITTEE

EXTRACT FROM THE MINUTES

5th Meeting, 2009 (Session 3)

Wednesday 11 February 2009

Present:

Rhoda Grant (Committee Substitute)  Liam McArthur
Alasdair Morgan                      Elaine Murray
Peter Peacock                      John Scott (Deputy Convener)
Bill Wilson

Apologies were received from Roseanna Cunningham (Convener), Karen Gillon.

The meeting opened at 10.01 am.

Climate Change (Scotland) Bill: The Committee took evidence on the Bill at Stage 1, in a roundtable discussion, from—

Stuart Goodall, Chief Executive, Confederation of Forest Industries;

Allan Mackenzie, Representative of Forestry Commission Trade Unions;

Dr Calum Macdonald, Forestry Commissioner and Chairman of the National Committee for Scotland, Forestry Commission Scotland;

Lisa Duggan, Landscapes Manager, Loch Lomond and the Trossachs National Park Authority;

Angus Yanwood, Convener of the Woodland Task Force, Scottish Environment LINK;

Janice Cassidy, Policy Officer, Scottish Rural Property and Business Association;

Gavin Ellis, Director, Scottish Tourism Forum;

Michael Russell MSP, Minister for Environment, Scottish Government, Anne Cairns, Solicitor, Rural Affairs Division, Scottish Government, Jo O'Hara, Head of the Natural Heritage Management Team, Scottish Government, Bob McIntosh, Director, Forestry Commission Scotland, and David Henderson-Howat, Policy Adviser, Forestry Commission Scotland.

Scottish Environment LINK agreed to provide the Committee with supplementary information in relation to the section of the Bill on muirburn. In addition, the Minister agreed to provide supplementary written information in
relation to the Scottish Government's proposal to lease Forestry Commission Scotland land.

**Climate Change (Scotland) Bill (in private):** The Committee reviewed the evidence heard earlier in the meeting.
SUBMISSION FROM CONFOR

ConFor (Confederation of Forest Industries) represents forestry and wood using businesses from nurseries and growers to wood-processing end-users. It has by far the largest membership of any representative body in the sector and works closely with members who own and/or manage the majority of Scotland’s actively managed non-public forests and who process the large majority of wood from those forests.

Delivering a low carbon economy

In the context of the current consultation on the Climate Change Bill it is important to recognise that the forestry and wood-using sector is well positioned to help deliver the Bill’s aim of developing a low carbon economy in Scotland. The sector contributes nearly £1 billion a year to Scotland’s economy, provides employment for 20,000, in particular in rural areas, and has capacity for growth.

The sector is one of the few in Scotland that can boast that the more it expands the greater carbon benefit it provides.

This benefit is realised through planting trees in the right places, and using wood to substitute for more energy-intensive materials. Unutilised wood or solid wood at the end of its useful life can also be used to generate renewable energy.

In order to inform its response to the consultation ConFor organised a number of meetings for businesses across the sector to be briefed on the consultation and to feed into ConFor’s response. Over 100 people attended, and we have received numerous comments that have been used to inform this paper. We therefore trust that this response will be given due weight when being considered by the Committee.

Climate Change (Scotland Bill) – proposals on forestry

1. Do you envisage that the Forestry Commission could play a greater role than it does at present in reducing greenhouse gas emissions or in alleviating or responding to the effects of climate change? If so, what suggestions would you make?

As part of the Scottish forestry and wood-using sector the Forestry Commission (FC) is already playing a valuable role in responding to the challenges of climate change. More can be achieved through a greater focus on partnership activity with the private sector, in part because these businesses can deliver outputs more cost effectively.

1 cebr report for the Forestry Commission and ConFor (2006)
As an example, the FC is currently raising £15m a year to deliver 2,000 hectares of planting (£7.5m per/1000 ha). £15m in grants to the private sector would deliver 5,000 ha (£3m per/1000 ha).

The FC should support and help deliver a more coherent approach to climate change mitigation. Current activities by FC focus overwhelmingly on supporting the development of the wood fuel market, and do not do enough to promote the use of wood in construction where the carbon and employment benefits are greater.

The public sector should take a lead in promoting the greater use of wood in construction, in particular through its use in public buildings and publicly-funded house building. The FC should do more to recognise and promote the benefits of a hierarchy of wood use that sees wood fuel make its most appropriate contribution to a low-carbon economy in Scotland.

Through the FC’s role in research, it has the capacity to do more to support silvicultural and tree breeding improvements that will make forestry more profitable and increase its carbon impact, as well as supporting the greater use of wood products.

2. Do you consider that either of the Government’s consultation proposals (on entering into joint ventures and on leasing cutting rights) would enhance the Forestry Commission’s role in dealing with greenhouse gas emissions and climate change?

The FC is already able to undertake renewable energy projects on its land and therefore the big opportunity from both joint ventures and leasing (or an alternative mechanism) would be the opportunity to raise additional money - in the case of leasing by realising, upfront, the value of the estate. This money could be used to deliver increased new planting through the private sector.

It is likely that any forest considered for leasing (or an alternative) would be composed of productive softwoods. While the private sector believes it can manage such forests more efficiently, and against the same standards as the FC, this would make only a minor difference to their role in carbon sequestration.

ConFor would wish to raise one important point regarding renewable energy projects on forest land, in particular wind farms. There is potential for a significant loss of productive forest with consequent negative carbon impacts. ConFor has pressed for action to minimise forest loss and to ensure that compensatory planting takes place.

3. Do you envisage any implications for nature conservation, biodiversity or recreational interests from the two proposals and, if so, what are they?

There may be impacts where a renewable project joint venture results in a loss of forest area. Productive softwoods provide valuable biodiversity benefits that are rarely properly recognised.
If leasing of commercial forests owned by FC was to take place we would expect little or no impact on nature conservation, biodiversity or recreation. It is expected that any areas to be leased would have no significant recreational use such as mountain biking or visitor centres, and that the current level of access would remain as provided for under legislation. The Land Reform Act applies equally to private and publicly owned land.

The leased forests would be productive softwood forests and therefore would be managed in that manner by a lease-holder. The same standards of management would apply – the Government’s UK Forestry Standard, and most likely the independent certification standard UKWAS that the private sector, FC, environmental and access groups all endorse.

Questions have been raised about lost potential to secure new and additional biodiversity benefits from these forests or on the cost to groups, such as car rally organisers, of exceptional use of these forests. It is important to note that the FC does not provide public goods for free. These are paid for by public subsidy to the FC. The private sector, including forestry businesses and organisations such as RSPB and Woodland Trust, is able to provide additional benefits if public subsidy is available.

4. Do you believe there are any implications for rural employment from the two proposals and, if so, what are they?

If the joint venture proposal went ahead and this raised additional funding which could be used in forestry then this will have a positive impact on jobs overall.

Leasing of 100,000 ha, if it was undertaken, would result in some displacement of employment between the public and private sectors.

If, and there are currently no guarantees, money raised from leasing and joint ventures was made available to deliver increased new planting then this would stimulate additional employment – see answer to question 5 below.

5. Do you have any other views on these two proposals from the Government?

The proposal to lease forests contains insufficient information on which to determine its impact on Scotland’s forestry and wood-using businesses. ConFor would wish to reiterate the central message from its response to the consultation, that:

- there is benefit in delivering increased new planting;
- this could be delivered by a variety of mechanisms and requires improvements to the SRDP;
- ConFor is keen to utilise both its and its membership’s expertise in developing a way forward that addresses legitimate concerns raised.
In terms of delivering new planting we would note that good information is available on where and how best to establish new forests to maximise carbon sequestration while securing other economic and environmental benefits. Current sustainable management standards provide a firm basis for Scotland to really begin to achieve a target of 25% forest cover.

ConFor recognises the benefit of delivering this within the context of a broad land-use policy. However, there is land currently available and planting a very small part of this now while developing a policy to guide future activity is vital to help secure jobs in the sector at a time of economic downturn.

Internationally agreed climate change targets focus on 2050. If Scotland planted 15,000 hectares a year with 9,000 ha being productive softwood forests then it would deliver the Government’s target of 25% forest cover by 2050 and provide significant, additional carbon benefits - up to 33.5 MtC.

**TABLE:** Estimated carbon sequestration for additional productive and broadleaf forest under new planting regimes of 10,000 ha/yr and 15,000 ha/yr from 2010 to 2050

<table>
<thead>
<tr>
<th>Planting regime over period 2010-2050 inc.</th>
<th>Productive softwoods</th>
<th>Broadleaves</th>
<th>Total</th>
<th>Total Est. carbon sequestration to 2050 (MtC)*</th>
</tr>
</thead>
<tbody>
<tr>
<td>New planting (ha/yr)</td>
<td>Carbon sequestration (MtC)</td>
<td>New planting (ha/yr)</td>
<td>Carbon sequestration (MtC)</td>
<td>New planting (ha/yr)</td>
</tr>
<tr>
<td>10,000 ha/yr</td>
<td>6000</td>
<td>15.5</td>
<td>4000</td>
<td>6.9</td>
</tr>
<tr>
<td>15,000 ha/yr</td>
<td>9000</td>
<td>23.2</td>
<td>6000</td>
<td>10.3</td>
</tr>
</tbody>
</table>

**NB** On a sustainably managed basis, at 10,000 ha/yr, the total additional forest would continue to sequester 1.1 MtC/yr after 2050, and 1.6 MtC/yr on a 15,000 ha/yr planting regime.

Such a planting programme would secure significant jobs and investment benefits. For productive softwood forests this is estimated at around 180 new jobs in planting and up to 900 for harvesting, transport and wood processing. Current investment in the sector is running at £100m a year and this would increase significantly.

**Increased use of Scottish wood**

Wood products are low energy materials that can save significant amounts of carbon when substituted for other building materials. Research shows that average savings of 0.8 tCO2e can be achieved by replacing 1 m3 of concrete/bloc/bricks with 1 m3 of sawn timber2. Long-term wood products also provide a benefit through their potential storage capacity, estimated at 0.9 tCO2 in 1 m3 of wood3.

---

3 Dr A Fruhwald, Hamburg University in CEI-Bois (2006) Tackle Climate Change: Use Wood
ConFor calculates that over the period to 2050 the additional productive forest area achieved from planting 9,000 ha/yr of productive softwoods could provide, based on current proportions, an additional 33.5M m$^3$ timber available to the construction market. This then gives the potential for substitution of materials delivering emissions savings of 27mtCO$_2$. This would be a tremendous resource for Scotland.

Wood can also be used to generate renewable energy. ConFor has campaigned for this to focus on wood that currently has no market, and to promote its use locally and in generating heat. It has also noted that carbon and jobs benefits are higher in solid wood products, not least because these can be used and re-used, and then be made available to generate energy at the end of their useful life. There is a danger that current and evolving public policy could provide such large incentives to burn wood that jobs are lost and the carbon emissions potential of wood is not fully realised.

*Scottish broadleaves and softwoods*

ConFor represents people who own and work with broadleaf woods. We support efforts to manage broadleaf woods sustainably and to develop markets for hardwoods. It is important, however, when talking about climate change mitigation, jobs and investment to recognise the scale and potential of Scotland’s diverse forest and wood-using businesses.

Including Scots Pine, Scotland produces over 6 million tonnes of softwood each year, while hardwood production, including non-native species, is just over 400,000 tonnes for the whole of the UK with the majority of this estimated to be in England.

Scotland is internationally competitive in growing softwoods and producing wood products that have a large market and where there is scope for significant growth. The businesses in the sector are mainly Scottish owned or headquartered.

The sector is unusual in that it combines successful, modern manufacturing with land management that is governed by environmental standards that are second to none.

The sector suffers from an image hang-over from the planting of last century, driven by the FC which did not deliver the multi-purpose forests that are being established today. Those single-species, forest blocks are now being restructured to improve their biodiversity and visual impact. Using lessons learnt from the past there is scope now for a modern forestry and wood-using sector that all Scotland can be proud of.

Unfortunately Scotland’s broadleaf woods are largely unmanaged and provide limited amounts of timber for wood fuel and for small businesses that produce furniture, flooring, etc. The potential for use in construction is limited by the lack of quality trees and the established, highly competitive operations on mainland Europe that dominate the hardwood market. This will not change in
the near future as hardwoods take up to 150 years to grow (against 40 for softwoods).

There is scope for development of the broadleaved resource and of hardwood markets, but by far the largest opportunity for sustainable growth and climate change mitigation sits with the softwood resource, and public policy and its delivery must reflect that.

Stuart Goodall
ConFor
29 January 2009
SUBMISSION FROM FORESTRY COMMISSION TRADE UNION

The Forestry Commission Trade Unions (FCTU) have submitted a full response to the Consultation on the Scottish Climate Change Bill, but we aim in this response to focus on the five questions posed in the Questions for Consultees from the Committee and have answered them in the order set out.

Question 1. Greater role for Forestry Commission Scotland (FCS)

FCS has built up a significant capital asset from the funds allocated by Government over its 90 year history and it has already started to use this asset to contribute to Climate Change planting targets. There is scope to do more on this. The current programme known as ‘Repositioning’ is to raise £15m per year over the three years of the Public Expenditure round from 2007-8 to 2009-10. This is focussed on areas of forest which contribute least to the aims of the 2006 Scottish Forestry Strategy (SFS). The money has then been used to acquire new planting land in areas closer to communities or where planting can contribute to the 10,000ha target for Scotland.

The key aspect to selection of these sites is that it considers all three of the legs of sustainability – economic, social and environmental. It is only when a scoring system shows low values in all of these, that they are considered for sale. The impact on staff is minimal as sales are dispersed around Scotland and there is no element of flooding a market. At the moment, the investment market in woodland is good and prices realised meet expectations.

Question 2. Effects of Joint Ventures and Leasing on FCS role in climate change.

Joint ventures have been widely accepted as allowing added value to the role of FCS. While they can only lease land for non-forestry purposes at present, this provision in the bill will generate greater opportunities for FCS to facilitate developments, particularly in wind and hydro power generation. Initial survey of the FCS estate has shown great potential and income from this should flow in the period about 5-10 years from now.

Leasing as presented by the Consultation document has been widely condemned by the public and is opposed very strongly by the Trade Unions. It considers only the economic aspect of sustainability and fails to recognise the added value of FCS staff in areas where the environment has less natural attractions for environment and tourism. Considerable staff resource and funding has been put into remote rural areas such as the Galloway Forest Park by such ventures as the 7Stanes Mountain Biking facilities.

Question 3 Implications for Nature Conservation or biodiversity.

Joint ventures could release funds for additional planting and if this is the right trees in the right place, as set out in the SFS, could have great benefits for the environment, with protection of peatlands and other Priority Habitat Types currently under threat from over-grazing, opportunities for expansion of native
woodlands and increased development of the woodland environment which has been so successful in allowing parts of Perthshire to be badged as ‘Big Tree Country’

With respect to tourism, the success of the Joint Venture between FCS and the Caravan and Camping Club GB in creating ‘Forest Holidays’ has shown the potential for this provision to be added to future Scottish legislation not linked purely to Climate Change.

Question 4 Implications for Rural Employment.

There is provision under the National Forest Land Scheme (NFLS) for communities to buy areas of FCS land, but this means many small communities cannot consider this option due to the large sums of capital they would have to raise. A better option would be to allow them to enter into Joint Ventures with FCS to lease the land or work in partnership with FCS to generate local employment opportunities. Heat generation from woodfuel is a particularly good example, with the necessity to increase the use of local sources of fuel and Combined Heat and Power schemes. The reduction in transport on fragile rural roads would be of particular benefit. Leasing as proposed at present will take this opportunity away from some of the most remote communities as the private manager is unlikely to have the same public benefit priorities as FCS.

Question 5 Other views.

We have set out our views above and welcome the opportunity to subject these to questioning by the Committee and expand on the detail on 11th February.

Forestry Commission Trade Union
4 February 2009
1) Do you envisage that the Forestry Commission could play a greater role than it does at present in reducing greenhouse gas emissions or in alleviating or responding to the effects of climate change? If so, what suggestions would you make?

As a land manager, producer and transporter of forestry products as well as a regulatory authority and producer of best practice guidelines there are a number of areas where the Forestry Commission could play a greater role. These include:

- Making greater use of existing landholdings for renewable energy generation, as proposed.
- Developing markets for wood products.

There is a need to create both local and national markets for timber products. Localised demand will encourage investment and better management of our woodland resource and limit the need for the transportation of products across the country. There needs to be a significant commitment to using more timber products in house building (including insulation products) and further assistance to put in biomass boilers in homes etc. Without development of the demand side we will have a lot of forests (that do help mitigate climate change) but no end markets for the raw material.

- Encouraging more land into forestry

More planting could be encouraged if it were allowed on land that receives Single Farm Payment. This would increase planting and would need no additional government investment.

Early indications suggest that the rate of take up of forestry options under Rural Priorities would be increased if the rates of payment were more attractive.

Woodlands in and around town (WIAT) should continue to be supported as they not only contribute to mitigating climate change but also help to absorb localised pollution and limit leisure travel by providing a full range of recreation facilities within easy travelling distance of major centres of population.

- Developing innovation and best practice in forest roads and timber transport

More sustainable forms of timber transport should be developed to reduce road haulage, specifically options and potential subsidies for rail and water transport should be investigated.
With increasing intensity of rainfall, greater encouragement should be given to non-standard engineering solutions for forest roads. Improved designs must reflect the changing climate and aim to minimise erosion and land slippage.

2) Do you consider that either of the Government’s consultation proposals (on entering into joint venture and on leasing cutting rights) would enhance the Forestry Commission’s role in dealing with greenhouse gas emissions and climate change?

LLTTNPA supports the proposal to allow the Forestry Commissioners to enter into joint ventures to develop renewable sources of energy on the national forest estate. This appears, in principle, to be a practical way for the Forestry Commissioners to increase the profitability of the national forest estate while contributing to the mitigation of climate change.

The NPA supports joint ventures between FCS and local communities which provide opportunities for the development of sustainable and affordable community renewable energy schemes. The development of sustainable and affordable energy generation is particularly important for those rural communities, off mains supply, that remain heavily reliant on fossil fuels for heating. This will help to engage and empower communities, creating local solutions for some of the issues of climate change. Any income generated from joint ventures with developers and local communities should be used directly to fund further measures to mitigate climate change.

Within the National Park, medium (generating between 1MW and 20MW with multiple turbines) and small-scale (generating below 1MW) wind renewable energy projects will be supported where, the siting, design, access and scale of the proposal does not create a detrimental impact on the landscape, natural or cultural heritage or has any adverse impacts on local communities or the rural road network. Large-scale wind renewable projects are unlikely to be acceptable. Within the National Park boundary, small-scale (generating less than 1MW) are likely to be acceptable where there is no significant environmental or landscape impact. Energy generation from biomass heating or combined heat and power combustion plants are likely to be acceptable in the National Park where the siting, scale and design, future support infrastructure and production of raw materials, do not have adverse impacts on the natural or cultural heritage of the area or on local communities.

There is an urgent need to undertake a feasibility study on the national forest estate to assess the potential for income generation from renewable energy schemes taking into consideration development constraints. If the potential is sufficient to generate adequate funding for FCS to make a significant contribution to climate change mitigation, leasing of land may not be necessary.
3) Do you envisage any implications for nature conservation, biodiversity or recreational interests from the two proposals and, if so, what are they?

We would draw your attention to the potential impact on bats, a European Protected Species, of siting wind renewable projects within forestry. Early indications suggest that bats may be particularly vulnerable to the localised disturbance created by turbines and this requires further research before specific proposals are developed.

Other key species which may be impacted upon by micro-renewables and associated infrastructure such as tracks, borrow pits etc include red squirrels, otter, water vole, birds, such as raptors and some fish species etc. Guidance would need to be developed to minimise impacts on the natural heritage, prior to this policy being progressed.

The Forestry Commission and Forest Enterprise work to best practice guidelines and aim to combine economic forestry with biodiversity (this is a duty for them under the Nature Conservation (Scotland) Act 2004), minimising landscape impact, community involvement and access and recreation. It is difficult to see how commercial operators, to whom the biodiversity duty does not apply, will be able to maintain this balance and continue to deliver to high standards.

Whilst land is unlikely to be removed from access rights, the provision of well managed, quality access provision; which is important for a visitor destination such as the National Park, is likely to deteriorate if large areas of the National Forest Estate are leased out.

The siting and scale of micro-renewables can have significant effects on landscape and biodiversity. Cumulative effects can combine to magnify these impacts. In dealing with a single landowner (the Forestry Commission) planning authorities will have greater ability to seek plans and appraisals which can address the potential for cumulative impact. This will become more complex if multiple interested parties come forward individually and potentially in competition.

4) Do you believe there are any implications for rural employment from the two proposals and, if so what are they?

The majority of woodland management is mechanised and involves time limited amounts of skilled/unskilled labour on individual sites. Consequently the majority of private woodland managers subcontract works and an increasing number use management firms to manage contracts and apply for state aid and subsidies where appropriate.
As such leasing arrangements are unlikely to have significant long term impacts on the number of permanent rural jobs in forestry. Rural jobs might be increased if the number of local markets for wood produce were increased as more jobs could be created in the processing and finishing of products.
Micro-renewables are creating new jobs in manufacture and installation; however these are unlikely to be rural as staff are concentrated in manufacturing areas.

5) Do you have any other views on these two proposals from the Government?

The consultation document does not provide enough detail on the proposed offer of leasing and cutting rights over areas of the National Forest Estate to the private sector to fully comment on this proposal. However, we have concerns that the basic principal of selling cutting rights or leasing sections of publicly owned land undermines the concept of a National Forest Estate and may, in the long-term, undermine its economic viability. Whilst leasing may release capital for the delivery of climate change objectives, the disposal of 25% of the most profitable estates may limit opportunities for FCS to cross subsidise work on their less profitable estates. It may also limit opportunities for savings arising from economies of scale.

As a theoretical argument, if the Forestry Commissioners wish to release capital then a case could be made for a disposal policy. This should look across the range of assets, rather than simply at the most profitable and might include small scale disposals to communities or investors. Income could then be used for future acquisition or planting schemes.

However, the NPA remains concerned that either leasing or disposal could undermine the concept of an economically viable, publicly valued National Forest Estate.

The NPA strongly supports the current consultation arrangements on FE Forest Design Plans. All current FDP’s have been subject to stakeholder engagement, including the NPA. FE has a strong policy commitment to improving the environmental value of the National Forest Estate, providing for recreation and conserving the historic environment above and beyond the minimum required by the UK Forestry Standard. The NPA is concerned that leasing of land to a third party, with the principal management objective of profitable timber production, will result in erosion of the environmental value and non-timber interests of the estate and the wider benefits forestry brings to the general public. The NPA is further concerned that leasing 25% of the Forest Estate may lead to pressure to increase timber production on the remaining forest estate, which again may result in a reduced commitment to conserving and enhancing non-silvicultural interests.

The proposal, as outlined in the Consultation Paper, does not discuss funding arrangements for management of the National Forest Estate by the private sector. If third party managers were to be eligible for funding through SRDP (and any subsequent funding mechanisms), and it is difficult to see why leasing/cutting rights would be attractive to the private sector if funding were not made available for management, additional funding would need to be made available through SRDP for planting/management to minimise the
impact on other landowners who would potentially be affected by the additional pressure on the limited funding currently available.

A rigorous selection process for leasing sites will need to be put in place to ensure that other interests are not compromised as a result of change of tenure and management objectives.

With reference to not-for-profit trusts, FCS is a public body, acting for the public interest, so the benefits of transferring profits made from joint ventures or leasing to a not-for-profit trust are not immediately apparent. Indeed, at first glance the added layer of administration may give little advantage.

FCS has led many Challenge Funds over the years and has proven this to be a workable and successful model for prioritising spending to achieve maximum public benefit. The NPA recommends the establishment of a Climate Change Challenge Fund, funded through the revenue received from joint ventures. A Climate Change Challenge Fund could finance a range of measures such as new planting or the use of forests to reduce emissions or mitigate the effects of climate change while keeping the money in the public domain and having it administered through a tried and tested mechanism.

Loch Lomond & The Trossachs National Park Authority
29 January 2009
SUBMISSION FROM SCOTTISH ENVIRONMENT LINK

Scottish Environment LINK (LINK) welcomes the opportunity to give written and oral evidence to the Committee on the forestry proposals in the Climate Change (Scotland) Bill. Established in 1987, LINK is the forum for Scotland’s voluntary environment organisations - 33 member bodies representing a broad spectrum of environmental interests with the common goal of contributing to a more environmentally sustainable society. LINK provides a forum and network for its member organisations, enabling informed debate, and assisting co-operation within the voluntary environmental sector. LINK assists communication between member bodies, government and its agencies and other sectors within civic society. Acting at local, national and international levels, LINK aims to ensure that the environment is fully recognised in the development of policy and legislation affecting Scotland.

Introduction

In principle we welcome the fresh look at how the Forestry Commission Scotland (FCS) can deliver for climate change but we are particularly uncomfortable, as we have highlighted before\(^1\), with woodland creation for carbon sequestration becoming the primary driver for the government and the National Forest Estate (NFE). LINK has repeatedly expressed its view that the best way to respond to climate change is to first reduce greenhouse gas emissions by moving away from carbon based energy production, reducing energy consumption and energy loss. We see carbon sequestration as one of the secondary responses that feature further down the list of the multiple benefits forestry provides.

The plans proposed in the recent consultation and the enabling powers in the Climate Change (Scotland) Bill are controversial and as yet, they have not been fully explained or costed. Our detailed concerns on these proposals are presented below.

It is LINK’s view that these proposals require more considered thought and discussion. As a result we are unhappy with the wide reaching enabling powers in Section 47, Sub-sections 1, 2 and 4 being included in the Bill. Rather we would like to see any specific powers that may be identified, brought forward in the future, after they have been properly explored and consulted upon.

We do however welcome the inclusion of Sub-section 3, a), b), c) and d) (i) which allows the FCS to enter into joint ventures for renewable energy projects because these proposals are specific, directly relevant to the Bill’s aims, and help to enable objectives already set out in the Scottish Forestry Strategy (SFS).

Question 1. Do you envisage that the Forestry Commission could play a greater role than it does at present in reducing greenhouse gas emissions or in alleviating or responding to the effects of climate change? If so, what suggestions would you make?

It is LINK’s view that there has been a clear change in policy drivers for forestry in the last 18 months, in favour of forestry and woodland creation for climate change ‘mitigation’. LINK has always accepted that creating new woodland contributes to the process of carbon sequestration but it cannot sequester more than a small proportion of the total carbon emissions generated each year.

Government efforts to reduce CO₂ emissions are best concentrated on mitigation activities such as better insulation of the existing housing and office stock, reduction of transport emissions and restructuring our energy supply away from carbon based energy sources.

The National Forest Estate, whilst having a role to play in carbon sequestration, has a greater role to play in climate change adaptation and making space for nature. Unfortunately climate change adaptation has not been properly considered in these forestry proposals.

Therefore, LINK believes, carbon sequestration should not be a primary driver for woodland creation. Rather it should be one of a range of benefits arising from long term, multi-benefit forestry. This would mean carbon storage can be assured in perpetuity and the woodland creation can provide additional benefits to society, such as new and enhanced public access, greater biodiversity, and landscape maintenance and enhancement.

LINK believes that to properly address these issues and to look at the role of carbon across all types of land use in Scotland, we need a Sustainable Land Use Strategy to be implement a holistic approach to integrated land use and delivery of multiple public benefits.

Question 2. Do you consider that either of the Government’s consultation proposals (on entering into joint ventures and on leasing cutting rights) would enhance the Forestry Commission’s role in dealing with greenhouse gas emissions and climate change?

JOINT VENTURES:
In principle we have no objection to legislation being amended to allow FCS to undertake joint ventures with renewable energy companies, subject to appropriate safeguards, because we support the principle of injecting new resources into forestry and climate change delivery. These joint ventures would be directly contributing to the government’s renewable energy targets and could provide funding and expertise in developing our renewable energy sector.

Any joint ventures would require careful consideration and we would expect safeguards to be in place to prevent inappropriate developments and an adverse effect to habitats that must be retained to enable adaptation to climate change. These safeguards should include the following requirements:
• That there is protection for other public benefits such as: Plantation Ancient Woodland Sites (PAWS), woods of high nature conservation value, biodiversity, priority open ground habitats, public access and recreation provision.

• That FCS will undertake full Environmental Impact Assessments on the joint ventures.

• That all proposals will follow the full planning process and any supplementary planning guidance on preferred locations for renewable projects.

Any money raised from such ventures would need to be properly reinvested in climate change actions and a protocol may need to be developed to ensure this delivers the greatest possible environmental benefit, including emissions reductions and wildlife adaptation.

CUTTING RIGHTS
There is considerable concern that by implementing this proposal, other non-timber production public benefits would not be well served. This is largely because the income that the FCS generates from the leased production forest may impact on other multi-benefit forestry it carries out on the rest of the estate.

For these proposals to be considered further, LINK would expect that:

• The economic case is properly laid out. This has not yet happened and therefore it is not possible for us to comment on the financial aspects of the proposals with any confidence.

• A full and satisfactory Strategic Environmental Assessment is undertaken on the fully costed proposals.

• A proper assessment is undertaken of the impact on the remaining FCS activities and ability to deliver the SFS. At present the FCS carry out a complicated balance of economic, social and environmental activities (including for the landscape and the historic environment) within their forests. Transferring the more commercial parts of the national estate for a period of perhaps 75 years could potentially and severely constrain funding of the social and environmental aspects of FCS activities.

• There is a full explanation of how enhanced delivery of non-market benefits will take place. For example meeting the commitments of the Scottish Biodiversity Strategy, UK Biodiversity Action Plan, EU Birds and Habitats Directive and the biodiversity theme of the SFS.
Evidence is provided that all the capital raised from the leases would be reinvested into forestry and associated climate change actions. So far there have only verbal ‘in principle’ assurances which are inadequate. In the absence of clearly set out protocols and structures we are not be able to further consider the proposals.

Accessibility must be retained if the land is leased. There is a significant difference between a right to access and accessibility.

Any company or body leasing the land would have to ensure that the land was certified against the UK Woodland Assurance Standard (UKWAS) for the entirety of the lease.

There is concern that releasing over 100,000ha of new land into the Scottish Rural Development Programme (SRDP) may lead to increased competition for woodland management funds, without increasing the SRDP budget. LINK would wish to see assurances that high quality land management for biodiversity, landscape conservation, historic environment and access would not lose out.

Question 3. Do you envisage any implications for nature conservation, biodiversity or recreational interests from the two proposals and, if so, what are they?
LINK is concerned that the woodland expansion elements of these proposals could threaten the conservation of open ground habitats and species, either by woodland creation, or lost opportunities to restore such habitats. For that reason, LINK urges the Scottish Government and its delivery bodies not to repeat the woodland expansion mistakes of the past, and to actively reverse the biodiversity damage created by inappropriate afforestation. Woodland expansion in Scotland must be carried out sensitively to ensure the protection and enhancement of important biodiversity and the delivery of multiple public benefits.

Question 4. Do you believe there are any implications for rural employment from the two proposals and, if so, what are they?
LINK does not have a specific view on the employment implication of these proposals because it is largely outside of our members’ direct remit. We would however say that we would not want to see a reduction of actively managed woodland in Scotland and it would be a disadvantage to the forestry sector if valuable skills and knowledge is not retained within the industry.

Q.5. Do you have any other views on these two proposals from the Government?
Within the FCS consultation document, there was a suggestion of creating a not-for profit trust (NFPT). This suggestion strongly implies a social and environmental purpose for such a body (i.e. public rather than commercial benefit), as well as some stakeholder representation in its governance arrangements, but this is not explicit in the proposals and that gives us some cause for concern.
LINK would need to see the following guarantees in order to further consider the proposal:

- All income from the lease of land and cutting rights to be invested through the NFPT into multiple public benefits through forestry and related climate change actions. This means investment in climate change adaptation as well as ‘mitigation’.
- The NFPT is constituted to deliver forestry related public benefits and priorities as laid out in the Scottish Forestry Strategy and in particular in relation to climate change ‘mitigation’ and adaptation.
- The NFPT will enable creation of significant areas of new native woodland.
- All woodland creation funded through the new structure should be UKWAS certified.

LINK would not support the idea of the NFPT using lease and cutting rights income to solely create new production forests. All new woodland created should be multi-purpose and provide significant public benefit. If the NFPT creates new woodland in the same proportion as the current estate, it will create 87% exotic species – this would be contrary to the vision of the SFS and would not be supported by LINK. In order to achieve the current SFS vision, more than 6,000 hectares of native woodland is required per annum for the next 50 years (35% of the enlarged forest cover of 25% land area). We cannot see the logic of the NFPT creating more production forest to sell or lease off and create more in a cyclical fashion.

LINK Woodland Task Force,
3 February 2009.

WWF Scotland
SUBMISSION FROM SRPBA

The SRPBA welcomes the opportunity to provide comments to the Rural Affairs and Environment (RAE) Committee on the provisions relating to forestry in the Climate Change (Scotland) Bill. Under section 47 of the Bill, the Scottish Ministers would be given the power to modify the functions of Forestry Commission Scotland (FCS) if they consider it necessary or expedient to meet greenhouse gas emissions reduction targets under the Bill or for other climate change reasons.

The SRPBA responded to FCS’s Climate Change and the National Forest Estate: Consultation on Forestry Provisions in the Scottish Climate Change Bill on the 27 February. This consultation paper indicated that the Scottish Ministers are considering using the section 47 power to enable FCS to (i) enter into joint ventures with developers on FCS land with the intention of participating in renewable energy programmes, and/or (ii) offer leases and cutting rights over parts of the national forest estate. It is suggested that FCS could use the money generated by these proposals on climate change related projects, such as forest creation.

1. Do you envisage that the Forestry Commission could play a greater role than it does at present in reducing greenhouse gas emissions or in alleviating or responding to the effects of climate change? If so, what suggestions would you make?

The SRPBA believes that FCS could play a greater role in reducing greenhouse gas emissions than it does at present. We consider that the proposal to allow Forestry Commissioners to enter into joint ventures with developers with the intention of participating in renewable energy programmes on the national forest estate seems to be a sensible suggestion. FCS can currently lease non-forested land for any purpose (but not forested land) and has done so for several projects including windfarms. The SRPBA believes that FCS could get better value for Scotland by entering into joint ventures with developers and receiving a share of the profits, thus generating more funds for investment in woodland expansion. Therefore, FCS would be contributing to reducing greenhouse gas emissions by (i) entering into renewable energy projects on the national forest estate and (ii) investing the money raised in planting more trees which lock up carbon, can be used as a renewable fuel resource, are easily recycled and can substitute for more energy intensive materials, thereby reducing carbon emissions.

2. Do you consider that either of the Government’s consultation proposals (on entering into joint ventures and on leasing cutting rights) would enhance the Forestry Commission’s role in dealing with greenhouse gas emissions and climate change?

As stated in our response to question 1, we believe that granting FCS the powers to enter into joint ventures with the intention of participating in renewable energy programmes on the national forest estate will enhance their contribution to reducing Scotland’s greenhouse gas emissions. However,
based on the limited amount of information available to date, the SRPBA does not think that the leasing proposal would enhance FCS's role in dealing with greenhouse gas emissions and climate change. It is proposed that the money raised from leasing would be put back into future planting which would have benefits for climate change. However, we are apprehensive that the money raised will not necessarily be put back into the forestry sector. The proposed leases will last for 75 years, during which time governments will change and agendas will change. In practice, the government cannot guarantee that money raised will be reinvested into the forestry sector. Any lease arrangement that attempts to ensure that the public's interest in the national forest estate is retained is likely to be very complex, possibly not 100% effective in the long run and very expensive overall. Furthermore, a 75 year lease does not relate to rotation length and this may lead to the demand for a lease roll over or sale of land.

3. Do you envisage any implications for nature conservation, biodiversity or recreational interests from the two proposals and if so, what are they?

The SRPBA envisages that the money raised from joint ventures will be reinvested back into the forestry sector for future woodland creation. With this additional income stream FCS will be able to fund biodiversity projects and ameliorate recreational opportunities on the national forest estate. However, if the leasing proposal goes ahead, FCS may stand to lose 25% of their land area but because this would include some of their most productive forests they may lose approximately 33% of their income, thus increasing their unit costs. Therefore, less money would be available for nature conservation, biodiversity and recreation. If FCS loses its income stream due to the introduction of a 75 year lease to a private company, there must be a guarantee that any shortfall in finances will be met by the Government in order to continue providing the public benefits noted above.

4. Do you believe there are any implications for rural employment from the two proposals and, if so, what are they?

The SRPBA believes that allowing FCS to enter into joint ventures could potentially create jobs in rural areas of Scotland. On the other hand, if 25% of the national forest estate is leased, including some of the most productive areas of forestry, then it is inevitable that FCS will not be able to fund as many positions as at present. The Minister has argued that there could be an increase in jobs available if the leasing proposals go ahead because the money raised from leasing could be reinvested back into the forestry sector and more positions could be created. However, there is no guarantee that the money will be put back into the forestry sector and the lessee will be under no obligation to employ existing FCS staff because they may already have their own staff.
5. Do you have any other views on these two proposals from the Government?

General comments

- The consultation period was unusually short from 4 November 2008 to 27 January 2009, including the Christmas and New Year breaks. A consultation period of three months is considered more usual and any shorter period makes it difficult for stakeholders to gather opinion and respond fully. We appreciate that the closing date is set early due to the fact that the Climate Change (Scotland) Bill has already been introduced in the Scottish Parliament. However, this suggests that there is some urgency to the government’s proposals and it appears that they are all a bit ‘last minute’. It has been rumoured that a single investor has already approached the Scottish Government to lease land and this would require the government to rush through enabling powers. The SRPBA is aware that the Minister has dismissed these claims but we would still like to raise them as concerns held by some of our members. In general, the whole consultation process seems rushed and this is evident from the consultation paper itself which lacks any detail about the joint ventures or leasing proposals. This lack of clarity makes it more difficult to formulate a definitive view.

- Before even contemplating whether the joint ventures and leasing powers are a good thing we need to address the main question in the consultation - should the government have enabling powers built into the Climate Change (Scotland) Bill to allow joint ventures and leasing? If it is granted enabling powers then sufficient checks and balances need to be contained within the primary Act to give the forestry industry some comfort that the detailed secondary legislation will be properly consulted upon and scrutinised. We would require confirmation that the secondary legislation will be passed using the affirmative procedure in parliament so that the relevant committee has the opportunity to scrutinise and ask questions of the government. This would give stakeholders an opportunity to engage with MSPs if any changes are required. We do not feel that negative resolution is appropriate in these circumstances.

- The SRPBA would like to know timing for the secondary legislation. We would like to know when we could expect to see draft regulations and need some assurance that the industry will be given sufficient time to scrutinise them. The primary Act must contain an obligation upon Scottish Ministers to consult.

Joint Ventures

- Some have questioned whether or not FCS has the appropriate skills to enter into joint ventures since their expertise is in managing state owned woodland, not renewable energy projects. However, Forestry Commissioners do have experience in management and commerce, consequently they are suitably equipped to enter into joint ventures. FCS can provide the land and management expertise while the other partner(s) can contribute their experience in overseeing renewable energy projects. Therefore, successful joint ventures are achievable.
However, we would like to add one point of caution regarding joint ventures: FCS would have to participate in any losses if projects failed and therefore risks would be taken with taxpayers’ money.

Leases and cutting rights
- How many leases will there be – one lease of the whole 25% of the national forest estate to a single (possibly foreign) investor or a number of leases to private sector interests in Scotland? The former option would be very unpopular with the public as well as some of our members but based on discussions to date it seems more likely.
- Will lease(s) be renewed or extended after the initial period of 75 years? If so, is this not just a sell-off in another name?
- FCS is generally regarded as a good neighbour. How can this benefit to landowners be preserved with the new tenants?
- How will the future of the processing sector be guaranteed beyond honouring existing contracts?
- The SRPBA does recognise that potential lessees will need to make their woods work hard to generate a return and they will have an interest in a competitive and vibrant market for their products. However, unlike FCS they could mothball their timber at times of low prices thus creating supply problems. Private growers have not generally been willing to enter into long term contracts with sawmills since they prefer to sell at times of better prices only and cannot therefore be relied on to maintain continuity of supply.
- Instead of offering leases to new investors, the SRPBA believes that more planting would take place if the rules of the Single Farm Payment, which facilitate ‘armchair farming’, were changed. There are costs and risks involved with planting trees on bare land whereas one can let that land remain bare and receive money for doing so in the form of a Single Farm Payment. Reform of these rules would remove one barrier to increasing planting. It would seem illogical to simply increase grant rates for forestry without firstly addressing this Single Farm Payment barrier. By planting on bare land, land managers could be contributing to a mosaic of land uses in Scotland which would provide both themselves and the wider Scottish population with multiple benefits such as biodiversity benefits, diversification of sources of income and helping to tackle climate change. The SRPBA strongly encourages the development of a rural land use framework for Scotland and we welcomed initial discussions on this topic in September 2008. Scotland needs a framework in order to identify the most appropriate land uses for each area in order to ensure our limited land resource is carefully used.
- The SRPBA believes that if funding was made more readily available to the private sector, they would be willing to increase planting to meet government targets. The SRDP needs to be simplified and streamlined to encourage private foresters to plant, grant rates for new planting schemes need to be increased and restocking grants (including for Sitka spruce) need to be reintroduced because this would ensure that there is no delay between felling and replanting. Private owners and investors have not lost their appetite for planting, as demonstrated by the large oversubscription
to the Ayrshire locational premia under the old SFGS. In short, if the incentive is present, the private sector will provide the forests.

SRPBA
January 2009
SUBMISSION FROM SCOTTISH TOURISM FORUM

The Scottish Tourism Forum is delighted to respond to the consultation on the Scottish Climate Change Bill on behalf of its members.

The Forum is the Scottish independent industry body representing tourism and hospitality businesses across many sectors, trade associations, local marketing groups, trade suppliers and businesses that earn their living from tourism or have an active interest in tourism and its importance to Scotland. The Scottish Tourism Forum is positioned as the national strategic voice of the industry and partners need look no further.

STF has a membership base of trade associations, area business groups and individual businesses. Within our membership we have forty five trade associations representing sectors right across the industry and we reach an estimated 6,000 businesses through this network.

STF is funded through its membership with a purpose to unite tourism interests and add value to members’ businesses. We bring public and private players together, to encourage the voicing of opinion about problems, priorities and solutions.

The value of tourism to Scotland is £4.2b annually and the industry has set itself the ambition to grow the economic value to over £6.1b by 2015, by adopting the strategies in the Tourism Framework for Change reviewed strategy. We feel our comments are reflective of this ambition recognising the enablers and barriers to drive growth even during these challenging economic times. The Scottish tourism industry by definition must be here and as such any investment in to tourism is an investment in to Scotland’s future and directly to its communities.

We recognise the important role, both at present and into the future the Forestry Commission plays in its stewardship of around 10% of the countryside of Scotland. This asset is one that is enjoyed by both tourists and local communities alike, it is also seen as having a key potentially role in the further development of the tourism offer in Scotland.

The consultation looks specifically to address four main questions and our response to this is as follows:

1. What are your views on allowing the Forestry Commission to enter joint ventures, with the intention of participating in renewable energy programs on forest estates?

The STF see this area as an opportunity for effective local partnerships to be involved at an early stage of planning, to vision and deliver a range of sympathetic initiatives that would be used to engage with visitors and local communities, assisting in the promotion of good practise and driving increased use of the forestry estate.
2. What are your views on allowing Scottish Ministers and Forestry Commission to offer leases and cutting rights over parts of the national estate?

Concerns have been raised over the potential conflicts between areas that have been leased out and their use for recreation. One of the strengths of the Forestry Commission's activities is their understanding of the needs and potential opportunities within their estate leading to sympathetic development of tourism projects. The role of the Rangers is vital, a much valued resource at the local level, working in partnership to unlock untapped potential (e.g., Dark Sky's) and working with communities to deliver benefit to both tourism and local communities. If long-term leases are applied, this could potentially stifle the further development of these opportunities.

The Commission operates in a fashion that is sympathetic in meeting the potential opposing needs of recreation against timber production and reassurance would be needed to avoid local issues arising.

The current arrangements operated by the Forestry Commission provide opportunities for local operators to be used. It is likely the beneficiaries of the leasing would be able to use national level contracts and this could have a real impact to employment in the local area. If national contracts are applied, this would potentially see higher carbon emissions and lower profits from the timber operations.

We understand the criteria for the selection of properties for inclusion in surplus property list, these should be looked at carefully and the development potential should also be identified in partnership before decisions are made.

3. What are your views on (1) transferring proceeds from leases and cutting rights to not-for-profit trust, for investment in woodland creation; (2) transferring the landlord’s interest in this land to not-for-profit trust; (3) ministers stipulating in the constitution of such a not-for-profit trust.

The Forum does not have particular opinions on this question.

4. Are there other actions which need to be taken, or are there other changes in legislation which need to be made, in order to allow the public and private forestry sector to contribute to Scotland’s target of reducing emissions by 80% by 2015? If so, please outline what these are.

We would fully support Government in its goal to reduce carbon emissions and are not aware of any unforeseen issues relating to legislation.

The Scottish Tourism Forum would be delighted to provide further evidence or information around the points raised if required.

Scottish Tourism Forum, January 2009
Climate Change (Scotland) Bill: Stage 1

10:04

The Deputy Convener: We will now take evidence on the Climate Change (Scotland) Bill. The committee was appointed as the secondary committee on the bill and we agreed to scrutinise the provisions on waste, forestry and muirburn. Today, we will take evidence on section 47, on forestry, and touch briefly on section 46, on muirburn.

I welcome the witnesses to this round-table discussion, the aim of which is to generate open discussion between witnesses and members. We want to get as much information as possible from the session. I remind everybody that, for ease of officially reporting what has been said, it is best if only one person at a time speaks. That rather contradicts the idea of having a lively discussion, but it makes it easier to report what has been said. Please refer to the table plan in front of you from our clever clerks, which should show where you are sitting and who is around you. On behalf of the committee, I welcome everybody who is here to give evidence.

To break the ice, I invite everybody around the table to introduce themselves briefly. Stuart Goodall can start. It is nice to see you.

Stuart Goodall (Confederation of Forest Industries): Thank you very much; it is nice to see you, too.

I am the chief executive of the Confederation of Forest Industries, which represents forestry and wood-using businesses in Scotland, from people who work in forests and people who own forests to sawmill and panel-board companies.

Alasdair Morgan (South of Scotland) (SNP): I am a member of the committee.

Allan Mackenzie (Forestry Commission Trade Unions): I am a Forestry Commission trade union representative.

Bill Wilson (West of Scotland) (SNP): I am a member of the committee.

Dr Calum MacDonald (Forestry Commission Scotland): I am chairman of the Forestry Commission’s national committee for Scotland.

Peter Peacock (Highlands and Islands) (Lab): I am a member of the committee.

Lisa Duggan (Loch Lomond and the Trossachs National Park Authority): I am landscapes manager for Loch Lomond and the Trossachs National Park Authority.

Angus Yarwood (Scottish Environment LINK): I represent Scottish Environment LINK, which is Scotland’s network for the environment movement. I am convener of its woodland task force.

Liam McArthur (Orkney) (LD): I am a committee member.

Janice Cassidy (Scottish Rural Property and Business Association): I am a policy officer for the Scottish Rural Property and Business Association.

Rhoda Grant (Highlands and Islands) (Lab): I am a Highlands and Islands Labour MSP.

Gavin Ellis (Scottish Tourism Forum): I am a Scottish Tourism Forum board member.

Elaine Murray (Dumfries) (Lab): I am a committee member.

The Deputy Convener: Thanks very much.

I will ask some questions to get the conversation going. In the absence of a formal early consultation process, what are your views on how the Scottish Government has taken into account the expertise of organisations and witnesses such as you in representing and developing the forestry proposals? Are you happy with how much you have been consulted so far? Have you been consulted too little?

Stuart Goodall: We welcome the Scottish Government’s desire to support the growth and development of the forestry wood-using business sector in Scotland and we share the objectives of delivering an increase in new planting and finding funding for that. However, we would have preferred more time, or perhaps an opportunity prior to the consultation, to focus on alternative ways of achieving those outcomes. As the minister has said, he has been open to alternative ideas during the consultation period, but it has been difficult to make proposals. If a proposal is put in front of somebody, people will generally focus on that. The Christmas and new year period has also made it difficult to get any debate going. We certainly found it difficult to come up with something substantive in the available time. We have worked on that further since we made our submission, but we would still like to have more debate about how things could be delivered as opposed to simply saying yes or no to the proposals in front of us.

Angus Yarwood: We are interested in expanding the debate and in not looking at the forestry proposals in a silo. We want the issues to be considered holistically across the land use sector, and we want a sustainable land use strategy to be brought forward.
As Stuart Goodall says, the timescales were unfortunate. It is also unfortunate that the Forestry Commission reports that have come out in the past few weeks were not available to us before the bill was published. It would have been useful to have seen the Scottish Government’s proposals on woodland expansion before we had to comment on the bill. That is because the bill deals with reducing our climate change emissions overall and I do not think that these proposals, which focus on carbon sequestration, are necessarily the primary way in which we should consider contributing to achieving the bill’s overall intention.

The Deputy Convener: That is quite interesting.

Bill Wilson: I have a follow-up question on what Angus Yarwood said about sustainability. In considering flooding, the committee has discussed sustainability fairly regularly. Should the bill require a commitment to sustainability, perhaps with reference to economic measures or to forestry?

Angus Yarwood: We would support such provisions. Scottish Environment LINK was keen for the Flood Risk Management (Scotland) Bill to refer to sustainability and we would like similar provisions in the Climate Change (Scotland) Bill.

The Deputy Convener: You spoke about sustainable land use. Do you have a view on integrated land use policy and on the overarching policy that forms the context for the provisions?

Angus Yarwood: Do you mean integration with all land uses?

The Deputy Convener: Yes.

Angus Yarwood: Forestry should be considered in that vein. As I said, having silos does not help much. Like other organisations that have submitted evidence, we would like an holistic view to be taken of how we use our land in Scotland. A much greater proportion of carbon emissions and greenhouse gas emissions comes from land use as a whole in Scotland, so we need an action plan across the board.

Elaine Murray: I will follow up the argument about carbon sequestration. I know that one view is that carbon sequestration should not be the primary reason for planting trees—there are many other reasons for planting trees—and that carbon can be sequestered by other methods, such as the reinstatement of peat bogs. Does anybody have comments on the certainty of the science? Should we address climate change in that way rather than plant trees for other desirable reasons?

Stuart Goodall: We have been very interested in carbon sequestration in forestry for years. I have liaised closely with the Forestry Commission, whose forest research arm has done an awful lot of studying and work on the subject. It has done world-leading research, which we have supported.

The common opinion is that forestry is about much more than sequestering carbon—that is our approach, too—and that tree planting should be part of an integrated land use policy.

You asked about the strength of the research. The research is pretty conclusive—if a tree is planted in the right place, it will sequester carbon, which is a benefit. The wood product locks up carbon, especially if it has a solid wood use such as construction and it can be used to displace more energy-intensive materials such as concrete, steel and plastic. That contributes significantly to mitigating the effect of climate change.

The Forestry Commission is considering more sensitivity in the types of planting, the trees that are planted and where they are planted, to understand the benefit more accurately. However, it is clear that such planting has a benefit and that we have enough information to plant trees to achieve that benefit.

Alasdair Morgan: Am I right in saying that people’s concern is not so much about the bill as it is about the Government policy that might drive how the bill is used? The bill will make almost identical changes to those that were passed at Westminster in 2006 in relation to the Forestry Commission south of the border. What concerns were expressed when those changes were made? Did devastating results flow from those changes?

The Deputy Convener: Calum MacDonald might be the person to answer those questions.

10:15

Dr MacDonald: The bill contains two sets of forestry provisions. The provisions on joint ventures replicate the legislation that was adopted south of the border, but the leasing proposals are new and different.

It is true to say that there is still work to be done on the science of carbon capture. However, the basic principle of carbon being captured in woodland is now accepted. As Stuart Goodall said, we are working to get more precise figures on how that operates.

It is also true to say that carbon capture is not the only benefit of a forestry programme, as there are also social, community and economic benefits. Over a number of years, forestry policy has developed to emphasise that wider range of benefits rather than being driven by only one factor.

Angus Yarwood: That is definitely the view of Scottish Environment LINK. There are multiple drivers for forestry, and carbon sequestration is
somewhere down the secondary list of actions that the Government can take to combat climate change. It is absolutely true that you can sequester carbon in woodlands, but you have to use the right tree in the right place at the right time. Carbon sequestration is a secondary benefit of forestry, which comes after the provision of space for wildlife in the interests of securing biodiversity; access and recreation; product substitution, which Stuart Goodall mentioned; and a range of other benefits.

The Deputy Convener: So you are slightly at odds with the Government’s view that carbon sequestration is a primary benefit. Do you think that the bill should address other issues first?

Angus Yarwood: We would certainly like the issue of adaptation for wildlife habitat networks to be included more prominently in the bill. The Forestry Commission is doing a lot of good work in that area, such as its beetle project, which maps the movement of species, but we would like all that work to be linked together in a sustainable land use strategy that encompasses all those elements.

Alasdair Morgan: I accept that but, given that, sadly, we all produce carbon—although we might prefer it if we did not, as then we would not need to sequester it—is the Government’s policy, as set out in its forestry strategy, of achieving woodland cover of 25 per cent by 2050, which is a 50 per cent increase on the current position, an aim that it should be pursuing?

Angus Yarwood: We wholly support the Government’s forestry strategy. We were closely involved in its development, along with other stakeholders. We would like forestry cover to be at that level and we also agree with the strategy’s aim of ensuring that 35 per cent of the cover is made up of native trees, as opposed to 17 per cent, which it is at the moment.

We do not want the mistakes of the past to be remade. Planting must be done as part of an holistic package, and it would be a backwards step if areas of land that have not been properly assessed were to be planted.

Gavin Ellis: The Scottish Tourism Forum is grateful for the chance to speak today, as tourism is an integral part of the Scottish economy.

I back Angus Yarwood’s point that the issue that we are discussing is about the economy. I also chair a tourism framework for change group—that strategy’s aim is to grow tourism by 50 per cent—so I am aware that forestry has many benefits for places such as Mull, with its sea eagles, Dumfriesshire, with its mountain biking trails, and the Culbin forest in Moray. Further, there are health benefits across the country. Physically, forestry is Scotland’s largest tourist attraction.

Liam McArthur: As our outgoing convener has said previously, the committee shares the concerns that have been expressed about the timeframe of the consultation. Given the points about the need for an integrated land use strategy and the forestry provisions in the bill coming ahead of their time, is there a concern that the proposals may not be in the right legislative vehicle? Would it be more appropriate for them to be set apart? The debate about the climate change impacts derives from the fact that the measures are in the Climate Change (Scotland) Bill. You are all working hard to say that there are other benefits as well. Concerns have been raised about the variety and range of enabling powers that the bill creates. Is it the most suitable vehicle for the measures on forestry?

Dr MacDonald: Speaking from the point of view of the national committee for Scotland, I can say that the Forestry Commission is comfortable with that approach. We feel that we have a role in tackling climate change. There might be arguments about the science at the edges—Forest Research is helping to develop that—but the fundamental principle that forestry plays a role in tackling climate change is accepted widely, including by us. We have a duty to be part of tackling climate change and we are comfortable with being covered by the bill.

Stuart Goodall: One key point is about the challenging timescale. It would have been ideal to have had a longer timescale and an opportunity to consider how forestry can contribute to tackling climate change in the context of a wider land use policy and the wider benefits that forestry provides. However, we are where we are and we have the Climate Change (Scotland) Bill. We can see the sense and attractiveness of including the forestry measures in the bill. If money is being raised from forestry, whether through leasing, joint ventures or some other mechanism, there will always be the pressure of what happens with the funding that is raised. I cannot speak for other people round the table, but everybody whom I represent from across the forestry spectrum would be unhappy if money that was raised from any part of the forestry sector, including the Forestry Commission, could be diverted elsewhere. At least with the bill, that money can be hypothecated. When new planting is delivered, because it has a significant climate change benefit, as well as other benefits, a strong case can be made for ensuring that the money is retained.

We therefore have a split position. We would have liked more time to consider the measures, but we understand that the bill might be a good place for them.

The Deputy Convener: Given the questions about the shortness of the consultation and the
inexactness of the science, and given the suggestion that one year of planting will not make a lot of difference in carbon sequestration terms, is the bill the right place for the measures, or should they be in a later piece of legislation?

Angus Yarwood: The powers in sections 47(1) and 47(2) are very broad. As Stuart Goodall said, we would like a longer discussion and more opportunity for all the stakeholders to get involved. We would prefer it if a later legislative opportunity was taken to introduce specific powers, once it has been determined what they should be. However, section 47(3), on joint ventures and giving the Forestry Commission more powers to consider renewable energy projects, has wide support. Scottish Environment LINK supports subsection (3) because—

The Deputy Convener: We will come to that subsection in a minute.

Angus Yarwood: It is important to us because it makes a contribution towards the bill’s overall aim, which is to reduce greenhouse gas emissions.

Janice Cassidy: We think that forestry sits well within the Climate Change (Scotland) Bill. Although the science of carbon sequestration might not be exact, forestry can provide other benefits, as Stuart Goodall mentioned. Wood can be used in construction and is a less energy-intensive material than concrete. Wood can also be used for energy in biomass. Forestry can provide many other benefits in helping us to reduce carbon emissions, so carbon sequestration is only one part of the issue. For that reason, we think that the forestry provisions sit very well within the bill.

Stuart Goodall: I should make it clear that we have been pushing hard for an increase in new planting and for the Forestry Commission to meet its target—which was set not just by the current Government but by the previous Administration—of planting 10,000 hectares a year. Ideally, we want a 15,000 hectare planting programme. Such a programme would release the benefits that we have discussed, which are not just to do with having productive forests. The Woodland Trust is a member of our confederation, so we support having a broad mixture of forestry.

Because of the drop-off in planting from the 1980s onwards, in 25, 30 or 35 years the availability of productive timber will experience a hump and then a trough before it starts to increase again. If we can fill in that trough with some planting now, we will be able to supply a significant additional sustainable volume of timber for Scotland’s businesses that will provide significant jobs, investment benefits and climate change benefits. If we cannot fill in that trough, everyone will predicate their business decisions on the bottom of the trough and we will lose a big opportunity. Instead, we will have a short-term spike of opportunity that will then disappear. We would be disappointed if that additional energy and potential funding to support new planting were lost. We need to tackle the issue now. We cannot keep putting it off.

Angus Yarwood: As I said, the powers in subsections (1) and (2) are very broad. We support the Subordinate Legislation Committee’s suggestion that the nature, scope and extent of the modification powers should be restricted.

Peter Peacock: I want to tease out that point a bit more. I understand the point that Calum MacDonald, Stuart Goodall and Angus Yarwood have made, which is that it is appropriate that the bill should include a section on forestry to signify that forestry has a role to play in climate change. However, that is very different from saying that the forestry provisions in the bill are in all circumstances appropriate. For example, there are two fundamentally different provisions, one of which deals with joint ventures and one of which deals with leasing. Within leasing, there are probably variations of what might be done. The Forestry Commission has probably been working on joint ventures for some time, but the leasing proposal is rather more recent. Notwithstanding what Calum MacDonald and others said about the principle of including forestry within the bill, do they think that there is a distinction between the joint ventures work and the leasing proposal? Does the commission’s national committee for Scotland have a clear view on that? How do other witnesses feel about that?

The Deputy Convener: I think that Lisa Duggan also wants to respond to that point.

Lisa Duggan: One of our concerns is that, although forestry sits well within the bill, the bill does not promote dialogue. As Stuart Goodall mentioned earlier, we have not really explored the other options. Although we support providing more land for forestry, there has been limited consultation on the proposals in the climate change action plan, so we have not explored other mechanisms for doing that. One of our big concerns is that options for more integrated environmental projects, such as wood pasture, have not been considered and are not even contained in the action plan, even though they might sit better with current upland agricultural schemes. We are just concerned about how quickly the proposal is going through.

10:30

Dr MacDonald: The two provisions are different, but a common rationale links them in the context of the bill: to generate income that will be used to
speed up the rate of afforestation and achieve the 25 per cent target. In that way, they are linked.

I get a sense that, because it is a question of science, a question mark still hangs over some of the discussion. The science may be inexact—to use the deputy convener’s word—but so is most science. I emphasise again that, despite that, the science is not in doubt that forestry can play a role in tackling climate change and in carbon capture. On page 10 of the Scottish Parliament information centre briefing on the bill’s forestry provisions, there are figures for the number of tonnes of carbon a year that could be sequestered if we reached the 25 per cent target for woodland cover. The only inexactness of the science is that the figure could be higher. Research that we are doing at the moment shows that it is quite a modest estimate. Forest Research is working on the figure, which will be available in the coming year.

The Deputy Convener: So the figures are low-end estimates.

Dr MacDonald: As I said, scientists in Forest Research and internationally are still continuing that work. However, the basic, core principle is established and accepted and, according to the work that we are doing at the moment, the estimates in the SPICE briefing are quite conservative.

Elaine Murray: There is a carbon sequestration balance between the tree above ground and the tree below ground. The National Trust for Scotland said:

“there is a need for better understanding of the balance” in the release of carbon.

“If cyclical cropping is encouraged then the benefits of sequestration will be consequently limited.”

Are you concerned that, if a commercial company came in and rapidly recycled or disturbed harvested ground, the amount of sequestration would be limited if the trees were not given enough time to grow and the land was not given enough time to recover? Are you concerned that, if a commercial company came in with such a leasing arrangement, you would not achieve some of the good that you could do if you managed the forests differently, or that you might even undo some good that has been done?

Dr MacDonald: I do not want to discuss the leasing proposals now, because I think that you will come to them later. I was focusing on the key question of carbon capture. It is true that different ways of managing the ground, planting and the length of cycles have an impact and that, if we want to maximise carbon capture, we must take those elements into account.

Rhoda Grant: I am picking up that the 25 per cent target is a good thing but that the bill’s method of achieving it is causing concern. How could it be achieved and paid for aside from leasing?

Stuart Goodall: I want to clarify a previous point. As Calum MacDonald says, there are different ways to consider the carbon element of how we fell and replant. Ultimately, the longer that we take to replant, the more opportunity we lose to sequester carbon in growing trees, so that has to be offset. If we introduce a standard that takes account of carbon, it will apply to the private and public sectors. Our businesses are working with the Forestry Commission on that, so I do not foresee any difficulty for us. That is not a principal concern about the effect of private sector planting on carbon capture. It is minor.

What was the other point?

The Deputy Convener: We will broaden the discussion out into leasing.

Stuart Goodall: The question was about other ways of raising money.

The Deputy Convener: Yes. What are your key objections to leasing and what are your alternatives?

Stuart Goodall: We seek an increase in new planting to achieve the 25 per cent target. The Forestry Commission’s latest paper, which was published yesterday, is good. It sets out why we should plant and how we can achieve the target, and states that we need to plant 10,000 to 15,000 hectares a year. The current objective is 10,000 hectares a year, and it has been in place for some time. If we are looking to deliver 25 per cent forest cover by 2050—which is an opportunity to maximise carbon benefits within the timeframes that people are discussing—planting 15,000 hectares a year would achieve it.

If we want to plant 10,000 hectares a year, we are looking at another £7 million to £10 million per year to pay for it, over and above the existing funding; 15,000 hectares would require something like £24 million to £30 million per year. Our understanding from the financial memorandum is that joint venture income would raise £10 million per year by 2012 and £30 million per year by 2020. The joint venture income could be hypothecated for new planting, the bulk of which, we argue, has to take place in the private sector, because it is more cost efficient—the Forestry Commission would have to buy the land and plant it up, which is more expensive. If we go down the proposed route, we could deliver the new planting targets from joint venture income.
The Deputy Convener: I imagine that the Forestry Commission would have something to say about that.

Dr MacDonald: Are you asking about hypothecation?

The Deputy Convener: Yes, and taking money that the Forestry Commission has earned and putting it into the private sector to enable it to plant trees.

Dr MacDonald: The Forestry Commission already distributes money to the private sector, so we are quite comfortable with that. We see the achievement of the 25 per cent target as collaboration between the private sector and the Forestry Commission. Obviously, you would not expect me to say anything other than that I would be keen for any money that is raised from joint ventures or by the commission to be spent on achieving forestry strategy targets.

The Deputy Convener: I will bring Angus Yarwood in here. We want to talk about leasing in particular.

Angus Yarwood: We support that. Money that is raised should go to meet Scottish forestry strategy targets. However, we are also keen for a good proportion of the money that is raised to go towards delivering the multiple public benefits, particularly in terms of the native woodland aspiration in the strategy.

The Deputy Convener: Has it been guaranteed that the money that is raised will go back into forestry?

Angus Yarwood: There has not been enough detail on that.

Alasdair Morgan: Do the figures that we have been given rely on the rough proportion of, say, native woodland to cash crops being the same as it is today? Presumably, if we raise the proportion of native woodland or reduce the amount of cash crop that is being rotated, the cost will go up. To what extent is that an influence?

Stuart Goodall: The target is to plant 15,000 hectares per year of native woodland and productive forestry. The target set by the Woodland Trust, Scottish Environment LINK and others is 6,000 hectares per year, while we are looking at 9,000 hectares per year. It is coincidental that those figures add up to 15,000 hectares per year; no back-door deal has been done between the various parties around the table, it is just a happy coincidence. The target is achievable. Productive forestry is self-financing in normal circumstances. Native broadleaf forests are not self-financing, so there needs to be ongoing grant support and other similar activities.

In the past, the private sector delivered 80 per cent of new planting and the Forestry Commission delivered 20 per cent. So to pick up on what Calum MacDonald said, taking a mixed approach can be a way of managing the cost of planting so that it does not become a significant burden on the Forestry Commission and leave it unable to deliver its other objectives. There is a lot of experience and understanding within the various parts of the public, private, business and environmental sectors that will make that approach work.

Bill Wilson: Stuart Goodall mentioned planting 10,000 to 15,000 hectares per year, which is quite a rapid acceleration of forestry planting in the coming years. He also thinks that it might have to be done mainly by the private sector. I am thinking back to the history of private sector planting, such as that which occurred in the flow country. Is anyone around the table concerned about such a rapid expansion of forestry being undertaken predominantly by the private sector? The question is not just aimed at Stuart Goodall.

Stuart Goodall: I would rather hear the views of some of the others around the table. We have spent a lot of time over the past 25 to 30 years developing standards and ways of identifying where to plant to avoid a flow country situation. From our point of view as representatives of the business sector, we have no desire—and it is not necessary—to get into a bunfight with farmers, environmental organisations or anybody else.

We have pushed for an integrated land use policy, and we feel that there is scope for taking forward a planting policy that integrates with farming and protects food production—that is important. We want the right tree to be planted in the right place—an issue that is raised continually—and we believe that such a policy will deliver the benefits of productive forestry and other sustainable benefits without conflicting with and damaging other land uses.

Bill Wilson: Can that be done on a voluntary basis, or will the Government have to set clear guidelines in advance?

Stuart Goodall: It is important that there are robust standards for planting, and those are already in place. The United Kingdom Government’s UK forestry standard, which is developed by all parties, is in place, and there is also, if required, an independent certification standard, which all parties have bought into and which is independently audited.

With regard to the number of hectares that are planted, we were planting 24,000 to 25,000 hectares a year back in the 1960s and 1970s. I am not saying that we should return to that approach, because it was very hard-headed and not particularly sympathetic to the landscape or to...
environmental and other interests. However, that level is achievable, but only if the planting is done in an integrated way. If it is presented as just getting on with it, we will run into the same problems as before, and we do not want that.

**Liam McArthur:** To return to Alasdair Morgan’s earlier question, if sequestration is viewed as an inexact science, perhaps the value projections—whether those involve planting 10,000 or 15,000 hectares—are inexact, too. Given the economic downturn and current market conditions, how much volatility is there in the numbers that you have quoted in relation to the return for the public purse that can be used for planting?

**Stuart Goodall:** There should not be too much volatility on the joint venture side. The joint ventures, and forestry in general, are an extremely attractive proposal when we are faced with the challenge of economic downturn—and economic growth, I hope, in the future—and tackling climate change. Wood is a unique renewable product that provides huge opportunities for sequestering carbon. The detail is inexact, but the broad pictures are robust, and the ability of wood to substitute for other materials and to provide biomass energy and all the other things means that it is an attractive material.

An increasing pent-up desire to deliver new planting has been evident, but because of the unavailability of grants for a couple of years, due to the closure of the grant scheme and the difficulty of getting the new grant scheme up and running, new planting has not been happening to the extent that we would expect. We feel that if those measures are put in place, planting will happen. I am referring to the joint venture income—sorry, I should have answered that question upfront.

With hydro opportunities, wind farms and other issues, we have concerns about the impact on deforestation. The Government is driving those things, and public subsidies are available. Those ventures will happen, and it is a pretty reasonable bet that the money will be raised.

**Liam McArthur:** We have had debates in relation to other areas about whether an economic downturn is the best of times or the worst of times to introduce measures that reduce waste or tackle climate change. Do you foresee any danger of there being pressure to go for lower-cost options? Will the strategy remain consistent over the medium to long term, and will the private sector be happy to subscribe to it?

**The Deputy Convener:** In fairness to everybody, I think that we have established that joint ventures are a good thing.

One of the privileges of being convener for the day is that I can focus our questioning on areas that are slightly more controversial. One area on which I would like to tease out information from our witnesses is leasing. There has been a lot of debate on the subject, much of which has focused on whether leasing is a good or a bad thing. Perhaps Allan Mackenzie will say something about the difficulties that are involved.

10:45

**Allan Mackenzie:** Thank you for the opportunity to do so and for the invitation to participate in this discussion.

As we have said, the Forestry Commission trade unions oppose leasing. We have proposed a variety of different avenues for consideration. Our opposition is focused first and foremost on the effect that leasing might have on staff members who are transferred from the public to the private sector. Staff are frightened about issues such as their future employment prospects and long-term pension provision. The committee should also take account of the groundswell of support from other parts of the forestry industry, the general public and others. We are greatly concerned about the lack of financial detail in the proposed leasing option. I refer to the effect that it could have over time on the public purse in Scotland.

One avenue for consideration is the opportunity loss from areas that are leased out for purely commercial gain. The forests that are being considered for leasing—some of which I helped to plant around 35 or 36 years ago—are in their first rotation. Elsewhere in Scotland, the opportunity that allows has been used to open up forests, create more diversity, ensure better access and provide downstream benefits to local communities. By leasing forest areas, those opportunities may be lost to the Scottish people.

A variety of issues are involved in our opposition to the leasing option. That said, we are keeping an open mind on the possibilities of the other options. Like others around the table, we feel that the joint ventures option is a way of bringing in the income that is required to offset the need for the private sector to plant more trees in Scotland.

**Gavin Ellis:** The Scottish Tourism Forum is concerned about the conflict of interest that is inherent in the commercial realities of private enterprise. Also, over the past five to 10 years, the Forestry Commission has taken extremely big steps in integrating recreation, health and education benefits with our forests. We are also concerned about not being able to develop the tourism opportunities that the dark skies of the Highlands offer. Our forest resource is fantastic for driving sustainability in communities that do not have many other options. We want to help to
develop those options. Our concern is that the baby might be thrown out with the bath water.

**The Deputy Convener:** I will bring in Lisa Duggan, as I want to hear all the arguments against leasing before bringing in witnesses who think that it is a good idea.

**Lisa Duggan:** I support what Gavin Ellis said. Visitors come to our national park because of the woodland and the positive recreational opportunities that forests provide. The park includes woodlands that are privately owned but to which access rights apply. However, the welcome that visitors get in such areas is not positive. They are told, “If you want to come in, you can. We are not going to lock the gate.” That contrasts with the Forestry Commission approach, which is one of saying, “You are welcome to walk here. These are the signs for you to follow. Here is what we have put in place for camping. These are the other management guides that we have put in place.”

I also support what Allan Mackenzie said. Forestry Commission staff in the park provide an essential service. In addition to providing the practical forestry work that private woodland operators might also provide, they are an essential part of the community. They do the rangering and they live in the community when they are off duty. The park does not want to lose those two important elements. The other thing that the Forestry Commission does particularly well—and perhaps better than a private woodland owner would do—is biodiversity. We work extensively with the Forestry Commission to consider how to manage public access and improve biodiversity. That work involves a big time commitment and quite a large financial commitment, which I cannot envisage many private woodland operators being willing to make.

**Elaine Murray:** Although it is proposed to lease 25 per cent of the total cover, it is the most commercially viable forests that will be leased, which in some areas could account for up to 40 per cent or even 60 per cent of forests.

**The Deputy Convener:** You can substantiate those figures, of course.

**Elaine Murray:** Yes. It has been argued that in productive forests such as the Galloway forest the proportion could be up to 60 per cent.

Mr Goodall, although your members purchase much timber from the private sector, I understand that the Forestry Commission guarantees supply, so that at times of reduced production your members can be assured of a supply. Are you concerned about the effect on your members of the possible loss of large parts of the most commercially viable forests and the possible loss of a guaranteed supply?

**Stuart Goodall:** I am happy to respond to your question, but first I want to make a point quickly. I need to be honest and say that the private sector cannot deliver the same level of environmental and recreational protection that the Forestry Commission can provide. That is because the Forestry Commission is Government funded. If the private sector was given grants and support to deliver that protection, it could do so. If organisations such as the Woodland Trust can deliver biodiversity benefits, woodland owners can deliver recreational benefits. However, that is not the current situation. The Forestry Commission can provide those benefits because it is funded to do so; we are not funded to provide those benefits—I do not argue with that point.

You asked about the impact of leasing on security of timber simply. It is very much about confidence. I represent members who are responsible for the overwhelming proportion of primary processing in Scotland—sawmills, wood panel companies and the like. Those people have confidence in the Forestry Commission’s ability to provide timber regularly, whether times are bad and prices are a bit lower, which is the case now, or times are good. The Forestry Commission provides long-term production forecasts, which it is pretty good at meeting. The private sector is not able to do that in quite the same way.

In the context of the proposal to lease land for 75 years, concern has been expressed that, although there might be opportunities to secure supplies of timber in the short term through existing contracts, security of supply will not be guaranteed 25, 30 or 75 years hence. That is of concern. We do not want companies to reduce investment, which is beneficial to everyone, so we are keen to consider alternatives that maintain the current security of supply.

**The Deputy Convener:** Let us get to the nitty-gritty. Are you saying that 75 years is the wrong timescale? Jean Balfour said in her submission that a lessee who had felled their crop and was not likely to be the beneficiary of replanting might be less than enthusiastic about cultivating that forestry. Should the length of leases be in sync with the planting cycle?

**Stuart Goodall:** Our understanding is that the purpose of proposing a 75-year lease was simply to have a period of time in place. The period sits slightly awkwardly with replanting cycles. We are talking about 100,000 hectares of Forestry Commission land, not all of which will have the same planting periods. It will always be the case that for some forests, two rotation periods will be involved, whereas for others, only one will be involved. Almost any period could be chosen.

There is a concern about the security of supply. Our fundamental point is that it will be extremely...
difficult for anyone to provide assurances for more than five or 10 years of secure supply. Sawmill operators, manufacturers and small companies that put £250,000 into a piece of harvesting kit want to know that there will be activity. I am not saying that if the Forestry Commission leased areas for 75 years it would suddenly be the case that those areas would not be harvested each year and that there would be a complete drop-off, but there is a concern that there could be some loss of activity, which would impact on confidence. At this time, we would prefer to explore alternatives that maintain confidence. We think that we can do that, although it does not mean that we have to stick with the status quo.

The Deputy Convener: So any leasing agreement would need to reassure downstream industries.

Angus Yarwood: Stuart Goodall has raised several points. In response to the deputy convener, I say that, if the leases go ahead, we would like a number of things to be built in. As has been highlighted, one of our concerns is that a reduction in the Forestry Commission’s income might have a negative effect on its ability to provide the multiple benefits that it has been mentioned are provided in the rest of its estate. To pick up on Lisa Duggan’s point, there is a big difference between having the right to access land and its being accessible to the general public. If we proceed with leases, we would like a range of conditions to be built into them.

However, as I have said, we want a longer consultation on how the process would work. In principle, we do not object to the private sector managing the most commercial parts of the national forest estate. We acknowledge that the private sector already meets high standards, as Stuart Goodall has said, and that that would continue, but it is unlikely that any lease would include only the most commercial parts of the estate. It would cover other areas of the estate that currently deliver multiple benefits, which private industry would not necessarily have the same interest in protecting, as Stuart Goodall highlighted. A specific example is the historic environment benefits. We are extremely keen that a proper strategic environmental assessment be carried out on any proposals to lease the estate.

Alasdair Morgan: I have a few questions, one of which occurred to me earlier. The private estate accounts for about two thirds of the forestry in Scotland. We have heard about access and the historical aspects of Scotland’s forestry. Have we magically arrived at the right balance between private and public ownership, or are people arguing that the balance is wrong and that the public percentage should go up? If private forests have many disadvantages—leaving aside what the industry has told us—should we be trying to nationalise some of the private forests?

Angus Yarwood: As I have said, we strongly support the Scottish forestry strategy and its aims. We would expect any land manager, whether public or private, to do their best to achieve environmental benefits and multiple public benefits. Scottish Environment LINK does not have a principled objection to the management of the forest estate being in private hands. Everyone’s long-term objective is to see the land managed properly. That is why we advocate the production of a sustainable land use strategy that will bring all those issues together.

The Deputy Convener: Provided that there is sufficient regulation to determine how the forest estate is managed, and that guarantees are in place, you do not care who owns it.

Angus Yarwood: We are not saying that the private sector—

The Deputy Convener: You are not indifferent; the public/private issue is just not relevant.

Angus Yarwood: Exactly—as long as the multiple benefits, including environmental benefits, access, the historic environment and so on are catered for in an holistic package.

11:00

The Deputy Convener: Does that answer your questions, Alasdair?

Alasdair Morgan: I would like to follow up my questions and ask about regulation. I do not think that people will mind my doing so. Galloway Fisheries Trust has a particular interest in the acidification of fishing rivers as a result of planting too close to them. It has said about the planting guidelines:

“The suggestion that the present guidelines and legislation is adequate to protect watercourses from acidification is simply not true. FCS have been excellent at using the guidelines very much as a minimum standard and putting in far wider buffer strips etc and being steered by the data we produce to show where there is the greatest risk of acidification—we have never had similar support in an area run by private interests.”

Does anybody want to comment on that?

The Deputy Convener: Certainly not me. I welcome your raising constituency interests, but that might be a matter—

Alasdair Morgan: Basically, the question is whether the standards are inadequate. It has been suggested that the Forestry Commission goes beyond the current standards. Are the current standards inadequate? Do we need to include in the package the aim of building up the standards?
The Deputy Convener: Alasdair Morgan has asked about acidification. Go for it, Lisa.

Lisa Duggan: The standards are minimum standards. We can look beyond acidification at designs for forest roads. The national park authority is very landscape focused. The minimum standard is okay, but it is not acceptable to us in the national park, so we work hard with the Forestry Commission and the Woodland Trust so that their roads are of a much higher standard. We simply would not get that from the private sector, because of its lack of revenue at the moment. Asking that of the private sector would be unfair and unrealistic, as significant extra costs would be involved. As I say, there are minimum standards, but we look for better.

Stuart Goodall: The issue is important and picks up on a point that I tried to make before. If somebody is asked to do something that involves costs or the loss of a benefit opportunity, and future income is therefore reduced, that must ultimately be paid for. We need to be clear that if the Forestry Commission reduces its income and increases its costs, the taxpayer, essentially, will have to pay for that.

There are plenty of examples of the private sector being prepared to go a little bit beyond the minimum that is required, but it should be funded in the same way as the Forestry Commission if it is to ensure water quality. It should be given the same opportunity because it is, ultimately, still a forestry owner that delivers benefits, and its funding should come from the same source. We should not think that the Forestry Commission somehow provides free goods, because it does not.

The Deputy Convener: Everybody should bear it in mind that we are aiming to finish this session by about 20 past 11 and that we want to discuss one or two other topics. Gavin Ellis has been trying to get in for a while.

Gavin Ellis: I am a bit of a layman. Is the system broken? Is the balance about right? As an outsider, I think that it is about right. If there is privatisation, public money will have to be made available to ensure that the private sector can deliver the things that tourism is looking for.

The Deputy Convener: That is a good point. Thank you very much.

Peter Peacock: We have focused mainly on commercial leasing, but there are other leasing possibilities—for example, to local communities that wish to have a greater stake in potential revenue streams from their local forests and in recreation and access opportunities. Do those who have concerns about large tracts of commercial forest land being leased have similar concerns about forest land being leased to local community groups in the spirit of the land ownership changes that we are seeing throughout Scotland?

The Deputy Convener: We also need to deal with the availability of Scottish rural development programme funding. Elaine Murray may want to talk about that.

Elaine Murray: Janice Cassidy is perhaps the most appropriate person to answer my question. In answer to a written question, ministers confirmed that, should the commercial leasing proposal go forward, the lessee would be entitled to apply for funding under the Scottish rural development programme. Are landowners who might be eligible for such funding concerned that a large company with a lot of expertise might come in and compete with them?

Janice Cassidy: That was one of the key points that we raised in response to the consultation. The consultation paper does not specify how many leases there would be, but it seems that the proposal is to have one, or possibly two. All our members were opposed to that because it would mean that one company would own a large proportion of the forestry in Scotland and could outcompete other, smaller growers. That is definitely a key concern. One large lessee would have a better chance to get SRDP funding than many of our growers, who would be small in comparison.

The Deputy Convener: So you feel that the current level of SRDP funding would be inadequate to sustain the potential extra demand.

Janice Cassidy: Yes, definitely.

Liam McArthur: This point goes back to an earlier one about commercial leasing as opposed to joint ventures. In his response to the committee and in the recent forestry debate in Parliament, the minister seemed to suggest that commercial leasing was a necessary evil to enable the level of planting that is required to meet the targets. My understanding of what you said is that properly structured joint ventures would enable the targets to be met and that leasing is therefore not required.

Stuart Goodall: Could we achieve the new planting targets by hypothecating the total of the joint venture income? Based on the calculations that we have seen, the answer is yes.

The Deputy Convener: Therefore, the leasing becomes unnecessary.

Stuart Goodall: The discussion about whether to lease forestry land is part of the broader issue, which is whether the Forestry Commission and its activities can become more efficient through partnership—or increased partnership—with the private sector. That would provide mixed public-private sector delivery of Government forestry
policy. Leasing is not necessarily the route to be followed for that; the principle could be explored in a different way.

**Liam McArthur:** We will hear from the minister later, but his view in the debate was that it is incumbent on those who oppose leasing to come up with an alternative. Your argument is that, while there might be a genuine debate to be had about leasing in order to incentivise other things, leasing is not required alongside joint ventures to achieve the planting targets.

**The Deputy Convener:** Do other people have views on the viability of the proposal that sufficient money could be raised from joint ventures to obviate the need to go down the leasing route?

**Janice Cassidy:** Our members’ view is that joint ventures would generate enough money without having to introduce leases, which would be complex and very long term. Our members felt that they did not receive sufficient information about the leases to back them as they stand. They thought that joint ventures would produce sufficient benefits.

**Lisa Duggan:** We had a question about whether anyone has done the maths. We did not see, during the consultation, hard and fast figures for how much could be brought in by joint ventures and leases, versus how much would go out in SRDP money that would then not be available to others for tree planting. So the question was whether we were putting an unnecessary spoke in the wheel. That was where we wanted the consultation to continue.

**Angus Yarwood:** We support that. We cannot give a full opinion either way until we have fully costed figures for all the options and have strategically assessed the proposals for their environmental worth.

**The Deputy Convener:** I ask Calum MacDonald to express a view on the proposal.

**Dr MacDonald:** I cannot comment on the leasing proposal because the national committee has discussed the matter only once—in December, after the consultation paper was published—and we decided not to come to a view on it until the consultation had concluded. That is what we will do. We are meeting tomorrow, so if it had been Friday I might have been able to give you more of a reply.

We have been considering the option of joint ventures since I joined the Forestry Commission. There are already wind farm developments on the national estate, so the income that is generated by those wind farms, albeit for private sector developers, provides us with a good basis from which to estimate the kind of income that is available. We therefore have a lot of confidence in the estimate of achieving £10 million by 2012 and £30 million by 2020.

We do not see the joint ventures as only a dash for cash; other benefits are to be gained from the joint venture approach. One such benefit is that the approach gives us a more strategic overview and control of the development of wind farms on the national estate. That is important, because we deliver many other public benefits, such as environmental benefits, biodiversity and so on. By developing a joint venture approach we can better protect those other elements of the estate, instead of taking what has been, up to now, an ad hoc approach whereby we respond to approaches made by various developers. If we take more of an active role ourselves, we will have better strategic oversight. The other big benefit is that we can better involve communities in the benefits of developing wind farms.

**The Deputy Convener:** People have, perhaps uncharitably, asked whether the Forestry Commission has the capability to develop joint ventures. Some have said, “Of course it does,” and others have questioned that. I seek your reassurance that the Forestry Commission has the capability to develop joint ventures. From my limited experience, joint ventures also imply that you have cash to put up. Given that this is about raising cash, would you raise the money from within your own organisation? Do you have the funds available to develop joint ventures?

**Dr MacDonald:** In respect of its capacity, as you know, the Forestry Commission is already involved in the commercial world. As Stuart Goodall said, it supplies timber on the basis of long-term investment programmes and long-term thinking, which is the approach that is required for renewables development. The commission’s staff also have many relevant skills, including environmental awareness and biodiversity awareness. The commission has, for example, a large database on modelling the effect of wind in forests. There is significant capacity within the commission but you are right that, depending on how far we want to go down the joint venture route, we will have to consider issues about developing further capacity, the revenue that is available and where we can access borrowing, as well as the legal right to do so, which is the whole point of the bill.

**The Deputy Convener:** Although you cannot yet commit yourself on the Forestry Commission’s view on the leasing proposal, could you let us know those views following the meeting tomorrow?
Dr MacDonald: The commission is conducting an options review, which has taken place in parallel with the consultation and which will report by the end of the month. I imagine that we could provide the committee with a summary of that review when it is ready.

Alasdair Morgan: I want to clarify whether we are all talking about the same joint ventures. Calum MacDonald talked about joint ventures such as wind farms and potential hydro schemes. Were Janice Cassidy and Stuart Goodall talking about the same developments, or did they also mean joint ventures that would involve planting and felling?

Janice Cassidy: I was talking about wind, hydro and any renewable energy developments.

The Deputy Convener: I gained the impression that joint ventures would raise cash through other means than forestry.

Alasdair Morgan: I just wanted to be clear about that.

Stuart Goodall: Like Janice Cassidy, we understand that the joint venture income and the sums that are discussed in the financial memorandum relate to hydro schemes, wind farms and—potentially—biomass developments. My additional point is that the joint venture principle could be taken further—that relates to the idea of the wider delivery of Forestry Commission activities. However, that would be additional to and separate from the joint ventures.

Angus Yarwood: I will follow up Calum MacDonald's point. We support the Forestry Commission having a more strategic role in deciding where joint ventures take place. We expect such developments to follow the full planning process, to ensure that they are not located in the wrong places.

The Deputy Convener: That was an excellent session. On the face of it, we appear to have found an alternative to leasing. Allan Mackenzie might be the happiest man of all in that regard.

We will now briefly discuss the muirburn proposals, on which various pieces of work have been done. I think that the witnesses have been primed for questions about muirburn. If anybody has anything to say about the muirburn dates, wildlife and birds nesting, we would like to hear your views. I appreciate that that is not everybody's expertise, but since you are here, we would like your views. I am looking round the room for speakers—I thank Angus Yarwood for responding.

Angus Yarwood: I am afraid that I will disappoint you—Scottish Environment LINK does not have a collective view on the muirburn provisions. However, if you have specific questions, we are more than happy to pull together views on them.

The Deputy Convener: We would be grateful if you did that. We are particularly interested in whether the muirburning season should end earlier or whether its start should be extended into September or even August. Should special licences be issued for burning out of season to counteract the danger of heather beetle? Such key questions need to be asked.

Does Janice Cassidy have a view on muirburn?

Janice Cassidy: We responded to the consultation on the muirburn dates. The consultation paper gave no specific details about how the dates would be changed—about whether the period of burning would be longer or shorter or whether it would be lengthened at the start or at the end. For that reason, our members were dubious about allowing the proposed changes. They felt that they were given insufficient information to make an informed decision about any changes to the dates.

The Deputy Convener: We will reflect on those comments.

I thank all the witnesses for giving evidence, for which the committee is grateful. As we always remind witnesses, if you wish on reflection that you had made comments that you did not make, please write to us. The clerks will be pleased to hear from you if you have further information to impart that is germane to the discussion.

Meeting suspended.

On resuming—

The Deputy Convener: Good morning, minister. I guess that this will be one of your last functions as Minister for Environment, but we look forward to hearing your evidence on the bill. In the meantime, we congratulate you on your new appointment and welcome you and your team—David Henderson-Howat, Bob McIntosh, Jo O'Hara and Anne Cairns—to the committee. I understand that you would like to make an opening statement; we would welcome a short one.
The Minister for Environment (Michael Russell): Taking your hint, convener, I shall make a short opening statement. Thank you for your good wishes. I am pleased to be here: it is likely to be my last appearance before the committee, but I have enjoyed the appearances that I have made and look forward to this one.

As the committee knows, consultation on the forestry provisions in the Climate Change (Scotland) Bill came to an end about two weeks ago, and I am pleased to have been able to circulate a preliminary analysis of the responses in advance of today’s meeting. There are no real surprises in that analysis. There appears to be consensus in favour of the proposals to allow forestry commissioners to enter into joint ventures with developers and local communities to accelerate renewable energy development. In addition, a good many useful suggestions have been made about ways to promote woodland expansion, including the urgent need to improve implementation of the Scottish rural development programme in that area.

I am sure that committee members have noted and will quote from what one could describe as considerable opposition to the suggestion of a long-term lease for up to 25 per cent of the national forest estate. Ministers—primarily my successor as Minister for Environment—will obviously need to reflect carefully on what has been said in the consultation, examine the reasons for the opposition and consider how they should respond to the ideas that have been suggested. For example, some of the respondents who opposed large-scale leases welcomed the proposal for small leases to communities—that is a useful distinction—while others made detailed suggestions about lease conditions that would help to address their concerns.

I am sure that, during the consideration of the provisions, the new Minister for Environment will be keen to engage positively in finding ways to fulfil our overarching objective of making better use of Scotland’s forests in the fight against climate change. That fight is an absolute imperative and respond to it.

The Deputy Convener: Thank you for your statement and its brevity. The committee shares your view that there is a need to address climate change urgently. We certainly support you in that.

We had a fruitful discussion this morning on the issues that you raised—leasing in particular. I do not know whether you were able to watch the discussion as it took place, but it was suggested that joint ventures in themselves might provide adequate funding—indeed, almost replacement funding. That was an interesting perspective.

Michael Russell: I recognise that perspective and realise that people have made the point for the best reasons, but there is an issue of timescale. It is extremely unlikely that the required income could be achieved from joint ventures in anything less than five or 10 years. By contrast, we are talking about income running from leases within two or three years. That is imperative for our purposes.

I would not want people to think that it is a simple matter of replacing one proposal with another. I would not have offered the proposals for consideration by the Parliament and the wider public if I had thought that there was another easy answer. I recognise—as I am sure members do—that there is none. Trying to find one through joint ventures is not as simple as it seems.

The Deputy Convener: I accept that. We would like to discuss the general welcome for joint ventures.

Alasdair Morgan: Given what the minister has just said, I have a question on joint ventures and, to a lesser extent, leases. It struck us that the consultation document lacked detail on joint ventures—several organisations have commented on that. Does the Government intend to publish any more details of what it is considering before the stage 1 debate or even before the committee considers its stage 1 report?

11:30

Michael Russell: As its chair Calum MacDonald pointed out, Forestry Commission Scotland is involved in an options review, which will provide more information on a range of matters.

The consultation was genuine. I have heard some of the evidence that has been given, and I would like to respond to it. There is no absolute detail on what should be in the proposed leases or on the proposed joint ventures. Joint ventures are a better-known approach, as that model is practised elsewhere, including south of the border. However, the idea was to consult on principles, particularly on the principle of leasing. At every consultation event that has been held, I have been at pains to point out that, if the principle of leases is accepted, the detail of what should be in the leases will require substantial stakeholder involvement at the second stage. Many of the discussions that I have had with representatives of various organisations have been based on that point. To reiterate, the consultation has been a genuine consultation on principles.

Alasdair Morgan: This point is perhaps more relevant to the matter of leases, but we do not have the details, and the provisions in the bill—its enabling powers—are very broad. That might make some people nervous.
Michael Russell: As those powers essentially enable secondary legislation, a great deal of the detail will be in that secondary legislation, which I am sure will be subject to intense scrutiny by this committee. That is not a model that this Government has invented; it was much used by our predecessors—although Mr Peacock looks shocked. I would not want secondary legislation to be made until there had been substantive involvement on the details from stakeholders in the wider community.

The Deputy Convener: Notwithstanding that, you are inviting us to buy a pig in a poke—to use an old-fashioned expression.

Michael Russell: I am sure that it is an old-fashioned expression in your farming communities, but I am not inviting you to do that. I am inviting you to do something that is well understood, in politics as in agriculture: to agree on principles and then to ensure that those principles are converted into detailed action, in this case by the process of consultation and parliamentary scrutiny.

Liam McArthur: The responses as set out in the summary that has been provided and the evidence that we have received this morning and hitherto have been markedly unfavourable to the proposed principle. The comment was made that, without the detail, it was difficult to articulate the suggestions in a more sophisticated fashion. The debate on much of what is covered by the consultation—for which there is widespread support—becomes derailed because of the focus on an issue on which there is a lack of clarity and complete uncertainty.

Michael Russell: I make no apology for bringing forward ideas—we would be living in a far less hospitable Scotland if we were closed to new ideas.

The consultation has been a useful exercise, and it has served a variety of purposes, particularly in the light of climate change but also more generally. As was referred to in the earlier discussion, there is a need constantly to examine the role and function of the Forestry Commission—to scrutinise a body that was established in 1919 for clear and strategic reasons, with the knowledge that times have substantially changed. I make no apology for our approach: the consultation has been a useful exercise and provided a useful way to look at things.

It is always possible to criticise a consultation. I am long enough in the tooth to remember other consultations that have been criticised for a lack of detail but, at every single meeting that I have attended to discuss the bill, we have been able to engage in substantive, detailed discussion about a range of aspects.

One of the really positive things is that I have excluded nothing and ruled nothing out. For example, we have discussed the lengths of leases and the way in which they could incorporate best practice in modern forestry. We have discussed different methods of approaching forestry and different ways in which forests are grown and managed. All those things have been discussed and will continue to be discussed. We have also discussed the guaranteeing of existing contracts and the interesting situation in Scotland, whereby the private sector has become very much dependent on long-term contracts from the Forestry Commission. That is not a common model in other parts of Europe and, although I think that it has been useful in the past, we need to discuss whether that is the best way forward.

All those things have been up for grabs, and there have been interesting debates and discussions. I simply wish that some people had reacted as positively in bringing ideas to the table.

Elaine Murray: The minister is right to point out that other pieces of primary legislation have used secondary powers. For example, the minister's current—and soon to be ex—department is progressing a number of statutory instruments flowing from the Animal Health and Welfare (Scotland) Act 2006 to regulate matters such as the sale of puppies and kittens and the registration of livery yards.

A parallel issue in that legislation is the controversial issue of mutilation and tail docking. The fact that such matters were dealt with in the original bill enabled John Scott's colleague Ted Brocklebank to lodge amendments at stages 2 and 3, which allowed parliamentary debate on issues that were generally considered to be contentious. Given that the leasing arrangements are more contentious than the other proposals, is there a possibility that they could be included in the Climate Change (Scotland) Bill—or a subsequent bill—so that the proposal could be discussed in Parliament?

Michael Russell: Dr Murray makes a fair point that is worthy of serious consideration. I am not happy about the timescale within which we are working. We are dealing not so much with late proposals as with the fact that, in our discussions on the bill and the Forestry Commission's parallel work on climate change, it has become increasingly apparent that the Climate Change (Scotland) Bill is the best—indeed, probably the only—available vehicle for climate change action by the commission. I accept that in the best of all possible worlds, which has existed under neither the previous nor the current Administration, we would have more time and more detail.
The substantive principle of leasing is clear to understand. It is not a new concept: the idea was included in the National Audit Office’s 1998 report and was proposed to the Forestry Commission by UK ministers in 1998, so the proposal has been around for more than a decade. The detail of leasing would be comparatively new, but that is where the detail of the secondary legislation would come in. However, I would not in any sense resolve from Elaine Murray’s point that, in an ideal world, we would have more time and more opportunity.

Peter Peacock: I want to pursue that point further slightly. Reflecting on where we have got to and given the apparent opposition to commercial leasing—I will come back to another variety of leasing in a minute—is the minister saying that he is now prepared to consider dropping from the bill the proposed powers to introduce secondary legislation on leasing?

As the minister will surely concede, the bill seeks to give ministers substantial powers. He will surely also concede that, notwithstanding his point that secondary legislation can receive detailed scrutiny, by definition secondary legislation cannot receive the same scrutiny as primary legislation. Members are not free to lodge amendments to secondary legislation, and there is not the same requirement to provide a financial memorandum and the like, so scrutiny of secondary legislation is truncated by comparison with primary legislation. Is the minister saying or hinting that, in the circumstances, he is prepared to consider withdrawing that proposal from the bill?

Michael Russell: No, I am not saying that. I believe that the leasing proposal is worthy of the committee’s support—in that remark, of course, I cannot bind anyone other than myself—and that the proposal needs to proceed.

It is possible to envisage a process in which the details of the proposal would be subject to substantial scrutiny. I accept Peter Peacock’s fair point about secondary legislation, but it is possible to consult on a draft instrument with the committee and outside interests and to engage fully with stakeholders. I have repeatedly made that commitment to everyone who has been involved in the discussions. Therefore, I will not close up my folder and say that I am now moving on. There are important aspects of the leasing proposal and other proposals—obviously, I do not want to spend all the time discussing leasing—that will move the forestry industry forward substantially in making its contribution to tackling climate change.

Let us just remember that, based on 2006 figures, planting of the nature that we are talking about—10,000 hectares a year—will sequester over time the equivalent of 44 per cent of vehicle emissions in Scotland. In some of the earlier evidence today, I heard doubt being expressed about the contribution that timber sequestration can make. There will always be doubt and debate, but we are in times when we do not need endless speculation on climate change objectives: we need delivery. Timber sequestration is a deliverable, and the Forestry Commission wants to be involved in it. The issue is one of getting on and delivering.

I will ask Bob McIntosh to come in on that.

Bob McIntosh (Forestry Commission Scotland): In the past, we have achieved planting levels of 10,000 hectares a year. For a variety of reasons, those levels have slipped over the past five or six years, and we are keen for them to be raised again to meet the aims of the Government’s forestry strategy. We will need to use a variety of mechanisms to achieve that. Clearly, we will want to look hard at the grants scheme, and ultimately if the Forestry Commission is to provide those extra grants, we will need additional funding. The issue is where the extra funding will come from.

Michael Russell: The Government can neither borrow the money nor change the tax regulations—the latter has traditionally been used as the strongest method of encouraging forestry. In addition, we do not have the resources to inflate artificially the price of timber. Given the timescales and requirements that we are discussing, we have to consider all possibilities.

The Scottish people—I am talking not about me or committee members but the Scottish people—own an asset that is worth £850 million. The question is: can we put part of the asset to work to meet important climate change objectives? The question is a sensible one, although it can be rejected. I have heard all sorts of things about the consultation and proposals, but that question is at the root of the matter. We have to ask ourselves whether we can put the resources that the Scottish people own and will continue to own to work to meet the real problem that we have.

Peter Peacock: I seek clarity on the powers, which I understand to be enabling powers. Your policy option is for commercial leasing of up to 25 per cent of the national estate over a period of 75 years—

Michael Russell: Up to 75 years. All these things are open for discussion.

Peter Peacock: Indeed.

That may be your policy objective, but the bill gives powers to not only your but subsequent Administrations. The bill also appears to set no limit on the figure of 25 per cent. Surely a future minister or subsequent Government could increase the figure to 40, 50 or 100 per cent. Am I technically correct in saying that?
Michael Russell: Technically, that is where we are, but any committee member can lodge an amendment to limit the powers. If that were to happen, I would give it serious consideration, and I am sure that my successor would do, too. The opportunity exists to lodge an amendment to create a ceiling or specify a maximum length of time. It is entirely legitimate for any member to do that. From the outset, I have been keen to engage in the detail of what is possible and desirable.

Peter Peacock: I regret that I do not have to hand the answer to a parliamentary question that I put on the links between the joint ventures and leasing options. In essence, the question was whether leasing could be done under a joint venture. I cannot remember the exact reply, but the gist was that that was a possibility. Notwithstanding the individual merits of the joint ventures powers, it would be unfortunate for them to become a Trojan horse for leasing provisions.

Michael Russell: There is no intention to make that linkage.

Peter Peacock: Is there a way of buttoning that down in the bill?

Michael Russell: I would be happy to find a way of buttoning it down.

Peter Peacock: That is helpful.

You have said that commercial leasing will make a contribution to climate change and accelerate the level of planting and so forth. In a letter to the convener, you said that the recent proposals were not necessarily the best or the only option—a statement that I find slightly curious. You are telling the committee that we should legislate to give you some pretty broad powers but that those powers are not necessarily the best or only option. What are the better and other options by which to reach your objectives?

Michael Russell: The letter has been much quoted throughout Scotland—from my reading of the local papers in Galloway, I see that Mr Hume seems to have given it almost totemic significance—but my point was more philosophical than political. As Mr Peacock knows, and my friends around the table such as Mr Morgan know even better, I am not arrogant enough to assume that I have all the answers. There may well be better options out there. From the outset, I have said constantly that I am looking for all the options.

Indeed, the consultation was unusual in that it included an additional question that said, “If you have any other ideas, will you come and tell us about them?” I am realistic enough to know that the substantial opposition to the leasing option creates a problem for the bill, and I am not in the business of bulldozing things through. What I meant in the letter that I wrote and signed and know entirely by heart is that it is possible that there are other, good proposals. I would like to hear about them, but I must say that I am not convinced that I have heard anything yet that will replace my view that leasing remains a good option.

11:45

Peter Peacock: That is pretty extraordinary, is it not? You said earlier that leasing is just an idea.

Michael Russell: No, I said that it was an idea.

Peter Peacock: But you seek colossal powers for that idea. Now you are saying to us that there might be better ideas but you do not plan to consult on them in the context of the Climate Change (Scotland) Bill.

Michael Russell: Because I have not yet heard them. If you have them, Mr Peacock, do not hold back. Please give me those ideas and I will be happy to say if they are better than this one, but you have not done so yet.

Peter Peacock: We might well have ideas but, with respect, you are in the midst of a consultation on a bill to give you powers to legislate in a profound way on the future of our forest estate, which has generated a lot of concern. You say that there might be better ideas but you do not know what they are and you will not consult in the context of the bill.

Michael Russell: We obviously differ in our political approach. I believe that there are always other options and possibilities. I repeat that the consultation was genuine and open and sought good ideas, some of which have come in, but I make the point in the letter, which I am happy to repeat, that I have not yet seen other ideas. Of course leasing is not the only option; I would be foolish to say that it was.

Peter Peacock: But do you concede that, even if some good, alternative ideas to the proposal in the bill were proposed at this stage, it would not be possible now to consult fully on them and accommodate them in the bill?

Michael Russell: Other people have other opinions, but if I thought that any proposals were better than our proposal, I would say so—I am not hidebound by it in the slightest. However, I go back to the important imperative that you have not yet raised, Mr Peacock, which is that the climate change clock is ticking. We need to plant more trees. We have not met the target, and we need to get on and do it. We can split hairs, talk about the number of conifers you can get on the head of a pin and all that sort of thing, but we need to get on with planting.
The Deputy Convener: Peter, the argument is becoming circular. You can ask a final question.

Peter Peacock: On this part, but we have other things to come back to.

I will put the contention to one side for the moment, if I can. Although we might disagree about the commercial scale of forestry, I am conscious that, given the Forestry Commission's powers, it may be constrained in community leasing. I heard what you said in your opening statement about that and I know that there are administrative provisions for Forestry Commission leasing under its natural forest land scheme, but it may not have the powers to do that. Do you think that, in the context of the bill, it is possible to construct a legal definition that would allow you to have powers over community leasing that would not open up the scope for the wider commercial leasing that people might be concerned about?

Michael Russell: Bob McIntosh wants to make a point on that.

Bob McIntosh: It would be possible to do what Peter Peacock described, but we need to remember that, because the bill is about climate change, the leasing would need a clear link with climate change, which might make it difficult to lease land to communities for any purpose. I think that Anne Cairns can confirm that.

Anne Cairns (Scottish Government Legal Directorate): Yes.

Michael Russell: I have talked to the community forestry sector about leasing and I am keen that it has the opportunity to do that, for two reasons. First, there are communities out there that would like to lease forest land for climate change purposes and to be involved in forestry. Secondly, as you will know, the purchase of forests by communities has dried up because of difficulties with the heritage funding. I deeply regret that and we must try to do something about it, but that is the present situation. However, discussions are taking place with the National Lottery. In those circumstances, I am keen to see community leasing happen. I think that it is necessary to have a section in the bill that permits leasing. Whether that section could be constrained by amendment to cover only community leasing, I will have to leave up to you. My view is that it is best to establish the power of leasing, then constrain it by secondary legislation that will be properly scrutinised. Other routes are, of course, open.

Bill Wilson: Many years ago when I was working as a biologist in another country, I came across an iron age fort that some genius had contrived to plant all over the top of. That experience has always left me rather nervous in discussions of historic monuments and forestry.

I have a few questions for you, minister, and I will bundle them together. Evidence suggests that the Forestry Commission possesses one of the largest collections of ancient monuments. What proportion of those monuments might be transferred to lessees—and if you cannot answer that question now, will you answer it in the near future? Will you reassure me that the level of protection guaranteed by the lessee for those monuments will be the same as that guaranteed by the Forestry Commission?

Evidence—especially that from Jean Balfour—suggests that, if 25 per cent of the forestry estate is leased out, 35 per cent of the income might be lost. If that is the case, I presume that a lower proportion of income would be left for the protection of biodiversity and ancient monuments.

If a not-for-profit trust is set up, it will obviously be planting in new areas. Would that not-for-profit trust have the same duties to protect ancient monuments and the biodiversity in sites of special scientific interest as would the Forestry Commission if it were planting in those new areas?

Michael Russell: Those were good questions. I am about to take on responsibility for ancient monuments, so I had better be careful in what I say. Perhaps it will be a lack of knowledge that drives me.

I will answer your last question first, Dr Wilson. I do not believe that the level of protection offered would be any less. There are statutory protections that the Forestry Commission observes and which a private owner would have to observe too.

An important distinction has to be drawn: what happens on leased land will not be the same as what happens when private forestry companies plant on their own land. Conditions will have to be attached to the lease, and they will refine the planting carried out by the private sector.

My answers to your first two questions, on transfers, are yes and yes. I want to ensure that that is on the record.

Your point about Jean Balfour was interesting. Jean has been an open critic of our proposals since the very first time that I discussed them with her. She is also an open critic of our proposals on crofting. I enjoy my conversations with Jean, but I have to say that, on many issues, they do not lead to much agreement. I disagree with her on the point that has been raised. It is absolutely certain that the resources of the Forestry Commission will not be adversely affected. Indeed, they will be positively affected by our proposals. The Forestry Commission is not being asked to commit suicide, so—with the greatest respect to her—I disagree with Jean. I want to place on record my great
respect for Jean Balfour and for her views on all these issues, which are very important.

I am informed that there is a clear legal definition relating to resources. We will ensure that it is applied.

The Deputy Convener: Elaine, did you have a question on archaeology?

Elaine Murray: No, I want to go back to a previous point.

The Deputy Convener: I would like to move on, but I will let Bill Wilson finish his questions on archaeology.

Bill Wilson: I want to follow up on my last question. Minister, why do you prefer, if you do, a not-for-profit trust doing more planting, as opposed to the Forestry Commission?

Michael Russell: I do not prefer that. Although the proposal for a trust is interesting and would offer certain advantages, I see little overall advantage. It might be overbureaucratic. That is my personal view, although I have not come to a final view on all the submissions on the subject. However, very few submissions were in favour of the trust.

Bill Wilson: So it might simply be the case that the trust does not happen and the Forestry Commission continues with its responsibilities.

Michael Russell: It will be up to the Government minister to make that decision. My view is that, although interesting, the trust proposal does not have a lot of mileage in it.

The Deputy Convener: I will bring in Elaine Murray and then Rhoda Grant.

Elaine Murray: I will preface my question by expressing a concern. We should not be saying that the solution to climate change lies in planting trees, because the solution to climate change will go a lot wider than that. Difficult decisions will have to be taken about how to produce fewer emissions, and we will have to consider microgeneration, energy efficiency and so on. It would be unfortunate if we sent out a message that all that we had to do was plant trees, and that would absolve us all of responsibility for controlling emissions.

You mentioned conditions that might be imposed on the lessee. Are they likely to reduce the amount of income that comes in? Has the fact that the lessee could be eligible for payments under the Scottish rural development programme been factored into the income? Would it result in a deficit over a longer period? Money might come in early, but there would be a deficit in the money available for planting trees as time went on.

Michael Russell: I will make two points before I get Bob McIntosh to address the financial questions, of which he has greater knowledge than I have. First, I have made it clear repeatedly and at every event that clear, substantive and rigorous lease conditions are essential. It would not faze me if it were impossible to undertake leasing because the conditions were too rigorous. I would regret the impact on income, but the priority is to get the conditions right. I do not think that lease conditions would have a great effect on leasing, but it is a point of principle that we must get them right and have a system to enforce them.

I am happy to agree that the solution to climate change is not planting trees. I do not think that I ever said that it was the total solution. However, I differ from you on an important point—or perhaps not; perhaps we can agree on it. It is really important that people understand the imperatives under which we are working and that a range of actions will be required. There is no single solution; there are many solutions. Forestry has its role in tackling climate change. As the minister with responsibility for forestry—at least until tomorrow—I am very keen that it fulfils that role. I must put on record what a great pleasure it has been to work with Bob McIntosh and his entire team. They too know that forestry has a role to play and they want to play their part. They know that they have to get on and do something and that their individual actions will be important. I do not want to hold them back from making a difference, because that is what they need to do.

Bob McIntosh: The estimate of £200 million arises from the assumption that the leasing option would involve perhaps 100,000 hectares—about a quarter of the woodland area of the estate—being leased out. There is a market in purchasing forest property, so we have a good idea what that package would be worth if it were sold freehold on the open market. We also know that a leasehold purchase is likely to be slightly less attractive than a freehold purchase and have used professional agents who are involved in the investment and forestry property market to give us their best estimate of what a 100,000 hectare leasing package would be worth. That is where the £200 million figure comes from.
Elaine Murray: Were the profiling of the income and potential SRDP payments to the lessee factored into the figure?

Bob McIntosh: Yes, they were. We have made an assumption about SRDP payments. It is a broad assumption because we do not know what sort of grants the lessee would apply for. If the new owner, to use that term, of the 100,000 hectares was eligible for grants, they might net something like £2 million a year in grants under the current scheme. That has been factored into the overall financial assessment.

Elaine Murray: You have not spoken yet about profiling. Over how many years do you expect to get the income? Will it come in all at once and, if so, how will you be able to spend it?

Bob McIntosh: That is a choice that the Government can make. Let us assume that £200 million was available. The choice would be to take it in year 1 or tell the purchaser that we would like to take it at £15 million a year over the next six or seven years so that it came in as a steady income stream.

Michael Russell: There are many permutations on that and they are all worthy of consideration.

Liam McArthur: I am interested in that response because Bob McIntosh provided a little more detail than some of the previous witnesses had before them. Lisa Duggan from the Loch Lomond and the Trossachs National Park Authority suggested that nobody appeared to have done the maths and that the money made available by a lease might at least in part be taken up by the lessee through the SRDP. I take the minister’s point about the purpose of a consultation and eliciting views, but it is rather strange that a consultation—albeit a truncated one—has concluded and key stakeholders appear still to be unaware of the basis of the calculations that were done to arrive at the conclusions that the Government has reached.

Michael Russell: I am surprised. The relevant witness has never requested that information from me as far as I know. I have a close relationship with the Loch Lomond and the Trossachs National Park Authority and would be happy to provide the information. Indeed, I would have been happy to talk to them in person about the matter.

At every meeting in which I have taken part and in all the discussions that have taken place, there has been a good opportunity to exchange information. I do not regard it as strange that we are still doing so; I welcome the fact that the opportunity exists to exchange information. I hope that the process has been entirely transparent. Indeed, had you or your colleagues sought any of the information from me face to face at any stage, I would have been delighted to provide it to you.

12:00

Liam McArthur: Clearly Jim Hume is no longer on your Christmas card list, and I would hate to think that the Loch Lomond and the Trossachs National Park—

Michael Russell: There will be no Christmases, according to Mr Hume, but there we are. I shall have to send cards to him at another time.

Liam McArthur: I am sure that seasonal greetings can be mutually communicated.

In relation to the paucity of information, it is fair to say that—

Michael Russell: There is no paucity of information.

Liam McArthur: That is your view.

Michael Russell: It is.

Liam McArthur: It is not the view shared by the witnesses that we had this morning.

Michael Russell: I listened to them quite carefully, and they were exploring ideas. I always welcome that, but there has always been the opportunity to discuss these issues properly and in a consultative way. Were I to have approached the issue by making an ex cathedra pronouncement, full of detail and appendices, I would have been attacked by the Liberal Democrats for every line of that document.

I have given the opportunity for a full and frank discussion, and many people—alas, not all—have availed themselves of that opportunity.

The Deputy Convener: Peter Peacock has a question on this point, and then I want to move on to our other questions.

Peter Peacock: What is your view of the cash flow that comes from joint ventures? You heard evidence this morning that joint ventures could probably provide all the income necessary to meet and fund the planting objectives. If you were to take the leasing route, when would the first payment become available? Would it be in 2012 or 2015?

Michael Russell: That is a key issue for profiling. Bob McIntosh might want to say a word about it; he heard this morning’s evidence too.

Bob McIntosh: If we were asked to push ahead with the leasing scheme, we would expect income to come in within two years. That might be pushing it, but within two years would be the earliest.

We would need legislation to set up joint ventures and it is difficult to see a significant joint venture income stream coming in in less than five to 10 years. It will take that long to build up to the £15 million to £20 million of additional income that we are talking about because of the long lead-in
time needed for big renewable energy projects, such as wind farms, in respect of planning and other issues.

**Peter Peacock:** What do you mean by “significant”?

**Bob McIntosh:** For funding additional planting, we are looking to raise somewhere in the region of an additional £10 million to £12 million per year. Generating that amount from renewable energy projects and joint ventures is at least five to eight years away.

**The Deputy Convener:** On that point, do you have the capacity to borrow for an interim term?

**Bob McIntosh:** We do not have the ability to borrow. If we set up a joint venture company, it would be able to borrow, but the Forestry Commission cannot borrow.

**The Deputy Convener:** Rhoda Grant, I am sorry for not bringing you in earlier; the enthusiasm of your colleagues overwhelmed me.

**Rhoda Grant:** No problem. I have a couple of supplementary questions, and then I will move on to another substantive area.

Given that the 25 per cent of forestry land that could be leased produces approximately 33 per cent of forestry income, how will the funding gap arising from the loss of that income be filled, so that the Forestry Commission can continue to provide the public benefits that it does at the moment?

**Bob McIntosh:** You must recognise that, as the estate is fairly young and a lot of investment is being made in forest roading, the estate does not make a profit at the moment. If we reduce the estate by 25 per cent, we are reducing 30 per cent of our income, but also a significant proportion of our expenditure. If we lost 100,000 hectares of the most commercial part of the estate tomorrow, broadly speaking, the annual cash cost of managing the estate for the next few years would be relatively neutral.

**Rhoda Grant:** But having once had the income, there would be a deficit. You would have had the income in the early years, and you would be facing 65 years of an income gap.

**Bob McIntosh:** That income would be a net loss in 15 to 20 years’ time, once things like our expensive roading programmes are completed. At the moment, however, the estate does not generate a profit or a surplus, so a 25 per cent reduction in the size of the estate would not lead to a 25 per cent reduction in the net income.

**Michael Russell:** Remember that we have been reprofiling the work of the Forestry Commission in the light of this change. We are essentially saying, as I have said from the beginning, that there will be no change. The assertion that there will be no change is not my assertion; it is an assertion based on the figures and on the support that I have been given by the commission. It will have no effect in that way, but it will produce substantive income for planting, which is crucial.

**Rhoda Grant:** It seems to me that it will have an effect on the public purse. You told the committee earlier that £2 million per annum could go out under SRDP. That is £150 million over the period of the lease, which leaves you with an income, over the period of the lease, of about £50 million, which will probably lead, in subsequent years, after the initial input, to a loss to the public purse.

**Michael Russell:** No, I do not see any loss to the public purse—I see only a gain to the public purse, because we will add resource to pay for planting and there will be no loss in respect of the operation of the Forestry Commission. I repeat that the commission is not being asked to commit suicide. The proposal will provide additional resource to the commission and it will provide additional planting; I would not have gone anywhere near it unless that was the case.

**Bob McIntosh:** The financial calculations are complicated, because they depend on whether we consider cash or full-resource accounting. Because we have a large estate with a large capital value, we are charged a non-cash capital charge, as it is called, on having the estate. If that is included, there is clearly a big saving, in a sense, from losing 25 per cent of the estate, because we lose quite a large chunk of that capital charge. The calculations on the financial side depend very much on whether we are looking at cash or full-resource accounting and whether the capital charges continue into the future—there is some doubt over that.

**Rhoda Grant:** But that is a paper exercise rather than hard cash to the taxpayer.

**Bob McIntosh:** It is in a sense but, as far as our budget is concerned, it is treated as cash. We have to set aside money from our budget to pay that charge.

**Michael Russell:** This is a problem for all parts of the public sector and it is a particular problem in forestry; it is an enormous charge, and it is a great disincentive to all sorts of things.

**Rhoda Grant:** I will move on to employment issues. The trade unions have raised concerns about the position of their members if the proposal goes ahead. You have said publicly that you would avoid compulsory redundancies and would look at redeployment. Forestry workers have come to me privately and told me that when they attend workshops they are being told that the position is much starker: either they accept the transfer to the new company or they are deemed to have
resigned and will not even be paid redundancy. On a policy level you are making statements that give people some comfort, although there are no guarantees, but on a practical level individuals are being told to take it or leave it.

Michael Russell: Let me put a public statement about this on the record, so that there can be no dubiety: there will be no compulsory redundancies. That is an absolute; it is the Government’s policy and it is what will happen. Secondly, although it may not be possible in every case, every effort will be made to transfer individuals to other work in the Forestry Commission. Thirdly, the Transfer of Undertakings (Protection of Employment) Regulations will, of course, apply in full.

I will make an additional commitment. I have met the unions to discuss these issues, and I hope to do so again. I cannot guarantee public sector jobs for ever, but I understand the concern about public sector jobs. I have said to people that I do not believe that it is possible to spend this amount of money on expanding tree planting in Scotland without creating new jobs in rural Scotland. I would not be so foolish as to play about with statistics on relative employment in the Forestry Commission — it is wise not to be burned twice on that—but a longer view on these matters, over the past 30 years, shows that there has been a steady decline in public sector employment in forestry. None of us can dispute that; I am not attributing any individual or corporate blame, but it has undoubtedly been the case. It should be possible to stabilise that position, and I think that the wider jobs situation in rural Scotland will be improved by the proposal.

I am conscious that the issue is crucial for individuals, and I said to the unions as recently as last week that I would actively seek ways in which we can make my pledges have real force so that they will not rely just on my word, even as it is reported in the Official Report. I will look for every possible way to do that and I will actively discuss the matter with the trade unions.

Rhoda Grant: I would like to push you slightly further on that. Given that people are not being offered compulsory redundancy if they do not transfer but are being told that they will be deemed to have resigned, which is a different thing and almost falls below your radar, will you give a guarantee that they will not be deemed to have resigned if they do not transfer across under TUPE?

Michael Russell: I guarantee that that is not the message or the fact of what I understand the situation to be. That is not what should happen. I will not go to the stage of saying that there would then be redundancies because, with the greatest respect, I would then be pilloried for saying that there will be redundancies. There will not be, but the message that you mention is certainly not being given with my sanction or authority and is not the Government’s view, which I know the Forestry Commission will listen to.

Rhoda Grant: It would be much more straightforward if you said that people will not be deemed to have resigned and that you will look to redeploy them if they do not transfer across under TUPE.

Michael Russell: I cannot give that commitment because, obviously, if I did, the union would say that that would be a redundancy situation and redundancies would be enforced. I am sorry that what I have said is not good enough for you, but I will repeat it. In my view, there is a guarantee on jobs, which I am seeking to give every possible force to. There is no intention to deprive anybody of their job, particularly those who have worked hard in the Forestry Commission in difficult circumstances. I hope that I stand four-square with them on such issues.

Elaine Murray: I have a supplementary question. As you know, those who work for the Forestry Commission may work in small numbers in remote rural areas. If those areas are transferred to the lessee, it may be difficult to offer employment in the same area to those individuals. Therefore, although you may wish to guarantee alternative employment to people, it might be difficult to do that because of the nature of the forestry industry. If large numbers of people say that they do not want to transfer to the new lessee under TUPE and that they would prefer to stay with the Forestry Commission, would that not add to the commission’s deficit? If it was able to redeploy all those people, a higher concentration of individuals would work in it. Would that put it under pressure, because it would seem to be less efficient? Perhaps there would be pressure on it to find efficiency savings.

Michael Russell: I strongly believe that it is important to be transparent and honest and show good will in such matters. There is no intention of forcing people to lose their jobs. It is always difficult in such circumstances to talk about every individual but, like the Forestry Commission, I have the strongest commitment to the staff who work in that organisation and to their future, and every effort is being expended to ensure that no individual suffers. I appreciate that there are always possibilities of all sorts of difficulties to which each of us can refer, but there is a very strong commitment at every level in the commission that what happens should be positive. The commission has a record as a good employer, which it wants to maintain. I have read and heard a lot of speculation, which I can counter only with my genuine intention, what I believe to be the genuine intention of the Forestry Commission, and
the desire to give that intention as much legislative force as I can. That is the commitment that I make.

Elaine Murray: People might have to move to other areas simply because of the nature of the Forestry Commission’s work.

Michael Russell: That is, regrettably, possible, but I hope that such moves will be very infrequent. I cannot rule that out, but I return to the desire that exists to handle matters in the best possible way, with the strongest commitment to the staff.

Elaine Murray: What about the consequences for the Forestry Commission’s budget if large numbers of employees transferred across? It might be better if Bob McIntosh answered that question.

Bob McIntosh: If we were asked to go ahead with leasing in two years’ time, we would endeavour to ensure that people who operated in the leasing area would get the first opportunity to transfer to vacancies in the rest of the organisation. That is the only thing that we could realistically do to limit the number of people affected. Ultimately, people would have to be transferred under the TUPE regulations which, as the minister said, would require the new employer to employ them under their current terms and conditions of employment. It is clear that people would rather stay with the commission, but if they are transferred, at least they are guaranteed to maintain their current terms and conditions.

Bob McIntosh: Was your question more about the resources available and the capacity to achieve increased planting?

Alasdair Morgan: Yes, and I was thinking about the consequences for employment. I am conscious that, at the moment, partly due to the construction industry cycle, sawmills in my areas are shedding labour.

Bob McIntosh: It is fair to say that the resources to achieve the new planting programme are not immediately available but, given the current economic climate, if an additional new planting programme were available, the contracting base would grow quickly to fill the vacuum and provide the capacity needed.

Michael Russell: It is also a question of the wood-using industries’ need for timber in the coming 20 to 30 years.

Bob McIntosh: There is a big concern in the processing sector about the dip in future production, which is a natural consequence of how the forests were planted originally. If that dip is not filled and we do not have a sustainable supply of timber over that period, there is no doubt that it will cause considerable difficulties for the processing sector. Planting needs to begin quickly to fill that gap and ensure that timber is available at the right time.

Michael Russell: When Alasdair Morgan spoke of redundancies in his area, I know precisely to where he refers. The industry is going through a very difficult time, but we hope that it will not last for ever and that opportunities will arise. Because forestry is a long-term business, it is necessary to plan and make decisions for the long term.

Rhoda Grant: The processors make the point that they have guaranteed supply from the Forestry Commission regardless of what is happening elsewhere, but there would not be the same onus on a commercial operator to provide the same throughput, regardless of the economic situation. They spoke about the security and sustainability of their industry and asked how that would be managed under the leasing agreement.

Michael Russell: I addressed that point slightly in earlier evidence. I understand the situation. We have said that we would regard existing long-term contracts as contracts that had to be honoured, but I also made the point that the arrangement in this country—dependence on state-supplied long-term contracts—is uncommon. A more flexible market might serve the wood processors better, although it would take some time to persuade them of that. However, there is no intention to disrupt supply—quite the reverse. We have made absolute commitments to the continuation of supply, but I regret that the point Stuart Goodall made in evidence is probably correct. We need a
bit more time to have that debate and discussion with the processors to assure them that it is so—but it is so.

**The Deputy Convener:** Does Peter Peacock wish to wind up the discussion?

**Peter Peacock:** No, I want to clarify with the minister two small technical points that arose in answer to an earlier question. Going back to the subject of cash flow from potential joint ventures, although I accept Mr McIntosh’s evidence, we heard firm evidence this morning that if you were to take a long view of the potential income stream from joint ventures, it would be sufficient to meet your planting objectives. Do you accept that that is the case?

**Michael Russell:** I do not dispute it. Both possibilities are desirable, and the short-term imperative makes it necessary to do both. However, the situation is not certain. Much will depend on what happens with the renewables market, and much will depend on the Forestry Commission’s ability to enter into sustainable joint ventures.

I do not dispute what you suggest, and I do not want to fall out with you about it.

**Peter Peacock:** That is very encouraging—

**Michael Russell:** Quite all right.

**Peter Peacock:**—just as you are moving on.

Section 47(1) says that ministers can “modify the functions of the Forestry Commissioners”. That could be a pretty broad power, but it is subsequently slightly modified.

As I understand the legislation on forestry, the commission and the commissioners have obligations on biodiversity. Would the powers that are being sought in section 47, which allows commissioners to delegate and you to modify the functions of commissioners, mean that present ministers or their successors could remove the biodiversity obligation?

**Bob McIntosh:** My understanding is that the Forestry Commission’s biodiversity obligation would transfer to the lessee.

**Michael Russell:** I think that I can see where Mr Peacock is coming from. If the bill does give ministers that power, then it should not. I am happy to make that clear. We may have to consider the drafting. I will ask Anne Cairns. Anne, do you believe that the bill gives ministers that power?

I am sorry to ask a solicitor for a legal opinion in such a way. But, hey ho, let us see what we get.

**Anne Cairns:** The biodiversity duty is on all public bodies in Scotland, including the forestry commissioners. I therefore do not believe that the power could be used as suggested.

**Michael Russell:** I thank Anne Cairns for that. I landed her with that question, but the answer was very good.

**Peter Peacock:** Yes, it was helpful.

You said earlier that an amendment to the bill might make it possible to fetter, in a variety of ways, the discretion that is being sought for ministers. Have you yourself—no, I will rephrase that, because it will not be you yourself who does this. Has the directorate been considering stage 2 amendments to the section on forestry? If so, can you tell us about them? Might they be in the territory of fettering discretion?

**Michael Russell:** I have seen no such proposals, but it is not unreasonable to assume that the idea might be occurring to some people, in light of today’s discussion. That would be quite legitimate.

**Bill Wilson:** You have given us a guarantee—or a legal reassurance—that biodiversity functions will not be affected. However, the Forestry Commission has other functions. Could the bill mean that other functions could be dropped?

**Michael Russell:** I will try my luck again and seek legal opinion. What do you think, Anne? It strikes me that access would be an absolute, because measures are imposed on all landowners in Scotland. I do not think that access could be affected, could it?

**Anne Cairns:** No.

**Michael Russell:** Were you thinking primarily of access?

**Bill Wilson:** Not necessarily. Quite a few organisations have expressed concern to me that the power in the bill is sweeping. Will you reassure us that you will consider what may or may not be lost because of the power?

**Michael Russell:** In seeking this power, we have no intention of doing anything other than what we have been talking about, and I would not be unsympathetic to making that clearer. I think that the section has been drafted as it has because ministers and forestry commissioners are constrained by other legislation.

**The Deputy Convener:** If you prefer, you may wish to reflect on that question and then write to us.

**Michael Russell:** It would be very civil to write to you, and I will ask my successor so to do.
The Deputy Convener: All right. I will bring in Alasdair Morgan and then Rhoda Grant.

Alasdair Morgan: I want to ask about the potential to raise all the money that is required from joint ventures—not immediately, but in the longer term. We have heard that the joint ventures would be mostly wind farms. As we know, and as Bob McIntosh has suggested, wind farms can have their problems when people object to planning permission being given for them. Have you a rough idea how many turbines would have to be built to raise the kind of money that is needed?

Bob McIntosh: No—but we might receive £2 million net income for roughly every 100MW of wind farm generation. It probably takes 40 to 50 turbines to generate 100MW nowadays, so £10 million would be received for five times that number of turbines. That is a broad indication of the scale.

Michael Russell: I would be cautious about the figures being used over time, because technology changes and planning is an issue, so it is difficult to tie things down to exact numbers of turbines.

Alasdair Morgan: We are, however, talking about a substantial number of wind farms over and above those that are already in the planning system.

Bob McIntosh: Hydroelectric schemes must also be considered, of course. There is quite a lot of scope for small-scale hydroelectric schemes on the estate.

Alasdair Morgan: There is, if the Scottish Environment Protection Agency approves them.

Michael Russell: This is not just about wind farms. Smaller-scale hydroelectric power still has potential in Scotland. Hydroelectric power is one of our great untapped resources.

Rhoda Grant: If it is okay to do so, I would like to move on to another subject, which NFU Environment Protection Agency approves them.

Alasdair Morgan: There is, if the Scottish Environment Protection Agency approves them.

Michael Russell: This is not just about wind farms. Smaller-scale hydroelectric power still has potential in Scotland. Hydroelectric power is one of our great untapped resources.

Rhoda Grant: If it is okay to do so, I would like to move on to another subject, which NFU Scotland raised.

The Deputy Convener: I will let Bill Wilson ask a supplementary question before we move on to that.

Bill Wilson: The joint ventures that we are talking about are mainly renewable energy ventures. It is understandable that we are doing so—we are discussing climate change—but I presume that other ventures, such as tourism ventures, could be included.

Michael Russell: No. There is support for the Forestry Commission to enter joint ventures in other areas, but we will have to wait until a public services reform bill is produced before that matter can even be considered. The proposals are targeted on climate change: there might be a grey area in respect of tourism ventures—people might want to visit wind farms, for example—but other ventures are highly unlikely to be included.

Bill Wilson: People might also want to visit hydroelectric plants.

Michael Russell: Some people want to visit such places. It strikes me that you are possibly one such person, Dr Wilson. [Laughter.]

The Deputy Convener: Enough.

Rhoda Grant: Let us move swiftly on.

In written evidence, the NFUS raised concerns about tree planting and where it occurred, and two witnesses this morning—from Scottish Environment LINK and the Confederation of Forest Industries—mentioned a land use strategy. My understanding is that the Government has talked about producing a land use strategy. It seems to me that this is a good time to revisit that and to consider how such a strategy could work.

Michael Russell: Rhoda Grant will no doubt be pleased to know, and will welcome the fact, that work on that is on-going. I am sure that you know about the event at the Macaulay Land Use Research Institute last September, which I think the deputy convener, John Scott, was at.

The Deputy Convener: No.

Michael Russell: That event started the process of research into land use in Scotland. There is no intention to have a five-year plan that tells people what they can do in each part of Scotland, but we need to be aware of the different pressures that exist.

I will give an example—we may get round to talking about muirburn. Since 1945, 25 per cent of heather moorland in Scotland has disappeared, so substantial changes have taken place and forestry has been a key player in the process. It is undoubtedly true that where trees are planted will be a significant issue. The Government’s view is that they must be planted on poorer land; I accept the NFUS’s evidence on there being pressure on better land. It has also been difficult to persuade the agricultural sector to engage fully with short-rotation coppicing, for example, which could have been used. There is undoubtedly an issue to be considered: it will not stop the process, but it will need to be considered.

Rhoda Grant: Witnesses have said that a strategy would manage the process, especially if we want a large increase in planting.

Michael Russell: Things will not all happen in a week. There is a lot of time to debate and discuss the matter, and there are already places that are ready and suitable for planting. That will continue. Of course, the issue that you raise is always an issue. As Mr Morgan will know, there are concerns
about planting of new forest in parts of Galloway and Upper Nithsdale at the moment. There are also concerns in other places. We must be sensitive to those concerns and recognise what communities want to do. Other places in Scotland are crying out for trees to be planted, and for a balance between native and non-native species in particular.

The Deputy Convener: That seems to have exhausted the questioning on that aspect of the Climate Change (Scotland) Bill. Perhaps we should now take up the minister’s entrée and discuss the vital issue of muirburn. A little. I am grateful to him for giving us the time that he has already given us. Minister, do you have anything to say as a brief opening statement on muirburn? We do not want to spend too long on the matter, as you have other commitments.

12:30

Michael Russell: I will be positive. There is nothing sinister in the proposal and I am slightly surprised that people have been taken aback by it, and that they think that it is an attempt to go out and stop people setting fire to hillsides in any way. The proposal in the bill is actually very constrained. The specific wording that is used is:

“necessary or expedient to do so in relation to climate change.”

That is clear. There is no doubt in anyone’s mind, aside from the occasional correspondence that we all get, that climate change is taking place. It is also clear that certain activities that are constrained within a legislative calendar, and which are also tied to the natural seasons, will change. Muirburn is one such activity, so we took the opportunity that the bill presented to ensure that there was flexibility in that respect.

We have been a little taken aback by some of the reaction. The reality is that muirburn will continue; no one is disputing that it is a very important land management tool. The bill offers the opportunity to be much more flexible. There will be a strong debate about exactly when muirburn can take place and how the provisions will apply, but there is no intention to abolish it, limit it or stop it happening. Indeed, the greater flexibility in September, for example, might be desirable. It is an issue on which we need to get everybody around the table and ask, “Can we go ahead with this?”

The Deputy Convener: From my experience of burning heather, I think that extending the season into September would be a good idea, although I would be grateful to hear views from other members. Is that your thinking, minister—given what you have said?

Michael Russell: The extension could be helpful. Many people have said that it will be. It would be equally helpful to ensure that we change the earlier time in the year to take account of, for example, the earlier breeding cycles of birds. Mr Peacock is much more expert on that than I am, but he would acknowledge the need to recognise what is happening in the countryside, and that things are changing.

The Deputy Convener: The view on the breeding cycles of birds does not seem to be unanimous.

Michael Russell: I do not think that it ever will be, but there is some evidence that we should address the subject. There is no imposition in the bill: it says merely that we need flexibility, which we will exercise in close consultation with all the interest groups.

Elaine Murray: I must admit that I, like the minister, was somewhat surprised by the strength of the response to the proposal. I am also surprised that people are saying that the breeding cycles of birds are not changing, because there is a fair amount of evidence that they are changing due to climate change.

Because some people are concerned that there might be a different motivation behind the muirburn proposals, will it be possible to lodge an amendment that might offer them reassurance?

Michael Russell: I would be positive about that. I want to give every reassurance to people that there are no sinister motivations behind the proposal. If anyone feels that it has been made for such reasons, I—or rather my successor—will be open to any suggestions. It is necessary that we move forward on the matter. On environmental issues, as members will know, people often seem to find themselves in opposition. There is no need for opposition on the proposal—we could fairly easily agree on it.

The Deputy Convener: Would anyone else like to say anything on the matter? The minister might like to talk about the special licences that relate to control of the heather beetle. That is another new concept for me. Someone suggested in the consultation that it might be an idea to help to control heather beetle in areas where there were unexpected outbreaks, and that licences might be issued to permit burning out with the normal season.

Michael Russell: Jo O’Hara knows so much more about that than I do, which is not difficult. I ask her to say something.

Jo O’Hara (Scottish Government Rural Directorate): It is clear in the bill that the enabling power on special licences kicks in only if it relates to climate change. We have received quite a lot of
evidence that suggests that people want to explore special licences. We will do that, but probably not within the scope of this bill. A lot of stuff to do with muirburn but which does not directly relate to climate change came out of the consultation. We are keen to explore that further, but it is probably not for the bill.

**The Deputy Convener:** Might such provision be subsequently introduced by secondary legislation if doing so was regarded as worthwhile. Do members have any other comments?

**Rhoda Grant:** Muirburn is not really to do with climate change. The process might need to change because of climate change, but muirburn is nothing to do with stopping climate change. Should the muirburn provisions be in the bill at all?

**Jo O’Hara:** The provisions are an adaptation measure. Muirburn is a weather-dependent activity. If the weather changes, it is likely that we will need to change the dates for muirburn. The situation is as the minister said.

**Rhoda Grant:** Muirburn does not mitigate the effects of climate change.

**Michael Russell:** We agree. Without doubt, the measures on muirburn will not advance or retire climate change, but the bill is a useful place for them because the activity results from climate change. Members might seek to exclude the measures from the bill on the ground that Rhoda Grant mentioned, but many people will not thank them for doing so.

**The Deputy Convener:** Would it not be fair to say that the bill is about mitigating the effects of climate change as well as seeking to avoid it? In that regard, the bill is probably a relevant place for the muirburn provisions.

**Rhoda Grant:** I was merely trying to be helpful. If there are other issues with muirburn that would not fit with the bill, would it not be wise to deal with those under different legislation, given that the muirburn provisions are because of climate change rather than to prevent climate change?

**Michael Russell:** Having consulted on the issue and taken it forward, we would like to get it settled. The issue is raised with us—it is certainly raised with me—regularly, so it is wise to get on with it.

The issue of special licences can be dealt with in a variety of ways, such as through secondary legislation. Indeed, as the countryside agencies are aware, it is possible that at some stage we will introduce legislation on natural heritage, which special licences could fit within. Special licences for tackling heather beetle would probably fit pretty well within secondary legislation.

**The Deputy Convener:** In the absence of further questions, I thank the minister for appearing before us today and on previous occasions. I wish him every success in his perhaps not chosen, but new, career.

**Michael Russell:** It might not quite be that.

**The Deputy Convener:** I also thank the officials for accompanying the minister and for their input into this most interesting of subjects.

**Michael Russell:** I thank the committee for the interesting discussions that we have had over the course of our relationship. I look forward to working with members in different capacities in the future.

**The Deputy Convener:** We look forward to that.

12:37

*Meeting continued in private until 12:56.*
SUPPLEMENTARY SUBMISSION FROM CONFOR

ConFor (Confederation of Forest Industries) has been established to represent forestry and wood using businesses from nurseries and growers to wood-processing end-users. ConFor aims to help build the market for timber and timber products, create a supportive policy environment for the forestry and wood using sector and to help members become more competitive and successful. ConFor has by far the largest membership of any representative body in the sector. This proposed legislation has attracted widespread interest from every part of the wood supply chain.

Thank you for the opportunity to reply to the Committee’s Call for Views. In context of the current consultation on the Climate Change Strategy it is important to recognise that the forestry and wood-using sector is well positioned to help deliver the aims of the Scottish Government to create a low carbon economy. As this is a call for views on the Bill, this response will concentrate on the sections relative to forestry and wood-using industries.

**Question 1**
The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

ConFor recognises the current situation is unsustainable and welcomes the Scottish Government’s aim to make Scotland a low carbon economy. Forestry and timber should be important elements in achieving this goal. The planting of new productive woodland offers a huge opportunity in carbon sequestration, in particular with faster growing softwoods. Utilising more timber and wood products in the construction industry stores carbon and displaces more energy intensive materials. Acknowledging that different tree species will absorb CO₂ at different rates and over different life-times, research by Broadmeadow and Matthews (Forestry Commission, Forest Research 2003) estimate removals over a lifetime for productive softwood crops of an average 3tC/ha/yr, although during high growth this rate may rise to 10tC/ha. New planting provides a relatively cheap and quick method to mitigate carbon emissions and would be good as part of a short to medium strategy, complemented in the long term with a change in practise to utilise more timber and wood products in construction as opposed to energy intensive products such as concrete and steel.

**Question 2**
The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.
What are your views on the setting of targets in batches from 2010 to 2022?

While carbon sequestration is a good short to medium term fix to offset carbon emissions, there must be a fundamental change to incorporate more sustainable processes in our lives. Timber and wood products can offer a far greater role than just energy creation. Using timber in construction can mean that there is less use of more energy intensive products such as concrete or metals, this wood can then be used at the end of its life for energy generation meaning that the fully utilised product will have a longer life and greater impact towards a low carbon economy.

The Bill must take into account the fact that “Scottish removals” are initially going to be coming from the planting of new trees throughout Scotland which the Scottish Government has asked the private sector to lead. The Bill must reflect this and support the industry to achieve the targets set out in the Bill.

Question 11
The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

The sector welcomes the Government’s desire to aid the future growth and development of Scotland’s forestry and wood using businesses, and has debated the current proposal in depth. The Scottish Government released a consultation on the forestry provisions in the Scottish Climate Change Bill which ConFor answered and is summarised below:

This consultation is the first step in what is a two-stage process. First, the Government would take powers to enable part of the forest estate to be leased and also for FC Scotland to enter into joint ventures. In the second stage the detail of how these leases and joint ventures would operate, and how any money raised would be utilised, would be set out. It is important to note that without this detail it is not possible for the business sector to provide a simple yes or no answer to the key questions on whether or not the Government should take powers to enter into joint ventures or lease part of the forest estate. It also makes consideration of alternative mechanisms more difficult.

The Government’s proposal and potential alternative mechanisms need further discussion and elaboration, and therefore the sector has set out below what it sees as key issues that it would have to explore further with the Government before providing a definitive response to the questions posed in the consultation. Key Issues 1 and 2 are of real importance to the sector and these issues would need to be addressed as part of any leasing or alternative option that is taken forward.
KEY ISSUE 1 - RECYCLING OF FUNDS RAISED

It has been estimated by Government that leasing 25% of the commercial element of the public forest estate (perhaps 100,000 ha) for something like 75 years could realise up-front income in the region of £200m. The amount raised may be less given the current economic climate. It could also vary depending on the exact area to be leased, the terms of the lease or on the final agreed length of the lease.

It is expected that there would be a desire on Government’s part to reinvest any money raised immediately and in particular ahead of the next election in 2011. It is important to note that due to limitations on capacity it would not be possible for the forestry sector to deliver tens of thousands of hectares of new planting by 2011. Achieving 15,000 ha per annum over two planting seasons would require perhaps an additional £48.4m, leaving a balance of over £150m.

ConFor would be strongly opposed to any proposal that saw anything more than a minor element of funds raised being spent on activities other than new planting. An effective mechanism would have to be put in place to ensure that the major element, at least, of any money raised would be retained for new productive softwood planting.

If FCS entered into joint ventures involving biomass then there is real potential for conflict of interest as it becomes customer and supplier.

It is estimated in the Financial Memorandum accompanying the Climate Change Bill that annual net income from joint ventures might be expected to reach £10m/yr by 2012 and perhaps £30m/yr by 2020.

ConFor estimates that planting 10,000 ha/yr would require an additional £7-10m/yr in grant and 15,000 ha/yr would require £24-28m/yr extra. This could be achieved by utilising income from joint ventures.

KEY ISSUE 2 – SECURITY OF SUPPLY

Since 2000 the pace of investment in the forestry and wood using sector has accelerated. It has been estimated by Scottish Enterprise that annual investment has risen from £60m a year in the 1980s and ‘90s, to £100m a year now. This has taken place against a backdrop of increasing supplies of wood from Scotland’s forests, and reflects a strong level of confidence amongst wood processing businesses that supplies of timber will be forthcoming in future years. In that context it is worthwhile noting that, unlike other countries in Europe, there is no potential for Scotland to import unprocessed wood.

A major element of that level of confidence is due to a belief amongst the wood processing community that FCS will be a reliable supplier of wood in the
medium to longer term, including providing reliable supplies of timber during times when prices are depressed. From a public sector perspective this helps to secure the long term viability of a customer base which is, for the most part, located in potentially vulnerable rural communities.

At present wood using businesses within ConFor are making, or are considering making, significant investments in excess of £100m. Companies have made clear that the issue of leasing has raised fundamental concerns over their levels of confidence in future wood supply, which in turn could have an impact on current and future levels of investment.

Reducing confidence in security of supply would have an impact along the wood supply chain, affecting forestry contractors, haulage businesses and the wider community in rural areas.

At present it is not possible to estimate the likely impact of any leasing arrangement on supply and confidence given that, for example, there is no information on the areas to be leased, the terms of any lease and how many lease-holders there could be (it is likely there would be a preference in the sector for more than one). It is also not clear how the value of any lease would be affected by TUPE requirements, existing Long Term Contracts, etc. The Government has also confirmed that it is not in a position, at this time, to provide any guarantees to the sector on how confidence in wood supply can be retained.

It is important to note that the leasing proposal has been developed without input from the business sector. An opportunity to input to emerging thinking would have provided a mechanism to explore issues such as overall marketing strategies both on the leased and the retained estate areas and their impact on potential future confidence, and to consider potential alternative mechanisms to raise funding to support new planting.

The issue of security of supply is fundamentally important to businesses along the supply chain. ConFor believes that the Government should work with it to consider, urgently, whether and how confidence could be retained to underpin the continued growth and development of the forestry and wood using sector in any future developments regarding the public forest estate.

**Question 12**

The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

**What are your views on this proposal?**

ConFor welcomes the measures to improve the energy efficiency of buildings. Timber used in construction can displace materials with a higher embedded energy, thereby reducing emissions of CO\textsubscript{2} by 1 tonne for every tonne of wood used. A study by the Edinburgh Centre for Carbon Management on emissions associated with construction materials in different sized domestic buildings
demonstrates that “there could be 86% reduction in GHG emissions associated with the embodied energy of building materials if timber internal and external structural elements and fittings are specified wherever possible.”

It has been shown that average savings of 0.8tCO₂ can be achieved by replacing 1m³ of concrete/block/bricks with 1m³ of sawn timber¹. ConFor calculates that over the period to 2050 the additional productive forest area achieved from planting 9,000 ha/yr of productive softwoods could provide, based on current proportions, an additional 33.5M m³ timber available to the construction market. This then gives the potential for substitution of materials delivering emissions savings of 27mtCO₂. This would be a tremendous resource for Scotland.

Question 14
The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

What are your views on this proposal?

District heating systems are the apparatus for distributing residential and commercial heating requirements throughout communities, which can include public buildings and private households. District heating plants can provide higher efficiencies and better pollution control than individual household boilers.

ConFor welcomes the development of incentives to the production of heat from renewables, but this must be taken forward in the context of the existing use of wood by businesses that already make a significant contribution to a low-carbon economy.

ConFor is also concerned about the loss of productive forests from renewable energy developments and has pressed for action to minimise forest loss and ensure that compensatory planting takes place. In the context of this proposal, and broader Government policy, there should, as a minimum, be no net loss of productive forestry in Scotland.

There are significant areas of under-utilised woodland, which have the capacity to provide fuel stock for a wood chip supply chain. However, these streams are only beginning to develop. Stakeholders would be reluctant to invest if the security of fuel cannot be guaranteed. Fuel security is a prerequisite in any supply chain and it is most likely to be secured in a joint venture arrangement, which sees all parties in a supply chain making a return on their investment.

CONFOR

Submission to the Transport, Infrastructure and Climate Change Committee

Responding to question 11 – Forestry.

The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

1. Renewable energy development

1.1. Forestry Commission Scotland (FCS) has developed considerable expertise in working with partners to permit developments on its land, but is currently constrained by the extent to which it can further support such ventures. Planning documentation for new developments has to be prepared by the developer, which usually limits participants to large commercial organisations.

1.2. The option of entering into Joint Ventures (JVs) will allow FCS to use its own expertise to ease project development. The range and scale of businesses which can enter into partnerships will be greater, as FCS will be able to provide its land as part of the venture and perhaps commission some of the planning preparation currently routine in preparing, for example, Forest Design Plans. Economies of scale and the good reputation of the organisation make this worthwhile.

1.3. Forest Holidays is a JV with the Caravanning and Camping Club, set up through UK Government legislation to invest in the cabin and camping venues across the UK and has proved very successful. The investment is expected to be about £20m over 10 years and is already reaping benefits, with increased bookings, additional employment opportunities and three new sites to be opened during 2009. The two parties working together has ensured maximum added value for both sides.

1.4. There is great potential for community renewable energy projects from JVs with FCS. Developments such as Combined Heat and Power (CHP), woodfuel and micro-hydro would be the most efficient way of substituting for oil-based fuels in rural areas away from the gas network, with significant reduction in road miles and increasing employment opportunities. Much of the expertise developed to date has been in facilitating projects, which then benefit other parties. Some of these will improve opportunities for private woodland owners who have still to begin harvesting in plantations, which are generally younger than those of FCS. The Balcas plant at Invergordon, now nearing completion, is an example of a larger scale project facilitated by FCS because of its ability to provide long-term commitments on wood supply and will transform the market in this area of the north Highlands. This 7MW CHP plant will use 300,000 Tonnes of timber to provide 4MW to the Grid and use the
rest to manufacture wood pellets as a value added product, giving around 20 people sustained employment.

1.5. Under the current National Forest Land Scheme, communities can buy smaller areas of NFE to manage for their own benefit. This means they have to raise significant capital for the purchase, as well as the revenue to look after the land thereafter. In most circumstances, it would be better for the community to enter into a JV with FCS to allow them to manage the land without having to raise the capital. This would also provide protection to the community and develop more innovative ventures.

2. Releasing capital for woodland expansion

2.1. The Trade Unions have seen no evidence to support the value of leasing or cutting rights on large areas of FCS land and show here the potential disadvantages for the Scottish Government and FCS.

2.2. Several governments around the world have either leased or sold significant parts of their National Forest Estate (NFE) and some have gained a significant lump sum of money from this. However, evidence accumulating over the last decade or so is showing up many problems with this method.

2.3. New Zealand sold its entire NFE in the 1980s and 90s. Of the woodlands sold, the Kiangaroo Forest was one of the most commercially valuable plantations in the country. The process of negotiation, between government and a single company, lasted approximately 16 years and involved lengthy and expensive litigation. A decision was finally reached and a price agreed, but the company went bankrupt after about six years due to the excessive valuation. As a result, none of the anticipated developments and job creation opportunities materialised. Management during the financial difficulties was inadequate and considerable overcutting took place and local sawmills put in jeopardy, despite the apparently strong regulatory framework of the Government Forestry Department.

2.4. A report prepared for the South African Government to advise on their leasing options in 1998, which drew on experience in New Zealand, Papua New Guinea, Indonesia and Nepal indicated that this had not been successful in the past. In each case where the most commercial areas were leased for maximum income, governments have had major problems in later years as they have tried to implement improved silvicultural or management practices. They did not foresee these changes at the time of drafting the lease so did not include them. Many of these leases throughout the world are now being withdrawn and replaced by Forest Management Agreements, which have more in common with joint ventures. More than five years after this report, the South African government had still suspended leasing due to their reservations about their success and the lack of subsequent methods of control.

2.5. In 1992, the Swedish Government sold a substantial part of its NFE to a single publicly listed company. 10 years later the private business was suffering extreme financial difficulties and was able to raise log prices due to its semi-monopoly. Since then 20-30 sawmills have gone bankrupt, or been sold to Russian or Baltic owners, reducing the capacity within Sweden and the levels of forestry employment. As
concerns with the company continued the Government offered to buy a 30% shareholding in the forests and have subsequently underwritten the remaining 70% should certain conditions prevail.

2.6. The leased area proposed in this Consultation is for about 100,000ha of the most commercial areas with the least social and environmental value. The criteria developed by FCS for measuring the social and environmental value were designed to rank forests, not ascribe an actual value. The removal of 100,000 ha (approx.25% of the NFE’s woodland cover) of the most commercial areas from FCS management is equivalent to removing nearly 35% of the income from FCS. This income is currently used to fund multi-purpose forestry across the whole of the forest estate. There will be some expenditure foregone by entering these leases, but as they are the most commercial areas, this will be <20%. The Scottish Government has made it clear that it will not meet this self-inflicted funding gap with extra revenue, so the amount of money available for the non-commercial benefits elsewhere will reduce significantly. This will impact across all of Scotland and is in line with the experience of other lease schemes around the world.

2.7. Any review of Forest Policy in the UK over the last 25 years will show a massive change in emphasis. The introduction of the broadleaf policy, increasing importance of environmental benefits, recognition of the value of forests for social, health and education activities, Forest Habitat Networks, requirements for public consultation and involvement, community purchase and partnership schemes are just a few of the real developments in forest management. There is no sign of this pace of change lessening and we do not believe FCS or the Scottish Government can foresee the level of changes likely over the next 25 years, let alone the 75 years proposed for these leases. Two options arise from this; regular revision of lease conditions or removal of policy improvements on 100,000 ha of forest land in Scotland. The first would reduce the value of the lease considerably; the second would be unacceptable to the people of Scotland.

2.8. The Unions also believe it is disingenuous to talk of the lease life as 75 years. It is accepted that the true value of a lease to any global investment company is the capital value of the forest. It is also accepted that as the end of a lease nears, the capital value reduces. For any private company, this would increase the risk and is likely to result in renegotiation of the lease at, say, 50 years for a 75 year extension. Any lease will, in reality, remain in perpetuity. The result of this is the same as outright sale, where management practice is regulated by Government authorities. However, as it was leased, the true value of the estate will not be realised.

2.9. A report presented to the Scottish Parliament (Mitigating against Climate Change in Scotland: Identification and Initial Assessment of Policy Options), proposes an option for improved carbon sequestration from forests by lengthening the time between planting and felling (rotation length). Current figures show that the average rotation length in private forests is at least 10 years shorter than on the NFE, because different discount rates are applied according to the priorities of the forest manager. This equates to about 8% reduction in sustainable carbon sequestration.
2.10. The Minister has given three guarantees to FCS staff affected by the lease proposal; no compulsory redundancies, protection under TUPE regulations if transferred to the private sector or transfer to another part of FCS. These would be welcome if they were not significantly devalued by the leasing proposal.

2.11. The likely loss of income to FCS has been set out in paragraph 2.6. An increase in cost base would be made worse by the cost of transferring staff to other parts of FCS. Many staff, particularly those on the lower pay rates are secondary earners within their household, which means the option of transfer is not realistic. Refusal to move in such circumstances could mean the person being classed as resigning, which is unacceptable to staff and their Trade Union representatives.

2.12. Although the Minister has given an assurance that any staff transferred to a private employer would be covered by the TUPE regulations, experience has shown that detrimental changes to terms and conditions can materialise very soon after transfer as a result of the pressure to reduce costs and maximise profits. The staff in FCS are exceptional within the public and private sector for the dedication they show to their employer and their long and continuous service. This is often due to the rural locations of many jobs, but also a demonstration of the high value they place on the public sector ethos of the organisation. This will add to the pressure for staff to transfer to other parts of FCS.

2.12.1. In a written response to the FCTU, the Forestry Commission has confirmed that the Scottish Government’s commitment of ‘no compulsory redundancies’ does not form part of the terms and conditions of employment for Forestry Commission staff and as such would not form part of any ongoing employment commitments should any FC staff be subject to a TUPE related transfer to another employer.

2.13. The effect of no compulsory redundancies on top of the loss of FCS income and cost of transfers will be to cripple the ability of FCS to deliver multi-purpose forestry across the remaining NFE by reducing efficiency and effectiveness. Money will not be available to fund social, environmental and economic improvements rightly demanded of us by Ministers.

Allan MacKenzie
19th February 2009
Next Wednesday I will be attending the Rural Affairs and Environment Committee meeting on behalf of LINK to give evidence on the forestry proposals in the Climate Change (Scotland) Bill.

These proposals have generated a broad range of views across the forestry and environmental sector. We have become aware that there may be a degree of misunderstanding about the joint LINK position on the proposals and I am keen to reiterate it clearly.

LINK is the forum for Scotland’s voluntary environment organisations and provides a network for its member organisations, enabling informed debate, and assisting co-operation within the voluntary environmental sector. When we make comment on matters of policy and legislation we do so after lengthy discussion across the network. We agree to proceed on the issues that unite us and avoid or comment with caution on issues where we differ. Our aim is to give weight to the strongest views that we share.

I would like to summarise our LINK written evidence to the Committee in order to clarify the agreed LINK position. Our written evidence states:

• We are supportive of Ministers’ intention to invest in actions to tackle climate change.

• Specifically, we welcome the measures laid out to allow the Forestry Commission Scotland to enter into joint ventures in renewable energy projects, and their desire to meet the woodland creation targets.

• However we are concerned that specific proposals to lease around 25% of the National Forest Estate have not yet been fully considered, costed and assessed on their environmental merits and drawbacks. We would like to see this addressed before we make a full assessment of their merits.

• In addition we are concerned that actions to tackle climate change will focus too strongly on carbon sequestration. Whilst trees have an important and complex role to play in absorbing carbon and tackling climate change, action to reduce carbon emissions should be focused on diversifying our energy consumption (away from carbon based sources) and reducing our consumption of energy through reducing our heat and energy loss.

• Finally, we believe that enabling wildlife to adapt to the effects of climate change must become a key component of our action on climate change. To this end we would like to see the introduction of a Sustainable Land Use Strategy that will address Scotland’s land use holistically, both for adaptation and the reduction of greenhouse gas emission from land use.

I am keen to meet with you in the Scottish Parliament on Tuesday 10 February 2009 to brief you further on our response. I have also sent this letter to the other members of the Committee.

Angus Yarwood, Scottish Environment LINK Woodland Task Force Convenor
9 February 2009
Dear Roseanna

Climate Change (Scotland) Bill: Forestry Provisions

Thank you for your letter of 18 December about this Bill.

I am sorry that we were unable to complete our consultation on the forestry provisions before the Bill was introduced. I would, therefore, like to take this opportunity to provide you with a short brief on the current progress with the consultation exercise.

As you know, the consultation was launched on 4 November. Since then, there has been considerable media coverage of the proposals and I have personally attended a number of meetings with stakeholders and Forestry Commission staff representatives. These have included, most recently, a meeting of the Scottish Forestry Forum on 18 December. In addition, senior managers in Forestry Commission Scotland are holding Q&A meetings for staff in all parts of Scotland. So far, we have had 35 responses to the consultation paper, and we expect a good many more. I know that a number of stakeholder organisations are engaged in their own internal consultation processes and, for this reason, do not expect to receive their responses before the deadline of 27 January.

My assessment of reaction so far is as follows:

- the proposal to enable Forestry Commission Scotland to enter into joint ventures appears to be uncontroversial and to be generally supported;

- most of the attention is focused on the proposal to enable Forestry Commission Scotland to lease out management, or cutting rights;

- there is general support for the intention to generate new funds for forestry related climate change mitigation activity, although the forestry sector would like to see a guarantee that any funds so generated would be reinvested in forestry;
- staff have concerns about the implications for job security of any who are transferred to a lessee, and concerns about the wider implications for the Forestry Commission. There is more information about this on the Forestry Commission Trade Union website http://www.fctu.org.uk/;

- industry stakeholders have a range of views, reflecting different interests; wood processors (in particular) having concerns about the future marketing arrangements for timber. The Confederation of Forest Industries (Confor) is gathering views on the industry position – their website is http://www.confor.org.uk/Default.aspx?pid=182&id=0;

- more specific questions about the suggestion of a lease relate to the standards of management that would be expected of a lessee, including their approach to access, heritage and community engagement issues; the effect on timber marketing and continuity of supply; the position at the end of the lease; the eligibility of a lessee to receive grants under the Scotland Rural Development Programme; and the impact on the remaining part of the national forest estate;

- the suggestion of a not for profit Trust has led to questions about how such a body would operate and how, in the longer term, it would be possible to guarantee that it continued to reflect the public interest;

- as you know there have also been a significant number of Parliamentary Questions.

When I launched the consultation paper, I stressed that our underlying aim is to make full use of the potential of our forests to help mitigate climate change. The potential role of forests was highlighted in the 2006 Stern Report on the Economics of Climate Change, which also emphasised the benefits of strong, early action. More recently, a report for the Scottish Government by AEA Technology on policy options for mitigating climate change has identified woodland creation (and increased use of wood biomass for fuel) as high priorities.

The consultation paper proposes the option of leasing management rights as one way of releasing capital from the national forest estate for reinvestment in woodland creation. During the consultation process, I have emphasised that the options we have suggested do not necessarily represent the best or only approach to achieving our aim of making better use of forests to help mitigate climate change. We are certainly willing to consider other proposals. In addition, I have asked Forestry Commission Scotland to undertake a wider review of options. To help inform this review, the Commission is examining the implications of a 75 year lease over about 100,000 hectares (or just under 25% of the national forest estate).

I very much sympathise with the uncertainty that a discussion process of this sort creates – and I have assured staff that if the leasing option goes ahead, there will be no compulsory redundancies; and any staff transferred along with the woodlands would have the protection of the TUPE regulations. Furthermore, I would want the Forestry Commission to make the strongest efforts to ensure that any individual who did not want to transfer to any new management company would be able to stay with the Commission.
I hope that this is helpful. We will also do our best to let you have a preliminary summary of the consultation responses by 11 February. In the meantime, Forestry Commission Scotland would be happy to make an arrangement with your Committee clerks for copying individual consultation responses to them.

Yours sincerely

Michael Russell MSP
Minister for Environment
29th January 2009

Dear Roseanna

Thank you for your letter of 16 January about the prioritisation of the waste provisions in the Climate Change (Scotland) Bill.

I recognise, and welcome, your Committee’s interest in the proper scrutiny of the provisions. Fundamentally the reason we proposed that nearly all regulations which might be made under the powers set out in the Bill should be made by affirmative resolution was to ensure proper scrutiny took place. At present, of course, we are considering only the enabling powers for such regulations to be made.

Now is an appropriate time to consider taking these enabling powers. As you will appreciate, the provisions in the Bill represent only a small part of the Scottish Government’s work on waste. Since May 2007 we have set new targets for recycling and recovery of household waste, and put a cap on the use of energy from waste to meet these targets. As Scotland’s household waste recycling rate has improved, the need to focus on the larger quantities of commercial and industrial waste has come into focus. The European governing legislation, the Waste Framework Directive, has been revised. For all these reasons it is an opportune time to consider the whole range of policies relating to waste. Accordingly, we are reviewing the National Waste Plan for Scotland in its entirety. We shall be consulting publicly on this revision in the course of 2009.

Some of the things we might wish to do, such as ban from landfill further materials which should instead be recycled, can be done under powers the Government has already. The provisions in front of you relate to work which needs new primary legislation to underpin it. Detailed work is needed in all cases to work up schemes, but when we want to put these schemes into effect we will need the ability to do so.
The Climate Change (Scotland) Bill provides an ideal vehicle, in view of the close relationship between climate change, and waste and resource use. Conversely, if we do not put these powers into primary legislation now we will have missed an opportunity to improve our approach to resource use, which is an essential part of work to address climate change. Moreover, it is difficult to see when a slot for a separate Bill might be arranged. Incidentally, you will note that the UK Climate Change Act provides a power to set carrier bag charges in England, Wales and Northern Ireland: it would be odd if a similar power were not set out in our equivalent Bill.

As to prioritisation, I have said that we have detailed work to do in the case of all the powers before you. This work will naturally take longer for some of the proposals than for others: we currently consider, for example, that a deposit and return scheme will take longer to put into effect than the other proposals, in view of the need for thorough consultation and, indeed, potential infrastructure provision. Other provisions are likely to take less time to put into effect, but still require a great deal of work to ensure the maximum benefit for the least burden. Indeed the timescale we consider for putting measures into force will have to take account of the current difficult economic situation, and prioritisation will have to take account of the position at the time.

In these circumstances I think it unlikely that regulations exercising any of these powers, should the Parliament agree to give them to us, a few if any, would be laid in the current Parliamentary session. Naturally, we would keep your Committee in touch with developments, should this prove otherwise.

I am copying this to Stewart Stevenson MSP, Minister for Transport, Infrastructure & Climate Change.

RICHARD LOCHHEAD
Thank you for your letter of 28 January about the definition of “recycling” used in the Bill, and how this may differ from the definition of recycling used in the revised Waste Framework Directive (98/2008/EC). I hope in the interim you have received my letter replying to yours of 16 January, which I sent on 29 January.

The definition of recycling used in the Bill includes recovery and re-use (whether or not the waste is subjected to any process). Mr Hazell, of the Scottish Environmental Services Association, appeared to consider that this was a way of avoiding discussing energy recovery in the context of the Bill. Similarly, your colleague Elaine Murray MSP made the point that recovery is placed below recycling in the waste hierarchy. She also asked about the Bill’s definition of recycling in Parliamentary Question S3W-19259. The concerns Dr Murray and Mr Hazell have derive ultimately from the explicit statement of the waste hierarchy in Article 4(1) of the revised Directive. This prioritises re-use above recycling, and recovery below it.

As I stated in my response to that question, the definition of recycling in Section 52(4) is merely a matter of drafting convenience. It is simply easier to talk of “recycling” than to set out “recycling, recovery and re-use (whether or not the waste is subjected to any process)” every time the Bill mentions this concept. As I went on to say in my answer, defining recycling in this way implies no preference either in favour of recycling over re-use and recovery, or to the contrary. It is, I repeat, a mere drafting convenience.

I can assure you that the Scottish Government certainly will be giving effect to the waste hierarchy as set out in the Directive. The policy on waste, to be set out in the revised National Waste Plan for Scotland, will make this clear. In the narrower context of the issues addressed by the Bill, the definition of recycling adopted in the Bill will not prevent us taking account of the hierarchy. As you know, the Bill’s waste provisions are enabling powers only. Should Parliament agree to give them to us, they will be given actual effect only by subsequent regulations. These regulations would have to take appropriate account of the waste hierarchy.

I hope this clarifies that the definition of recycling in the Bill is for simplicity only, and will not detract from our application of the waste hierarchy.

RICHARD LOCHHEAD
2 FEBRUARY 2009

cc: Minister for Transport, Infrastructure & Climate Change
CLIMATE CHANGE (SCOTLAND) BILL – WASTE PROVISIONS
STAGE 2 AMENDMENTS

When I gave evidence to your Committee on 4 February I said I would write to you giving notice of the Stage 2 amendments to the waste provisions we had under consideration. As I indicated at the time, these all relate to the deposit and return provisions in Section 58 of the Bill. Your Committee, however, may wish to have more detail.

As we discussed on 4 February, we are some way from presenting detailed proposals on deposit and return schemes and, should we wish to proceed, we would need to have detailed discussions with interested parties to prepare a scheme that is right for Scotland. It is clear, however, that some currently-operating models of deposit and return scheme depend on a “clearing house” function, in which a central body levies the deposits, ensures that they are returned to those returning the relevant materials, and ensures that the returned materials are re-used, recycled or recovered. Should we wish to replicate such a scheme we will need to have the powers to do so.

In addition to the powers in respect of such a body currently set out in Section 58(5), we shall be proposing amendments to:

- Allow us to establish a new body, if necessary, rather than use an existing one;
- Establish and amend the functions of that body;
- Direct that body in the performance of its duties, for example on the use of any surplus;
- Give public monies to that body, whether in the form of loans or grants;
- Keep a proportion of the deposits collected to defray costs; and
- Put the running of that body out to tender.
There is another matter relating to deposit and return schemes which arises from the evidence to the Committee on 4 February. It was noted that the powers in Section 58 relate explicitly to packaging, whereas items other than packaging might usefully be addressed by a scheme under these powers. On reflection, I think this is correct, and we are considering whether appropriate amendments may be made.

I hope this is of interest to your Committee. I would like to take this opportunity to repeat my assurance that, if we intend to proceed with regulations in the term of this Parliament (assuming, of course, that the Parliament gives us the powers to make them) I shall inform your Committee as early, and as fully, as possible.

RICHARD LOCHHEAD

cc: Minister for Transport, Infrastructure and Climate Change
When Michael Russell gave evidence to the Committee about the forestry provisions in this Bill on 11 February, he agreed that we would write further about the use of the powers in section 47.

The Policy Memorandum to the Bill explains that these powers are needed to allow the Forestry Commissioners to enter into joint ventures with developers and local communities to accelerate renewable energy development, and to release capital from the national forest estate. It identifies leasing as one option for releasing capital. As you know, the leasing option has been controversial and we have said that we would carefully consider the outcome of recent consultation, together with Forestry Commission Scotland’s options review, before coming to a decision on this.

During the discussion on 11 February, Committee members asked about the broad nature of these powers in section 47 of the Bill. The power to modify the functions of the Forestry Commissioners in or as regards Scotland is, however, limited by section 47(2). Scottish Ministers may only make such an order where they consider it necessary or expedient in order to comply with their duty under sections 1, 2 or 3(1)(b) to meet the targets set out in those provisions, or otherwise in relation to climate change. Thus, any modifications to the functions of the Forestry Commissioners in or as regards Scotland contained in an order under section 47 may only be made for purposes demonstrably related to the mitigation of the effects of climate change.
The power in section 47 to modify the Forestry Commissioners’ functions could not be used to remove over-arching duties imposed upon the Forestry Commissioners in legislation such as the duty to further the conservation of biodiversity in the exercise of their functions, which is imposed by the Nature Conservation (Scotland) Act 2004.

The Committee will also be aware of the fact that, in terms of section 64(4), an order to be made under section 47 will be subject to affirmative resolution procedure. This will ensure that any such order will have to be debated, and approved by, the Parliament, before it can be made.

ROSEANNA CUNNINGHAM MSP
MINISTER FOR ENVIRONMENT
Subordinate Legislation Committee

Climate Change (Scotland) Bill

The Committee reports to the lead committee as follows—

Introduction

1. At its meetings on 27 January\textsuperscript{1} and 24 February 2009\textsuperscript{2} the Subordinate Legislation Committee considered the delegated powers provisions in the Climate Change (Scotland) Bill at Stage 1. The Committee submits this report to the Transport, Infrastructure and Climate Change Committee as the lead committee for the Bill under Rule 9.6.2 of Standing Orders.

2. The Scottish Government provided the Parliament with a memorandum on the delegated powers provisions in the Bill (DPM).\textsuperscript{3}

3. The Committee’s correspondence with the Scottish Government is reproduced in the Annex.

Delegated Powers Provisions

4. The Committee considered each of the delegated powers provisions in the Bill.

5. The Committee determined that it did not need to draw the attention of the Parliament to the delegated powers in the following sections: 9, 11, 15, 17, 20, Schedule 1, paragraphs 2(2), 6(1), 7(5), 8(2) and 9(3), sections 23, 24, 35, 38, 39, 40(2), 42(1) and (2), 43, 44(1), 50, 52(3), 53(4), 54(3), 55(1), (2), (3) and (4), 56(4) and (5), 57(3), 58, 59 and 67.

Section 4 - Setting annual targets

6. Section 4 imposes a requirement on the Scottish Ministers to set annual targets for the maximum amount of the net Scottish emissions account, by order. Subsection (2) states for which years the targets must be set. The Scottish Ministers intend to set targets in batches; the first batch will be for 13 years (2010-2022), with subsequent targets set in batches of 5 years until the last batch, which will be 3 years in length (2048-2050). The dates in advance, by which each batch

\textsuperscript{1} Official Report 27 January 2009
\textsuperscript{2} Official Report 24 February 2009
\textsuperscript{3} Delegated Powers Memorandum
of targets must be set are also given. The annual targets must be set in accordance with provisions in section 3.

7. The Committee queried (given that there was no explanation of this in the DPM) whether there should be any requirements for consultation on the face of the Bill, on setting the annual targets by order, with specified bodies or persons who may have interest in the proposals.

8. The response from the Scottish Government noted (amongst other matters, as set out in the Annex to this Report) that annual targets shall be set for the whole of Scotland, and so far as there are no targets for specific industries or sectors, that does not indicate that specific persons or bodies should be prescribed to be consulted on an order before it is made. The Government shall also require to take into account the advice of the relevant advisory body, prior to setting the annual targets by order.

9. Following this further explanation given by the Scottish Government, the Committee concluded that there was a sufficient explanation of why there are no further consultation requirements prescribed on the face of the Bill.

10. The Committee was therefore content with the delegated power in section 4, and that it is subject to affirmative procedure.

Section 6 - Modifying annual targets

11. Section 6 allows the Scottish Ministers to modify certain parts of sections 3 and 4 by order. Subsection (1) (c) enables the Scottish Ministers to modify any of the dates set out in section 4 (the dates of the batches of annual targets, and/or the advance date by which the target must be set) and subsection (1)(d) allows modification of the criteria to which Ministers must have regard when setting the annual targets. Subsection (4) sets out that the Scottish Ministers may only exercise these powers if they consider it appropriate to do so.

12. The DPM offered no explanation as to why this flexibility to change these matters is needed, and the approach contrasts with sub-section (2) and (3), where Ministers require to show it is no longer necessary for the annual targets to be set by reference to the 3% reduction, or require to show there have been significant changes to the basis on which the annual target was set. The Committee therefore asked for further explanation.

13. The Committee considers that the Government’s response on section 6 offers a proper explanation; that it has considered how section 6(4) might possibly have been restricted by reference, for example, to changes reflecting changes in the UK, European or international position/criteria, but it was considered this would not be appropriate.

14. The response also highlighted that Parliament shall be asked to approve any changes by affirmative procedure, and that a sufficient degree of flexibility is required because the annual targets require to be set up to 2050.
15. The Committee, being satisfied with the response in relation to section 6, is content with the delegated powers in that section, and that they are subject to affirmative procedure.

Section 12 - The net Scottish emissions account

16. Section 12(2) enables the Scottish Ministers to make provision by regulations about how and in what circumstances carbon units are credited to and debited from the net Scottish emissions account, and the manner in which this is to be done.

17. Section 64(7)(a) of the Bill proposes that the first regulations under section 12(2) shall be by affirmative procedure, but the second or subsequent regulations shall be by negative procedure. However, affirmative procedure is retained where the regulations shall make provision altering the amount by which a carbon unit credited or debited to the net emissions account for a period either reduces or increases the account for that period. The DPM explains that this is because of the significant effect this could have on the account.

18. The DPM also explained that the initial regulations will set out how and in what circumstances carbon units are credited to and debited from the net emissions account, which will be a key component of the operation of that account. Affirmative resolution procedure was therefore considered appropriate for the initial regulations.

19. The Committee notified the Scottish Government that it does not generally favour the use of the lesser degree of scrutiny of negative procedure for second or subsequent regulations, as is provided for in section 64(7)(a) in relation to section 12(2), while the first set of regulations are subject to affirmative procedure. The Committee sought further explanation on this matter from the Scottish Government, on why this is appropriate for this particular Bill.

20. The Committee considered that the Scottish Government’s response gave persuasive argument for the specific reasons why the procedures for regulations under sections 12 and 18 of the Bill were chosen. The Committee considered that there is sufficient explanation that the choice of procedure is appropriate for these particular sections of this Bill. In particular, the Committee noted that it appears from the Government response that further regulations after the first regulations under these sections are likely to be highly technical in subject matter, and any changes that increase or decrease the net Scottish emissions account shall be by affirmative procedure.

21. The Committee was content with the delegated powers in section 12, and that they are subject to affirmative procedure on the first occasion, but the second and subsequent Regulations will be subject to negative resolution, other than regulations making provision to alter the amount by which a carbon unit credited or debited to the net Scottish emissions account for a period reduces or increases the account for that period. (This is provided for in section 64(7)(a)).
22. The Committee also reports that generally it does not favour the use of affirmative procedure for a first set of regulations and negative procedure for second and subsequent regulations. However, in the instance of section 12 of this Bill, it was satisfied that the Scottish Government has provided sufficient reasons why this choice of procedure appears to be suitable.

Section 14 - Scottish share of emissions from international aviation and international shipping

23. International aviation and international shipping emissions are generally not directly emitted in a specific country. Section 14(1) and (2) allow the Scottish Ministers to specify by order how certain emissions from international aviation and shipping are to be attributable as “Scottish emissions”. Section 14(3) requires the Scottish Ministers to seek advice from the relevant body defined in section 5(5) prior to making an order. Section 14(4) requires the Scottish Ministers to publish a statement if the advice of the relevant body is not followed.

24. The DPM explained in justification for this delegated power that, as international aviation and international shipping emissions are generally not directly emitted in a specific country, it is necessary to specify how certain amounts of these emissions will be allocated to the net Scottish emissions account. This allocation may also need to change over time, particularly if a European or international agreement makes such a change necessary in the future. There is no current international agreement on how to allocate these emissions to States.

25. Given the significance of this power within the Bill, the DPM contained no explanation in relation to appropriate consultation before making an order under section 14, or why it was considered appropriate that there should be no particular prescribed consultation requirements on the face of the Bill. The Committee therefore asked for further explanation on this aspect.

26. The Committee accepted the further explanation offered by the Scottish Government, as to why there are no specific requirements for Scottish Ministers to consult with specified persons or bodies on the terms of an order under section 14, within the Bill.

27. The Committee therefore reports that it is content with the delegated power in section 14, and that it is subject to affirmative procedure.

Section 18 - Carbon units and carbon accounting

28. Section 18(1) allows the Scottish Ministers to create a scheme for the purpose of monitoring the use of carbon units, including registering them and keeping track of them. The scheme may establish and maintain accounts in which carbon units may be held, and between which they can be transferred. Section 18(2) allows existing schemes, which might be established in future by Ministers, to be adapted for the purposes set out in subsection (1).

29. The DPM explains that it may be necessary (in future) to create a scheme to monitor the use of carbon units. "The trading of units across borders can be
complicated and it is not yet known whether such a scheme is necessary. However, if it does become necessary, these provisions allow for such a scheme to be created.”

30. The Committee notified the Scottish Government that it does not generally favour the use of the lesser degree of scrutiny of negative procedure for second or subsequent regulations, as provided for in section 64(7)(b) in relation to section 18(1), while the first regulations shall be subject to affirmative procedure. The Committee sought further explanation on this matter from the Scottish Government. (The issue here is similar to that in relation to section 12 of the Bill).

31. The Committee considered that the Scottish Government’s response gave persuasive argument for the specific reasons why the procedures for regulations under sections 12 and 18 of the Bill were chosen. The Committee considered that there is sufficient explanation that the choice of procedures is appropriate for these particular sections of this Bill. In particular, the Committee noted that it appears from the Government response that further regulations after the first regulations under these sections are likely to be highly technical in subject matter. Also, any changes which increase or decrease the net Scottish emissions account, or which specify a new type of carbon unit which may have an effect that account, shall be by affirmative procedure.

32. The Committee was content with the delegated powers in section 18, and that they are subject to affirmative procedure on the first occasion, but the second and subsequent Regulations will be subject to negative resolution, other than regulations making provision specifying a carbon unit of a kind not previously specified in regulations which shall be subject to affirmative procedure (as provided for in section 64(7)(b)).

The Committee also reports that generally it does not favour the use of affirmative procedure for a first set of regulations and negative procedure for second and subsequent regulations. However, in the instance of section 18 of this Bill, the Scottish Government has provided sufficient reasons why this choice of procedures appears to be suitable.

Section 19 – Meaning of advisory body

Section 20 and Schedule 1- Scottish Committee on Climate Change

33. Section 19(1) enables the Scottish Ministers to designate by order, a body or person to carry out the advisory functions as set out in the Bill. In the absence of an order made under section 19(1), the Scottish Ministers will seek advice from the UK Committee on Climate Change established by the UK Climate Change Act 2008 (as set out in section 5(5) of this Bill). An order under section 19 shall be subject to affirmative resolution procedure. Such an order may in future specify the Scottish Committee on Climate Change as the advisory body.

34. By section 20, the Scottish Ministers may by order establish the Scottish Committee.
35. Schedule 1 of the Bill makes further provision for the constitution and membership of the Scottish Committee on Climate Change. By paragraph 2(3) of Schedule 1, the members of that Committee shall be appointed by the Scottish Ministers.

36. The Committee considers the delegated powers in sections 19, 20 and Schedule 1 to be acceptable. The Committee draws to the attention of the lead and secondary committees for the Bill (in relation to the effect of the delegated powers contained in sections 19, 20 and Schedule 1) that the Explanatory Notes with the Bill (paragraph 33) and the Policy Memorandum (paragraph 31) indicate that Ministers will require to seek expert, independent advice from the advisory body, but the Bill provides –

(a) in section 19(1) and (5), that a designated advisory body may be any public body as Ministers consider appropriate, which may be a person or body with functions of a public nature (not necessarily independent of the Scottish Ministers or Government), and

(b) in Schedule 1, paragraph 2, that the members of the Scottish Committee on Climate Change shall be appointed by the Scottish Ministers.

37. The Committee acknowledges, however, that in relation to those statements in the Policy Memorandum and Explanatory Notes, “independent” is capable of having different meanings and does not necessarily refer to a body which is wholly independent of the Scottish Ministers.

Section 26 – Guidance to advisory body
Section 27 – Power to give directions to the advisory body

38. Section 26 provides that the advisory body (to the Scottish Ministers) must have regard to any guidance given by the Scottish Ministers to it in relation to the exercise of its functions under the Act. However, Ministers may not give guidance as to the content of any advice or report. This includes power to vary or revoke the guidance.

39. Section 27 provides that the Scottish Ministers may, if they consider it appropriate, give the advisory body directions as to the exercise of its functions under the Act. However, Ministers may not give directions as to the content of any advice or report. This includes the power to vary or revoke the directions. Unlike guidance, directions issued in relation to the functions of the advisory body shall be binding on the body.

40. The Committee considers that the delegated powers contained in sections 26 and 27 are acceptable to be in the form of guidance and directions (respectively) issued by the Scottish Ministers, and those powers would not be more appropriately expressed in the form of subordinate legislation. The remit of the Committee in regard to these sections is to so
consider whether the powers would be more appropriate to be expressed in that form.

41. The Committee draws to the attention of the lead and secondary committees for the Bill the delegated powers conferred on the Scottish Ministers in sections 26 and 27 to issue directions and guidance to the advisory body given that the Explanatory Notes (at paragraph 33) and the Policy Memorandum (at paragraph 31) indicate that the advisory body shall provide independent advice to the Scottish Ministers.

Section 36 - Duties of public bodies relating to climate change

42. Section 36 empowers the Scottish Ministers to impose ‘climate change duties’ by order, on public bodies. A public body, as defined in sections 19(5) and 65, is a person or body with functions of a public nature. ‘Climate change’ is not defined in the Bill. ‘Climate change duties’ are neither listed nor defined in section 36. Section 36(3) provides that an order under this section may, in particular, impose climate change duties on all public bodies, public bodies of a particular description, or individual public bodies. Different climate change duties may be imposed on different public bodies or descriptions of public body. Section 36(4) provides that before laying a statutory instrument containing an order before the Scottish Parliament, the Scottish Ministers must consult, in so far as reasonably practicable, with such associations of local authorities and such other persons as the Scottish Ministers consider appropriate. Section 36(6) requires the Scottish Ministers to co-operate with a relevant public body to help that body comply with its climate change duties.

43. Given the width of these powers and the lack of definition with respect to public bodies and climate change duties, the Committee asked the Scottish Government about the meaning and scope of ‘public bodies’ and ‘climate change duties’, and whether consideration had been given to the type of ‘public bodies’ which could be subject to climate change duties. It was apparent from the Scottish Government response that Ministers did give consideration to the types of bodies to be subject to the duties, but ‘felt that it was not appropriate to list the bodies to which the duties might be applied’. A public body as defined in the Bill is a person or body with functions of a public nature. ‘Functions of a public nature’ are not defined. The definition of ‘public body’ is therefore ambiguous and potentially very wide. This is in effect acknowledged in the third paragraph of the Scottish Government response, in which it is stated that ‘It is not possible to know exactly which public bodies may need to become subject to statutory climate change duties at various points over the course of the forty years which the framework is designed to cover.’ In the response, the Scottish Government stated that it was never the intention to define ‘climate change duties’ more specifically elsewhere in the Bill. The response commented on the need for flexibility to be able to respond to or in anticipation of circumstances which cannot be foreseen at the present time.

44. The Committee considered that it would be possible to provide a list of bodies in the Bill so that Parliament (in approving the Bill) could assess whether these are the bodies to which the powers should apply. A power to add bodies to
the list or modify the list subject to affirmative procedure would allow Parliament to remain in control of the definition of ‘public bodies

45. The Committee reports to the lead committee that the power under section 36(1) to impose climate change duties on public bodies is extremely wide in its scope, in particular as neither the public bodies which may be subject to climate change duties nor climate change duties themselves are adequately and clearly defined.

46. The Committee also recommends that this could be mitigated to some extent by provision of a list of public bodies to whom the power is to apply along with a power to add to the list subject to affirmative procedure. This would be in line with the approach adopted to other regimes regulating public bodies such as freedom of information.

Section 37 – Guidance to relevant public bodies

47. Section 37(1) provides that ‘relevant public bodies’ are required to have regard to any guidance given to them by the Scottish Ministers in relation to climate change duties. A ‘relevant public body’ is a body which has climate change duties by virtue of section 36(1). Before issuing guidance the Scottish Ministers have a duty to consult the same bodies as those specified in section 36(5) with respect to the imposition of climate change duties. Guidance issued under this section has to be published by Scottish Ministers.

48. The guidance which the Scottish Ministers can issue and which public bodies will have to have regard to will not be subject to any form of parliamentary procedure or scrutiny. Section 37 does not give any indication of, nor does it provide any limitation on, the nature or scope of the guidance which the Scottish Ministers can give.

49. The Committee therefore asked the Scottish Government for more information as to the function and likely content of such guidance.

50. The response from the Scottish Government stated that guidance will indicate how specific climate change duties should be discharged and that it is intended to assist in developing consistency of approach across those public bodies to which climate duties apply.

51. The Committee considered that the response did not aid its consideration of this power. The Committee concluded that it would be appropriate for the Parliament to have a role in scrutinising the guidance produced under section 37 because of its potential impact, and recommends that guidance under this section should be laid before Parliament for a period prior to implementation, and any resolutions of the Parliament made in respect of the draft guidance during that period taken into account.

Section 46 - Variation of permitted times for making muirburn

52. Section 46 inserts a new section 23A into the Hill Farming Act 1946 (“the 1946 Act”). Section 23 of that Act currently prohibits muirburn between certain
dates. Subsection (1) of new section 23A of the 1946 Act provides the Scottish Ministers with an order-making power to specify different dates before which, and after which, it is lawful to make muirburn in any year. Subsection (3) stipulates that the Scottish Ministers may make an order under subsection (1) only if they consider it necessary or expedient to do so in relation to climate change. The effect of this power is therefore to allow the Scottish Ministers to change the dates between which muirburn may be conducted so as to have regard to the impact of this activity on climate change. The section does not contain a requirement for consultation of affected landowners or others prior to the making of an order.

53. The committee asked the Government why it does not consider that provision for consultation is necessary or appropriate in order to take into account the impact on landowners that any changes might cause.

54. The Scottish Government acknowledges that it would be appropriate to consult with parties likely to be affected by changes to the times at which muirburn may be made. They point to their perceived difficulties in identifying a specific body or specific bodies whom they might be obliged to consult. However, they do refer to what is stated to be their standard practice of consulting on a non-statutory basis with potentially interested parties and consider that this would be appropriate and reasonable in the circumstances.

55. The Committee was content with the response in respect that it may be taken to confirm that informal consultation with potentially interested parties will take place in advance of any instrument.

Section 47 - Power to modify functions of Forestry Commissioners

56. The Forestry Commissioners were established by the Forestry Act 1967. Section 47 confers on the Scottish Ministers the power to modify the functions of the Forestry Commissioners in or as regards Scotland. The Committee was concerned about the potential scope of the proposed power to modify the functions of the Forestry Commissioners in or as regards Scotland. The Committee was concerned about the potential scope of the proposed power to modify the functions of the Forestry Commissioners in or as regards Scotland. The Committee was concerned about the potential scope of the proposed power to modify the functions of the Forestry Commissioners in or as regards Scotland. Section 47(2) imposes limitations on the circumstances in which Scottish Ministers may exercise the power to modify under section 47(1) but the section does not impose any restrictions or limitations on the nature, scope or extent of any modification of the Forestry Commissioners’ functions. The power could have the potential to alter, quite radically, the Forestry Commissioner’s functions, either by the addition of new functions or by the removal of existing functions.

57. The Committee asked the Scottish Government if consideration had been given to the imposition of a restriction on the power. The Scottish Government response did not address the committee’s concerns. The response refers to the limitation on the circumstances in which the power may be exercised, namely to comply with Scottish Ministers duties under sections 1, 2 and 3 of the Bill (namely the 2050 target, the interim target and annual targets) or otherwise in relation to climate change. However, it was the Committee’s view that the limitation on the circumstances in which the power may be exercised does not place any limitation on the nature, scope or extent of any modification of the Forestry Commissioners’ functions which may arise in consequence of the exercise of that power beyond that it must be for a climate change purpose. It is the absence of limitations on
what may be done in consequence of the exercise of the power which was of concern, not the circumstances in which the power may be exercised, which circumstances are subject to limitations.

58. Section 47(3) gives examples of what an order may in particular enable the Forestry Commissioners to do. They indicate how wide-ranging the consequences and impact of the exercise of the power may be. The question is whether the climate change purpose should be allowed to overrule any other considerations as to what should properly be the functions of the Forestry Commissioners.

59. The Committee draws to the attention of the lead committee that the power under section 47(1) to modify the functions of the Forestry Commissioners in or as regards Scotland is, in the opinion of the Committee, very wide in its scope as there is no limitation within the power on what may be done in exercise of the power beyond that it must deliver a climate change purpose.

Section 52(1), (2) and (4) - Waste prevention and management plans
Section 53(1), (2), (3) and (5) - Information on waste
Section 54(1), (2), (4) and (5) - Recyclable waste: facilities for deposit etc.
Section 56(1), (2), (3) and (6) - Procurement of recyclate - regulations

Section 52 empowers the Scottish Ministers, by regulations, to place a duty on specified persons to prepare waste prevention and management plans. Section 53 enables the Scottish Ministers, by regulations, to require specified persons to provide information to SEPA about the waste that they produce. Section 54 enables the Scottish Ministers to make regulations which may require receptacles to be provided by persons of the kinds specified for a broad range of types of waste. Section 56 gives the Scottish Ministers powers to require specified persons to ensure that particular things procured or constructed by or on behalf of them contain or include a certain proportion of recyclate, which is waste that has been recycled.

60. The Committee’s concerns with respect to these 4 sections related to the lack of specification in the provisions with respect to the kinds or classes of persons who would be (or whom it was anticipated would be) subject to duties under the various sets of regulations. In particular, the regulations could apply to domestic activities or individuals in the absence of any express restriction.

61. In its response to questions posed by legal advisers on these sections, the Scottish Government state that it is not possible at present to be specific as to the classes of persons on whom duties may fall. They explain their reasons for this response. No firm proposals have as yet been drawn up. The Scottish Government have admitted that they are not yet clear how these powers will be used. It is not clear what restrictions if any will be applied to the exercise of these powers. There is nothing on the face of these powers to restrict their application and in particular to exclude non-commercial activity.

62. The Committee took the view that whether or not duties could be applied to domestic activities is a policy matter to be decided by the lead committee and
Parliament, but that if the lead committee or Parliament considers that the powers should have no application to non-commercial activity then this should be made express on the face of the Bill.

63. The Committee therefore reports to the lead committee and to Parliament that these powers are expressed in very broad terms and that there is nothing on the face of the Bill to restrict their application to purely commercial activity.

Section 57(1), (2) and (4) – Targets for reduction of packaging etc.

64. Section 57 enables the Scottish Ministers, by regulations, to set targets to reduce the amount of packaging used and to require specified persons to comply with those targets. Targets may also be set for the reduction of greenhouse gas emissions produced by packaging.

65. Given the lack of information offered in the DPM in relation to the scope or extent of these powers, the committee sought clarity with respect to the scope of the powers and whether the powers were drawn no more widely than required.

66. In its response, the Scottish Government point out that producers of packaging are already subject to a producer responsibility regime and that in terms of waste in general producer responsibility is a requirement of community law. This is why retailers and not producers were specifically mentioned in the Delegated Powers Memorandum.

67. Section 57 places no limits on the persons who may be subject to regulations under this section. The Committee was concerned about the potential scope of the application of these regulations and to the fact that there are no restrictions within the provisions themselves on the persons who may be subject to duties under the regulations. In particular the committee was concerned that duties imposed by regulations may be extended to non-commercial applications.

68. The Committee took the view that whether or not duties could be applied to domestic activities is a policy matter to be decided by the lead committee and Parliament but that if the lead committee or Parliament considers that the powers should have no application to non-commercial activity then this should be made express on the face of the Bill.

69. The Committee reports that Parliament should be made aware that these powers are expressed in very broad terms and that there is nothing on the face of the Bill to restrict their application to commercial activity.

Section 64 – Subordinate legislation

70. This section contains the general subordinate legislation provisions, including the specification of the affirmative or negative procedures applying to the order or regulation-making powers in the Act.

71. The power to modify enactments in section 64(3) is framed at its widest. There is no express limitation placed on that power, with reference to the provisions or purposes of the Bill. This is a “Henry VIII power” which does not
contain a limit on the purposes of the power and which can be attached to any other power to make subordinate legislation under the Act. The Committee considers however that it should be implied within section 64(3) as drafted that any modification shall be for the purposes of the provisions of the Act, at least. However, this is still a very wide proposed power to modify enactments.

72. Generally, the Committee would take as a starting point that such a “Henry VIII” power, framed in this way, is unacceptable, unless sufficient justification is provided for the width of the power required, which should be in exceptional circumstances. Accordingly, the Committee requested further explanation, to establish why this power may be justifiable for this particular Bill.

73. The response from the Government explains that this is a wide-ranging Bill, and “it is difficult to know in advance which powers might need to modify enactments. That is why section 64(3) is expressed as applying generally”. The response also highlights that certain powers proposed in the Bill are potentially wide in effect, for example the powers in section 36 and 47 in relation to the imposition of duties on public authorities in relation to climate change, and the power to modify the functions of the Forestry Commissioners in or as regards Scotland. The modification of, for example, the Forestry Act 1967 would be the “main method by which the power would be used, rather than being merely ancillary.”

74. In essence therefore, the response from the Government indicates that it considers that such a wide power to modify enactments (by way of affirmative procedure regulations or orders in future) is required for this particular Bill, given the potential width, or uncertain future effects, of some of the other delegated powers proposed in the Bill, and so that a general power to modify for the purposes of this particular Bill is required. The Committee accepted this explanation as sufficient, while noting that the effect of this power to modify enactments (including this Act) may be potentially very wide in effect. The Committee also noted that modifications of enactments by future subordinate legislation under the Bill shall require to be affirmed by Parliament.

75. Accordingly, the Committee considered that in the instance of this particular Bill, the proposed general power contained in section 64(3), which enables orders or regulations to modify any enactment (including the Act) by affirmative procedure is acceptable.
Response from Scottish Government

Climate Change (Scotland) Bill at stage 1

1. Thank you for your letter of 28 January 2009 to Paul Johnston regarding the Subordinate Legislation Committee’s consideration of the Climate Change (Scotland) Bill at Stage 1.

For ease of reference I have set out each of the points raised, followed by the Scottish Government response.

Section 4 - Setting annual targets

2. The Committee asked the Scottish Government——

   in relation to sections 4 and 6, on what basis it has considered that there should be no requirements on the face of the Bill to the effect that Ministers shall consult on the terms of an order under those sections (setting or modifying annual targets) with specified persons or bodies who may have particular interest in the proposals?

3. Scottish Government response——

   i. When setting annual targets (section 4) and modifying them (section 6), Ministers must first seek the advice of the relevant body (sections 5 and 7 respectively). Section 5(5) provides that the relevant body is the UK Committee on Climate Change or a person or body designated under section 19(1), in practice an existing body or a Scottish Committee on Climate Change.

   ii. The Scottish Government has committed to utilising the UK Committee on Climate Change in the short to medium term before reviewing the situation. The UK Committee comprises leading experts on the subject of climate change. Paragraph 1(3) of Schedule 1 to the UK Climate Change Act 2008 sets out the areas of experience and knowledge that the national authorities, which include the Scottish Ministers, must have regard to securing for the Committee as a whole when appointing its members. This includes an understanding of the differences in circumstances between England, Wales, Scotland and Northern Ireland.

   iii. If Ministers decide to lay an instrument which makes provision different from that recommended by the Committee, section 5(3) of the Bill requires that they publish a statement explaining why. This is intended to enhance transparency and scrutiny.

   iv. The annual targets in the Climate Change (Scotland) Bill apply to the entire Scottish economy. The Bill contains no targets for individual sectors of the economy in order to allow sufficient flexibility for policies to be put in place to reduce emissions in the most cost effective ways possible, without disproportionately disadvantaging any particular industry in Scotland. This is
reinforced by the fact that the duty to ensure that the net Scottish emissions account is reduced in line with the annual and longer-term targets in the Bill is placed upon the Scottish Ministers alone.

v. These factors, combined with the provisions requiring the advice of the relevant body, means that it is not felt necessary to require additional consultation on the proposed levels of the annual targets, or on proposed modification of these levels, both of which will be set by orders subject to affirmative resolution.

Section 6 - Modifying annual targets

4. The Committee asked the Scottish Government—

(a) to explain and justify why it is considered, in relation to the power in section 6(4), that this may be exercised in any circumstances where the Scottish Ministers consider it appropriate to do so; and

(b) whether more defined circumstances in which it would be appropriate to exercise the power (in a similar manner to section 6(2) and (3)) could be prescribed, for instance where it becomes necessary for the achievement of targets?

5. Scottish Government response—

i. The power in section 6(1)(c) enables the Scottish Ministers to amend the dates for which batches of annual targets must be set. The power in section 6(1)(d) enables the Scottish Ministers to amend the criteria which Ministers must have regard to when setting annual targets. Section 6(4) stipulates that Scottish Ministers may make orders under sections 6(1)(c) and (d) only if they consider it appropriate to do so. Consideration was given to whether it would be desirable to limit the exercise of these powers by reference to particular conditions which must be met but this was rejected because of the factors outlined below.

ii. The dates set out in section 4(2) mirror the dates for which carbon budgets will be set by the UK Government under the Climate Change Act 2008. This recognises that total emissions reductions in Scotland depend in part upon policies which are reserved and therefore that the batches of annual targets should take account of the levels at which UK carbon budgets are set. It also provides greater certainty for the many organisations which operate both in Scotland and other parts of the UK. It is necessary for Scottish Ministers to be able to amend the annual target dates should the Secretary of State ever exercise the power in section 23(1) of the UK Act to change the length or timing of the UK carbon budgets.

iii. Consideration was given to drafting this section so that the power could only be exercised in order to keep Scottish annual target batch dates in line with the UK carbon budgets or other relevant European or other international agreements. However, it was felt that this was unnecessarily restrictive given the differences between the Scottish annual target model and other emissions reduction models in place elsewhere. Any amendments made under the section
6(1)(c) provision would be subject to affirmative resolution and therefore open to considerable Parliamentary scrutiny.

iv. The target setting criteria in section 4(4) represent the areas and issues which the Scottish Ministers believe are relevant and appropriate to have regard to when setting annual targets. The framework established by the Climate Change (Scotland) Bill is designed to last until at least 2050. It may become appropriate to amend these criteria at some point in the coming four decades. Given this lengthy timescale, it is felt that there needs to be considerable flexibility to adapt these criteria to best fit current thinking and therefore it would not be desirable to attempt to try to restrict the use of the section 6(1)(d) power in a specific way. Once again, any such amendment will be subject to the level of Parliamentary scrutiny afforded by affirmative resolution procedure.

v. With regard to the Committee’s suggestion that the exercise of the power in section 6(4) be restricted so that it is used only, for example, where it becomes necessary for the achievement of targets, we consider that this would be difficult to achieve satisfactorily. It would be difficult to argue that changing the dates for which batches of targets are set affects the ability to achieve those targets because it is the level at which any particular target is set which is the key factor in whether or not it is achievable. Similarly, it would be difficult to draw a direct link between changing the target setting criteria and the achievability of targets themselves.

vi. Finally, it is worth noting the duty in section 7 of the Bill which requires that Ministers seek the advice of the relevant body before making an order under section 6. If the order makes provision different from that recommended by the relevant body, Ministers must publish a statement explaining why. This provides another safeguard as to the use of the section 6 powers.

Section 12 - The net Scottish emissions account

6. The Committee notified the Scottish Government that it does not favour the use of the lesser degree of scrutiny of negative procedure for second or subsequent regulations, as provided for in section 64(7)(a) in relation to section 12(2), rather than affirmative procedure.

7. The Committee asked the Scottish Government—

(a) whether it could re-consider if all regulations under section 12(2) could be by affirmative procedure, and

(b) if it does not take this view, if it could fully explain to the Committee what types of “technical” provisions would be subject to second and subsequent negative procedure regulations under section 12(2) (but would not be provisions that would attract affirmative procedure under section 64(7)(a)); could a description of these provisions be put in the Bill; and why it is considered appropriate those provisions should be subject to negative procedure, while the other provisions should be subject to affirmative procedure?
8. **Scottish Government response**—

i. The Scottish Government does not take the view that affirmative resolution is necessary for all regulations made under section 12(2). The first regulations made under this section will be used to establish the circumstances in which carbon units will be credited to or debited from the net Scottish emissions account and the manner in which this is to be done. This first set of regulations will be subject to affirmative resolution, as will any amendment to them or to subsequent regulations which would have a fundamental impact on the operation of the net Scottish emissions account by altering the amount by which carbon units increase or decrease that account.

ii. It is envisioned that second and subsequent regulations which would attract negative procedure would be instruments designed to align emissions trading schemes operating in Scotland, such as the EU Emissions Trading Scheme (EU ETS), with the net Scottish emissions account. These regulations are likely to be very technical and detailed in nature but would be unlikely to change the fundamental operation of the net Scottish emissions account.

iii. For example, in Phase II of the EU ETS (up to and including the year 2012) nearly all emissions allowances are allocated to industry free of charge. Participants only have to pay for extra allowances necessary to offset emissions over and above their allocation. However, in Phase III of the EU ETS (2013-2020), auctioning will become the default method of distributing allowances, rather than free allocation. In sectors of industry not subject to specific exemptions, 20% of allowances to be distributed will be auctioned in 2013, gradually increasing to 70% in 2020. Additionally the electricity generation sector in most Member States will not receive any free allowances from 2013 onwards. The proportion they would have received will also be auctioned. Work is underway within the Scottish Government to develop section 12 regulations covering the operation of the EU ETS up to and including 2012. However, although the principles of Phase III of the EU ETS are known, there are currently a great number of uncertainties about how it will actually operate in practice. It is almost certain that the first set of section 12 regulations, put in place to enable the net Scottish emissions account to operate appropriately in 2010-2012, will need to be amended to take account of the changes to the EU ETS from 2013. The aim of these amendments will simply be to enable the EU ETS allowances used by installations in Scotland to continue to be properly accounted for. The amended regulations will not change the amounts by which individual EU ETS allowances increase or decrease the net Scottish emissions account. The Scottish Government therefore considers that negative resolution is appropriate in such circumstances. This follows the approach taken in the equivalent sections of the UK Climate Change Act (sections 27 and 28).

9. **The Committee asked the Scottish Government**—

---

**Section 14 - Scottish share of emissions from international aviation and international shipping**

9. **The Committee asked the Scottish Government**—
in relation to section 14, on what basis it has considered that there should be no requirements on the face of the Bill to the effect that Ministers shall consult on the terms of an order with specified persons or bodies who may have particular interest in these proposals?

10. **Scottish Government response—**

i. Emissions from domestic aviation and domestic shipping are considered to have been emitted from sources in Scotland and therefore fall within the scope of the Bill’s targets by virtue of section 13(a). An order made under section 14(1) of the Bill would designate a share of emissions from international aviation and international shipping as being attributable to Scotland. The effect of such an order would be to include these emissions within those which count towards the reduction targets set in the Bill. This does not amount to specific targets for either the aviation or the shipping industries because the Bill’s targets apply to Scotland’s emissions taken as a whole, not to individual sectors. This, combined with the requirement in section 14(3) that Scottish Ministers request advice from the relevant body (the expert Committee on Climate Change or Scottish equivalent), and the related requirement to publish a statement setting out any reasons for not following that advice should that be the case, meant that it was not felt necessary to require consultation on the terms on any order made under section 14(1).

Section 18 - Carbon units and carbon accounting

11. The Committee notified the Scottish Government that it does not favour the use of the lesser degree of scrutiny of negative procedure for second or subsequent regulations, as provided for in section 64(7)(b) in relation to section 18(1), rather than affirmative procedure.

12. The Committee asked the Scottish Government—

   (a) whether it could re-consider if all regulations under section 18 could be by affirmative procedure, and

   (b) if it does not take this view, if it could fully explain and justify to the Committee why it is considered appropriate that the first use of the regulation-making power under section 18 together with any regulations making provision specifying a carbon unit of a kind not previously specified) should be subject to affirmative procedure, whereas all other second or subsequent regulations under section 18 should be subject to negative procedure?

13. **Scottish Government response—**

i. The Scottish Government does not take the view that affirmative resolution is necessary for all regulations made under section 18. Once a scheme is established under section 18(1) for registering or otherwise keeping track of carbon units, including the establishment and maintenance of accounts for holding such units, and the designation or establishment of a person or body to administer
the scheme, it is considered that any further regulations made under section 18(1) would be used simply to vary the operation of this scheme.

ii. For example, a second or subsequent set of section 18(1) regulations might be necessary at some point in the future to create an additional account within which carbon units may be held because of changes to the way in which carbon units are traded at a UK or international level. This is considered to be an administrative procedure. Similarly, it may become necessary to change the level of the charges that users of the scheme are required to pay, to cover the reasonable operating costs of the scheme. Changes of these types would not fundamentally alter the carbon accounting scheme established in the first set of regulations made under section 18(1) and negative resolution is therefore considered sufficient for second and subsequent regulations which seek to make such amendments.

iii. By comparison, specifying a new type of carbon unit would have a significant effect because of the direct relevance to the net Scottish emissions account. Regulations making such a specification would therefore be subject to affirmative resolution.

iv. This follows the approach taken in the equivalent sections of the UK Climate Change Act (sections 26 and 28).

Section 36 - Duties of public bodies relating to climate change

14. The Committee asked the Scottish Government—

- Whether consideration was given to the type of ‘public bodies’ which could be subject to climate change duties and, if so, whether ‘public bodies’ for purposes of this section could be better defined;

- Whether consideration was given to providing a definition of ‘climate change duties’ which did not refer back to section 36(1) and, if so, whether ‘climate change duties’ for purposes of this section could be more specifically defined; and

- Given that climate change duties are not precisely defined and given that any order under section 36 could potentially affect a very wide range and large number of public bodies, whether consideration was given to providing for a broader range of persons whom the Scottish Ministers are obliged to consult under section 36(4) and (5)?

15. Scottish Government response—

i. In response to part (a) of the question, section 19(5) of the Bill provides that the term ‘public body’ means any body with a function of a public nature. This definition applies to section 36 by virtue of section 65 of the Bill. When drafting the Bill, consideration was given to the lists of public bodies in both the Freedom of Information (Scotland) Act 2002 and the Public Appointments and Public Bodies etc. (Scotland) Act 2003. However, given that the policy intention is only to use
the powers in section 36 when it is considered necessary in the future (about which more detail is given below) it was not felt appropriate to list the bodies to which the duties might be applied. It was considered more appropriate to use the general term ‘public bodies’.

ii. Apart from the set of specific provisions in Part 5, the Climate Change (Scotland) Bill is principally designed to set long-term statutory emissions reduction targets for Scotland and to establish the framework of annual targets, reporting and scrutiny to drive the policies for delivering the emissions reductions necessary for meeting these targets. The public sector can act as an exemplar by reducing its own emissions in line with the Bill’s targets. The Scottish Ministers wish to work in partnership with public bodies to achieve this but recognise that as emissions reductions become more difficult and more expensive to achieve it may become necessary to place duties on certain public bodies to take specific action. If this does become necessary, section 36(6) of the Bill specifically requires Scottish Ministers to co-operate with relevant public bodies to help them comply with their climate change duties.

iii. It is not possible to know exactly which public bodies may need to become subject to statutory climate change duties at various points over the course of the forty years that the Bill’s framework is designed to cover. If the Bill were to include a list of the public bodies relevant to section 36 it would be highly likely that bodies would need to be included in the list for the sake of completeness but upon which climate change duties may never need to be applied. This approach could also limit the Bill in terms of future application to any new bodies which are created between now and 2050. It was therefore considered appropriate to retain flexibility as to which public bodies climate change duties might be applied to.

iv. Section 36(5) of the Bill contains the safeguard that Scottish Ministers must consult with associations of local authorities or other persons (it is intended that this should be the representative bodies for the part of the public sector in question or, if there are none, the specific public bodies themselves) before laying a draft of a statutory instrument containing an order under section 36(1). Scrutiny is further strengthened by the requirement that such orders be subject to affirmative resolution.

v. In response to part (b) of the question, it was never the intention to define ‘climate change duties’ more specifically elsewhere in the Bill. Given the complex nature of climate change and the long-term nature of the emissions reduction framework established by the Bill, it was felt that this power should be flexible enough to be used in reaction to or anticipation of circumstances which cannot be foreseen at the present time.

vi. It is intended that the term ‘climate change duties’ be sufficiently broad to encompass measures designed to mitigate specific public bodies’ contribution to climate change, ways in which the bodies may adapt to the effects of climate change, or ways in which they may carry out their functions with regard to the objectives of mitigation and adaptation.
vii. In response to part (c) of the question, the Scottish Ministers are required to consult with associations of local authorities or other persons as the Scottish Ministers consider appropriate. As explained above, the term ‘other persons’ is intended to cover representative bodies for the part of the public sector in question (other than local authorities) should they exist, or, if they do not, the specific public bodies themselves. However, because the specific public bodies to which duties might be applied are not listed in the Bill in order to retain the flexibility sought for this power, it was not considered appropriate to set out a more specific or broader list of persons whom the Scottish Ministers would be obliged to consult.

Section 37 – Guidance to relevant public bodies

16. The Committee asked the Scottish Government for more information as to the function and likely content of this guidance.

17. Scottish Government response—

i. Guidance issued under section 37(1) will indicate how specific climate change duties should be discharged. This is intended to assist in developing consistency of approach across those public bodies to which specific section 36 duties apply. For example, and for illustrative purposes only, a duty might be applied requiring certain public bodies to take account of greenhouse emissions in new procurement contracts. Associated guidance issued under section 37 might set out examples of best practice as to how this might be achieved.

Section 46 - Variation of permitted times for making muirburn

18. The Committee asked the Scottish Government—

whether or not it considers it would be appropriate to consult the hill farming community, landowners and others who may be affected on the dates which may be appropriate for muirburn, in advance of making an instrument.

19. Scottish Government response—

i. The Scottish Government agrees that it would be appropriate to consult with parties likely to be affected by any proposed change to the times at which muirburn may be made. However, the Scottish Government considers that the introduction by section 46 of the Bill of provision in a new section 23A of the Hill Farming Act 1946 to create a statutory duty to consult would be impractical. Unlike sections 36(4) and 37(2) of the Bill, which require the Scottish Ministers to consult with, among other persons, associations of local authorities prior to placing climate change duties on public bodies and giving guidance about those duties, there is no one organised body or group of individuals that specifically or particularly represent the interests of those who are involved in the practice of making muirburn. In addition, the Scottish Government is not aware of any existing statutory body or agency with any particular role or statutory function in relation to muirburn.
ii. Muirburn may be made by any person, both a landowner or a tenant, anywhere in Scotland. The Scottish Government considers that in the absence of any organised persons or bodies representing those who may make muirburn, its standard practice of consulting on a non-statutory basis with potentially interested parties is appropriate and reasonable in the circumstances. Such a means of consultation will help to ensure that the views of those generally with an interest in muirburn are obtained and taken into account, as opposed to obtaining views from persons or groups whose remit or experience does not in particular concern the activity of muirburn.

Section 47 - Power to modify functions of Forestry Commissioners

20. The Committee asked the Scottish Government—

Given that the proposed power under section 47(1) to modify, by order, the functions of the Forestry Commissioners in or as regards Scotland does not contain any limitation with respect to the nature, scope or extent of any such modification, has the Scottish Government given consideration to the imposition of a restriction, within the power, on the nature, scope and extent of any modification which may be made; and, whether or not any such consideration has been given, does the Scottish Government not consider that such a limitation would be both feasible and appropriate?

21. Scottish Government response—

i. The Scottish Government considers that the power in draft section 47(1) to modify the functions of the Forestry Commissioners in or as regards Scotland is limited by section 47(2) to the effect that the Scottish Ministers may only make such an order where they consider it necessary or expedient to do so in order to comply with their duty under sections 1, 2 or 3(1)(b) to meet the targets set out in those provisions, or otherwise in relation to climate change.

ii. Any modifications to the functions of the Forestry Commissioners in or as regards Scotland contained in an order under section 47(1) may therefore only be made for purposes demonstrably related to the mitigation of the effects of climate change. The Scottish Government’s position is that consideration has been given to limiting the power in section 47(1), and that it is both feasible and appropriate that the power should be limited in such a way that it requires to relate to climate change purposes.

iii. The Committee will also have noted that, in terms of section 64(4), an order to be made under section 47(1) will be subject to affirmative resolution procedure, thereby ensuring that any such order will require to be debated and approved by the Parliament before it can be made.

Section 52(1), (2) and (4) - Waste prevention and management plans

22. The Committee asked the Scottish Government—
(a) What kinds or classes of persons does the Scottish Government intend or anticipate will be subject to duties under the regulations? In particular is there any intention to apply the power to domestic activities or individuals?

(b) Would it not be possible for the Scottish Government to specify, in the section, the classes of persons to be subject to the regulations and, if so, why has this not been done?

Section 53(1), (2), (3) and (5) - Information on waste

23. The Committee asked the Scottish Government—

(a) What kinds or classes of persons does the Scottish Government intend or anticipate will be subject to duties under the regulations? In particular is there any intention to apply the power to domestic activities or individuals?

(b) Would it not be possible for the Scottish Government to specify, in the section, the classes of persons to be subject to the regulations and, if so, why has this not been done?

Section 54(1), (2), (4) and (5) - Recyclable waste: facilities for deposit etc.

24. The Committee asked the Scottish Government—

(a) What kinds or classes of persons does the Scottish Government intend or anticipate will be subject to duties under the regulations? In particular is there any intention to apply the power to domestic activities or individuals?

(b) Would it not be possible for the Scottish Government to specify, in the section, the classes of persons to be subject to the regulations and, if so, why has this not been done?

Section 56(1), (2), (3) and (6) - Procurement of recyclate - regulations

25. The Committee asked the Scottish Government—

(a) What kinds or classes of persons does the Scottish Government intend or anticipate will be subject to duties under the regulations? In particular is there any intention to apply the power to domestic activities or individuals?

(b) Would it not be possible for the Scottish Government to specify, in the section, the classes of persons to be subject to the regulations and, if so, why has this not been done?
Scottish Government response—

i. In respect of sections 52, 53, 54, and 56 the Committee asks about the classes of persons on whom the Scottish Government believes duties under eventual regulations may fall. It is not at present possible to be specific, since in none of these cases has the Scottish Government yet drawn up firm proposals for regulation. In addition to policy considerations (which might, for example, mean exemptions for small businesses or particular sectors), actual regulations, which are not foreseen in the current economic circumstances, will have to be drawn up according to the economic, market and environmental position at the time. There is, however, no intention to apply regulations made in terms of any of these sections to private individuals acting in a non-business capacity.

Section 57(1), (2) and (4) – Targets for reduction of packaging etc.

26. The Committee asked the Scottish Government to fully explain and justify (given that no such explanation is given in the Delegated Powers Memorandum) why—

(a) unlike the approach taken in Part 1 of the Bill, the Government requires to take the powers in section 57(1) and (2), in so far as they propose that any targets without limit (set by any method) may be set for the reduction of packaging or the reduction of emissions produced by packaging, or requirements on persons to comply with those targets;

(b) given that the Memorandum refers to the possibility of targets being imposed on retailers, the Government requires to impose those targets or requirements on any types of persons (individuals or legal persons) who might be specified in the Regulations, and

(c) On what basis it has considered that there should be no requirements on the face of the Bill to the effect that Ministers shall consult on the terms of the regulations with specified persons or bodies that may have particular interest in the proposals?

27. Scottish Government response—

i. With regard to part (a) of the question, concerning the power in section 57(1) to set targets, the Bill requires that this power be exercised through regulations. A different approach from that taken in Part 1 is required since producers of packaging are already subject to a producer responsibility regime. In Scotland, this is set out in the Producer Responsibility Obligations (Packaging Waste) Regulations 2007 (SI 2007/871). These, in turn, implement the requirement in Article 7 of the Packaging and Packaging Waste Directive (94/62/EC) that return, collection and recovery systems be established. The Scottish Government does not consider it appropriate to transfer responsibilities to itself for meeting packaging targets when a statutory scheme placing considerable responsibilities on producers is already in place.
ii. Furthermore, in terms of waste in general, producer responsibility is a requirement of Community law - see, for example, Article 8 of the recently revised Waste Framework Directive (2008/98/EC). The power to set targets in respect of packaging is obviously less far-reaching in its effects on life in Scotland than the targets in Part 1 may potentially be. It is not limited because very different targets may be appropriate for different forms of packaging on different kinds of product - and indeed the appropriate targets will vary widely according to the state of the market.

iii. Part (b) of the Committee's question on Section 57 asks why the Bill refers to the imposition of targets on persons other than retailers. A great deal of the packaging in circulation does not pass through the hands of retailers, so requirements to reduce these forms of packaging would need to be set for other categories of person. Even where packaging does pass through the hands of retailers, it may well be appropriate to place reduction requirements on producers instead. (As indicated above, these persons are the object of existing producer responsibility legislation in any case.) This does not mean that the Delegated Powers Memorandum's reference to retailers was necessarily wrong. Measures to reduce the amount of packaging reaching consumers in particular, for example, would be likely to be addressed at retailers.

iv. Part (c) of the Committee's question on Section 57 concerns the lack of a specific provision on consultation. The Scottish Government's usual practice is to consult with interested parties when making secondary legislation. It seemed, therefore, unnecessary to require this on the face of the Bill.

Section 64 – Subordinate legislation

28. The Committee asked the Scottish Government—

Why (in contrast for example to the approach taken in sections 74 and 75 of the Judiciary and Courts (Scotland) Act 2008))—

(a) it is considered that section 64(3) requires to contain a power for orders or regulations to modify any enactment (including the Act) by affirmative procedure (a “Henry VIII power”), without any reference to the purposes of such modification, for example, for the purposes of making consequential, incidental, transitional, transitory, or savings provisions; and

(b) if the Government could re-consider whether the power to make supplementary, incidental or consequential provision could be limited to the purposes of giving full effect to, any provision of the Act, and the power to make transitory, transitional or saving provisions could be limited to being in connection with the coming into force of any provision of the Act?

29. Scottish Government response—
i. With regard to part (a) of the question, the Scottish Government considers that it is necessary for the power in section 64(3) to be available for use in wider circumstances than those prescribed in section 64(2)(b) for making consequential, incidental, transitional, transitory, or savings provision.

ii. For example, the power in section 47 enables the Scottish Ministers to modify the functions of the Forestry Commissioners in or as regards Scotland. It is likely that doing so will necessitate the modification of enactments, because the existing functions of the Forestry Commission are mainly set out in the Forestry Act 1967. The modification of that Act would be the main method by which the power would be used, rather than being merely ancillary. Section 36(1) provides a similar case because it might be necessary to modify enactments applying to local authorities, for example, to reflect the new climate change duties.

iii. This is a wide-ranging Bill and it is difficult to know in advance which powers might need to modify enactments. That is why section 64(3) is expressed as applying generally.

iv. Turning to part (b) of the question, the Scottish Government considers that dividing the section 64(3) powers in the way described would result in some of the ancillary powers being subject to the ‘full effect’ test and others subject to the ‘in connection with the coming into force’ test. As previously stated, it is difficult in advance to know which of the ancillary powers will be needed in practice. The Bill contains such a wide range of different powers that a particular set of subordinate legislation in a particular subject area might, for example, need to ‘mix and match’ a consequential provision with a saving. It was not felt that having to use different tests in this manner would add to the level of scrutiny which will have to be applied.

v. The Judiciary and Courts (Scotland) Act 2008, contains separate standalone “ancillary” and “transitional provision etc.” powers in sections 74 and 75, but it also contains a full list of incidental etc. powers within section 71. Section 64(2) (b) of the Climate Change (Scotland) Bill takes a similar approach to section 71(2) (a) in that Act.

I hope this information is helpful to the Committee.
Present:

Malcolm Chisholm
Tom McCabe
Jamie Stone (Convener)

Bob Doris
Ian McKee (Deputy Convener)

Apologies were received from Jackson Carlaw.

The meeting opened at 2.15 pm.

**Climate Change (Scotland) Bill:** The Committee considered the delegated powers provisions in this Bill at Stage 1, and agreed to seek further clarification from the Scottish Government.
Climate Change (Scotland) Bill: Stage 1

14:22

The Convener: This is the big one today. We have seen the bill, and read the long and detailed legal briefing. On behalf of all of us, I thank the legal team. It was no mean undertaking to put that brief together.

The delegated powers in the bill are lengthy and complex, and there is a large number of recommendations for us to consider. When I can, I will refer to the summary of recommendations rather than read the proposed decisions out in full. That said, we will still have to go into some detail. We will take it section by section.

On section 4, "Setting annual targets", and in relation to section 6, "Modifying annual targets etc.", are we content to ask the Scottish Government on what basis it considers that there should be no requirements in the bill for ministers to consult on the terms of an order made under those sections with specified persons or bodies that might have particular interest in the proposals?

Malcolm Chisholm: The Climate Change (Scotland) Bill is different from other bills. Normally I would support consultation, but there is a specific advisory body—presumably of experts on climate change—that will be consulted on this and other proposals. That is what makes me uncertain whether there is a need to consult other bodies; presumably it is the experts who matter as far as climate change is concerned. I assume that the advisory committee will be constructed in such as way as to contain the relevant experts.

Ian McKee: Convener, I seek your guidance on how much we might be straying into lead committee territory by saying that certain people should be consulted. Rather than making a point, I am asking for guidance. Is that this committee's duty or should we pass it on to the lead committee for a decision?

The Convener: I am fairly content that we are asking a relevant question. Of course, the Scottish Government could come back and say that it does not agree. I am in the committee's hands, but I think that the question is reasonable, given our role as custodians of the Parliament's interests. We do not assume that there will be any particular response from the Government.

Ian McKee: I thought that leaving the provision out would not impair the bill and that is what we are looking at. Perhaps who should and who should not be consulted is more to do with policy.

The Convener: I would be concerned if we never asked questions—I would rather err on the side of asking questions, not for the sake of it, but because I never want us not to fulfil our duty. Also, in asking questions, we do not impair the progress of the bill; we will revisit it in due course.

Ian McKee: If the rest of the committee is happy with that, so am I.

The Convener: Both your point and Malcolm Chisholm's are on the record.

Malcolm Chisholm: A further point to that is in the next section of the bill, section 5. The assumption is that the ministers will follow the advice of the advisory body. If they do not, they have to set out the reasons why. That is a completely different situation from what we are used to in other legislation.

The Convener: Let us move on to section 6, "Modifying annual targets etc.". There are two questions for the Scottish Government. The first is to explain and justify why it is considered that the power in section 6(4) may be exercised in any circumstances where the Scottish ministers consider it appropriate to do so. The second question is whether more defined circumstances in which it would be appropriate to exercise the power—in a similar manner to sections 6(2) and 6(3)—could be prescribed, for instance, where it becomes necessary for the achievement of targets.

Members indicated agreement.

The Convener: We come to section 9, "Greenhouse gases". I had not expected this—I thought that we knew what all the greenhouse gases were, but it appears that we do not.

Are we content that the proposed power is acceptable in principle and that its exercise will be subject to affirmative procedure—as they discover new gases, although hopefully they will not?

Members indicated agreement.

The Convener: On section 11, "Baselines for additional greenhouse gases", are we content that the proposed power is acceptable in principle and that it is subject to affirmative procedure?

Members indicated agreement.

The Convener: On section 12, "The net Scottish emissions account", are we content to notify the Scottish Government that we do not favour the use of the lesser degree of scrutiny of negative procedure for second or subsequent regulations, as provided for in section 64(7)(a) in relation to section 12(2), rather than affirmative procedure? It is an old point, and it is one that we have stuck to in the past.

Members indicated agreement.
The Convener: Also on section 12, are members content to ask the Scottish Government the questions set out in the summary of recommendations?

Members indicated agreement.

The Convener: That takes us to section 14, “Scottish share of emissions from international aviation and international shipping”, which seemed tricky to me when I read it.

Are members content to ask the Scottish Government on what basis it has considered that there should be no requirements in the bill to the effect that ministers shall consult on the terms of an order with specified persons or bodies who may have particular interest in the proposals?

Members indicated agreement.

Malcolm Chisholm: That relates to our comments on section 4.

The Convener: That is on the record.

On section 15, “Scottish emissions and removals”, are we content that the proposed power is acceptable in principle and that it is subject to affirmative procedure?

Members indicated agreement.

The Convener: On section 17, “International carbon reporting practice”, are we agreed that the proposed power is acceptable in principle and that it is subject to negative procedure?

Members indicated agreement.

The Convener: On section 18, “Carbon units and carbon accounting”, are we content to notify the Scottish Government that we do not favour the use of the lesser degree of scrutiny of negative procedure for second or subsequent regulations, as provided for in section 64(7)(b) in relation to section 18(1), rather than our preferred affirmative procedure?

Members indicated agreement.

The Convener: Are we also content to ask the Scottish Government the questions on section 18 that are set out in the summary of recommendations?

Members indicated agreement.

The Convener: On section 19, “Meaning of advisory body”, are we content that the proposed power is acceptable in principle and that it is subject to affirmative procedure?

Members indicated agreement.

The Convener: Also on section 19, are we content to draw to the attention of the lead and secondary committees for the bill, in relation to the effect of the delegated powers contained in sections 19 and 20 and schedule 1, that paragraph 33 of the explanatory notes and paragraph 31 of the policy memorandum indicate that ministers will require to seek expert and—in this is the important word—Independent advice from the advisory body, but that the bill provides, first, in sections 19(1) and 19(5) that a designated advisory body may be any public body that ministers consider appropriate, which may be a person or body with functions of a public nature, not necessarily independent of the Scottish ministers or Government; and secondly, in paragraph 2 of schedule 1, that the members of the Scottish committee on climate change shall be appointed by the Scottish ministers?

In pointing that out, however, we acknowledge that, in relation to the statements in the policy memorandum and explanatory notes, “independent” is capable of having different meanings and does not necessarily refer to a body that is wholly independent of the Scottish ministers.

14:30

Ian McKee: Is that last bit not the Scottish Government’s answer to us, rather than our answer to the Scottish Government?

The Convener: No. I think that we are seeking clarification of the meaning of “independent”. It may be very clear to you, as a member of the Scottish National Party—

Ian McKee: That is not my point. My point is that the last paragraph of the recommendation is saying that all that the Government needs to say is that “independent” has different meanings and does not necessarily refer to a body that is wholly independent of the Scottish ministers. We should leave it to the Scottish Government to decide what the response should be, rather than telling it what we think would be a good response to keep us happy.

The Convener: We are not doing that—perish the thought. Ministers are not such shrinking violets that they would not come back and tell us exactly what they thought.

Ian McKee: I am sure that the ministers are perfectly capable of looking after themselves, but it is the function of the committee to ask the questions and it is the function of the Government to reply.

The Convener: That is a thought that I shall bear in mind in future. Is the committee content to proceed on those lines, with that admonition from Dr McKee’s good self in the meantime?

Members indicated agreement.
The Convener: On section 20, “Scottish Committee on Climate Change”, are we content that the proposed power is acceptable in principle, and that it is subject to affirmative procedure?

Members indicated agreement.

The Convener: Schedule 1 to the bill is on the Scottish committee on climate change that is introduced by section 20. Paragraph 2(2) of the schedule is on the membership of the committee. Are we content that the proposed power is acceptable in principle and that it is subject to negative procedure?

Members indicated agreement.

The Convener: The next question is on the delegated powers in schedule 1 that are in the form of directions or determinations. Are we content that the proposed delegated powers are acceptable in the form of directions or determinations, as the case may be, and that they are not more appropriately expressed in the form of subordinate legislation? The delegated powers in schedule 1 to which I refer are in paragraphs 6(1), 7(5), 8(2) and 9(3).

I, too, found the wording of that question slightly confusing—it is almost a double negative. However, I promise that that is no criticism of the legal team; it is a reflection of my brain power.

Is that okay?

Members indicated agreement.

The Convener: That takes us to section 23, “Reporting on progress towards targets”. Are we content that the proposed powers are acceptable in principle and that they are subject to affirmative procedure?

Members indicated agreement.

The Convener: On section 24, “Scottish Ministers’ response to reports on progress”, are we content that the proposed powers are acceptable in principle and that they are subject to affirmative procedure?

Members indicated agreement.

The Convener: Section 26 is “Guidance to advisory body”. I point out that, unfortunately, the proposal in the summary of recommendations is somewhat misleading. For the avoidance of doubt, we are invited to agree that it is appropriate for the delegated power to be in the form of guidance, rather than subordinate legislation. Are members clear about that? It is a little confusing.

The question is, is the committee content that the proposed delegated power is acceptable in the form of the issue of guidance and is not more appropriately expressed in the form of subordinate legislation?

Members indicated agreement.

The Convener: On section 27, “Power to give directions to advisory body”, is the committee content that it is acceptable that the proposed delegated power is exercised by issuing directions and is not more appropriately expressed in the form of subordinate legislation?

Members indicated agreement.

The Convener: Are members content to draw to the attention of the lead and secondary committees for the bill the delegated powers that are conferred on the Scottish ministers in sections 26 and 27 to issue directions and guidance to the advisory body, given that paragraph 33 of the explanatory notes and paragraph 31 of the policy memorandum indicate that the advisory body will provide independent advice to ministers?

Members indicated agreement.

The Convener: On section 35, “Further provision about reporting duties”, are members content that that power is acceptable in principle, and that it is subject to affirmative procedure?

Members indicated agreement.

The Convener: On section 36, “Duties of public bodies relating to climate change”, there are three questions to ask the Scottish Government.

The first question is whether consideration was given to the type of public bodies that could be subject to climate change duties and, if so, whether “public bodies”, for the purposes of this section, could be more narrowly defined.

The second question is whether consideration was given by the Scottish Government to providing a definition of “climate change duties” that did not refer back to section 36(1) and, if so, whether “climate change duties”, for the purposes of this section, could be more specifically and more narrowly defined.

The third question is whether, given that climate change duties are not precisely defined and given that any order under section 36 could potentially affect a very wide range and large number of public bodies, consideration was given to providing for a broader range of persons whom Scottish ministers are obliged to consult under section 36(4) and (5).

That is quite an important section in terms of the powers that ministers propose to take to themselves. Do members have any comments?
Malcolm Chisholm: Section 36(3) distinguishes between
“all public bodies; ... public bodies of a particular description”
and
“individual public bodies”.
With regard to the first question, it seems to be clear that consideration has been given to the type of bodies that may be subject to an order. It is clear that, in certain cases, it covers all public bodies. I do not think that the point is valid.

With regard to the second question, I suppose that one could ask for a more precise definition, although a narrower definition is not necessarily desirable. At the same time, it is quite clear what climate change duties are. The third question is another point about consultation.

The Convener: So you are clear on what public bodies are? It includes everyone, really.

Malcolm Chisholm: I think that they are referred to in several pieces of legislation.

The Convener: Do you propose that we do not ask the three questions that I read out, or are you content to make your point on the record?

Malcolm Chisholm: I have made the point on the record. My concern about the first question, in particular, is that it might imply the subtext that we want to limit the number of public bodies to which section 36 applies, whereas the legislation quite clearly says that, in some cases, it is appropriate that the order should apply to all public bodies.

The Convener: Perish the thought that the Subordinate Legislation Committee should stand in the way of stopping climate change—we would be vilified in no uncertain terms. Do members have any more comments on that point?

Tom McCabe (Hamilton South) (Lab): With regard to the second question, I understand the concern about a lack of definition. A minister or ministers could decide to do lots of things under the guise of climate change. For instance, they could say that people will get their bins emptied only once every month, which would be controversial. That is just one example, but there are many others, so there might be a case for a bit more definition.

The Convener: Okay. I thought that you were going to take us back to the realm of trees.

Tom McCabe: No—I have no interest in high trees.

The Convener: That would indeed be for a subject committee rather than for our committee. Given that Malcolm Chisholm’s caveats are on the record, will we proceed to ask the three questions and wait to see what comes back? I have to say, on the record, that there is no way that we want to stand in way of the progress of a bill that is as important as this one. Nevertheless, we have to balance that consideration against our duties to Parliament.

Ian McKee: Would a compromise be to take out the word “narrowly” in the first question, which implies that it is trying to be restrictive?

Malcolm Chisholm: And indeed, the same word in the second question.

Ian McKee: Indeed—it is also in the second question.

The Convener: That would be acceptable. There is enough on the record to cover ourselves and to show that we are not trying to prevent efforts to stop the world from heating up.

Ian McKee: One is judged by one’s public utterances in writing as well.

The Convener: With that amendment, we will proceed. I see that the legal team is content with that.

On section 37, “Guidance to relevant public bodies”, are we content that the proposed delegated power is acceptable in the form of the issue of guidance and that it is not more appropriately expressed as a power to make subordinate legislation? If we seek further justification from the Scottish Government as to the nature and scope of the power that is sought under section 36, however, we may wish to ask for more information as to the function and likely content of the guidance.

That is not expressing opposition to guidance as such, but simply asking for a little more information. Are members happy with that?

Members indicated agreement.

The Convener: On section 38, “Reporting on climate change duties”, are members content, subject to considering section 36—and depending on what we get back—to find the power acceptable in principle and that it is subject to negative procedure?

Members indicated agreement.

The Convener: On section 39, “Appointment of monitoring body”, are members content that the proposed power is acceptable in principle and that it is subject to affirmative procedure?

Members indicated agreement.

The Convener: On sections 40 to 44 inclusive, are members content that the proposed powers to direct in sections 40(2), 42(1), 42(2) and 44(1) are acceptable in principle and are not more
appropriately expressed in the form of subordinate legislation?

Members indicated agreement.

The Convener: Are members also content that the proposed delegated power in section 43 is acceptable in the form of the issue of guidance, and that it is not more appropriately expressed in the form of subordinate legislation?

Members indicated agreement.

The Convener: On section 46, “Variation of permitted times for making muirburn”—I do not know how to pronounce that, but I know what it means—are members content to ask the Scottish Government whether or not it considers that it would be appropriate to consult the hill farming community, landowners and others who may be affected on the dates that may be appropriate for muirburn, in advance of making an instrument? Do we talk to the farmers and the lairds about that one?

Members indicated agreement.

The Convener: Indeed—we are open with everyone.

On section 47, “Power to modify functions of Forestry Commissioners”, are we content to ask the Scottish Government the questions as set out in the summary of recommendations? It is fairly far-reaching stuff, but rather than read it out I ask whether members are happy to go with the summary of recommendations?

Members indicated agreement.

The Convener: On section 50, “Non-domestic buildings: assessment of energy performance and emissions”, are members content that the proposed power to make regulations with respect to the assessment of energy performance and emissions is acceptable in principle; and that, subject to the following exception, the affirmative procedure is appropriate, the exception being that negative procedure is appropriate in respect of regulations with respect to the levy of charges to enable the enforcement authority to recover reasonable costs incurred by it in exercising its functions under the regulations?

Malcolm Chisholm: I have a question—you read out that recommendation, but you did not read out the recommendation for section 47. Will the section 47 recommendation still appear in the Official Report?

The Convener: I am sorry—have I failed to read out the recommendation for section 47?

Malcolm Chisholm: Yes. It is a particularly important recommendation.

The Convener: Okay—I offer my apologies for that. On section 47, “Power to modify functions of Forestry Commissioners”,

“The Committee may wish to consider asking the Scottish Government, given that the proposed power under section 47(1) to modify, by order, the functions of the Forestry Commissioners in or as regards Scotland does not contain any limitation with respect to the nature, scope or extent of any such modification, whether it has given consideration to the imposition of a restriction, within the power, on the nature, scope and extent of any modification which may be made; and, whether or not any such consideration has been given, does it not consider that such a limitation would be both feasible and appropriate.”

That is now a matter of record.

Malcolm Chisholm: It is important that that modification should be in primary legislation. The functions are in the Forestry Act 1967, which was amended by primary legislation, so that is important.

The Convener: That is a fair point. It is now on the record in full—thank you for that.

Where are we? We have done section 50, so we move on to section 52, “Waste prevention and management plans”. Sections 52(1), 52(2) and 52(4) are on waste management plans and section 52(3) provides that the enforcement authority must have regard to any guidance given to it by the Scottish ministers in relation to the functions conferred on it by the regulations.

Are we content to ask the Scottish Government what classes of person it intends or anticipates will be subject to duties under the regulations, and whether there is any particular intention to apply the power to domestic activities or individuals? That could mean you or me. Secondly, would it not be possible for the Scottish Government to specify, in the section, the classes of persons to be subject to the regulations and, if it is, why has that not been done? We are looking for a bit of clarity on that point. Are we happy with those questions? They seem to be quite logical.

Members indicated agreement.

14:45

The Convener: Are we also content that the proposed delegated power to issue guidance under section 52(3) is acceptable, and that it would not be more appropriately expressed in the form of subordinate legislation?

Members indicated agreement.

The Convener: I suppose that we have to phrase it that way for legal accuracy.
Sections 53(1), (2), (3) and (5) are on information on waste, and section 53(4) provides that the Scottish Environment Protection Agency may give guidance to persons to whom the regulations apply on how to comply with the regulatory requirements.

Are we content to ask the Scottish Government the questions as set out in the summary of recommendations? Are we content that the proposed delegated power to issue guidance in section 53(4) is acceptable and that it would not be more appropriately expressed in the form of subordinate legislation?

Members indicated agreement.

The Convener: Sections 54(1), (2), (4) and (5) are on facilities for the deposit of recyclable waste, and section 54(3) provides that the enforcement authority must have regard to any guidance given to it by the Scottish ministers in relation to the functions that are conferred on it by the regulations. Are we content to ask the Scottish Government the questions as set out in the summary of recommendations? Are we also content that the proposed delegated power to issue guidance is acceptable and that it would not be more appropriately expressed in the form of subordinate legislation?

Members indicated agreement.

The Convener: Sections 55(1) and 55(2) contain provisions for facilities for the deposit of recyclable waste at events, and sections 55(3) and 55(4) provide that local authorities and enforcement authorities must have regard to any guidance that has been given to them by the Scottish ministers in relation to the functions that will be conferred on them by the regulations. Are we content that the delegated powers in sections 55(1) and 55(2) are acceptable in principle and that they are subject to affirmative procedure, with specified exceptions where negative procedure applies?

Members indicated agreement.

The Convener: Are we also content that the proposed delegated powers under sections 55(3) and 55(4) are acceptable in the form of guidance and that they would not be more appropriately expressed in the form of subordinate legislation?

Members indicated agreement.

The Convener: Sections 56(1), 56(2), 56(3) and 56(6) are on the procurement of recyclate regulations, and section 56(4) provides that the enforcement authority must have regard to any guidance given to it by the Scottish ministers in relation to the functions that the regulations will confer on it. Section 56(5) provides that persons to whom the regulations apply must have regard to any guidance that has been given by the Scottish ministers or the enforcement authority in relation to the requirements that are imposed by the regulations.

Are we content to ask the Scottish Government the questions as set out in the summary of recommendations? Are we content that the proposed delegated powers to issue guidance under sections 56(4) and 56(6) are acceptable and that they would not be more appropriately expressed in the form of subordinate legislation?

Members indicated agreement.

The Convener: Sections 57(1), 57(2) and 57(4) are on the targets for the reduction of packaging, and section 57(3) provides that the enforcement authority must have regard to any guidance issued to it by the Scottish ministers in relation to the functions that the regulations will confer on it. Are we content that the particular power to issue guidance that is contained in section 57(3) would not be more appropriately expressed as a power to make subordinate legislation?

Members indicated agreement.

The Convener: In relation to sections 57(1), 57(2) and 57(4), are members content that we should ask the Scottish Government to fully explain and justify why, unlike the approach taken in part 1 of the bill, the Scottish Government requires to take the powers in sections 57(1) and 57(2), in so far as they propose that any targets without limit—set by any method—may be set for the reduction of packaging or the reduction of emissions produced by packaging, or requirements on persons to comply with those targets?

Given that the memorandum refers to the possibility of targets being imposed on retailers, why does the Scottish Government require to impose those targets or requirements on any types of persons—individuals or legal persons—who might be specified in the regulations?

On what basis has the Government considered that there should be no requirements on the face of the bill to the effect that ministers shall consult on the terms of the regulations with specified persons or bodies that may have particular interest in the proposals?

Is the committee content to ask those three questions?

Members indicated agreement.

The Convener: On section 58, "Deposit and return schemes", are we content that that power is acceptable in principle and—with specified exceptions where negative procedure applies—subject to affirmative procedure?

Members indicated agreement.
The Convener: Section 59 is “Charges for supply of carrier bags”. Mike Pringle, where are you?

Section 59(3) says that the enforcement authority must have regard to guidance issued by the Scottish ministers in relation to the functions conferred on it by the regulations.

Are we content that the powers are acceptable in principle and are subject to affirmative procedure, with the exception of negative procedure for regulations dealing only with charging by the enforcement authority, under section 64(7)(e)?

Are we content that the power to issue guidance contained in section 59(3) is not more appropriately expressed as a power to make subordinate legislation?

Are we content?

Members indicated agreement.

The Convener: Thank you. I would take silence as assent—I have probably bowed you all into complete silence.

Now we look at ourselves, as in a mirror. On section 64, “Subordinate legislation”, are we content to ask the Scottish Government why, in contrast to the approach taken in sections 74 and 75 of the Judiciary and Courts (Scotland) Act 2008, it is considered that section 64(3) requires to contain a power for orders or regulations to modify any enactment, including the act, by affirmative procedure—a Henry VIII power—without any reference to the purposes of such modification, for example for the purposes of making consequential, incidental, transitional, transitory, or savings provisions?

Members indicated agreement.

The Convener: Are we content to ask the Scottish Government whether it would reconsider whether the power to make supplementary, incidental or consequential provision could be limited to the purposes of giving full effect to any provision of the act, and whether the power to make transitory, transitional or savings provisions could be limited to being in connection with the coming into force of any provision of the act?

Members indicated agreement.

The Convener: On section 67, “Short title and commencement”, are we content that the power is acceptable, and that the provisions—being commencement provisions—are subject to no procedure?

Members indicated agreement.
SUBORDINATE LEGISLATION COMMITTEE

MINUTES

7th Meeting, 2009 (Session 3)

Tuesday 24 February 2009

Present:

Jackson Carlaw
Bob Doris
Tom McCabe
Jamie Stone (Convener)

Malcolm Chisholm
Helen Eadie
Ian McKee (Deputy Convener)

The meeting opened at 2.15 pm.

**Climate Change (Scotland) Bill:** The Committee considered the Scottish Government's response to points raised on the delegated powers provisions in this Bill at Stage 1, and agreed the terms of its report.
Climate Change (Scotland) Bill:
Stage 1

14:15

The Convener: The next item concerns consideration of the Scottish Government’s response to points raised by the committee on the delegated powers in the Climate Change (Scotland) Bill at Stage 1.

Are we content with the delegated power in section 4, “Setting annual targets”, and that it is subject to affirmative procedure?

Members indicated agreement.

The Convener: Are we content with the delegated powers in section 6, “Modifying annual targets etc”, and that they are subject to affirmative procedure?

Members indicated agreement.

The Convener: Are we content with the delegated powers in section 12, “The net Scottish emissions account”, and that they are subject to affirmative procedure on the first occasion, but that the second and subsequent regulations will be subject to negative resolution, other than regulations making provision to alter the amount by which a carbon unit credited or debited to the net Scottish emissions account for a period reduces or increases the account for that period?

Members indicated agreement.

Ian McKee (Lothians) (SNP): The Scottish Government’s response talks about emissions from domestic aviation being considered to have been emitted from sources in Scotland. Do we have a definition of “domestic aviation” in the Scottish context?

The Convener: I certainly do not.

Judith Morrison (Legal Adviser): Section 14 of the bill contains a power to make provision regarding what emissions are to be attributable to Scotland. The Government will use delegated powers to define what emissions are attributable to Scotland for the purposes of the account.

Ian McKee: Do you mean the Scottish Government or the United Kingdom Government?

Judith Morrison: The Scottish ministers define the emissions for the purposes of the bill.

The Convener: Are you content with that? It is not an easy subject.

Ian McKee: It seems to give the Scottish ministers a welcome degree of freedom.

The Convener: Indeed. Are we content to report that, generally, we do not favour the use of
affirmative procedure for a first set of regulations and negative procedure for second and subsequent regulations, but that we believe that, in the instance of section 12 of this bill, the Scottish Government has provided sufficient reasons why that choice of procedure appears to be suitable.

Members indicated agreement.

The Convener: Are we content with the delegated power in section 14, “Scottish share of emissions from international aviation and international shipping”, and that it is subject to affirmative procedure?

Members indicated agreement.

The Convener: Are we content with the delegated powers in section 18, “Carbon units and carbon accounting”, and that they are subject to affirmative procedure on the first occasion, but that the second and subsequent regulations will be subject to negative resolution, other than regulations making provision specifying a carbon unit of a kind not previously specified in regulations?

Members indicated agreement.

The Convener: On section 36, “Duties of public bodies relating to climate change”, are we content to report that, generally, we do not favour the use of affirmative procedure for a first set of regulations and negative procedure for second and subsequent regulations, but that we believe that, in the instance of section 18 of this bill, the Scottish Government has provided sufficient reasons why that choice of procedure appears to be suitable?

Members indicated agreement.

The Convener: Are we content to recommend that that could be mitigated to some extent by the provision of a list of public bodies to which the power is to apply, along with a power, subject to affirmative procedure, to add to the list? That would be in line with the approach that has been adopted with regard to other regimes regulating public bodies in relation to matters such as freedom of information.

We do not have to go down that route, but we could think about having some kind of list.

Ian McKee: I do not think that that suggestion is necessary. We are reporting our view—that the power is extremely wide in its scope—to the lead committee, which is a group of informed individuals. We should leave it to the lead committee to decide how that might be mitigated.

Helen Eadie (Dunfermline East) (Lab): I take a different view. Given that the approach has been adopted with regard to matters such as freedom of information, we should consider adopting it in relation to this bill. I recommend strongly that we take a different view to that which is proposed by Ian McKee.

Malcolm Chisholm (Edinburgh North and Leith) (Lab): I am fairly sceptical about the need to make that recommendation to the lead committee, but I accept that an argument can be made for having a list. It is better to have a detailed suggestion as that gets around the obvious objection that the bill is for the next 40 years, in which time there will be new public bodies. If we really want to deal with the problem, it is better to propose a solution.

The Convener: At the moment, the committee is inclining towards recommending that there be a list. Can you live with that, Dr McKee?

Ian McKee: I simply feel that it is up to the lead committee to decide how the problem should be solved. There are benefits to providing a list but there are also problems with providing a list.

The Convener: We could tell the lead committee that we have thought about the matter but that, ultimately, it is up to its members to decide. That might incorporate our thinking on the matter. Would that be a way forward?

Helen Eadie: The only problem with that is that it raises the question of why we meet. We, too, have a responsibility; it is not just down to the lead committee. We provide knowledge and expertise. We want to avoid a situation in which people get involved in litigation because they cannot decide on the definition of certain elements of legislation. It would be unfortunate for the people of Scotland if we were to leave them in that position.

Bob Doris (Glasgow) (SNP): I can see why a list might be desirable. However, I have not spoken up until now because I can see problems with it as well. Although the list can be added to via affirmative instruments, that takes time and if by some error a body is not on the list, the minister cannot set targets for it at the point when he or she would want to. Leaving those points to one side, however, I have to say that I do not know whether it should be this committee or the lead committee that decides whether there should be a list.
Helen Eadie: I agree that it would take time to add bodies to the list, but only a couple of months, which is not an inordinate amount of time. We have to take this committee seriously. We either do our job or we may as well not be here.

Jackson Carlaw (West of Scotland) (Con): I am inclined towards Helen Eadie's point of view on this matter.

Tom McCabe (Hamilton South) (Lab): So am I.

The Convener: I think that we have a majority view. Can you live with that, Ian?

Ian McKee: Yes.

The Convener: That is very considerate of you.

We ask our clerks to outline to the lead committee the nature of what we have in mind, and, of course, the record of our discussion can be read in the Official Report.

Moving on, are we agreed that it would be appropriate for the Parliament to have a role in scrutinising the guidance that is produced under section 37, "Guidance to relevant public bodies", because of its potential impact?

Members indicated agreement.

The Convener: That being the case, are we content to recommend that guidance under this section should be laid before Parliament for a period prior to implementation and that any resolutions of the Parliament that are made in respect of the draft guidance during that period should be implemented?

Members indicated agreement.

The Convener: On section 46, "Variation of permitted times for making muirburn", are we content with the Government’s response in the respect that it may be taken to confirm that informal consultation with potentially interested parties will take place in advance of any instrument being made?

Members indicated agreement.

Tom McCabe: Convener, could I take us back to section 37? The final part of the recommendation says:

"and any resolutions of the Parliament made in respect of the draft guidance during that period implemented".

What exactly does that mean? Is it saying that if the Parliament passes a resolution on the guidance, the Government must take account of it?

Judith Morrison: The Government should take account of it in producing revised guidance.

Tom McCabe: Yes, but the Government is not obliged to do so.

Judith Morrison: It is for members to decide how they would like the Government to take account of the resolution.

Tom McCabe: My firm understanding is that Parliament cannot instruct Government. It can make its view known, but there is never an obligation on the Government to take up every dot and comma of that view, is there?

Judith Morrison: As I recall, there is a similar issue in relation to the national planning framework, whereby the planning framework must be laid in draft before the Parliament for a certain period of time, and if the Parliament makes a resolution in relation to that draft, the Government is required to take it into account. I do not have the legislation in front of me to give you chapter and verse, but I can certainly come back to you on it.

Malcolm Chisholm: The word "implemented" should probably be changed to "taken into account", or something like that.

Tom McCabe: Yes.

The Convener: Okay. Is that form of words acceptable?

Tom McCabe: Yes; it is softer.

Members indicated agreement.

The Convener: Let us go back to where we were. I am sure that we have all read the legal brief on section 47, "Power to modify functions of Forestry Commissioners", quite closely.

[Interrupt.] I call for just a touch of order from my Labour colleagues, please.

Are we content to draw it to the attention of the lead committee that the power under section 47(1), to modify the functions of the forestry commissioners in or as regards Scotland, is very wide in its scope as there is no limitation within the power, beyond that it must deliver a climate change purpose?

Helen Eadie: We agree with that.

The Convener: That was certainly quite a big issue; it leaped out of the legal brief.

Ian McKee: Could you give me an example of the misuse of the power?

The Convener: I would not use the word "misuse" but the powers are quite wide. The legal brief gives a couple of examples. In a way, we have a duty to report something like that. What the lead committee or Parliament does with it is another matter.

Ian McKee: I think that there are occasions when the climate change tail should wag the dog.
The Convener: Ah, you have read your legal brief. That was the test phrase.

Ian McKee: Did you doubt it, convener?

The Convener: Sections 52(1), (2) and (4) are on waste prevention and management plans, sections 53(1), (2), (3) and (5) are on information on waste, sections 54(1), (2), (4) and (5) are on facilities for the deposit of recyclable waste, and sections 56(1), (2), (3) and (6) are on regulations for the procurement of recyclate.

Are we content to report to the lead committee and to Parliament that the powers are expressed in very broad terms and that there is nothing in the bill to restrict their application to purely commercial activity?

Members indicated agreement.

The Convener: Sections 57(1), (2) and (4) are on the targets for reduction of packaging. Are we agreed that the Parliament should be made aware that the powers are expressed in very broad terms and that there is nothing in the bill to restrict their application to commercial activity?

Members indicated agreement.

The Convener: On section 64, “Subordinate legislation”—our good selves—can we agree that the general power contained in section 64(3), which enables orders or regulations to modify any enactment, including the act, is, in the case of the bill, acceptable?

Members indicated agreement.

The Convener: That completes item 2. I thank you.
ANNEXE C: ORAL EVIDENCE AND ASSOCIATED WRITTEN EVIDENCE TO THE TRANSPORT, INFRASTRUCTURE AND CLIMATE CHANGE COMMITTEE

20 January (3rd Meeting, 2009 (Session 3))

Oral Evidence
Philip Wright, Deputy Director Climate Change, Fiona Page, Head of Scottish Climate Change Bill Team, Andrew Henderson, Policy Officer Scottish Climate Change Bill Team, and Cameron Maxwell, Climate Change Policy Team, Scottish Government.

Written Evidence
Scottish Climate Change Bill Team

Supplementary Written Evidence
Scottish Climate Change Bill Team

27 January (4th Meeting, 2009 (Session 3))

Oral Evidence
Professor John Mitchell, Director of Climate Science, Met Office; Professor Peter Smith, Professor of Soils and Global Change, University of Aberdeen; Phil Matthews, Senior Policy Advisor, Sustainable Development Commission Scotland; Dr Andy Kerr, Assistant Director of Scottish Alliance for Geoscience, Environment and Society, University of Edinburgh; David Kennedy, Chief Executive, and Katherine White, Economic Adviser, Committee on Climate Change.

Supplementary Written Evidence
Met Office

3 February (5th Meeting, 2009 (Session 3))

Oral Evidence
Richard Dixon, Director, WWF Scotland; Duncan McLaren, Chief Executive, Friends of the Earth Scotland; Dave Watson, Scottish Organiser, UNISON; Chris Hegarty, Advocacy Manager, SCIAF; Gavin McLellan, Head of Christian Aid Scotland, Christian Aid Scotland; Judith Robertson, Head of Oxfam in Scotland, Oxfam.

Written Evidence
Friends of the Earth Scotland

Supplementary Written Evidence
Stop Climate Chaos Scotland

10 February (6th Meeting, 2009 (Session 3))
Oral Evidence
Chris Austin, Head of Public Affairs, Association of Train Operating Companies;
Marjory Rodger, Director of Government Relations in Scotland, Confederation of Passenger Transport UK;
Derek Halden, Director, DH Consultancy;
Gordon Dewar, Managing Director, Edinburgh Airport, BAA Scotland;
Robert Ashdown, Head of Technical Division, Chamber of Shipping;
Gordon Wilmsmeier, Senior Research Fellow, Transport Research Institute, Napier University;
Dr Alice Bows, Core Researcher, Tyndall Centre Manchester;
Paul Tetlaw, Chair, Transform Scotland;
Jeff Gazzard, Coordinator, GreenSkies Campaign;
John Lauder, National Director for Scotland, Sustrans.

Written Evidence
Association of Train Operating Companies
BAA Scotland
Confederation of Passenger Transport
Chamber of Shipping
Transform Scotland

Supplementary Written Evidence
BAA Scotland:
Covering letter
Sustainable aviation CO2 roadmap
Non CO2 climate change effects of aviation emissions
Car parking additional information
Public transport additional information
GreenSkies Campaign
Derek Halden

24 February (7th Meeting, 2009 (Session 3))

Oral Evidence
Ken Gibb, Chair, Sustainable Scotland Network;
Councillor Alison Hay, Spokesperson for Regeneration and Sustainable Development, and Anil Gupta, Team Leader for Environment and Regeneration, COSLA;
John Stocks, Manager, Scotland, Carbon Trust;
Mike Thornton, Director, Scotland, Energy Saving Trust;
Chas Booth, Senior Press and Parliamentary Officer, Association for the Conservation of Energy;
Stephen Boyd, Assistant Secretary, STUC;
Anne Douglas, National Secretary, Prospect.

Written Evidence
COSLA and Sustainable Scotland Network
STUC
3 March (8th Meeting, 2009 (Session 3))

**Oral Evidence**

Matthew Farrow, Head of Environment Group, CBI;
Brendan Dick, and Grant Hodges, Climate Change Business Delivery Group;
Jason Ormiston, Chief Executive, Scottish Renewables;
Colin Galbraith, Director, Policy and Advice, and Clive Mitchell, Strategy and Communications Manager, Scottish Natural Heritage;
Dr Chris Spray, Director of Environmental Science, and David Gorman, Head of Environmental Strategy, SEPA;
Geoff Aitkenhead, Asset Management Director, and Mark Williams, Business Strategy and Climate Change Manager, Scottish Water.

Written Evidence/Submissions to call for views
- Climate Change Business Delivery Group
- Scottish Renewables
- Scottish Natural Heritage
- SEPA
- Scottish Water

10 March (9th Meeting, 2009 (Session 3))

**Oral Evidence**

Stewart Stevenson MSP, Minister for Transport, Infrastructure, and Climate Change, Philip Wright, Deputy Director, Climate Change, Fiona Page, Head of Scottish Climate Change Bill Team, Cameron Maxwell, Climate Change Policy Team, Madeleine Cusack, Climate Change Policy Team, and Kevin Philpott, Waste Regulation Senior Policy Officer, Scottish Government; David Henderson-Howat, Policy Adviser, Forestry Commission Scotland.

Supplementary Written Evidence
- Minister for Transport, Infrastructure and Climate Change
14:00

The Convener: Item 2 is an evidence session on the Climate Change (Scotland) Bill. This is the first of many evidence sessions. We will be hearing today from Scottish Government officials and the bill team. It is expected that we will continue to take evidence until some time in March, at which point we will hear from the minister. In addition, we have issued a call for written evidence. The deadline for submissions is 27 February.

I welcome the officials: Philip Wright, the deputy director on climate change; Fiona Page, head of the Scottish climate change bill team; Andrew Henderson, policy officer for the Scottish climate change bill team; and Cameron Maxwell, from the climate change policy team. I am sure that committee members are familiar with the documentation, so we will go straight to questions.

I will lead off by asking whether any topics are still in development—either being consulted on or awaiting analysis within Government—and what the timescale is for the completion of that work.

Fiona Page (Scottish Government Climate Change and Water Industry Directorate): The bill contains all the significant topics that are coming forward, but some topics, especially in part 5, will be subject to amendment at stage 2. Would you like a bit more detail?

The Convener: That would be helpful.

Fiona Page: There was a recent consultation on muirburn, in respect of which it is possible that, at stage 2, officials will seek to amend the bill slightly. As members will be aware, the forestry consultation ends next week. At the moment, the Government does not intend to introduce any significant amendments, but it is being informed by the results of the consultation, so it is possible that something will come forward from that.

It is possible that we will further develop the promotion of energy efficiency provision at stage 2. The committee will be aware that the non-domestic building provisions consultation ended recently, final analysis of which is on-going, and we are certain that it will result in some amendments at stage 2.

It is also possible that, subject to ministers’ approval, we will introduce an amendment to oblige the Scottish ministers to prepare and publish a plan for the promotion of renewable heat, similar to the plan for the promotion of energy efficiency.
There are plans to introduce an amendment on the waste provisions’ deposit and return schemes, particularly in relation to clearing houses.

We do not have any plans to introduce significant amendments to parts 1 to 4 of the bill, but we will be informed by the stage 1 debate.

The Convener: Thank you. It is helpful to have a sense of the amendments that are being contemplated. Can we expect material on new topics or additional policy areas to be introduced into the bill?

Fiona Page: No.

The Convener: The consultation stated that one of the reasons for legislating in Scotland was “to create and enable new means of reducing emissions”.

Which of the bill’s means of achieving emissions reductions are new?

Fiona Page: The forestry provisions in part 5 are new. There is the energy efficiency action plan provision in chapter 3 of part 5—the policy is not new, but the provision of primary legislation is new. The renewable heat provision is new. I have to be honest and say that I do not know whether the energy performance for non-domestic buildings provision is new: I am not completely familiar with the primary legislation in that area.

Philip Wright (Scottish Government Climate Change and Water Industry Directorate): It is an extension of the regime that is currently in place.

Fiona Page: You will be aware that there is currently a lot of legislation on waste management, but the provisions that we are looking to implement, such as the extra enabling powers, are new.

The Convener: New powers will enable ministers to begin to take action in particular areas. I have asked this question repeatedly, and I will ask it once more. We have been told that the policy intention of securing average 3 per cent annual reductions in Scotland’s emissions need not wait for a bill. Given that you did not specify that as a new area in the bill, is there still a policy intention to secure such a reduction in emissions?

Fiona Page: It is reasonable to say that ministers’ ambition to deliver 3 per cent annual emissions reductions remains absolutely unchanged. To deliver an overall 80 per cent reduction target by 2050, we will have to have delivered, on average, at least 3 per cent reductions each year, according to the 1990 baseline.

The Convener: This is perhaps a question to ask ministers later, but is it the Government’s position that work can begin now to put us on that trajectory before the bill is in place?

Philip Wright: Ministers’ commitment was also to take early action and not to await the outcome of the bill process. There is a multitude of policy measures at European Union, United Kingdom and Scotland levels to try to accelerate progress along the trajectory towards an 80 per cent reduction. We will probably touch on the shape of that trajectory later, but there is no let-up in the effort to come forward with measures to facilitate the reduction in emissions.

Cathy Peattie (Falkirk East) (Lab): I am interested in how we know that we are achieving the targets. Are any monitoring systems in place to allow us to examine what is happening and when and how we can build on it?

Philip Wright: The main means of monitoring is the greenhouse gas inventory, which, as you probably know, is prepared at UK level and is disaggregated to the four country levels. Scotland’s emissions are, in effect, monitored through the disaggregated inventory of greenhouse gas emissions. The main issue is the delay in the production of that inventory, because it is produced about 20 months after the year in which the emissions occurred.

Shirley-Anne Somerville (Lothians) (SNP): The policy memorandum and the Scottish Government statements that have supported the bill have said that the bill should be consistent with the principles of sustainable development. Could that be made clear in the bill as well as in the policy memorandum and in other statements on the policy behind the bill?

Fiona Page: That was considered when the bill was being drafted. An awful lot of primary legislation has sustainable development as one of the main provisions, which is one reason why we did not put it in the bill. I am sure that ministers would be happy to have a dialogue about that if committee members want it to be in the bill.

Philip Wright: In seeking advice from the Committee on Climate Change or other bodies, we have criteria that require to be taken into account, which include economic and social issues, as well as environmental issues. The principle of sustainable development is implicit, if not explicit, in the documentation.

Des McNulty (Clydebank and Milngavie) (Lab): Why did the technical note on emissions, which was promised to the committee in early December, not appear until January?

Fiona Page: We sent the note to the committee on 18 December, but we found out after Christmas that the e-mail that was sent from the private office contained the letter from the minister, the technical note and the factual briefing document as one file. Your clerk found that the file size was 12Mb, and therefore completely undeliverable to members.
We did not find out about that until after Christmas, otherwise we could have rectified the problem. That is the reason for the delay. We were intent on your having the information before Christmas, so that you had time to look at it over the Christmas recess, had you wished to do so. I apologise for that.

Des McNulty: The greenhouse gas emissions track that is shown in chart 1 in the technical note seems to run counter to the view of the Tyndall centre for climate change research, which is that larger cuts must happen more quickly if cumulative emissions are to be kept to a level at which dangerous climate change will be avoided. Chart 1 shows a rapid increase in control over emissions from 2019, so you seem to be end-loading the changes that are needed. The Tyndall centre says that action is needed now if we are to avoid reaching a tipping point. Will you expand on that? You admit that cumulative emissions in the atmosphere are the important factor, so why does the bill provide for point-in-time targets?

Fiona Page: We acknowledge that there is quite a body of scientific evidence and thought on climate change. We are conscious that around 50 per cent of Scottish emissions are likely to be covered by emissions trading schemes. Emissions reductions will be driven by the rules of schemes—initially, in particular.

You are probably aware that the UK Committee on Climate Change recently indicated that during the first three UK carbon budgets, more than 70 per cent of emissions reductions will come from the traded sector. With that in mind, it is more challenging to envisage how we could put initial targets in the bill. We will be informed by the advice of the Committee on Climate Change. It is encouraging that in its initial advice it recommended challenging targets to the UK Government. We await the UK Government's response, into which our comments will, of course, be fed. The ambition that the Committee on Climate Change is expressing is encouraging, as is its view that the targets are deliverable if enough work is done.

Des McNulty: However, on cumulative emissions, I am considering the area below the curve, which shows that you will achieve much less than you would achieve if you opted for early delivery of reductions. Do you accept that there are genuine concerns about that and, if so, will you review the situation?

Philip Wright: A balance must be struck between deliverability, ambition and the science. The science acknowledges that early action is better than action in the longer term—Nicholas Stern made that point. However, as Fiona Page said, Scotland is reliant on EU action on some issues. For example, Scotland has only so many levers that it can pull to reduce transport emissions. You might respond that we should focus on areas in which the Scottish Government has policy levers, but doing so would probably put even greater pressure on the sectors concerned.

The issue is deliverability. The Committee on Climate Change has considered the potential for abatement, and its advice is challenging and ambitious but deliverable. The UK Government, in concert with the Scottish Government, will come to a view on that during the next few weeks and will respond. If we accept that the Committee on Climate Change's advice is ambitious and stretching for Governments, we can see that the proposed approach is better than an approach that would be too stretching in the early years and would lead to failure in years 1, 2 and so on.

Des McNulty: What plans are there to measure and report on cumulative emissions and emissions that are generated anywhere as a result of goods and services being used in Scotland, as well as on the statutory targets?

Philip Wright: I assume that you are referring to the consumption-based approach.

One of the Scottish Government's indicators is the ecological footprint, part of which is the carbon footprint, which will enable us to reflect and report on Scotland's carbon footprint. That information will be available in parallel with the range of information that we will get from the disaggregated greenhouse gas inventory. When the information is put together, we will have a reasonably comprehensive picture of the carbon that is associated with Scotland.

Des McNulty: Are you saying that the carbon footprint will be considered as a cumulative measure or as a point-in-time measure?

14:15

Philip Wright: It will be considered on an annual basis. If we have the annual figures, I think that it will be relatively straightforward to establish the cumulative emissions.

The Convener: Does that imply that the footprint measure will have the same time lag as the measure of Scotland's carbon emissions?

Philip Wright: It has been suggested to me that the lag may be greater, but we can come back to the committee on that. A different methodology is used, and I am not sure when the information will become available, relative to the disaggregated inventory.

The Convener: It might be helpful to explore that in writing.

Rob Gibson (Highlands and Islands) (SNP): Has the Government considered using the UK
Committee on Climate Change to help us to achieve a suitable curve? The levers, for example for transport, are not really in our hands—they are in Britain’s or Europe’s hands. Has any thought been given to increasing the number of miles to the gallon that vehicles achieve? That could be part of the approach, and would be a practical example of the value of having the UK CCC.

**Philip Wright:** There are EU measures, UK measures and Scottish measures. At UK level, there is general advice from the Committee on Climate Change, which contains a devolved Administrations chapter that says a bit more about what the advice means for Scotland. In relation to the bill, we will seek that committee’s advice specifically on Scottish issues.

In an area such as transport, product and technology standards will stem from Europe—fact—but there is an opportunity through UK fiscal measures to encourage the take-up of new technology, for example electric vehicles. There is also an opportunity for the Scottish Government to encourage and facilitate the take-up of that new technology through its procurement arrangements or through the public sector in Scotland more generally. Packages of measures will come into play to deliver emissions reductions in particular sectors—in this case, the transport sector.

**Rob Gibson:** I recognise the complexities. Procurement is an area that Scotland could take action on. We will be looking for practical examples as we go through the bill.

**Alison McInnes** (North East Scotland) (LD): I want to go back to the issue of targets. In the absence of the promised annual targets, an interim target may be a useful milestone, but the 2030 target is not on the trajectory that would be achieved with at least 3 per cent annual emissions reductions from the start. You said that we really need to achieve 3 per cent year on year. Why is the trajectory much less ambitious than the original manifesto commitment? Why is the target for 2030 instead of 2020, which would be more in line with international, European and UK commitments?

**Fiona Page:** I will take your second question first, because that might set the scene. An overwhelming number of responses to ministers in the 2008 consultation on the bill asked for an interim target. You are right—we considered quite a few permutations. Indeed, 2020 was one of my starting points. Obviously, we have a lot of synergies with EU targets and other targets around the world. I felt that if we had only 2020 as the interim target, we would still have 30 years left to deliver the end target, which is a long time for identifying certainty in primary legislation. I did not feel that having only 2020 as an interim target—in the true spirit of an interim target—would be enough. That automatically led me to wonder whether we should have two interim targets—2020 and perhaps 2030. In some ways, that is the next logical step. However, I felt that by having annual targets, 2020 and 2030, we would probably be obliged to have a 2040 target, because it would be as if we were having decade targets as well as the end target. If we had a model with three interim targets, a 2050 target, and annual targets on top of that, it would be a little top heavy for targets. As a result, I went back to the original idea of having just one interim target and felt that, as the bill had to cover 41 years, 2030 struck a better balance. Of course, there will be a target in 2020, but it will be an annual target.

**Des McNulty:** It is obviously up to the committee to make recommendations on what the interim target should be. If we decided that 2020 should be the interim target, at what level would your current projection suggest that the target would have to be set?

**Fiona Page:** On which scenario? We have outlined a number of them. We would also have to consider further advice from the UK Committee on Climate Change before we could say what a 2020 target would be. The bill identifies constraints. We and ministers want the target from 2020 onwards to be 3 per cent less than the previous year’s target, which is the reason for its inclusion in the first set of annual targets.

**Des McNulty:** My understanding is that, if you calculate the 2020 target using the assumptions on which the 2030 target has been based, only the 2019-20 target will be 3 per cent, with different targets up to 2019. I suppose that I am asking you to revise your projections. What are you projecting for, say, 2020 and is it the best that we can do?

**Philip Wright:** Perhaps I should address that question in a slightly more general way by referring to the UK Climate Change Act 2008—which, I point out, is also our act. The original UK bill set out a range of targets: the reduction was to be not less than 26 per cent by 2020, with an upper limit of 32 per cent. The upper limit, however, was removed. In any case, it was seen not as a limit but as a range. Although the 2008 act specifies a reduction of 26 per cent, the UK Committee on Climate Change has said that if the European Union stays with a 20 per cent emissions reduction, the recommended target for the UK will be 34 per cent, which is 8 per cent more than is set out in the 2008 act. If the EU moves to a 30 per cent emissions reduction, our target will have to be 42 per cent.

As a result, the 26 per cent target in the UK act has in no way constrained the Committee on Climate Change in being more ambitious or making a very clear link with the EU-level target. Given that the EU’s proposals for a 20 per cent or
a 30 per cent world are a lot more challenging, the committee’s recommendations in that respect take us into the very complex area of buying allowances and so on. It would be really difficult for Scotland to set its own interim target for 2020. The figures in the bill do not limit the Scottish Government’s ambition: they are not less than what has been proposed elsewhere.

The Convener: Just to wrap up this section—

Alison McInnes: Convener, Ms Page has answered only the second part of my question. She has not dealt with the suggestion that the 2030 target does not put us on the right trajectory for a 3 per cent year-on-year reduction.

Fiona Page: The target is definitely in the right region. When we did the numbers, the initial number that I was given was 51.5 per cent. However, I was uncomfortable with putting that figure into primary legislation, which is why we decided that the aim in the bill should be “at least 50%”. When the annual targets are set, it will be up to ministers to decide the actual target for a particular year. However, it will have to be set relative to a reduction of at least 50 per cent in carbon dioxide equivalent—it could very well be higher.

The Convener: Just to tie up the question of the interim target, I believe that you said that there was a process for considering whether there should be a 2020 target, a 2030 target, a 2020 and a 2030 target, a decade target, three decade targets, and so on. Given that you have agreed—and that the Government has acknowledged—that the trajectory is most clearly defined by early action, I am still slightly unclear why the 2020 target was ruled out. I understand the policy reasons for arguing that 2030 is closer to the midpoint, but the trajectory is important, and the fact is that the early target defines that more clearly.

Fiona Page: Yes, but from June 2010—in 18 months’ time—we will set the first batches of annual targets. From then on, we will establish annual targets, covering the period up to and beyond 2020. We will have a set of targets then.

The Convener: However, the bill that the Parliament is being asked to pass does not specify those targets. The Parliament is being asked to agree to an interim target being placed at a point that will be less capable of defining the trajectory.

Fiona Page: The annual targets will be set in regulations, which will be subject to the affirmative resolution procedure, so the Parliament will have a chance to scrutinise them as they come forward.

Des McNulty: Would meeting a 30 per cent target by 2020 be significantly more challenging than meeting a 50 per cent target by 2030?

Philip Wright: Delivering such a target would be more challenging—even if we set the numbers to one side—because we would have less time in which to do so. Short-term targets are more challenging, simply because they are so much closer. A 2030 target gives us that bit longer to move energy and transport systems in the direction of a low-carbon economy.

Des McNulty: Would 25 per cent by 2020 be a more challenging target?

Philip Wright: Probably not, given that the UK’s target is a 26 per cent reduction in emissions by 2020.

Des McNulty: That is interesting. If we are to make a success of the policy we must involve the public in various ways. The bill contains provisions that acknowledge that reality and move in that direction, but there is no target on public engagement, and public engagement is not explicitly made a priority. Did you consider including such a target when the bill was being drafted? If an amendment was lodged to introduce process targets on public engagement on climate change, to sit alongside the scientific targets on emissions reduction, would you regard it as a positive addition to the bill?

Philip Wright: Are you talking about the framework that will be set by the bill or the delivery of emissions reduction?

Des McNulty: I think that I am talking about the framework, but I suppose that implementation mechanisms might be part of the delivery process. I am thinking about the issue in the context of section 1, in relation to the framework—

Philip Wright: Fiona Page can talk about the framework and Cameron Maxwell can talk about delivery. Andrew Henderson wants to comment, too.

Andrew Henderson (Scottish Government Climate Change and Water Industry Directorate): I think that all members have had a chance to consider the consultation, which ran at the beginning of last year and garnered more than 21,000 responses. Many responses were the result of campaigns by several non-governmental organisations, which was helpful to us in our policy considerations. We received more substantive, weightier and longer responses from more than 300 organisations and individuals, who addressed the questions in the consultation paper. The process very much informed policy making and we tried to reflect that in the analysis report and the Scottish Government response to the consultation, which was published in October.
14:30

**Des McNulty:** Your answer highlights the problem that I see with the bill, which is not necessarily anybody’s fault. The Smoking, Health and Social Care (Scotland) Act 2005 had a profound impact on people’s behaviour. Perhaps that is the most significant example of legislation having a direct effect. My concern is that climate change is taken extremely seriously by members of environmental organisations, who are interested in the issues, but not necessarily by the broader population, whose interest is necessary if the bill is to be effective. Could we add targets for public engagement and buy-in to the process? That is every bit as much a task for ministers as achieving the scientifically set targets.

**Fiona Page:** If you have any specific ideas of the kind of things that you are after, we would be interested in exploring them with you. I am sure that ministers would be happy to enter into dialogue about that.

**Philip Wright:** I ask Cameron Maxwell to cover delivery, which will involve public engagement.

**Cameron Maxwell (Scottish Government Climate Change and Water Industry Directorate):** Public engagement would be useful on climate change because emissions cover so many things. A huge section of Scotland’s emissions comes from domestic households, so there is value in considering what is being done on energy efficiency advice, such as the advice that the Energy Saving Trust provides through energy efficiency centres. A lot of new stuff has come in this year. There is also value in considering transport, transport planning and the measures that go out to citizens in relation to that.

There might be value in breaking things down in that way and asking how we want to engage with the public, because I suspect that what we want to do will be different in different circumstances. For instance, large-scale energy generation will involve different stakeholders. It will be important to address domestic and business consumers, but it will be useful to break engagement down into particular areas.

**Des McNulty:** That is helpful.

**Alex Johnstone (North East Scotland) (Con):** We have already covered some of what I want to cover, but I will try to take a slightly different angle. Why does the Government not have more ambitious targets for reductions before 2019?

**Philip Wright:** I feel like a record stuck in a groove. This is about deliverability. Many things have come together over the past year or so: the passage of the 2008 act through Westminster; the EU climate change and energy package, which was agreed only in December; and the establishment, initially in shadow form a year ago, of the Committee on Climate Change, which reported only in December. Many things were going on outside the Scottish Government but we were party and privy to much of the information that was part of that work.

The first really definitive advice that we got was from the Committee on Climate Change in December. As I have said, it has mapped out an ambitious agenda. If we had had that information a year ago, we might have done a bit more analysis and ministers might have come to a different view on the level of ambition in the interim target. We now have the information for the UK, although it is still a bit iffy at the individual country level. We need that level of information so that we are properly informed and can ensure that we put into statute a credible and deliverable trajectory.

I can almost categorically say that, if we put in a 3 per cent emissions reduction target for year 1, we would fail unless we purchased allowances to offset that failure. That is pretty close to being a fact. Any shortfall in year 1 would follow into year 2, so a 1 or 2 per cent failure in year 1 would realise a 4 or 5 per cent target in year 2—we would be playing catch-up for the first few years. However, the advice of the Committee on Climate Change means that we can design a trajectory with which we can look ahead to what will come on stream.

We must also take account of the EU emission trading scheme, which will increase its level of ambition by 1.74 per cent each year from 2013 onwards. That is a key part of our arsenal in addressing climate change, so we must have an eye on it, too.

We will need to have an eye on that whole package when we consider, or possibly revise, any trajectory or definition of interim targets.

**Alex Johnstone:** Is it fair to say that the controlling logic behind that decision is to do with achievability?

**Philip Wright:** That is certainly in there, but it is matched by ambition. We need ambition to stretch what we are prepared to try to achieve.

**Alex Johnstone:** Is that the reason why the 3 per cent annual targets do not appear in the bill?

**Philip Wright:** Those will apply in the period after 2019.

**Alex Johnstone:** But not prior to that.

**Philip Wright:** No—not in the first period.

**Alex Johnstone:** We talked about interim targets. The UK Climate Change Act 2008 has an interim target for 2020. Given that other aspects of the bill are designed to be in step with the UK act,
did the Government ever consider the logic of being in step with the UK act on the interim target?

Philip Wright: No. We have moved significantly away from the UK act by adopting annual targets. The five-year carbon budget approach in the UK act gives the UK Government—and us, as part of the process—a great deal more flexibility. Annual targets are a lot more demanding than a carbon budget. With a carbon budget, if you fail in one year for whatever reason, you can make that up in subsequent years. With annual targets, if you fail, you fail, and there is little flexibility. However, the annual targets will, in effect, be a subdivision of the five-year carbon budgets. We are reliant on UK policy measures. Reports will come out at the UK level that will say how the UK Government plans to address or deliver carbon reductions in the coming three sets of five years. We will take that information into consideration in designing—and offering to the Parliament through instruments under the affirmative procedure—the annual target trajectory through to 2019.

Alex Johnstone: It might be more appropriate for me to put my next question to the minister, but I will ask it carefully and for no purpose other than that it might allow the minister to be prepared when I put it to him. Is the bill in step with the UK act on the interim target? The five-year carbon budget approach in the UK act and the 2050 target was made at least 50% lower than the baseline.

Philip Wright: As officials, we can probably answer that to an extent. I do not immediately see a political dimension to the question, but one might be there.

As I said, EU, UK and Scottish measures will all play a part in achieving the Scottish target. We will be informed by the evidence base that the Committee on Climate Change uses at the UK level. We will try to disaggregate that as far as possible down to the Scotland level but, inevitably, certain things will be almost a pro rata reflection of what is happening at the UK level. There will definitely be linkages between the implementation of the UK act and the way in which we envisage the Scottish bill being implemented. For example, a similar evidence base will be used and high-level UK modelling will go on. Over time, we will look to do a lot more in Scotland, but at present we are linked to much of the UK modelling, which is a key part of the process in defining trajectories and the way ahead. So there are links between the bill and the UK act.

Alex Johnstone: My final question, which is on general targets, looks well into the future. Given that scientific analysis and knowledge tend to change, might the Scottish Government consider a more ambitious 2050 target?

Fiona Page: The targets in the bill are expressed intentionally as reductions of “at least” a certain amount. For example, when ministers set the annual targets to reach the 2030 and 2050 targets, they will definitely be able to make the targets go above the level in the bill if they want to. We might reduce emissions at a higher rate than anticipated, so the level at which the targets are set might be found subsequently to be no longer meaningful—I am optimistic that that may happen at some stage. In those circumstances, there is provision to allow the annual targets that have been set to be revisited. The provision will be available to ministers to go back and change the targets.

I am sorry that that was a long response, but the simple answer to your question is yes—ministers are ambitious to deliver reductions in greenhouse gas emissions and to help combat climate change. They want the bill to be the tool that does that. They want the demanding targets to be there, and they want to be held fully accountable by the Parliament for delivering them. They would certainly be willing to consider higher targets in the future on the basis of the expert advice that they will seek at the time. At the moment, the bill provides a good framework to aim for. It is ambitious, and we hope that the Parliament agrees with us in that respect.

Alex Johnstone: So the bill gives us scope to aim higher if we are doing well.

Fiona Page: Potentially. That is why, in setting the annual targets, the constraint from 2020 was made “at least 3%”; the 2030 target was made “at least 50% lower than the baseline”; and the 2050 target was made “at least 80% lower than the baseline.”

The phrase “at least” is used intentionally. We do not want the figures to be viewed in any way as a constraint; we want to be as ambitious as possible and to deliver real improvements.

Philip Wright: Fiona Page quite rightly referred to our current set of ministers and our current Administration but, with a 2050 target, future Administrations are involved, too. The provisions are there for them to be equally ambitious. The Committee on Climate Change is charged with taking account of scientific advice and the latest scientific evidence when it offers its own advice. The facilities will be there for this and future Administrations.

The Convener: You mentioned the publication of the report of the Committee on Climate Change in December 2008. Forgive me if I misquote you, but I think that you described it as the first “definitive advice” that had been received. If it had been available a year ago, rather than in...
December, it might have informed some different decisions in the drafting of the Climate Change (Scotland) Bill. If that is the case, are there aspects of the bill that the Government is open minded about changing? Might it consider changes that the committee proposes, given that we will all share a few months of analysing the position of the Committee on Climate Change? I am happy to hear an answer from the optimist or from the pessimist.

Philip Wright: We do not reflect pessimism. [Laughter.] Your question principally concerns the targets in the bill. I spoke about the December report offering the first “definitive advice”, but I should properly have said that it was the first definitive statutory advice. There is no shortage of evidence in the area of climate change, but it has now been packaged up as advice for the UK Government and the devolved Administrations. The report of the Committee on Climate Change is the first such package to which we have had access. As we have said in previous responses, that committee’s advice will be taken into account in prescribing the trajectory, as defined by the annual targets. Yes, there are spot figures in the bill, but there will be an opportunity in the future for the Parliament to have a say in defining the trajectory, based on the advice of the Committee on Climate Change. That is covered in the bill.

Rob Gibson: The bill contains no sectoral targets. How will the Scottish Government and Parliament be kept informed on how different sectors of the economy are delivering on emissions cuts?

Philip Wright: We could respond to that in different ways. The greenhouse gas inventories are based on sectors, so we can examine performance in each one. The difficulty is that, although there is a lot of information, it is split in different sectoral ways. Land use and agriculture are defined in one inventory, but different aspects are treated differently in other inventories. Cameron Maxwell might be able to say something about the approach that we have been adopting in considering abatement potential in different sectors.

Cameron Maxwell: One of the important things to consider when it comes to significant emissions reductions over long periods is the fact that different sectors will play different roles at different times. The Committee on Climate Change suggests a heavy focus on decarbonising the power supply in the period to 2030—by that point, it should be largely decarbonised. There are further issues around transport technology, which might allow for some reductions in the period to 2020, with improved petrol and advanced diesel engines. During that period, there will also be a switch to plug-in hybrids, and then to electric vehicles.

Across sectors, large savings are being made at different times, but they are often interconnected. For example, if you run electric cars off the current energy mix, you will make a saving, but you will make a much bigger saving if you run them off decarbonised electricity supplies. Where we get the big savings from over the next 40 years is a complicated patchwork, and some will come quicker than others.

14:45

Rob Gibson: Will that be made explicit in annual reporting?

Philip Wright: There are different aspects to annual reporting—one is our performance and the other is the policies and measures that we plan to put in place. There will be a sectoral dimension to that. In a way that is similar to the approach taken in the report of the Committee on Climate Change, our reporting looks at the sectors in different ways because, as Cameron Maxwell said, they will respond differently and at different times.

Rob Gibson: I do not suggest that we can compare one year with the next if the policy is different by sector, but there will be some information in the reporting that gives us a handle on how each sector is performing.

Section 4 of the strategic transport projects review report 1 states:

“On present trends, transport will not contribute to the reduction target”.

Would it make sense for specific sectors to be given policy direction on annual emissions targets and for there to be more scrutiny of those sectors?

Philip Wright: I refer back to Cameron Maxwell’s response about the different times at which abatement potential occurs. The strategic transport projects review was published around the same time as the report of the Committee on Climate Change, in which issues were raised about the move towards electric vehicles, for example. That was not factored into the STPR, because it was built on a factual evidence base and stated, “Here’s where we stand on transport infrastructure and here are the possible interventions over the next umpty-ump years.”

Cameron Maxwell: Transport is a very interesting area because some aspects are held at UK or EU level. We spoke about vehicle standards, which must be driven from an EU level, but we benefit from that as electric cars and so on penetrate our ownership. Transport emissions will have to fall, and in our conversations with transport colleagues about how we will deliver the targets, we have discussed projections that are
either level with the current situation or show an upwards trend. Ultimately, it is not a question of maintaining the current level, because emissions have to drop. That will happen partly through demand management and partly through technology, and it will happen over time.

Our work on climate change allows us to ask how our transport colleagues’ thinking compares with what the Committee on Climate Change is saying. The work of that committee offers an opportunity for a useful benchmarking exercise, albeit on a UK basis at the moment. We can say, “This is what the UK Committee on Climate Change says we should be doing. It talks about technology and demand reduction and where we should phase things in.” It is useful to compare that committee’s thinking with ours.

The Convener: There are a couple of supplementary questions on transport before we move on.

Des McNulty: It is a paradox—I expect that the convener might use the same example—that we are building a road-only bridge at the same time as we are focusing on climate change.

Ministers have responsibility for distinct areas in the Administration. On the assumption that emissions reduction begins at home, are there any plans in the framework to give ministers an obligation to take responsibility for linking organisations in their portfolios—perhaps hospitals, in the case of the Cabinet Secretary for Health and Wellbeing—with climate change reductions targets?

Philip Wright: I will answer that with regard to the Scottish Government’s contribution. You know about the commitment to assess the carbon implications of the Government’s £30 billion-plus of expenditure. We do not know what the carbon impact of that expenditure is; we are trying to get a handle on it. That will be a means to an end—the end being to use that information to turn the screw on emissions that are associated with the Government’s expenditure.

That is the so-called high-level assessment; there is also an individual-level assessment, which scrutinises and assesses policies and identifies their carbon impact. We will want to see that, across Government, all policies contribute to the Government’s target, to the extent that that is possible. We will have a much better handle on the Scottish Government’s direct impact on emissions through either its expenditure or its policies.

Des McNulty: In effect, you are saying that the carbon assessment mechanism will allow you to measure those things better than you have been able to in the past.

Philip Wright: Not so much measure as assess. It is not an absolute science, but the mechanism will give us estimates of the carbon impact. I cannot go into the detail; it is extremely complex.

Des McNulty: Will any enforcement be linked to the carbon assessment tool? The Transport, Infrastructure and Climate Change Committee and the Finance Committee are interested in the way in which budgets are brought forward. Do you think that the carbon assessment tool will be a mechanism that can inform budget setting, both annually and perhaps over a programme period?

Philip Wright: The safest answer is to refer you to Mr Swinney’s response to a similar question that he was asked when he came before the committee. The carbon assessment tool will provide additional information in relation to the budget, but Mr Swinney’s reply was that, because the budget seeks to address so many other outcomes, it may be difficult to focus on only carbon assessment.

The Convener: Rob Gibson mentioned the STPR. If I may paraphrase, it has been stated that transport will not pull its weight. You said that there is perhaps less comfort around the idea of sectoral targets, but there must be a clear expectation of what transport will do in respect of emissions if the statement about transport not pulling its weight can be made. Can the Government say what the expectation is for the transport emissions trajectory and how much by way of additional emissions reduction will be required from the rest of the economy?

Philip Wright: I again refer back to the report of the Committee on Climate Change, which assesses the abatement potential in each sector. We can work with the information from that report and we will also have access to our own report, which will say what the abatement potential is in each sector. That will inform the Government’s response. The Committee on Climate Change will have identified potential in the transport sector, and the Government can look to ensure that it delivers that. The Government will look across the piece and say, “If we go with the Committee on Climate Change’s advice, we need to bring about these reductions in each area; if we do not achieve the reduction in transport emissions, we will have to compensate in another area.” That would be the Government’s call, but the Committee on Climate Change will give us the information to allow the decision to be made.

The Convener: In arriving at the position that allows the Government to state that, on present trends, transport will not contribute to the reduction targets, did it assess the role that demand management could play now if it was put in place, the role that land use planning could play now if a different approach was taken, and the role that a
re-evaluation of infrastructure projects that are already in the pipeline could play? Did the Government go through such a process?

Philip Wright: To the extent that it was possible to do so, carbon was taken into account. For example, the STPR attempted to assess the emissions implications of 100,000 to 150,000 tonnes of carbon. The modelling will, over time, result in a different figure because there will be a different fuel mix for transport. What is coming through on electric vehicles will influence the implications of infrastructure projects. If those interventions do not happen until 2020, there will be a different fuel mix, so the remodelling will probably produce a different figure. That is in the transport sector. Other sectors have also sought to identify carbon issues.

I go back a stage to carbon balance sheets for transport. Our transport policy colleagues are developing a carbon balance sheet, which the committee has been told about. It is a case of them bringing it forward in sync with the high-level carbon assessment project. The tools are being developed, but it is impossible to deliver everything in such a short time.

Alison McInnes: On that issue, I am concerned about the rather circular argument in the—understandably—cautious and slightly tentative approach that has been taken. The changes in technology that we all want to see will not necessarily happen unless we break into that circle by providing some certainty about the investment that is needed in new technology. Rather than going back round that argument again, if we included a provision in the bill to require all sectors to deliver, and to start delivering as soon as possible—however it is decided that that should be packaged up—the bill would surely encourage that investment, and attention would be paid to those issues. The danger is that we let people off the hook if nothing is firm and everyone thinks that the issue is for someone else.

Philip Wright: I apologise if our approach comes over as in any way cautious. The facts are complex, so we need to dip into those areas if we are to get a real handle on them. If we move away from transport and consider the energy sector, we see drivers for technology development such as the saltire prize. Initiatives in individual sectors—for example, the smarter choices, smarter places project in the transport sector—will encourage carbon reduction. Initiatives are being taken to help encourage innovation within the different sectors. Measures will also be put in place at UK level to meet UK ambitions and at EU level, if the EU moves to a 30 per cent target. We will rely on technology being driven at those different levels in achieving our target.

Rob Gibson: I want to return to the issue of international credits. The UK act places a duty on the secretary of state in London to set a limit on international credits that is based on advice from the UK Committee on Climate Change. Why does the Scottish Government not intend to prescribe such a limit?

Fiona Page: Ministers are anxious to ensure that the bill sets annual targets. They intend to meet the targets and do not favour the use of credits. In particular, they would prefer to focus Scottish resources on delivering emissions reductions in Scotland. That is why no upper cap or limit on the use of carbon credits has been included in the bill. Equally, I think that ministers would probably be happy to enter into dialogue with committee members if the Parliament felt that the bill should include such a limit.

Rob Gibson: Given that in previous evidence today it has been suggested that the emission trading scheme will cover about half of our CO2 emissions, should the bill not spell out the areas where the effect is likely to fail?

Fiona Page: When we consider carbon credits, we are thinking of additional carbon credits that might be purchased if targets are not met. The EU emission trading scheme is pretty much a closed loop that works on an allocation basis, so companies that emit beyond their allocations must purchase additional allocations. As part of the net Scottish emissions account that is established in the bill—which, in many ways, is an attempt to develop an accounting scheme—we will take account of those allocations. However, when I refer to carbon credits, I am thinking more along the lines of the possibility of purchasing additional units if we failed to meet a target. That is a little bit different from the allocations scheme that we are involved in through the EU emission trading scheme.

Rob Gibson: If there is no such limit, how exactly can the Scottish Government ensure that domestic effort accounts for the lion’s share of the emission reductions?

Philip Wright: Again, the fact that the EU ETS covers about 50 per cent of our emissions suggests that the balance is less than 50 per cent. Other measures at EU level, such as product standards, will also influence the achievement of our targets. As things stand, UK fiscal measures will also impact on the delivery of our targets. We are trying to identify the contribution that each of those will make, and the contribution that Scottish policies will have to make as well.

15:00

Rob Gibson: Can you share with us any particular example of that?
Philip Wright: It might be useful if Cameron Maxwell explained our strategic overview.

Cameron Maxwell: One of the interesting aspects of how the emission trading scheme works is that, because it captures the principal industrial installations and generators, it catches around 50 per cent of emissions and has a set trajectory.

It is common to consider the traded sector on one hand and the non-traded sector on the other, which is what the Committee on Climate Change’s report does. In the non-traded sector, there is transport, domestic heat and so on. Some people argue that the all-singing, all-dancing market will deliver. However, there are clearly things that Government does under the emission trading scheme that are important. For instance, any energy efficiency measures relating to electricity and incentives for renewable energy contribute to helping to meet the delivery trajectory for the scheme—they are enabling policies to help the ETS deliver, which might lead you to say that the market mechanism is not perfect. Similarly, with regard to domestic heat, the promotion of energy efficiency measures such as insulation, and boiler swapping is important.

The Committee on Climate Change says that the majority of the emissions reductions to 2020 will come from the trajectory of the emission trading scheme and will involve the big users of carbon, with a subsidiary contribution from the non-traded sector. That is a useful way in which to split the sectors.

It is interesting to note that, as transport becomes electrified, part of that sector will start to fall within the traded sector, as electric trains do just now.

Rob Gibson: Similarly, power stations, which are one of our major sources of emissions, will change over time either because there will be a different mix of electricity generation or because of carbon capture technology and so on.

Philip Wright: Yes.

Shirley-Anne Somerville: Section 18 of the bill deals with carbon units and carbon counting and allows for the establishment of a trading scheme in carbon units. Could you give us more information about the aim of that section and what it would establish?

Andrew Henderson: We talk a lot about frameworks, and section 18 deals with a framework within the framework. Should the Scottish Government be purchasing carbon units on the international market, we will need a mechanism that will enable us to keep track of what we are doing. There is a possibility that units could be purchased and not used or surrendered in the same calendar year. The provisions in section 18 will enable us to hold and transfer units that might be purchased from different sources and used in different ways. They will also enable us to keep track of that.

Shirley-Anne Somerville: The cabinet secretary made a commitment that the Scottish climate change legislation would include international aviation and shipping. Can you explain why those elements have been included in the bill in the way that they have? Is there any way in which the bill could be strengthened in that regard?

Fiona Page: Scottish ministers have committed to including Scotland’s share of international aviation and shipping emissions in the targets, and that remains the case. Section 14 is, obviously, the key provision in this context. The reason why we are suggesting that we bring those areas into the targets through regulations is simply to provide us with a flexible mechanism to adapt to international agreement in the future. Scottish ministers are obviously keen for other countries to follow their lead and take on board the need to tackle emissions from international aviation and shipping. We need a mechanism that we can use in the short term until we have an internationally agreed protocol.

When we first considered the topic, we thought about leaving the bill silent on it. Originally, the UK bill specifically excluded such emissions, but we felt that if our bill was silent on the issue—which would mean, by default, that it included such emissions—given that the very nature of international aviation and shipping emissions is such that they will occur, in part, beyond Scottish boundaries, there was a danger that we would not be able to capture them, so we decided that we needed to be quite active in capturing them. However, if we had put in the bill a mechanism that we could use for only a number of years until an internationally agreed method was developed that we wanted to adopt, we would have tied our hands in a way that might not have been helpful and might simply not have worked.

We decided that we needed to adopt a flexible approach and we thought that the best way of doing that would be through regulation. We could state in regulations how we want to deal with the issue and could change the regulations at a future date, if and when there is international agreement on the matter, which we hope will happen.

Shirley-Anne Somerville: I appreciate that there is a need for flexibility and that the use of regulations will help with the necessary calculations. Can we take it that there is an absolute commitment that emissions from shipping and aviation will be included in the targets?
Fiona Page: Absolutely. They will be included, beginning with the first set of targets from 2010 onwards. The order will probably come forward in tandem with or even, if possible, in advance of the annual target regulations. I am certain that Scottish ministers would be happy to make that commitment.

Shirley-Anne Somerville: The timing of the order will be based on the timing of the annual targets—that is when we will get the information.

Fiona Page: That is possible, but we have not pinned down whether we will lay the order six months after the bill is passed—as we hope it will be—by the Parliament. It must be in force by the time we set the annual targets, so it might come forward in tandem with or in advance of the targets.

Shirley-Anne Somerville: Okay.

I have a question about the advice that you have sought on including international aviation and shipping emissions. There are no international agreements on how the matter is to be dealt with; it is another area in which the bill is world leading. Has the UK Committee on Climate Change been asked for its thoughts on your proposal? What other advice have you taken on board in developing it?

Fiona Page: We have identified a methodology that we think represents a reasonable compromise and which allows us to capture a proportion of the relevant emissions such that they can be included in our future targets. We recognise that, until we get international agreement, the solution that we have proposed is temporary.

Our methodology will be based on the disaggregated greenhouse gas inventory, which is fed down from the UK greenhouse gas inventory. As of October last year, the emissions data for international aviation and shipping are published as a memo item. We will take the disaggregated inventory data, which are calculated on the basis of airport, source, destination, fuel type, plane type and engine type, and will include them in the emissions that are attributed to Scotland, which will then be measured against the Scottish ministers’ annual targets.

Shirley-Anne Somerville: Can you confirm that there will be continuous liaison with the UK Committee on Climate Change about the targets that are set in that area?

Fiona Page: Absolutely. I am sorry—before I explained how we would do the calculations, I should have said that, under section 14, ministers will be obliged to seek the advice of the UK Committee on Climate Change or a future advisory body, if a different arrangement is adopted, on how best to proceed. The proposal in the bill is our initial idea of how we can tackle the issue in the short term but, before we lay the regulations, we will seek the UK committee’s advice on whether our proposal represents the best interim solution. We will take time to have some dialogue with the UK committee on the proposal, but there will be no change in ministers’ decision to proceed with it. We will include Scotland’s share of the emissions from international aviation and shipping in a target. We will just seek the UK committee’s views on our suggested way of proceeding in the absence of an internationally agreed solution.

Philip Wright: Back in October, when the shadow committee on climate change suggested a revision to the UK target, it made specific reference to international aviation and shipping. It accepted the complexity of including emissions from those sectors in the target, but asked the UK and Scottish Governments to consider that as part of the policy response. The issue will be addressed at the UK level. The other new kid on the block is that aviation will be part of the emission trading scheme from 2013, so we have to factor the implications of that into the process by which we account for aviation emissions, although that does not apply to shipping emissions.

The Convener: I want to check up on one last detail, which is about the stated intention to introduce an order to include aviation and shipping emissions in the first batch of targets. Is it intended to include aviation and shipping emissions fully in all the targets in the first batch, rather than to phase them in?

Fiona Page: Yes. We do not plan on making a distinction. When we introduce the annual targets, they will apply to Scotland’s emissions, which will include Scotland’s share of international aviation and shipping emissions. So, absolutely, the first targets will include those emissions.

Charlie Gordon (Glasgow Cathcart) (Lab): What criteria will be used to assess whether a body other than the UK Committee on Climate Change is required to provide advice to the Scottish ministers, and how would such an evaluation take place?

Fiona Page: Ultimately, it will be down to the Scottish ministers to decide whether they are happy with the advice from the UK Committee on Climate Change. At present, the advice is of very high quality. The committee is a new one that is full of some of the best experts from throughout the UK and we are tied into it. I am confident that, in the short term, the Scottish ministers will be happy to use the UK committee. However, as members know, the bill will cover a long period—more than 40 years—and many Administrations,
so we want to ensure that it is future-proofed in respect of advice to ministers.

That is why we suggest the introduction of provisions that will allow ministers to have alternative sources of information. They could decide to confer the advisory duties on an existing public body or to set up a Scottish climate change committee. The criteria on which ministers base a decision to go down that route will be up to them, but I am sure that the issue will come down to whether the UK Committee on Climate Change provides the advice that ministers are after. The bill takes a slightly different approach from that in the UK act. The bill goes hand in hand with the UK act and we will be in line with the UK targets, but we are taking a distinctive Scottish approach, with the annual targets and the recognition of the importance of including international aviation and shipping emissions in the targets.

In many respects, in the years to come, the UK Committee on Climate Change will have to prove its ability to respond to Scottish ministers’ requests for advice. Obviously, the most significant advice in the next year will be on the levels at which to set our annual targets. That will be the first test. However, it is probably too soon to speculate—and possibly not for me to do so—on how exactly ministers will decide whether the UK committee meets their needs. I am optimistic that it will do so, but that will be for the current and future Administrations to decide.

**Charlie Gordon:** So there are no criteria—the matter will be left to the political judgment of future ministers.

**Fiona Page:** Yes. We do not want to tie down future ministers in legislation on how to judge on the issue. It will come down to a personal decision of the Administration at the time. Future Administrations will need to be confident that they are getting the best possible advice. I hope that they can get that from the UK Committee on Climate Change, but we want to provide flexibility in the bill to allow alternative mechanisms if that does not happen.

**Charlie Gordon:** Will you summarise the advice that the Scottish Government has sought thus far from the UK Committee on Climate Change?

**Philip Wright:** To date, we have made no formal request to the UK committee but, because we are co-sponsors of it, we are closely engaged with it. There have been various working groups both on the UK bill process and on the implementation of the UK act. There is contact through those fora and we also have direct informal contact with the committee secretariat. Lord Adair Turner and David Kennedy, the chief executive, have been up to Scotland on two occasions to engage with the Scottish stakeholders, and I think that David Kennedy will be here again next week. We have a good level of contact with the UK committee.

15:15

**Charlie Gordon:** So you pick their brains without making it too obvious or formal.

**Philip Wright:** It is not a case of picking their brains—

**Charlie Gordon:** Maybe they pick your brains.

**Philip Wright:** They might well do in some cases. I should add that we have a seconded to the Committee on Climate Change to help it to understand the Scottish issues to which Fiona Page referred. We are trying to be helpful in both directions.

**Charlie Gordon:** Has the Scottish Government considered in detail any advisory models other than the UK Committee on Climate Change?

**Fiona Page:** It is my strong recommendation that ministers use the UK committee initially. It is a new body that has not yet been given a chance to prove itself. It is made up of experts from across the UK, we fund it jointly, Scottish ministers are involved in any decision to appoint people to it and, as Philip Wright explained, a key member of our staff—an economist—is seconded to it to work on devolved Administration work. I am very hopeful that the new body will deliver great things and it useful for us to work closely with it on the Scottish bill as well as on the UK act.

I believe in seeking best value for money. Frankly, we get the services of that committee at a reasonable cost and we would have to pay much more money were we to set up a Scottish climate change committee in the future. Before we took the step of setting up such a committee, ministers would definitely consider first whether they wanted to apply the advisory duties to an existing body. The one that springs to mind logically is the Scottish Environment Protection Agency. However, we have had no dialogue with SEPA about that and Scottish ministers would not want to consider that option at this stage.

I am sure that members feel that I am beginning to sound like a broken record on the subject, but I do not think that we could get better value for money or better expert advice at this time than we will get from the UK Committee on Climate Change. Even though it has been established formally for just over a month, it has been sitting in shadow form for almost a year.

We have pooled the best minds in the UK to work on the UK act. Scottish ministers have an excellent provision in that act that allows them to seek advice from the UK Committee on Climate
Change—as any of the devolved Administrations can do—on anything to do with climate change targets, but the advice does not have to be only in relation to Scotland’s share of the UK act; it can relate to our own targets, including the annual ones. It is only right and proper that we explore that mechanism fully before we venture down other roads and consider other mechanisms.

Charlie Gordon: Thank you; you have convinced me.

Philip Wright: I add a supplement to that. Cameron Maxwell has just reminded me that, in my earlier response, I was thinking of direct contact with the UK committee officials, but we have also contributed our thoughts on its work programme—a package of activities that the UK committee is asked to address from 2009 to 2012. We have let the committee know at what points we are likely to seek advice.

Charlie Gordon: So you are in on the ground floor—

Philip Wright: Yes, but through the UK process rather than through direct contact.

Andrew Henderson: We are very aware that we will go to the UK committee with a formal request for advice on the annual targets. It also knows about our aviation and shipping considerations. Discussion has taken place at an official level, but the formal approach will come when the UK committee’s work plan, with which we are involved, is developed.

The Convener: If, at any point in the future, a political judgment is made, for whatever reason, that a Scottish advisory body should be established, we will want ministers at that time to work with an act that makes it possible to establish such a body in the best way. Has the Government considered creating a body that is accountable to the Parliament, rather than the Government? The Scottish equivalents of some UK bodies that are accountable to the Government at a UK level are accountable to the Scottish Parliament at a Scottish level. Does the bill make it possible to establish a body, would the provisions in the bill enable them to make that body accountable to the Parliament rather than the Government?

Fiona Page: That is an interesting question. Schedule 1 contains most of the detail on the matter, and it provides for the body to be an NDPB, rather than to be something under a commissioner, which would be an unusual step. I think that the legislation would need to be amended to enable that to happen.

Alison McInnes: The bill provides for Scottish ministers to produce a plan to compensate in future years, should annual targets not be met. Can you explain how that is substantively different from the approach that is taken in the UK act, which involves banking and borrowing from five-yearly budgets?

Fiona Page: Banking and borrowing was a key option when Scottish ministers were considering emissions budgets because, clearly, there is a high degree of flexibility in the emissions budgets period. We considered using the banking and borrowing approach when we were moving to an annual-target model, but we felt that it was not compatible with it—either we meet an annual target or we do not, and it is quite difficult to see how we can bank and borrow in that regard.

You are right that, in terms of meeting an annual target, purchasing carbon credits or carbon units is an option, but it is not one that is favoured by Scottish ministers.

Andrew Henderson: Banking and borrowing is a mechanism that is specific to carbon or emissions budgets, where one has a set quantity of emissions that should be permitted within a certain period—five years, in the case of the UK act. Within the framework of the UK act, the idea is that, for example, if one overemits by a quantity of 50 megatonnes in period 1, one can—rather than purchasing emissions units to offset that
overemission—reduce the level of the next budget so that it is 50 megatonnes lower than it otherwise would have been.

Ministers are required to produce an action plan setting out what they would do in order to address the failure to meet a target. That plan is simply a road map of any range of options that might be identified as ways of getting emissions reductions back on track in the short, medium and long term. Banking and borrowing is quite a specific element of the emissions budget mechanism.

**Alison McInnes:** That was helpful, thank you.

We have spoken about reporting on different sectors and so on. There is a requirement for electricity figures to be included in the report on annual targets. Is there a case for widening that out to cover other sectors?

**Andrew Henderson:** One reason for including electricity figures is that we have robust statistics on electricity production and consumption which have already been published. We believe that it made sense to draw them into what is being reported annually regarding emissions more widely. We can read across those statistics to see whether we could have a greener fuel mix in our electricity generation sector. There is not necessarily always an immediate read-across to reductions in emissions—although there might be a lot more green electricity generation from renewable sources, there will still be the same quantity of carbon emissions unless the fossil fuel parts of the generation mix are being decarbonised or brought off-stream. The inclusion of the electricity generation statistics in annual reporting is an attempt to illustrate better the advances that have been made in renewable and sustainable electricity.

We considered the inclusion of renewable heat in the reporting because heating emissions are an important part of our emissions, but we simply do not have good enough figures to do that yet. Work is continuing in order that we can produce better figures. We did not wish to include in the bill a provision that would compel us to report something that would not be useful. The bill contains a provision that ministers may add to the reporting duties that are already specified.

**Alison McInnes:** That returns us to an earlier point in the discussion. We do not have the information, but we perhaps need to encourage the gathering of information. The question is whether the bill can serve as a lever to bring that about.

I will move on to enforcements and sanctions. Targets being set in statute might focus the mind, but will reporting annually to Parliament be enough to ensure the step change that will be required to meet the 2050 target? What other enforcement measures did the Government explore?

**Fiona Page:** Reporting to Parliament is quite a robust measure. It is possibly more for ministers to consider the question, but I do not think that it would be practical for ministers to consider, for example, imposing financial penalties on themselves, or any other such mechanisms. It is difficult for us to see what further censure there might be. The requirement for robust reporting to the Scottish Parliament is a strong measure.

The Scottish ministers were keen to have strong reporting included in the bill. As members will probably have noted, we have gone much further in this bill than we have in a lot of previous legislation, by requiring ministers as far as is possible to make a statement in Parliament when the annual report is produced so that Parliament can scrutinise ministers, debate the matter with them and question them in public on their delivery of the policy.

Ministers wanted to go even further than that in requesting meetings with the Conveners Group at the time of reporting. That offers a further level of scrutiny and accountability, and goes much further than any other primary legislation has gone. We will be interested to know how Parliament responds to that provision. I can honestly say, hand on heart, that we made our solicitors quite nervous by requesting that provision in the bill. Scottish ministers had to insist that the provision be included and are particularly keen to be held accountable on this matter, and to ensure complete openness and transparency regarding the bill's provisions. I am sure that ministers will be happy to discuss the matter further if you think that they could consider other levels of scrutiny or accountability.

**Alison McInnes:** Part of good scrutiny is ensuring that there is enough information available for Parliament to make a considered judgment. Does the Government believe that there is enough information around for that to happen? Will there be enough information annually?

**Philip Wright:** I will offer a supplementary point to Fiona Page's response. Through the proposed reporting mechanism, plus the meetings with committee conveners, a certain onus is placed on Parliament. There is almost a cascade effect: because information will be made available to Parliament and committee conveners, they can challenge Government on the sectoral approach that Mr Gibson spoke about earlier. When the budget is presented, the Finance Committee may challenge the Government, this committee may challenge our transport colleagues, and so on. The bill will have that effect; the information that is made available to Parliament will allow Parliament
as a whole to challenge the various parts of Government.

15:30

Fiona Page: There are quite a lot of reporting provisions in the bill. I do not know whether you wish to explore the matter further, but I am happy to talk you through the different levels. Would that be helpful?

Alison McInnes: Yes.

Fiona Page: A helpful note has just been handed to me—but I know the provisions well enough.

Andrew Henderson: They are all in one place.

Fiona Page: After annual targets have been set, the first thing that ministers must do is to produce a report to Parliament to explain how they will deliver and meet the annual targets. That is the starting point. Scottish ministers will also need to produce an annual report to Parliament to confirm how they have delivered and met the targets for the year concerned. If they have not met the targets, they will have to explain what their actions will be to deliver them in the future.

There will also be a specific report on the interim target for 2030—or whenever it may be, once the bill is passed—and one on the 2050 target. Furthermore, there will be a reporting requirement in relation to adaptation. That allows us to fall into line with the UK 2008 act. When the Westminster secretary of state lays a report on adaptation for climate change at that time. I do not know whether you wish to explore the matter further, but I am happy to talk you through the different levels. Would that be helpful?

Fiona Page: There are quite a lot of reporting provisions—they are all linked to the annual reporting cycle and to the question of whether targets have been met, which the annual report will confirm. An independent report will also be made by the advisory body—for example, the UK Committee on Climate Change—on its view as to how successful Scottish ministers’ actions have been, and whether they could go further in delivering the targets.

Sorry—that was probably not a very good explanation, but there is a lot to cover.

Andrew Henderson: Ministers must, in turn, respond to that independent report. Included within the annual reporting cycle are reporting of emissions achievement statistics, with detail on what has been happening in respect of emissions and the linked reporting; scrutiny by the Committee on Climate Change; and ministers’ response to that scrutiny. That is all done publicly.

A further part of the reporting requirements is that, whenever ministers set annual targets—which, in practice, will be every five years or so, although we have a slight compression at the beginning of the target-setting process—a report must be made about the policies and proposals for meeting the targets. That will provide an indication of ambitions and of practice in respect of how the targets are to be achieved.

The Convener: The proposal for ministers to meet the conveners of parliamentary committees took a few people by surprise. It reminded me of the proposal by the First Minister in 2007 to answer questions by the Conveners Group, as a more in-depth version of First Minister’s question time. At the time, that was not felt to be an appropriate use of the Conveners Group. How was that proposal developed? How much dialogue took place with the Conveners Group, or with the Presiding Officer, to determine whether that would be a useful or, indeed, appropriate mechanism?

Fiona Page: The proposal came from ministers’ idea. We did not pursue specific engagement with Parliament on it. It was a decision by Scottish ministers: they wanted to go further than happens in normal reporting because they recognised the importance of the bill, in particular its long-term nature and how it will affect future Administrations over the next 40 years. They wanted to offer more than an annual report to Parliament. We adopted the first stage—an annual statement to Parliament, which provides members with a clear opportunity to debate the annual report and to challenge question ministers on it—but ministers wanted to go one step further and to help the committees. Ministers recognise the cross-cutting nature of climate change, and so wanted the committees to be fully involved and engaged in the process.

The thinking behind the proposal was that drawing the conveners together would provide one possible mechanism to do that—giving them a special meeting would allow them to question ministers specifically. As I say, it is a new territory and ministers will be happy to have dialogue on that provision, if Parliament feels that the provision is not appropriate.

The Convener: I appreciate the intention to go further than standard reporting mechanisms and I am by no means hostile to the idea of finding the right way to do that but, for clarity, was there no dialogue with the Conveners Group about whether it felt that this was an appropriate mechanism?

Fiona Page: I cannot answer on behalf of Scottish ministers, but I can say from the official side that we did not have any dialogue. That would have been quite a difficult dialogue for us to have; the matter probably should have been taken
forward, if it was felt necessary, through dialogue at political level.

The Convener: We can perhaps explore with the minister at a future meeting whether there is an on-the-record forum within which such dialogue could happen rather than its taking place in an off-the-record forum.

Fiona Page: Absolutely.

The Convener: Given Philip Wright's comments, information that is provided at the additional meeting must be available to the whole Parliament if it is to be fully used.

Andrew Henderson: I have a point that is relevant to what the convener has just said. Several subsections of section 34 use the words "in so far as reasonably practicable".

When we were drafting the section it was clear that we could not or would not wish to place a duty on Parliament itself, so in this case that phrase essentially refers to an offer made by ministers that is subject to Parliament's acceptance in so far as it is conditional on the Parliament saying, "Yes, we would like to hear from the minister in the chamber and we would like the minister to appear before a committee of the conveners." The ball is in Parliament's court on that one.

Fiona Page: We had to make it clear in the bill that we are not placing any obligations on Parliament or applying a duty that ministers could not meet, which is why section 34 is phrased as it is. I am certain that ministers are completely open to dialogue on the issue, if members feel that there is a better way to proceed. The spirit is clear: ministers want to be held accountable, to be open and to offer Parliament every opportunity to scrutinise and question them on these matters. Please, by all means, ask the minister to consider the issue further.

Cathy Peattie: I will pick up on that issue before I move on to the matter that I want to explore.

It is obviously important that ministers have given assurances that Parliament and committee conveners will have an opportunity to consider where we are on climate change. Can you give us an indication of what is happening, perhaps in the long-term, across departments? It is all very well to report to conveners and for ministers and departments to report to this committee or another, but I am not sure that we can, if the issue is not mainstreamed across departments, achieve what we need to achieve. Is there any dialogue on mainstreaming across departments?

Philip Wright: The carbon assessment project is one example of that. It is a cross-cutting mechanism that will be available to ministers and will engage other departments.

A long-term initiative to mainstream climate-change thinking across the Government has been in place for some time. It is about policy makers in the Government, senior staff in the Government and policy analysts all thinking about climate change when they develop policies in their areas. I mentioned the transport carbon balance sheet, which came out of that process. Our transport colleagues can now address climate change with less reference to us than used to be the case. Many years ago we, as a small climate change division, had to field all the inquiries that came in on climate change, but our transport colleagues, our energy colleagues and our agriculture colleagues can now deal with such inquiries. The situation is not ideal, but it is improving.

The same is happening at the top of the office. The strategic board, which is the top management group within the office, is being exposed to those issues and we are looking for buy-in from the top of the office. The issue is obviously reflected in the Government's purpose and in the sustainability targets, which support that purpose. A whole mechanism is in place within Government to ensure delivery of the two sustainability targets to reduce emissions by 2011 and by 2050.

Cameron Maxwell: It might be useful to flag up some of the work that I am heavily involved in, which involves mainstreaming the issue across the offices. We are working on a strategic overview and are trying to map out a pathway of emissions reductions for Scotland between now and 2050 for short-term changes, and focusing in particular on the medium-term and long-term changes that will have to take place. That involves my spending a lot of time talking to my energy, renewable energy and energy efficiency colleagues about their plans, and flagging up the type of emissions reductions that we need and what the Committee on Climate Change report recommends. We are trying to put together a document that will demonstrate that there is a pathway from where we are now to where we want to be in 2050. Areas that are important in that regard include energy efficiency, housing and transport.

This morning, for example, I was at a seminar with my transport colleagues in which I was able to assess the emissions-reduction potential of some of the work that they have been doing. Similar work has been going on in the rural land-use sector, as the agriculture and forestry sectors are quite big emitters. We are working to ensure that everyone across the office is aware of the key priorities that can be taken forward.

Cathy Peattie: That is an area that we should keep an eye on, convener.

When will the Government introduce secondary legislation that will place duties on public bodies? What will those duties be?
Fiona Page: At the moment, Scottish ministers have not earmarked a number of duties because we have been trying to future proof the bill and the ability of all the Administrations to deliver on the targets.

We hope that everyone will embrace the need to act to reduce greenhouse gas emissions, but we need to be realistic about the fact that, as emissions reductions become harder and more expensive to deliver, the public sector must be seen to lead the way, so ministers might need a number of tools to ensure that the public sector plays a significant part in reducing greenhouse gas emissions.

We recognise that we have to maximise Parliament’s opportunity to scrutinise any such proposals, which is why we recommend that we introduce them under the affirmative procedure. The proposals will depend on the level at which we want to start. However, public bodies could be required to ensure that they do a carbon assessment of any significant new builds. That could be taken to a lower level by requiring public bodies to report annually on the work that they are doing to reduce emissions, on the energy efficiency of their buildings and on the state of their estate.

It is important to recognise that ministers believe in working in partnership, and that the proposals that I am discussing are more of a last resort. We would not want to introduce regulations requiring things to be done that could be done voluntarily. The local government concordat is a good example of ministers’ aspirations for partnership working. Ministers hope that bodies will work to reduce their emissions either voluntarily or through dialogue with ministers, with ministers indicating their desire for certain activities to take place. However, the power to introduce regulations exists to enable us to take matters to a different level if we are not as successful as we would like to be in driving forward the emissions reductions.

The provisions are quite open ended, which I appreciate is challenging for Parliament. We have done everything we can do to ensure that Parliament will have an additional degree of scrutiny, through regulations that are introduced being subject to the affirmative procedure. We would introduce regulations only after considerable dialogue with the organisations and a lot of discussion about the types of duties that could be put in place. In particular, ministers want to ensure that they are tied into the process. Therefore, if duties are placed in relation to climate change, ministers have an obligation to work with bodies and organisations to help them to achieve those duties. That is why the bill is framed as it is. I hope that that answers your question.

Cathy Peattie: It does not. I am concerned about the fact that we are talking about “hope”. My experience in equalities is that it took 20 years for local authorities to make progress in that regard, and, even then, it happened only through legislation. It was hoped that progress would be made on equalities, and a department in each local authority had responsibility for equalities, but that work was not mainstreamed. I am concerned, therefore, that there does not seem to be a duty on public bodies and local authorities to work on the issues that are covered in the bill, such as conservation and biodiversity. Those bodies need to be given targets if they are to make progress. Frankly, “hope” is not enough. We all hope that things will happen, but unless legislation is in place, we might be hoping forever.

15:45
Fiona Page: If you have particular suggestions as to how the bill can be enhanced in that respect—

Cathy Peattie: I have.

Fiona Page: I am sure that ministers will be happy to have a dialogue.

Cathy Peattie: I am really shocked.

Philip Wright: Fiona Page was describing the bill, but a plethora of other measures will bear down on public bodies. For example, the carbon reduction commitment will bear down on local authorities, which will be obliged to participate in the scheme subject to their meeting a certain energy threshold—as a good number of authorities will. Other policy measures will also bear directly on public sector bodies. The bill represents a fall-back position; if the measures to which I have referred and other measures in specific policy areas that may come along in the future do not work, we can resort to the general provisions of the bill to apply the duty.

From working with local authorities and their community planning partners, we have the sense that there is a real willingness to address climate change. That may have been the case 20 years ago with equalities—it is certainly the case with climate change now. The Convention of Scottish Local Authorities has set up a task force on the issue and we believe that there is the momentum for a voluntary approach. If that does not deliver, we can fall back on the bill.

Cathy Peattie: So, there is no way of auditing what is happening. You just “hope” that it will happen.

Philip Wright: No. There is no “hope” behind the likes of the CRC—it is a statutory process with which authorities will be required to comply. There will be other examples of that in other policy areas.
The Convener: Is that all right for the moment? Save some questions for the minister.

Cathy Peattie: Just for the moment.

Alison McInnes: I share Cathy Peattie’s concerns. You have said that the bill is the “last resort”. Is not there an in-built time lag in the system, in that if the voluntary approach is not successful we will have to go through a process in imposing a duty? A co-operative effort is required. I do not criticise local authorities at all—some of the best examples of action to tackle climate change have been at local level—but it should be made clear in the bill that we are all in this together from the start. That would allow local authorities and other public bodies to plan. Why have you not been prepared to do that?

Fiona Page: I am not sure what duty or specific example you would like us to include in the bill.

Alison McInnes: You might want to consider including a provision for annual reporting, as is required of the Government, at local level. Such reporting could deal with issues such as the state of local authority estates.

Fiona Page: Would it cover emissions reductions, action on energy efficiency or other issues?

Alison McInnes: It could cover any of those issues. Did you not consider such matters?

Philip Wright: We were conscious that measures to address such issues are already in place or are planned. The carbon reduction commitment will require local authorities to report on their energy use and associated emissions. That will capture a large chunk of the public sector.

Alison McInnes: If we required something further, would we be duplicating the carbon reduction commitment?

Philip Wright: Any provision that we included in the bill would be duplicating the carbon reduction commitment. The UK Climate Change Act 2008 includes a reference to the commitment and to the need for provision of information. That was a preliminary move simply to get information to flow in and to provide a basis for the allowances that are made to the bodies that are covered by the carbon reduction commitment. The carbon reduction regulations will not be introduced until later, but they will cover many of the areas about which members have concerns.

Alison McInnes: Did not the consultation responses to the bill indicate clearly that public sector bodies such as local authorities support the introduction of a statutory duty?

Andrew Henderson: Some public bodies indicated that they are keen for a statutory duty to be imposed, but many others support our approach. COSLA was more than happy for us to include in the bill an enabling measure that might need to be used if we were not getting anywhere under the current concordat and the new arrangements that the Scottish Government has built up with local authorities through single outcome agreements and so on. The loudest message that came through was that we need to give those arrangements a chance to work before we impose specific obligations.

Alison McInnes: I asked about the time lag. If the voluntary approach is not working and you feel the need to impose a duty, what will be the timescale for the secondary legislation and how long will it take before we see action?

Philip Wright: If we consider the profile of sources of emissions, we see that the public sector does not make such a large contribution to emissions. Therefore, failure to deliver in that area will not have as significant an impact as it would have in the energy, transport or agriculture sectors, where the large emissions come from. The main reason why we want to focus on public sector organisations is that they have a key role as exemplars: they have a role in reducing emissions in their estates and through their procurement activities, although their direct emissions are relatively small in the overall scheme of things. That gives us breathing space to address the issue over time.

The Convener: Does the Government have a view on the timescale within which a duty would be implemented if ministers decided to make use of the provision? For example, would it be appropriate to impose a duty on the public sector within a spending review period? A public sector duty would have an impact on the finances of the bodies that were subject to it. Would it be appropriate for ministers to consider that in the run-up to the 2010 part of the cycle?

Philip Wright: I will think out loud. Fiona Page and I have mentioned the carbon assessment project. A large percentage of the Government’s expenditure—£11 billion-plus—goes directly to local authorities. The Government can try to do what it can, but once the money goes into local authorities, we lose it, to an extent. From our knowledge of how the carbon assessment project works, we might want to extend any commitment to undertake such an assessment into local authorities. However, it is a brave new area, so we are not sure how it will work. It may be the trigger for promoting action such as the convener suggests. We might not have to go to the extent of imposing a duty. There could be encouragement or demonstration.

The Convener: It could be argued that the promotion of a duty in association with a spending
review might be more compatible with the concordat approach, rather than with a return to ring fencing. Has the Government considered that or discussed it with local authorities?

**Philip Wright:** I will have to pass on that. I have heard nothing about a return to ring fencing.

**Rob Gibson:** We realise that other committees will deal with part 5 issues, but we are keen to talk about adaptation. Will the Scottish Government publish climate change adaptation documents before those are required statutorily under the bill?

**Philip Wright:** In parallel with the bill process, we are developing an adaptation framework. We consulted last year on the principles and definitions. That was a generic approach to building up Scotland’s resilience to the impacts of climate change. We will issue a second consultation in the spring, which will build on the earlier consultation and reflect something of the responses. That will be about development of the Government’s adaptation strategy, with a view to engaging with various sectors of the economy. It is a non-statutory approach to climate proofing Scotland and facilitating that process.

The approach will be based on the evidence that is available from the UK climate impacts programme scenarios of 2002. A new set of scenarios—or projections, as they are to be called—will be produced in the next two or three months, which will provide a new baseline for developing the adaptation agenda. There is a lot of activity.

The UK Climate Change Act 2008 contains an obligation to produce a UK risk assessment, which will use the UKCIP 2009 projections, as they will be called, to look across the economic sectors to identify the level of risk to which they are exposed. That will help to inform the Government’s response and the response of businesses and public sector organisations that operate in those sectors.

**Rob Gibson:** Can you share with us any outstanding ideas that emerged from the first consultation, and which you will include in the second consultation?

**Philip Wright:** I had a look at the draft last week. The document is in preparation and will be consulted on in the office because it is cross-cutting and touches on a number of policy areas. It would be premature to suggest how we will reflect people’s views; you will find out in due course.

**Shirley-Anne Somerville:** On the Scottish adaptation strategy, the bill will rely on a UK impacts report. What guarantees have you been given that the report will address Scotland’s unique opportunities and challenges? What role will Scottish organisations have in developing the report?

**Philip Wright:** I do not know the scientific detail, but there will in essence be a scientific assessment of the risk to the UK. Because the science does not acknowledge administrative boundaries, the UK will be considered as a whole. I expect the report to be relatively neutral in relation to administrative arrangements, so we should get as good a picture of Scotland as we get of the other countries in the UK. There will be a separate response from each of the four countries, because we will quickly drop into devolved matters. We are on the steering group, so we are closely engaged in the process. We are also engaged in the UK’s CIP programme.

**The Convener:** It is strange to mention this at the end of our discussion, but why is there no reference in the bill’s long title to the need to avoid dangerous climate change? Was such a reference considered? Its inclusion would allow the advice from the Committee on Climate Change or subsequent advisory bodies to be geared towards avoiding dangerous climate change rather than towards a specific target to reduce emissions by 80 per cent.

**Philip Wright:** Such a reference was called for during the passage of the UK Climate Change Bill. The UK’s responsibility in that regard is an issue, and such a high-level objective seemed inappropriate. The bill will inform the trajectory, as we discussed, but it is not in the gift of the UK Government or the Scottish ministers to prevent dangerous climate change—

**The Convener:** They might not be able to do so unilaterally. However, was another form of words considered? For example, there could be an acknowledgement of the need to contribute to international efforts to avoid dangerous climate change.

**Philip Wright:** That is the bill’s implied objective, but whether ministers would be prepared to make explicit such an objective is a matter for further consideration.

**Fiona Page:** As the convener knows, Parliament has the final say on the bill’s short and long titles. Ministers wanted to introduce a climate change bill, so that was our starting point. As additional provisions to help us to achieve the policy aims were identified, we captured the spirit of them in the long title, but we did not go much beyond that.

**Philip Wright:** I talked about moving targets. It has been suggested that dangerous climate change might be avoided if temperatures do not rise by more than 2°C, but there are different views on that, just as there are different views on the atmospheric concentration of greenhouse
gases that is associated with a 2°C rise. We must steer clear of words that attach themselves to anything too specific. A conference took place in Exeter two years ago simply to discuss what "dangerous climate change" means. The convener's suggestion might take us into a tricky area in legislating.

16:00

**The Convener:** No doubt the science will continue to develop on the danger of a 2°C rise and on parts per million. I understand why you would not want to include "2°C" in the long title. Does that not reinforce the argument for making the title less specific and more conceptual, for example by referring to the need to contribute to efforts to avoid dangerous climate change?

**Philip Wright:** We will take your proposal away and think about it. Perhaps you can ask the minister about it when he gives evidence to the committee.

**The Convener:** Thank you.

Were additional measures considered for inclusion in the bill, but rejected? Can you give us information about decisions to reject issues during the preparation of the bill?

**Andrew Henderson:** In the consultation, we explored in detail and asked about the possibility of using emissions budgets as a model for the reduction of emissions and the shaping of the trajectory to 2050.

**The Convener:** I thank the witnesses for answering our questions. We will no doubt be well informed by your answers as we continue our scrutiny of the bill.
ANNEXE C

20 January (3rd Meeting, 2009 (Session 3)) – Written Evidence

WRITTEN EVIDENCE FROM THE CLIMATE CHANGE BILL TEAM

Factual Briefing Document - December 2008
Climate Change (Scotland) Bill

Emissions reduction targets (Sections 1 – 44)

Overall aim of the Bill

To reduce Kyoto Protocol greenhouse gas emissions by 80% by 2050.

The emissions reductions targets in the Bill relate to Kyoto Protocol greenhouse gases, carbon dioxide, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons and sulphur hexafluoride, the latter three being described as the F-Gases.

Public Consultation

Between 29 January and 23 April 2008 the Scottish Government ran a public consultation on its proposals for a Scottish Climate Change Bill. The consultation primarily addressed the subjects covered in Parts 1 to 4 of the Bill.

A total of 21,046 responses were received. The majority of respondents welcomed the consultation, the commitment and intention to introduce legislation or establish a framework, and/or the leadership shown by Scotland. Further information about the consultation, including a detailed report of the analysis of the responses, is available on the Scottish Government website from the following address: http://www.scotland.gov.uk/Topics/Environment/Climate-Change/16327/Climate-Change-Bill/SCCBConsultation

Stage 2

The Scottish Government does not anticipate making significant amendments at Stage 2 to the provisions contained in Parts 1 to 4 of the Climate Change (Scotland) Bill.

Part 1 – Emissions Reduction Targets

The Bill places a duty on the Scottish Ministers to reduce the net Scottish emissions account by 50% by 2030 and 80% by 2050.

The net Scottish emissions account comprises all Scottish greenhouse gas emissions and removals (i.e. carbon sinks such as forestry etc.) plus or minus any carbon units used or traded.

The Bill requires Ministers to set annual emissions reduction targets.

- Annual targets will be set in batches, the first for 13 years then for five years thereafter: 2010-22, 2023-27, and 2028-32 and so on until 2048-50, which will only cover three years.
- With the exception of the first batch, annual targets must be set at least 12 years in advance.
- Ministers must seek advice from the relevant body (the Committee on Climate Change or Scottish equivalent) before setting any annual targets.

The Bill permits Scottish Ministers to designate a share of the emissions from international aviation and international shipping as being attributable to Scotland. Scottish Ministers have committed to including Scotland’s share of international aviation and international shipping emissions and an order will be laid in the Scottish Parliament in time for these emissions to be included in the first batch of annual targets.
Transport, Infrastructure and Climate Change Committee, 2nd Report, 2009
(Session 3) – ANNEXE C

Part 2 – Advisory Functions

The Scottish Ministers have committed to using the Committee on Climate Change, established under the UK Climate Change Act 2008, to provide expert advice and independent scrutiny regarding Scotland’s climate change targets.

This situation will be reviewed and if it is concluded that a dedicated Scottish body would provide advice and scrutiny more suited to Scotland’s particular circumstances, the provisions enable equivalent powers to be conferred upon an existing Scottish public body or for a Scottish Committee on Climate Change to be established.

Part 3 – Reporting Duties

The intention is that the Scottish Ministers must report regularly to the Scottish Parliament on Scotland’s emissions, and on the progress being made towards the emissions reduction targets set in the Bill. The majority of reporting duties are contained in Part 3 of the Bill but two requirements are contained in Parts 1 and 5 respectively. These additional reporting duties are described here for ease of reference. The reporting requirements are as follows:

- **Annual reporting duty** (Sections 28 and 29): the Scottish Ministers will be placed under a duty annually to lay a report before the Parliament setting out specific information about the net Scottish emissions account for the year in question. It is these figures which will determine whether or not the relevant annual target has been met. If the annual emissions target has been exceeded, the report should also explain why.

- **Report on proposals and polices for meeting annual targets** (Section 30): as soon as reasonably practicable after setting any set of annual emissions targets, the Scottish Ministers will be required to lay a report before the Scottish Parliament setting out proposals and policies for meeting the current and future annual emissions targets, up to and including the annual targets just set. In practice, this report will require to be made at least once every five years.

- **Report on proposals and policies to compensate for excess emissions** (Section 31): where Scottish emissions exceed an emissions target, Scottish Ministers should also lay a report on the proposals and policies by which they will compensate for the excess emissions.

- **Requirement to seek scrutiny of relevant body** (Section 8): each year, following the annual statement on emissions, Scottish Ministers will be required to seek the views of the relevant body (the UK CCC) on progress towards achievement of the annual targets that have been set, the mid-point 2030 target and the 2050 target. Ministers will be required to lay a response in the Scottish Parliament to the points made in the report by the advisory body.

**Final statements for 2030 and 2050** (Sections 32 and 33): Scottish Ministers will also lay a final statement setting out whether the 2030 and 2050 emissions reduction targets have been met and, if not, why not. These reports will be distinct for the annual reports in respect of 2030 and 2050 which will focus on the action in these two calendar years as opposed to the long term targets.

**Reports on proposals and policies for adaptation to climate change** (Section 45): Scottish Ministers must lay a programme before the Scottish Parliament setting out their objectives in relation to adaptation to climate change, proposals and policies for meeting these objectives and the timescales within which they will be introduced. These programmes should respond to the risks posed by climate change identified in each UK-wide risk assessment prepared in accordance with the section 56 the UK Climate Change Act. In practice, the UK risk assessment will be published every five years and the Scottish Ministers’ response made as soon as practicable thereafter.
Provision of further information to the Scottish Parliament

Section 34 of the Bill requires that, where the Scottish Ministers lay certain reports before the Scottish Parliament they must as soon as reasonably practicable thereafter, and in so far as reasonably practicable (i.e. the Parliament agrees to it), make a statement to the Parliament relating to the report. These are:

- Report on annual target;
- Report on proposals and policies for meeting annual targets;
- Report on proposals and policies to compensate for excess emissions;
- Report on interim 2030 target; and
- Report on 2050 target.

Section 34 additionally requires that where the Scottish Ministers lay a report on the annual target, as soon as reasonably practicable thereafter, and in so far as reasonably practicable, they must meet with the Conveners of the Committees of the Scottish Parliament.

Part 4 – Duties of Public Bodies Relating to Climate Change

Scottish Ministers are committed to working in partnership with the public sector in reducing the target greenhouse gas emissions which affect climate change. The provisions in Part 4 of the Bill are only intended for use if emissions reductions become harder and more expensive to deliver and it is concluded that the Scottish Ministers have to use statutory measures to ensure consistent and fair contributions to delivery across the public sector.

Therefore the Bill contains an enabling power (Section 36) which allows Scottish Ministers to create secondary legislation to impose public sector duties, to take action on climate change. Scottish Ministers are required to carry out appropriate consultation before creating such climate change duties.

If duties are imposed, Scottish Ministers recognise the need to work with public bodies to help deliver these duties. Section 37 provides powers to issue statutory guidance in relation to these climate change duties.

If such duties are imposed, it will be important to monitor compliance. Section 38 of the Bill gives Ministers the power to require reporting on progress and Section 39 allows Scottish Ministers to appoint a monitoring body to monitor the carrying out of any climate change duties placed on public sector bodies under the Bill.

Climate Change (Scotland) Bill
Variation of permitted times for making muirburn (Section 46)

Summary of Bill provisions

This provision provides an enabling power for the Scottish Ministers to lay Orders to vary the permitted dates for undertaking muirburn where they consider it necessary or expedient to do so in relation to climate change.

In Scotland, there are discernible changes in the climate and in seasonal weather patterns. These climatic changes have impacted on the ability to undertake muirburn and have reduced the frequency of suitable burning days. As a result, the ability to use muirburn has been negatively affected.

Muirburn is an important land management technique which assists new growth on rough grassland and moorland managed for livestock, game and wildlife; and assists in the management of older vegetation which can act as a source of fuel for wildfires. The Bill provision aims to provide flexibility to enable it to continue to be used.

Implementation of any variation in the permitted dates will require Ministers to lay an Order in Parliament which will entail a Regulatory Impact Assessment. There is no expectation that the current muirburn season would need to be changed immediately.
Public Consultation

A consultation on the proposal that Ministers should have a power to vary the permitted dates for muirburn was launched on 25 August and ended on 17 November [http://www.scotland.gov.uk/Publications/2008/08/Muirburn](http://www.scotland.gov.uk/Publications/2008/08/Muirburn).

Analysis of the consultation is currently underway and the consultation responses will be available to view on the Scottish Government web page by the end of December 2008.

The consultation analysis report will be issued in January 2009.

Climate Change (Scotland) Bill
Power to modify functions of Forestry Commissioners (Section 47)

Summary of Bill provisions

These provisions will enable Forestry Commission Scotland to play a greater role in tackling climate change.

They will allow Scottish Ministers (by order) to modify the functions of the Forestry Commissioners in or as regards Scotland.

Such an order may also allow the Forestry Commissioners to delegate their functions to other bodies.

Public Consultation

This consultation seeks views on permitting:

- Forestry Commission Scotland to enter into joint ventures for the purposes of participating in renewable energy programmes;
- Scottish Ministers to lease land for forestry purposes and the Forestry Commission Scotland to grant cutting rights over this forest;
- Scottish Ministers the option of transferring ownership of leased land to a not-for profit trust and funds to be used to promote woodland creation to help mitigate greenhouse gas emissions.

Ministers are seeking a report on the results from the consultation exercise, and an associated options review, by the end of February. The results of this will be reported to the Parliament as soon as possible.

Stage 2

The need to amend the provisions at Stage 2 will depend on decisions taken following the outcome of the consultation exercise.
Climate Change (Scotland) Bill
Promotion of energy efficiency (Sections 48 - 49)

Summary of Bill provisions

These provisions are aiming to improve the energy efficiency of domestic, business and public sectors in Scotland.

These provisions will require Scottish Ministers

- to develop and publish an Energy Efficiency Action plan within one year of the provision being enacted;
- to report on the implementation of the action annually, laying this in parliament; and
- to review this plan at least every three years.

Although primary legislation is not required to prepare the plan, setting this in statute demonstrates the commitment of Scottish Ministers to improving energy efficiency across Scotland.

The action plan will set out all the action being taken across Government to improve energy efficiency in Scotland.

Public Consultation

The previous administration consulted on a draft Energy Efficiency and Microgeneration Strategy for Scotland between 13 March and 11 June 2007. Links to this and the associated documents are listed below:

- Energy Efficiency and Microgeneration - Achieving a low carbon future - A Strategy for Scotland: Consultation Responses (9 August 2007)

On 4 June 2008 the Scottish Government published a consultation analysis report summarising the issues raised by respondents.

As the consultation had been initiated under the previous administration, the Scottish Government published a separate response to the issues raised during the consultation along side the analysis report. Links to these documents are:

  [http://www.scotland.gov.uk/Publications/2008/05/30140817/0](http://www.scotland.gov.uk/Publications/2008/05/30140817/0)
  [http://www.scotland.gov.uk/Publications/2008/06/03113737/0](http://www.scotland.gov.uk/Publications/2008/06/03113737/0)

Stage 2

Officials are currently in discussion with the Steering Group for Sarah Boyack’s Members’ Bill on Energy Efficiency and Microgeneration and separately the Green Party over possible measures which could be included in either the Climate Change Bill or the Energy Efficiency Action Plan.
Transport, Infrastructure and Climate Change Committee, 2nd Report, 2009
(Session 3) – ANNEXE C

There is the possibility that these discussions may result in the need for Amendments at Stage 2.

Climate Change (Scotland) Bill
Energy performance of non-domestic buildings (Section 50)

Summary of Bill provisions
The aim of these provisions is to improve the energy performance of existing non-domestic buildings which will raise the contribution that the existing non-domestic stock can make to mitigating climate change.

Buildings account for over 40% of emissions and there is scope to further reduce these levels.

Why are they necessary?
The provisions are required to make regulations providing for the assessment of the energy performance of non-domestic buildings and the emissions of greenhouse gases produced or associated with such buildings.

The regulations for the assessment of existing non-domestic buildings could include:
  o type of non-domestic buildings covered;
  o persons who are required to obtain assessments;
  o time periods for carrying out assessments;
  o procedures and methodologies that must apply;
  o persons who can carry out such assessments;
  o certificates issued following assessment;
  o enforcement authorities; and
  o keeping of records and enforcement and offences.

Public Consultation
A public consultation “Action on Climate Change: Proposals for improving the energy performance of existing non-domestic buildings” was launched on 2 September 2008 and closed on 24 November 2008.

The consultation document can be accessed at http://www.scotland.gov.uk/Publications/2008/08/15155233/1

A total of 70 responses have been received and analysis of the responses is on-going and will be completed by the end of January 2009.

Topics covered in the consultation include:
  o Extending the scope of energy performance certificates into Assessment of Carbon and Energy Performance (ACEP) to take account of operational ratings as well as asset ratings and also embodied energy/carbon when a robust methodology is available to address the issue of historic and traditional buildings. This includes varying the lifespan of such assessments/certificates;
  o Requiring owners or their delegated persons to obtain ACEPs (even though they are not selling or renting out their buildings);
  o Requiring owners of non-domestic buildings to formulate action plans for building work arising from the advice on their ACEPs and encouraging them to implement their action plans;
  o Developing appropriate standards for such building work e.g. energy efficient lighting, roof space insulation or sub-metering; and
  o Empowering local authorities, or similar public bodies, to check ACEPs.
Scottish Climate Change Bill
Promotion of Renewable Heat (Section 51)

Summary of Bill provisions

This provision will enable Scottish Ministers to take steps to promote the use of heat produced from renewable sources.

This is needed to build a commercially viable renewable heat industry in Scotland in support of the Scottish Government 2020 renewable energy target (11% of heat demand to come from renewable sources). This will help to reduce carbon emissions.

It is recognised that Scottish Ministers already have powers to promote renewable heat – heat is not mentioned in the Scotland Act, therefore is devolved by omission. However setting this in statute (e.g. by putting an obligation on Scottish Ministers to develop and publish a Renewable Heat Action Plan) shows the importance and commitment by Scottish Ministers to increase the uptake of heat from renewable sources.

Public Consultation

In 2006, the previous administration asked a sub group of the Forum for Renewable Energy Development in Scotland (FREDS) to identify and develop recommendations for the key components of a Scottish Renewable Heat Strategy. The group published a report in February 2008. The link to the report can be found at:

  http://www.scotland.gov.uk/Publications/2008/03/11102501/0

The document contained a section on renewable heat (section 6) which included a proposed Action Plan for Renewable Heat in response to the report from FREDS. The link to the report can be found at:

- Making Scotland a Leader in Green Energy – draft framework for the development and deployment of renewables in Scotland
  http://www.scotland.gov.uk/Publications/2008/11/05115324/0

The responses to the consultation are currently being considered. However there appears to be broad support for the need to promote renewable heat and for the target of 11%. In addition other views expressed commented on the need to raise awareness by showcasing good practice, targeting off-gas grid areas and the need to produce a renewable heat route map. All comments received will help inform the completion of the Action Plan.

Stage 2

The responses to the consultation are currently being considered. It is possible that Scottish Ministers may seek to include an amendment at Stage 2 to require the production of a Renewable Heat Action Plan for Scotland. The Action plan could include a wide range of actions such as:

- Route map
- Information provision
- Links with waste heat
- Fuel poverty
- Planning
- Skills and Training
Additional information

Steps are being taken to introduce a UK wide financial mechanism to help support the take-up of renewable heat. The UK Energy Act includes enabling powers to design such a mechanism.

Renewable heat is a mixture of devolved and reserved provisions (while Scottish Ministers have powers to promote renewable heat, any regulatory incentive administered by Ofgem will cut across reserved functions).

Scottish Ministers have agreed with UK Government that Westminster can legislate on their behalf in terms of a renewable heat incentive (RHI) but that Scottish Ministers will be fully consulted. There is broad support from stakeholders of this approach.

Any future Renewable Heat Action Plan will focus on actions that are within Scottish Ministers devolved powers and will enhance any RHI introduced at a future date.

Scottish Climate Change Bill
Waste reduction and recycling (Sections 52 - 61)

Summary of Bill provisions

Scottish Ministers may, through regulations, introduce new obligations for providing:
- Waste prevention and management plans
- Information on waste
- Facilities for deposit of recyclable waste
- Procurement of recyclate
- Targets for reduction of packaging
- Deposit and return schemes
- Charges for supply of carrier bags

These powers are being taken to reduce the impact of waste management and, misuse of resources have on climate change.

It is intended that regulations (by affirmative procedure) would be used to set out detailed requirements, for example:
- Contents of a waste plan;
- Who should give what information on waste;
- Who should provide facilities to recycle, what should those facilities be and for what types of wastes;
- What types of recyclate should be procured and the quantities;
- What targets would apply to packaging placed on the market, the types of packaging and on whom the targets would apply;
- How a deposit and return scheme would function, in relation to which materials supplied by whom; and
- Charges for carrier bags - what charges, for which bags and the application of the charge revenue.

Public Consultation

The consultation responses indicated general support for the principal of taking measures in the Bill to implement zero waste.
The level of support varied according to specific provision (and, indeed, between taking powers and actually exercising them). The least support was for charges for carrier bags.

**Stage 2**
Amendments at Stage 2 are only likely if there is a need to refine provisions in the Bill in the light of discussions at Stage 1.

**TECHNICAL NOTE: Climate Change (Scotland) Bill: Greenhouse gas (GHG) Emissions, Annual Reductions and Targets**

**Purpose**
The purpose of this Technical Note is to describe in more detail the trajectory prescribed in the Climate Change (Scotland) Bill for reducing Scottish emissions of Kyoto Protocol greenhouse gases, in particular the annual percentage rate of reduction necessary to achieve the targets. The approach described includes estimated emissions from international aviation and shipping.

The target greenhouse gases for the Bill are carbon dioxide, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons and sulphur hexafluoride, the latter three being described as the F-Gases.

**GHG Data**
Figures for Scottish greenhouse gas emissions at source are currently published approximately twenty months after the end of the calendar year to which they refer - 5 months after publication of the final UK inventory. The latest published figures, the 2006 GHG emissions, were published in September 2008¹. Disaggregated figures for international aviation and shipping emissions, for each of the four countries of the UK, have recently become available and the Scottish figures are included in this analysis².

**Baselines**
1990 is the base year for emissions of carbon dioxide, methane and nitrous oxide, and 1995 is the base year for emissions of fluorinated compounds (F-Gases) in accordance with Article 3.8 of the Kyoto Protocol. For ease of reference, the figures shown as 1990 in this document combine 1990 figures for carbon dioxide, methane and nitrous oxide with the 1995 figures for the F-Gases.

The first year for which an annual target will be set under the Bill, once enacted, is 2010.

**Emissions Reductions**
The emissions reduction framework in the Climate Change (Scotland) Bill is based on the following pillars:

- The annual target for the year 2010 must be an amount which is less than the estimated net Scottish emissions account for 2009.
- The emissions reduction targets for each year in the period 2011-2019 must be an amount which is less than the target amount for the previous year.

In the period 2020-2050 the annual percentage rate of reduction in greenhouse gas emissions will be driven by targets which must be at least 3% lower than the target for the previous year.

- Greenhouse gas emissions in 2030 must be at least 50% below emissions reported for 1990.
- Greenhouse gas emissions in 2050 must be 80% below emissions reported for 1990.

For information, on the basis of the 2006 GHG inventory (including international aviation and shipping emissions) Scottish emissions were 70.1 megatonnes of carbon dioxide equivalent (Mt CO₂e) of GHG emissions relevant to the 1990 baseline (1995 for F-gases).

Emissions in 2009

It is necessary to make certain assumptions about the starting point for the new statutory emissions reductions trajectories because the statutory regime is being put in place before the actual emission levels for 2009 will be known.

The first assumption is that greenhouse gas emissions in 2009 will follow a similar trend to 1990-2006, taking account of the EU Emissions Trading Scheme for emissions in 2005 and 2006. On this basis the average annual rate of reduction in GHG emissions between 1990 and 2006 was 1.23%. While we have information on UK allocations under the EU Emissions Trading Scheme for the period 2008-2012, there is as yet no agreed methodology on how to apportion a share of the allocations for Scotland’s carbon budget.

Reductions to 2019

Assuming the 2009 emissions have fallen at an average rate of reduction of 1.23% since 1990, emissions in 2009 would equate to some 55.4 Mt CO₂e. If the average annual rate of reduction in the period 2009-2019 ranges between 1.23% - 2.75% (as described in the example scenarios below), on the basis of these assumptions, emissions in 2019 would be estimated between 48.96 - 41.93 Mt CO₂e. This represents a reduction of 30-40% below the 1990 value.

Before setting the levels for annual targets, Scottish Ministers will be informed by the advice of the UK Committee on Climate Change. This advice is expected to detail the optimal, most cost effective emissions reductions options to pursue and may define a different trajectory to the range outlined in the paragraph above.

For illustrative purposes a number of emissions reductions scenarios are described below and detailed in Table 1. The reduction rates relate to the period 2010-2019.

**Scenario 1 – 1.23% average annual reduction in greenhouse gas emissions**
Annual rate of reduction is in line with the average rate in the period 1990-2006.

**Scenario 2 – 1.49% average annual reduction in greenhouse gas emissions**
Emissions reduction required to achieve a 34% reduction in emissions in 2020 against 1990 baseline – this target relates to the emissions reductions required by the interim carbon budget set out by the Committee on Climate Change in its inaugural report Building a low carbon economy, published on 1 December 2008.

**Scenario 3 – 1.50% average annual reduction in greenhouse gas emissions**

**Scenario 4 – 2.00% average annual reduction in greenhouse gas emissions**

**Scenario 5 – 2.50% average annual reduction in greenhouse gas emissions**

**Scenario 6 – 2.75% average annual reduction in greenhouse gas emissions**
Emissions reduction required to achieve a 42% reduction in emissions in 2020 against 1990 baseline – this target relates to the emissions reductions required by the intended carbon budget set out by the Committee on Climate Change in its inaugural report Building a low carbon economy, published on 1 December 2008.
Reductions from 2020 to 2030

From the estimated emissions level of 48.96 Mt CO$_2$e in 2019, which would be the position if emissions continue to reduce at 1.23% per year, in line with the average rate in the period 1990-2006, emissions would need to have an average annual rate of reduction from 2020 of 3.95% in order to achieve an 80% reduction by 2050. On such a trajectory, emissions in 2030 would be approximately 55% less than in 1990.

The Bill requires that emissions in 2030 be reduced by at least 50% compared to the amount in 1990. To achieve a reduction of exactly 50% in 2030 from a position of 48.96 Mt CO$_2$e emissions in 2019, the annual rate of reduction of emissions in the period 2020 to 2030 would have to average 2.99%. The Bill sets a minimum annual reduction of 3% from 2020.

Reductions from 2030 to 2050

Having achieved the 2030 target of 50% reduction in emissions, relevant to the 1990 level of emissions, the average annual rate of reduction required to achieve the 2050 target (an 80% reduction from 1990 emissions) would be 4.5%.

Chart 1 shows the pattern of reductions required to achieve the targets assuming that emissions in 2009 in line with the rate of reduction from 1990-2006 and that annual percentage reductions are constant in each period and as described above. Table 1 provides estimates of the key figures for the 6 scenarios.
Greenhouse gas emissions - 1990 to 2050 - includes international aviation & shipping & takes account of trading in the EU Emission Trading Scheme in 2005 and 2006

Assumes that emissions in 2009 are on the same trajectory as 1990-2006 and this continues to 2019 - annual rate of reduction 1.23%

Constant average annual rate of reduction of 2.99% required to achieve 2030 target

Constant average annual rate of reduction of 4.48% required to achieve 2050 target

Interim Target 50% reduction from 1990

2050 Target 80% reduction from 1990
Table 1  Emissions reductions necessary to achieve 50% reduction target in 2030, and 80% reduction target in 2050; taking account of trading in the EU Emission Trading Scheme in 2005 and 2006

Scenarios considered:
emissions in 2009 are in line with the rate of reduction between 1990 and 2006 (1.23%); between 2009 and 2019 rate of reduction ranges between 1.23% and 2.75%

EU Emission Trading Scheme allocations and emissions for Scotland

(1) This scenario shows that if emissions in 2009 have fallen in line with the average annual rate of reduction in the period 1990-2006 (1.23%) and this annual rate of reduction continues in the period 2010-2019, followed by a 3% annual rate of reduction in the period 2020-2030 - this would result in the 2030 target of 50% of 1990 emissions (i.e. 35.06 Mt CO₂e) being achieved and would necessitate an annual rate of reduction of 4.47% in the period 2031-2050 in order to achieve the 2050 target.

(2) These scenarios give the annual rate of reduction required in order to achieve emission reductions of 34% and 42% in 2020 against a 1990 baseline. The figures of 34% and 42% relate respectively to the emissions reductions required by the Interim and Intended carbon budgets set out by the Committee on Climate Change in its inaugural report Building a low-carbon economy - the UK’s contribution to tackling climate change, December 2008, available from: [http://www.theccc.org.uk/reports](http://www.theccc.org.uk/reports)

(3) From 2020, the Bill requires minimum annual reductions of 3% compared with the target for the previous year. In these scenarios, such reductions lead to emissions in 2030 below 50% of 1990 baseline emissions (35.06 Mt CO₂e), and the subsequent annual rate of reduction in the period 2031-2050 required to achieve the 2050 will differ from the 4.48% annual rate of reduction if 2030 emissions were exactly 50% of 1990 emissions.
Climate Change (Scotland) Bill
Written Evidence Request - Carbon Footprint Reporting Timeframe

At the Transport, Infrastructure and Climate Change Committee meeting on 20 January 2009, the subject of the Scottish Government’s ecological footprint project was discussed. The Convener stated that it would be helpful to explore in writing the potential timeframe for reporting the outputs of this work. This letter seeks to provide that information, which I hope the Committee will find useful.

The Scottish Government is committed to measuring Scotland’s ecological footprint, with work currently underway investigating the development of Scottish economic-environmental accounts to improve the quality and transparency of footprint calculations. The output from this work will include a carbon footprint for Scotland which we expect to be available in 2010.

In the interim, ecological and carbon footprint information for Scotland and Scottish Local Authority Areas will be available in May this year from the Stockholm Environment Institute (SEI), University of York and Experian. This footprint calculation uses UK input-output tables and UK economic-environmental accounts, disaggregated using Scottish consumption data based on 2006 data. By comparison, Scotland’s carbon emissions for 2006 were published in September 2008.

The Scottish Government is also considering the frequency for producing the ecological footprint indicator and, given the complexities of the indicator and the frequency of the data available to feed into the model, we anticipate recalculating Scotland’s ecological footprint every two or four years.

The frequency of reporting on the ecological and carbon footprint does not prevent the Scottish Government from reporting the latest position on the carbon footprint as part of the Scottish Ministers’ annual report on production-based emissions performance required by the current Climate Change (Scotland) Bill provisions.

Further information regarding the national indicator to reduce Scotland's ecological footprint is available on the Scottish Government website at the following address: http://www.scotland.gov.uk/About/scotPerforms/indicators/ecologicalFootprint.

I hope that this is helpful.

Philip Wright
Deputy Director
Climate Change Division
Scottish Parliament

Transport, Infrastructure and Climate Change Committee

[THE CONVENER opened the meeting at 14:00]

Climate Change (Scotland) Bill: Stage 1

The Convener (Patrick Harvie): Good afternoon. Welcome to the fourth meeting this year of the Transport, Infrastructure and Climate Change Committee. I remind everyone present that all mobile devices—phones, BlackBerrys, pagers and so on—should be switched off.

There is just one item on the agenda for today’s meeting: continuation of our consideration of the Climate Change (Scotland) Bill at stage 1. This is our second evidence-taking session on the bill. Today, we will hear first from experts in the field from the Met Office, universities and the Sustainable Development Commission Scotland, and then from the United Kingdom Committee on Climate Change. We expect to continue taking evidence until some time in March, at which point we will hear from the Minister for Transport, Infrastructure and Climate Change and publish our report. In addition to taking oral evidence, we have issued a call for views on the bill; the deadline for written responses is 27 February.

Without further ado, I welcome the first of our two panels. We are joined by Professor John Mitchell, director of climate science at the Met Office; Professor Peter Smith, professor of soils and global change at the University of Aberdeen; Phil Matthews, senior policy adviser at the Sustainable Development Commission Scotland; and Dr Andy Kerr of the University of Edinburgh, who is the assistant director of the Scottish alliance for geoscience, environment and society. I invite the witnesses to say some brief words of introduction before we get started with questions.

Dr Andy Kerr (University of Edinburgh): I need to add that currently I am seconded part-time to the Scottish Government’s climate change team to work two days a week on its strategic overview project, about which the committee has heard. The project is concerned with delivery of whatever targets are set by the bill.

The Convener: I will kick off the questioning. When considering the bill, we are interested in hearing about the most recent climate science, to enable us to judge whether the approach that is being taken in the bill and by the Government more generally is up to the mark. Could you provide us with a synopsis—it may need to be a brief one, given the complexity of the subject—of how the science has moved on since the 2007 report of the Intergovernmental Panel on Climate Change was published?

Professor John Mitchell (Met Office): The IPCC report came out just over a year ago, by which point the science that it contains was about two years old. The biggest change that has taken place since then is that there is now more emphasis on trying to understand the probability of different levels of climate change. The word “probability” is relevant to the bill. For example, our current understanding is that reducing emissions by 50 per cent by 2050 would give us a 50 per cent chance of keeping warming down to 2°C; an 80 per cent reduction in emissions would bring the chance of warming exceeding 2°C down to 10 per cent. However, it is necessary to emphasise that this is cutting-edge science, and that both the mean level of change and levels of uncertainty may change. For example, the IPCC included in its report only at a late stage the effects of changes in the carbon cycle, which tend to push temperatures up slightly. When considering legislation, the committee must be aware that, in 10 years’ time, the numbers may be different.

My second point, to which we will probably return during the session, is that when considering measures to reduce emissions and to monitor what is happening, we must take into account not only climate change but climate variability in the future. For example, it is proposed to check emission levels every year; a very cold winter will increase space heating, which will push up emissions in that year, but the position may be different in the following year. Therefore, when you are considering measures, you must take into account not only climate change but climate variability.

The Convener: For clarity, are the 50 per cent and 80 per cent reduction figures to which you refer global figures?

Professor Mitchell: Those are global figures.

The Convener: So they are the figures before we get into any policy decision about whether richer countries should make deeper cuts and so on.

Professor Mitchell: Exactly.

Professor Peter Smith (University of Aberdeen): On mitigation, which is my specialist area, the work since the publication of the IPCC’s fourth assessment report has focused on identifying and better quantifying the economic costs of mitigation—how much we can do with a given range of measures across all the sectors, what that will cost and how it will play out across
the sectors. Many of the studies that have appeared since the assessment report have drilled down into the individual sectors to look at the measures that are available and to cost those to see how much we can achieve and how much it would cost to get there.

The Convener: The bill uses the IPCC report as its basis and the Government will also use advice from the UK Committee on Climate Change as a basis for determining its approach to the issue. Could the Government incorporate more recent scientific evidence and data into the bill? Is there a more appropriate way in which it could ensure that, once the bill is passed, further scientific developments are brought into Government thinking?

Professor Smith: As I understand it, the Parliament will take advice from the UK Committee on Climate Change and from a Scottish committee on climate change—is that correct?

The Convener: That is one of the possibilities for which the bill allows, although we have heard that the Government does not intend to propose the creation of such a committee in the immediate future.

Professor Smith: Clearly, that would be the main mechanism through which to get such information and to enable cutting-edge scientific understanding to be fed through to inform the passage of the bill and, after the bill has been passed, further decisions on setting and achieving annual targets.

Professor Mitchell: A couple of things are coming up. One is the UK climate impacts programme, which will produce its new scenarios by—I hope—21 April. That will help, perhaps not so much with mitigation as with adaptation. Those scenarios will be quite an advance on UKCIP02 and they cover all the United Kingdom, so they will be of interest.

My organisation provides advice to the Westminster Government through the Department of Energy and Climate Change and the Department for Environment, Food and Rural Affairs, which fund us, but we are able to advise where that is helpful.

The nice thing about the IPCC is that it ensures that there is a consensus. If you are looking for more recent advice, you have to trust the people whom you are asking; it is a matter of judgment.

Dr Kerr: I will add to what Pete Smith said, which is that if you are going to bring in the latest science, all that you need is a repeat cycle so that you keep checking against the latest science that comes out. As long as you have a process for doing that, you can update your targets a few years out. My understanding is that the bill delivers such an approach.

The Convener: Do any of the witnesses want to comment on where we are in the development of a global deal on climate change? The process attracts a certain amount of press attention and it is one in which the Scottish Government has some level of participation, but perhaps less than the Government of an independent country. Without getting into whether that would be desirable, where do you think we stand in relation to that process?

Professor Smith: I guess that you are referring to the Bali road map, which is in place. The meetings that took place in Poznań were to enable the various interested parties to position themselves with respect to the main decisions that will be taken in Copenhagen, so it would be premature to say now what we imagine will be in any agreement that is reached. The really important thing about the Bali road map is that it includes not just the developed countries, as the Kyoto protocol does, but the developing countries. Given that, from an emissions perspective, developing countries such as India and China, the economies of which are in transition, are jumping ahead of some of the formerly industrialised countries that were covered by the Kyoto protocol, it is extremely important to have those countries on board for any meaningful global climate agreement. Whatever agreement we reach, we need to have more global coverage than we had under the Kyoto protocol.

Dr Kerr: I will make two points. It is clear that one of the great sticking points has been that countries such as China and India have required the USA to be involved substantively in delivering emissions reductions, which has not been the case until now. Comments by the new President suggest that the USA will get on board, which might be grounds for optimism, but if one talks, in particular, to businesses and carbon market players in the City of London, it is fair to say that there is a degree of scepticism about whether the Copenhagen talks will deliver a meaningful global deal, as opposed to a series of regional deals, which appears more likely. It is difficult to say; that is just conjecture.

Professor Mitchell: It is too early to say exactly how the US position will change as regards engagement in emissions reductions. We might be optimistic, but we should wait and see what happens. Through the World Meteorological Organization, I have been involved in organising the next world climate conference, and the US has been highly reluctant to engage in anything involving climate change. It is too early to say whether that has changed—the President has just been inaugurated—or in what direction it might
change. It might not change in the direction that we expect.

The Convener: Before we move on to the next set of questions, I should have recorded at the beginning of the meeting that Cathy Peattie and Charlie Gordon have sent their apologies. That is on the record now.

Alex Johnstone (North East Scotland) (Con): As practitioners in the field of climate change science, do you feel that the Scottish Government has properly exploited your expertise in framing the Climate Change (Scotland) Bill and other proposed legislation that might take climate change into account?

Professor Mitchell: From my point of view—this is the second committee that I have appeared before—you have tried to take into account a range of scientific opinion and, so far, that has been done well.

Alex Johnstone: I am trying to get at whether, in this bill and in other proposed legislation, the Scottish Government is up to speed with scientific opinion. Is there any lag? Is more effort required?

Professor Smith: The Government—as in the civil service part of the Government—is consulting and has had a number of meetings. More broadly, outside the Government specifically, the public consultation on the bill has allowed various groups and interested parties to feed in. From my perspective, that process has been completely open and inclusive. The Government has taken the necessary advice and has contacted the main players. As far as I am aware, no one in the scientific community has felt excluded from that process.

Dr Kerr: An issue from my perspective is that all Administrations, certainly in the United Kingdom and in most other European countries—it is not just to do with the Scottish Government or any particular Administration—have had a significant problem with delivery, as opposed to the setting of targets. They might well set targets that are based on science, but it is clear from their emissions inventories that there has been a problem with how those targets are delivered. One of the key issues is delivery rather than the use of science to set targets in the first place.

14:15

Alex Johnstone: The bill consultation stated that one of the reasons for legislating in the first place was

"to create and enable new means of reducing emissions."

Are any of the means in the bill to achieve Scottish targets new? Are any of them world leading?

Professor Smith: I would say that there is nothing new under the sun. We have known for a long time that planting trees will deliver carbon sequestration, for example. Some measures are specific to Scottish circumstances, such as the muirburn provisions, which you will not find in many other places, simply because muirburn is not an issue in many other countries. The bill also covers land use, land use change and forestry emissions that are specific to Scotland.

The targets are ambitious. There are no more ambitious targets anywhere else in the world, although some other countries are also aiming for an 80 per cent reduction in emissions by 2050. The targets are brave, bold and world leading in that respect.

Professor Mitchell: I want to comment on the measures and their relative effectiveness. Carbon credits are a one-off. In a sense, you buy the emissions for the year and that is it. If you want to keep the emissions down to that level, you have to repeat the exercise each year or find a replacement.

Forestation is a fairly short-term measure in terms of the carbon cycle because, after a while, the forest reaches maturity and no more carbon is being fixed. One has to be aware that forestation is not so effective in areas of prolonged snow cover, because there begins to be an albedo effect: the trees make the ground appear black and there is more heat, particularly in spring, when the sun comes up. The main point is that to keep the benefit, the land has to be kept forested—it saturates if it is kept forested. How you frame the conditions on which land is let out to forestry will have to be managed carefully, so that people do not take the money for putting forests in and then take them away again, in which case you would lose the benefit.

I know that in Northern Ireland they have been looking at carbon capture and sequestration in the area between Larne and Portpatrick. I am not sure to what extent you have looked to Northern Ireland or Norway to see what can be done. Scotland has a lot to learn from countries that are in an equivalent geographical position and have similar vegetation. In relation to muirburn, it might help to find out what is happening in similar countries.

Dr Kerr: Can I just clarify your question? Are you talking about measures such as the energy efficiency action plan and the measures in relation to public sector organisations, or are you talking specifically about the natural science?

Alex Johnstone: In effect, I am talking about both, but we are looking primarily at the provisions in the bill. I am interested to know whether you feel that we have achieved anything unique in Scotland, particularly in the bill.
Dr Kerr: I back up Peter Smith’s point: I am not aware of any more stringent targets in any other country. On the measures to reduce emissions, it is my understanding that the bill is enabling legislation and that other pieces of work will have to be brought forward.

It is worth flagging up that we have to work within the context of the UK and the European Union when it comes to a number of these measures. For example, we know that the UK Government is going to bring forward the renewable heat obligation. Scotland will need to work within that context. The bill will have to work hand in glove with the legislation that is coming through at Westminster. I imagine that that can be done by providing enabling powers, although you will understand the process better than I do.

The main gaps in terms of economic instruments to reduce emissions will be in the domestic heat sector, so a heat obligation is important. Everyone recognises that energy efficiency is critical, but it is still very hard to achieve. Transport is also important. Some of these things relate to reserved powers, some are EU functions, and others are things that can be done in Scotland by local authorities and local agencies. I suspect that it is difficult to put all that into one bill, rather than saying that you will have enabling powers that will deliver measures elsewhere.

Shirley-Anne Somerville (Lothians) (SNP): Could you explain the importance of cumulative emissions? Is it technologically possible to measure them and, if so, how would that be done?

Professor Smith: If by cumulative emissions you are talking about the emissions that have accumulated since the industrial revolution—

Shirley-Anne Somerville: Sorry—I am talking about what is going to happen. The bill contains annual targets, but it is also concerned with what goes under the graph, if you like, and with cumulative emissions up to 2050.

Professor Smith: I misunderstood. I will pass the question over while I have another think about it.

Dr Kerr: There are two ways of finding out emissions from Scotland, the first of which is the annually published emissions inventory. However, one problem with that is that it is 20 months in arrears. The second way is the allocation of auctioning rights in the traded sector. Using both, you can get a sense of what the net Scottish emissions will be and adding them up over the years will give you a figure for cumulative emissions. In that sense, the information is available if you want to understand what the total emissions block will be up to 2050 and whether we will meet the stretching targets that you set.

Phil Matthews (Sustainable Development Commission Scotland): I also assume that you are referring to the area under the curve of emissions between now and 2050. The bill sets out a broad trajectory of gradual reduction in emissions up to 2020, followed by a 3 per cent reduction per year from 2020 and perhaps a 4.5 per cent cut per year after 2030. The steepness of the curve between now and 2020 is actually quite important to the overall carbon budget to 2050; I believe, for example, that it has been calculated that an additional 200 million tonnes of carbon will be generated by following that path instead of having a linear 3 per cent cut from now onwards.

The commission recognises that, in the immediate term, it is hard to move beyond what we are doing, but we would like to get much closer to 3 per cent per annum before 2020 instead of setting that as the benchmark for the 3 per cent annual cut. That approach will be important to our overall impact on the climate over the 40 years covered by the bill.

Professor Mitchell: The theoretical attraction of using cumulative emissions is that, because carbon dioxide has such a long lifespan, they probably indicate what long-term global climate change will be. However, as far as the bill is concerned, it is less clear how such an approach is relevant to a particular country that is trying to restrict its own emissions.

Dr Kerr: Many of the policy statements that have been made have been about cutting emissions by 3 per cent a year. Of course, 3 per cent of a large number is bigger than 3 per cent of a small number; as a result, there will be a very steep drop to begin with. However, because of the momentum in economies, emissions reduction will almost always take the form of an S-shape; almost all economies will reduce slowly to begin with, sharpen up in the middle and slow down again when they have to deal with the really challenging stuff at the end. I think that, instead of the assumption that emissions will simply drop away to begin with, that is a more pragmatic view of how emissions will be reduced.

Shirley-Anne Somerville: Have any other countries—large states or whatever—set cumulative emissions targets rather than annual targets in their climate change legislation?

Phil Matthews: I am not aware of that. Given that, to my knowledge, the UK and Scottish bills are the first of their kind in the world, we cannot draw on other evidence.

Alison McInnes (North East Scotland) (LD): The fact that, as Dr Kerr pointed out, the emissions inventory runs 20 months in arrears has always concerned me. Has anything been done to
speed up the process? How important is it for such information to be reported sooner?

Professor Smith: The inventory runs behind because the activity data for a given year need to be collected and pulled together. Although one could improve the efficiency of an inventory process, there is only so much that can be done. After all, a certain amount of time will always have to elapse before one can feasibly collect necessary statistics such as livestock numbers, afforestation rates and fuel consumption. Although the delay could be reduced from 20 months, a reduction to 12 months would be the maximum that could be achieved even if there was an instantaneous evaluation.

Alison McInnes: Would it be worth while trying to report within 12 months rather than 20 months?

Professor Smith: Under Kyoto accounting, reporting must be done at the end of the first commitment period, which is in 2012. Reports will be made more or less at the end of that period for the previous five years. Once we reach critical periods such as that, one would hope that annual reporting targets could speed up that process, but we will still be reporting at least one year in the past because that is where the data for the period come from.

Dr Kerr: The international standard is that reports must be made 15 months in arrears of the end of the year, so a 2006 report should be published in March or April of 2008. The Scottish statistics are published five or six months later. Presumably, we could get that back to somewhere closer to the international reporting requirements. However, we are unlikely to beat those requirements, so there will be a limit to how much can be achieved.

On the question whether the delay affects things, the answer is yes. If Scotland does not achieve its 3 per cent cut by 2021, we will find that out only in 2023. By the time that we have done anything about that, it will be 2025 so, yes, you bet it makes a difference. Such delays create all sorts of problems with the whole principle of having annual targets as opposed to carbon budgets.

Shirley-Anne Somerville: Is it feasible to measure and report on the emissions generated anywhere for goods and services that are used in Scotland?

Phil Matthews: That is consumption-based reporting. We support the Government’s general approach of using source-based emissions as the basis for the Scottish target. In our view, it would be useful to have an indicator of our wider carbon footprint or wider consumption in parallel with that, given that the two issues have been closely linked over the past 20 years. For example, in closing Ravenscraig and importing steel from the far east, we are still using something that is part of our overall carbon impact on the global economy. I would say that, yes, consumption-based reporting is important and, yes, it can be calculated. Within the national performance framework, the Government already has an environmental footprint indicator from which—as I understand it—our carbon footprint could quite easily be extrapolated.

Dr Kerr: It would be great if such reporting could be done, but it will take a while before the standards of reporting around the world are appropriate. We have global movements of goods, but the standard of reporting for emissions inventories is reasonably good in countries that are liable under the Kyoto target and pretty weak in countries that are not liable under Kyoto. There will always be a challenge in dealing with that sort of trade of goods.

Shirley-Anne Somerville: You suggest that there will be a time lag. When might the reporting be statistically strong enough?

Dr Kerr: I would not like to conjecture, to be honest.

Professor Smith: We are limited by the capacity to collect those sorts of data in the countries from which we import. Whereas many industrialised countries have what the IPCC calls tier 2 or tier 3 methods that use national bases and fairly sophisticated models for calculating emissions, many developing countries use tier 1 methods that just use default emission factors, which are not specific to their region. Generally speaking, I think that there is a greater uncertainty associated with the emissions inventories of developing countries. The only way to improve that would be to increase the capacity within those countries to move from tier 1 reporting to higher tiers of reporting. Perhaps that could be done through capacity building to improve the way that we report globally.

Shirley-Anne Somerville: Do the emission tracks that the Government has outlined—mention was made earlier of the line that the Government is assuming in the bill—reflect any of the global emissions deals that are happening? Are they flexible or stringent or optimistic enough?

14:30

Phil Matthews: The Scottish trajectory is towards a cut of 50 per cent by 2030. The cut that the Committee on Climate Change recommended as a potential target by 2020, which could be a cut of up to 42 per cent from 1990 levels, is a more ambitious target than what we have in Scotland. Obviously, Scotland is part of the wider UK act as well, but I am not sure that our target is as ambitious as the one in the UK act.
Dr Kerr: You will hear from Katherine White later, but the interim target of a reduction by 2020 of just over 34 per cent from 1990 levels, which includes Scottish emissions, was deemed to be done within the UK. The expectation was that a lot of credits would be purchased to help to deliver on the more stringent target of 42 per cent. It is not entirely appropriate to use an identical system to that which is laid out in the Government’s technical note, which talks primarily about internal emissions production.

Shirley-Anne Somerville: Based on the current scientific consensus, do you have a view on the 2030 and 2050 targets in the bill?

Phil Matthews: I take on board what Andy Kerr said earlier. Obviously, we cannot turn the economy around overnight. We are likely to see an S shape as we get all the mechanisms in place, proceed to more stringent cuts, and finally, when the low-hanging fruit has gone, complete the last stuff, which will be quite hard to achieve. However, I still think that we can do more between now and 2020 than just move on from the business-as-usual case that we have at present, with cuts in emissions of about 1.25 per cent per annum. I do not know how it could be included in the bill, but it would be good to move more quickly than the bill suggests towards annual cuts of 3 per cent by 2020.

Professor Smith: There are two factors that influence the rate at which we can change. We can change things quickly by taking the easiest and cheapest mitigation options that we can identify. Those are the options that we can adopt fairly quickly. From that perspective, we can make a large cut in emissions relatively quickly. However, there is inertia in some of our systems and institutions. We have to strike the right balance between taking the quick and easy options that we can identify and implement relatively quickly and tackling the inertia that we encounter in the system as we try to change things. Some of the changes that are required involve large changes to infrastructure. Some things will cost more but will be easy to implement once the infrastructure has changed. Some things will be relatively easy and cheap to implement. The target needs to strike a balance between those competing pressures.

However, I agree with Phil Matthews about the interim targets. It is great that we have an 80 per cent target by 2050 and a 50 per cent target by 2030, but it would focus our minds a little more if we had a more stringent target in the nearer future, such as in 2020.

Dr Kerr: I agree that Scotland can do better than scenario 1 in the technical note suggests. I wrote a paper a couple of years ago on the extent to which lots of different industrial countries had reduced their emissions, and not a single country had managed to reduce emissions year on year by more than 1 per cent except those that were going into a major recession or depression, which will deliver reductions quite easily. I impress on members the fact that radical changes will be needed in the next few years in the production and use of energy and the use of land. Whatever the trajectory is over the next 10 years, the key is to put in place the processes and policies that will deliver the cuts of 3 per cent and more that are required thereafter.

I will give an example from transport. Everyone is talking about going electric with hybrid cars. Large-scale commercial production of such cars around the world may start in about 2014, but would you buy a plug-in hybrid car unless there was electrical charging apparatus in every town and city throughout Scotland? Your answer would be no.

Scotland can put in place policies, programmes and infrastructure that will not reduce emissions now but which will enable really radical changes in the future. Regardless of what targets you set, in the next 10 years you can deliver renewable heat and electricity opportunities within the domestic sector—although renewable electricity is tied to the traded sector—and get the transport infrastructure sorted out. Those measures will not necessarily be reflected in the emissions inventory but they are critical to delivering the longer-term radical cuts that we are talking about.

The Convener: There has been some discussion of the annual targets and the trajectory in emissions reductions that are expected from the bill. Professor Smith described the momentum in the system that makes it more likely that the economy would achieve an S-shaped curve in reductions rather than more sudden or stark cuts. We have acknowledged that cumulative emissions over time will determine whether we contribute to dangerous climate change. Is the S sufficiently curvy, if I can put it that way, to avoid that? Do any of the witnesses have a view on the suggestion that the bill’s long title should explicitly refer to the Government’s contribution to the avoidance of dangerous climate change and include a specific figure for 2050?

Professor Smith: Including “dangerous climate change” in the long title would not add anything other than complexity and lots of argument about what the phrase constitutes. My preference would be to leave it simple, but that is up to you guys.

The less stringent the annual emission reduction targets are now, the more stringent they need to be in future. Andy Kerr commented that the best that has been achieved so far is a 1 per cent year-on-year reduction, so we already have fairly ambitious targets. However, just as we do not
want to load future debt on to our children, we do not want to load future emissions reduction commitments on to them. My preference, not as a Scottish citizen but from a climate change perspective, would be to have a sharper reduction and to try to identify some low-cost or even negative-cost options that could be implemented quickly to put us on the right track. The S-shaped curve could be steeper at the beginning.

The Convener: It could be steeper at the beginning than is suggested by the range of targets that are made possible by the bill.

Professor Smith: That is my opinion. Having said that I do not think that this will be easy. It will be tough to do the job that we are trying to do, and we need to balance out how realistic we are being. However, from the climate change perspective, more radical mitigation early on would be preferable.

The Convener: Some people suggest that, as Dr Kerr perhaps hinted, if an economy experiences a spike in energy prices followed by a recession, its emissions might go down as a result. It is not necessarily simple to predict whether that will happen, but it is a scenario that might occur. Given the situation that we are in, could we not expect more ambitious reductions in the early stages and require that, should the recovery materialise as expected in a couple of years, it must be sustainable in the fullest sense of the word and based on policy changes that we can put in place before then?

Professor Smith: Reduced demand and consumption should reduce emissions, but we must also develop the infrastructure to ensure larger reductions in emissions later on. Although we would rather not be in the current economic situation, it may lead to some short-term windfall benefits through a reduction in greenhouse gas emissions. However, the same economic situation may reduce the opportunities for investment in infrastructure that would lead to larger reductions in emissions later on. Andy Kerr spoke about electric cars and the need to put infrastructure in place for them. Infrastructure is also required to feed the results of microgeneration back into a large electricity grid for distribution, and that will require investment.

The recession—if it is a recession—will work in two ways: there will be a short-term windfall benefit, but there will also be threats to future investment in infrastructure.

Dr Kerr: We should also flag up the difference between the traded sector and the non-traded sector. Emissions from the traded sector are fixed by the number of allowances across the EU. Those are now set until 2020, regardless of whether people use them up or—if there is a recession—do not use them up. If people do not use their allowances this year, they will be able to keep them until 2018 or 2019. As a result, the nominal emissions in Scotland from the traded sector are fixed until 2020, regardless of what happens with end-of-year emissions.

The non-traded sector—for example, domestic heat, agricultural land use and much of transport—is a different issue. Emissions have come down, but can we drive them down further? Yes—absolutely. However, we have to distinguish between what Scotland can deliver and what has already been fixed at international level for the future.

The Convener: Should we simply accept that the traded sector can defer its emissions reductions if it does not use up its allowances, or should we challenge that assumption?

Dr Kerr: You can challenge it, but the place to do so is the European Commission. The challenge will be to get 27 member states to agree.

The Convener: I am told that that can be complicated.

Dr Kerr: Yes.

The Convener: Are there any more comments on the trajectory and on whether we could be more ambitious in the early stages? Would there be value in that? Would it be achievable?

Professor Mitchell: There is an obvious comment: it is a bit like paying off your mortgage. The sooner you start, the easier it is.

Professor Smith: I wish I had thought of that analogy.

The Convener: The Government has said that it will bring forward batches of targets, rather than set targets year by year. What issues should the Government take into account when it determines what the targets in the first batch ought to be?

Phil Matthews: The first batch goes up to 2022, so it covers the period up to and beyond the time when we are definitely aiming for 3 per cent reductions, even based on what is in the bill at the moment.

It is important that a clear steer is given every year to the business sector and the public sector on the reductions in emissions that are expected. However, it is also important that, towards the end of the period, we ensure that the slope in reductions is steeper.

Dr Kerr: If, because of any recession, emissions reduce in the next year or two, we should take that starting point and then consider the non-traded sector’s potential for reductions. We should then set targets that are a real challenge, so that the sector delivers right at the limit of what it can
achieve. That is how to push things forward. However, in order to help the sector reach those targets, you will have to vote through the right policies and measures. That may be the most challenging part.

**The Convener:** So this is about not only achievability but sending a signal. Are we talking about sending a signal that the handle will be turned further each year?

14:45

**Dr Kerr:** I would have thought so. We need to balance achievability against wanting emissions to be as low as possible. A fair approach would be to set out what is achievable and push it as hard as we can.

**Rob Gibson (Highlands and Islands) (SNP):** The bill contains no sectoral targets. Would it make sense for specific sectors to be given more scrutiny and policy direction in relation to annual emissions targets?

**Dr Kerr:** There should certainly be more scrutiny, but I am not sure whether it would be sensible to have specific sectoral targets. The more we salami slice an economy down to specific regional areas or industries, the more costly it is to deliver overall emissions reductions. However, it is clear that certain sectors have not delivered. For example, neither the transport sector nor the residential heating sector has delivered because neither sector has serious economic instruments for reducing emissions. We can pinpoint areas that have not delivered at all over the past eight to 10 years, which we must scrutinise particularly carefully. Given the Committee on Climate Change’s figures for the UK as a whole, many sectors will have to deliver dramatically more than they have done in the past few years. If one or two of them do not deliver what is required, it is clear that the overall target will not be hit. There is therefore a requirement on them all to deliver far more than they have done.

**Professor Smith:** It is useful to maintain the flexibility of not having sectoral targets at the outset because that allows the Government to choose the policy instruments that it feels are appropriate for each sector’s prevailing economic situation. If one analyses how much potential different measures can have in a sector and how cheaply that potential can be achieved, one can then assess where to get most bang for our buck across the sectors and implement a range of policies that will influence different sectors in different ways. Having separate sectoral targets at the beginning would be unnecessarily cumbersome and reduce the policy levers’ flexibility to influence different sectors at different times.

**Rob Gibson:** Professor Smith referred to low-cost options for early action in certain areas. Is the domestic heating area one of those areas, given that it has the potential for energy efficiency as well?

**Professor Smith:** Yes—definitely. On the marginal abatement cost curve, energy efficiency is right down there as cost negative; it saves money and energy, so it makes a huge amount of sense. The question is why it is not happening. One must consider the educational, societal, institutional and economic barriers that prevent it from happening. If energy efficiency is cheaper, why are we not being more energy efficient? There must be barriers in the way. The policy levers ought to try to get in place energy efficiency and other mitigation or abatement options.

**Rob Gibson:** Given that, for most parts of the UK, winter has been colder this year than in the past 10 years, I wonder whether, despite the economic depression, more domestic heating has been used than before. Does that kind of variable highlight why we should make tackling the domestic heating issue a high priority?

**Professor Mitchell:** Yes.

**Professor Smith:** Yes.

**Phil Matthews:** There has been much discussion at the UK level of a green new deal. It is vital that, in seeking ways to get out of recession, we target investment at areas that are job-creation rich, which the home energy area is. That would create an awful lot of jobs, particularly for lower-skilled people. It would have huge social benefits and provide the carbon and environmental benefits that we want. In the short term, that would help to deliver those benefits and would give us time to wait for the technologies that might take longer to kick in.

**Rob Gibson:** To sum up, you think that scrutiny is the best way to achieve the aim—you have highlighted that for us. Thank you.

Land use, land use change and forestry are particularly important to Scotland. Will you explain why that sector is important to net greenhouse gas emissions?

**Professor Smith:** Our country has a large area and a relatively small population of 5 million or so. For an industrialised country, emissions from our land use, land use change and forestry make up a relatively large proportion of our total emissions. That is why the sector is important for Scotland.

As members know, agriculture emits fairly large amounts of greenhouse gases, which could be reduced. Forestry could provide a carbon sink to remove carbon dioxide from the atmosphere. We have a lot of land and quite a lot of forestry, and
the sector is larger in Scotland than it is in most other industrialised countries.

**Rob Gibson:** Given earlier remarks, are you saying that the best policy now is not clear fell but managed forestry, which will require working in a way that is very different from how the Forestry Commission has operated?

**Professor Mitchell:** That depends to an extent on what we are trying to achieve. If we are thinking of using wood as a renewable fuel we will continue to keep the carbon sink by deforesting and allowing forests to grow again. Wood is not particularly efficient, and processing and transporting it might involve extra costs. If a forest is used merely as a sink, some management might help as it becomes more mature. However, that is a short-term measure in the life of carbon dioxide, because when a forest eventually matures, respiration and so on will start to occur, which means that the amount of carbon that it can store is saturated.

**Rob Gibson:** Since the industrial revolution, woodlands in this country have vastly diminished, so it could be argued that it is important for Scotland to restore more woodland. I will leave aside the albedo effect, because it is increasingly the case that Scotland does not have much snow.

**Professor Mitchell:** A couple of centuries ago, deforestation contributed to early increases in carbon dioxide. Scotland does not have the problem of Brazil or some other tropical countries, which found that when they started to use renewable fuels they were pushing out areas that were used for food production. That is not the case in Scotland, so the measure seems appropriate for Scotland.
