**Professor Smith:** Increasing the area of woodland is a key option. The only point to bear in mind is that there are appropriate and inappropriate sites on which to do that. Deep peats hold huge amounts of carbon, particularly in Scotland, which has massive reserves of carbon stocks. About 50 per cent of all the UK’s soil carbon is held in Scottish peats, so we need to protect that resource. We could increase our sequestration by planting more trees, but we would need to do that in appropriate places and to ensure that we do not lose the large carbon stocks in our peatlands.

**Rob Gibson:** Does that apply to areas such as the east Highlands, where the only food source on the prospective land is grouse?

**Professor Smith:** We would need to look at the soil carbon map to decide that.

**Rob Gibson:** We must consider those large areas for such development, given the difference between the minerals in the soils there and those in the deep peat areas in the north and the west.

**Professor Smith:** One would need to consider the issue case by case.

**Dr Kerr:** There is a real issue with the emissions inventory in relation to land use, in the sense that landowners can undertake a number of abatement measures that will not get flagged up in the inventory as it currently is. The methods that are used to create the inventory will not necessarily flag up actions that are taken by landowners on a year-to-year basis. Until that is rectified, there is a real problem in using the emissions inventory.

**Rob Gibson:** For the record, how do you suggest that that be rectified?

**Dr Kerr:** We need annual surveys of land cover, and we need to change the methodology that is used to create the emissions inventory.

**Professor Smith:** At the moment, the inventory is too blunt a tool. It picks up land use change, but it does not pick up very well changes in the management of an individual piece of land. For example, if an area of cropland is managed differently from the way in which it was managed 10 years ago, that will not show up very well; however, if the land use changes from cropland to grassland, that will show up. We would need a new level of information and data to enable us to process that. As with all inventories globally, the activity data—the data on what is going on in management terms—are difficult to come by. Therefore, we would need not just a new inventory, but many additional resources to collect the statistics that would be needed to drive that inventory.

**Rob Gibson:** That is very helpful. Thanks. I have no further comments on that point just now.

Let us turn to international credits. The UK Climate Change Act 2008 places a duty on the Secretary of State for Environment, Food and Rural Affairs to set a limit on international credits on the basis of advice from the UK Committee on Climate Change. The Scottish Government does not intend to prescribe such a limit. Why might those different approaches have been taken?

**Professor Smith:** I do not know.

**Dr Kerr:** I do not know.

**Rob Gibson:** The UK Climate Change Act 2008 provides access to the levers at an international level that the Scottish Government does not have. Is that a reason? Could there be other reasons?

**Professor Smith:** I cannot comment.

**Dr Kerr:** The Scottish Administration has argued that it will not use carbon credits to meet its targets but that it is leaving the option open in case it
needs to do so in the future. If there is an international agreement at Copenhagen and the UK then buys in carbon credits to meet the Committee on Climate Change’s intended target of 42 per cent, a certain number of those credits will be allocated to Scotland. In that scenario, the Scottish Government will have no choice but to accept a certain number of credits on behalf of the overall UK target. So, in talking about the traded sector credits, there are sometimes unintended consequences of which we must be aware.

I do not know why the Scottish Government has chosen not to set a limit. I cannot answer that.

Rob Gibson: We will have to dig into that a little further.

I will use two value-laden words: George Monbiot. In his critique of Lord Adair Turner’s report, he suggests an immediate renegotiation of "the European Emissions Trading Scheme, imposing a lower cap on carbon pollution and the mandatory sale of all emissions permits to the industries covered by the scheme (currently over 90% are given away)."

We know that the proposal has been watered down, in European terms, even since that report was published because of the fears of industry in Germany and Poland. How do those events bear on the intentions regarding the carbon trading accounts and so on, given the conversation that we have just had?

Dr Kerr: There was a fairly basic misunderstanding among some of the non-governmental organisations after the EU agreement in December. The environmental effectiveness of a trading scheme is set entirely by the number of allowances that are available. Whether those are given out free affects distributional consequences—who has to pay the money. If they are all given out freely to industry, that is fine as long as the cap comes down—the environmental effectiveness is not changed. What that means is that consumers pay more, as industries will pass the cost of the allowances on to consumers. So, there is an economic issue to do with industry in Poland and Germany getting more free allowances over the next few years.

Nevertheless, the original proposal that was laid out by the EU to reduce the number of allowances from 2 billion to 1.7 billion in 2020 is what was agreed, so the environmental effectiveness of the scheme is as it was proposed two years ago.

You need to distinguish between the distributional consequences of the proposal—who pays for it—and its environmental effectiveness, which is set by the cap. The proposal was certainly watered down, and many industries will get windfall profits out of it. However, in December, many NGOs did not pick up on the fact that we are dealing with two very different issues.

15:00

Rob Gibson: Thank you for that helpful explanation.

The Convener: Notwithstanding Dr Kerr’s comments about the UK’s relationship with the use of international credits, the Scottish ministers have stated publicly their intention to expend most of the effort to reach Scottish targets in Scotland. However, if the bill is passed in its current form, it will allow them to decide on the additional use of credits. If the Parliament wants to hold not just the current Government but future Governments to the pledge to expend the bulk of the effort on Scottish emissions reduction targets in Scotland, would it not be most effective for us to include a cap or limit in the legislation?

Dr Kerr: Yes. Two types of credits may be distinguished. One is an EU allowance within a capped system—many of those are traded and surrendered by Scottish installations. The other is something like a clean development mechanism credit, which is bought in from an outside source. If the committee wants to create a trajectory that guarantees that emissions from Scotland through to 2050 are below the curve and that cumulative emissions are at a set amount, it must impose limits.

The Convener: Would other witnesses like to comment on that issue or on the effectiveness of CDM credits? Are such credits a reliable way of achieving additional emissions reductions?

Phil Matthews: I support what Dr Kerr said. If you want a limit, which is a good way of ensuring that the majority of action is taken at home, you should impose one through the bill.

Professor Smith: I agree. I assumed that the aim was to maintain flexibility, to allow other mechanisms to come into play if there was trouble in meeting targets. Such mechanisms are better than nothing, and it would be difficult not to allow any flexibility. However, placing a limit on their use would be beneficial.

The Convener: How much better than nothing are the other mechanisms outside the EU system?

Professor Smith: It depends. There are all sorts of issues to do with leakage and so on. I do not want to say that the other mechanisms are not credible, but we have less control over their credibility. We have much better control over reductions in domestic emissions.

The Convener: Presumably, we would also have to factor in impacts on aspects of sustainable development and the interests of developing countries, as well as our emissions targets.

Professor Smith: Quite so.
Dr Kerr: Yes. If Scotland meets its 80 per cent target in 2050 and sits there grinning at everyone else, but no one else has got halfway there, we will not have achieved anything. There are mechanisms, such as the CDM, that have the potential to support technology transfer and low-emission routes for other countries. However, whether they achieve that is a moot point—some do and some do not. It is difficult to say in the round whether such mechanisms are good or bad; it is a grey area. Some are very good and some are very poor.

Shirley-Anne Somerville: If we set 10 per cent as the maximum reduction from international credits, is there a danger that future Administrations will use that figure instead of seeing it as the ultimate limit, on the basis that it must be okay because it is set in statute? We have seen that happen in other sectors. Are we in danger of giving future Administrations an easy opt-out by setting the limit in statute, rather than basing it on independent advice and allowing flexibility?

Professor Smith: I suppose that one way round that would be to make the cap more stringent as time goes on—as will happen with the annual targets. The cap could be made more stringent each year.

Dr Kerr: Shirley-Anne Somerville made a good point. I have no doubt that once a figure is put in statute it will be used. There might be an argument for leaving things slightly more ambiguous, while ensuring that there will be a credibility gap for the Government if it has to buy credits. That might be a more powerful tool. If the penalty for missing a target is simply a loss of credibility for the Government, an approach whereby a cap on credits is not set but the Government has to go to the Parliament and say, humbly, “We’ll have to buy credits to meet our target,” might be better. Shirley-Anne Somerville was quite right to suggest that enshrining a figure in statute would force the issue.

Alison McInnes: It is intended to include international aviation and shipping in the Scottish targets. Why are those sectors often singled out as important?

Professor Smith: It is difficult to attribute emissions from those sectors to individual countries. Such emissions have historically accounted for one of the least tractable aspects of negotiations under the United Nations Framework Convention on Climate Change. That is simply to do with the fact that ships sail all round the world and can be owned in one country and registered in another. There are issues to do with bunker fuels in shipping. Aviation raises similar issues, although they are perhaps slightly less intractable.

That is the background to the position that we are in, but it does not excuse the position.

Alison McInnes: Will you talk about the sectors’ contribution to emissions?

Professor Smith: Globally, the sectors are relatively small, but, as is often pointed out in the media, they are rapidly growing, so it is right to account for them. Whether it is easy to do so is a different matter.

Alison McInnes: The bill does not set targets for emissions from those sectors, but provides that “The Scottish Ministers may, by order, make provision regarding the emissions of greenhouse gases from international aviation and international shipping that are attributable to Scotland.” Are there inherent weaknesses in such an approach?

Dr Kerr: It is worth flagging up that disaggregated emissions inventories for aviation and shipping came out only last autumn. Disaggregating to constituent countries in the UK is at an early stage.

There is a particular problem with leakage. If we fly to the United States, many of us go via Amsterdam, Heathrow or Paris. Under the inventory, such flights are deemed to be local flights, even though our end destination is the US or Asia. There is an issue about how we account for those types of emissions, and how we get round the problem is not straightforward, given that we do not always know passengers’ end destinations. There will always be an issue to do with trying to draw a little circle round Scotland and say, “These emissions are caused by passengers from Scotland.” We cannot get round that problem; it is a challenge for us.

Alison McInnes: Should we do nothing until we have solved the problem or should we accept an imperfect system?

Dr Kerr: An imperfect system is far better than no system at all. We should bear it in mind that international aviation will come into the EU emissions trading scheme from 2013. As Pete Smith said, shipping is a real challenge, which we need to find ways of meeting.

Professor Smith: That should probably be done at international level—at UNFCCC level. We cannot take action unilaterally.

Alison McInnes: Will the witnesses elaborate on the impact of Scotland’s being the only place so far to set targets that include emissions from international aviation and shipping?

Dr Kerr: The challenge is about what policy levers allow the Scottish Government to reduce emissions from those sectors. International aviation will be tied into the traded sector, so
Scotland will be allocated a certain proportion of the nominal emissions from the UK that are associated with that. Shipping is a real challenge. If that is the sector that is pushing Scotland over a target, what is the Government supposed to do to reduce emissions from that sector? The answer is that there is very little that it can do at present, but it can work with others. It can set in train a series of actions and events to support local shipping around Scotland. There are measures that can be taken in relation to Scottish waters, but one must be aware of the wider context, especially within Europe.

The Convener: Will the witnesses say a little more about the contribution that aviation emissions make to climate change? Beyond the volume of greenhouse gases that are emitted from aviation, a number of different multipliers are used to determine the impact of aviation on the climate and on climate change. Is it safe to say that we know what the correct figure is, or is that still a developing area of the science? Is the IPCC or the UK Committee on Climate Change in the correct position in that regard?

Professor Mitchell: It is not really my area of expertise, but I understand that aviation has tended to include some of the knock-on effects, which has not been the case with other areas of transport. If the committee would like, I could make a written submission on that.

The Convener: That would be very helpful. Thank you.

As there are no more comments on that issue, we will move on. I see that Des McNulty has rejoined us.

Des McNulty (Clydebank and Milngavie) (Lab): I apologise for having to leave the meeting for a period.

I want to ask you about advisory functions and the role of the UK Committee on Climate Change. I am sure that the fact that the chief executive of that body is sitting behind you will not influence your answers.

The Scottish Government proposes to use the UK Committee on Climate Change to provide advice in the first instance, but the bill allows for the establishment of a Scottish body to reflect Scottish conditions, if that is necessary. Is such a body likely to be needed? Should we draw on the best expertise that is available in the UK, or should we look to Scotland-based scientists to provide a Scottish perspective on climate change in Scottish conditions?

Phil Matthews: I think that the position that is set out in the bill is extremely sensible. There is a great deal of expertise on the UK committee, which has just published a good report, but it is useful for Scotland to at least have the option to create a body that is separate from the UK committee if, for any reason, it is thought not to be providing all the information or evidence that is necessary to implement the bill.

Professor Smith: My view is that it is extremely useful to have a critical mass of expertise. If we can ensure that the Committee on Climate Change is able to provide everything that we need in Scotland, it will be the appropriate advisory body. It is early days—the committee has been around for only a year or so—but, if things are done in that way, the more scientific expertise one has, the better.

There are unique conditions in Scotland, and there are provisions in the bill that are relatively unique to Scotland. We will need to ensure that the advice that we receive from the Committee on Climate Change adequately reflects the specific conditions in Scotland. In the first instance, the way to go might be to ensure that the committee has on it people who have some expertise of Scottish conditions in each of the various sectors.

Des McNulty: So rather than establish a separate Scottish body, you suggest that we should go for the biggest mass of expertise but consider how we access it, to ensure that the advice is particularly appropriate for Scottish conditions.

15:15

Professor Smith: Yes. For example, the land use sector might not consider muirburn, but we need to ensure that it is considered when land use, land use change and forestry projections or recommendations are passed to the Scottish Government.

Professor Mitchell: As Pete Smith said, the climate change community is quite small, and we must be careful that we do not dilute the expertise. Apart from that, I do not have a view on the question.

Dr Kerr: It is important to realise that Scotland cannot achieve its targets alone. To achieve them, the United Kingdom, European Union and local authorities all need to work together. It is therefore extremely important to have advice at a UK level, but that could be added to with specific Scottish advice if the Committee on Climate Change does not provide such advice.

Des McNulty: The Scottish Government can ask the UK Committee on Climate Change for advice but, so far, it has not done so formally. Should it ask for advice as we move into detailed consideration of the bill?

Dr Kerr: In the first report of the shadow committee on climate change, the work on
Scotland was fairly cursory, but it tried to cover an awful lot of ground. I think that the Committee on Climate Change will pick up a number of issues from that. The Scottish Government ought to say that, now that the overview report has been delivered, it needs much more detail on specific issues that are associated with the Climate Change (Scotland) Bill and/or other specific Scottish issues. Now is the time to argue for that.

Des McNulty: Is that a shared view?

Professor Smith: Yes. The national inventory is compiled at the UK level, but it is split up into the separate countries. It would be useful to receive advice in a similar way, so that it is specific to the individual devolved Administrations.

Des McNulty: Is the UK Committee on Climate Change sufficiently independent, robust and flexible to maintain the consistency of its advice and strong recommendations in the context of the present policy diversity on energy generation, for example, and fluctuating political balances in future?

Professor Smith: I have no reason to suspect otherwise.

Dr Kerr: It is worth pointing out that the energy market—or at least the electricity market—is a UK market, so even though projections may be devolved or disaggregated to Scotland, they are tied to the wider UK situation. There is no reason to assume that the Committee on Climate Change is not doing its job of considering the Scottish issues, but that needs to be scrutinised, and if the advice is inappropriate, you will need to push harder.

Des McNulty: I can give you an example. The Scottish Government is not of the view that nuclear power has a role to play in future energy generation, whereas the UK Government sees it as central to its strategy. How can the Committee on Climate Change deal with that different policy context in two separate jurisdictions when it makes recommendations?

Professor Smith: I guess that it will be your job to ensure that the brief for the Committee on Climate Change is clear and to tell it how you need the information. You will need to say that we have a separate policy environment in Scotland and that you want not a devolved, area-based estimate that is derived from the UK estimate but one that takes account of the situation here. If Scotland buys into the UK Committee on Climate Change, you can ask for that.

Professor Mitchell: I guess that the same issue applies to adaptation, in that the changes and issues in Scotland will in some respects be different from those in the rest of the United Kingdom. My understanding is that, for example, the next UK climate impacts programme will deal with the whole of the UK. It is expensive to produce that information, and it is probably more effective to do so corporately than for each bit to try to produce its own. Climate change is very much a global problem.

Des McNulty: The difficulty that I have is that the UK Committee on Climate Change is made up of people with scientific expertise. Although they are sensitive to the policy climate, if they believe that one approach to energy generation is the best approach, arguably they should argue for it and say, “But if, in policy terms, you want to do something different, here are the consequences.” It would seem to be sensible not to place the scientists in the difficult position of following the politicians. I am trying to tease out what you think the role of the UK Committee on Climate Change is. Is its role to offer the best evidence—irrespective of policy considerations—and challenge the politicians to come up with their policies on that basis, or is it to devise advice that fits in with policy considerations with which it might not agree?

Phil Matthews: I am wary about saying this when the head of the UK Committee on Climate Change is sitting behind me, but my recollection is that its recently published report said that nuclear is a low-carbon and potentially cost-effective technology, but that Government will have to take on board wider considerations. Such advice will be taken on board by the UK Government and the Scottish Government, and different decisions might be made. The Committee on Climate Change gives scientific advice and lets people take on board the wider consequences of decisions.

The Convener: I will follow up briefly on one aspect. Dr Kerr said that the community of climate expertise is small. Given that commitments are being put into legislation at a Scottish level, that commitments are already in legislation at a UK level, and that, if the international process is successful, a host of other Governments will take on responsibilities, seek to acquire such expertise and put in place arrangements so that they can meet their commitments, are we doing enough, either in Scotland or in the UK, to increase that expertise and grow the knowledge base?

Dr Kerr: I guess that I have a slight conflict of interest, in that the Scottish alliance for geoscience, environment and society, of which I am assistant director, is a big initiative by the Scottish Further and Higher Education Funding Council and 10 different Scottish universities to pool resources and expertise in environmental science to bring some of the best people into Scotland—people such as Professor Simon Tett, a climate scientist whom John Mitchell knows very
well. Having been at the Hadley centre at the Met Office, he is now up at the University of Edinburgh.

About 30 outstanding new people have been brought into Scotland under the initiative. There is a desire within the academic community to bring in the best. There is still work to be done in translating some of the academic work into usable policy evidence. That is, essentially, about a knowledge exchange involving academia, business and policy makers. I suggest that there is still a gap.

The Convener: The ability to attract talent to Scotland is positive, but if the same desire to attract talent increases in other countries, is there a danger that we will face limited supply?

Professor Smith: That is possible. Although the climate change science community in the UK is small, it is world leading, so we are not currently experiencing that problem. We have a small but very healthy community. Many of the research councils’ new research programmes, including the living with environmental change programme, which is a cross-Government, cross-research-council initiative, are moving funding in the direction of climate change science. The fact that climate change is recognised not only within society but within the research community as a large and challenging issue will attract more funding into the area. Unlike many areas of the economy, we are in relatively good shape.

Dr Kerr: Because of the very strong leadership that has been shown, people who are into renewable energy engineering and technologies, for example, find Scotland a very attractive place to come to. Also, a lot of work is being carried out on, for example, soils, soil emissions and terrestrial carbon cycles. Strong demand will follow Scotland’s genuine leadership.

Professor Mitchell: Over the past 15 years, the number of people in the field has grown enormously. For example, there has been a lot more work in universities, and the good side of that is that it brings diversity. Indeed, the Met Office is just about to sign an agreement with the Natural Environment Research Council on a joint climate research programme. There is a tension between having diversity, which allows new ideas to come forth, and bringing together people in areas where critical mass is required. One of the hopes behind the programme is that the work that is carried out in academia and at the Met Office’s Hadley centre will be well distributed to ensure that we cover the gaps and do not tramp on each other’s toes or do things twice.

The situation in the UK is becoming healthier. As Dr Kerr made clear, the important point is to build expertise and bring climate science into applications. At this point, I must declare an interest, as the Met Office is trying to use some of its commercial expertise in weather and climate issues to grow that area, which is probably where demand is greatest. Provided that things are well enough organised, climate science is probably okay; indeed, as Professor Smith has said, we are leading in the area.

The Convener: That is helpful. We touched on reporting duties a little earlier, but I believe that there are a couple of follow-up questions.

Shirley-Anne Somerville: We have already heard about the time lag between emissions taking place and reporting on them. How strong are the statistics with regard to margins of error? How are the figures revised over time? Is that an additional problem and, if so, has any work been carried out on it?

Professor Smith: Uncertainties have to be quantified as far as possible, and the UK follows the IPCC’s good practice guidance on quantifying uncertainties in national greenhouse gas inventories. Occasionally, however, there might be a methodological breakthrough or we might get a better data set that allows us to go back and make better assessments of our emissions. That is particularly the case in the very messy biological system of land use, land use change and forestry. When that happens, we have to revise the estimates all the way back to the baseline. Of course, that can be tricky for policy makers. The proportion of emissions from the land use sector can fluctuate with every new method of calculation that emerges. Once we are sure that it is the right way to go, we back-calculate the figures, which can change the relative importance of different sectors in the total budget.

As I say, all uncertainties have to be reported as best they can. There are internationally agreed methods of doing that and, as you know, the national inventories are relatively regularly—and quite stringently—inspected and reviewed by independent review panels. The issue, I think, is covered.

Dr Kerr: Professor Smith makes a good point about uncertainties. For example, the baseline between the 2005 and 2006 inventories moved by 4 million tonnes, which is a non-trivial movement—indeed, all the numbers in the 2006 inventory were changed, because they were revised backwards. Such moves cause presentational problems.

The other issue is variability in year-to-year data sets as a result, for example, of more coal burn in power stations or of a colder winter requiring more domestic heating. As I say, between 2005 and 2006, there was a change in CO₂ of about 4 million tonnes, because of an increase in coal burn in Longannet and Cockenzie. That is 7 per cent of the entire inventory and, in setting targets, one
needs to be aware of such variability and try to understand that one year's high figures might mean nothing more than that it was cold that year. I suspect that the Government’s report to the Parliament will set all this out but, as I say, one has to be sensitive to the inventory’s sheer variability from year to year.

15:30

Shirley-Anne Somerville: Do you think that the Scottish Parliament has enough expertise to assess whether the Scottish Government is delivering on its emissions reduction targets?

The Convener: You can laugh if you want.

Professor Smith: It should not be difficult for the Parliament to assess progress. The targets are transparent and there are inventories to back them up, so we will know what the emissions are and where the targets have been met. It will be challenging to allocate the emissions to different sectors and work out why things have gone wrong—that will be challenging for the science too—but you should receive advice on that from the Committee on Climate Change.

The Convener: Do you have any thoughts on what climate change duties should be imposed on public bodies? The Scottish Government is accepting some duties on ministers, which are explicit in the bill, but it is also taking the power to impose duties on other public bodies in the future. Is that a useful mechanism? What might those duties be? Would there be value in holding other office-holders in the public sector to account for their performance?

Dr Kerr: If you are talking specifically about duties to reduce emissions, the UK carbon reduction commitment will impose reductions on all public bodies that use more than a certain amount of energy, so that will be captured anyway. I presume that you are asking about other duties. Is that correct, or are you thinking about emissions reductions?

The Convener: The bill gives a broad power to impose climate change duties, but it does not specify what those duties would be, and so far the Government has not said whether it intends to use the power. Perhaps the power would be used later if it was felt that the voluntary approach was not up to the mark.

Dr Kerr: I return to the point that was made earlier about providing the required infrastructure and programmes for radical changes in the next few years. The Government may well need to require certain public bodies to do more than they would otherwise do to set the changes in train. In that sense, the provision seems a sensible measure, but it will depend on how it is delivered and used.

To give transport as an example, if we want to install charging points for hybrid cars in every city and town and at every supermarket throughout Scotland, who will pay for that? The Government might need to place a duty on local authorities to enforce the system and ensure that charging points are delivered. That is just an arbitrary example, but such things might not happen without enforcement from the top, which might well be a good place to start.

Phil Matthews: I support the Government’s ability to use that power in the future. As Andy Kerr said, the carbon reduction commitment partly addresses the matter, but we should also consider the wider community leadership role that a lot of public bodies have through community planning and so on. There is potential for joined-up local action, which could have the benefits of engaging with local people and encouraging behaviour change.

There are issues about adaptation at the local level, and a duty on that could be placed on public bodies. There is also potential to use mechanisms such as best value to encourage better performance from public bodies in relation to climate change. Some big changes are under way in best value. There are different approaches, but the bill must be flexible enough to allow more direct engagement on the matter between the Government and local authorities and other public bodies.

The Convener: That concludes our questions. Do you want to bring to the committee’s attention any points or issues that we did not discuss?

Professor Mitchell: There are a couple of minor matters. First, I mentioned the importance of taking into account adaptation—both to climate variability and to climate change—as well as mitigation. We have talked a lot about mitigation, which is right, but I will give a couple of examples of adaptation. Hydro power and, in particular, wind power are subject to variations in weather. Often when there is a persistent high-pressure system over the country, which in winter brings cold weather and high energy demand, there tends to be little wind. We must plan a certain resilience into renewables, although that is not an argument against using them. For example, some hydro power facilities have small catchments, which tend to dry out first in summer.

Secondly, on muirburn, the Met Office hopes to make a submission, with the Scottish wildfire forum, on how climate change may affect vegetation, the length of the dry season and so on.

The Convener: I am aware that secondary committees are also examining some of the issues
that you have raised. Thank you for taking the time to answer our questions. I remind you that we have set a deadline of 27 February for written evidence, if you wish to raise any other issues in writing. I suspend the meeting briefly to allow for the changeover of witnesses.

15:36
*Meeting suspended.*

15:43
*On resuming—*

**The Convener:** I welcome our second panel of witnesses: David Kennedy, chief executive of the UK Committee on Climate Change; and Katherine White, economic adviser to the committee. Thank you for joining us. Would you like to make some brief introductory comments before we move to questions?

**David Kennedy (Committee on Climate Change):** No, we are happy to crack on with questions.

**The Convener:** That is grand. I will start with an easy opener. Will you share with us your initial reflections on the Climate Change (Scotland) Bill?

**David Kennedy:** Is that an easy opener? As you know, to date we have been very focused on the UK Climate Change Bill. My first reaction to the Scottish bill is that it sets an ambitious long-term target. We have thought a little about the interim target and have some questions about how ambitious that is. We are not saying that it is not ambitious enough, but there is more thinking to be done about it and its implications for what must be done now. I reiterate a point that was made by the previous panel—the next five, 10 and 15 years are key. We must take our lead from what we have to do in the longer term—that has implications for what we do now—but we must act now. We must take opportunities and put in place the necessary policies. If we do not, we will miss the boat on reducing the risk of dangerous climate change.

15:45

**Des McNulty:** I have been beating on about the idea of short-term action and the fact that if we do not set targets that change the shape of the curve, we will end up not being able to achieve the targets that are set after 2020—which might be irrelevant in the end. Does the bill as drafted provide any—or adequate—reassurances about action in the short term, for example on our contribution to the peaking of climate change internationally?

**David Kennedy:** The framework is there. You need legally binding targets in the near to medium term, which you have in the bill. You have not said what those targets are, which is probably appropriate, because you have to do more analysis of what needs to be done and what can be done over the next few years.

There are two parts to this. One is the legislation and the numbers that you put in it, such as whether you have a 2 per cent or a 3 per cent annual emissions reduction target or whether you have five-year carbon budgets. Secondly—and possibly more important—there is the strategy that you adopt to deliver the carbon budgets. As a previous speaker said, we have a good track record at UK level of adopting ambitious targets, but a less good track record of meeting those targets. The challenge will be to set the targets, but the bigger challenge will be to come up with the strategies, and to implement them across all the sectors to achieve big social transformation, such as changes in the way that we think about business or corporate culture. That is what is required in the near to medium term. The targets are a starting point—you have the framework for them—but we need action around the targets, too.

**Des McNulty:** You said that the target for 2050 is ambitious and that it is in line with ambitious targets elsewhere. We do not have a target for 2020. The trajectory to 2020 perhaps does not do all that the environmental organisations are suggesting should be done. Do we need to have a target for 2020? If that target is not a percentage reduction of 3 per cent, what should it be?

**David Kennedy:** Let me talk you through the thought process that we used to set our carbon budgets. First, we asked what we need to do in 2050. We have said that we need at least an 80 per cent emissions reduction in 2050, relative to 1990. We then asked, what are the implications of that for 2020 and how do we get to 2020? You could take the same steps and swap 2030 for 2020 within your legislative framework. In 2050, you want to achieve an 80 per cent or more reduction in emissions. You would ask how you get to 2030 and see whether that is consistent with your being on the path to 2050. You would then ask what the implications are over the next 10 years for meeting your 2030 target rather than your 2020 target. There is a question about whether your 2030 target is appropriate; I do not know the answer to that, because we have not looked at it in detail.

At UK level, we will do a lot of work over the next year and a half on the appropriate path through the 2020s on the way to 2050. The UK Climate Change Act 2008 requires us to do that in recommending the fourth carbon budget, which we will do at the end of next year. In principle, it is okay to have the 2030 target and draw the implications for the next 10 years. As long as you
have a target for the next 10 years that is legally binding and is on track to what you are trying to achieve in the long term, that is adequate.

Des McNulty: What type of advice can your organisation make available to the Scottish Government to assist it in taking forward this policy agenda?

David Kennedy: Let us take stock of where we have got to. First, we asked what the appropriate target is based on the science and judgments around that science at UK level. You can move from the UK level to the Scotland level in relation to what is appropriate both in 2050 and on the path to 2050 in terms of ambition and contributions to global emissions reduction. We have put out a comprehensive picture of what is achievable in our view across the UK economy as a whole, in the sectors of power and transport, in our buildings, industry and in the non-CO2-emitting sectors.

We have tried to provide a high-level assessment of what is possible at the level of the devolved Administrations. That assessment is high level—an earlier witness described it as “cursory”—and it is certainly preliminary. We have had to use rules of thumb to go from the UK level to the Scotland level. For example, in considering Scotland’s energy efficiency potential, we have simply said that Scotland’s share of the total UK energy efficiency potential should be in proportion to Scotland’s share of total UK energy consumption. However, that might not be the appropriate way to go when we look at the issue in more detail if Scotland has specific factors—for example, if the building stock here is different—that need to be taken into account.

The next stage of our analysis will be to ask whether those rules of thumb are appropriate. For example, if we have not accounted for the specific factors that face the different national authorities, we will need to ask what we can do to correct that. Going forward—this depends to an extent on resourcing—we hope to build on our preliminary assessment by providing an assessment that is much more tailored to the specific circumstances that face the different national authorities in Scotland and other parts of the UK.

Des McNulty: You heard my question to the previous panel about the different policy context within which you might operate here in Scotland. Is the Committee on Climate Change’s role to provide scientific advice irrespective of the policy context, or should that advice to some extent be influenced by, and adapted to, the goals that are set by the politicians? How will you deal with that dilemma in taking things forward?

David Kennedy: I think that we will take things forward in a pragmatic way. First, we are independent, so we will not always take the policy context as a given. Before we published our report, the UK Government’s policy position was to proceed with investment in conventional coal-fired generation. Rather than take that as a given, we have said that it might be appropriate to take a different approach. Similarly, on the expansion of Heathrow airport, we have been asked to review UK aviation emissions but we will revisit the Government’s policy positions on aviation infrastructure rather than take those as a given.

That said, we are sensitive to the policy context as well. For example, on the question of investment in new nuclear power stations, it might be useful to recap what the Committee on Climate Change has said on power generation. We have said that there are different ways of decarbonising the power sector. One way is to have a portfolio of low-carbon generation assets that includes nuclear power alongside carbon capture and storage for coal and gas, as well as different forms of renewable energy. However, one could decarbonise the power sector without all those technologies in one package. For example, one could do it without CCS, in which case nuclear energy might need to pick up the slack. Alternatively, one could do it without nuclear power, in which case CCS might need to pick up the slack.

I liked the way in which you described the issue previously as a choice between various scenarios. Because of a particular policy position—for example, if people do not want nuclear power because they do not like the safety consequences or the proliferation issues, or the concerns about waste disposal—people might choose a different scenario. The consequences of that choice might be to raise the cost of meeting the given target, but people might choose to pay that extra cost to avoid building nuclear power stations here because they value some things differently from how they are seen in the UK context.

We will take a pragmatic approach that is sensitive to the policy context without taking it as a given. We will work around the policy context and be constructive by showing how the targets can be met in a way that is consistent with people’s objectives.

Des McNulty: The next question perhaps builds on that. Can you outline how the Scottish Government currently fits into your developing work plan? How do you expect that contribution or involvement to develop in the future?

David Kennedy: It is fair to say that our work programme for Scotland and the other national authorities is in flux and is up for discussion. In the discussion with the previous witnesses, it was mentioned that no formal request has been made to the Committee on Climate Change. I think that we need a formal request asking us to carry out
work to which we can then respond. Certainly, our intention is to carry on working in this area. We are committed to understanding better what opportunities exist at the level of each of the national authorities. The level of detail to which we take that work is open for discussion.

The issue of resource is involved: the more detail that you require, the more resource we need. We are resourced to take this work to a certain level, but not beyond it. More discussion is needed on the subject. That said, in principle, we are open to giving the committee the kind of advice that is needed in terms of target setting and strategies to meet those targets.

**Des McNulty:** I am not entirely clear on how the Scottish Government fed into your work plan. Your answer drifted into the issue of resources. Are you saying that you have taken a high-level look at the situation, but that you have not undertaken the detailed work that would have required greater input from the Scottish Government? As things move forward, will it make that greater input into your work?

**David Kennedy:** We should not underestimate the level of interaction that we have had thus far. When Adair Turner became the committee chairman, the first thing he did was to come up to Scotland and go to Northern Ireland and Cardiff. He did that as a statement of intent, to send out the message that the committee took seriously its duties under the Climate Change Act 2008 to contribute to an understanding of what is possible at the national level.

Beyond that, we have on-going interaction with officials at various levels of Government. I speak to some officials and Katherine White works with others on a frequent basis. Various groups also shape our thinking; again, Scotland is represented on those groups. In the report that we published in December, we scoped the part that talks about Scotland in consultation with officials in Scotland.

Thus far, we have not received a formal request from the Scottish Government. It has not yet said, “Can you advise us on what carbon targets can be achieved in certain sectors, or give us an overall picture that will tell us what our targets should be over the next 10 years?” In principle, we could do that, albeit that logistical issues would arise as a result.

**Katherine White (Committee on Climate Change):** Over the past six to eight months, I have worked directly with each of the devolved Administrations in preparing the committee’s first report. We held regular videoconference meetings during which we discussed how things were going. The Scottish analysts in particular were supportive of the process. They supplied the information that we required for our analysis. We are at the stage of thinking about what next year’s work programme will look like. We are doing work on behalf of the three devolved Administrations to contribute towards the UK progress report and UK budget. We are also in the process of developing the provision of specific advice to each Administration.

**Des McNulty:** With regard to the bill, the Scottish Government’s position is that it will rely on the UK Committee on Climate Change for advice in the first instance, but it reserves the option to establish a separate Scottish committee in due course. What level of resource and which governance and accountability arrangements need to be put in place if the UK Committee on Climate Change is to continue to act as the appropriate resource for advice to the Scottish Government?

**David Kennedy:** Under the Climate Change Act 2008, appropriate provision was made for governance, the framework for which involves a set of duties that include the duty to respond to requests from Scotland, whatever the issue. The sponsors group is key to shaping our work programme and channelling requests to us. We are holding a sponsors group meeting tomorrow, at which we might discuss the detail of what we can contribute to the emerging agenda in Scotland.

You asked about resource. At the moment, in our work with all the devolved Administrations, Katherine White is our only resource. She is on secondment from Scotland to the committee. Although she has made a valiant effort, I do not expect her to be able to propose appropriate targets and say how Scotland should meet them across all the sectors over the next 10 years. That would be too much for one person to do.

Further discussion will be needed on how to make progress. We will probably need at least one other person on our side; we are not talking about another five or 10 people, but at least another one. That person would work on the analytical and evidence base with all the people whom you have on your side, to make joint progress. I will have to go back and discuss the issue, but I think that our committee would probably have the capacity to scrutinise and discuss issues relevant to the Scottish Government, just as we did on the UK carbon budgets.

16:00

**Des McNulty:** Scotland has a specific landscape and environment—not just in geographical terms, but in policy terms. Can the way in which your committee is set up take account of our different circumstances?

**David Kennedy:** The short answer is yes. That will be the next stage of the work.
I will give you another example. We have done high-level UK assessments of changes in land use, of forestry and of agriculture. We suspect that the analysis will be very different at Scotland level, and we would like to look into that in more detail. From an analytical perspective, we are well equipped to do that. We have the collective expertise; we may need more people, but they could tap into a general expertise that we have built up. If evidence were taken to the committee, it would be able to give it a good hearing, understanding the specific conditions in Scotland under the different authorities here, and making appropriate recommendations.

**The Convener:** Earlier, in discussing whether the UK committee could challenge Government policy, you described the committee as independent. How is that independence guaranteed?

**David Kennedy:** It is up to us to ensure that we continue to be independent. From what we have already reported on, I think that you can see that we have not been swayed by Government—for example, on the question of investment in coal-fired generation. On the issue of credits, we have suggested that the Government be more restrictive than I think it would like to be. I could give a range of examples.

We report to Government and to Parliament, and what we say is transparent—everybody can see why we are saying what we are saying, and that it is all based on evidence and analysis. That is the foundation of our independence. We are not pulled by the political considerations of the day, and we demonstrate that by backing up our arguments with evidence and analysis.

**The Convener:** You will be well aware that, in Scotland, we do not always have Governments with a majority or a democratic mandate in the Parliament. Could it be argued that the resources that are made available for an advisory body in Scotland, or for appointments to that advisory body, might be better held by the Parliament than by the Government?

**David Kennedy:** I have asked myself that question in the context of the UK Government and our funding. The people who decide on my budget are the people whom we are advising, and we might not be advising them in the way that they would want. One solution to that would for Parliament to agree the funding and the appointments each year. At the moment, we could have recourse to a select committee if we felt that issues arose to do with funding and appointments, but such issues have not arisen so far. However, there could be a risk.

**The Convener:** It is early days.

**David Kennedy:** Yes.

**Rob Gibson:** The convener’s question may have been relevant at UK level, because there might be a minority Government in London after the next election.

You heard the evidence—Mr McNulty did not, because he did not hear the questions—on fine-tuning the emissions inventory. You have spoken about Scotland’s particular land use concerns. In the next year, will you be able to use the inventory? Your first reports contain high-level information, but will it be possible to collect better information for the emissions inventory, as part of our weaponry?

**David Kennedy:** In respect of non-CO₂ emissions, particularly in land use in agriculture, there is uncertainty about what the emissions actually are. There are rules of thumb, and conventions are used for translating numbers of livestock into emissions, for example, but that may not reflect what happens in practice on individual farms. Ideally, that should be addressed over time, and it is being addressed. We are moving towards using a smart inventory, which DEFRA is developing at the moment. We will have better information.

Does that mean that we should just wait and do nothing in those areas until we have better information? No: it is pretty clear—even on the basis of the information that we currently have—that there are abatement opportunities that we can quantify and take advantage of, although they may change over time. That is not a reason not to proceed, and we can make progress over the next year.

**Katherine White:** I recognise that the uncertainties that are associated with reporting land use change emissions in Scotland are greater than those for the UK, but the figures are the best that we have for now. There are two ways in which they will be improved over time. The centre for ecology and hydrology, which produces the projections and inventory for land use, land use change and forestry, is constantly improving its approach—that is part of its contract. Also, I am involved in the steering committee for the inventory contract that DECC leads on. The national atmospheric emissions inventory team is reviewing every area of the disaggregated emissions inventory and considering how it could be improved. No doubt, it will identify areas in land use change and other sectors where, as Pete Smith discussed, we could collect more bottom-up, Scottish or relevant devolved Administration data to support a more accurate inventory. We are directly engaged in that, but we recognise that it will take time and more resources if we are to collect annual surveys of different types of data.

**David Kennedy:** A flexible strategy might be needed. If it becomes clear that emissions
reductions in land use change, forestry or agriculture are not being delivered, they may need to be picked up somewhere else or the level of ambition may need to be changed. That will be a choice in the future. However, the Scottish Parliament’s legislative framework will allow such flexibility.

Rob Gibson: That is interesting work in progress that is happening before our eyes. Are you in a position to tell the committee about advice that may have been requested by either the UK Government or other devolved administrations either since the Committee on Climate Change was statutorily established or while it operated in shadow form?

David Kennedy: Can we tell you about work that the Government has requested from us?

Rob Gibson: Yes.

David Kennedy: The Committee on Climate Change existed in shadow form for a year and was established statutorily on 1 December 2008, which is when we reported back on the first set of questions we had been asked. Originally, it was about the carbon budget and the five-year emissions ceilings for the UK. The questions then became, “Should those be carbon or greenhouse gas budgets?” “Should aviation and shipping be included in our long-term target?” and “What should the long-term target be?” We reported on all those on 1 December 2008.

The next thing on which we have to report to the UK Parliament is progress in reducing emissions relative to budgets, in September 2009, although we will not by then have a lot of data. We will have preliminary data on 2008 emissions, but they will not be the basis for a substantial report. We are going to use that report as an opportunity to lay out a set of detailed indicators—a road map or strategy for meeting the carbon budgets that we proposed last December.

Another piece of concrete work that we have been asked to do is to review UK aviation emissions between now and 2050; to provide advice on whether they should, in 2050, be below or at 2005 levels; to consider the implications for emissions in aviation on the path to 2050; and to draw out some of those implications as regards infrastructure—the expansion of airports, new runways and so on.

We were also asked to review the UK framework for low-carbon technology research and development. I think that we are about to agree in principle to do that review. We will be asked next year to review the second-phase cap for the carbon-reduction commitment across the UK. We must also fulfil some statutory duties and report in July 2010 to Parliament, which we must also provide in 2010 with our first report on adaptation and our advice on the appropriate path through the 2020s.

Rob Gibson: Has either of the other devolved Administrations asked you for advice?

David Kennedy: We have worked closely with them, but have not had specific requests. They know that we have a work programme in this area and that we are scoping another—which is where the opportunity to advise you here in Scotland comes from—but they have made no specific requests. I am not sure that the Northern Ireland Assembly will do so, but the National Assembly for Wales might.

Rob Gibson: It is early days. Given that the UK Committee on Climate Change will have a role in reporting on progress towards the Scottish emissions targets, do you monitor the Scottish Government’s policy decisions and publication of key documents, such as the national planning framework and the strategic transport projects review? If so, how do you do it?

David Kennedy: Rob Gibson has touched on a sensitive issue for us. When the UK Climate Change Bill was going through the Westminster Parliament, there were many questions about what we would say about policy as opposed to what we would say on appropriate targets and the technical means of meeting them. There is a difference between saying what we can do about our buildings and saying something about the policies that will help to achieve that.

We started by looking at what we need to do and at the opportunities, but we are moving into a space in which we will speak much more about appropriate policies, whether for buildings, supplier obligation or energy performance certificates. For example, we will ask what the appropriate policy is for making people want to buy electric cars rather than conventional cars.

Moving into the policy area is a transition for us. We are aware of the UK policy framework and of the national authorities’ frameworks at a high level, but we have not yet looked at them in as much detail as we will. Part of our work programme will therefore be to develop a detailed understanding of the policy framework, and then to make appropriate statements to take it forward.

Rob Gibson: It appears from what you say that you expect the UK Committee on Climate Change to change how it gives advice. Currently, you can give advice, but people can carry out their own policies, whatever you say. However, you expect increasingly to target policies in such a way that it will be more difficult in the future for Governments to dodge them because they will be more focused through having better information.
David Kennedy: We will have our views on what the appropriate policies are, and we intend that they will be based on robust analysis and evidence. If Governments—at UK level or at the level of the national authorities—disagree with us, they will have to say why. That will certainly be the case at UK level. Governments set the rules and are free to disagree with us, but a dialogue would have to happen before they could disregard what we said.

The Convener: You said previously that you can advise not only the Governments but the Parliaments and the Assemblies. Does that apply to requests for advice? For example, would a request for advice from the Transport, Infrastructure and Climate Change Committee be dealt with in the same way as a request from the Scottish ministers?

David Kennedy: Let us be clear: the UK Parliament cannot ask us to do things. We will report to it annually on progress on meeting carbon budgets. I am not sure whether, under the relevant legislation, this committee could make a request to us—I suspect that it could not. I think that such requests must come to the sponsors group from the Scottish Government.

The Convener: That is clear—thank you.

16:15

Shirley-Anne Somerville: You believe that the Scottish Government's 2030 and 2050 emissions reduction targets can be met, but will the requirement to implement 3 per cent year-on-year cuts only from 2020 deliver those targets?

David Kennedy: The best way to answer that question is to approach it from the UK level. We have said that under our intended budgets—which would apply following a global deal and which would make the appropriate and necessary contribution to global emissions reduction—we envisage a 42 per cent emissions reduction by 2020, on the way to an 80 per cent emissions reduction by 2050. Along that path, the annual average percentage emissions reductions are between 2.5 to 3 per cent to 2020 and are above 3 per cent beyond 2020. If we read across from that, the 3 per cent reductions from 2020 that Shirley-Anne Somerville mentioned are probably okay as a minimum. Scotland might well want to do more than that—it will depend on how far it has got by 2020. Up to 2020, Scotland will be looking for reductions of at least 2 per cent, moving towards 3 per cent, to be consistent with the UK as a whole.

Shirley-Anne Somerville: The Climate Change (Scotland) Bill's approach differs from that in the UK act. Do you have a view on setting batches of annual targets rather than carbon budgets? Is one option better than the other or does the choice of approach make no difference?

David Kennedy: We took carbon budgets as a given in the UK context. Our duty was to advise on carbon budgets, not on annual targets. If we were asked to advise on annual targets, we could do so using our analysis and our evidence base, because we have assessed the emissions reduction opportunity in each year to 2020 and we have assessed the appropriate and required international contribution by the UK in each year to 2020.

I can rehearse the arguments that arose as the UK act went through Parliament. That act does not include annual targets because they might not provide adequate flexibility, given the year-on-year changes in emissions because of the weather, for example—emissions rise in a cold winter because people use more heating and we must burn more coal in our power stations. Such factors can mean that reductions go off track from year to year, although they are not off track in the five-year context. That is why the UK went for five-year carbon budgets.

Shirley-Anne Somerville: Another difference is that the Scottish bill does not include the concept of banking and borrowing. Do you have views on the different approach that we are taking?

David Kennedy: Banking and borrowing—particularly borrowing—was felt to be necessary in the UK to allow for events that can happen year on year. If a cold winter occurred at the end of a budget period, borrowing against the next budget might be possible. Banking and borrowing provides flexibility for such events. What can be borrowed is tightly drawn; that is certainly not a get-out-of-jail-free card that allows borrowing to delay the taking of action, which would store risks for the future.

Is it appropriate not to have banking and borrowing in Scotland? If Scotland has year-on-year targets, some flexibility is probably wanted to allow for such events. The committee might want seriously to consider allowing a little borrowing from future years.

Shirley-Anne Somerville: You have said that Scotland has opportunities to reduce emissions by 7 million tonnes of carbon dioxide by 2020. Have you calculated what year-on-year percentage reduction would be required for Scotland to hit your figure?

Katherine White: No. That figure is the sum in 2020 of the sector-specific abatement opportunities that we identified for Scotland—it means 7 million tonnes of abatement in 2020 versus the projected emissions without those measures. We have not yet examined how that would evolve over time, nor have we examined the
annual savings in Scotland, which would enable us to say what percentage reduction would need to be achieved.

**David Kennedy:** We can do the calculation for you—not today but with a short turnaround. It would not be difficult to compare reduced emissions levels with current levels and to come up with an annual percentage reduction.

**Shirley-Anne Somerville:** Am I right in saying that the figure for abatement potential for each nation was not arrived at through a bottom-up analysis of policies and might be subject to change?

**David Kennedy:** Yes. That is the next stage of the work. The preliminary assessment does not reflect specific circumstances in Scotland. That is something that we need to bottom out. We have said clearly in our report that the figure would not be an appropriate basis for target setting, because further work is needed to tailor it to the specific situation in Scotland. We envisage that work being done during the next year, which will lead up to the inclusion of your targets in legislation in about a year and a half.

**Alex Johnstone:** It is interesting that you think that there is the potential to reduce CO₂ emissions in Scotland by 7 million tonnes by 2020. Have you done the calculations for any of the other five key gases?

**Katherine White:** Alex Johnstone quoted the CO₂ equivalent figure, which includes savings associated with methane, nitrous oxide and fluorinated gases.

**Alex Johnstone:** If that is the case, in which key area can the best savings be made in Scotland?

**Katherine White:** The abatement potential that we identified, which I stress is an initial assessment—as David Kennedy said—does not cover all areas of the Scottish economy. We focused on emissions savings through energy efficiency in buildings and industry as well as on savings in the road transport, agriculture and waste sectors. We did not cover the power sector, for example.

There is significant potential in energy efficiency in the residential sector. If I remember rightly, about 3 million tonnes of the 7 million tonnes of savings would come from the residential sector. Energy efficiency is a key area of potential in Scotland. However, we did not take into account the state of the housing stock in Scotland, which is different from the UK average on which the analysis was based. We have done an initial assessment, but we would have to take into account that there are more off-grid homes in Scotland and that different types of wall structure might mean that it is not possible to insulate walls as cost effectively as we assumed it would be in the assessment. Although we identified considerable abatement opportunity, I cannot say that there is an accurate assessment for Scotland.

**David Kennedy:** Let us not underplay the assessment too much. We keep saying that it is an initial assessment; although the numbers might change a little as we take account of specific circumstances, the message will not change. The message is that there are opportunities in all sectors in Scotland, none of which should be neglected. Scotland’s strategy should cover residential and non-residential buildings, transport, agriculture, waste and the power sector.

**Alex Johnstone:** In statistical terms, would you say that potential savings are about 7 million tonnes?

**Katherine White:** Yes. I cannot give the range, but we expect the figure to be in that ball park.

**Alex Johnstone:** Is the information that is available on international aviation and shipping robust enough to be included in Scottish targets at this stage?

**David Kennedy:** I would differentiate between aviation and shipping. We have considered the issues in great depth and we have been troubled over whether aviation and shipping should be included in the UK carbon budgets. We recommended that they should be in the long-term target but not in the budget, because of complexities to do with measuring and allocating emissions. There are methodologies that we are comfortable with for allocating aviation emissions to the UK from international flights. Bunker fuels data comprise one of those. We could have gone either way on recommending whether or not aviation should be included in the carbon budget.

Somebody asked a question earlier about radiative forcing. That issue needs to be bottomed out—there is no consensus on the appropriate solution. We have used a radiative forcing factor of 1, as is the convention—that number is used for the inclusion of aviation under the EU ETS. Everybody agrees that 1 is not the number that we would choose, however; it is at the very left-hand side of the distribution of numbers that we could possibly use, and its use is the result of political negotiation. That number will probably have to change in the future. We will examine further whether it should be 2, 3 or 4, in the context of the aviation emissions review.

Aside from radiative forcing, we think that it is possible to allocate aviation emissions at least to the UK level; we will need to look into the complexities of going to the Scotland level. I believe that you will be asking us about that as part of your wider requests in the future.
Shipping is slightly different. We were not satisfied that we could get a handle on the UK share of international shipping emissions. If we think about a ship that has come from east Asia and has stopped at 15 places on the way here, unloading and loading different cargos and fuelling up at different places, it is not clear what the UK’s share of that vessel’s emissions will be. Although we have methodologies to apportion emissions, we were not comfortable that they actually represent our share of shipping emissions. That led us to conclude that we cannot tackle shipping emissions at national level, and that the only way to tackle it is at global level, with global agreement. With that in mind, we are watching what the International Maritime Organization proposes to the United Nations Framework Convention on Climate Change by way of a global agreement later this year. That will be the key as far as shipping is concerned. It is difficult, however, to arrive at a meaningful number for shipping at the national level.

Alex Johnstone: We heard earlier that the UK act is likely to apply a limit on international credits, based on your advice. The Climate Change (Scotland) Bill does not contain a similar power for the Scottish Government. What is your view on that difference?

David Kennedy: I will quickly take you through why we said what we did about credits. We started off at 2050. We do not envisage that there will be a lot of use of credits in 2050 because all the countries of the world will have ambitious targets that they will have to meet under a global agreement. Nobody will be selling. The implication is that we must have an 80 per cent reduction domestically—or largely domestically—by 2050. As we move forward in time, we must start preparing for that. We cannot buy credits right up until 2050 and suddenly have an 80 per cent cut domestically; we must do things domestically on the way to 2050 to meet the 80 per cent target through domestic action. We were aware of concerns around the certainty of credits, which are calculated against the baseline—rather than a cap—but that was not why we said that we should limit the use of credits; rather, it was because we need to be on track in taking action domestically for 2050.

We should certainly meet our interim budget through domestic action alone—that is the 34 per cent cut. Then, we could buy credits to go from 34 to 42 per cent in 2020. The UK act, as you have said, requires the Government to consult the Committee on Climate Change on the appropriate use of credits and to legislate five years ahead. The use of credits will be discussed only for the first budget period. In March or April, the Government will say what legislation it will introduce on carbon budgets.

We expect the Government to follow our advice and to allow the use of credits under the legislation, but to choose not to, in order to meet the interim carbon budgets. Beyond that, when there is a global deal, we will be comfortable about buying in, for instance, 10 to 15 million tonnes of CO₂ emissions reduction a year. In the Scottish framework, you do not have the flexibility to buy in 10 or 15 million tonnes of CO₂ a year. Within your framework, I would approach carbon budgets by asking what is achievable in the non-traded sector—buildings, transport and so on. That would form the basis of the targets in Scottish legislation—unless you decide that you, too, wish to buy credits as a means to meeting targets. I am not sure, however, whether that would be consistent with the Climate Change (Scotland) Bill.

The Convener: You mentioned that you were doing some further work on radiative forcing. Are you able to say when that is likely to be completed?

16:30

David Kennedy: We have to report back on aviation emissions in the UK as a whole in December this year. It is not specified when in December, but we are working towards the end of November for a 1 December delivery. We will examine a range of matters, including the role of carbon prices in aviation, possible efficiency improvements, the role of infrastructure investment, radiative forcing and what forcing factor is appropriate. I imagine that we will say that 1 is not is an appropriate forcing factor to use, but it is difficult for the UK to change to a different forcing factor. Unless other countries also change, there is not much point in doing it. However, let us not pre-empt what we will find.

The Convener: A couple of committee members asked the previous panel of witnesses about whether the current economic situation makes a reduction in short-term emissions over the next year or two likely. There will obviously be a time lag before we find out whether it has happened, but is it a reasonable expectation? If it is, should that make it possible for us to set a more ambitious trajectory in the ranges for annual targets that are specified in the bill?

David Kennedy: I cannot give you a definitive answer to that, but it will be part of our work programme at UK level over the next few months. We want our report to Parliament to include a chapter about the macro context and its implications for meeting carbon budgets.

There are two countervailing forces. As economic activity falls and gross domestic product drops, energy consumption goes down and emissions go down with it. On the other hand,
fossil fuel prices have fallen as part of the global economic situation and, as they fall, we consume more energy. We will have to watch how those two forces balance out. We will analyse that using our energy models and come to a view on it.

I agree that, if emissions were to go down because of the macro situation, you should reflect that in your targets and make them more ambitious than they otherwise would be. You should not use the economic downturn to say that you have been successful in reducing emissions and do not need to take other measures on buildings and transport. That is a risk, but we will give a clear message in the UK context that, although the budgets that we will have in legislation may have been based on a different macro context, we should attempt to outperform them because the macro situation has helped to drive emissions down.

Alison McInnes: Will you outline the reporting requirements that result for you from the Climate Change Act 2008?

David Kennedy: The primary requirement is that we must report annually to Parliament on progress in meeting carbon budgets. The way that we interpret that requirement is that we will make a detailed assessment. We will not simply say what the trajectory for emissions is under the budgets, what emissions are doing and what the difference is and leave it at that. In our report to Parliament this year, we will publish a set of leading indicators against which we will judge future progress. We will have indicators for the number of buildings that should have been insulated, the number of hybrid cars that we should have in the mix at a certain point in time, and the number of gigawatts of renewable electricity capacity that we should have on the system, as well as targets for emissions in particular years. We will use that framework to report annually to Parliament. The first annual report after September this year will be in July 2010 and we have to report each year after that.

Alison McInnes: Will the Scottish Parliament have sufficient expertise to assess whether the Scottish Government is achieving emissions reduction targets? How might we improve that?

David Kennedy: I do not know enough about what expertise the Scottish Parliament has to be able to have a view on that. It will depend on whether the Parliament is presented with a robust analysis upon which it can make a judgment. One does not need to be a specialist scientist to read a decent progress report, so I guess that it will come down to the quality of the report that is presented to the Parliament.

The Convener: My final question concerns the part of the bill that creates the power for the Scottish ministers to introduce secondary legislation to impose climate change duties on other public bodies. Do you have any thoughts on what the role of those duties might be and what kind of duties would be applied? Would there be value in acting on that power early rather than tucking it away and thinking about using it in a few years?

David Kennedy: The main lever for reducing emissions in the public sector is the carbon reduction commitment, which provides a significant opportunity across public sector bodies. If the cap in that is set correctly, it will provide incentives to get emissions down and manage energy efficiently. It is not immediately obvious to me that there is a need to go beyond that, but there may be scope for the Government and public bodies to do something on green procurement. Certainly, many of our stakeholders perceive that the Government must be seen to act as it tells everybody else to act. Green procurement is a highly effective lever in that, so there may be an opportunity to do something on that over and above the carbon reduction commitment.

The Convener: That would mean requiring public bodies to do what they have been permitted to do so far: to take sustainable development into account in procurement.

David Kennedy: Yes, it would mean strengthening the incentives and requirements on green procurement, although I am not in a position to say exactly what that would achieve. As I have said, there is a lot in our work programme this year. The Committee on Climate Change has existed for only a year and there was a limit to what we could do in the past year. However, green procurement will be important for us in the future and we want to come to a view on whether it will be a big issue. I suspect that, regardless of whether it results in big emissions reductions, the signal that it gives will be important as part of leadership from Government on the climate change strategy.

The Convener: The committee has no further questions. Do you want to bring to our attention any other issues that have not been covered?

David Kennedy: We have covered the range of issues that came up in the report and signalled our intention and willingness to work with you in the future. We need to take that debate forward, but we can do so offline; we do not need to do it today.

The Convener: We look forward to that. I thank you both for the time that you gave to answer questions. That concludes the meeting.

Meeting closed at 16:37.
Dear Mr Harvie,

During your evidence session on the Climate Change (Scotland) Bill which took place on 27 January, you asked for witnesses views on the use of aviation multipliers. I undertook to provide you with a written note.

Aviation emissions contribute to climate change through a variety of climate agents (carbon dioxide, ozone and methane, water vapour, aerosols, contrails and cirrus) with a large range of timescales. The objective of non-CO2 multipliers is to factor in these non-CO2 climate effects into an equivalent CO2 alone effect. It has been suggested that the Radiative Forcing Index –defined as the ratio of the total radiative forcing due to aviation to that due to CO2 alone– should be used as a non-CO2 multiplier for aviation. We do not believe this is appropriate because radiative forcing is an instantaneous rather than a forward-looking measure of climate change. As such it can be highly misleading, because it gives too little weight to carbon dioxide –that remains in the atmosphere for several hundred years after emission– and too much weight to the effect of condensation trails that only last for a few hours. Other metrics of climate change can be used, which suggests that if an aviation multiplier is to be used, it should be smaller than earlier suggestions that were based on the Radiative Forcing Index.

In addition, multipliers have not been calculated systematically for every economic sector. Some sectors like shipping have a multiplier less than one because of the negative radiative forcing—or climate cooling—associated with emissions of short-lived sulphur dioxide and smoke particles. It is not clear yet how to treat less-than-one multipliers in climate policies because there are also good reasons to reduce aerosol emissions to improve air quality and combat acid rain.

In the case of aviation there are further issues concerning the long term effects of nitrogen oxides on methane and ozone which are not yet well quantified.

In conclusion the current scientific knowledge does not support the use of a non-CO2 aviation multiplier when assessing the impact of aviation emissions on climate. However, given that there are currently no robust alternatives, there may sometimes be a case for using RFI for illustrative purposes to show the non-CO2 effects of aviation until a robust measure is available, provided its limitations are made clear.

Our research has shown that there is some scope to reduce the non-CO2 climate effects from aviation and more collaborative research is needed to find practical solutions that would allow the aviation sector to minimise their non-CO2 climate effects.

I am grateful to Professor Keith Shine (University of Reading) for directing me to the following papers, where further information on this issue can be found:

Forster P, K Shine and N Stuber, 2006. It is premature to include non-CO2 effects of aviation in emissions trading schemes, Atmospheric Environment, 40, 1117-1121.

Forster P, K Shine and N Stuber, 2007. Corrigendum to It is premature to include non-CO2 effects of aviation in emissions trading scheme, Atmospheric Environment, 41, 3941. (The corrigendum does not materially affect the conclusions of the original paper.)

Thanks also go to Olivier Boucher, Met Office Hadley Centre, who undertook several pieces of work on this subject for the International Civil Aviation Organisation (ICAO) and EUROCONTROL.

I hope this information is helpful.

Yours sincerely,

Professor John Mitchell
Director of Climate Science, Met Office
Climate Change (Scotland) Bill: Stage 1

14:01

The Convener: Item 2 is continuation of our scrutiny at stage 1 of the Climate Change (Scotland) Bill. This is our third evidence-taking session on the bill. Today, we will hear from two panels of representatives of the Stop Climate Chaos Coalition. We expect to continue taking evidence on the bill at stage 1 until around March, when we will hear from the Minister for Transport, Infrastructure and Climate Change. In addition, we have issued a call for written evidence, the deadline for which is 27 February.

I welcome the first of our two panels, which comprises Richard Dixon, director of WWF Scotland; Duncan McLaren, chief executive of Friends of the Earth Scotland; and Dave Watson, Scottish organiser for Unison. I gather that the witnesses would like to make some brief opening remarks.

Richard Dixon (WWF Scotland): I will introduce the Stop Climate Chaos Scotland coalition, so that the committee is clear about who we are. Today, you will hear from two panels of witnesses from the coalition. We are made up of 30 organisations that are campaigning together on climate change. Our members include environment groups, two of which are represented here today, development non-governmental organisations, some of which will take part in the next session, faith groups, unions, community councils, student societies, women’s organisations and many others. Collectively, we represent supporters in Scotland numbering about 1.5 million.

For more than two years, we have been coming together to think about the key issues and how a Scottish climate bill might look, and to discuss what our collective views should be. Active working groups in the coalition have worked on detailed issues, which we will address when answering members’ questions. We have campaigned on those issues for most of the past two years.

As members know, 2009 is a critical year for action on climate change. The global deal negotiations will continue throughout the year, culminating in the Copenhagen meeting in December. In Scotland, we have an opportunity to contribute to that global deal by producing a world-class piece of climate legislation. Our aim is to help the committee and the Parliament to come up with a benchmark piece of legislation that means that the global deal to which everyone signs up at
the end of the year is better than it might otherwise have been.

The Convener: I will begin with a couple of questions about the science. The scientific basis for the Climate Change (Scotland) Bill is the reports of the Intergovernmental Panel on Climate Change and the United Kingdom Committee on Climate Change. Is the Scottish Government using the most relevant and up-to-date scientific information on climate change? If not, where should it look?

Richard Dixon: The IPCC is a big, collective scientific enterprise. It is quite conservative, because its conclusions must be signed off by all the Governments that have signed up to it. When it presents a picture, we can believe that that has a lot of credibility. We can also believe that its reports are quite conservative and that the science that has gone into them was probably a couple of years out of date by the time that they were published, because the process is so long. When the IPCC assessment report first appears—the most recent is the fourth assessment report—it is the authoritative, mass verdict of scientists. However, after it has appeared, other studies might be published that suggest that a particular thing is going wrong more rapidly than we expected.

We need to start with the IPCC report because it is the collective view, but we must also be up to speed with new science that comes along, which might suggest different impacts from those in the IPCC report. For example, it is quite well known that the most recent IPCC report reduced the estimates for what the sea level rise might be in 2100. Since then, a number of studies have suggested—there is now quite a consensus on this within the scientific community—that the estimates should go back up again to a higher set of numbers. The Government’s civil servants, those who deal with the science and committee members have a judgment to make about the credibility of individual scientific studies. Pretty much anything that the IPCC says can be taken as credible, but it will be out of date. In taking other studies into consideration, we need to be careful about how we treat what might be an outlier or maverick study.

For the bill, the key thing about the IPCC reports and any other additional studies is what they say that we should do. There has been a quite consistent message: we must reduce emissions rapidly, as the next five to 10 years are important for global reductions; the scale of the reduction required is that we reduce emissions for the whole world by about 50 per cent by 2050; for industrialised countries such as ours, that means that we need to reduce emissions by at least 80 per cent by 2050. That is what the bill is telling us.

On the scale of the emissions reduction that is required by 2050, we are still saying the same sort of thing about the need for early action, on which we are very keen. The most important thing is how quickly everyone’s emissions decline. The IPCC agrees on that, but some scientists now say that, actually, 450 parts per million or 400 parts per million might not be quite enough. The outliers now suggest that we need to aim for around 350ppm of carbon dioxide equivalent, so we need to do something more impressive in terms of the global concentration in the atmosphere in 2050.

The bill has in mind the 2° threshold that most scientists have been talking about, which is somewhere between 400ppm and 450ppm. That is still probably where the scientific consensus is. Aiming for that sort of temperature increase and that range of concentrations gives us a reasonable chance of keeping the final temperature rise to a 2° increase. However, some credible outliers are beginning to say that we need to do a bit more than that. By starting off with rapid reductions and the long-term target, the bill is probably about the right thing to pass just now.

Duncan McLaren (Friends of the Earth Scotland): I have two brief points to add.

On a practical note, I am not sure that it would help if the bill specified additional sources of scientific advice. However, the bill could ensure that the advisory body is constituted in such a way that it can access the most up-to-date scientific advice and that it has a remit to transmit that advice to ministers. That could have implications for a number of the high-level targets and mechanisms within the bill, including the 80 per cent target. Members will note that we have called for a reduction of at least 80 per cent. My reading of the climate science as it is moving—in particular, the advice that concentrations will need to be lower—suggests that 80 per cent will be only a staging point in a longer-term transition. The target might need to be achieved earlier than 2050. It ought to be possible within the mechanisms under the bill to bring the target forward or to make it tougher before we reach 2050.

Similarly, if the bill requires ministers to make reference to a safe cumulative budget as well as to a point target—as part of a belt-and-braces approach—that will, by definition, require the advisory body to think about what is safe and fair in the context of the current state of the science. I understand that that is how the UK Committee on Climate Change intends to operate. The UK committee has indicated that, if the science changes, it expects that it will advise budgets for subsequent periods to be significantly tightened. We need to have that capacity in the bill.
Rob Gibson (Highlands and Islands) (SNP): I just want to catch up with your thinking. How can outlying scientific studies do any better, given that, at present, it takes about 20 months to provide the statistics for the IPCC to judge how we are progressing?

Richard Dixon: The issue is that the IPCC process involves about 2,000 scientists. It is a lengthy process that involves a lot of sign-off and peer review. Many of those 2,000 scientists are doing their own research. Even while the IPCC report is in gestation, they might be producing another paper that is more up to date. Even if that takes a year to get through the peer review process before it appears in a credible scientific journal, it is still probably a year more advanced than the IPCC report that has just been published.

Important, credible and correct pieces of research can emerge even at the same time as the IPCC report, and certainly just after it, which are worth taking note of.

As Duncan McLaren suggests, part of the advisory body’s role must be to help you as parliamentarians and the Scottish Government as the Administration understand which bits of research are significant and worth acting on straight away; which bits have findings that are interesting but that it is worth waiting for confirmation of; and which bits are outliers, which you would not accept only one of. That is how to treat the stuff that comes through.

We expect that sea levels will be higher than the IPCC says; we certainly see that the north polar ice cap is melting much faster than the IPCC suggested. There are quite credible results and there are other outliers that suggest things that it is worth waiting to see whether someone else confirms.

The Convener: You mentioned the figure 2°C, which, according to the bulk of consensus, is tied to 450 to 400 CO₂e parts per million. Is that the definition of “dangerous climate change” that you would use? It has been suggested that that phrase should be somewhere in the text of the bill. Is that how you would define dangerous climate change, or is it more about the impact that climate change has on systems than about the degree of warming?

Richard Dixon: The phrase “avoiding dangerous climate change” comes from the United Nations Framework Convention on Climate Change, to which most nations of the world, including the UK, signed up in 1992. The convention does not use that exact phrase; it has been paraphrased. The figure 2°C is the scientific translation of that into something practical.

The World Health Organization says that 150,000 people are dying every year because of climate change, which is an extremely conservative estimate. Those people probably think that climate change is already dangerous. There is a question about what the phrase means.

In trying to interpret that political phrase, the scientists have come up with a reasonable consensus that 2°C is about the right figure. The European Union signed up to that in 1996 and the UK signed up to it, too. There is a reasonable consensus that we should be trying to avoid exceeding that. We are heading towards it quite rapidly, so we need to act quite fast if we are really going to stop there. The figure is important.

Scientific studies try to predict what will happen at different degrees. If you look beyond 2°C, you start to see some really important things going wrong. You start to see the Amazon rainforest dying back and eventually becoming the Amazon desert, releasing all the carbon that is locked up there and disrupting the water cycle that it regulates. You start to see the big ice caps and ice sheets being really affected.

Two degrees is bad enough and is already dangerous, but we are saying that if we tried hard, the world could stop at 2°C and that some of the big things that would go wrong will not go wrong if we stop there. It is a good place to aim for, but that is based on our current understanding. If we want to put something in the bill, we should go back to that phrase “avoiding dangerous climate change” and rely on advice from our advisory body in 2030, 2040 and 2050 about what we think that dangerous climate change is then. We might have become more relaxed and decide that 2.5°C is the right figure or we might have become much more nervous and decide on 1.5°C.

We also have to translate that number into a concentration of gases in the atmosphere. That science is evolving and we might decide on a different number that corresponds with a good chance of stopping at 2°C. As a way of referring in the bill to the global discussion, the safest place to start would be to add something on the fair contribution that we should make to avoiding dangerous climate change. At the moment, we think that that means 2°C, but it would be wrong to add in a number, as we may decide on a different number in future.

Duncan McLaren: The Government should state, either in the long title of the bill or in its objectives for the bill, that it is to play a fair role in preventing dangerous climate change by reducing Scotland’s emissions in a sustainable manner. Whenever we hear the shorthand of 2°C, we should understand it to mean that a rise in temperature of no more than 2°C is compatible with
preventing dangerous climate change rather than that getting to 2°C warmer is a target.

The Convener: I would like to put what we are talking about into the current economic context. The argument has been put that a recession might make it easier in the short term to reduce emissions or for emissions to fall by more than would otherwise be the case but that, instead of putting Scotland on a more ambitious trajectory for the longer term, the recession could undermine the investment that needs to be made in low-carbon infrastructure and make the problem worse. I seek the panel’s view on that. Also, given Scotland’s current skill base, what is our ability to rise to the challenge?

Dave Watson (Unison): We hope that the recession, or economic downturn, is relatively short lived. Even the most pessimistic of people—and there plenty of those on the television and radio every morning—would admit that the recession will not take the timescale of the bill, which is 2050 and beyond. We have to look at climate change in the context of the longer term and not be too fazed by the immediate economic circumstances.

I would argue against what you suggest. Certainly, the stats might show that there is a downturn in activity during a recession and that we may see a reduction in emissions as a result, but we should see the opportunities as well as the threats from climate change. The opportunities for a country such as Scotland are clear to see. For example, there is a lot of talk at the moment about a green new deal. That offers opportunities for Scotland to address the issues by creating new manufacturing and service opportunities, which will in turn bring new jobs. Importantly, those jobs will be at a higher skill level. We need to start thinking now about the sort of skills that our universities should consider. We need to build those skills into our education plans right down to school level.

Great opportunities will arise, but only if we are ahead of the game. Too often, Scottish Enterprise and others say in reports that 30,000 or 60,000 jobs will be created—indeed, last week, the number was 160,000 jobs. That is fine but, unless we put in place hard plans and real accountability—which is a key part of the discussion that I am sure we will come to—none of that will happen. Our view is that we should look past the short term to the longer term. If we plan now, we can take advantage of the opportunities.

The Convener: Is that happening?

Dave Watson: It is not happening yet. There are a number of reasons for that. In the main, it comes down to the fact that not everyone has signed up to the approach yet. The Government has not set clear targets and not all public bodies have signed up. We see some good initiatives, but it has not all come together. The bill will put in place the framework that ensures that there is at least a fighting chance that that will happen.

Duncan McLaren: One unhappy advantage of a recession is the cuts in emissions that we might see in the first year—or two years, if we are unfortunate—without any effort being made. Obviously, we should not give up on the additional effort but should recognise the need to lift the investment about which the panel spoke at last week’s meeting.

Governments are talking right now about directing and stimulating investment. They are putting together the largest fiscal and economic stimulus packages that we have seen—certainly in my lifetime, and long before that. The key question is whether those packages are being targeted at creating future low-carbon economic opportunities or whether they are indiscriminate and do not take any account of whether any growth that is stimulated might be under the conventional high-carbon model. Given that money is short, we must surely be discriminating and targeted. As Dave Watson has pointed out, such an approach will give us an opportunity to provide jobs not only in high-skilled and high-knowledge sectors but in lower-skilled sectors. For example, a Scotland-wide home energy insulation package would provide work for plumbers, builders and carpenters as well as for scientists and energy specialists.

I might have been rather unfair in my paraphrase of Dave Watson’s comments.

Cathy Peattie (Falkirk East) (Lab): I am interested in your views on the consultation process for the bill. We have already heard about Stop Climate Chaos Scotland’s role in developing the bill, but how do you reach the wider community, win hearts and minds and get round the attitude of “That sounds like a good idea; someone should do it. Not me, though”?

Richard Dixon: The fact that, as you know, the consultation received 21,000 responses from all over the world—indeed, it has been the biggest response ever to any consultation, apart from that on the smoking ban—shows the strength of feeling on this issue. The motivation for many of the people whom we helped to send the Government this message was the link between the Scottish bill and the global process and the fact that, because of the timing, the bill could influence the global deal that will be struck in Copenhagen at the end of the year. That level of response sends a very clear message that large numbers of people both inside and outside Scotland expect the bill to be world leading.
Some interesting issues that the consultation treated in an even-handed and sensible way—for example, consumption targets, which we might well discuss later—have not made it into the final bill. That said, our reading of the process is that, as a standard consultation, it was fairly well done. Of course, that does not mean that it reached every community or was covered in the Daily Record on more than half an occasion. There is a bigger job to be done, and we would like the bill to say something more about how we might capture hearts and minds.

All of us in the coalition agree—and, I think, the general feeling is—that in tackling climate change the Government has a very important role in putting in place the right frameworks, the Parliament has an essential role in ensuring that things work and individuals have a very important responsibility to do their part. For example, 40 years ago, no one did what we now call recycling; now a third of the population are quite happy to sort lots of things and either take them somewhere or put them out on the right day. Although the activity can be quite bothersome, people feel good about it; it has become habit, and they are doing the right thing for the environment. If we can make tackling climate change a bit like that, with the Government setting the framework and the targets that drive the big processes and individuals realising that they have to do their bit to make the system work, we will have won.

**Duncan McLaren:** The bill’s provisions can be delivered only if the public are engaged and begin to change their behaviour. However, our experience is that the public often find it difficult to change their behaviour on matters that are out of their control. Such changes can be made not only through the powers proposed in the bill but, particularly, by duties that the bill might put on public bodies. The coalition strongly advocates that a general duty be placed on public bodies to reduce emissions in line with the national target. That would enable and encourage local authorities, health authorities and a range of other public bodies to start thinking about what people who live in their areas or who work for them could do. That would be one of the best ways to trickle down, or perhaps drive down, the impetus for engagement and behaviour change.

**Dave Watson:** In many ways, this is one of the most important issues that we need to address. We, and a number of other organisations, got involved with Stop Climate Chaos Scotland because, historically, climate change was viewed as something that beady environmental groups did. I do not have a beard—I am only a trainee eco-warrior, you understand. It was something that green bodies did and no one else. However, we have to realise that we all have to do something about it.

We have not yet got people to come on board; we have not yet achieved the public engagement that was achieved on the issues of drink driving and the smoking ban. The bill will be important in that regard, but only if it drills down that engagement to the local level. For example, I have been encouraged by the hard time that I have been given at schools events. Sometimes when I have done events in schools about workplace greening, I have had a harder time than I ever had on a picket line with disgruntled union members in a dispute. That is how keen some of the responses that we have had are.

From a trade union perspective, I note that two thirds of all greenhouse emissions come from the workplace. If we do not engage people in the workplace, we will not address that issue. That is why we emphasise workplace environment agreements and the role of environment representatives, for example. When we have done that in workplaces, we have found that when we sit down with workers and get them to talk about how they can be greener in their environment, they take it home. Sometimes, they bring their home practice in and say, “We do more at home than our workplace is doing, yet two thirds of all emissions come from the workplace.” That is one example of our experience of how we can drill down that engagement and start to set a tone or attitude that will mean that we can make progress on the issue.

**Cathy Peattie:** I was going to ask about public duties later, but the issue has been raised, so I will ask about it now. I am interested to hear the panel’s view of placing duties on public bodies, such as local authorities, education authorities, environmental health and so on. Last week, we heard the word “hopeful” at least five times. The witnesses were hopeful that local authorities and public bodies would do something, but I am not hopeful.

**Dave Watson:** The coalition’s position is very clear. We believe that hope is a wonderful thing, but a bit of statutory action gets things moving.

In my long experience of dealing with public bodies, I know that if you want to move things up the line or get something on to the chief executive’s agenda, you do not say, “We hope you’ll do it.” You say, “You have a statutory duty to do it, and you might be summoned to this or another committee to be quizzed on exactly what you’ve done.” There should be a duty in the primary legislation, but that does not mean that there should not be secondary legislation that might give more detail. It is not good enough for a piece of legislation to say that the Scottish Government may give secondary powers. That is not adequate in any way.
The other reason for building duties into legislation is that we need to start now. If the word used is “may”, and there is to be secondary legislation on the subject, we all know that there will be another round of consultation, discussion, and regulations, and it will be two or three years before anything happens. If we put the duty into legislation now, we can get cracking. Many of the consultation responses indicated support for that.

Statutory duties should include a requirement to measure the environmental impact of all decisions that are made by public bodies. There should be emission targets. They might not be the same for every public body because some areas will have a bigger impact than others, but there have to be targets.

There also has to be an annual report from public bodies. We came up with a range of ideas for the annual report. For example, the chief executive and leader of the council should have to have an annual meeting to which each school sends a rep to quiz them. If I have had to do it in the schools, the leader of the council can do it as well. You should watch the way schoolchildren ask really difficult questions. They do not fluff about being polite like we do; they ask direct questions and if they get waffle, they say, “That’s waffle. What are you actually doing?” That kind of accountability is very important and it will bring out the lower level rather than some of the higher-level things that are in the bill.

14:30

Cathy Peattie: Does anyone else want to say anything on that?

Duncan McLaren: Dave Watson has said it all.

Shirley-Anne Somerville (Lothians) (SNP): I will bring the panel back to the question of engagement with the public. I agree that it is an important issue for which we have a number of layers of responsibility and that we should examine it as a committee.

Do you think that the bill is one of those pieces of legislation that is so important that Parliament, and all of us, have a responsibility to ensure that we do not use it as a political argument and thereby allow the public to switch off? If we get into that kind of argument, there is a danger that members of the public might say, “Parliament cannot even get a handle on the issue—we should just leave it,” without changing their individual behaviour. Do we need to make clear our responsibility to ensure that we deal with the bill in the most sensible way?

Duncan McLaren: It is clear that there is a responsibility to engage in the debate in a way that reflects the science as it is understood and the urgency and reality of the problem. However, I do not believe that Parliament should seek consensus purely for the sake of it. Healthy debate is one of the ways in which we can get the public interested in a topic. If they see that their representatives—who they hope share their views and values—are having a healthy debate about the topic, that will raise the level of public engagement rather than turn the public off.

Dave Watson: I think that we have made quite a lot of progress. The existence of coalitions such as ours illustrates the fact that there are fewer blatant climate change deniers around any more. There is a debate about how we should tactically deal with the issue, and there is also debate within our coalition: we do not agree on all the fine points of detail. However, there is now a clear consensus in Scotland about the key things that need to be done—we have managed to reach clear agreement on those areas and on the practical measures that need to be taken.

I know from talking to people at workplace and school events that we are a long way down that road. People would not be too worried if there was a debate about the detail, as long as Parliament did not get into climate change denial. In fairness, I have heard very few, if any, MSPs getting into that area of debate. We can have a legitimate debate about how we deal with the issue without damaging the overall message that the public has—largely—already got. As Duncan McLaren said earlier, they just need some help to get there.

Richard Dixon: In the message that we are sending to the public, we are suggesting that the bill is a good start and has great potential, both here and internationally, but that there are important details—in relation to targets, aviation and international credits, for example—that still need to be dealt with. That is the arena of debate: we need to tighten up those detailed issues and get them exactly right. It is not that anything is fundamentally wrong. I hope that, in that context, we can have a healthy to and fro, but without challenging the idea that there should, of course, be a climate change bill, which I think all of us agree with.

Des McNulty (Clydebank and Milngavie) (Lab): I will ask a brief supplementary to Shirley-Anne Somerville’s question before I move on to my main topic.

Do you think that there should be a public engagement target in the bill, in the same way that there are scientific targets for emissions reductions? Would that route perhaps take the bill even further forward as world-leading legislation?

Dave Watson: It is an interesting idea, but I am a touch sceptical about it. In my long experience of public bodies, any public engagement target that
is created tends to be measured in terms of how many public meetings are held, or how many surveys are sent out. I am more in favour of energising local communities and essentially getting them to set the targets for local politicians and other public bodies. If we get them interested, there will be no limit to the amount of public engagement that will follow.

The bill needs to include a framework that forces public bodies to go out there and enable the communities to give that pressure back. I am a little wary about the fairly artificial targets that I suspect would be involved in public engagement. However, I am open to other ideas—anything that would achieve that public engagement would be a good idea.

Duncan McLaren: There is an interesting idea or concept to be pursued here. I note that David Kennedy told you last week that the UK Committee on Climate Change is going to set what will be, in a sense, performance indicators, which will include such things as the number of renewable energy systems that are installed, the number of electric vehicles that are available and the number of homes that are insulated. With such indicators—they might not be in the bill but they will follow guidance from the advisory body, and there will be a role for the delivery bodies—you might get some engagement with the public. They could say, “Hold on. If 150,000 homes were insulated last year, why wasn’t mine?” or, “Mine was one of them. Now I’ve seen what I can do. I’m telling my colleagues and friends that they can do the same.” The practical delivery of the bill may allow for engagement without necessarily specifying a target for talking to X number of people or whatever.

I am not sure whether that was in your mind, but you are right to highlight the fact that we need to engage people in delivery and in behaviour change. That is all well and good, whether it is done through targets, performance indicators or public duties.

Des McNulty: Let us move on to targets. Before we get into the meat of the debate, I have three brief, relatively technical questions. First, do you have any comments on how the net Scottish emissions account has been calculated?

Do you want to come back to that?

Duncan McLaren: Yes.

Des McNulty: My second question is about cumulative emissions. Why are cumulative emissions in the atmosphere considered more important than the amount of greenhouse gases that is emitted annually, and is it technically possible to measure and report on them?

Richard Dixon: On cumulative emissions, the thing that matters to the planet is the amount of greenhouse gases that is in the atmosphere at any one time, which causes climate change. Different gases have different lifetimes in the atmosphere, so some of the gases that were emitted 20 or even 30 years ago are still there, causing an impact. Between now and 2050, we must reduce not just what we emit in any given year, but the totality of the gases, many of which have long lifetimes. That is important. The area under the curve that describes Scotland’s emissions will tell us about the total contribution that Scotland is making to the climate change problem around the world.

It is important to think about that total amount, which is why it is important to define the shape of that curve tightly so that no one is allowed to get away with not doing very much in the early days or slacking off somewhere in the middle and leaving it all for someone to catch up with at the end. It is pretty simple to measure cumulative emissions, as we know how much we emit every year. We understand at least a reasonable amount about the lifetime of the gases, so it is also possible to calculate our cumulative impact over the period, or the impact today of gases that we have emitted in previous years and gases that we are emitting at the moment.

We can produce all those numbers, but the key is to ensure that the area under the curve is as small as possible and that the early part of the curve declines sharply. That will show that we are acting early to get ourselves on the right track.

Des McNulty: I will come back to both those questions, but first I will ask my third technical question. Is it feasible to measure and report on emissions that are generated elsewhere as a result of goods and services that are used in Scotland? Are you aware of that approach being taken anywhere else?

Richard Dixon: The approach is possible, but it is much more difficult. In Scotland, we still use plenty of steel—we buy cars and washing machines with steel in them, and we build buildings with steel frames—but we do not make any steel in Scotland any more. Apparently, we are saving 2 million tonnes of CO₂ because we do not make steel here any more; however, somebody else is emitting those 2 million tonnes or more, which is really our CO₂. There is a need for us to capture that information. There are calculations that suggest that a third of all emissions from China result from China making things for the western world. We are always worrying about China, but a third of its emissions are actually ours. We should be worrying about ourselves.

Although it may not be possible to set targets, because it is difficult to be very accurate with the
numbers, we should certainly try to understand our total global impact. WWF Scotland would like the bill to contain provisions on parallel reporting of the impact of our consumption. The reporting of consumption would not have a target, unlike the reporting of production, but every year the minister would tell you not only how many emissions Scotland had produced directly a year or two ago but how many Scotland had been responsible for around the world. We could do terribly well with our nice, sharply declining curve, and we could reach 2050 having produced hardly any emissions at all, but that would be because the Chinese, the Indians and the Taiwanese were doing it all for us.

The planet would still be in a disastrous mess.
The other scenarios in the technical note are clearly more interesting. The sixth scenario involves a much quicker reduction in greenhouse gas emissions between now and 2020 of 2.75 per cent a year, which is nearly the 3 per cent that was promised in the SNP’s manifesto. Such reductions would pretty much deliver on the UK Committee on Climate Change’s intended target of a 42 per cent reduction by 2020, which is why the Government presented that scenario. The Government has shown how things could be done to meet that target, giving possible reduction rates between now and 2020. Ministers clearly suggested that they would be doing more already, and that they would do even more as soon as the bill came into force, but the scenario that they have chosen to illustrate does not deliver on either of those things.

Duncan McLaren: Stop Climate Chaos
Scotland is clear that we want the statute to establish that there should be emissions reductions of at least 3 per cent year on year from the beginning, not from 2020. We think that such reductions are necessary to meet the requirement for early action and that they are entirely possible.

Earlier, I spoke about an unforeseen advantage of recession for a couple of years. There is also good evidence from jurisdictions such as New Zealand, Brazil and California that significant emissions reductions in the order of 10 to 15 per cent over periods of two to four years can be achieved by concerted effort when there is a need to save energy because of energy shortages. If we move from recession with an investment package to improve our energy efficiency and reduce demand for energy, annual emissions reductions of 3 per cent or more could be sustained for several years. We would then clearly be in scenarios in which we would be looking at the technological solutions that are coming online.

Last week, it was rightly said in evidence to the committee that emissions reductions follow an S-shaped curve. There is a period at the start when things go slowly and very little is done, a period in the middle when a lot is done, and a period at the end when it becomes hard to make the last bit. We are already between 10 and 20 years into the flat bit at the top of the S shape. Industry has explored solutions and scientists have done the research, so the technologies and solutions that are necessary to move us on to the fast descent part of the curve are generally available or are very nearly available. We are not in 1990, saying, “We’ve just realised that this is a problem, and it’s going to take us 10 years to start to cut emissions by 3 per cent a year.” This is 2009, when cutting emissions by 3 per cent a year is entirely feasible. Such cuts are the minimum necessary if we are to give the urgent response to the science that we have all been told about.

The Scottish Government’s most robust scenario, which matches the UK Committee on Climate Change’s scenario, probably would not contribute what the UK expects. The UK sees Scotland as a renewable energy powerhouse, and Scotland rightly adopted an 80 per cent emissions reduction target when the UK still had a 60 per cent target. The UK reasonably thinks that, proportionately, Scotland will contribute more to the UK’s target, not less. If we are to do so, that would clearly push us above even the reduction targets of 2.75 per cent a year and 42 per cent by 2020, perhaps into achieving reductions of as much as 50 per cent by 2020, and certainly into achieving reductions of at least 3 per cent a year.

Des McNulty: I will pursue that in a bit more detail. At one level, there is a clear difference of view, which we can talk about in general terms. The climate change organisations say, “We want a 3 per cent reduction in emissions now. We believe that that can be achieved.” The Government has different advice and says that it cannot reach a 3 per cent target until 2019-20 but that it will make its best efforts to reach that point as the years go by.

How can we find out who is right? How can we decide whether you are right to say that the reduction can be achieved immediately or whether the Government is right to accept the advice on which it based its projection that it cannot reach 3 per cent reductions year on year until 2019? How can we get at the scientific correctness, if I may put it that way, of the argument?

Duncan McLaren: The challenge is that it is not just a physical science argument but a social science argument. People make different assessments of how quickly different technologies can penetrate the building stock or the vehicle stock, and you could get modelling done on those by experts of various persuasions. However, the crux of the matter is how much leadership the Government shows by saying, “We know that some of these things might feel uncomfortable, some might be expensive, and some might be politically unpopular.” That is a challenging thing for a Government to do, of course, which is why the suggestion of winning cross-party consensus for the principles of the bill is valuable. A Government that does something that is politically unpopular in the short term is unlikely to lose an election as a result, and obviously no one would counsel a political party that it should lose an election, even if that was necessary for the planet and the people in the longer term.

It would be nice to get to the scientific detail, but at the heart of the matter is a cultural question. The suggestions about how we can engage the
Public more are therefore critical to whether we will sustain significant emissions reductions year on year.

Richard Dixon: I will clarify a technical point. The bill does not rule out going for reductions of 3 per cent a year between now and 2020 and having 42 or 50 per cent reductions by then. That is possible under the bill, because all that it says is that we must have at least 50 per cent by 2030—we can have considerably more than that if we want to—and that we must have a reduction every year between 2010 and 2020, which could be 0.1 per cent, 3 per cent, or more. In its most ambitious scenario, the Government’s technical paper proposes 2.75 per cent. That suggests that it is possible to get close to 3 per cent.

In considering what recommendations to make, the question for the committee is how much you want to constrain the Government and push it to increase the targets in the bill. That might involve increasing the percentage reductions in the early years so that they are higher than just 0.1 per cent, or it could involve introducing an interim target so that we have to move faster in order to reach it. To what extent do you want to put such targets in place so that you know how fast the Government will go?

Under the bill, the Government could do 3 per cent a year and have a nice reduction by 2020, or, as the first scenario suggests, it could do nothing new for 10 years and only start getting serious about 3 per cent reductions in 2020. One of your key challenges is how to constrain things in the early years by suggesting changes to the bill that mean that whoever is in power in that decade has to act more quickly.

Rob Gibson: Duncan McLaren talks about doing things that are good or bad and popular or unpopular with the electorate. It is time to cut to the chase. What actions with which the public can engage will provide the answers to the questions that Des McNulty asked? What things could we do easily in the early period of tackling climate change? Do they involve renewable energy development? I would like concrete answers. Arguing about 2 or 3 per cent is all very well, but the public are mystified.

Duncan McLaren: The easiest way to make significant reductions quickly is by reducing energy consumption. The Sustainable Development Commission has told us that, in households that are provided with an energy display meter, average consumption reductions of 12 per cent are made in the first year. That device costs only a few pounds. Even if meters were installed in only half the building stock, a major reduction would occur in the first year. Such measures are not necessarily unpopular.

It might be unpopular to encourage people to make a similar reduction in their vehicle-related emissions by committing to work from home or to walk or cycle one day a week. Such steps are not impossible or inconceivable, although they would be more difficult to take in some areas than in others. However, that would generally be seen as an imposition. That is what I mean in talking about how far to push the politically unpopular.

The Scottish Government does not control fuel prices, on which even more unpopular decisions could be taken, but it controls the support that is made available for public transport, walking and cycling. It also controls support for improving the building stock, and the speed at which we make those improvements, so that people can reduce their domestic or workplace energy consumption.

Renewable energy is an additional element that is developing at a remarkable and positive pace. The industry tells us that that could be accelerated. I ask colleagues to add to that.

Richard Dixon: In its 500-page report to the UK Government on how to head for a 42 per cent reduction, the UK Committee on Climate Change picked out energy efficiency improvements in homes and commercial buildings and in industry, the transport sector, the decarbonisation of the power sector and doing more on heat. We are doing something in all those areas, so that is not rocket science; it is more of the same and some new measures. Some of that is techno-fix—the Committee on Climate Change comes from quite a technical-fix perspective, so it does not say much about how to help people change their behaviour, although it will do more work on that. However, in all those sectors, we can see the potential.

Duncan McLaren mentioned an example of energy efficiency in homes and how people can change their behaviour simply by having more information. We want to do big things with power stations but, like Rob Gibson, people can do something with microrenewables in their homes. In the transport sector, behaviour changes would make a big difference. If someone who commuted to work by car five days a week stopped commuting on one day a week by working from home or shared a car for one day, they would reduce their emissions by 20 per cent through just one action, their quality of life would probably be rather better and their employer might get better work from them. Simple activities can produce reasonably big reductions, in addition to the technical stuff that we need to do.

Dave Watson: We have a programme of workplace greening. That is not just theoretical; it involves a course and a range of measures that we suggest that people can take. We train our environmental reps to raise such issues with employers. Most actions require not a clever piece
of technology, but behavioural changes by people, as Richard Dixon said. Many measures could be done quickly in the public sector. When we talked about the budget, we gave examples of how the public sector could lead the way, through stopping some of the crazier relocations, dealing with travelling from the home to the office and taking an awful lot of recycling and energy measures. Those examples would also roll out into the home. All those activities would provide an initial quick hit.

I will turn the question around a little. Another issue is public credibility. To be frank, the public are not much impressed by Governments and politicians who set targets for 2050. We all know that the political cycle is about four years and does not last until 2050. It is therefore important to set earlier, more realistic targets that are achievable and which show a political willingness to make the required changes. If politicians put their reputations on the line in that way, it would be reasonable to expect the public to make the required changes as well.

15:00

Rob Gibson: But we have one hand tied behind our back in trying to deal with such matters through the bill. For example, it would have been easy for the UK Climate Change Act 2008 to say that all motor vehicles would have to do 100 miles to the gallon. It could have made that change, which would have been a win-win situation for many people. However, we cannot do that, and you expect us to do techno-fixes that are only a small part of the process. Should we say to the UK Committee on Climate Change that we must have answers from the UK about certain matters to make it easier for us to take certain actions?

Richard Dixon: That is certainly part of what you need to do, but you should remember that the bill sensibly proposes that the targets for each year are set with the help of advice from the advisory body, whether that is the UK Committee on Climate Change or a new Scottish version of that. Such a group of experts will think "Well, the EU is doing this on vehicle efficiency, the UK Treasury is doing that on the price of fuel and the Scottish Government is doing this on building bridges"—or not building certain bridges—"so this is what we think is possible over the next few years in reducing emissions from transport," to take one sector as an example.

You will therefore have advice from experts who say, "Oh, it's terribly possible to do 4 per cent next year," or, "It's quite difficult to do any more than your 3 per cent next year." You will get that kind of advice and intelligence, which will be gathered from all the other policy levers. Almost everything that produces climate change emissions has policy levers that are outside Scotland, from the EU influence on cows' farts to influences from elsewhere on vehicle efficiency.

The Convener: I thought that the other end of the cow was the problem.

Richard Dixon: It is both ends.

Des McNulty: In their answers, the witnesses have pointed to a disjunction between the strength of the levers in the Climate Change (Scotland) Bill and the expectations around it and the policy cycle that the current Government has or which the Parliament might have in its next session. Perhaps we need to consider that.

The other point that Richard Dixon raised is about the gap under the curve. The bill proposes annual point-in-time targets rather than the five-year carbon budget approach of the UK Climate Change Act 2008. The witnesses seem to suggest that we need to focus on cumulative emissions because they have a real impact on global climate change. How can we focus on the area under the curve rather than on points on the curve and get sensible consistency into the process?

Duncan McLaren: Our suggestion is that, at a practical level, the cumulative budget approach can reinforce an annual-targets approach. A minimum target of at least 3 per cent a year would be set, targets would continue to be set in batches, and the advice from the advisory body and the duties placed on ministers in formulating the targets would have regard to the cumulative budget.

We have argued strongly for 3 per cent annual reductions from the beginning because—certainly in my analysis and, I think, that of others—we will meet a safe and fair cumulative budget target only if we make rapid early progress. Clearly, a 3 per cent cut this year reduces the base for all subsequent years, so it has the biggest effect on the cumulative budget of any annual 3 per cent cut during the whole process. The longer we leave it before we start to make significant cuts, the harder it will be to get anywhere near a safe and fair cumulative budget. We therefore think that the annual-targets approach and the cumulative budget approach can work in synergy.

Richard Dixon: The big picture is made up of two things: how quickly we get moving at the start and the total area under the curve. The mechanism by which we focus is annual targets based on those considerations. Annual targets are a sensible way to let us know what will happen each year and will enable us to report sensibly—to say how we are doing and whether we need to make up for a failure—but the big picture is what they add up to over 50 years.

Des McNulty: The bill does not provide for formal banking and borrowing between reporting
years, although it allows the Scottish ministers to produce a plan to compensate in future years if annual targets are not achieved. Do you have any views on that?

Duncan McLaren: I have a suspicion that, although the bill does not explicitly provide for banking and borrowing, there is in effect a banking mechanism in the provisions for setting up carbon accounts. Under section 18, I think, the Scottish ministers could buy credits one year and not use them that year but hold them in the bank to use against future years. It is a relatively small banking mechanism, but I think that it exists.

Banking and borrowing are not necessary. We support the proposal that the Scottish ministers should produce a remedial action plan and that, in the event of failure, the plan should involve new and additional measures. We would not be satisfied with ministers saying—to paraphrase rather cruelly—"What we did last year was fine. It just didn’t work but it will this year." I think that the Westminster legislation uses the phrase "new or additional measures"; it is worth learning that lesson.

Des McNulty: If we are to ensure that the area under the curve is as small as possible, we need to consider interim targets to force the process. What kind of interim target would be appropriate? Are you content with the 2030 figure that the bill suggests? How should the interim target be constituted as an alternative?

Duncan McLaren: That has been a topic of some debate within Stop Climate Chaos Scotland. There is a view that specifying annual targets throughout the process is better than having interim targets, but we have agreed that we need a view on the interim target, and our view is clear and strong. To set an interim target for as late as 2030 is not appropriate because of the urgent need for action in the short term and because it is different from the date set by most other developed nations and blocks of nations—which have defined targets for 2020—and so is not comparable. Moreover, the level of ambition in the target is too low. Our conclusion is that, ideally, the bill should have an interim target of a 50 per cent reduction in emissions by 2020.

Richard Dixon: Since the bill was drafted, the UK Committee on Climate Change has produced its advice and proposed a target of 42 per cent by 2020 for the whole of the UK. As Duncan McLaren suggests, the UK Government expects Scotland to do more, the aspiration of ministers appeared to be for Scotland to do more and, because of our natural resources—we have lots of renewables—we have the ability to do more. That is why a 50 per cent reduction by 2020 looks like the target that we should set.

We would like the bill to specify a reduction of at least 3 per cent every year from the start. Of course, if it said "at least 3 per cent", we would get only 3 per cent every year unless we imposed some other constraints. If we said not only that we must make an annual reduction of at least 3 per cent but that, by 2020, we must reach the 50 per cent target, we would force the reduction at some point during the first decade to go slightly faster than 3 per cent per year.

Des McNulty: I want to challenge you a wee bit. You have consistently said that the bill is ambitious—as indeed it is, by international standards—but the bill is end loaded, with big changes envisaged from 2020 onwards. I am not sure whether a 50 per cent reduction by 2020 is feasible, but it is clear to me that a properly ambitious target is one that relates to the period between now and 2020 or 2025. To some extent, 2050 is politically irrelevant because it is so far in the future. Why are the organisations in the Stop Climate Chaos Scotland not saying that we should be properly ambitious and focus on what will happen in the next 15 years?

Richard Dixon: We are doing that by suggesting that there should be a tough target for 2020 and that, if we are to meet that target, we must move quickly in the first decade after the bill is passed.

If we reduce emissions at a rate of 3 per cent a year from 2010, as the SNP promised to do in its manifesto, we will achieve a 43 per cent reduction or thereabouts by 2020. Therefore, if the Government of the day delivers on its manifesto promise, it will achieve just more than what the UK Climate Change Committee is asking the UK to achieve in its toughest scenario. We have heard ministers commit to doing more than the UK is doing, and the target of a 50 per cent reduction by 2020 would drive down emissions in Scotland more quickly than a reduction of 3 per cent a year.

Des McNulty: As you said, the scenario that the Government currently proposes involves relatively restricted change between now and 2019. We cannot have it both ways: I will be happy if you are saying that by 2020 or thereabouts we need to have equalled or beaten—if that is feasible—the percentage reductions in the UK Government's toughest scenario, but I do not know whether that is what you are calling for or whether you think that such reductions are deliverable. That is what we need to know.

Duncan McLaren: I am sorry, but I wonder what you heard that gave you any other impression. Yes, we are calling for emissions reductions of at least 3 per cent a year in the first decade; yes, we are calling for a minimum reduction of 50 per cent by 2020; and yes, we think that all that is feasible for the reasons that we have set out, which include
Scotland’s advantages in delivering greater reductions on the grand scale through renewable energy and on the micro scale through interventions based on household energy efficiency and so on.

Des McNulty: Perhaps I have not made myself clear. You seem to be saying both that this is a great bill—it is fine—and that it does not deliver the objectives that you seek. I want to fill in the gap.

Duncan McLaren: I think that I know how the misunderstanding has arisen. We are saying that the principles and framework of the bill and its provisions for setting targets are okay—indeed, they are world leading in some ways—but that, if our approach is to be truly world leading, a number of things must change.

First, the level of ambition in the early years must change. Secondly, there must be a statutory limit on how much of that ambition can be deflected into buying international credits. Thirdly, the bill must from the outset include the international aviation and shipping emissions for which we are responsible. Each of those three changes would send a message to other nations that are coming up with plans for legislation and the Copenhagen climate summit. Such an approach would put us ahead of the international curve and make the bill truly world leading. That is our ambition—I think that my colleagues agree.

Richard Dixon: Yes.

The Convener: We must move on. If we are to allow time to question our second panel of witnesses, I must ask members and witnesses to be as brief as possible.

Shirley-Anne Somerville: The annual targets have to be set in bulk, and the first batch of targets will cover the period from 2010 to 2019. When they are published, you will be able to calculate a target for 2020. Is there enough in the bill to enable you to look at what will be happening in 2020 and to develop your policies and critique from that?

Richard Dixon: I would look at the issue the other way around. If we set a 2020 target, the advisory body will have a point to aim at when it sets the first decade of targets, as it will know what it must hit or exceed by 2020. However, if there is no such target under the bill—if we can have any figure for emissions as long as they are a bit lower than today’s—the advisory body will be able to flail about with any combination of reductions as long as the figure for a given year is slightly lower than that for the previous year.

If we set a target for 2020, the advisory body will know where it is going. It will then be able decide whether progress is a bit slow and a bigger reduction is needed to reach that target, whether there are things that we can do straight away or whether, because the recession has helped to reduce emissions sharply, we can cruise for a bit. If we set a figure for 2020, we will define exactly where we are going and the advisory body will give advice based on that.

We are keen to have such a number because it will enable us to know how much Scotland has to do—it may be an easy start or a tough start, but we will know where we will be in a decade’s time. A 2020 figure would signal to the rest of the world that we think that we can equal or better the performance of the UK or that we do not think that we can do as well as the UK. Regardless of whether we get the number only after annual targets have been set or whether it is set in the bill, people will look at it when deciding whether Scotland is doing something interesting or is not doing quite as well as it should.

Rob Gibson: Friends of the Earth Scotland is sympathetic to the idea of including central targets in legislation, but the bill contains no central targets. Last week, Professor Pete Smith stated:

“Having separate sectoral targets at the beginning would be unnecessarily cumbersome and reduce the policy levers’ flexibility to influence different sectors at different times.”—[Official Report, Transport, Infrastructure and Climate Change Committee, 27 January 2009; c 1371.]

How do you respond to that comment?

Duncan McLaren: I will try to be brief. There is some truth in what the professor said, but there is also a lot of truth in the concern that has motivated us to call for sectoral targets in the past. In some sectors, there may be great technical potential that is being overly constrained by worries about the sector’s political viability or public popularity, and if we are to meet the ambitious long and mid-term targets that we advocate, action close to the technical limits will be needed in all sectors.

We are not arguing that there should be highly detailed, specified sector targets—that is not the general position of SCCS—but no one at this end of the table would disagree that all sectors must play their role and that the bill must include measures, targets, duties or other enabled powers to ensure that that happens. The bill includes such powers for the waste and energy efficiency sectors but not for the transport sector.

Rob Gibson: Does the coalition have a view on land use and greenhouse gas emissions? The issue is being addressed by other committees, but are there general points that you think must be borne in mind?
Richard Dixon: Land use is a key issue in Scotland. We have a large land area for our population and a lot of peaty soils—much more carbon is locked up in our soils than in the rest of the UK. There is a statistic that suggests that the peat in Scotland contains more carbon than all the trees, bushes and leafy things in the whole of the UK, so it is important. If we treat it badly and it releases carbon and methane, there will be a problem. There has been some activity on land use—for example, the agriculture sector has a forum that is looking at climate change and agriculture—but it is clear that a lot more can be done. The UK Committee on Climate Change will look into that.

Our land and the carbon that it holds are one of the key assets that Scotland has. In future, we may find that farmers, foresters and other land users are paid through a European or even a global scheme to do or not do certain things to their land because that helps to lock up carbon or, in some cases, even hold extra carbon. We may find that one of our chief assets and ways of making money from Scotland’s land is the action that we take to safeguard carbon, so it is clear that we must start early to think about what we can do and what we are not doing. Land use is an important area, but it is one in which we already know some of the answers.

Rob Gibson: Okay. I just wanted to get that on the record.

I will move quickly on to international credits, on which the Scottish Government does not intend to prescribe a limit. What are the positives and negatives of having such a limit? By and large, the Government hopes to meet climate change targets through our own efforts.

Duncan McLaren: It is clearly right to have the ambition of dealing with climate change emissions reduction largely domestically. As a witness put it to you at last week’s meeting, by 2050 no one will have any spare credits to sell, so we need to plan for a world in which emissions reductions are made domestically.

The big advantage of having a set limit is that it would ensure that we directed investment to and encouraged investment in those technologies and sectors that could help us to make emissions reductions domestically, which would mean that we could be one of the countries that could sell those technologies and that expertise, rather than one that subsequently had to import them.

Perhaps the key reason for having a statutory limit is the accountability that it would provide. If there were no statutory limit and just an aspiration, a decade from now the minister of the day could not be brought up in front of the committee’s successor and held to account in the same way that he or she could be if there were a statutory duty. For those reasons, Stop Climate Chaos Scotland calls for a statutory effort target, whereby 80 per cent of the emissions reduction effort must be achieved domestically—in other words, not through the purchase of international credits.

Rob Gibson: Thanks. I will leave it at that just now.

Shirley-Anne Somerville: I will move on to international aviation and shipping. The Scottish Government has given assurances that international aviation and shipping will be included in the Scottish targets. What approach could be taken to formalise that position?

Richard Dixon: International aviation and shipping is probably the area in which the bill, when it becomes an act, could be most world leading and most influential in Copenhagen. The target of reducing emissions by 80 per cent by 2050 is the same as the UK’s, now that it has caught up. The UK has quite an ambitious short-term target of reducing emissions by 42 per cent by 2020; if we do better than that, it will be quite important. A limit on international credits would be quite important, too, but perhaps what is most important is that we do the right thing on aviation and shipping.

We very much welcome the ministerial commitment, which the bill team repeated to the committee two weeks ago, that ministers will ensure that the order is passed in time, so that when the bill comes into force, emissions from international aviation and shipping are included in the targets and the reporting right from the start. That is great, but why do we need a separate order? The bill team’s logic is that things need to be set up in that way so that when the international methodology for doing such calculations changes, we will have the power to make alterations, but the bill has had in it from the start provisions that are accompanied by a power to change them. For example, it sets out which greenhouse gases are included from the start and gives ministers the power to include different gases if it is decided that there are other important gases. It would send a clearer message to the international community if the bill were amended to say that international aviation and shipping emissions will be included in the targets and the reporting right from the start, and that ministers will have the power to adjust the way in which those emissions are calculated, on the basis of advice from experts, when the need arises. We are happy that there is a ministerial commitment, but we would be much happier if the bill stated that those emissions were to be included from the start.

One other technical issue, which was touched on last week by David Kennedy of the Committee on Climate Change, concerns the impact beyond
the simple CO₂ that comes from aeroplanes. Because aeroplanes fly at high altitude, they have more impact than they would have if they were sitting on the ground and producing the same emissions. He talked about radiative forcing or multiplier factors that should be applied. At the moment, in the figures that the Government has presented to you, it is not applying any multiplier. The UK Government often uses a multiplier of about 2. The message that you heard from David Kennedy was that nobody really knows the number; we know only that it is not 1—it is more than 1. He said that, when it works on aviation emissions, the Committee on Climate Change uses a multiplier of between 2 and 4.

So, although aviation is a reasonably small contributor to our emissions today—about 3.5 per cent of emissions from Scotland come from international aviation—we are underestimating it if we do not use a multiplier to reflect the extra impact of forming clouds and producing gases at high level. That technical issue is not covered in the bill or in the technical papers that you have received from the Government.

**Duncan McLaren:** The disaggregated figures for the UK are available, so we know Scotland’s share of aviation and shipping emissions under the methodology that is currently used for reporting in the Kyoto process as a memo item. So, the data are technically available and can be provided. Having those figures within the targets would also encourage actions to be taken in Scotland, perhaps through the national planning framework, to reduce aviation emissions.

**Shirley-Anne Somerville:** You say that data on aviation emissions are available, but there is more of a debate about how we can measure emissions from shipping and their impact. Do you have any comments on that?

**Duncan McLaren:** The data on shipping are not as good as those on aviation because, whereas most airliners that land in Scotland will refuel in Scotland, a ship tends not to have to refuel whenever it comes into port. The current methodology for aviation, although not perfect, captures a reasonable reflection. The current methodology for shipping is not as accurate, but it is the best place to start because it is the one that is shared internationally. A new methodology for shipping is urgently needed, but that is not in itself a reason to avoid setting up the methodology to begin with.

**Richard Dixon:** If everyone in the world did what we propose to do on shipping—which is to record the fuel that is put on ships—we would cover all the fuel that was put on ships everywhere, so we would capture everything. Although the methodology is not great—it does not really reflect our true impact—it would help to capture everything. It is a good place to start, given that we have those data.

There are international discussions in the International Maritime Organisation and there are UK discussions with the Chamber of Shipping about how we can do something more sophisticated. A range of options has been produced, but the favoured one is to look at the goods that we buy that come in a container by ship and to attribute some CO₂ to each of them. If that is a more sophisticated methodology that attributes the CO₂ to countries in a more accurate way, that is great. However, the IMO has been trying for 10 years to come up with a methodology.

So, let us do something here that will be ground breaking and not bad. Then, when the international community catches up, we will go with its methodology.

**The Convener:** I want to pick up on the issue of the multiplier in relation to aviation emissions. You say that everyone agrees that the multiplier is not 1—I assume that you mean that it is greater than 1, not less than 1—and that the UK uses 1.9 or whatever as a cautious estimate. Would it be reasonable for the bill to require the regulations incorporating international aviation to specify a multiplier? Is there another estimate of what it ought to be?

15:30

**Richard Dixon:** That would be helpful. Clearly, aviation and shipping could simply be included in the bill. The Government would say at some point how it will deal with those sectors and would have the power to change what it decided whenever it felt like doing so. In that case, there would be no obligation to include the multiplier correctly. If you were to put into the bill something that said that the Government was required to take advice on the multiplier from the advisory body, that would force the issue sufficiently that it would have to explain why it was not using 2 if everyone else thought that it should be 2.

There is a lot of scientific work going on in this area, because it is a live international discussion. As I said, the Government down south has been using 1.9 consistently for about two years. When the Intergovernmental Panel on Climate Change first raised the issue, it said that the multiplier should be somewhere between 2 and 4, which means that the Government is using something at the lower end of the IPCC’s range. As we go along, we will probably get a more refined number. However, it certainly will not be 1—it might be closer to 2 or, possibly, a bit bigger. If we were to go for 2, we would be using the best available science. However, as you suggest, there should be an obligation on the Government to take the
best scientific advice and implement it in any methodology that it uses to report and set targets.

Charlie Gordon (Glasgow Cathcart) (Lab): The committee has heard evidence that the Scottish Government has not formally asked the UK Committee on Climate Change for advice on developing the bill. Do you have any views on whether it should have?

Richard Dixon: Via the internet, I watched your session with David Kennedy of the Committee on Climate Change and I was surprised that it had not been consulted. However, I was also surprised that, when the members of that committee were asked what they were going to do for Scotland, they talked about money and said things like, “We might need more resources for that,” and, “We’ll see what resources allow.” I did not think that it was a terribly generous presentation. Some work needs to be done in that regard.

The UK act set up the Committee on Climate Change in a fashion that provides for the Scottish Government to contribute some money and formally ask for things. Formally asking for something is quite a big deal, as it involves getting something back for the money that has been put in. When the Government says that it has not asked questions formally, that is quite different from saying that it has not met members of the panel for a chat or exchanged e-mails—as we know, that sort of contact is happening.

Clearly, the UK committee is doing extremely useful work. The picture that it has generated of where the UK stands on issues such as the scale of targets, the ways in which we might meet those targets and the budgets that have been set for the two initial periods is important, but, as David Kennedy admitted to you, the chapter in the 500-page report that examined the devolved areas was a little preliminary—I think that that was his description of it, although someone in an earlier question-and-answer session was a little ruder about it and described it as being quite sketchy.

If the UK committee is to be useful to us, it needs to do a lot of work to understand Scotland and ensure that the statistics that it uses are more specifically Scottish rather than being just 10 per cent of some UK number. A lot of work must be done to ensure that that relationship will work, but I have no doubt that, even if we set up a Scottish body rather than staying in the UK body, the UK committee will still be an important body to talk to.

I will ask Dave Watson to talk about our preference with regard to whether there should be a Scottish body or a UK body.

Charlie Gordon: Yes, go on, Dave—answer my next question before I ask it.

Dave Watson: I always do that, Charlie—I have almost made a career out of it.

The answers that you got from the UK committee, to which Richard Dixon referred, highlight the problem of relying solely on the UK committee. Our view is that we need a distinctive body in Scotland. It should work constructively with the UK committee rather than being a competing committee; it should be a commission, if for no other reason than to differentiate between it and your committee; and it should report to Parliament, not the Government.

We were not impressed by the answers that you received last week on the issue of the establishment of a non-departmental public body, not only because we are supposed to be reducing the number of such bodies but because I have never met an executive or chair of an NDPB who offered fearless criticism of any Government of any colour at any time, which is what we want the commission to do. NDPBs are under ministerial direction and, if they say something a bit naughty, the civil servants get on the phone and say, “Why are you doing that?” As that happens under all Governments of all colours, an NDPB model is not helpful.

Why should we have a separate body in Scotland? First, we will have a different legislative framework from that of the UK—if, as we hope, the bill is enacted—so it will be difficult for the UK Committee on Climate Change to juggle with that. Secondly, most policy areas that impact on climate change are devolved issues on which the UK committee would not be of much use. Thirdly, an important point is that we have not only different public bodies but different structures. Advice on how public services in England might respond to climate change will need to be different from the advice in Scotland, where we have a different type of public service structure.

Essentially, our view is that we should have a distinctive body that can provide independent advice, primarily to Parliament but also to Government. If members are unsure about that point, they need only look at the words of the chair of the UK Committee on Climate Change. When asked about Scotland, he said that, frankly, he did not think that he would be able to support Scotland, for the reasons that I have indicated. The UK committee is sceptical about whether it could do the job. We think that there is a case—we have no scepticism on this point—for having a separate Scottish body.

Charlie Gordon: Do you believe that there is enough scientific expertise in Scotland to staff such a commission? Given that you are presumably talking about appointing not just a commissioner or tsar—as you know, we are not too keen on tsars any more—is there enough
Des McNulty: I want to make an analogous point. The UK Committee on Climate Change suggested that the UK impacts report will be a key mechanism. Presumably, that report will be used to inform the adaptation plan here in Scotland as well as elsewhere. However, as I understand it, there is no mechanism in the UK impacts report for key Scottish bodies to be asked for their view in a formal way. Is that a problem? Should the Scottish Environment Protection Agency, Scottish Natural Heritage and other relevant bodies be required to make a formal contribution to that process, if that is the road that we are going down?

Dave Watson: Yes. We see that as part of the reporting mechanisms under the bill. Frankly, those reporting mechanisms need to be tougher and more meaningful than those that are currently sketched out in the bill. Yes, we agree that the First Minister should be required to make an annual statement to Parliament. Yes, there should be an annual report and a response by the independent Scottish commission, but other bodies should also have the opportunity to be involved. Probably, the Public Audit Committee should have a role in scrutinising that annual report by asking SEPA and other regulatory bodies to comment on the approach that had been taken. The kind of reporting mechanism and accountability that would be created would be tougher and more meaningful than the approach set out in the bill.

Duncan McLaren: I understood David Kennedy last week to be slightly more sanguine about what would happen if resources became available. He was talking about dedicating one or two more people to Scotland. That suggests that the estimate in the financial memorandum of the cost of a Scottish committee might be a little exorbitant—it seems to believe that we could function only with the full equivalent of the UK committee, which has 25 to 30 members of staff. So the costs of financing a Scottish committee might be less than estimated and, from David Kennedy’s perspective, the costs of getting advice through the UK body are probably more than has been estimated, making them more comparable.

The Convener: Following on from Dave Watson’s comment on the duties on ministers to report to Parliament and the structure for reporting, I wonder whether the other witnesses have any views, not only on existing duties but on the proposal that ministers should meet the conveners of parliamentary committees once they have laid their report before Parliament. I should clarify that unless the Parliament’s standing orders are changed in some way, that process would be off the record and would not form part of the Parliament’s formal, recorded decision-making
process. Could that process be improved in some way or the discussions put on the record?

Richard Dixon: The proposal for ministers to meet the Conveners Group clearly shows the Government’s good intentions about bringing the Parliament up to speed and involving key committees in the process. However, as you pointed out, the fact that the meeting will be off the record means that it will not form an appropriate part of the scrutiny of this very important legislation. Whether it means forming another group that happens to have the same people in it—which means that it does not need to fit in with standing orders and can be defined in the bill to ensure that its meetings are recorded and the minutes put up somewhere on the internet—or finding some other mechanism, we must deliver on the Government’s intention in an open and transparent way and ensure that any discussions are put on the record.

Dave Watson: I have already set out our proposals, which will also be included in our written evidence.

The Convener: Rob Gibson has a question on adaptation.

Rob Gibson: Other committees are considering various aspects of part 5, but do the witnesses have any views on the bill’s adaptation provisions?

Richard Dixon: We are in favour of treating the issue of adaptation seriously. The bill’s proposal that a programme and reports be laid before Parliament is sensible, but we would like the timescale for such reports to be formalised. We feel that adaptation is the second most important issue in the bill—the most important is reducing emissions—but, given that the climate has already changed and that, even if we stopped all emissions in the world today, it would continue to change, it is clear that we need to plan for a different future. We are reasonably happy with the provision, but, as I said, we need to look at the timescales for reporting.

Duncan McLaren: It is probably reasonable to say that we are reasonably happy with the proposals. Our key request is that we ensure that adaptation is carried out in compliance with sustainable development outcomes, no matter whether they are defined as a high-level duty in the bill or whether they are attached to these particular sections. Obviously, certain adaptations would be very damaging to other social, economic or environmental interests while others would have very positive effects.

15:45

Cathy Peattie: The panel will be aware that this is not the only bill going through Parliament that is concerned with climate change; a member’s bill is coming forward. What is the panel’s view of Sarah Boyack’s bill?

Richard Dixon: I should start off, because we have been involved with the thinking behind Sarah Boyack’s proposed bill, so obviously we are keen on its intent. Clearly, the Climate Change (Scotland) Bill is an opportunity to deliver the same things in a more joined-up way. We have been talking to Sarah Boyack about how the two might come together, and I gather that she has been having productive discussions with the Cabinet Secretary for Finance and Sustainable Growth about how that might be done. It is up to her to decide whether enough is being offered in the delivery of the Government’s bill.

We are happy with the principles of her bill. What she intends to do is extremely sensible and would make a good contribution to reducing emissions and tackling fuel poverty. I hope that those principles progress, whether through her bill or through the Government’s bill.

Dave Watson: The trade unions strongly support Sarah Boyack’s bill. It is a good example of the practical measures that need to be put in place. There is a lot of theoretical talk about high targets, but Sarah Boyack’s bill is a good example of practical measures. Those of us who represent energy industry workers think that the bill has merit. We are relaxed about how you do it, but it is a good initiative.

Des McNulty: I understand that the Westminster Government’s adaptation plans must be consistent with the principles of sustainable development and that they will be independently assessed by the UK Committee on Climate Change. Could the adaptation provisions in the Scottish bill be similarly strengthened by including a sustainable development duty? Should independent scrutiny of adaptation plans be written into the bill?

Duncan McLaren: As we have noted, there should be a duty for the whole bill to be in accordance with sustainable development. That would apply to adaptation. Indeed, it would be preferable if Scottish ministers were required to seek independent assessment of progress made towards implementing the adaptation programme, and if there were appropriate assessment of the impact of climate change in Scotland, not just a UK assessment with a Scottish dimension.

The final thing to say about adaptation is that Scotland should also seek to support adaptation work to address the impacts of climate change on vulnerable communities and ecosystems in developing countries that are already being directly affected.
The Convener: Before we close this panel, do you have any points to raise that have not come up in questioning?

Duncan McLaren: I am afraid that I have one; I am sorry to add to time.

One of Stop Climate Chaos Scotland’s headline asks is that the bill incorporates strong enforcement measures to ensure that its provisions come to fruition. We are particularly concerned to ensure that the bill is clearly justiciable, so that the decisions of ministers and other competent actors on setting targets or activities, plans and programmes that might lead to the missing of targets in the future can be challenged in the courts, and that the courts can make a direction on that in compliance with the Aarhus principles that access to justice should be timely, affordable and merits-based. Those principles should apply in Scotland at the moment, but we do not believe that they are consistently applied and this is the point at which, either in the bill or in the debate, ministers should commit to the bill’s provisions being challengeable in that way, as are those of Westminster’s 2008 act.

We are also clear that effectively enforceable duties should be imposed on public bodies.

Finally, there might well need to be more incentives to ensure that ministers and other public bodies deliver on their duties. One option for that is to set up a system of financial incentives or sanctions, but there might be other options, and we would welcome the opportunity to explore those at greater length.

The Convener: I thank all three witnesses for their time. If you have further evidence to give, the deadline for submitting written evidence is 27 February.

15:50
Meeting suspended.

15:56
On resuming—

The Convener: I welcome our second panel. Chris Hegarty is advocacy manager at the Scottish Catholic International Aid Fund, Gavin McLellan is head of Christian Aid Scotland, and Judith Robertson is head of Oxfam in Scotland. I am sorry that we are starting this part of the meeting a wee bit later than we expected. We will try to ensure that there is adequate time for questioning.

You represent organisations that are involved in international development. What are your reasons for participating in the process of the Climate Change (Scotland) Bill? Why is it important for you to devote resources to the issue? Why is it important that developed countries work towards ambitious reduction targets for greenhouse gas emissions?

Gavin McLellan (Christian Aid Scotland): I will kick off with a soundbite that came from one of our partners in India:

“Climate change will make poverty permanent.”

We have put a lot of resources into making poverty history. Members will recall that in 2005 the G8 summit took place in Scotland—you might have marched in the streets at that time. All that work is at risk, because increasing frequency and severity of disasters are sweeping away a lot of development gains that we have been working on for the past 50 or 60 years. From a humanitarian point of view, and in the context of sustainable development, we want to protect and preserve the development gains that have been made. We also want to encourage communities to be resilient and to adapt to changing circumstances.

It is important that we highlight other issues to our constituencies and there is a moral obligation to act. Some 75 per cent of carbon emissions have occurred during my lifetime and the industrialised north has been responsible. Members know the moral arguments well. There is a moral issue about who is responsible and who is suffering, as we witness the impacts of climate change on developing countries. All the witnesses could talk about field reports; for example, about communities in Bangladesh that have had to move rapidly, salination of fields, threats to food security, frequent and severe droughts and famines, and so on.

Those are the main issues, but we also need to ensure that there are proper compensatory measures for communities and countries that are suffering. We need to ensure that there is a proper global agreement that gives space to countries that are trying to get on to a clean development path, and we need to ensure that countries that have the main responsibility for contributing to climate change pay for adaptation in developing countries. I am sure that my colleagues on the panel will want to add to what I have said.

Judith Robertson (Oxfam in Scotland): I agree with Gavin McLellan. The fundamental issue is the human impacts of climate change now and during the past 20 or 30 years. People are becoming poorer because of climate change, and that will not stop happening. I could not endorse Gavin’s words more.

We see in some places daily evidence of the devastating impact of climate change. Climate change is a global issue—it is not just for Scotland. My role, as the representative of Oxfam in Scotland, is to emphasise to the committee that climate change has such strong global impacts
that we cannot afford to ignore it or the contribution that the Scottish Government makes to it. The issue is important and urgent. Furthermore, it is important for us not only to be seen to behave responsibly, but to behave responsibly so that developing countries can build trust in the rich countries in relation to climate change, which is of such human importance. We are talking about effects on the lives of hundreds of millions of people that will happen soon and develop over time. For us, 2050 seems to be very far away, but it is nothing for the children of the people with whom we work and, indeed, for their children.

16:00

Chris Hegarty (Scottish Catholic International Aid Fund): I will quote somebody called Javier Gomez, who is a beneficiary of the SCIAF partnership in El Salvador. When asked what he would say to people in developing countries whose lifestyles might contribute to the change in climate, he said:

“Stop using so much energy. It’s impacting on our lives. It’s killing us.”

That explains powerfully why we are all sitting here. To an extent, we represent the Javiers of the world.

The Convener: What are the witnesses’ views on the bill’s consultation? Did it give your organisations sufficient opportunity to help shape the bill ahead of its introduction?

Judith Robertson: I am reasonably happy with the consultation, which engaged the participants. We chose to join Stop Climate Chaos Scotland because we felt that we could add another dimension to that important discussion, and that coming together in a collective effort would have more impact. We feel that participating in this process today, too, will help.

Gavin McLellan: I have nothing to add.

The Convener: An issue that arose previously in discussing the consultation was whether it focused sufficiently on creating positive reasons for people to participate in the climate change agenda as opposed to just consulting on the bill, and whether the bill needs to go forward by building on public engagement or outlining how the Scottish Government will create such public engagement. Do the witnesses have views on that theme?

Gavin McLellan: I would highlight our expertise in galvanising the public in that regard. There has been a lot of discussion in the past two hours about capturing hearts and minds. As I said, my agency has experience in mobilising people through campaigns such as make poverty history. If issues are spelled out to people well and there is a sense of urgency, they will want to act. The climate change problem is so big and people can make so many different responses to it, but they are not being guided.

However, we can start harnessing spheres of influence. For example, the eco-congregations network, which is a member of Stop Climate Chaos Scotland, has 200 communities of interest that have come together to work out their responses, but they will need to see big movements and incentives out there. The bill can work towards creating those and can push the investment choices and the mix of interests to make something happen. People feel slightly powerless about what they can do and feel that there are limits to it, but acting together gives real encouragement. In that regard, we can bring expertise in galvanising people.

Chris Hegarty: The challenge that we face as NGOs is to explain to our constituencies why we are working on climate change issues. In that regard, SCIAF is sending out to our constituency about 150,000 packs on climate change issues. That shows that the work is already happening on the ground. I am sure that my colleagues here are involved in similar processes. We are doing our bit, if you like, and we encourage you to do yours.

Judith Robertson: I want to address two dimensions in this context. First, the public will engage when they see leadership that they can trust. For example, the UK Government’s decision to have a third runway at Heathrow has an impact on public engagement with climate change, as does the decision to have at Kingsnorth a new coal-fired power station that will not have carbon capture built in from the start.

It is clear that the public will follow where the Government leads, although not always. The Government must be honest in dealing with issues such as climate change, in respect of which individual action will play a huge role in determining the outcome and success of processes. It must say that it will make and commit to targets, it must take the hard decisions that Duncan McLaren and others talked about earlier and it must show leadership to the public. It must show that it has to engage in the matter, ask the public to engage in it, and take responsibility. Public engagement is a huge dimension.

More practically—if what I have just outlined could not be said to be practical—Oxfam has been involved in sustainable development education for many years, which is one reason why Dave Watson gets harassed to death in schools by young people who know what questions to ask people in power. They know how to hold people to account because they understand the issues that are at stake. We need to continue to ensure that
young people in our schools are taught about the impact of their actions on climate change. The bill could at least support that education, as could wider Government action, to ensure that not only the public of today are engaged in the issue, but that future generations will know why hard asks have been made of them, why reduced energy use is being sought, and why we do not use our cars daily.

Children and young people should be able to hold their parents to account. My friends who have children tell me every day that they have been harassed in the morning because they have bought something with extra packaging, something that is not eco-friendly or something that puts detergents into water. Children’s pester power should be used for outcomes that we favour, rather than for buying Mars bars.

**The Convener:** I have a couple of questions about Scotland’s opportunity to influence matters beyond the domestic agenda. Obviously, the Scottish Government does not participate directly in international negotiations, but it has been put to us that the bill could have an impact by being an example of world-leading legislation. To what extent is it a realistic objective for us to pass world-leading legislation to set an example for other Governments or countries? What opportunities does Scotland have to help low-carbon development in developing countries and to help them to skip the dirty stage of development by developing in cleaner and greener ways?

**Chris Hegarty:** I would not underestimate the power of Scotland’s precedence in this. We all recognise that Scotland by itself will not solve the problems of climate change, but it stated its intention of going to an 80 per cent emissions reduction target while the UK still had only a 60 per cent target. I would not underestimate the impact that that might have had as a political factor in the UK’s moving to an 80 per cent target. By the same token, the UK’s 80 per cent target may have been an influence on the United States of America, which now has an 80 per cent target.

Richard Dixon talked about the various ways in which the bill could lead the world. At the moment, it is fair to say that we are slightly reserved about the number of areas in which its proposals lead the world, but Scotland could genuinely lead the world if we imposed immediate annual targets of 3 per cent, had firm commitments on getting 80 per cent of our reductions from domestic efforts as opposed to buying our way out through credits, included aviation and shipping from the start, and made funding commitments for adaptation in overseas countries explicitly, over and above existing aid commitments.

The other aspect is timing. Whether it likes it or not, Scotland has put itself in a position in which it will be examined at a time when many big decisions will be taken in the Copenhagen processes. If consideration of the bill concludes before the summer recess, as has been suggested, we will be in a good position to influence international processes because the hard negotiations on the United Nations Framework Convention on Climate Change towards the Copenhagen summit will take place from June to September.

**Gavin McLeLLan:** I echo many of Chris Hegarty’s points, but I want to put extra emphasis on the need for 80 per cent of our reductions to come from domestic effort and the need for a 20 per cent cap on emissions trading so that we are not reliant on it. We could make the bill a world leader in many respects. At present, it is potentially world leading: it is important that we make it so and that we give international leadership by ensuring that we achieve 80 per cent of our reductions through domestic effort.

We need real trust to be built up at Copenhagen. Any legislation that will create a lot of political will and a belief that there is real will in the north to achieve emissions reductions would be a good thing. It would be great if the bill achieved that. Ambitious climate change legislation in advance of the Copenhagen conference will send a strong signal, so we are calling for that.

As members will know, the traded sector in Scotland covers about 50 per cent of our emissions. It is therefore particularly important to cap trading so that there is a real incentive to decarbonise—particularly for the power industry—and to send out the right kind of investment signals to ensure that that action happens. That would be a world-leading and important message that could be sent out ahead of the Copenhagen conference.

The convener also asked about what Scotland can do on adaptation and to assist developing countries. I will pass the buck slightly and say that I think that Judith Robertson has done some work on that.

**Judith Robertson:** We have not done an analysis of industry in Scotland to show what could be applied in the context of developing countries. However, there is no doubt that, if we decided to invest in developing renewables and low-carbon processes to generate energy, those developments could be used and adapted overseas. Patrick Harvie’s point about jumping stages in the process is important. The bulk of that work will be done in small communities of people who are already very poor.

We dealt briefly with adaptation, which is a complicated process. The development agencies and the World Bank estimate that it will cost 50
billion annually to put in place adaptation processes that make developing countries secure from the negative effects of climate change. That is a huge investment that needs to take place overseas, on top of the investment that is needed in Scotland and other rich countries to support new industries, new ways of operating and the development of low-carbon processes. Our strong view is that Scotland has a role in supporting the adaptation process. We could add to our international development policy to make it clear that we want to provide resources to support adaptation processes. That is part of our international responsibility, which is not just to reduce our emissions in the future, but to deal with the effects of our past emissions. Those are important dynamics that we have to consider.

On the impact that Scotland’s leadership could have, if the bill will hold the Government of today and Governments of the future to account, that will be read and understood by Governments globally, such as the Indian and Chinese Governments and all the Governments that are trying to get off the hook in this difficult situation in which we find ourselves. In some ways, every Government is trying to do that. If, through the bill, we do not let ourselves or the Government off the hook, that will show India and China—which potentially will emit far more than we ever will—that action can be taken. That would be inspiring and responsible and would show commitment to future processes.

We cannot let developing countries not develop—we cannot say that it is not okay for them to get rich, to be successful economies or for people to have cars. It is not okay for anybody to say, “You can’t have what we’ve got.” The bill is a really important part of that process. It is inspiring that Scotland can take such action and it is exciting that we will be one of the first countries to do so. I would love to go to Copenhagen and say, “Look what we’ve done—you can live up to this.” rather than say, “Well, we could have made some changes, lobbied harder and done a better job.” We do not have to do that. We have the chance to make the bill really strong, good and powerful.

16:15

Chris Hegarty: It will be all very well to create world-leading legislation, but we will then have to become much more evangelical. If we place Scotland’s carbon footprint in context, we might think that we cannot contribute all that much; however, we can encourage people in all political parties—regardless of their position on constitutional issues—to push the idea really hard. That will be the next step after we get world-leading legislation in place, as I hope we will.

SCIaF is campaigning on climate change as part of a coalition of equivalent aid agencies in something like 170 countries. If we get a clear example from Scotland, the first thing that I will do is present it to 170 countries, so that they can use our example as an international precedent.

Des McNulty: I note what Judith Robertson said about the international development strategy and the possibility of our processes being adapted. Do skills issues also arise for the international development agencies in Scotland that operate in other countries? Should those agencies get more access to climate change technologies that can be applied in other countries, so that they can encourage those technologies to be used more quickly and more effectively, where appropriate?

Judith Robertson: It would depend on the level at which you want to operate. There are plenty of skills overseas; most communities in developing countries know what they need in order to adapt effectively.

We have limited ability to change weather patterns in the short term, but we can adapt crop production and water schemes. For example, Oxfam can help to lift communities off the ground so that, when tidal disruption and floods happen, people and their goods are still safe and secure. With a bit of support, most communities can have the skills to do that. Asked whether Scottish NGOs are engaged in that sort of work at the moment, I would say, “Mm—possibly to some degree.” However, that does not mean that Scotland should hold back, and it does not mean that there is not plenty of potential for developing programmes of work and relationships on the ground overseas.

Des McNulty: I want to ask about targets. What is your view of the approach that has been adopted in the bill of setting batches of annual targets, rather than setting carbon budgets, as has been done in the UK’s Climate Change Act 2008?

Judith Robertson: Oxfam in Scotland agrees with the approach that has been advocated by Stop Climate Chaos Scotland. We believe that we have to make annual commitments to a minimum of a 3 per cent reduction. That will allow us to monitor our present reductions and plan our future reductions.

We have heard plenty promises about future targets—the millennium development goals are a fantastic example of that. A wide range of targets for developing countries were set by the United Nations and by global systems, but no accountability mechanisms were built in and no stepping stones were put in place at which Governments could be held to account.

Oxfam in Scotland and the other international development NGOs that are part of Stop Climate Chaos Scotland heartily welcome the notion of annual targets, but we would set them at 3 per cent—we would not leave things to chance. We
would not wait for a Government to decide, on the basis of advice, that it was enough just to do 0.1 per cent more than we had done the previous year. It will not be enough. It will not allow us to achieve our goals. If the committee wants us to, we can provide more evidence of where targets are not being reached. We have to hold ourselves to account for what we commit ourselves to.

Gavin McLellan: I would like to amplify that. One of the reasons for what we are doing is the urgency and scale of the problem. Judith Robertson has just given us a helpful critique of the millennium development goals framework, which has not been delivering anything like as quickly as was originally envisaged. There is a lot to be learned from that. We would not wish to fall into a trap as we go into the negotiations in Copenhagen at the end of the year.

There is an opportunity to show that Scotland is responding to that urgency. If we are committed to the annual target, we should ensure that accountability is strong. That is one of the messages that we can put into the international framework as it gets negotiated: we are serious about our response, and we are dealing with it urgently. We are not going to prevaricate too much about the framework—we want to get started.

Chris Hegarty: I wish to touch on the reasons for front-loading our response, as opposed to end-loading it. Climate change is not some sort of abstract concept that might happen over the next 20 or 30 years. UN figures show that, throughout the first five years of this decade, 262 million people have been adversely affected by climatic events, and 98 per cent of them live in the developing world. We are well positioned to stress the urgency of the situation, and the fact that we cannot afford to sit around for another 10 years just sorting out some infrastructure projects. We really must start taking action sooner rather than later.

Des McNulty: Let us consider the emissions track that the Scottish Government has suggested. It seems not to be front-loading, but end-loading, which is exactly the millennium goals position that you described previously. Targets are being set for a significant distance into the future, which either avoids our having to take action now, or allows the rate at which action is taken now to be slowed. Is that a reasonable parallel to draw? Is it your view that the Climate Change (Scotland) Bill as drafted, with its long-term targets focused on 2050, potentially avoids the early action that you see as necessary? Is that similar to problems that you have experienced in your specialist areas?

Judith Robertson: We support what was said by the earlier panel—we wish the effort to be made in Scotland. We want responsibility for managing what we emit and how we deal with it. We should be a process whereby we can hold Government to account against delivery of the targets.

The reason for that—apart from urgency—is that we need not just to deliver first on the easy things, but to invest for the future. We must ensure that the investment is made, and that Government is aware that, if it does not invest now, action will not be deliverable in five, eight or 10 years. Under the bill as drafted, we are not committed to a three per cent annual target until after 2019. That is too far away. We need to bring that date forward. We need to bring the provisions into current-day activity. We should encourage the general public and private and public sector bodies to act.

Des McNulty: Again, there are interesting parallels here. The bill does not include formal banking and borrowing arrangements between emissions budgets. Do you have any views on that approach, or any experiences from your activities in the international development field that give you pause for thought?

Judith Robertson: We support what was said by the previous panel—that a target of reducing emissions by 50 per cent by 2030 will not necessarily lead us to a reduction of 80 per cent by 2050, because that does not fit in with the other ways in which targets are being set. We advocate an annual minimum target of 3 per cent, which will bring us a potential reduction of 42 to 50 per cent by 2020.

Chris Hegarty: I will tie that in with our earlier conversation about how Scotland could lead the world. Irrespective of whether we set annual
targets of 3 per cent or an interim target for 2020, we would, in setting a target for 2020 that is tougher than any existing target anywhere in the world, create another area in which we could—and should—lead the international discussions.

I reiterate what Gavin McLellan said about developing countries’ lack of trust and cynicism about what richer countries will deliver being one of the biggest sticking points in relation to the Copenhagen discussions. Offering a further example of a developed country that is stepping up to the mark and taking its responsibilities seriously will help that process.

Des McNulty: So a target of 42 to 50 per cent by 2020 would be more meaningful, relevant and ambitious.

Chris Hegarty: The different targets that are set—by the EU and the IPCC, for example—tend to be for 2020, so it would be difficult to make comparisons if we set a target for 2030. The most helpful thing that we could do is simultaneously set a target for 2020 and make it the most ambitious in the world.

Gavin McLellan: It would be more responsible to set a target for 2020. As we are trying to deal with climate change urgently, it is important that we send the right signals to the Copenhagen negotiations, and that we bring our target into line—we do not wish to appear to be laggards. It is important that we set a target for 2020.

Judith Robertson: However, if we have 3 per cent annual targets that we meet, we will get where we need to be by 2020, 2030 and 2050. That is our objective.

Rob Gibson: The bill contains no sectoral targets. Should it?

Gavin McLellan: I echo the answer that previous witnesses gave with regard to the technical difficulties around sectoral targets. I am not sure that, between us, we have the expertise to comment further.

Judith Robertson: Sectoral targets could be part of either secondary legislation or the guidance that accompanies the bill. If the bill has an annual minimum target for emissions reductions of 3 per cent, work will have to be undertaken to hold the different sectors to account in relation to supporting the Government in meeting that target. Delivering against the target is not completely within the hands of the Scottish Government.

It is not that we do not require sectoral targets, but if the bill contains binding 3 per cent annual targets, sectoral targets will not necessarily need to appear in the primary legislation.

Rob Gibson: I am interested in taking that a little further in relation to food and transport. Food has not been mentioned, but the idea is that we cut down on the amount of CO₂ emissions that arise from importing food and build up our self-reliance through producing basic foodstuffs here. We have reached a self-sufficiency level of 57 per cent in terms of what is sold over the counter. Ought the food sector to appear in the sectoral targets?

Judith Robertson: We have not examined that issue in detail, but if we seek to use sustainable development principles to underpin the way in which the bill is delivered, we must be careful about the impact of the activities that you recommend on developing countries.

The structure of developing countries’ economies is very different from that of rich countries’ economies. We are 57 per cent self-sufficient because we import the remaining 43 per cent, much of which comes from developing countries whose economies are based solely on crop production and the exportation of primary products. Our cutting that chain will not support the international development process that we seek; it will undermine the development of countries’ economies—it has the potential to do fundamental damage. That does not mean that there is no merit in your argument that examining what happens to other countries as a result of our decisions and take responsibility for that.

16:30

Rob Gibson: I do not want to touch directly on the issues of shipping and aviation, but there seems to be a contradiction in what you are saying, because there is no doubt that bringing food from other places is causing us to create more emissions than we otherwise might. Other members may want to ask you about that, but I invite you to comment on the issue now.

Chris Hegarty: These are complex issues. This discussion exemplifies to us why the principle of global sustainable development should underpin the bill—it could be included in the long title, for example. Some of the contradictions to which you refer will have to be thrashed out in the context of global sustainable development. Having that as a principle would help to frame those discussions.

Rob Gibson: Do you have a view on the different approaches that the Scottish Government and the UK Government have taken to international credits? The UK Government has set a limit on the use of international credits, based on advice from the UK Committee on Climate Change, but the Scottish Government does not intend to prescribe one. Which approach is better?
Gavin McLellan: To make the bill world-leading legislation on climate change, we should prescribe a limit of 20 per cent. The previous panel spoke about the renewables resources that are available in Scotland. We have a great opportunity to cap international credits at a lower level and to create a framework for better investment choices that will release investment into those resources.

Judith Robertson: Having a cap is important, because it means that, ultimately, we invest in effort in the necessary places. I assume that you understand that argument.

Rob Gibson: I do.

Judith Robertson: Effort should be focused on Scotland, and we should invest to ensure that that happens. The Scottish and UK Governments should not assume that constantly buying credits from overseas will do the job.

Rob Gibson: The point of a cap would be to reduce the amount that is tradeable.

Judith Robertson: Exactly.

Rob Gibson: We know that. You must agree that sourcing credits outside the European Union to offset our activities is extremely damaging to the developing world.

Judith Robertson: It depends. There is no doubt that some developing countries’ economies could benefit in the short term from finances raised by carbon trading, but we would have to be really careful about who we traded with and how. We agreed to a limit of 20 per cent because there is potential for financial investment from carbon trading to support developing countries’ economies. However, if we invest that money overseas, we are not investing it in activity in Scotland—that is the real issue.

Rob Gibson: What do you see money from carbon trading being used to fund in developing countries?

Judith Robertson: Public sector provision of health and education.

The Convener: Is there a need to specify not just the extent to which international credits may be used but their nature? We have heard conflicting opinions on international credits—sometimes they are good, but sometimes they are bad. Is it sufficient for us to set a limit on the extent to which international credits are used? Should we say something about their nature, to maximise the development benefit of those credits that we permit to be used?

Gavin McLellan: In June, the Parliament passed a motion that said that carbon offsetting does not substitute for policies to reduce carbon emissions. In that context, the role that credits play is transitional. That said, standards need to be applied to ensure that projects are genuinely beneficial to overseas communities. As the convener rightly says—and current awareness levels show—not all schemes are particularly beneficial.

I will give some examples that build on what Judith Robertson said. There can be health improvement impacts, but we must not assume that everything rests with us; work is already happening in countries such as China and India. One example is the west Bengal renewable energy development agency, which has links with Christian Aid partners and has provided power to poor communities on Sagar island to enable small businesses to run into the evening. That project has also boosted literacy rates. That is an example of a gold-standard project enabled by adaptation funding and the mechanisms that we are discussing. It is important to consider the quality of projects.

Des McNulty: I understand the argument for making an 80 per cent minimum domestic effort. We should not simply export to other countries our responsibility for carbon saving. That said, how can we make more than a 100 per cent contribution to help other countries to deal with the carbon issues that they face? Are you interested in exploring that form of development support?

Chris Hegarty: There is room for all sorts of responses to the challenges. Earlier, you linked the issue with the Scottish Government’s international development policy. Although we are keen to tie together the two issues, we are also keen not to conflate the two budgets. I hope that that makes sense. The last thing that we want is for a precedent to be set under which people tap into existing aid budget commitments for purposes that, in essence, should come under the polluter-pays principle. We should sort out the mess that our pollution causes and tackle problems of global poverty. That is our clear position.

Des McNulty: I am very aware of the issue. Nonetheless, the question whether a contribution could be secured in that way is an interesting one.

Judith Robertson: The bill makes no provision for international adaptation; it does not mention it. It would be good to build in the potential for international adaptation. The Government may want to explore that strategy, either as part of the bill process or by other means.

Over the course of developing as a nation, we have polluted the atmosphere. The principal price of that is being paid not in Scotland but internationally. Unless things change drastically, that will remain the case. In some instances, the human impact of pollution is devastating.

Gavin McLellan spoke of building trust. As part of that process, and if we are to show off our work
on the world stage, it is important for us to integrate the kind of approach that Des McNulty describes, even if it makes only a small contribution to a £50 billion pot. Again, doing that would provide evidence of a recognition that the impact is global.

Des McNulty: I turn to an entirely different issue. How will the arrangements for the EU emission trading scheme be affected by a minimum domestic effort requirement? What are your thoughts on that?

Gavin McLellan: What is the question specifically about?

Des McNulty: How would a minimum domestic effort requirement of 80 per cent work with the arrangements in Europe—the EU emission trading scheme and the various aspects of carbon trading within Europe?

Gavin McLellan: Several points arise. We have discussed them, but I will re-emphasise what we have said.

We must not ignore the ETS sector. As we stated, the sector approximates to 50 per cent of Scotland’s emissions. We have to ensure that a cap is put in place. That will incentivise investment in decarbonisation—I am thinking of the power sector in particular. If we do not follow through to the logical conclusion, people will end up with no incentive to reduce emissions. It is important that we do that. We can also make the economic argument that we can develop our expertise, become a market leader and ensure that we send the right signal in investing in the renewables sector, given the cap on emissions trading.

Alex Johnstone (North East Scotland) (Con): I would like to develop an issue that Rob Gibson touched on a moment ago, which is aviation and shipping emissions. We see in the news every day that when we suffer a recession, protectionism raises its head. How do development organisations reconcile an imperative to reduce emissions from aviation and particularly shipping with the importance of opening up our market to developing economies for trade, particularly the trading of their products into our market?

Chris Hegarty: I go back to the point that I made about framing this discussion in the context of global sustainable development. You are right to say that there are contradictions. If we address climate change from the perspective of doing everything we possibly can to reduce our emissions, we will end up with slightly unhelpful policies, such as the one that says that 10 per cent of certain fuels must comprise first-generation biofuels, which does not pay sufficient attention to the social impact in developing countries. That is an example of framing the issue in the context of global sustainable development.

It might also lead to the kind of advice that has been given to the Government on these issues. It is quite interesting to look at the make-up of the UK Committee on Climate Change. The chief executive has some experience in the World Bank, which some might classify as experience of international development, but there is no international development expertise on that committee, which is a gap. If Scotland created a similar committee, using people with international development expertise would help to flesh out the arguments, so that the overall response would be in the context of global sustainable development.

Judith Robertson: There is something about effort in the argument. One of the reasons why we are so keen to include aviation and shipping emissions is because of the scale of their contribution to global climate change. I have not done the analysis, but I am sure that it is available. If we source aviation and shipping emissions, we will find that the vast majority originate in the rich northern countries, not in poor developing countries. We could prioritise the way in which we examine that. We could look at taking responsibility for the emissions that we create, as we talked about earlier in our discussion about shipping and where fuel is put on ships. We are talking long term.

One of the reasons for engaging in the climate change debate and enacting legislation is that we want to take responsibility for what will happen in future. The same applies to the structure of global economies. We are not in a sustainable global economic structure—it does not exist. The economic structure is extremely iniquitous, which is why the sustainable development dynamic is important.

The issue is not just about addressing climate change and aviation and shipping emissions; it is about the way in which we impose on developing countries’ economies and restrict their growth and development. That is why it is so important to come back to the point about effort. We need to take responsibility for what we emit. Most emissions come from the rich countries in the north, and we need to factor that into the conversation. More important, we should not use that as an excuse for not including aviation and shipping emissions in the conversation.

16:45

Alex Johnstone: What issues arise as a result of Scotland being the only place so far to set targets that include emissions from international aviation and shipping?

Judith Robertson: There is no doubt that, if that approach is taken globally, the whole process will become much easier. However, if that
approach is not taken elsewhere, it is unlikely that those emissions will be reduced at all. It is important that Scotland is leading the charge, because it means that we can go to Copenhagen and say, “This is on the table in Scotland. We are holding ourselves to account for those emissions and we need you to do the same.” It makes the arguments for including those emissions much stronger.

**Alex Johnstone:** Are you confident that, at this stage, the information that we have is sufficiently robust to enable us to include aviation and shipping in legislation?

**Judith Robertson:** It seems that the information is limited—I am trusting colleagues who gave evidence earlier on the matter. It seems that some information is robust, but more work needs to be done.

**Charlie Gordon:** Is the UK Committee on Climate Change model replicated anywhere else? How does scientific analysis feed directly into political negotiations at international level?

**Judith Robertson:** I am not sure that we can answer those questions. I am sorry.

**Chris Hegarty:** We have been told that where we do not have technical expertise we can rely on our colleagues from the previous panel to provide written evidence to the committee, if that is helpful.

**Charlie Gordon:** It would be helpful to receive such evidence in due course.

What is your view on the idea of a Scottish commission on climate change? Mr Hegarty, I think that you endorsed the Dave Watson view.

**Judith Robertson:** I hesitate to call it the Dave Watson view, not because I have a problem with Dave Watson expressing that view, but because the view is held not just by him but by all the organisations in the coalition.

**Charlie Gordon:** Yes, but Mr Watson’s holding that view is not necessarily a disadvantage for the coalition.

**Judith Robertson:** I absolutely agree. It is worth saying that we very much endorse the idea of an independent commission that can hold Scotland to account on its own terms. We are concerned that the UK committee will not have the capacity to do that—indeed, that is not just a concern but the reality.

The issue is the reporting process and the accountability process. A witness on the previous panel talked about the role of the Conveners Group—that group is not an appropriate end point for the reporting process. We suggest that Audit Scotland should have responsibility in that regard and should present an analysis to the Parliament. A commission could be the first port of call in supporting the development of an annual report, which would consider progress on the target to reduce emissions by 3 per cent annually. It is all part of a package—the Dave Watson package, if you want to call it that. The accountability and reporting process, of which a commission would be part, is an important dynamic that would support the legislation to deliver on its ambition.

**Des McNulty:** I am not sure that your argument applies to advice in the same way as it applies to accountability and reporting. Your particular concern seems to be about accountability and reporting and the measurements in Scotland. It is perfectly possible to envisage a Scottish accountability and reporting mechanism that draws on UK-based advice. Have you separated the two issues in your consideration?

**Judith Robertson:** Both are important. A Scottish commission would be able to advise from a Scottish perspective and would understand the Scottish context better, for example because it would be closer to local government and would understand how it works and what it does. There is no doubt that we could draw on scientific expertise that is held at UK level. The process could operate in different ways.

On the reporting and accountability process, the important point is that a commission would be independent. The independence of not just advice but monitoring and support for the reporting process is important.

**Shirley-Anne Somerville:** Is it feasible to measure and report on emissions that are generated elsewhere from goods and services that are used in Scotland? Is that happening or being planned anywhere else in the world? The first panel discussed that matter. Do you have any alternative or additional views?

**Gavin McLellan:** We do not have an alternative view. We support what Richard Dixon said. Data that help to show our overall global impact are already available. Last year, Christian Aid campaigned on targeting some companies that were registered on the stock exchange, because there was a lot of talk about the UK’s contribution to global warming being only 2 per cent, but the figure went up to 12 to 15 per cent if wider, indirect emissions from companies that were registered on the stock exchange were taken into account. We used the campaign to tell the public that we have a moral responsibility in that context. It is important that the Government has access to such figures and that members of the public know what they are so that they have a far broader sense of their moral responsibilities in relation to the emissions that we are creating.

**Judith Robertson:** During the earlier discussion, it occurred to me that there is quite
interesting experience from the private sector. For example, when Procter and Gamble analysed not only the emissions from producing its soap powder but those from its use, it found that the biggest emissions came from washing that was done at 40°C. As a result, it now advertises a brand of Ariel that can achieve the same cleanliness by washing at 15°C. There is a reason for that: the company did the analysis, designed its product and targeted its marketing in a different way. That may not be a perfect example, but it shows that the private sector is leading some of the thinking. We could learn from that.

Cathy Peattie: The Scottish Government has proposed introducing secondary legislation to place climate change duties on public bodies. Do you have any suggestions about what those duties might be?

Judith Robertson: Doing that could potentially support 3 per cent reductions in annual emissions. Public bodies could develop their own strategies or learn from guidance from our independent climate change commission. Public sector buildings contribute hugely to public sector emissions. Investment in energy efficiency measures and the use of renewables in those buildings would clearly be beneficial in contributing to meeting the targets.

Gavin McLellan: Such duties would strengthen procurement and commissioning practices, for example, and help us to meet the targets, as Judith Robertson highlighted.

Cathy Peattie: It is clear that there would be targets if there were a duty to mainstream the tackling of climate change, but how would that be monitored? Sometimes we talk about local authorities taking on duties, but often we are not absolutely clear about what those duties are and how they will be monitored. How would we know that local authorities were doing what they needed to do? Do you have any expectations in that context?

Gavin McLellan: We have called for annual reporting, which could boost local accountability. Perhaps local communities, community councils and local hearings could have a role. We have already mentioned work in schools. Lots of things are happening across the sectors to boost monitoring, and many mechanisms could be put in place.

Judith Robertson: I presume that Audit Scotland would have a role to play, too. If addressing climate change were among the objectives of local government and it had a duty to deliver on that, it would have to report against that duty. It would have to monitor its progress against its objectives, and Audit Scotland would have a role in assessing progress.

Cathy Peattie: So targets that can be audited should be set.

Judith Robertson: Yes.

The Convener: I want to follow up on one small aspect. Gavin McLellan mentioned procurement. For the past few years, it has been possible for sustainable development to be taken into account in procurement decisions, although that has been done patchily. To what extent do those who are involved in public sector procurement take account of the international context of sustainable development? Would a public sector duty improve matters?

Gavin McLellan: I am sure that our coalition members could provide a written view on that. I think that we already have the analysis.

Rob Gibson: I want to clear up something that Judith Robertson said. She said that the World Bank estimates that the cost of support for adaptation will be 50 billion annually. Is that pounds or dollars?

Judith Robertson: I think that it is dollars.

Alex Johnstone: There is not a lot of difference at the moment.

Judith Robertson: Yes—that is becoming less important as an issue.

Rob Gibson: I am glad that my colleague was able to make the joke that I was going to make. I simply wanted to clarify that. Do you have a view on the adaptation provisions in the bill?

Judith Robertson: They will not meet international responsibilities and they will not deliver. From our perspective, the bill does not take responsibility for adaptation.

Rob Gibson: I picked that up from your previous comments.

Cathy Peattie: I have a final question on Sarah Boyack’s proposed member’s bill, which relates to climate change. What is your view of that bill? Will it enhance the work of the bill that we are considering?

Chris Hegarty: I refer to the answer that our colleagues on the previous panel gave.

The Convener: I thank the witnesses for their time in answering questions. Are there any final issues that you intended to raise but which did not come up in questions? If there are none, I remind you that, if you want to provide further written evidence, the deadline is 27 February.
Advance note from Duncan McLaren, Friends of the Earth Scotland and Stop Climate Chaos Scotland. The notes below reflect key positions adopted by SCCS on which FoES has specific views or expertise. It is not a complete list of SCCS or FoES positions.

- The SCCB is the most important piece of legislation to come before Holyrood so far, and is very welcome. As it sets a framework for four decades of action we believe it is essential to get it as good as possible now.

- The **objective of the Bill** must be to play a fair role in preventing dangerous climate change (more than 2°C warming) by reducing Scotland’s emissions in a sustainable manner.

- The **2050 target** of at least 80% is in line with current scientific advice, but may well need to be further tightened or achieved earlier. The advisory body must be empowered to advise of when and whether long term targets should be tightened.

- In setting **annual targets** Ministers should be subject to the ‘minimum floor’ of at least 3% per annum from the beginning (including the 2010-2019 period), and also required to be compatible with a **fair and safe cumulative budget** to be identified by the advisory body.

- The **interim target** of at least 50% reductions should be met by 2020, not by 2030, to ensure early and rapid action in line with scientific advice, and deliver a fair and safe cumulative budget.

- For reasons of equity and sustainable economic development, a target should be imposed that at least 80% of the effort to reduce emissions on an annual basis must occur within Scotland, with **international trading** minimised. **The net account** must therefore be constrained to reflect this. It also needs parallel consumption accounting to ensure that Scottish emissions are not reduced by off-shoring economic activity.

- **International aviation and shipping** emissions should be included in Scotland’s account from the outset using existing Kyoto reporting methodologies, with powers to amend the methodology in line with international practice.

- The Bill should include the necessary enabling powers to provide effective **financial incentives** for delivery (such as a public sector climate fund) and provide clarity that **access to the courts** to ensure justiciability over targets and their delivery will follow the principles of the Arhus Convention.

- A **duty on public bodies**, to reduce emissions in line with national targets, and report appropriately, should be imposed and resourced from the outset. The Bill must ensure it is enforceable; and establish powers to amend it, or specify more detailed duties to help deliver targets.

- **Energy efficiency** measures should be placed within a statutory energy hierarchy which promotes sustainable energy management and supply, and the objectives of the action plan should be in line with those in the Housing (Scotland) Act – to ‘improve’ efficiency, not just ‘promote’ it. The powers to regulate building improvements should be extended to all buildings, and include powers to require all identified recommendations to improve operational ratings.

- The Bill should include a requirement to take such steps as necessary to deliver sustainable supply of **renewable heat**. The definition of renewables should
exclude mass-burn incineration technologies, and prioritise heat management, efficiency and biogas from anaerobic digestion, in line with an energy hierarchy.

- The waste management measures included in the Bill are all welcome, but fall short of a comprehensive approach to zero waste which would prioritise waste reduction, and seek to phase out incineration, and minimise energy-from-waste in preference to reuse and recycling which save more energy.

- The proposals for joint venturing by the forestry commission are welcome, but those on leasing the estate are of questionable value. Measures to maximise climate benefits from forestry and upland land-use should be addressed in an integrated manner in a land-use strategy for Scotland. The Bill could usefully require Ministers to bring forward such a strategy, compatible with the CCB targets.
UK Committee on Climate Change (Col 1457)

Are you aware if the UK Committee on Climate Change model has been replicated elsewhere?

We are not aware of any other country that has an advisory body that is directional rather than informative. As far as we know, the UK Climate Change Act is the only piece of legislation that has a formal requirement that the Secretary of State (or equivalent) must take advice from the Committee on carbon budgets and targets and must follow that advice. The EU, for example, has an EU Committee on Climate Change which has a purely advisory function and the EU is not bound to follow its recommendations.

How does scientific analysis feed directly into political negotiations at an international level?

The Intergovernmental Panel on Climate Change

The international negotiations under the 1992 United Nations Framework Convention on Climate Change (UNFCCC) and the subsidiary 1997 Kyoto Protocol are primarily advised by the Intergovernmental Panel on Climate Change (IPCC). The IPCC was set up by the World Meteorological Organisation and the United Nations Environment Programme in 1988 and they say this about themselves:

“The IPCC was established to provide the decision-makers and others interested in climate change with an objective source of information about climate change. The IPCC does not conduct any research nor does it monitor climate related data or parameters. Its role is to assess on a comprehensive, objective, open and transparent basis the latest scientific, technical and socio-economic literature produced worldwide relevant to the understanding of the risk of human-induced climate change, its observed and projected impacts and options for adaptation and mitigation. IPCC reports should be neutral with respect to policy, although they need to deal objectively with policy relevant scientific, technical and socio economic factors. They should be of high scientific and technical standards, and aim to reflect a range of views, expertise and wide geographical coverage.”

The IPCC’s constituency is made of:

- The governments: the IPCC is open to all member countries of WMO and UNEP. Governments participate in plenary Sessions of the IPCC where main decisions about the IPCC work programme are taken and reports are accepted, adopted and approved. They also participate the review of IPCC Reports.
- The scientists: hundreds of scientists all over the world contribute to the work of the IPCC as authors, contributors and reviewers.
- The people: as United Nations body, the IPCC work aims at the promotion of the United Nations human development goals.

The IPCC is a scientific body: the information it provides with its reports is based on scientific evidence and reflects existing viewpoints within the scientific community. The comprehensiveness of the scientific content is achieved through contributions from experts in all regions of the world and all relevant disciplines including, where appropriately documented, industry literature and traditional practices, and a two stage review process by experts and governments.

The IPCC produces numerous technical reports and guidance on measurement and reporting methodologies but their major products are the Assessment Reports which summarise the latest state of knowledge on climate change science, current and predicted impacts and

3 http://www.ipcc.ch/about/index.htm
possible responses. The fourth Assessment Report was published in four volumes in 2007.\textsuperscript{4} The fifth report is expected in 2014. These Assessment Reports also include a short Summary for Policymakers.\textsuperscript{5}

The work around these reports is done through three Working Groups on:

- the physical scientific aspects of the climate system and climate change.
- the vulnerability of socio-economic and natural systems to climate change, negative and positive consequences of climate change, and options for adapting to it.
- the options for mitigating climate change through limiting or preventing greenhouse gas emissions and enhancing activities that remove them from the atmosphere.

The reports of IPCC have to be accepted by all the member governments and the Summary for Policymakers has to be approved word for word by all these governments.

The IPCC Assessment Reports are the absolutely definitive scientific statement on climate change when they come out. The first report in 1990 was crucial in creating the Framework Convention signed almost all the world’s governments in 1992 and the subsequent reports have all be very influential in determining what level of cuts are being discussed and which issues are at the table at the annual UN conferences on the Convention and the Kyoto Protocol.

However, the Assessment Reports have also been criticised for being out of date and overly conservative. Because the review process is lengthy there can be 18-months’ worth of more up-to-date scientific studies published on a particular issue by the time an Assessment Report comes out. For instance, by the time the Fourth Assessment Report was published in 2007 there was already a scientific consensus that the Arctic ice cap is melting faster and the sea levels will rise by more than predicted in the Report. Because the Summary for Policymakers is signed off by all the governments involved there is also plenty of room for watering down the messages by those governments which do not wish to acknowledge the scale of climate change.

The IPCC can also be vulnerable to direct political interference. A leaked memo from oil giant ExxonMobil to the Bush administration led to strong US lobbying to remove Dr Robert Watson as the chair of IPCC in 2002. Nonetheless the IPCC reports are the principal source of scientific input to the political negotiations.

Other sources
At the UN conferences and intervening working group meetings government officials will come to the negotiating table with knowledge of further scientific studies, in addition to the work of IPCC. For instance, the UK’s Hadley Centre produces updated models of future global climate in time for the annual UN meetings, and NGOs will publish their own scientific work or publicise that of others in order to inform debate on specific issues.

There has never been a set of international negotiations as well informed about the science of their issue as is the case for climate change. Of course it is the political process which needs to rise to the challenge of agreeing sufficiently rapid and radical action.

Public sector procurement (Col 1460)

To what extent do public sector procurement systems take into account of the international context of sustainable development?

As the Convener stated, sustainable development can be taken into account in public procurement decisions, but it has only been done in a patchy way. We would obviously like to see this being fully implemented across the public sector. One reason that it is patchy is perhaps because in many aspects of procurement it is up to the procuring public sector body to decide how far it goes in pursuing sustainable development objectives via procurement, and there are concerns about what is allowed. Not enough has been done to promote the

Transport, Infrastructure and Climate Change Committee, 2nd Report, 2009
(Session 3) – ANNEXE C

fact that this is possible, while complying with Best Value and European procurement rules. Some areas of procurement are stronger than others, for example school catering procurement, following the The Schools (Health Promotion and Nutrition) (Scotland) Act 2007.

We are not sure whether the Convener was questioning what international environmental/sustainable development standards are part of current procurement work or whether he was seeking to find out what international factors are currently taken into account, such as sourcing of products from fair trade suppliers. It is certainly possible in catering contracts to make specifications around fair trade options being welcome in a tender, and indeed, for example, to specify that fair trade products should be supplied for certain functions. (The specifications cannot be framed in terms of 'social' fair trade requirements.) We are unaware at present of the extent of any major efforts to look in depth at a range of international sustainability factors in procurement, but it is possible this is happening in some areas and we would certainly support it.

As regards international standards/specifications, the Public Contracts (Scotland) Regulations 2006 make reference to some international/European environmental standards, for example European quality assurance standards or environmental management standards or eco-label specifications.

Cabinet Secretary, John Swinney, said in May 2008\(^6\) that the forthcoming Scottish Sustainable Procurement Action Plan would “advocate a whole organisation approach which flows from top level support, and a public statement of intent, down to buy in at all levels of the organisation and supported by appropriate training. This should lead to sustainability being built into public sector requirements at ground level, rather than expecting procurement staff to define sustainability towards the end of the process.”

This is welcome, but we still believe that it should be underpinned by the general climate change duty on public bodies that SCCS has been advocating, to ensure that procurement and commissioning practices, as regards sustainable development, fit with the entire approach of each body to mitigation and adaptation work on climate change.

Do you believe a public sector duty would improve the current system?

We do believe that a public sector duty would help dramatically improve public bodies’ action in procurement by focusing, through the duty and through subsequent guidance, on the urgent need for cuts in greenhouse gas emissions, with the public sector playing a key part. We would expect the detailed guidance to include reference to the importance of sustainable development and practical examples of how this could be applied. The duty would encourage the spread of best practice because public bodies would have a strong incentive.

Please see our Briefing Paper 6 ‘Duty on Public Bodies’ for more information.

Scottish Parliament

Transport, Infrastructure and Climate Change Committee

Tuesday 10 February 2009

[THE CONVENER opened the meeting at 14:01]

Climate Change (Scotland) Bill: Stage 1

The Convener (Patrick Harvie): Good afternoon, everybody. I welcome everyone to the Transport, Infrastructure and Climate Change Committee’s sixth meeting this year. I remind members and everybody else that all mobile devices should be switched off. I record apologies from Rob Gibson, for whom we hope Alasdair Allan will attend as a substitute, and from Alex Johnstone.

We have just one agenda item, which is continuation of our stage 1 scrutiny of the Climate Change (Scotland) Bill in our fourth evidence-taking session. We will hear from three panels today. The first consists of representatives who will talk about surface transport. Following that, we will have a panel of representatives who will talk about aviation and shipping. Finally, we will hear from Transform Scotland, the GreenSkies campaign and Sustrans.

We expect to continue to hear oral evidence until March, when we will hear from the minister. We have also issued a call for written evidence, the deadline for responses to which is 27 February.

I will crack on and welcome panel 1. We have Chris Austin, the head of public affairs at the Association of Train Operating Companies; Marjory Rodger, the director of Government relations in Scotland for the Confederation of Passenger Transport UK; and Derek Halden, the director of Derek Halden Consultancy. I welcome you all. Would you like to make brief introductions?

Chris Austin (Association of Train Operating Companies): Would you like a few words by way of background or an opening statement?

The Convener: If you would like to introduce your organisation briefly, that would be fine.

Chris Austin: The Association of Train Operating Companies represents franchised passenger train operators throughout Britain. We are a trade association and we provide the facilities to support members through national rail inquiries and the rail settlement plan process, which allocates revenue among companies. We also take the lead on fare and ticketing issues and on other passenger-related issues for passenger train services throughout Britain.

Marjory Rodger (Confederation of Passenger Transport UK): Thank you for the opportunity to come to the meeting. Members know what the CPT does, so I will skip describing that. The contributions that we feel bus transport can make and the assistance that we need can be delivered without further legislation, so we have limited our written response, to which I have nothing to add at this stage.

Derek Halden (Derek Halden Consultancy): The agenda says that I am here as the director of a consultancy, but a large part of the reason why I am here, rather than somebody else, is that I chair Scotland’s transport think-tank, the Scottish Transport Studies Group. We have, in the past couple of years, held three debates on climate change and transport that covered a wide range of views and which have been written up. As the chair of those debates, I hope that I can give the committee an overview of the views that are out there.

We are a networking group, and as such we never respond to consultations, or take a view on them. Our members include many of the bodies that will present their own evidence here today, and that evidence will contain differing views. I will give my views as chair of STSG.

The Convener: Thank you for that clarification.

I will open with a general question. From a passenger transport perspective, what are your views on the proposals in the Climate Change (Scotland) Bill?

Marjory Rodger: The bill is welcome and CPT supports the proposals. Something has to be done and, as we have shown in our submission, transport has already started—in our premises and our fleets—to try to reduce emissions and make our contribution.

Chris Austin: ATOC is in the same position. Rail has a major contribution to make to tackling climate change, by reducing the impacts of carbon emissions. Rail is inherently efficient in terms of emissions per passenger kilometre.

The submission that we circulated last week points out that, in considering the bill’s effects on transport, targets must be set for the transport sector as a whole. It would be perverse to set targets that would constrain the growth of rail through taking a share from car and air, thereby preventing a shift from an environmentally less friendly mode to an environmentally more friendly one.
Derek Halden: I have quite a few points to make, but I will just make a couple as an introduction and then perhaps come back to the others when we go into more detail.

Clearly, the Scottish Government has to do something, because international and United Kingdom Government targets have been set. The proposal of a more ambitious target for Scotland presents both risks and opportunities. Transport is a slippery sector. What if everybody started to go south of the border to fill up with fuel, so that it did not count? The way things are counted could lead to all sorts of unintended consequences.

Because transport is such a slippery sector, the main point that has come up in our discussions is the need to keep things really simple. We have to stay focused on what can be changed. We are never going to count everything, but if the view of carbon emissions in Scotland is not comprehensive, people will dodge targets. The inventiveness of businesses in finding ways of avoiding particular aspects could actually cause damage through increased emissions.

I will give a classic example of a problem that can arise with a target for transport. A company such as Tesco might decide to have fewer warehouses if its warehousing emissions, but not its transport emissions, were in the traded sector. The company might therefore end up producing more emissions, because if its warehouses were further apart, its lorries would have to drive further. The issue is very complicated. The wrong targets might, rather than trigger positive action, be a trigger on a blunderbuss that causes as much damage as it creates benefit.

We could talk more about the details, but those are the sorts of general issues that have to be considered now, during the bill process.

The Convener: Has the transport sector been given sufficient opportunity, through formal consultation or through informal dialogue with the Government, to influence the development and shaping of the bill before its introduction?

Marjory Rodger: CPT has certainly been consulted. We responded back in September or October, and have since responded again.

As my two colleagues on the witness panel have suggested, a lot will depend on what happens when we get down to the details. The powers are broad, and further consultation will be required when we consider how the powers will be put into practice. It is good to know that it is very likely that we will be consulted again.

Chris Austin: I echo those views. ATOC has had the opportunity to make representations, both directly to the Government and through this committee. As Marjory suggests, the devil will be in the detail and it will be important to continue the consultation when we reach that stage.

Derek Halden: Some of the wording could be tweaked—at the moment, it is a bit processy. The bill states that people must demonstrate action, rather than that they must ensure delivery, so I would like to tighten up the wording throughout. We will never be able to measure everything, so let us measure what we can change. If we can secure and deliver something, the bill should be used as a trigger for that.

The Convener: I have a question specifically for the CPT. You cited examples of best practice in depots and offices. How are they rolled out in the rest of the industry? How are those lessons learned?

Marjory Rodger: We gave the committee examples from the two biggest groups—First and Stagecoach—because between them they cover about 70 per cent of bus services. We also gave one example from Lothian Buses, although not in relation to depots. We did not provide examples for all operators, but all of them are developing best practice in their own ways. If you have been to a lot of bus garages and depots, you will know that they are big, cold and draughty places, so there is a big incentive to run them more efficiently. We have been discussing the issue—I could have cited examples from Arriva and others. All the knowledge that is gained from the money that the industry spends on research and development of vehicles and new technologies is shared.

Cathy Peattie (Falkirk East) (Lab): Is there scope to include in the bill engagement targets to encourage the use of public transport?

Marjory Rodger: That is an attractive thought, but it could be difficult to measure engagement. Modal shift and use of public transport can best be encouraged outwith the bill, provided that we get real buy-in from local authorities under the concordat with the Convention of Scottish Local Authorities. I am speaking for bus, coach and light-rail operators and there is a lot that we could do in working with single outcome agreements to improve access to health care and encourage modal shift. There is an onus on the industry to come up with information and other incentives to make public transport attractive.

Cathy Peattie: Are you saying that the industry does not think that the bill is necessary?

Marjory Rodger: Not at all—but the bill covers an awful lot more than transport.

Chris Austin: The same is true of rail use. There is every reason to encourage its use, and the track record over the past 10 years demonstrates that that is entirely achievable.
Throughout Great Britain, the number of rail passenger journeys has grown by about 50 per cent. It is now at the highest-ever recorded peacetime level, despite the fact that the network is a lot smaller than it used to be. Over the past 10 years, our members have demonstrated that there is an appetite for people to shift to rail, and that they have done so in large numbers. Over the same period, we have been able to reduce CO₂ emissions per passenger kilometre by around 25 per cent. Continued reductions of that order will be needed if the targets that the bill will set are to be met. That makes encouraging a shift to public transport very important.

**Derek Halden:** I am slightly concerned about talking about individual modes. There have been various reviews, the most high-profile of which was Sir Rod Eddington’s review of transport systems, which have led to major reorganisations of the transport sector, such that we should stop thinking about modes and start thinking about end-to-end journeys. Divisions in the Scottish Government and Transport Scotland have not been reorganised in the same way as those in London departments have been. Down south there is now no such thing as a rail department; it is all about regions and localities—it is about who plans end-to-end journeys.

Once we start to talk about modal shift, we get into a complicated arena because, at the end of the day, people choose to go by bus to the shops and to drive to other places—destination and mode choice are bundled up together. We are trying to encourage sustainable places, environments and choices. Bus and rail are clearly essential elements within that, but it would be inappropriate and counterproductive for the bill to set targets for particular modes, because the unintended consequences could be far greater than any benefits.

**Stagecoach** conducted research in Cambridge and in the South West Trains area, which are pretty affluent areas. Brian Souter had the idea that his growth in those two areas was down to, as he put it, the “green welly brigade”: people were thinking with their consciences and switching to public transport, so he conducted a pretty hefty piece of research. It is interesting that it found that the top reason for switching to public transport was health—people were tired of stress and problems, so they switched to public transport. The green agenda came second. A range of influences play their parts and using them together we can make a shift.

**Derek Halden:** That finding echoes research that my firm did for the Scottish Government back in 2003, so there is nothing new about that.

The key point about winning hearts and minds is that climate change is a very high-profile agenda, but there is a lot of scepticism about whether what we do will make a difference. We must consider where the money is spent on transport and who spends it. Government currently spends about £2 billion a year while consumers and businesses spend about £20 billion a year. If we want, as a country, to change transport in Scotland, we should be more focused on the £20 billion than on the £2 billion, but we often plan how we can optimise the £2 billion that Government spends rather than the £20 billion. That relates to what was said about hearts and minds. The question is this: how do we get the purchasing decisions of the public to change? It is about enabling people to do more. The bill is much too top-down and it seems to envisage a command and control economy; I would far rather see a carbon-free or low-carbon economy develop according to Barack Obama’s language of growing new jobs in the low-carbon economy. Can we do that with the current wording of the bill? It is possible, but measures would need to be implemented to back it up.

The measure that I will highlight, which has come out of our think-tank discussions, is that we need something like a Scottish carbon trading scheme. The UK Climate Change Act 2008 offers that prospect. Such a scheme could include on a common footing all modes of transport and it could, for example, let a large business that finds carbon reductions difficult invest in low-carbon buses. Marjory Rodger and her colleagues have conducted research on such issues, but where will the billions of pounds come from to invest in new cars?

Billions of pounds will probably also be required to roll out a network of electric plug sockets across the country. That will take place in the next 10 years, but it seems—as far as I can see—to have been completely missed in strategic funding decisions. People will be buying plug-in cars in
mass volumes from next year, or even this year. How will such massive expenditure programmes be funded? I cannot see the funds coming from public expenditure, but I could see them coming through a Scottish carbon trading scheme, which would enable people to invest and engage, and would enable businesses and the public to purchase from one another. That is a long answer to the question, but that is the sort of future that I would like to see. Such a scheme is perhaps not addressed specifically in the bill, but it is about what we do with the regulations under it and under the UK bill.

**Chris Austin:** Our experience in rail has focused particularly on business travel. The themes of the Climate Change (Scotland) Bill and the UK bill before it have been reflected in the approaches that businesses have taken to corporate travel plans and corporate social responsibility.

One of the reasons why Eurostar has done a lot of work in the area and has worked hard to become a carbon-neutral railway is that its customers—especially business customers—have been demanding it. Virgin Trains has a carbon calculator on its website so that the effect of a journey can be calculated, which is important to people within the corporate culture in their travel decisions. Such considerations have become important and appear to have induced a modal shift—both Virgin and National Express East Coast have gained market share from air travel over the past year. Change seems to be working through in that practical sense.

**The Convener:** Is there evidence to back up the assertion that that is what has caused modal shift—if it is happening—rather than its being caused by other aspects of what makes air travel convenient or inconvenient? For example, security changes will have had an impact on aviation.

**Chris Austin:** That is absolutely right. I cannot point to research that pins that change to environmental issues, but it appears to be one factor that is clearly marked in Eurostar’s marketing campaign and in the results that it has achieved.

**The Convener:** Perhaps we will also explore that question with a future panel.

I have a subsequent question on the wider issue of engaging with individual decisions—whether we call it hearts and minds, public engagement or whatever. Does the Scottish Government need to address prices in public transport? One could say that the operators need to make a better offer, but there is also a question about by how much Government is willing to subsidise public transport to make its prices genuinely attractive. In some cases they are attractive and in others they are not. Does the Government need to start changing the financial incentives alongside introducing legislation?

**Chris Austin:** I will start by answering for rail, which is, as you know, less contentious. It is important to recognise that more than 60 per cent of passengers are already travelling on a regulated fare and that about 80 per cent of them are travelling on some form of discounted ticket. As is the case for air fares, the range of rail fares is broad. As I mentioned, the proof of the pudding is in the success of rail having grown its market by 50 per cent over 10 years. That would not have happened if we had got the pricing hopelessly wrong. It might not be perfect, but it has certainly generated a lot of growth in business and that seems to be a major success criterion.

**The Convener:** It has not been enough to stop road traffic growing at the same time.

**Chris Austin:** Yes, but road traffic has not grown as fast. Rail growth has outstripped growth in road traffic and domestic air travel for some time now, which is good if you work for the railway. That is partly reflected in the pricing policy and the amazing degree of very low, advance-purchase fares that are available for long-distance journeys—I have been talking principally about long-distance journeys. That pricing policy has been successful and offers fares that would have been unimaginable five years ago—for example, £16.50 and, I believe, £12 on one offer for travel to London. We are talking about very cheap fares as against much more expensive business fares.

As I said, the proof of the pudding is in the eating: the successful growth of rail business over the period and the resilience of the rail industry in response to changes in economic demand. I am not saying that the economic slowdown has not had an effect on rail—of course it has—but it has not been as marked as one might have expected.

**The Convener:** Are there any other views?

**Marjory Rodger:** Yes. Eighty per cent of the bus industry is still totally commercial and in the cities the figure rises to 98 and 99 per cent. We are going through a three-year review on one of the major sources of public funding—concessionary travel. The review is reaching its conclusions, however, and I do not want to pre-empt them.

We are also working with Government on the bus service operators grant and will put in place a new environmental BSOG linked to emissions and engine quality.

I come back to what the industry is doing, which has to be funded when fares are set. The last thing we want to do is put fares up unnecessarily because every time we put fares up, we lose fare-
paying passengers. That is where I am coming from.

In relation to climate change, we are spending a lot on research and development. One example is the Stagecoach biodiesel buses that are running in Ayrshire, but at a loss. There is no public money to help us out in that. We are trying to see how it works. We are one year in, so it is early days, despite the fact that 30 tonnes of recycled chip fat have been brought by the residents of Stewarton.

I can speak for the bus manufacturers, too, when I say that huge investment is required to get, for example, low-floor vehicles for wheelchair access to coaches. We have had major problems with balancing comfort with accessibility. The industry is funding those things with no Government help, and the costs have to be fed through.

Most of our bus fares are very good value for money. If there are problems, we need to talk about them in local partnerships and local bus forums, which are part of the bus action plan, and address them case by case.

**Derek Halden:** We need to start thinking about end-to-end journeys and people getting to places rather than about individual modes of transport. If we want to offer a tariff that is appropriate for an elderly person who is going to hospital, whether by bus or taxi, for example, the Government must ask whether it is regulating a system of fares that ensures that all the options are available. For example, is it possible to buy those fares? The bus industry is probably right to say that most of the time, the public would not buy the regulated fare, and that it can provide a more competitive fare. Individual bus and rail companies would be the same. The Government should make sure that people have the option to buy those fares. That links closely to what I said about the tradable credits that we envisage being used under climate change legislation. There are new ways of funding the bus and rail industries for the trips that are particularly efficient.

**The Convener:** Let us move on to examine some of the specifics of the bill.

**Alison McInnes (North East Scotland) (LD):** At the beginning of the session, Mr Halden said that we cannot measure everything. I have a couple of questions to explore that a bit further, and I would welcome comments from other members of the panel.

The bill uses the Intergovernmental Panel on Climate Change and the report of the UK Committee on Climate Change as a scientific benchmark. How robust are the figures on emissions from public transport in Scotland?

**Derek Halden:** Public transport figures are probably okay. I envisage that the biggest problem will be with the car fleet, which is the biggest consumer of energy. As we move through the next 10 years, a substantial proportion of cars—15 or 30 per cent; the figures are disputed—will be plug-in. Section 29(4)(a) of the bill refers to “gross electricity consumption”, which is clearly inappropriate. We want to encourage people to move towards zero carbon, which will involve their plugging in their cars at night. At the moment we waste electricity, which is why we have night storage radiators—they use largely free electricity that we could use to charge up our cars. If we want to encourage that, it seems counterintuitive to discriminate against it by counting the amount of electricity that we burn.

My overall comment is therefore that we do not want such detail in the legislation. We want the generic provisions on carbon, but it should be for the advisory body and the committee to get the detail right so that we do not end up with counterintuitive scenarios such as the one that I described.

The same point applies to buses. We could have hydrogen buses that recharge at a hydrogen store at, say, First Glasgow’s Victoria depot. The hydrogen buses that are in use in London cost about £2 million each. That is expensive but, if we could afford a fleet of hydrogen buses, we could charge them up overnight from free night-storage electricity, build up a hydrogen store and run them during the day on hydrogen. The bill discriminates against that.

14:30

**Marjory Rodger:** Those vehicles will come to Glasgow, but there is another problem as well as the initial outlay. As is the case with the biodiesel vehicles, there are questions about the lifetime of the vehicles—we do not know what problems we might encounter after even just one year. Issues with biodiesel vehicles have already arisen. For example, in summer they get fungus if you do not keep the tank cool and in winter they wax. There are things to learn with any new system. For example, we had to learn to add Adblue to diesel to enable it to cope with changes in temperature.

We do not know what will happen with the vehicle’s engines over time or what the situation will be with replacement parts. We will have to go through a generation of each of the experimental vehicles to understand fully what using them means and how much it costs the industry. That is why I am wary of being tied to figures at the moment.

**Chris Austin:** As my two colleagues have said, it would be useful to keep some flexibility in the
legislation to take account of technical changes. In rail, there is a move away from measuring electricity consumption through the supply points and towards train metering. That will allow a much more accurate assessment to be made within a geographical area, a company or group of services. The legislation probably needs to reflect the fact that, as the technology changes, we will be able to be much more specific about electricity consumption.

**Alison McInnes:** That is helpful.

When the United Kingdom Committee on Climate Change carried out some sectoral-based work on transport, it concluded that surface transport could reduce its emissions in the UK by between 5 million and 32 million tonnes. Can any of you shed any light on why that range is so broad?

**Derek Halden:** Julia King's review of low-carbon vehicles envisages that, by 2050, land-based transport will produce zero emissions. That seems like a sensible view, which means that the increase in emissions from transport that we are looking at will arise largely from aviation.

I would like to think that, because of the more ambitious targets in Scotland and the fact that we are working to a shorter timescale, we can reach the point at which land transport produces zero emissions faster than elsewhere. However, that can take place only in the context of the electric future that we are talking about, which involves renewable or zero-carbon energy and people charging up cars and buses. That is what we are working towards, and we need to ensure that the bill sets challenging targets year on year so that it can happen.

There are major instabilities in the area that we are discussing. For whatever reason, the international carbon trading schemes now seem to include aviation and international shipping. For years, the UK Government took what I think is the right view, which is that either all forms of transport should be included or no forms of transport should be included. The French argued that aviation should be included. They saw it as a way of getting a competitive advantage because the UK is an island and—this is particularly true of Scotland—dependent on aviation. After all of the usual European negotiations, aviation has ended up being included. That is significant, because there is an instability in transport markets that could cause all sorts of catastrophes. We could end up inadvertently encouraging one mode of transport instead of another: the system could end up being good for aviation or bad for aviation. No one has any idea what could happen.

There is a lack of consistency in the treatment of international tradeable credits. I hope that we can remove that instability and use policy regulation to ensure that the credits that the Scottish Government buys through the international trading schemes score fairly for all modes against its climate change targets. It is a difficult issue that probably needs more consideration than we can give to it now. Members of the group that I represent or other firms could look at it—there is a real analytical task to be done.

**Marjory Rodger:** I offer a slight caveat. Much of the research was done in a healthier economic climate. I worry about the impact that the depth and length of the recession will have on the cost of the changes.

**Chris Austin:** To some extent, the variation will depend on how many miles are run by electric traction and how many are run by diesel, as electric traction is more efficient in terms of carbon usage. However, everything depends on generating policy—the proportion of electricity that comes from renewables and the proportion that comes from fossil fuels. Rail can offer carbon-neutral travel, as Eurostar does, but that depends on the source of the electricity.

**Alison McInnes:** I would like to ask a general question before handing back to the convener. Do you have a view on the 2050 and interim targets?

**Derek Halden:** I contributed to the Scottish Council for Development and Industry response, which said that we can achieve the targets, even with renewables, but that we had better get our skates on if we want to do so. We could have moved faster in the past few years.

**Alison McInnes:** If we need to be encouraged to get a move on, do you think that the interim target is set at the wrong date?

**Derek Halden:** I do not have a view on that.

**Chris Austin:** In our view, the dates are far enough away to enable us to make the significant changes that are needed. I come back to my original point: targets need to be set for the transport sector or more broadly. If they are set for rail, growth and transfer from less friendly modes to rail will be inhibited.

**The Convener:** I assume that there is broad comfort with the long-term target; that gives us some confidence that you regard the target as achievable, rather than just necessary.

The policy memorandum to the bill suggests that, prior to 2020, annual emission targets will be lower than 3 per cent—perhaps 1 per cent—and that we will build towards targets of 3 per cent a year after 2020. Can the transport sector achieve cuts of that order? Are cuts of a more ambitious nature achievable? When the intention to publish the bill was announced, it was intended that there should be annual cuts of 3 per cent.
Derek Halden: There is a lot of freight and air transport, but 85 per cent of personal travel is by car or on foot—and one of those modes is effectively zero carbon.

We work with retail developers. Why are they the only people to have installed public electric charging points for cars—at Silverburn and at the St Enoch centre in Glasgow? Is everyone else asleep? The Norwegian Think car is now on the market; Golf and Focus plug-ins will be on the market within six to 12 months. Every car manufacturer is working on the issue, but where are the charging sockets? It will take a decade to install the infrastructure. Why are we asleep?

If we take out the 85 per cent of trips that are made on foot or by car, of course ambitious short-term targets are achievable. It really depends on whether consumers will find it attractive to buy the new products. The Germans are trying to keep their car industry moving by giving people £2,000 if they replace an old, inefficient car with a new one. Perhaps Government should use such levers to kick-start movement in that sector, so that we can meet the ambitious targets that have been set.

The Convener: Should Government be willing to consider not just technology change but demand management? We have said little about the role that demand management could play in reducing emissions.

Derek Halden: Demand management is something that we do all the time—for example, by choosing not to have a road between one place and another. It is in our decisions about the infrastructure that we build; it is inherent in everything that we do. In my view, we need to determine our management criteria.

Demand management is important. In most places, profits in the shops go up when we pedestrianise town centres. It is obviously important to manage demand in town centres so that people find shopping there more attractive. We should look at the criteria and what we are trying to achieve. Talking about demand management in the round—as a means of reducing car travel—does no more than pay lip service to Government policy. Government depends on revenue from car taxation to afford everything that it does, and councils depend on car parking revenue to fund a huge proportion of local services. We depend on the car to fund our current lifestyle, so changing the taxation system would have major implications.

The Convener: I invite the other witnesses to comment on whether the annual target should be 3 per cent up to 2020 or less than that.

Marjory Rodger: According to current figures, buses are responsible for about 3 per cent of emissions, and I am confident that the 3 per cent target can be achieved in the short term. Under disability discrimination legislation, all single-decker buses must have low-floor access by 2015; for double-deckers and coaches, the target dates are 2017 and 2020 respectively. That means that buses will have to be replaced. When they are, we will move from having vehicles with Euro 1 engines to having vehicles with engines that comply with the Euro 3 or Euro 6 engine emission standard, which are a lot cleaner.

That is the interim phase. We cannot switch over to hybrids and biodiesel-fuelled vehicles overnight as we must see how they work in the longer term. After that, the manufacturers must jig up—it is not a quick fix. However, clean diesel engines will be introduced in the short term. They are coming in now, and that process will accelerate.

Chris Austin: I would not like the timescale to be any tighter, partly because of the point that Marjory Rodger just made. That is accentuated in the rail industry, given the long lead time for investment in new technology.

The Convener: Taking account of the point that you made earlier, I make it clear that we are talking not about a specific target of 3 per cent for rail but about a target for transport. Do you believe that the transport sector as a whole can achieve annual reductions of 1 per cent up to 2020? Could it achieve reductions of closer to 3 per cent?

Chris Austin: I do not think that it can do better than that because of the lead time for replacing vehicles and equipment, whether bus or rail, and for the changeover to electric cars that Derek Halden described.

Des McNulty (Clydebank and Milngavie) (Lab): Patrick Harvie's question was about improving efficiency in the transport sector. I will put the reverse question. Should we ensure that new housing and retail developments are transport accessible—in other words, that there is a rail or bus connection within walking distance? One of the big problems that we face is that a great deal of development is permitted in places where people's access to services—places of work, schools and hospitals—is entirely dependent on cars. Do you have a view on that aspect of the issue, as well as on the reductions that you can deliver through your operations? If we organised ourselves in a different way, we could make much greater use of public transport and avoid putting people in a position where their only option is to use the car.

14:45

Marjory Rodger: My strong view is that I would love to see that happen. Planning is essential, and it is a huge mistake that transport has, historically, been involved far too late in planning decisions.
That still happens. The tools are available and the research and development has been done—any postcode can be put into the Traveline Scotland database. For example, if the national health service looked at three sites for relocation and decided that, as everything else was equal, it should consider the transport connections, some different decisions might have been made. I agree with any proposal that leads to transport being included in planning decisions, because you do not change habits retrospectively. The industry would offer incentives for all modes of transport—we would give free travel and lay on services—if we could get in at the start of the process. I would welcome that.

**Chris Austin:** That has to be right, but it has taken a long time to reach those conclusions. There has been a lot of retrospective action in respect of rail, in that new stations have been built to serve new developments. That has helped, but I agree that that is not a substitute for planning it all from the outset.

**Derek Halden:** I come back to the point that I made at the outset. It is about door-to-door journeys. We have had Sir Rod Eddington’s review and Cabinet Office reviews that have come to conclusions about making the connections, joining things up and planning access rather than transport modes. All those conclusions are clear, but it worries me that we still invest the money separately by mode. Although we might talk the talk about planning access and connections, we do not walk the walk, because we still fund rail, bus and road through separate delivery mechanisms. Until we change our approach and put the money behind improving access and connections, we will not achieve those aims.

**The Convener:** I have one more question on targets. Beyond the targets in the bill, will other European, UK or Scottish targets that the transport sector is having to meet impact on transport’s ability to make greenhouse gas emission cuts? The European targets on renewables or reducing energy use might be examples. Are there others that impact on transport’s ability to make the transformational change on climate change that we seek?

**Chris Austin:** I am aware of one such target, which is the restriction on the sulphur content of diesel. The sulphur emissions target means that our freight colleagues in particular have to burn more diesel to achieve the same mileage, because the chemical composition of the clean fuel is different. That demonstrates that, unless you are very careful, you can set conflicting targets and solve one problem but create another. That is a practical example that stems from European Union rules.

**Marjory Rodger:** Another practical example is that the cleaner our engines get, the heavier they get and the more fuel they burn. We are therefore producing fewer emissions but using more fuel.

**The Convener:** In order to try to be cleaner.

**Marjory Rodger:** Yes. We are getting there, and that trend is being slightly reversed, but that has definitely been the case.

**Derek Halden:** The problem is so serious that unless the bus industry gets its loadings up or rationalises its service, it could become worse than the car in respect of emissions per passenger kilometre. I would be the last person to want to knock buses: we must increase the bus loadings dramatically so that we get the benefits. However, that has been the impact of the change that Marjory Rodger described.

My conclusion is that we must unlock the power of consumer expenditure. Consider what is spent on bikes, cars and the purchase of tickets. That is where the big money is out there. To come back to my first point, the changes that will be made by, for example, Tesco in warehousing and distribution, in the way that it packages products and sells them, and how much is charged for car parking and so on will be the drivers of change.

Whether the targets are right or wrong seems such a detailed academic question. I know that I am at the committee representing a study group, but I would turn round and ask, “Why, academically, does it matter?” It does not matter. The important thing from a research perspective is that we know that setting targets acts as a trigger for action. The problem is that the mechanisms for action—the delivery mechanisms—are not there yet. We might pull the trigger and then find that we go bursting off in all different directions because we do not have a barrel that will send the bullet towards the outcomes that we want.

I mentioned a figure of 85 per cent for car and walking. I should have clarified that I was talking about shopping trips. Of course, public transport achieves a much higher modal share on work trips. Workplaces tend to be more usefully situated than shops—a lot of the really poor interaction between land use and transport has involved shopping centres and out-of-town developments.

I wanted to get the facts clear, because someone is writing all this down.

**The Convener:** They are giving it a go, certainly.

**Shirley-Anne Somerville (Lothians) (SNP):** The strategic transport projects review suggests a saving of 100,000 tonnes to 150,000 tonnes of CO₂ equivalent if all the projects in the review are delivered, relative to business as usual. Do you think that that is an equitable contribution for the...
transport sector to make in pursuit of the 80 per cent emission cuts?

**Derek Halden:** The strategic transport projects review has had a difficult job to do because the strategy is not clear and you cannot do a strategic review unless there is a strategy. I cannot therefore make a lot of sense of any of that. I do not think that any of its conclusions look crazy; they all look perfectly sensible. You can get to the right answer in lots of different ways. I would not want to be critical of the review, but I think that we need a strategy that does more than the national transport strategy, which says, more or less, "We need to reduce emissions somehow."

We need to sort these things out and decide what we are going to do—our options include the things that I have been talking about, such as powering cars from electric plug sockets or using some sort of future biofuels for aviation. Once we have that strategy, we will inevitably have different figures from those that the strategic transport projects review used.

The detail of the specific schemes will be interesting in that regard. Some schemes will increase carbon dioxide emissions and some will reduce them. Therefore, we should focus on delivering quickly those that reduce carbon emissions and perhaps think about what can be done to those that increase carbon emissions to make that less of a problem. The aggregate figure is much less interesting than the detail.

**Marjory Rodger:** The strategic transport projects review document is a massive read, but to me it is simply 29 projects. Until they are prioritised, have funding streams attached and we have some idea of how they will move ahead, I will find it hard to comment on the figures.

**Chris Austin:** I am not an expert on this but, to the extent that the review includes projects that will increase capacity for public transport, which will encourage modal shift, it must be good. Allowing the shift to rail to take place is key to the issue that we are discussing. That shift is constrained at the moment by the existence of a number of pinch points around the network. Enabling communities that are no longer rail connected to access the network is also important, which is what some of the new rail projects will do.

**Marjory Rodger:** One quick fix would be integrated ticketing, which would not cost much to introduce. Anything that makes public transport simpler for people to use, such as better information, would make a valuable contribution.

**Shirley-Anne Somerville:** Given the challenging targets that are proposed in the bill, do you think that there needs to be a change in the emphasis on emissions reduction in the Scottish Government’s transport policy? Is so, what should that change be?

**Marjory Rodger:** I will be parochial and talk about buses. We are already working with the Scottish Government on ways of ensuring that the BSOG grant conditions include an environmental target. What we are talking about would be pretty challenging for the industry to meet.

**Chris Austin:** The same may be true of rail. There are a lot of initiatives that the operators are taking and which they have been able to justify commercially, either because the initiatives reduce energy consumption and cost or because they attract more passengers. That said, we do get to the point at which, if we are to take things further, further investment is needed. That is the point at which Government needs to come in.

**Derek Halden:** I will bang on at the point that we have transport because we are trying to do economic and social activity; that is why it is there. It is not sensible to try to set targets for transport that are independent of those wider activities. We cannot carve off transport and say, "This is why it is different." One of the biggest emitters is the entire machinery of freight transport in Scotland. What to do about that is a difficult optimisation decision. Do we build more warehouses and hold stuff for longer or have fewer warehouses and run more trucks around the country? The choice is between warehouses and trucks, and only one of those is a transport decision. The idea that we can set emissions targets for only the transport sector is wrong. People will just shift sectors and we might achieve efficiency gains, or we might not. It is not sensible to try to set targets only for the transport sector.

**Des McNulty:** It may not be your central interest, but what are your views on the inclusion in the bill of emissions targets for aviation and shipping?

**Marjory Rodger:** No sector can be excluded. I am not qualified to say whether the targets are appropriate, but everything must be included.

**Chris Austin:** That is right, particularly given the environmental performance of aviation. If we are to make significant change, modal shift will be involved—at least on domestic journeys. If we do not include or measure aviation, it will be difficult to achieve such change.

**Derek Halden:** It is simply a question of following the issue from the European Community, to the UK and then to Scotland. The fact is that international aviation and shipping will be traded, while other modes will not. We have inherited a situation about which we can do nothing. We need to try to deliver differently for international aviation and shipping, so they must be in the bill and they have to be dealt with separately. Trying to redress the unfortunate imbalance that the EC has created
by trading only some sectors is a major issue for this committee and the Scottish Government.

Des McNulty: I will concretise things: my next question is on surface transport links to airports. Should surface transport links be improved in order to deliver maximum emissions savings? At the outset, Derek Halden made the point that this is all about end-to-end journey planning. Should aviation emissions be considered in the wider context of airport access links?

Derek Halden: Yes.

Des McNulty: Do you want to expand on that a bit?

Derek Halden: Well—

Des McNulty: The committee is about to publish the results of its inquiry into the potential benefits of high-speed rail services, as part of which we have considered high-speed rail as an alternative to aviation, particularly for journeys within the UK. Should we think about aircraft emissions in the context of planning journeys to airports? Should aircraft emissions be included in the equation for rail and air and consumer alternatives?

15:00

Derek Halden: Yes, but I do not know what decisions consumers would make. One huge area—everyone has highlighted it—is the market’s failure to get out information on the issue. We need think only of the Government’s decision to put a health warning on cigarette packs, in which it said, “This could seriously damage your health.” It did that for reasons of health and social care.

There is no reason why, when people can receive journey plans on their mobiles or PDAs, information on carbon cannot be included. Many websites already contain carbon calculators, and such information could be standardised across all systems. The Government would have to pay for that, because there would be no commercial benefit for airline or rail companies—even though Virgin already provides such information. In order to achieve the social and environmental benefits, it would be up to the Government to ensure that the information was available to consumers. Would consumers then choose high-speed rail or would they choose air? We do not know. However, big money will come from such markets, and we will have to develop them and provide people with information. The future of transport will be completely unstable as long as consumers—or, as you would regard them, voters—do not understand transport. We cannot make any progress until we tackle the information agenda.

Marjory Rodger: Can I come back on this point? I definitely did not talk about market failure in information. I said that we had to keep improving and enhancing the information. At the minute, for example, we are talking about getting comprehensive journey planning and individual travel plans from Traveline Scotland to people’s mobiles via SMS texting.

While we are still talking about surface transport to airports, I will say that we have some excellent bus partnerships. Shuttle buses can provide a door-to-door service, and that service is very good in Edinburgh. There are good partnerships in Glasgow too.

If there are gaps in services, we can enhance those services easily, cheaply and flexibly.

Derek Halden: I am sorry, I did not want to imply otherwise—I do not disagree with anything that Marjory said there. I agree entirely. The Government’s stake in Traveline has been to fund components with social and environmental benefits, whereas it has been the bus industry that has financed information on journey planning.

Chris Austin: A lot of action has been taken on providing information on the National Rail website, which provides local onward travel information, links to Traveline, and local maps showing where buses stop. That provision of information has been revolutionised over the past 12 to 18 months. A lot more local information is provided in order to enable people to plan their door-to-door journey.

There is still more to be done. The provision of train information via SMS texting, which Marjory mentioned, has revolutionised people’s travel experiences. People are no longer left wondering where the train is; they can see from their mobile phone what has happened to it.

Airports are such big travel generators that the management of surface travel to airports is really important. Across the piece, people have been turning to higher-volume public transport modes such as bus, tram or rail, all of which have a part to play. The number of trips generated will depend on the size of the airport. Transport systems that use low-carbon vehicles—or, in the case of electric trains, vehicles that emit no carbon at the point of use—have advantages.

ATO has been working on station as well as airport travel and access plans. Stations are major travel generators too. Most of the large stations in the country carry far more passengers daily than the airports. They employ large numbers of workers too, in train crew and station staff. It will therefore be quite important to make travel information available so that people can make informed choices on how they can reach the station without automatically jumping in the car. That will work on a commercial level too, because congestion and restricted parking around stations may mean that people will not choose rail for their main journey. If people realise that they can reach
the station by bus or on foot, it will influence their travel choice.

Marjory Rodger: I would like interchanges to be improved. We must spend money on making interchanges much easier and on providing better facilities. My quick fix win to pay for that would be to treble car parking charges.

Des McNulty: BAA is coming in behind you, so to speak—we have a BAA witness on the next panel. I will put the same question to him. The airport car parks at Glasgow and Edinburgh airports seem to get ever bigger, while the airport buses seem to run empty. Is that visual impression wrong? In terms of surface transport links to airports, is bus patronage increasing relative to car usage? It seems to me that more people are using the car to get to the airport. For example, Edinburgh airport has not only the official BAA car parks but an outer ring of private car parking provision.

Derek Halden: We do quite a bit of work with property developers. Parking is a very nice revenue earner: the developer of a typical shopping centre is making a lot of money from car parking. We have been trying hard to get shopping centre developers and operators to do partnerships with the bus industry so that public transport operators can share in the increased profits that attracting new business in that way can bring. We cannot drive up modal shift from car to bus unless the people at the destinations work with the public transport providers in business partnerships. At the moment, most trip attractors—including airports and shopping centres—are making money only from car travel. They are businesses, so of course that is what they will do. We will see no change until we find a way to unlock the potential of partnerships between public transport operators and trip attractors. Success in that regard is key to all this. If we do not get modal shift, we will see further increases in car parking at most of the key trip attractors.

Marjory Rodger: Bus partnerships with airports make money. They must be carrying passengers. The Edinburgh shuttle, which was launched as an experiment, broke even and then went on to make money much more quickly than people anticipated. Park and rides are exceedingly important in this regard. They work.

The Convener: Perhaps we can explore in writing the question whether we have any statistical information on what proportion of journeys are made by car and what by public transport. That would be helpful to know.

I turn to the advisory body that may be established under the bill. The UK Committee on Climate Change will take on that role, at least in the first instance. There is the option to set up a Scottish advisory body to carry out the same functions. Will the UK Committee on Climate Change understand the Scottish context well enough to carry out its functions in relation to the Scottish act, as it will be, the Scottish Government and the Scottish economy, or is it more appropriate to have a stand-alone Scottish body?

Marjory Rodger: Could a secondment not be made? Perhaps two people from Scotland could be seconded to the UK committee?

The Convener: I believe that the UK committee is looking at how it will take on the function.

Marjory Rodger: I do not have a strong view on the matter.

Chris Austin: As we said earlier, in the main, the devil will be in the detail. The Scottish national perspective needs to be heard. From Scotland’s rail network’s point of view, the detail is important. I do not have a view on how this is done—whether by way of secondment or separate committee—but the information flow needs to be there.

Marjory Rodger: I agree.

Derek Halden: This is about hearts and minds. The public needs to have an identifiable figure that they can relate to; a visible champion. I am not sure whether that could be done from London, particularly given the more ambitious targets that are being set in Scotland and the huge potential of our renewables capacity. I have looked at the two options. My view is that what is proposed may all be too top heavy. That is part of my top-down concern in terms of delivery. It does not really matter which option is taken, but we need a presence in Scotland; an identifiable person who will champion the agenda on behalf of Government. Without a key champion figure, the public will have no one to relate to. People may end up believing that nothing will happen.

The Convener: We are not going to say the tsar word, are we?

Derek Halden: If someone is called a tsar, it is a symptom of top-down failure. The tsar-type way of doing business does not work because it is so top down. The top down and the bottom up have to meet. Tsars do not work for the simple reason that they are called tsars.

The Convener: Has the transport sector engaged with the UK Committee on Climate Change to date? Does another forum exist for that sector to feed in views on the climate change agenda?

Marjory Rodger: I know that my London colleagues have fed in CPT views. Briefing papers have been submitted. That is all that I can say about that.
Chris Austin: We have fed in views, too. There is also quite a dialogue through the Department for Transport, which we would regard as our sponsoring department.

The Convener: But not with the UK Committee on Climate Change.

Chris Austin: We have been involved in input to it.

Derek Halden: I am, like many others, a consultant who works on projects. Most of the information is out there in reports that my colleagues and I have done. We have produced the evidence. I hope that those we have done those projects for—whether lobby groups such as the CPT or public authorities—submit that evidence. We would not get involved in that. I am happy to talk as the director of a consultancy, albeit one that works mainly for English clients.

Cathy Peattie: The CPT does not believe that sectoral targets would be workable, but is there a case for developing a mechanism for reporting on the emissions from the surface transport sector?

Marjory Rodger: If we go ahead with the proposal to allow for duties to be placed on public bodies. What duties could be placed on public bodies to drive towards a lower carbon transport system?

Derek Halden: I would go for big hits again. Even now, planning permission should not be given for new housing developments without our having clearly thought through what to do. We may need slightly off-street mini-multistorey car parks, for example, to free up streets for other uses, such as for people walking about. There could be common charging points. We need a different way of thinking.

The duties that are placed on public bodies will be related to a range of changes. The climate change agenda is big, and many changes in practice are needed. Duties will need to be placed on those bodies, but the bill should not prescribe them. We are talking about levels of detail. If we lock such things in, we will end up in a mess. The bill should be kept really simple. The aim is to reduce carbon emissions and create an enabling framework for lots of good things to happen.

Marjory Rodger: I echo that.

Cathy Peattie: Would local authorities benefit from having to report annually? Derek Halden talks about not being prescriptive. If we are not prescriptive, how can we measure local authorities’ achievements? How can we give them something to work towards, now and in the future?

Derek Halden: Earlier, I referred to international carbon trading schemes. The same sort of mechanism could be used. Why cannot there be carbon equivalent reductions? Projects could be rewarded. People could say, “Okay, if you do and do this good project, that'll be equivalent to a carbon emission reduction of X.” However, it would not currently be viable to trade that CER in an international market—it is much cheaper to buy credits in India, which I have real concerns about. The right to buy cheap credits overseas should be balanced by responsibilities to buy credits at home. That is the sort of practice that I would like the Scottish Government to develop. We should say that we will put our own house in order, as well as trade in international markets. We should consider that type of certification mechanism, how to audit it and whom we should get to do the certification. Primary legislation is not needed to deal with such details; the UK Climate Change Act 2008 empowers the Scottish Parliament to pass regulations to deliver such things.

Cathy Peattie: But the UK act does not place a duty on public bodies to deliver.

Derek Halden: No, it does not—sorry.

Marjory Rodger: Requiring public bodies to deal with the energy efficiency performance of public buildings would be a good start in getting the mindset focused on delivery. If they can get good practice examples and roll them out, that would be a good start.
mechanised transport, but I cannot trade with anybody if I walk to Princes Street from here, so therefore nobody is making any money and there is no mechanism to deliver. However, if we set up a framework around footfall and driving up the number of walking trips that replace car trips, local authorities can deliver a carbon reduction and that will create a financial funding framework within which those sorts of things can happen. That is the type of progressive trading that I am arguing for. If we want to deliver, we need such tools because, otherwise, all the reductions will have to be delivered with a top-down approach, for example, by trying to have more and more renewable energy and making transport as clean as possible. It is probably a lot easier just to have people walking from A to B a bit more.

Marjory Rodger: My keep-it-simple suggestion is that a transport plan should be in place before planning permission is given for any development of a reasonable size, residential or commercial.

Chris Austin: I certainly agree with Marjory Rodger’s point. The only other point that occurs to me is that we need to reflect the approach in the various objectives that are set for transport operators on regulated activities. I was going to say that climate change is relatively new, but I do not mean that—people have been thinking about climate change for some years. I mean that the implementation of measures to tackle climate change is relatively new and is not yet embedded in everybody’s thinking, and certainly not in objective setting. That might be considered. However, as Derek Halden said, that does not have to be specified in the bill; it can be dealt with downstream in the light of advice from advisory committees and through delegated powers.

The Convener: Finally, we have a question from Alison McInnes.

Alison McInnes: My question was covered in the earlier discussion about hearts and minds, so I am happy to leave it there.

The Convener: Okay.

Are there any outstanding issues that the witnesses intended to raise with the committee but which have not come up in questions?

Marjory Rodger: No.

Chris Austin: No.

The Convener: In that case, I thank you for giving up your time to answer our questions. I suspend the meeting briefly to allow for the changeover of witnesses.

15:18

Meeting suspended.

15:20

On resuming—

The Convener: I welcome the second panel of witnesses. Gordon Dewar is the managing director of Edinburgh airport and represents BAA Scotland; Robert Ashdown is head of the technical division at the Chamber of Shipping; Gordon Wilmsmeier—I hope that I pronounced his name correctly—is senior research fellow at Napier University’s transport research institute; and Dr Alice Bows is a researcher at the Tyndall centre for climate change research in Manchester.

I will start with a general question about aviation and shipping. Why are they often singled out in the climate change agenda and in relation to the proposed legislation?

Robert Ashdown (Chamber of Shipping): It is important that we decouple aviation and shipping. There is no reason why the two industries should be treated as one, and both can be dealt with on their own merits. Historically, they have been lumped together primarily because they are both international industries—they straddle national borders—that are out with the current Kyoto climate change protocol and do not pay tax on bunker fuels. To my mind, those are the key elements that link aviation and shipping.

Gordon Dewar (BAA Scotland): I do not disagree with that. Aviation and shipping present different issues and face different challenges. It is fair to say that BAA wants aviation to be included in carbon trading but, because of the issues with international boundaries, which were well recognised in the consultation on the proposals for the bill, the best place for it to be dealt with is within the EU emission trading scheme.

Dr Alice Bows (Sustainable Consumption Institute for Climate Change Research and Tyndall Centre, University of Manchester): I agree with what Robert Ashdown said about separating the two industries. They are quite different. One reason why the Tyndall centre started examining aviation and then shipping was that they were two of the sectors with the fastest-growing carbon emissions.

Gordon Wilmsmeier (Napier University): I also agree with what Robert Ashdown said, but it is important to acknowledge that shipping is one of the most international industries in the world—perhaps even more international than aviation in its workings—and is hard to control. The main controlling body for anything that happens in international shipping is the International Maritime Organization. It is an important body to support because, although many countries have not signed certain agreements, they still flag ships. There is a global issue.
The other important matter is domestic shipping—not only coastal shipping within the UK, but ferry services in Scotland. Those services are not covered by the bill, which is an important point. They are also part of public transport but were not mentioned when public transport was discussed earlier.

The Convener: The bill gives the Scottish ministers the power to include aviation and shipping—I will try to put a pause between them—in the Scottish targets and they have indicated their intention to include both sectors fully in the targets from the very first batch. What is your view on that decision? Do you accept that it gives Scotland the opportunity to lead, rather than follow, the debate on how the targets on greenhouse gas emissions will be pursued?

Gordon Dewar: We certainly understand and welcome the leadership and commitment that the Scottish Government has shown in pursuing this critical agenda. Our concerns are more about the practical aspects and the risk of unintended consequences from dealing with the issue at the national level, so we are waiting to see what will come out in the detail. I think that an earlier panel of witnesses expressed similar concerns.

We support the ambition to ensure that we do the best that we can, but we believe that, to make a difference, the European emission trading scheme will be the right forum because the European level is the minimum level at which aviation operates. The unintended consequences that we are concerned about would make Scotland uncompetitive. Any measures that try to limit aviation or, indeed, to impose costs on aviation are likely only to move emissions from Scotland to somewhere else rather than reduce them overall. Therefore, such measures would be ineffective and would place Scotland, which is already a peripheral nation on the north-west fringe of Europe, at a distinct disadvantage.

Gordon Wilmsmeier: The ambition to include shipping is good, but I would extend it to include not only international shipping but domestic shipping and ferry services.

On the competitiveness issue, maritime transport in Scotland, which is basically an island country, is underdeveloped in comparison with maritime transport in nations with a similar gross domestic product or population. The strategy of moving towards modal shift might lead to greater use of shipping. The important question is how you ensure that measures do not impact negatively on shipping developments; otherwise, shipping might become uncompetitive in comparison with other transport modes. In that respect, it is important to consider level playing fields for transport modes. How do you get the infrastructure charges right? How can you promote shipping to make it competitive in comparison with other modes? In particular, how do you switch from moving freight by road transport to moving it by shipping? Doing that would perhaps bring efficiency gains.

Robert Ashdown: It is not a question of desirability but of practicality. It would of course be good if the Climate Change (Scotland) Bill was entirely holistic and dealt with every aspect of every sector. The problem is how that could be done. How can Scottish shipping be defined, and how can Scotland’s contribution to global international shipping emissions be taken into account? Let us be clear that we are talking about international shipping, not domestic shipping, at this stage. I make it clear, too, that the Chamber of Shipping advocates bringing shipping into a global carbon emissions reduction scheme and that we have gone out for an emission trading scheme.

We stress the global element because shipping is an international industry, and the policy levers that are available to nation states, let alone devolved nations or regional bodies such as the European Union, are so weak that it is almost impossible to enforce the delivery of desired actions. Therefore, we end up with unintended consequences that might result in modal shift, which would increase carbon emissions. If Scotland included international shipping in the emissions calculation and put a target and cost on that, what would a commercial ship operator do? He could call at a Scottish port and pay a fee, or he could call at an English port, pay no fee and let another body drive the goods up across the border. We must be careful to separate out our laudable ambitions from the practical effects of the actions involved.

Dr Bows: From a practical point of view, if the bill aims to avoid so-called dangerous climate change—whatever that means—the science behind that means that all sectors must be included because the climate obviously does not identify which sectors you do or do not choose to include. Obviously, taking action involves practical issues and can have unintended consequences, but we must also consider the consequences of climate change. A recent paper that Kevin Anderson and I had published at the Royal Society illustrated that we have very few years left in which to start to reduce emissions globally in real terms, because we are heading for a 4°C temperature increase by 2100, which is significant climate change. In the absence of a global cap, which we do not have and which is not likely to be agreed by the end of the year, any mitigation action that we take in the meantime will be positive in the context of climate change because the quicker we reduce emissions, the less challenging the situation will be in the future.
The issue concerns cumulative emissions—we cannot focus only on the 2050 target, because it matters what we do in the early years. The less that we do in the early years, the more stringent that target will have to be in the future.

15:30

The Convener: It has been suggested that one way in which we can account for emissions that are associated with international industries is to examine consumption rather than production—to measure and report on the emissions that are associated with the production of goods or services that are consumed domestically. Would you support that? Is it a reasonable way forward?

Dr Bows: In each sector, there is a combination of producer-based and consumer-based approaches. Some sectors could argue that, essentially, double counting is taking place. The electricity power sector, for example, is in the emission trading scheme, and consumers are also being pushed to improve their energy efficiency by turning their lights off and their televisions off standby. Because the challenge is so great, I advocate the use of both consumer methods and producer methods where they are most appropriate.

We are currently working on a method for aviation, which will involve the allocation of regional aviation emissions on the basis of a producer-and-consumer approach. It is difficult to use one or the other and come up with something that is relatively equitable, or as equitable as we can get.

The Convener: Is it possible to take that approach in relation to shipping, given the complexities?

Dr Bows: I would like to do more work on shipping. It is a more complicated issue: the travel that is involved is less of an A-to-B route, and more actors are involved. We are trying to carry out more research on that at the moment.

The Convener: Are there any other views on the options for the producer and the consumer?

Robert Ashdown: It is not quite clear from the terminology that you use how you define the producer and the consumer. Perhaps you could explain that further.

The Convener: One aspect involves having a duty to measure and report on emissions that are created elsewhere but associated with imported goods.

Robert Ashdown: There are numerous ways of measuring emissions from ships. Looking at imported goods is one way to do that, although it, like all the other ways, has its problems. To be clear, the comments that I made in the COS submission about the difficulties that the shipping sector faces in relation to national legislation for what is an international industry relate solely to actual reduction targets rather than to measurement, because measurement provides no incentive to try to avoid, in a legitimate way, additional costs or charges.

Cathy Peattie: I will begin with some questions on the aviation sector. Does Gordon Dewar agree that early action is required to reduce greenhouse gas emissions in order to avoid dangerous climate change?

Gordon Dewar: I am not an expert on the science, as you can imagine, but there is certainly enough evidence, which is growing and becoming more compelling, that we need to take action. The only debate that we need to have is on the appropriate action to take. The aviation industry is viewed by many as a significant problem—it is viewed as a greater problem than is suggested by the reality of the situation, given that it currently accounts for only 1.6 per cent of global emissions.

However, it is true to say that the sector is growing quickly, and therefore we cannot sit back and take the situation lightly—we have to act. Many developments are already occurring in aviation, such as new technologies and improvements in engine efficiency. We have also made efforts in relation to our own building emissions at an airport level, and consideration has been given to surface access, which we heard a lot about from the earlier panel.

Our track record on putting the matter at the core of what we do is important, but, fundamentally, that does not entirely address the fact that the sector is growing and that the technology of using kerosene in jet engines is an issue going forward. That is why we think—and the Stern report makes it clear—that the right answer is to consider emissions trading as the way forward. A trading scheme would balance the economic benefits and the wider benefits of aviation and many other transport modes, including shipping, with the ease of addressing the issue.

Global emissions are important, no matter where they are produced, and that is why trading—at least at a minimum European level, if not at a world level in the future—is the right place to start. It preserves the model of advocacy and leadership, which the developed world needs to take firmly on its own shoulders, but it is not so fundamentally damaging to our own economy that we undo the good. I am constantly reminded that people will only follow good leadership—they will not follow stupid leadership.
Dr Bows: Globally, aviation emissions are quite small, but, globally, most people do not fly. In the UK, we have a slighter higher proportion of emissions from aviation than a lot of other European nations. Our aviation emissions are about 6.4 per cent of our total emissions, but in the EU aviation emissions are closer to the 4 per cent mark. Emissions trading is okay—in aviation, emissions are likely to grow in the future, while other sectors will find it easier to reduce their emissions—but at the moment, the cap is not strong enough to be in line with the standard on avoiding dangerous climate change within the EU’s emission trading scheme. I hope that it will be strengthened in the future. We are concerned that we should do something sooner rather than later.

On the evidence that links economic growth to the aviation sector, we have been doing new research by looking at the documents that say that there is an economic benefit to having an aviation industry. There are areas of economic benefit, but some of the research and indicators in the data are dubious. We would like to do further research to try to bottom out some of the links that are being cited but which are not really backed up by the evidence.

Gordon Dewar: It is not me who is saying that there are such benefits—you might think, “He would say that, wouldn’t he?” The bodies that are advocating that aviation growth should continue in Scotland are the SCDI, the chambers of commerce and local authorities. Those bodies have no axe to grind for the specific benefit of the aviation industry; they are motivated only by what they believe provides added value to the Scottish economy.

Cathy Peattie: Could the environmental impact of the aviation industry be better understood and reported? Aviation is the first thing that people look at when they are discussing climate change—they throw their hands up in horror about aviation.

Gordon Dewar: I would really welcome our having an informed debate for a change about the impact of aviation in this sphere. If we all stopped flying tomorrow, it would not make that much difference environmentally, but it would do a huge amount of economic damage and would raise a variety of social issues. We talk glibly about improving domestic rail travel. There are still not too many options for travelling from the central belt in Scotland to London and back to do a day’s business. You certainly cannot do that journey by train in a day from the Western Isles, the northern isles or even Inverness or Aberdeen. We have to consider transport in the round. Scotland is a relatively isolated nation within the EU. We are more reliant on transport than just about anybody else.

The Convener: Has anybody seriously suggested that we all stop flying tomorrow?

Gordon Dewar: No, nor did I suggest that they had.

Cathy Peattie: BAA Scotland cites a report that concludes that technological advances, operational efficiencies and the use of low-carbon fuels could see aviation emissions fall back to 2000 levels by 2050. When could we expect to see tangible progress in those areas? Are we likely to see such developments accelerate in an era of rising energy costs? There is a lot of ambition, but when will progress be made?

Gordon Dewar: The process is on-going. Engine technology has moved on significantly in the past 20 years. I think that we have seen 40 per cent reductions in emissions. People say that we should be driven by the data. When Willie Walsh addressed the business community in Scotland just before Christmas, he made the point that, in terms of passenger kilometres, his fleet was more efficient than a Prius car. That is an interesting comparison. I want to have an informed debate about the best choices available, albeit that we will have to rely on emission trading to get the balance right. Remember that we are not arguing for growth regardless; we are saying that we would grow only when we could remain within a cap and within a trading scheme.

Dr Bows: One of the problems for the aviation industry is the maturity of the engine technology. There have been new developments lately in open-rotor engines, for example, but there are always trade-offs within the aviation sector. When you are trying to reduce noise, for example, you increase the weight of the aircraft and, therefore, increase the emissions. One of the key issues that we have considered is growth. We have efficiency improvements of the order of 1 to 2 per cent at the moment. That situation is likely to continue, given the maturity of the technology and given that there are not going to be radically different air-frame designs within the next 10 years or so. While growth rates are higher than efficiency gains, emissions will increase, so we must not think only about how we can further incentivise technology developments.

Alternative fuels are interesting and the debate about them has progressed in the past five years. Much more research and development on alternative fuels is taking place and that needs to be accelerated. All such measures need to be accelerated, but we also need to keep an eye on the growth rate. No matter how much we improve efficiency and alternative fuels, if the growth rate is high and kerosene is still used, we will have increased emissions.
Shirley-Anne Somerville: I will press Mr Dewar on his answer to Cathy Peattie’s question about emissions falling back to 2000 levels by 2050. I appreciate that giving exact timeframes is difficult, but that timeframe is very long. Saying that the position will develop over time to 2050 does not take us much further forward on whether emissions will fall in 2049 or in five years’ time. Can we have a bit of an idea about the cumulative emissions from aviation?

Gordon Dewar: I do not pretend to be an expert in all the various developments that are behind the reduction. Could I provide information in writing?

Shirley-Anne Somerville: That would help—thank you.

Your evidence cites the IPCC’s estimate that aviation will contribute 5 per cent of the world’s total human contribution to climate change by 2050. Given that emissions are already above the worst-case scenario that the IPCC scoped, what contribution should aviation make to getting us back on track to the central point that the IPCC discussed?

Gordon Dewar: My plucking out arbitrary forecasts of our share of those emissions would not add an awful lot to the debate. What is important is managing sensible caps in sensible trading schemes in the round. We have argued for several years to bring the aviation industry in line with others, which has not been easy. Many in the industry saw emissions trading as a threat, but there is now almost consensus that we should not avoid, but embrace that.

By 2012, we will be in the European emission trading scheme. That will allow us to recognise in an efficient way the fact that our emissions are growing. To allow that to happen, we must fund research and the buying of credits from other people. We will therefore give all the other industries incentives to invest in the new technology that will start to drive down emissions overall, which is the point of the scheme.

Shirley-Anne Somerville: In previous weeks, witnesses talked about the problems of emissions at height, which have more impact. What does the industry think about that? Will you explain a bit of the theory behind that?

Gordon Dewar: Again, it would probably be better for me to write to you. Suffice it to say that we acknowledge that emissions at height contribute more, as do some different combinations of chemicals that are up there. We acknowledge that multiplier effects will need to be applied to some emissions from the aviation industry. Science must be used to best effect in ensuring that we are as close to consensus as possible when we consider trading overall. I am happy to provide references to several scientific papers that go into the matter in much more detail than I can aspire to give.

Dr Bows: I dislike the use of multipliers, because emissions are different—for example, some are localised and last for short times. One mistake that was made in the past—I made it when I started, too—was that people often used multipliers to project into the future. They just multiplied the CO₂ in the future by some multiplier, but multipliers change, because different emissions will emerge, and the CO₂ does not go away, unlike some other emissions. The situation is more complicated.

We should concentrate on CO₂ for trading and perhaps consider oxides of nitrogen emissions, which increase some greenhouse gases and reduce others. However, we should think about and treat the condensation trail issue separately.

Shirley-Anne Somerville: We have heard that BAA is reducing emissions at its airports; that is separate from emissions from flights. What successful measures has BAA employed, or does it plan to employ, to reduce its emissions?

Gordon Dewar: We have set ourselves energy consumption reduction targets for all our airports, on which I would be happy to give the committee more detail. Reducing emissions also involves behavioural aspects. Surface access is a big driver of our emissions footprint and has a wider reach.

We have schemes such as the public transport fund, where we take an average of 20p from every parking activity for which we collect revenue and reallocate it for investment in public transport. Marjory Rodger talked about that earlier. We give start-up funding to some of the more developmental initiatives; indeed, we prop up some of the less commercial bus networks that operate around our airports.

15:45

We are also mindful of the fact that even different types of transportation by car have a different impact. The worst form of car access to an airport is kiss and fly, where someone gets dropped off, because that generates two return trips to the airport. Only one return trip is generated if someone leaves their car at the airport.

We have a hierarchy within our transport strategy that tries to encourage people. It uses pricing mechanisms to manage the situation and makes the person who benefits pay so that we get the best possible mix.

You will be aware of some bigger projects. The tram project is on-going in Edinburgh, and there will be a fixed-rail line to Edinburgh airport in the
not-too-distant future. Similarly, Glasgow airport rail link is undergoing development work. We have contributed land and financing to those projects and are helping to make them happen. We are trying to increase our modal share of public transport, which we know is more effective. However, that is not to say that we think that we can do away with car access. For many people, the car is the only credible option for them to get to the airport.

Shirley-Anne Somerville: There is a bit of scepticism because parking provides an excellent revenue stream for the airport, so perhaps it is not in your interests to discourage people from parking. Can you try to convince me that that is not an issue?

Gordon Dewar: I will not try to convince you that that revenue is not important. However, we try to achieve a balance. We have a sensible structure, and people recognise the facilities that we provide. For example, we make sure that anyone who uses the bus is not exposed to having to support the costs of providing car parking. It would be a double disincentive if someone paid a bus fare and then had to meet such costs. We are trying to get the balance right.

We have to remember that we are a privately financed business, which is quite unusual in Europe, and yet we are national assets that get no public funding whatsoever. Every penny that we take from non-airline sources—for example, by charging people less to land—will mean that we can grow the attractiveness of our networks. Although we are talking about climate change, I will not pretend anything other than that we believe that growing our network and increasing our connectivity, particularly for direct flights that avoid the need to hub through other airports, is at the core of our business, and it is worth accommodating that within a wider climate change agenda because of the economic benefits that it provides.

Des McNulty: What has been the annual increase in your parking revenue during the past three years, and how many additional vehicles does that represent on a year-by-year basis?

Gordon Dewar: Having reflected on a question that was asked earlier, I think the best response would be to give you a breakdown of modal share for the past few years to show you the trends, if you would be happy with that.

Des McNulty: I would be quite interested in that, although I am sure that you know what the figures are for the year-on-year increases in your parking revenue. I would be very surprised if you did not.

Gordon Dewar: Again, I do not think that giving you an absolute number would give a lot of context. I would be happy to share some idea of the proportion of our income that parking revenue represents, and contrast that with our public transport share, which is growing strongly.

The Convener: I would like Dr Bows to clarify something. You argued that, in looking at the additional damage caused by aviation emissions, the contrails issue should be considered separately. How should it be considered? In what way should it be taken into account?

Dr Bows: If you want to avoid forming a contrail, you might want to change altitude, which might increase the fuel burn. If you were to ground an aircraft tomorrow, its CO$_2$ emissions would still be there for the next 100 years, whereas the contrail disappears very quickly.

Given that the contrail is localised and lasts for a matter of minutes and that CO$_2$ emissions last for 100 years, the science and policies that might address them are very different. I would not want to say how we should go about considering them, except to note that it would be difficult to trade a contrail.

Alison McInnes: I come back to a more general question, which I should perhaps have asked earlier. Do any of the panel have a view on the 2050 target and the interim targets in the bill?

Dr Bows: Focusing on 2050 and having it as something that is frequently spoken about means that people think very long term. The important thing is the emission pathway that you travel down to get to your aspiration in the future—the 2050 target. The target is likely to change depending on how much emissions increase in the short term. If they increase more now than you think they will, the 2050 target has to drop.

I would advocate an emission pathway. The interim target seems to be along the kind of emission pathway that we want to follow, but we must also think carefully about where we think emissions will go in the next five, 10 or 15 years. The 2008 UK act suggested that emissions in 2008 would be somewhat lower than they were. That mistake has been made already over only a few months, which means that emissions in the future will have to be reduced by more.

Alison McInnes: Would you prefer interim targets to be brought forward?

Dr Bows: Yes.

Robert Ashdown: From the shipping perspective, ships are very long-life assets. A ship will last for 20 to 25 years, so we are only two or perhaps three generations of ships away from 2050. Ironically, that makes it easier for us to meet the 2050 targets than the 2020 targets, because we are already locked into the technology that we have.
Shipping is a mature industry that has been around for a very long time, so many technological advances have already been implemented. We are looking for step changes in technology—fuel cells, solar power, hydrogen and that sort of thing—to help us to meet the longer-term targets. It is difficult to see those coming on stream in time to have a real impact by 2020, which is not to say that I underestimate the importance of early action—it is all about the area under the curve—but for our sector the longer-term targets are more achievable than the medium-term ones.

Gordon Wilmsmeier: It is important to enhance technical development and evolution in shipping. Something has been done but, for a long time, shipping was neglected because it was argued that nothing could be done because it is a global industry. There have been a lot of gaps, so it is necessary to get a grip on them and start innovation. There has not been huge pressure on shipping to innovate. In certain trades, there has been innovation in paints and hull shapes. We can also improve the loading capacity for certain ships. We must introduce incentives to strengthen technical innovation within shipping. We should also transfer from certain types of fuel to marine diesel oil, which contains fewer other air pollutants. CO$_2$ is an important issue for shipping, but we must consider all the air pollutants. It is important to find a way to incentivise that push. In shipping, it is obviously difficult to push technological development from just a Scottish perspective; there is no national flag in Scotland, so how can you push technological development? The matter needs to be discussed at international level.

Robert Ashdown: I agree that the shipping industry would benefit greatly from greater investment in research and development. It is not right to say that we have had no incentive. Fuel costs are approximately 30 to 50 per cent of voyage costs, so we have always had the strongest possible commercial incentive to reduce fuel consumption. Indeed, every generation of ships has been cleaner and more efficient than the last for purely commercial reasons.

We have not benefited from other high-end aspects. In the aviation industry, for example, military technologies and the space race have allowed cutting-edge technologies to filter down to civil aviation. We do not really see that in the marine world, which does not have a high-end, non-commercial sector to drive technical innovation, so R and D would be welcome.

I disagree with the point about moving to distillate fuels, on which the International Maritime Organization has just had a long, two-year debate. I will spare you the details, but the decision was made not to move to distillate fuels. Distillate fuels are about 3 per cent more carbon efficient than residual fuels, but to produce distillate fuels in the volumes that are necessary for the international shipping industry, refinery production would have to increase to such an extent that there would be a net 15 per cent gain in carbon emissions. Distillate fuels are not the answer to reducing carbon emissions from shipping.

Alison McInnes: I want to explore that further. I had intended to come on to the issue later, but it is appropriate to pick it up now.

It is clear that we have not seen the innovation that we should have seen in the shipping industry. You have given us some of the reasons why that is the case, but that pushes me towards favouring regulation, as self-regulation does not seem to have worked. The previous panel told us that the bus industry was investing in measures to reduce carbon emissions on a commercial basis. I do not think that the international shipping industry has invested as much as it needs to, which does not give me comfort. Can you give me some comfort as regards the IMO’s commitment to bringing about international action in the near future?

Robert Ashdown: Absolutely. At the next meeting of the IMO committee that deals with such matters, we hope that a mandatory energy efficiency design index will be introduced, which will give new ships a rating, from A to G, such as one finds on white goods. That will allow owners and charterers—we must not forget the importance of charterers in the shipping industry—to choose the cleanest ship for their transport purposes. We hope that that measure will come into force quickly.

Gordon Wilmsmeier: It is important to bear in mind that the IMO regulation might solve certain problems that we have in Europe, but many countries have not signed the IMO agreement, so we might just be pushing problems towards other regions of the world, which is not a solution. It is not a solution to achieve high standards in Europe by sending ships and aeroplanes to be used in other regions.

We see that happening in Scandinavia, which has been quite proactive in imposing differentiated environmental port charges and fairway charges. All the ships in that region now have newer technology and the ships with older technology have moved out, but they have not disappeared. If we want to get rid of the old technology, we must ensure that the ships that use it disappear and are not just shifted geographically.

Des McNulty: Gordon Dewar and Dr Bows mentioned that aviation is to be included in the EU emission trading scheme, which will mean that aviation emissions will have to be measured and reported on anyway, so will including aviation in
the bill make any difference, or is it simply symbolic? What is your view on that?

**Dr Bows:** I come back to the idea of consumer and producer-based approaches and the analogy with the power industry. Because of the challenge that we face on climate change, we need to push every button that is available. The inclusion of aviation in the emission trading scheme does not mean that other policies should not be brought on board. Most sectors are subject to a suite of policies, but the aviation sector does not appear to be subject to quite as many policies on carbon emissions and energy efficiency. Robert Ashdown mentioned the energy efficiency ratings for ships, which might come to the fore, but no such ratings exist for planes, and there are no regulations on CO2 emissions from airports, although there are regulations for other emissions. My view is that it is a good thing for aviation emissions to be included in the bill.

**Gordon Dewar:** As I said at the outset, we are concerned that including aviation emissions in the bill might end up having unintended consequences. From the point of view of effectiveness and equitability, action on the issue should be taken at the level of the European market as a minimum.

However, we understand the political necessity of addressing the issue and I guess that we are supportive of the proposal in principle. It was interesting that, when we spoke to the Scottish Government as part of the consultation exercise, it made clear that it regards the provision as an enabling provision that will give us time to get into the emission trading process by 2012. There is a gap of three years or so in which to get there. If that is the approach that is being taken, I would be quite supportive of including aviation emissions in the bill, as long as we are mindful of that endgame. I have no difficulty with the idea that we should be pushing on all fronts, but we must maintain equitability and not hamstring ourselves in an extremely competitive environment.

I echo my shipping colleague’s comment that there is no doubt that it is not the case that unilateral action will lead to no change. We have already lost large numbers of flights because airlines have chosen to fly from other European airports to gain the most marginal or fringe commercial benefits. We make such changes at significant risk of fundamentally changing the attractiveness of Scotland as a market.

16:00

**Des McNulty:** Pursuing that a tiny bit further, I want to pick up the point that Dr Bows made about the advantage of having a suite of regulations. The different sets of regulations should not try to force or produce different kinds of behaviour. If aviation emissions are included in the bill, how do we establish a system of monitoring in Scotland that is not only consistent with the European approach but potentially adds something to that approach? I am asking not just about the principle of including aviation emissions but about the practicalities of doing so and how we might add value.

**Dr Bows:** The cap on the emission trading scheme is currently so loose that the scheme is nowhere near aiming for a 2°C target. One way forward might be for Scotland to use the same method of allocating aviation emissions but with a more stringent cap. Scotland could use basically the same approach but just do things more stringently over the course of the few years before the emission trading scheme starts. If the emission trading scheme is still not in line with a 2°C target when it starts, Scotland could continue with its previous approach until we have a global cap that will avoid dangerous climate change rather than just act as a mechanism to get people used to emissions trading.

**Gordon Dewar:** I am 100 per cent opposed to that argument. That is exactly the approach that would make a fundamental difference to us. If we impose additional costs only in Scotland, all that will happen is that aircraft will be reallocated to other airports in Europe, so we will lose the economic benefit without making a jot of difference to overall emissions.

**Dr Bows:** I should add that I would give the same advice to the UK, French and Dutch Governments. In other words, all nations are considering tackling climate change through using targets. The assumption must be that, if we want to avoid dangerous climate change, everyone must eventually come on board. Some countries might move earlier than others but, at the end of the day, everyone will need to follow. Scotland will not be able to do that alone.

**Des McNulty:** One point that Adair Turner makes when talking about achieving a low-carbon economy within the framework in which we must operate is that we should separate out interim targets from intended targets—I am talking about targets more generally—based on our commitments at Copenhagen and our European commitments. If we go for the idea of having a harder target rather than a weaker target, how would that translate in aviation terms? The suggestion is that the target might be for a 42 per cent reduction rather than a 34 per cent reduction, although the figure depends on which base year one starts with.

**Dr Bows:** Including the aviation sector in a trading scheme will not necessarily require aviation to reduce its emissions because it will be able to purchase emissions from other sectors. If
the overall cap has two different levels for the intended and interim targets, all the sectors under the cap will be affected. The only effect on aviation might be that it will need to pay a little bit more for the emission permits that it purchases. Including aviation does not necessarily mean that aviation growth will be reduced significantly, particularly at the moment when the cap is so high that the carbon price is very low.

Des McNulty: I want to pick up what Dr Bows said about aviation needing to pay more. Who in aviation would need to pay more?

Dr Bows: My understanding is that the costs are likely to be passed on to passengers. That is my understanding from various interviews with the aviation sector about what would happen if the airlines had to pay an additional charge.

Gordon Dewar: I support that point. Inevitably, the user pays in the end.

Des McNulty: If Scotland or the UK goes down the route of including aviation emissions, can we quantify what the implications of that would be for aviation prices, or can that not be calculated at this point?

Gordon Dewar: I do not think that there is enough certainty about the price of carbon or how the interaction will go. It will depend on how people respond to the need to reduce carbon overall. There is certainly recognition that the cost of emissions will increase over time, and I am sure that there will be a lively debate about the appropriate cap to be set. It seems likely that the only direction in which carbon costs will go is up. The aviation industry is well aware that that means that its costs will increase and that, ultimately, prices will increase.

Des McNulty: What is the best method of organising that? Is it through what is, in effect, a taxation scheme, or is it through other approaches that bear more on the industry?

Gordon Dewar: Trading will be a far more efficient method of recognising the true cost of emissions, because it is about creating a market in something that allows people to respond. In the past, we have had taxation. For example, we have air passenger duty, which is a significant burden on the ticket price. In many cases, APD taxation accounts for more than half the ticket price. Unfortunately, it is a blunt instrument and the money has not been reinvested in new technologies or in the ability of other industries and sectors to reduce emissions. It might have reduced travel at the margins—in fact, it certainly has—but it has not had the spin-off benefit of money being reinvested in the longer-term gains that trading will allow.

Des McNulty: That gives me the industry’s point of view, but I am also interested in the impact from the consumer’s point of view. What is the difference for the consumer between a trading arrangement and a taxation system?

Gordon Dewar: An efficient system should allow the consumer to make sensible choices. If the aviation industry buys credits to allow it to offer a service that people still pay for, in effect, they are getting that efficient choice. A traveller might have a choice between travelling by train, flying, or perhaps not travelling at all, and they will take an informed view by considering all the options that are on the table. The best way in which to make sure that that is an efficient option for them is to ensure that we have a true recognition of the price of carbon. The trading scheme should allow that to happen.

Des McNulty: I will change tack a wee bit. In response to an earlier question, you said that Scotland is in a relatively isolated position in Europe. That is undoubtedly the case. We are part of an island that is remote from the European continent. Presumably, that partly explains why aviation usage and emission rates are higher in the UK. The central belt of Scotland is 400 miles from London and 500 miles from the Channel tunnel, so we probably do not have the surface alternatives that other people in Europe—or perhaps even people in the south-east of England—have. If we want to do business with other parts of Europe or travel there for leisure, we are at a comparative disadvantage geographically. If we are the ones to wear the hair shirts—if I can put it in that way—in capping our systems, are there any issues in that for Scotland?

Gordon Dewar: There are—that is what we are saying. We need to be aware of why we are doing things differently—why we are setting higher targets, or using the mechanisms differently—and we should bear in mind the unintended consequences.

As I said, people want to follow wise leadership. It is right that the developed nations take a leadership role on emissions and climate change. To my mind, there is no justification for pulling up the ladder behind us. However, we need to know that we are setting a path that other people will want to follow because, ultimately, we want to persuade everybody else to join us.

We should not impose artificial costs on our accessibility to markets. Let us not forget that we are talking not just about people who fly off on holiday but about people who fly into Scotland for tourism, which is our biggest industry. VisitScotland recognises the importance of that. We are also talking about getting to markets, including world markets such as the far east, where we know our wealth of the future will be
based. If we start to make it more expensive or difficult to travel, we will do ourselves a disservice and will not show leadership or set a path that anybody else will want to follow.

**Dr Bows:** At the end of the day, if there was a cap for all sectors, the choice could be made to allow aviation to consume the entire budget. In that scenario, there would be a reasonable amount, or perhaps a significant amount—I do not know, as I have not done the numbers—of growth in aviation in Scotland. That would be a choice that would be made. The other issue is the shipping industry. If it was included in the cap and the target, there is a long-term issue with technology, as has been stated. Given the lead time that is required to reduce emissions, it is likely that emissions could be reduced in the long term, but not in the short term. Thought would therefore have to be given to which of the sectors would be allowed, or chosen, to use up the biggest part of the budget. Ultimately, the cap will have to be in line with a climate change target.

When I interview people from industry, I hear that their sector wants to be able to consume the majority of the budget, but not all sectors can do that. We have published a paper that shows that, ultimately, emissions trading cannot reasonably happen after 2030 if we are to avoid a 2°C rise. However, setting stringent caps and allowing the sectors that wish to use up more of the emissions to do so within a trading scheme is the way to go. There will still be some growth in the aviation industry in Scotland.

**Gordon Wilmsmeier:** Des McNulty’s question takes us back to something that was said earlier. Why is aviation singled out? What about co-modality? In Germany, the route between Frankfurt and Cologne, which is just less than 300km, was traditionally done by aeroplane, but it is now done by train. Lufthansa flights and all other flights between the two cities were cancelled because the train was competitive in terms of speed. Even though Scotland is on the periphery, if high-speed rail was delivered, there would be sufficient links within the UK to allow the consumer to choose other modes of transport. The time is right for that. We should not forget the issue of security in aviation. It is much more convenient to get on a train at the station than to go through all the hassle at an airport. We must also consider the point that was made by the previous panel about complex travel time. The travel time by air is not just the one-hour flight to London, as people need to get to the city centre. Even today, with relatively slow trains to London, the train ride from Edinburgh to London might already be more attractive, particularly given that people can use their time better, which is especially important for business.

We need a clear statement from the Government that it is willing to invest in modern technology. That will not come about in a couple of years, because it is a long-term investment. Spain and Germany have made a long-term investment in high-speed rail. Such investment would not have an effect tomorrow. On certain routes, there is an option to move towards a co-modality approach. That takes us back to issues to do with convenience for travellers, such as integrated ticketing and just getting off the plane and getting on the train.

**Des McNulty:** That takes me neatly on to the point that I was trying to get to. Is the argument that, rather than have a cap or an arrangement that takes into account international aviation, we should take into account aviation as a whole? If the overall objective is to reduce or control aviation emissions, should we consider how to reduce aviation use where there is a feasible alternative? That approach could permit more international aviation where there is no alternative. Should we consider that policy issue?

**Gordon Dewar:** I believe fundamentally in consumer choice. I would have no difficulty if the Government wanted to invest in a high-speed rail link. That is long overdue and it would be a great asset for the country to pursue. People will then vote with their feet and their wallets—that is important. At present, it does not cost the Government any money at all to have the aviation industry providing links to London or anywhere else, because all the money is private. However, high-speed rail will have a significant cost. As well as the infrastructure cost of any new high-speed rail links, in most cases rail franchises receive a significant on-going subsidy for running costs. That is a decision for the politicians. There is not an either/or situation—it is important that people have a choice. I am reminded that there are still six flights a day between Brussels and Amsterdam, which are less than 100 miles apart and which have one of the best high-speed rail links in Europe. People want choice and the different modes offer different levels of service.

16:15

**Dr Bows:** If we had the right cap for climate change, the trading scheme would be all that we would need. While we do not—and I do not envisage us having the right cap for some years, although maybe it is different in Scotland—we have to consider suites of policy measures, particularly for sectors that already have a large proportion of emissions or sectors whose emissions are likely to grow significantly in the future. That would send the right signals.

In a set of interviews that I did about four years ago, manufacturers in the airlines told me that,
other than fuel efficiency—and the price of fuel was low at the time—there was no added incentive from anywhere to drive up fuel efficiency and look at alternative fuels. That situation has changed because of current fuel prices, but we need additional buttons to press to send the right signals.

**The Convener:** Gordon Dewar said clearly that people should continue to have a choice, even if there are high-speed rail alternatives at some point in the future. He also said that he expects the aviation industry to grow. We all understand that such growth will not necessarily be matched by efficiency improvements, so the conclusion is that aviation emissions will continue to grow rather than reduce. How much slack should the rest of the economy take for aviation growth?

**Gordon Dewar:** That should be decided through emission trading. Regardless of the conversation about whether the cap is set at the right level now or should be tightened or about what it will be in the future, it is sensible to leave it to the emission trading scheme so that people can value the cost of emissions, factor that into investments and use the money that they receive from trading to invest further in their ability to improve the overall emissions level. If we presume that we can concentrate on one set of emissions rather than another, we will penalise a sector unnecessarily and might create unforeseen outcomes. More important, we will not offer the best incentives to people to invest where we can make overall emissions reductions.

**The Convener:** Surely that same criticism applies if there is no focus on reducing emissions in one sector—if aviation does not have to make urgent changes—and we just expect every other sector of the economy to be penalised.

**Gordon Dewar:** But growth will not happen except within the overall cap. If aviation cannot buy its share of what it thinks it needs or wants, it will not be able to grow—that is the point of the cap under the emission trading scheme. Therefore, growth can happen only if the trading scheme is effective.

**Alison McInnes:** In its written submission, the Chamber of Shipping highlighted the difficulties that it foresees in measuring accurately Scotland’s share of international emissions and Robert Ashdown has spoken about that today. The chamber also said in its submission that including international shipping in the bill could be a retrograde step that might hinder international negotiations on emissions reduction in the sector. What are the chamber’s concerns on those issues?

**Robert Ashdown:** Broadly speaking, there are two ways to measure emissions from ships: they can be measured on physical activity or on economic activity. Depending on which way Scotland chose to measure its emissions, that measure could be in conflict with the proposals from the IMO. I am not sure about the interrelationship between the Scottish and English Governments, but the line that the UK Government takes within the IMO might be curtailed by decisions that you take in Scotland.

**Alison McInnes:** Are you aware of any contact between the Scottish Government and the IMO on the matter?

**Robert Ashdown:** The IMO is made up of nation states, so only the UK has a seat and, of course, shipping is not a devolved matter.

**Alison McInnes:** No, but clearly shipping is being considered in the bill, so I wondered whether there had been any discussion about it.

Official national atmospheric emissions inventory figures have now been published that allocate emissions from shipping to Scotland, based on the Department for Transport port movement data. How robust are those data?

**Robert Ashdown:** I doubt that they are robust at all. We have several ways of measuring emissions from shipping but, unfortunately, they are all inaccurate. It is an exceedingly difficult sector to measure because unlike aviation, ships can carry enormous quantities of fuel; they do not need to refuel every time they touch a port. A ship can come into a Scottish port and then disappear; it might take on no bunkers or 100 per cent of bunkers. It depends entirely on its voyage patterns and the bunker capacity of the ship.

**Alison McInnes:** I note from your joint letter with WWF to the Committee on Climate Change that “the two organisations … have committed to working together … to assist the UK government to quickly develop a methodology for measuring the carbon emissions from ships”.

What progress have you made on that?

**Robert Ashdown:** It is very early days. The Climate Change Act 2008 came into force only in December last year. We acknowledge the Committee on Climate Change’s recommendation for the Government to take account of international shipping emissions, for measurement purposes only—that is key. We fully endorse that position. We need to be able to measure the industry to set an accurate baseline, so that we can make reductions in line with targets and achieve a position under the level of the cap. I do not disagree with any of that philosophy.

The question arises how to measure that. We have teamed up with WWF to deliver quickly the most robust and accurate measurement that we
can, so that the UK Government has a handle on what shipping's share is. However, what does that actually mean? Are we talking about UK-flagged ships, ships that operate in UK territorial waters or the UK's contribution to international shipping emissions? To a large extent, the volume of shipping measures world trade—the plot lines are broadly parallel going up the graph—so perhaps we could do something as simple as taking Britain's share of global GDP and declaring that we are responsible for that share of international shipping emissions. There are a number of ways of doing that. We think that the economic measurement is the most appropriate way.

We are meeting representatives of the Office of Climate Change on 3 March to discuss further the letter that I have appended to our written submission, and we very much hope that, with work from our three organisations, the Office of Climate Change will be able to make a firm recommendation in its report in September.

Gordon Wilmsmeier: I completely agree with Rob Ashdown. The issue is difficult, and we should probably be measuring the trade flows. Different ships are used, and it is hardly possible to get data on what ship a container might have used on the five legs of its journey to Scotland. Ship details and technical data on ships could be obtained from the IMO, but freight data would need to be linked to the ship that delivered the goods to the Scottish port. If we consider things from a Scotland-only perspective, a lot of cargo is brought into ports in the south of England and then moved north by truck or train. You should not just consider the shipping aspects; you need to examine the whole transport chain. There is scope to reduce CO₂ emissions through increasing the length of the maritime leg of the whole voyage. That might be of benefit—it could contribute to a reduction in carbon emissions—but just taking the shipping leg into account is not sufficient.

Alison McInnes: You said earlier that we have weak policy levers to influence what happens in shipping, which I understand. What can the Scottish Government do to assist the shipping industry to reduce its emissions, including those caused by ships in harbours?

Robert Ashdown: A lot of the focus today has been on caps, trading and so on. The important thing in the longer-term carbon debate is to lock in carbon savings. That means infrastructure. If we want to move to electrically powered, fuel cell ships, they will need to be able to plug in to recharge in ports.

At the moment, we are running at about 98 per cent of port capacity, which is a dangerously high level. That causes a lot of congestion. Ships might arrive and have to wait for a week, burning fuel, because they need to provide their own power in fairways. If we had greater port capacity and better port infrastructure in this country, we would save a lot of carbon emissions. If the hinterland infrastructure for lorries bringing goods into and out of ports was improved, we would reduce the carbon burn of the lorries that provide co-modality.

Governments can act positively in a number of areas to reduce overall carbon emissions from the shipping industry.

Gordon Wilmsmeier: One thing that is relatively easy is cold ironing, which is when ships use the electricity supply on the quay so that they do not use their engines while they are in port. If the energy generation is right, there is a reduction not only in CO₂ emissions but in NOₓ and SO₂ emissions, which act very locally.

The United Kingdom has a specific port operation scheme. The trust ports have not been the most positive in their approach, because they have not really contributed to port development. The UK has some of the least developed ports in Europe, because the trust ports have not made the right decisions—they sometimes find housing more attractive than port development. That is an important issue, because it means that maritime interests are not developed, and therefore ports are not attractive for some shipping services.

This is the Scottish climate change bill, and ferries are a Scottish issue. The ferries that operate in Scotland are old. They have served their time and should be replaced. That is an issue on which the Scottish Government can act directly by strengthening technological change.

Shirley-Anne Somerville: The evidence from the Chamber of Shipping states:

"Any reductions in ships' carbon emissions must therefore be achieved in a way that permits growth in the volume of goods shipped by sea."

How can that be achieved in the timescale that the scientists tell us is necessary to stop climate change?

Robert Ashdown: In three words: market-based instruments. The growth of the industry is the result of the growth in global population and world trade. As I have said before, shipping is a service industry. We mirror global trade, and we know that our emissions will grow—they are likely to grow more quickly than technological innovations will enable us to decrease them. We recognise that we may have to invest in other sectors so that they can make the carbon reductions that we cannot make until we reach that step change in technology.

Shirley-Anne Somerville: I was about to ask you about the changes in technology and energy efficiency. Will you describe the successes to date and give us a rough idea of what is achievable in the next 10 or 20 years?
Robert Ashdown: Without wishing to sound facetious, it all depends on what you call an existing ship. If you call an existing ship a ship that is 15 or 20 years old, it might be possible to make a 30 or 40 per cent reduction by using a brand new ship from the yard. If you call an existing ship a ship such as the high-end, high-spec Queen Mary II, which was launched last year, if you threw absolutely everything at that ship, and cost and passenger comfort were not an issue, you might make a 5 per cent saving. Technological savings can be made, but they are increasingly hard to achieve.

We cannot address the carbon issue in a vacuum. A number of years ago, we had very good hull coatings based on TBT—tributyltin oxide—paint, which harmed marine life. Quite rightly, such hull coatings were banned, but the efficiency of ships decreased. Similarly, there is the issue of addressing air pollution resulting from oxides of nitrogen and sulphur—NO\textsubscript{x} and SO\textsubscript{2}. If you look at the curve of ships’ carbon emissions between 1912, when the first oil-burning ship was launched, and 2005, there was a steady reduction. That has now flattened, because the trade-off for cleaner NO\textsubscript{x} emissions is increased carbon emissions. We are perpetually trying to juggle all of those issues to deliver net environmental benefit. Unfortunately, we are constrained in what we can do to deliver clean carbon technologies, because we have other factors to consider.

Gordon Wilmsmeier: Sails have been used successfully on container ships crossing the Atlantic. Such good examples should be strengthened. However, from a Scottish perspective, that requires an industry that can innovate. You need research to support such innovation. Scotland could contribute by investing in research and innovation.

Shirley-Anne Somerville: You said that shipping requires a global deal, in order to overcome the problem of double counting. However, could this Scottish bill be world leading, if it includes international aviation—pause—and shipping? When we get to Copenhagen and are considering a global deal, we could be leading, and the bill could play a part in shaping the deal. We should not wait; we should take the initiative and lead the rest of the world.

16:30

Robert Ashdown: As I said before, the issue is not desirability or ambition but practicality. You have to ask yourselves how policies would be implemented. The bill is about Scotland taking legal responsibility for carbon emissions, but you wish to take legal responsibility for something that you simply cannot control. If you impose reductions on United Kingdom ships, those ships will simply not go to Scottish ports. A great deal of north European traffic heads through northern Scottish waters, but if you try to take responsibility for emissions from those ships, you will find that, because of the rights bestowed by the United Nations Convention on the Law of the Sea and the rights of free passage, you can do absolutely nothing to restrict their movements. I hope that our written evidence explained the situation more clearly than I am doing now, but it is extremely difficult for any nation state or any regional body to regulate the international shipping industry.

Shirley-Anne Somerville: Let us leave aside the issue of regulation and consider simply the measurement of emissions for inclusion within Scottish targets. Should such measurement be included in the bill, to ensure that the picture is holistic? The industry could then get behind the bill and help to ensure that Copenhagen results in positive changes.

Robert Ashdown: You might briefly have been out of the room when I said that my comments were solely about reduction targets for international shipping. As long as the administrative burden is not completely horrific, measurement should be possible, although it would be complicated. Committee members will have seen the letter to the Office of Climate Change in which we address those issues. However, measurement would be possible. The real difficulty would arise only if you imposed reduction targets on international shipping. For reduction targets to be meaningful, they will have to bite; if they bite, they will have a commercial impact and cost; and if that is the case, operators, as commercial businesses, will legitimately seek to avoid those costs where they can.

Measurement provisions can, of course, be included. Indeed, the Climate Change Committee recommended that UK climate change legislation should include them. If you wished to do the same thing in the Scottish bill, you would have to ensure that you did not double count under the UK legislation, but that would be a positive move and the Chamber of Shipping would seek to work with you. If you established a climate change committee north of the border, we would seek to work with it to define the most accurate and robust measure that we can.

Shirley-Anne Somerville: My apologies for missing part of your evidence earlier—I had to attend another committee briefly—but I am back now.

Gordon Wilmsmeier: I would like to answer the question and to underline Robert Ashdown’s points. Measurement is extremely important. We cannot consider one mode, because we have to consider modal shift. Only if we measure modal shift can we see whether we have actually...
achieved anything. You cannot leave something out and not measure it. There is no point in saying that you have reduced shipping if you do not measure whether movements are now taking place by air or by truck. You need to measure all transport modes.

You will not be able to impose legislation on certain things, but you should look on your own doorstep, as I said earlier. I know that I keep hitting on the same point, but ferries and coastal shipping are on your doorstep. They are what you can influence, and they are what you should focus on. That is where you have legal powers to change things and to drive innovation. For example, you can have influence over and drive innovation in ports. You can offer incentives and advice on carbon emissions at international shipping level, and you can measure those emissions, but it will be important for you to show leadership in what is happening in Scotland, so that you can say that you have tried this and this, have put this and this in place, have renewed your coastal shipping fleet and your ferry fleet, and have improved your ports, equipping them with up-to-date technology. That can be achieved independently of others.

Cathy Peattie: I would like to pursue the issue of measurement. When responding to my colleagues, you seemed to accept that measuring emissions, especially around the coast, is important, but I do not understand why there is a commitment to measure emissions if there are no targets. If there are no targets, how can we monitor what is happening?

Robert Ashdown: Our answer was predicated on the fact that you cannot change behaviour purely by measuring emissions. We argue that any change of behaviour would be negative: ships would simply stop coming to Scottish ports and go to English ports, and the cost of goods would be driven up. However, measurement is important, so that Scotland knows what its responsibilities are. If the trajectory curve already includes some measurement of shipping, it will not come as such a great surprise if and when—in three or four years' time—the IMO or the European Union imposes a climate change scheme on shipping. That is why we think that measurement is beneficial but we draw the line at reduction targets.

Cathy Peattie: If the other European countries got involved in measuring and setting targets, surely there would be an advantage to Scotland in having led the way?

Robert Ashdown: I am not aware of any other European countries that are taking unilateral action in that fashion, primarily because they are equally convinced of the arguments for global or, as a second-best step, regional legislation. I cannot see what advantage would accrue to Scotland from setting targets that will almost undoubtedly be subject to international bargaining once the issue reaches more international forums.

Cathy Peattie: So setting targets for emissions would be bad for Scotland.

Robert Ashdown: The ports represent a significant amount of the Scottish economy and provide a significant number of Scottish jobs. Anything that harmed their commercial competitiveness would be bad for the Scottish economy.

Cathy Peattie: Ministers have a policy commitment to aim for 3 per cent year-on-year emissions cuts. How well placed is the international shipping sector to deliver such cuts, even if they are not included in global targets? You have probably answered the question by indicating that there is a lack of commitment to deliver cuts, but I am still interested in hearing your views.

Gordon Wilmsmeier: To tell you the truth, the question is difficult to answer. Let me put it this way—the consumer can contribute to reducing emissions from shipping. If you stop buying kiwi fruit from New Zealand and buy it from Italy, you contribute to CO₂ reduction, because the goods are not moved a long distance. It comes down to what consumers use. If they go back to using locally and regionally produced food, CO₂ emissions will be reduced. If people continue to eat strawberries from the Canary Islands or from Chile, it will have a huge CO₂ impact. However, eating Scottish salmon instead of Chilean salmon, even though it is a little more expensive, has a positive impact on CO₂ emissions. It may be a good idea to address the issue through the shipping industry, but consumers need to be aware of the CO₂ emissions that they produce as a result of their consumption.

Cathy Peattie: Are you saying that the shipping industry is not really responsible for CO₂ emissions, and that they are an issue for someone else?

Gordon Wilmsmeier: It is responsible in so far as it can achieve technological efficiency, but the demand for shipping is generated by us.

Cathy Peattie: I know what you are saying.

Robert Ashdown: The Chamber of Shipping recognises fully that we, along with all other sectors, have a responsibility to reduce our carbon emissions in line with societal expectations, and we do not shy away from that. We are keen to deliver carbon reductions in an efficient and robust manner, so that we can deliver real carbon savings. As we said earlier, this is not a zero-sum game. By getting it wrong and penalising shipping—which is the most efficient form of
transport—we might drive carbon emissions up. We must be careful how we approach the issue and ensure that we put the right policies in place.

I disagree slightly with Gordon Wilmsmeier, because, unfortunately, it does not help to buy goods locally. The food miles argument was debunked a couple of years ago. Lamb that is imported from New Zealand has a lower carbon impact than lamb that is grown in Wales, because shipping is so efficient and the farming in New Zealand is much less carbon intensive. The sums just do not add up. The same goes for tomatoes that are grown in poly tunnels. Tomatoes that are grown in Spain over the winter and shipped here are less carbon intensive than tomatoes that are grown in heated poly tunnels in the UK. The argument for local produce reducing carbon emissions is a complete non sequitur.

The Convener: I hope that you agree that the statement that you have made is not absolute. You say that local production does not reduce carbon emissions in every circumstance, but it is inappropriate to say that it never does. Do you agree that, if potatoes are grown in 10 different countries, they might as well be grown within those countries, rather than be whirled around the world a few times before they are consumed?

Robert Ashdown: I am sure that there are one or two instances in which local produce is more carbon efficient.

The Convener: Yes, I am sure that there are one or two.

A moment ago, you said that the shipping industry takes its commitment and obligation to reduce its emissions seriously. However, five or 10 minutes ago, you said that it is important that we allow for the possibility that shipping emissions will increase. Which is it to be?

Robert Ashdown: Both.

The Convener: The level of emissions will go up and down at the same time?

Robert Ashdown: No. The increase will be at the global fleet level; the decrease will be on a per-ship basis.

The Convener: I see. So you have an obligation to reduce the emissions per ship but no obligation to reduce emissions overall.

Robert Ashdown: We would like to see a cap on global shipping emissions, but shipping must be allowed to trade above that cap; otherwise, you will constrain the world economy.

The Convener: My final question, before I hand over to Des McNulty, is to both Gordon Dewar and Robert Ashdown. Your two sectors are telling us that their contribution to the economy is so important that their emissions must be allowed to grow in absolute terms. Food and housing are essential to life, and health services are essential to the economy. If every sector of the economy came here and told us that it understood that climate change is real, that it is human induced and that it threatens human survival, but that their sector was too important to be included within an ambitious timetable for emissions reduction, we would not have a chance, would we?

Gordon Dewar: I do not think that there is any conflict between what I am saying and what you are saying. We are saying that, according to current forecasts, we will increase our usage of the allowable cap, but that will happen only if other sectors reduce their usage and we can buy their share of it. If others, in all sectors, do not reduce their usage, we will not be able to buy their share and we will not be able to grow. We are saying that, within an efficient trading scheme, there should be the opportunity for that growth. However, no sector can be certain of that growth, because it relies on an overall reduction in other sectors.

The Convener: That still implies that, in an efficient trading system that we might have at some point in the future, every other sector of the economy will have to shrink dramatically in order to allow your two sectors to continue to increase their emissions.

Gordon Dewar: And they will do that only if they get a better return from their emissions trading than from the alternatives. Again, it is all predicated on there being more efficient ways of reducing carbon emissions than putting individual caps on sectors such as aviation and shipping.

The Convener: We note that it is heavily based on that assumption.

Des McNulty: I have one final question for the shipping representatives. We have heard that there is an EU emission trading scheme for aviation, which provides a preferred framework for aviation. Should there be a shipping equivalent, or should shipping be included in the EU ETS?

Robert Ashdown: I am glad that you asked that, because it highlights clearly the difficulties of trying to regulate this global industry at anything other than a global level. The European Parliament tasked the European Commission with including shipping in the EU ETS in 1997, but the Commission has not done that, because it understands fully that, although imposing legislation on aviation at a regional level is very difficult, doing so on shipping is twice as difficult. For 10 years, the Commission has urged and pressed the IMO to take action for it in that regard, because global regulation is much more effective and has a much bigger impact on global carbon reductions. So shipping is not in the EU ETS, but
that is changing. The Commission has indicated that it is losing patience with the IMO and has said that, unless the IMO comes up with a robust scheme by the end of 2010, the Commission will look to include shipping in the EU ETS by 2013. That is very much a second step, but if we cannot achieve the A1 approach, A2 sometimes has to do.

16:45

Des McNulty: On that A2 approach, and leaving aside the global versus regional issue, is the aviation mechanism appropriate for shipping?

Robert Ashdown: No. The specifics would be different.

Des McNulty: How would they be different?

Robert Ashdown: The issue of free allocation is trickier for ships. The aviation industry has tried to work with the World Trade Organization on policy levers and on a series of bilateral negotiations with countries that have flights to the EU. It is not possible to do something similar for shipping, because a ship may make five or six port calls in different countries, so arrangements for shipping would have to be different. Because ships might not buy bunker fuels, that aspect would be different, too. Further, with the prospect of hubs being established outside Europe, for example in north Africa, any EU ETS for shipping would have to ensure that it did not create an incentive for such hubs to grow because, technically, they would require only short final journeys from north Africa into the EU, rather than journeys from, say, Asia into the EU. A range of areas therefore require specific policy mechanisms to ensure that carbon leakage does not occur.

Gordon Wilmsmeier: I agree. If an EU ETS makes sense, it will have to be related to the freight flow from origin to destination. A good example of shipping finding its way around regional regulation arises from the United States cabotage law that does not allow ships sailing under flags other than the US flag to carry cargo along the US coast. The port of the Bahamas has grown a great deal because of that. It is on the doorstep of the US, so containers are brought to the Bahamas to be picked up for the last leg to the US on US-flagged ships.

So hub strategies are important, and a global approach is needed. It is important to bring within the global scope countries such as Panama and Liberia that flag ships but have not signed many agreements. The question is how we get such countries to accept our concerns about CO₂ emissions and get them on board.

The Convener: Are there any final questions for the panel? Do the witnesses want to make any final points that have not been raised in questioning?

Robert Ashdown: We recognise the problems and we want to do more. We are working hard to deliver a global open-trading scheme that can work for the international shipping industry and take account of countries that have not signed up to international schemes. We think that it is possible to do that, but it is proving challenging. However, we are committed to working towards that aim with the Scottish Government, the United Kingdom Government, Europe and the IMO.

Gordon Wilmsmeier: We would like to see a Scottish perspective on local shipping and an incentive for that in the bill, because it has been left out so far.

The Convener: That is a useful observation. Thank you for your time in answering questions. We will suspend briefly for a comfort break and a changeover of witnesses.

16:49

Meeting suspended.

16:54

On resuming—

The Convener: I welcome panel three. I apologise to the witnesses because we are running a wee bit late and the committee’s numbers are a bit depleted, but we hope that we can explore the issues in depth with you. I welcome Paul Tetlaw, the chair of Transform Scotland; Jeff Gazzard, co-ordinator of the GreenSkies campaign; and John Lauder, national director for Scotland at Sustrans.

I invite you to say some brief introductory words and give us your initial view of the bill from a transport perspective.

John Lauder (Sustrans): Sustrans is a charity that campaigns on sustainable transport, particularly active travel. We work closely with the Scottish Government to deliver projects throughout Scotland.

Our initial view of the bill is that we are pleased that it has been produced and with the target, but we were a little bit surprised that walking and cycling, which are forms of active travel, are seen as only small measures. We think that they could be significant in helping to reduce carbon emissions. We do not think that the bill emphasises transport as much as it could. Perhaps we can explore that.

Paul Tetlaw (Transform Scotland): We, too, welcome the bill and the ambition in Scotland for Scotland to be a leader in tackling climate change.
We have made only four recommendations to enhance the bill.

First, the bill must set annual emissions reduction targets of at least 3 per cent from 2010.

Secondly, the bill should include international shipping and aviation. I listened to the evidence that the committee has just heard on that, and would like to comment on it.

Thirdly, the bill should establish a duty on all public bodies to reduce emissions in line with the national targets. We certainly do not believe that it is right that politicians at a national level should shoulder all the responsibility. Things cannot be done in that way. There needs to be a cascade.

Fourthly, the bill should include mechanisms for enforcing emissions reduction targets. I have a water industry background, so I am familiar with all the improvements in water quality and waste water quality that have been brought about over the years. Those improvements have been helped by firm regulation and the work of enforcement bodies such as the Scottish Environment Protection Agency and the drinking water inspectorate. I am familiar with how the processes have worked.

As I said, I listened to the evidence that has already been given. I have a “Blue Peter” homemade model with me that shows where we are now with emissions and where we need to get to by 2050 with an 80 per cent reduction. The strategic transport projects review tells us that emissions from road transport in Scotland will increase by 10 per cent to 2022. I am afraid that if we listen to the special pleadings from certain sectors in transport and there is business as usual, all of our emissions and more will be taken up by transport alone. Therefore, emissions in every other area of society will have to be sacrificed so that there can be business as usual in transport. That is clearly untenable.

The Convener: Thank you very much. I am sure that we will explore in our questions issues to do with the targets and how different sectors will perform.

Jeff Gazzard (GreenSkies): The Aviation Environment Federation, which is a very small body—there are four of us—is the only non-governmental organisation anywhere in the world that works exclusively on aviation. We are proud of that.

I am not the kind of guy who often uses the word “innovative”, but I would say that the bill is innovative and ambitious. I was amazed to hear that BAA was not able to say how much it makes from car parking. I will let you know about that.

We have had a good look at the bill and tried to put aviation in a Scottish context. There is a Scotland, UK and European Union hierarchy when it comes to such issues. We have come up with just four brief recommendations, which are contained in our paper. I will not bore members by explaining them.

There are complicated issues to do with the science of climate change and radiative forcing and equally complex policy issues, such as the design and content of the European emissions trading scheme and the inclusion of aviation in that, but the simple fact that we want to bring to your attention is that Scotland needs to know what its aviation emissions are before it can even begin to get a grip on them.

Facts and figures and our four recommendations are encapsulated in our comments on the bill. It is important that the step of introducing the bill has been taken. We look forward to answering members’ questions.

The Convener: The UK Committee on Climate Change, which is not as pessimistic as Paul Tetlaw—or perhaps it is—estimates that the surface transport modes throughout the UK could reduce CO\textsubscript{2} emissions by between 5 million tonnes and 32 million tonnes. Do you endorse those figures? Why is the range so broad?

17:00

John Lauder: The variety of possible figures is really interesting. Before I came to the meeting, I looked at some estimates that the Department for Transport has made for the UK. It has estimated that if every large town and city in the UK ran an individualised travel marketing programme—essentially a soft measure like the travelsmart programme that Sustrans runs, in which we sit down with households, assess their transport needs and consider how to reduce their individual car trips by walking, cycling and taking public transport—14.2 million tonnes of carbon emissions could be saved by 2015. That figure is for the UK. We could make a wild estimate and say that, at 10 per cent of that, Scotland could save 1.42 million tonnes. However, we will not do that; we will go with what the DFT said. In light of that, it seems to me that 32 million tonnes might be conservative.

I think that Scotland is aiming at a reduction of 14.02 million tonnes. That suggests to me that leaving walking and cycling as peripheral issues—saying that they are small things that we might or might not do once in a while if the weather is nice—rather than bringing them into the bill and really investing in them means that we are missing a big opportunity to make a fairly easy emissions reduction by using programmes that are already well established, well researched and up and running in various places.
The Convener: Are there any other views on the projected reductions?

Paul Tetlaw: The range is interestingly wide and not terribly ambitious. As I tried to illustrate with my crude “Blue Peter” model, it is unacceptable for transport not to play its part, which it has not been doing. It has been going in the wrong direction: between 1990 and 2006, transport emissions rose by more than 14 per cent in Scotland, whereas overall emissions fell by 12.3 per cent, which means that non-transport emissions fell by much more. All other sectors are contributing, but transport is not.

There is no single simple measure. The range of figures that you gave indicates that a series of different measures needs to be used for transport to contribute. John Lauder spoke well about what walking and cycling can do. We need a huge change in our planning and land-use policies. Cascading responsibility to local authorities will focus their minds on ensuring that the housing developments that they construct and allow to be constructed in future reduce people’s need to travel rather than increase it, as many have done in the past. Modal shift to more sustainable and more efficient modes of transport—such as rail and bus—is also important.

The breadth of the figures illustrates the range of initiatives that need to be taken. We have no choice but to take them. We owe it to future generations—our children and grandchildren—to do that. We must get away from the idea that taking those measures will be difficult and punishing, because people will welcome many of them. They will welcome living in much more sustainable communities in which they do not have to travel so far because facilities are closer at hand.

I also share John Lauder’s view that the targets are not terribly ambitious.

The Convener: The question largely concerned surface-based transport. Does Jeff Gazzard have anything to add?

Jeff Gazzard: The debate is framed by policy measures that, as my two colleagues said, stem from basic mathematics. If we cannot agree on the figures, how will we ever agree about the policy measures? This is not algebraic logarithmic equations or mathematics meeting physics; it is simple addition and percentages, which even I can do.

Once again, we have set out figures for aviation in Scotland. We have taken apart the DFT’s forecasting and shown how it has lost millions of tonnes of CO\textsubscript{2}. We have tried to put that in a Scottish context, and our second recommendation measures all that. There cannot be a wide range; we have to agree on the current scale of Scottish emissions and be realistic about what they might be in 2020, 2030, 2040 and 2050, and that will give us a set of figures.

We are very good at special pleading, too. I have a small anecdote, if you will bear with me for one minute. I recently met a lot of environmental colleagues who are based in Brussels. One of our sister organisations there does not have enough passes, so it is, in effect, us. They were discussing whether lobbyists should be registered, and saying that industry lobbyists should be registered. I said that we should all be registered too because we are all industry lobbyists, but we are just a different industry. That put the cat among the pigeons, I can tell you.

There is special pleading on all sides, but my special pleading is to say that we should forget the policy issues and our children and the future, because we know all about that; we need to know about the mathematics of climate change. The bill’s target is 14.02 million tonnes of CO\textsubscript{2} equivalent by 2050. You cannot fit all that in; you have to make some tough choices, but you have to understand the maths of where the sectors contribute. It could be the cement manufacturers or the power generators, or the wide range of non-governmental organisations. Honestly, if there is one thing that my 17 years of working on this has shown me, it is that we have to do the maths. If you cannot understand the maths, you might as well go home and not bother.

The Convener: I have another question about walking and cycling in particular. John Lauder expressed some surprise—or disappointment—that the bill does not do more on active travel. I can take it as read that you think that there is scope for legislation to achieve more active travel. How should it be achieved? Should there be targets for public transport or active travel? Would it be more appropriate to think of mechanisms to create financial incentives as other witnesses have argued, to ensure that people have clearer reasons for making those different choices?

John Lauder: Both of those ideas could be applied. We could learn something from other northern European countries. The Scandinavian countries have already done a lot of the work that I think we should start to do in Scotland. They did not set targets for modal share—Denmark, for example, did not say that it was going to have a 15 per cent modal share in 20 years’ time; rather, the Danes looked at why people do not walk and cycle and began to tackle those reasons through a range of interventions. They built paths, for example, and reallocated road space. They built that into their planning frameworks and they enforced it fairly rigorously. For example, they reduced the amount of car parking in city centres every year. They did it quietly, but they did it and they set targets for it.
The Danes also ran campaigns about soft measures to give people more of an idea of the benefits to them as citizens of walking and cycling. They showed the health and financial benefits. They also worked with businesses. They used a raft of measures, and we could learn and incorporate what they have done already.

It is dangerous to set ambitious targets straight away because we could set ourselves up to fail, but it is also important to make definite plans. The Government has started to look at individual towns and how they might have networks through the smarter choices, smarter places initiative, and that is welcome. It is applying some of what has been learned in England and on the continent, but it is doing it in a small way.

A lot of evidence for how we can go about creating the switch to modal share already exists. It is about winning hearts and minds as much as about building things. The good news on this front is that the cost benefit ratio is very good. The study that Rod Eddington did for the DFT in 2006 showed that there is a lot of benefit in investing in these soft measures and encouraging people to walk and cycle.

When I read the draft bill I was surprised that the Government did not seize on the short trips that we make, particularly by car. I am not isolating the car, but about 50 per cent of road trips by car are less than five miles. I was surprised that the Government did not seize on that in the bill and say, “Great—that’s an easy hit. Let’s make a big investment here and let’s get people walking and cycling for those short trips, which will obviously reduce carbon emissions and improve public health, which also has a big benefit in a cost benefit analysis.” I was surprised that that did not feature in the bill, because we could do what the Danes, Norwegians and Swedes have already done—give ourselves an easy hit straight away.

**The Convener:** Did those countries take a legislative approach that needs to be taken in the bill, or are you asking for a more strategic approach and a change to Government transport strategy?

**John Lauder:** A change in strategy at all levels of government is required—it is required at national level but it must be cascaded down.

Scotland already has the legislation. For example, when you read Scottish planning policy 17, you would think that everyone in Scotland is walking or cycling for short trips. The legislation is in place, but it seems to drop through the cracks and we do not enforce it. I think that it is about taking a strategic approach.

**The Convener:** I put the same question to Paul Tetlaw: given the aspiration that everyone, across the political spectrum, is signing up to, does there need to be a clearer emphasis on emissions reduction in the Government’s transport strategy?

**Paul Tetlaw:** Yes. To build on what John Lauder said, there needs to be a national framework. Whether it is part of the STPR or national planning framework 2 does not matter; nationally, we must set a framework that states that this is where we are going with policy and cascades that down to local authorities. We have examined the matter quite closely and our understanding is that the other countries to which John Lauder refers—the Scandinavian countries and so on—set a national framework; it was part of a national plan that all parties would buy into over the long term. Emissions reduction is not a contentious issue like road pricing and so on; I cannot see that people would get upset about it—people would welcome it. We need a framework to drive it forward. At a national level we must grasp the bull by the horns, and whether it is part of NPF 2 or STPR does not really matter.

I will also respond to the question that you asked John Lauder about other measures. It is clear that over the years the cost of public transport—buses and trains—has gone up in real terms, while the cost of motoring, and indeed flying, has come down. It is not tenable, if we want to achieve the modal shift that I think we all recognise we need to achieve, to allow that gap to continue to widen. Although I accept that it is a more difficult issue to tackle, we have to tackle demand management on the roads and other forms of surface transport. Most cars are driven about with only one person in them—the driver—at peak times, whereas other modes of transport, such as buses and trains, are full and people stand on them. That is an inefficient use of our infrastructure and we have the wrong price signals. Whether it is done through the pricing mechanism or high-occupancy vehicle lanes does not really matter, but we must start to shift the balance and it must be done nationally.

**The Convener:** I will bring in other members; I am sure that other points can be built into other questions.

**Shirley-Anne Somerville:** I ask you all for your thoughts on the 2050 target and the interim target. How ambitious are they? Would you like to see any changes?

**John Lauder:** We are perfectly happy with the target, although we would be happier if it included aviation and shipping. The important thing is the interim target, on which we feel we could make some progress quite quickly.

17:15

**Shirley-Anne Somerville:** Would you like the interim target to be changed?
John Lauder: No, we are happy with it.

Paul Tetlaw: In my written submission, I mentioned a 3 per cent annual emission reduction target, which would allow for better interim targets along the way. As long as we have that target in place, we will hit a trajectory. There are a lot of graphs flying around in the WWF Scotland paper—I am not sure whether it has been submitted to you, but I found it very helpful in demonstrating the sort of trajectory that could be achieved with a 3 per cent target. With that target in place, we will hit the interim targets and the end point that we need to achieve. Scientists are questioning whether that end point is good enough or whether it needs to be tougher, but we have to start somewhere.

Jeff Gazzard: There is not a problem with realising that the target should include aviation and shipping emissions—however imperfect some of the measurement systems might be, they still exist. Bunker fuels are reported only as memo items in an arcane situation in which both aviation and shipping emissions are dealt with by their respective trade bodies. The organisations are trade bodies, despite the fact that they have the initials "UN" in front of their names—the fact that the IMO and the United Nations International Civil Aviation Organisation are dealing with the issue is akin to having the drug companies run the World Health Organization. That is not a throwaway line.

Once again, this is about mathematics—that is my theme for the day. The interim targets and the reduction percentages, and the target of 14.02 million tonnes by 2050 are fine. We came across the background paper on the bill, “Technical Note: Climate Change (Scotland) Bill: Greenhouse gas (GHG) Emissions, Annual Reductions and Targets”, which includes aviation and shipping emissions in its 1990 starting point. Logic tells me, therefore, that those should be included at every step along the way. What to do about it is a different kettle of fish, but that is a pretty good document, and the figures should be included.

On the question of bunker fuels in aviation, an old colleague of ours, Peter Lockley—who left to work for WWF—is the sole non-governmental organisation representative at the IMO. I will ask him to send you a couple of pages about shipping emissions, so that you are fully informed on that, because there are things that can be done.

Shirley-Anne Somerville: We will come to international aviation and shipping later—I will ask some further questions on the targets. Paul Tetlaw has given his view already, but I ask the other witnesses for their views on the annual targets.

The policy memorandum states:

"Prior to 2020, the Scottish Ministers will be expected to set annual targets which build towards delivering emissions reductions of at least 3% each year."

How well placed is Scotland's transport system to meet that ambition? Are you happy with the targets in the policy memorandum? Perhaps John Lauder would like to start.

John Lauder: It would be great to have 3 per cent per year. As to how well placed transport is to deliver that, in the immediate aftermath of the strategic transport projects review I struggle to see how transport will manage to make those cuts. There is heavy investment in road transport, which accounts for 95 per cent of all transport emissions, and which—as Paul Tetlaw said—will only grow. I do not think that it can be done—transport cannot reduce its emissions if there is such an investment in petrol-based and oil-based travel.

Shirley-Anne Somerville: I am sorry—I should have asked how you think transport is placed to achieve the emissions reductions that you hope for in an annual target.

Paul Tetlaw: Are you asking about internal surface-based transport within Scotland?

Shirley-Anne Somerville: We will start with that.

Paul Tetlaw: It is not well placed—the strategic transport projects review projects that emissions from road transport will increase by 10 per cent to 2022, which is not a good starting point.

The idea of a long-term transport plan is good and many aspects of the strategic transport projects review are good and welcome. The methodology is good and I welcome all the work on rail electrification. However, of the long list of 29 projects in the review, some need to be prioritised and developed earlier, whereas some are untenable in the context of the discussion that we are having—alternatives to them need to be considered. Without a priority list in the review document, we are in difficulty.

Shirley-Anne Somerville: Does aviation have any chance of contributing to a reduction in emissions in the short term?

Jeff Gazzard: No—it just does not. We have only to look at the figures to see that. My head spun when I analysed the scale of what Scotland's aviation emissions could be. Members might not believe me, but the Department for Transport's UK-wide figures, from which Scotland's figures come, lost millions of tonnes of CO₂ when they were recast between 2006 and 2007. That is a big issue.

We heard from Alice Bows and—a little grudgingly—from Mr Dewar that growth overtakes technology. There is no doubt that the aircraft that are being delivered now—the Boeing 787 and the Airbus A380—are a technological tour de force, but a Boeing 787's fuel capacity, one tankload, is equivalent to 1.2 million miles of motoring. Such
aircraft are not environmentally benign. They are more efficient and represent tremendous technology, but growth outpaces the best technological improvement rates. The growth rate is 3 to 4 per cent, whereas the best technological improvement rate is 1 to 2 per cent, so the problem continues.

**Shirley-Anne Somerville:** Regardless of the type of transport, does Scotland have the skill base to move to a low-carbon transport system and take advantage of the opportunities that will arise when we change our transport systems?

**Paul Tetlaw:** Absolutely. Why not? Scotland has a great history of innovation. I have no reason to believe that Scotland does not have people who can be equally successful in the new era by innovating in the required ways. We heard a lot from earlier witnesses about the importance of the economy. If Scotland developed appropriate technologies and took a lead, that could be a great boost to the economy. Others would come here to benefit from that, which would have an economic value.

May I comment on aviation?

**Shirley-Anne Somerville:** Certainly.

**Paul Tetlaw:** I heard what you heard—what I describe as special pleading about the fundamental importance to the Scottish economy of aviation, which means that it cannot possibly contribute to achieving the targets, but there are many types of aviation. People have talked about rail travel replacing air travel. There are a huge number of internal flights. Most people accept the argument for rail travel—I know that the business sector accepts it because I am a member of a group of which the Confederation of British Industry Scotland and the chambers of commerce are also members, and it is heavily promoting high-speed rail links to the south. I am sure that business understands that an alternative will have to be presented and that internal aviation will not continue at existing levels. That is one area in which aviation emissions could be reduced.

I do not question essential business journeys by air, but I question the value of some other air journeys. For example, a good friend of mine—I will not say the name—went to Spain last weekend for a hen weekend that lasted four days. I am sure that the committee does not want to know the details, but far too much alcohol was consumed and I do not think that the group did any good to the reputation of Scotland or England—English people were also there. The people returned very much the worse for wear and I do not think that they were productive at work for a couple of days after returning. I am sure that members are all familiar with such trips. I question whether they are essential to the economy—in fact, they damage the economy and Scotland’s reputation. Much flying is for such purposes.

**Shirley-Anne Somerville:** I will pick up on your comments about leisure travel. How could the Government and Parliament change that behaviour and tell people that they cannot go on holiday?

**Paul Tetlaw:** Pricing mechanisms are the simple answer. The only reason why that hen party went on that trip was because it was so cheap to fly to Spain for the weekend. Jeff Gazzard can tell you much more than I can about air travel and whether it pays the true price of its impact on the environment. However, I think that pricing mechanisms could soon change the situation and prices will rise due to oil scarcity, if not through other means. The vision of ever-expanding airports and ever-growing numbers of air passengers is a fantasy.

**John Lauder:** You asked about the skills base. As Paul Tetlaw said, the skills base is definitely there. It is interesting to note that many of the big consulting engineering firms are interested in active travel and see it as a growth area. They are very imaginative and come up with great ideas all the time.

There is a lot of good legislation out there anyway. Before I came here today, I conducted a little test to see what was available and I found that, over the past six years, there has been a lot of good legislation, good reports and good recommendations, and there is more to come this year. There is no shortage of good ideas. What is lacking is governmental effort to bring it all together and fund it adequately.

**Shirley-Anne Somerville:** I am sorry to go on about leisure travel, but I represent the Lothians, and Edinburgh bases much of its tourism on short breaks. People might be worried that we are trying to stop them travelling, which would discourage people from coming here, as well. How do we deal with those concerns, which are based on the contribution that tourism—including the leisure weekends that you think are inappropriate—makes to the capital and other parts of Scotland?

**Jeff Gazzard:** I am not sure that you can sit here and say that such trips are appropriate. In a way, they are a bit of an easy target. The fact is that the website of the Scottish Government’s version of the UK Government’s act on CO2 campaign gives advice on how people can cut their CO2 emissions. It advises people to holiday at home, avoid flying, use videoconferencing, take the train and so on. The Scottish Government’s advice differs slightly from the UK Government’s campaign in that it suggests that people should buy offsets if they fly, whereas the UK Government says, basically, “You can buy offsets.
as a last resort, but they do not make much difference.”

Over the past few years, we have offshored much of our basic service industry. However, in the past 25 years, we have offshored our personal tourism. I do not want to stop people travelling or even—if they think it is really necessary—going to Malaga for a hen night. However, as Paul Tetlaw said, people only do that because it is cheap to do so. If they paid the cost of the environmental damage that their journey causes, they would not do it—they would do their vomiting in an alley off the Royal Mile instead.

Shirley-Anne Somerville: Unfortunately.

Jeff Gazzard: Indeed. However, your Government tells people to holiday at home. I love coming to Scotland, because it is one of the few places where I get on with my colleagues—you can understand why. I think it is great that I can get to Scotland by train. Scotland is a nation in Europe and people like Scotland. People like fiercely independent countries. Get out there and talk to other European nations about your policy. Appoint a Scottish climate change ambassador—I do not care who you choose; perhaps Al Gore might discover that he has long-forgotten Scottish links. There is a lot that you can do to adapt your policy and sell it to other people in a way that enables you to work with them.

17:30

The Convener: Cathy Peattie would like to ask a quick supplementary, and so would I.

Cathy Peattie: I will not go into the visit to Spain.

Jeff Gazzard talked about the Scottish Government’s website and the wisdom there. I agree with that, but I suggest that people who go to Spain—in fact, most people who get short flights to wherever—have not read that advice, which might seem to them like something that somebody else should do, or something that does not affect them. I speak to people who say, “That’s a daft idea. What are you involved in climate change for?” As you can imagine, they use worse words than “daft”. How do we get beyond that? We can offer good advice on all sorts of things, but how do we get people to take it?

Jeff Gazzard: It is a question of compulsion, regulation, exhortation and education. One of the most fantastic things that I have seen happening recently is walking buses, where kids walk to school as a group. That comes up every couple of years. A car manufacturer usually gives them fluorescent jerseys and stuff like that.

My colleagues on the panel are the experts on the easy, cheap hits in relation to public transport and personal responsibility. I work at the other end, which is expensive. I consider what we need to do in high-tech demand management. You have a broad spectrum of witnesses, and none of us does the work for the sake of our health.

I have worked in marketing and advertising for most of my commercial career—or, as my mum so delicately puts it, since the last time I had a proper job. It is possible to develop communication campaigns that grab people’s imagination and shift their views—I will e-mail links to a couple of examples. However, once again, hitting people through the web, Scottish newspapers, Scottish television and the Government’s own information campaigns is very cost effective per head of the population. It is cheap to do. I will be the climate change ambassador. I do not mind.

The Convener: I will follow that up with a quick question for Paul Tetlaw. You said that you are part of a group that promotes high-speed rail and that the CBI, the chambers of commerce and so on are involved and signed up to that agenda. To what extent do those business voices see the business case for bringing some of the tourism and leisure industries back to Scotland so that we benefit from them here, rather than our facilitating the continual offshoring of those industries?

Paul Tetlaw: I have not had that conversation with them, so on that basis I cannot comment, but I am sure that they understand, as we do, that it would be beneficial if the amount of money that goes out of the country was turned around and spent here instead.

The Convener: Whether people spent the money on colourful hen nights or drunken weekends in Edinburgh or on something that is more benign, they would be spending that money in Scotland.

Paul Tetlaw: There is also a huge market just south of the border. At the moment, many people tend to go the other way. It would help if we could get a volume of them coming our way. I observe that there are a lot of English people in Edinburgh at the moment, and have been throughout the winter. I think a lot of them have come by train because the rail companies are marketing their services quite heavily. There is a big market to aim for there.

John Lauder: My comment is almost an anecdote. Every year, we run a conference for school travel co-ordinators, and in the past two years the best speakers were 17-year-olds. Those two sixth-year pupils from different schools absolutely understood the position. Their view was, “Of course I’m going to go abroad with my pals. I know that cheap flying is going to end pretty soon.”
Sustrans has been working in schools for a few years now. I am not saying that it is because of us, but the curriculum is informing the kids. My view is that the public know far more than the politicians who agonise about the matter think. The public know that cheap flying is coming to an end.

Shirley-Anne Somerville: One of the witnesses mentioned the Government technical note that is attached to the bill. What do the witnesses think about the emission tracks that the Government suggests? Do you think that the emission changes are being made quickly enough?

John Lauder: Are you asking whether the emissions targets are being made quickly enough?

Shirley-Anne Somerville: Are we seeing the trajectory go down as quickly as you would like? Would you like to see cuts being made earlier?

John Lauder: Yes. We want to see action.

Shirley-Anne Somerville: You surprise me. What changes would you like to see?

John Lauder: As Paul Tetlaw said, we cannot beat the Government, because everyone has a responsibility. I have been trying to work out how targets will filter down. Paul Tetlaw also mentioned local government. I cannot see how the targets will filter down to local government through, for example, the single outcome agreements. We completely support those agreements; they are working on the ground in some instances, but not universally. I am sorry if I have gone off the topic of the question, but you pretty much knew the answer I was going to give.

Shirley-Anne Somerville: It is nice to have it on the record.

John Lauder: It is more about how the targets will filter down. The way the framework has been set up means that it is not just about the Government setting targets. It is setting indicators and outcomes, but it is up to local authorities to reach agreement with the Government through the single outcome agreements. It is about how 3 per cent year-on-year cuts in carbon can be negotiated on that basis.

Paul Tetlaw: The less we do now, the more we will leave to be done in the future and the worse we make it for the future. You have probably heard that it is all about the area under the curve. The sooner we start the better. It is easier to start now, because there are lots of soft targets—everything we have been talking about that is not that difficult to shift.

In transport and travel terms, we are doing a lot of the wrong things. If we just gave better signals to people and produced better legislation, people would shift quite quickly to doing the right things. We really should start now—hence our request to the committee that a 3 per cent annual target should come in straight away.

Jeff Gazzard: I echo that.

I have a quick comment to make about targets and what to do about flying. If the aviation industry can deliver only 1 to 2 per cent improvements a year, that is its growth. Demand could be managed down through taxation at 5.4p per passenger kilometre, to be introduced over three to five years. About three years ago, we had access to the Department for Transport’s passenger allocation model and HM Treasury’s gross domestic product model—we did not break in; they let us have the information. If you put such taxes on tickets, you will halve the rate of growth. Industries world wide would kill for a guaranteed 1 to 2 per cent growth rate a year. That would give you the chance to stabilise emissions. If you are dealing in percentages, you would say, “Here are the policies. Here’s how to take CO₂ out. Here’s the structure that underpins the bill.” You have a top-down approach—most of the people who have given evidence today are in the middle or somewhere near the bottom, but the absolutely right thing to do is to start at the top. The point that Cathy Peattie made is absolutely right: you have to educate people. You could almost go around and knock on everybody’s door—members could take 10 people each at the weekend. I think that the target of 14.02 million tonnes is achievable by 2050. The trajectories are fine. Scotland, in the political sense, is taking all this very seriously, which is good news.

Shirley-Anne Somerville: Should the bill have sectoral emissions targets for transport?

Paul Tetlaw: Yes, it should.

Shirley-Anne Somerville: That was nice and easy.

Paul Tetlaw: If it does not, there will be special pleading around transport and we will not be able to do anything about it. That would just not be realistic.

John Lauder: I agree with Paul Tetlaw. My concern is that the view could be taken that, in order to grow the economy, we must drive a cart and horses through any targets that we set for transport—that transport must be taken out of those targets. I feel that that is what we heard from the previous witnesses. That goes right to the root of what we measure and what we regard as economic growth. However, I do not want to open up that debate this afternoon.

The Convener: Somebody had to make a joke about driving a horse and cart at some point.

Jeff Gazzard: It is always the Greens.
What you are doing is clever and sophisticated in terms of policy development—all credit to the UK Government and the Scottish Executive. It is a top-down approach that sets out where you want to go. Afterwards, you can have all the arguments, discussions and differences of opinion about what we need to do and how we can get there. Usually, we have all those discussions first, which go nowhere because we are discussing them without a target. That is why the bill is fundamental. We have a road map—a much-abused term—and a trajectory, some figures and some mathematics. We can have the arguments later. Yes, it is difficult. There are educational issues and some people will be intractable—mostly those who float on oceans and fly through the air.

I am a deeply sardonic and pessimistic person—I am not always this happy—but I love it when reasonable questions are asked by reasonable people and reasonable answers are given. That was not what I heard from the previous witnesses—apart from Alice Bows, who is lovely.

Shirley-Anne Somerville: I have a final question on targets. Do you have an opinion on the measurement and reporting of emissions that are generated anywhere as a result of goods and services that are used in Scotland?

Paul Tetlaw: Yes, I do—if I have understood your question correctly.

Shirley-Anne Somerville: It is about overall consumption and the Scottish economy.

Paul Tetlaw: It should be in terms of where it is produced, as well. One reason why our emissions have gone down over the years, while transport emissions have continued to go up, is that we have exported our manufacturing industry. Let us not kid ourselves that we have done anything other than that. It is naïve to believe that we can continue to allow China or whoever else to take the hit for those emissions when they are produced in the manufacture of products that we import. It is only a matter of time before it is accepted that each country must take responsibility for the products that it imports. That will change the whole picture for shipping and so on, because there will not be the same volume of shipping around the world. Once a carbon budget has been created for a country’s own goods, market forces will intervene and people will realise that it makes much more sense to produce those goods at home than to transport them halfway around the world.

I take issue with what one of the earlier witnesses said. He said that it is predominantly more carbon efficient to transport goods around the world. I just do not believe that. Produce that is grown locally in season surely must be better. As for heating tomatoes in polythene tunnels in Kent or wherever, there are all sorts of waste-heat schemes that could be used for that. Instead of being lost, that heat could be used to grow local produce. Therefore, I simply disagree with what I heard about that.

Shirley-Anne Somerville: I think I disagree, as well.

John Lauder: Quite a bit of work could be done to measure the costs and benefits of reducing carbon emissions. We regularly try to sell our ideas to the public, but that is a lot easier to do when we can produce facts and figures that people can understand. Where we struggle at the moment is in measurement and monitoring. The Government could invest in that research to help us to understand the benefits to individuals of reducing carbon emissions. We struggle for figures on that.

The Convener: Aviation and shipping—particularly aviation—tend to get singled out for attention in the climate change agenda, sometimes by me but also by high-profile direct action activists and by a number of people who have debated the UK bill. The previous panel of witnesses might argue that the aviation sector should be allowed to continue to increase its emissions. The flip side of that is to ask why we should single it out for special attention.

17:45

Jeff Gazzard: Simply because it is kerosene all the way.

I agreed with Mr Dewar on one point. He said that by 2050 aviation emissions are likely to be about 5 per cent of the global total, but that is under the scenario of complete carbon business as usual in the IPCC’s “Special Report on Emissions Scenarios”—the relevant graph, in colour, happens to be in our submission. It indicates emissions of 2.5 billion tonnes by 2050, which is an awful lot of carbon given that the total figure is supposed to be between 10 and 20 gigatonnes.

In the UK, we are fortunate to have had a focus on air travel simply because we are a fairly air travel-intensive country. We use a lot of low-cost air travel and have had major airport developments since 1995, such as the second runway at Manchester, so the issue has been flavour of the month. As members know, I run an European alliance. If you speak to people about the new Athens airport, people linked to Charles de Gaulle airport or our NGO colleagues, such as the Sierra Club, the Natural Resources Defense Council and the Environmental Defense Fund in the United States, you find that everyone is concerned about the issue. That is why aviation is emphasised.
In a way, aviation is an easy target, as many people fly and make the connection between their business and leisure trips and what comes out of the engines of the planes that they use—it is a no-brainer. We lobby effectively but we cannot generate stories: the media will print only things that are of interest. The Environmental Audit Committee of the Westminster Parliament and the Transport, Infrastructure and Climate Change Committee of the Scottish Parliament seek facts only about issues that stick out to them like a sore thumb. That is the problem.

We are told that other industries can reduce their emissions, but aviation is more or less kerosene dependent: as emissions from elsewhere come down, its emissions go up. The figures that we have produced for Scotland seem to intersect. That is why the issue gets the attention that it deserves. However, we have a carbon-intensive lifestyle and, if the truth be told, issues such as coal and road transport are just as important as aviation. We must pay rigorous attention to them all.

The Convener: Would you like to respond to the argument that we heard from the previous panel of witnesses, who claimed that aviation’s contribution to the economy is such that it is legitimate to argue that, within an efficient and tightly-capped trading system, it can be allowed to continue to grow, with the rest of the economy taking up the slack?

Jeff Gazzard: The contribution of aviation to GDP is important. Historically, aviation has grown at about twice the rate of GDP. It facilitates the movement of people and certain goods around the world, and the further it goes the more efficient it is. We cannot turn the clock back, but aviation does not pay its costs. If it did, we reckon that we could stabilise emissions at today’s level.

In late December, the Parliamentary Office of Science and Technology at Westminster produced a stunning report—which I will send to the committee—that took apart the DFT’s cost benefit analysis for expanding Heathrow. The way that climate change impacts, economic benefits and job creation ratios are calculated is phenomenal. It is estimated that 1,000 jobs—direct, indirect and induced—are created at the airport and off site per million passengers. If you are Mr Dewar, you employ a car park attendant at Edinburgh and a paper boy is created in Aberdeen. If the ratios were accurate, we would be housing aircraft workers on the dark side of the moon, because that would be the only space left.

The volume of work that is always quoted by the industry and the DFT is a report by Oxford Economic Forecasting Ltd. We have taken that apart in a report by our consultants, CE Delft, who are pretty well respected. I am conscious of the time, so I will send the committee a short note on those findings. Aviation contributes to the economy and is worth having, but only at the rate that we suggest, because it does not pay its external costs. If we were to factor into the cost of air travel some of the social costs of carbon identified in the Stern report, we would probably not fly at all, although I am not suggesting that.

The DFT, in all its financial meanderings to justify the expansion of air transport, assumes a very low cost of carbon based on the amazing assumption that we have hit our 2050 targets. That is what it says—if you are stunned at that, so am I. The DFT assumes that its policies will work and it will hit its target, so we need only a low cost of carbon. I kid you not.

The Convener: You have mentioned some of the aviation emissions figures, and in a previous meeting the committee discussed the national atmospheric emissions inventory as a source for those figures. How robust is that source of emissions data?

Jeff Gazzard: It is as robust as you will get. As we say on page 3 of our written submission, the latest NAEI figure is that there were 1.122 million tonnes of CO₂ emissions from international flights from Scotland in 2006. That is not so far from the 2005 DFT figure for all domestic and international flights, which was 1.5 million tonnes.

These things can be forecast and measured reasonably accurately, although two or three years ago the DFT suddenly decided that there will be no growth in aviation in the UK beyond 2030. I find that amazing, because there will be growth everywhere else in the world. That allows the DFT to get rid of those tonnes of CO₂. Does that answer your question?

The Convener: Yes.

Jeff Gazzard: Forecasts from the DFT, the Civil Aviation Authority and the NAEI are about as good as you will get, but Scotland needs to conduct a study into what its own figures are now and what they will be in future.

The Convener: That is useful, thank you.

I have one more question for the whole panel on international credits as a means of reaching or purporting to reach domestic emissions reduction targets. The Scottish Government does not intend to prescribe a limit on the use of international credits for that purpose. Are there any views on whether a limit is desirable?

Jeff Gazzard: There should be a limit. The UK Government is establishing a limit—I have picked my words very carefully—and so, I believe, is the EU within its 2 degrees policy.

Incidentally, it is our clear understanding from the environment commissioner Stavros Dimas that
the EU 2 degrees policy of which Scotland is, in effect, a subset will include aviation and shipping emissions in its targets.

All international credits should be limited.

The Convener: Would you support a proposal for an 80:20 split, for example, so that no more than 20 per cent of the domestic target should be reached through those measures?

Jeff Gazzard: I think that that is a lot, but it is about as good as you will get, and it is fair enough. We have spent the past five years working on having aviation included in the ETS because it was the only policy option open to us. Do not believe that we are fans of emissions trading as a concept to save the planet.

The Convener: Are there any other views on international credits?

Paul Tetlaw: I support the 20 per cent figure that has been proposed. A limit is needed.

Cathy Peattie: I want to consider the role of advisory functions, reporting duties, public organisations and so on. What advantages or disadvantages do you see in the UK Committee on Climate Change providing advice to the Scottish ministers?

Paul Tetlaw: There is probably a short-term advantage in that the UKCCC has been created and is up and running, but in the longer term it would be better to have a body that is appropriate to and for Scotland.

John Lauder: I agree completely.

Cathy Peattie: That was my next question. Is the idea of a Scottish commission on climate change positive and helpful in the longer term? In a sense, that is what you have just said.

Paul Tetlaw: Yes, it is because it will take account of particularly Scottish circumstances.

Jeff Gazzard: The UKCCC has been very clever because it has rigorously distanced itself from NGOs, industry and special interest groups in its initial 18-month period. The committee has, in the immortal phrase, formed its own views, which was a smart thing to do. Scotland should have an equivalent commission, but it would need to work closely with the UKCCC. The way that it writes its reports and what it says seems okay to me.

Cathy Peattie: So some kind of relationship between the two organisations and parallel working would make sense so that they did not go in different directions.

Jeff Gazzard: Yes. As I said, Scotland may have only 5.1 million people, but you are very important. The Executive and the Parliament do a cracking job; every time I have been here, I have been impressed. We are in Europe and you are part of the UK. At all those pinch points, there are policies and institutions that you need to engage with pretty quickly and thoroughly.

Cathy Peattie: Is the reporting mechanism in the bill robust enough? If not, how can it be improved? Will the bill deliver flexible adaptation options for the transport sector?

Paul Tetlaw: I mentioned the water industry as an example of a sector in which regulation is clearly in the hands of particular bodies. One of our recommendations is that simply reporting on progress is not sufficient and that we need enforcement to ensure that we achieve the targets we set ourselves. Most of my career was in the water industry. We have brought about tremendous improvements in drinking water and waste water quality as a result of clear legislation and bodies that are tasked with enforcing it. The Scottish Environment Protection Agency, which deals with waste water, and the drinking water quality regulator for Scotland have worked successfully with the industry, and society has benefited.

John Lauder: We need to ensure that we have the right mix of people and that they have sufficient enforcement powers and independence.

Cathy Peattie: I am interested in hearing more about the benefit of placing a duty on local authorities to tackle climate change and to report annually on their transport emissions, as well as on their other work on climate change.

John Lauder: That is vital. The point that I explored earlier was whether the single outcome agreement framework will allow local authorities to opt out or change their approach. Some local authorities are already enthusiastic, but others are not. The idea of enforcement seems to go against the idea of single outcome agreements, and it will be interesting to see how targets are enforced—if they can be.

Cathy Peattie: Local authorities have public duties in issues such as equality and biodiversity.

John Lauder: Yes—a public duty is required.

Jeff Gazzard: I have a small point on that. The situation here is analogous with that in the US if we view local authorities as states—we have the good, the bad and the ugly. As we discussed, there are good local councils that can be green beacons and can be encouraged. We should start where we know we will get successes, whatever they may be, to provide a model. Just off the top of my head, we could have town twinning for carbon reduction measures. We have had a lot of input on air transport issues in the US, and we have worked with local authorities and regional bodies such as the air quality management group for the
north-east states. In such groups, there are environmental protection officers, councillors, people from education authorities and others who can take many of the actions that have been mentioned. We need to consider what local authorities can do. On whether the approach should be voluntary or advisory, I suggest advisory. That is a good way forward.

**Paul Tetlaw:** The point is wider—public bodies generally should have a responsibility—but local authorities are key, given the activities that go on in their areas. I referred to the importance of land use planning and the type of developments that we permit in future. A duty would focus the minds of local authorities on the type of developments that they allow in their areas.

Let us be honest: there has been competition between local authorities as regards where people live and what type of housing is allowed, which has led to longer-distance commuting. Local authorities must have a mechanism that makes them think about the implications of allowing housing developments to go ahead. They need to realise that allowing a housing development to proceed might lead to much more transport activity, which would mean that transport activity in another area would have to be cut if there was a target to meet. Having such a mechanism would focus the minds of local authorities.

18:00

**Cathy Peattie:** For many of the past 20 years, if not longer, I found that, although everyone thought that equality was an extremely good idea, only one officer or department had the responsibility for dealing with it. The creation of a public sector duty on equalities has meant that statutory organisations have had to take on the responsibility across the board. Do you not think that imposing a climate change duty would help us to get away from the idea that one department is wonderful and another is awful and that one council is good whereas another is awful? Such a duty would not be prescriptive but would work across councils.

**Jeff Gazzard:** That is a good point. For example, all local authorities are big users of travel. In the final few weeks before Ken Livingstone lost the mayoral election, the Greater London Authority put through a policy on air travel whereby, if a journey in Europe takes up to eight hours from door to door, it must be made by rail. Flying within the UK is not allowed—videoconferencing must be used.

Our organisation also has a travel policy, because we have international advocacy responsibilities. We have cut our flights, and I have made train journeys that are among some of the most convoluted in the history of the railways. Getting to Verona from Manchester by train is not easy, but that is how we must do things.

Bodies such as HM Revenue and Customs say on their websites that their staff will not fly around the UK but use videoconferencing. Even Phil Woolas, one of our middle-ranking environment ministers, did not fly to Australia; he held a videoconference instead. That must become the norm, and public sector institutions are the places in which to implement such policies.

**The Convener:** As there are no further questions for the panel, I ask the witnesses whether there are any outstanding issues that they intended to raise with the committee but which did not come up during questioning.

**Jeff Gazzard:** The Scottish Executive should have some policies on whether to use air travel when travelling around the UK. Some of the Scottish islands are a bit peripheral, and I will not argue against the public service obligations that are in place. There are PSOs for Polish politicians to fly from Warsaw to Strasbourg, which does not represent a good use of air travel, but I accept that the air services to the Scottish islands are vital. They should be a little more expensive than they are, but PSOs have a role to play in peripherality.

A final point on peripherality is that I do not buy the argument that Scotland is very peripheral in Europe, especially if one goes to the other end of Europe and sees how peripheral the countries there are.

**The Convener:** I appreciate your point about the island links. If Rob Gibson had been at today’s meeting, I am sure that that issue would have come up earlier.

Does John Lauder have anything to add?

**John Lauder:** This might sound like special pleading, but it definitely is not. I would like the committee to take account of paragraph 8.1 of the consultation document, which classes walking or cycling instead of using the car as a small change. A big opportunity is being missed: the issue should be mentioned in the bill, just as forestry—which has its own section—is.

**The Convener:** Thank you very much. I appreciate the time that you have spent with us. I know that our meeting has overrun quite badly, and I put on record my appreciation to the staff who have supported us in continuing the meeting so late. I thank everyone for their time.

*Meeting closed at 18:04.*
Introduction

This paper provides background information from the Association of Train Operating Companies (ATOC) for the Committee’s scrutiny of the Climate Change (Scotland) Bill. It highlights the contribution rail can make to some of the policy issues that arise from the Bill, in particular the potential for reduction of energy consumption and emissions in transport. We are scheduled to give oral evidence to the Committee on 10 February and will be happy to provide further written information following this if the Committee would find this helpful.

We would emphasise the important role rail can play in reducing carbon emissions from transport:

- Rail has a substantially lower carbon footprint (CO₂ per passenger kilometre) than car or domestic air rail and has reduced this by 25% in the last ten years. Modal shift to rail from more carbon intensive modes can reduce total transport emissions.
- Train operators are committed to further reductions in rail's carbon footprint and are implementing a range of initiatives designed to reduce energy consumption and associated CO₂ emissions;
- Further electrification offers the opportunity for further reductions in emissions from rail and, in the long term, to provide a very low carbon form of travel. This is particularly important since road and air will continue to rely heavily on petroleum-based fuels for many years and reductions in the carbon intensity of these fuels will be much more difficult to achieve.

Given its increasing environmental advantages, the best thing the railway can do to support Scotland’s carbon reduction targets is to carry a greater share of national passenger travel and freight movement. Train operators will attract passengers onto the railway where capacity exists to do so. We therefore strongly support the recent and current investment in rail capacity being made.

Background

Rail's environmental performance

Recent work undertaken by ATOC has confirmed rail’s continuing carbon advantage over competing modes. The figures below are for Great Britain:

- On a per passenger kilometre basis, rail emits approximately half the CO₂ of car travel and a quarter that of domestic air.
- Rail has reduced its carbon footprint (CO₂ per passenger kilometre) faster than other modes – by 5% in the last year and by 25% over the last decade. In comparison, cars have seen a 9% reduction over the last ten years while UK domestic air has worsened, increasing by 11%.
- Rail can carry additional passengers with minimal carbon impact by filing spare capacity and extending train length. In the long term we believe rail can provide additional capacity at a very low carbon penalty.

The rail industry is actively taking steps to reduce its carbon footprint still further. A programme of initiatives is in hand including:

- The roll-out of regenerative braking, where electrical energy generated under braking is returned back to the grid;
- ‘Eco-driving’ (using the optimum power to maintain the schedule);
- On-train metering, which will enable much improved energy management and;
- Re-engining of High Speed Diesel Trains with improved fuel consumption and quieter engines.

Background Note by the Association of Train Operating Companies (ATOC)

Introduction

This paper provides background information from the Association of Train Operating Companies (ATOC) for the Committee’s scrutiny of the Climate Change (Scotland) Bill. It highlights the contribution rail can make to some of the policy issues that arise from the Bill, in particular the potential for reduction of energy consumption and emissions in transport. We are scheduled to give oral evidence to the Committee on 10 February and will be happy to provide further written information following this if the Committee would find this helpful.

We would emphasise the important role rail can play in reducing carbon emissions from transport:

- Rail has a substantially lower carbon footprint (CO₂ per passenger kilometre) than car or domestic air rail and has reduced this by 25% in the last ten years. Modal shift to rail from more carbon intensive modes can reduce total transport emissions.
- Train operators are committed to further reductions in rail’s carbon footprint and are implementing a range of initiatives designed to reduce energy consumption and associated CO₂ emissions;
- Further electrification offers the opportunity for further reductions in emissions from rail and, in the long term, to provide a very low carbon form of travel. This is particularly important since road and air will continue to rely heavily on petroleum-based fuels for many years and reductions in the carbon intensity of these fuels will be much more difficult to achieve.

Given its increasing environmental advantages, the best thing the railway can do to support Scotland’s carbon reduction targets is to carry a greater share of national passenger travel and freight movement. Train operators will attract passengers onto the railway where capacity exists to do so. We therefore strongly support the recent and current investment in rail capacity being made.

Background

Rail's environmental performance

Recent work undertaken by ATOC has confirmed rail’s continuing carbon advantage over competing modes. The figures below are for Great Britain:

- On a per passenger kilometre basis, rail emits approximately half the CO₂ of car travel and a quarter that of domestic air.
- Rail has reduced its carbon footprint (CO₂ per passenger kilometre) faster than other modes – by 5% in the last year and by 25% over the last decade. In comparison, cars have seen a 9% reduction over the last ten years while UK domestic air has worsened, increasing by 11%.
- Rail can carry additional passengers with minimal carbon impact by filing spare capacity and extending train length. In the long term we believe rail can provide additional capacity at a very low carbon penalty.

The rail industry is actively taking steps to reduce its carbon footprint still further. A programme of initiatives is in hand including:

- The roll-out of regenerative braking, where electrical energy generated under braking is returned back to the grid;
- ‘Eco-driving’ (using the optimum power to maintain the schedule);
- On-train metering, which will enable much improved energy management and;
- Re-engining of High Speed Diesel Trains with improved fuel consumption and quieter engines.
Modal shift

Given rail’s relative carbon advantage there is a significant opportunity to tackle carbon emissions from transport within Scotland through modal shift from road to rail. Road transport emissions currently comprise approximately 17% of Scottish CO₂ emissions – the second largest source after power station emissions. CO₂ emissions from road transport in Scotland have grown by over 11% since 1990 despite total CO₂ emissions falling by 7% over the same period. Similarly, emissions from domestic flights originating in Scotland have more than doubled since 1990.7

Modal shift from road and air to rail, where practicable, can therefore help to reduce (or limit the growth in) overall carbon emissions from transport in Scotland.

Improving capacity/integration

As regards existing service provision, rail currently delivers a number of critical services in Scotland:

- Supporting significant flows in the Central Belt, particularly between Edinburgh and Glasgow;
- Providing a key role for commuters in Strathclyde with a dense electrified network and a key role in commuting to Edinburgh, particularly from Fife
- Providing fast links to London well as connections to other major cities such as Birmingham, Manchester, Newcastle and Liverpool and;
- Providing important social links to rural communities in South West Scotland and the Highlands.

The Scotland Route Utilisation Strategy, published in March 2007 by Network Rail, forecasts that Scottish rail demand would grow by 3% pa and freight by 10% by 2016.

High speed rail

Modern electric high speed trains provide a fast, comfortable and very energy efficient alternative to domestic aviation. ATOC analysis indicates that, on a per seat km basis, short haul jet aviation is around 4-5 times more carbon intensive than electric high speed rail (using the current UK generation mix). In the longer term, as the electricity supply is progressively decarbonised, electric high speed rail’s carbon performance could be expected to improve rapidly. High speed rail is therefore a very attractive alternative to existing domestic air services and further airport capacity expansion. Significant modal shift from air to rail could make an important contribution to reducing emissions from this market.

Summary and recommendations

Rail has a demonstrable – and improving – carbon advantage over competing modes. Modal shift to rail, particularly from road, is a key mechanism for reducing overall carbon emissions from transport. In light of this, the single most important role rail can play in reducing carbon emissions is to carry a greater share of travel demand, both passenger and freight.

In closing, we also underline the following points:

- Rail’s significant carbon advantage over other modes should be fully reflected in any strategies developed to meet the targets set out in the Climate Change (Scotland) Bill;
- Electrification brings the potential for sourcing power from very low carbon supplies. This will widen rail’s carbon advantage over both road and air which will continue to rely on carbon-intensive, petroleum-based fuels for some time to come;
- There is potential for electric high speed rail to reduce overall CO₂ emissions with mode transfer from domestic air traffic movements.

7 NAEI Greenhouse Gas Inventory data for Scotland (1990-2006).
Background

BAA Scotland welcomes this opportunity to contribute to the Transport, Infrastructure and Climate Change Committee’s consideration of the Climate Change (Scotland) Bill. As the owner and operator of Scotland’s three largest airports – Aberdeen, Edinburgh and Glasgow, BAA Scotland plays a critical role in connecting Scotland with the world. Collectively, our airports handle more than 20 million passengers a year and serve more than 150 destinations, spread across 28 countries. As a country on the North West periphery of Europe, Scotland’s economy depends on a successful aviation industry to compete successfully in global markets. Many of the industries on which our economy depends, including tourism, financial services and the oil and gas sector, rely on the free movement of goods, people and ideas. This is why a competitive and successful aviation industry is so important to Scotland.

Our airports also act as major economic generators for the cities they serve and for Scotland as a whole. The respected Fraser of Allander Institute carried out an independent economic impact analysis of the three Scottish airports and found that collectively, the airports employ 10,000 people, support tens of thousands more jobs across Scotland and contribute nearly £1.5 billion a year to the Scottish economy.

Strengthening Scotland’s international connectivity through increased direct air links has been a key focus for BAA Scotland. We have reduced our airline landing charges in real terms at each of our three Scottish airports every year, year on year, for the last 15 years. We have also administered the BAA Scotland route development fund, which has invested an additional £130 million in new international routes through a package of discounted landing charges and direct marketing support.

This hard work has paid off with world class carriers like Emirates, Virgin Atlantic, US Airways, Continental and Delta coming to Scotland. European carriers, including bmi, easyJet and Ryanair have also expanded their operation at our airports to the benefit of passengers and the wider Scottish economy. As a result, international passenger numbers across our three airports have grown by 36% in the last five years.

However, we are far from complacent and recognise the strong desire within Scotland to further enhance our country’s international connectivity, an aim that attracts support from across the political spectrum. To that end, we have also welcomed the decision of the Scottish Government to include the development of our airports within the draft National Planning Framework, which will help ensure our airports continue to act as fitting gateways into the country we serve. We also welcome the proactive engagement undertaken by Scottish Government with regards to airlines, particularly at international routes conferences.

Aviation’s contribution to climate change

BAA Scotland recognises that climate change presents one of the most significant challenges facing the aviation industry, both here in Scotland and throughout the world. Our starting point is simple – that aviation’s contribution to climate change is growing and we must take action now to curb emissions from flights. According to the Stern review on the economic of climate change, world-wide aviation is estimated to contribute about 1.6% of global greenhouse gas emissions. This compares to 10% for road traffic and 2.3% for rail and shipping. The Intergovernmental Panel on Climate Change central case estimate is that aviation will account for 5% of the world’s total human contribution to climate change by 2050.

There are two main areas of impact:
• aviation in the air, which has CO2 impacts and non CO2 impacts
• airport related, which can be broken down into four main areas: aircraft on the ground, energy use in airport terminals, building new infrastructure and surface transport to the airport.

Of the total emissions from aviation, around 95% of carbon dioxide emissions come from aircraft in the air. Whilst aviation’s overall contribution to global emissions is small, it is growing.
Technological advances

The aviation industry as a whole is focused on improving technology to help address the industry’s contribution to global emissions. Aircraft fuel efficiency has more than doubled in the past 40 years and the industry has set a target for a further 50% improvement for new aircraft in 2020 when compared to 2000 levels. Work is also underway to look at possible alternative fuels for aircraft, including bio-fuels and fuel cells.

Improvements to the management of airspace also have an important part to play in addressing emissions from aviation. According to the International Air Transport Association (IATA), around six million tonnes of CO2 have already been saved by shortening existing routes and BAA is pushing for a unified system of air traffic management within the EU to significantly reduce emissions within Europe. IATA estimates that a single air traffic management system for the European Union could cut aviation CO2 emissions by 12%.

In December 2008, the pan industry UK group Sustainable Aviation issued a report outlining its forecast of future CO2 emissions from UK aviation to 2050. The report concluded that technological advances, operational efficiencies and the use of low carbon fuels in the future can allow emissions from UK aviation to fall back to 2000 levels by 2050.

Emissions Trading

BAA has been at the forefront of the lobbying for aviation to be included in the European Union Emissions Trading Scheme (ETS). The ETS places a cap on the total amount of emissions that is allowed across industry as a whole. Permits are subsequently allocated to companies, which clearly set the amount they are allowed to pollute. The total number of permits is finite and no pollution is allowed above the cap. Companies can then trade permits, selling permits if they can cut their emissions below their allocation and buying them if they want to pollute above their own allocation.

This system was identified by the Stern Review as one of the most effective ways of addressing emissions and on 13th January 2009, the European Union published directive 2008/101/EC, which confirmed that aviation would be included in the EU ETS from 2012.

There are a number of clear advantages to the ETS:
• The amount of CO2 that is emitted into the atmosphere is set – in the EU all departing and arriving emissions from 2012 this will be capped at 97% of average emissions between 2004 and 2006, reducing to 95% after 2013 through to 2020. This represents a significant reduction when compared to business as usual projections
• CO2 reductions are made in the most effective way possible and at least possible cost to the economy
• Emissions trading rewards those who cut their emissions and incentivises the development of new low carbon technology
• The system can be operated internationally and avoids unilateral action by individual countries that could have the unintended consequence of harming local economies. The inclusion of aviation in the EU ETS from 2012 is an important first step in moving towards a global solution.

We welcome the strong support that has been given by the Scottish Government for the inclusion of aviation within the EU ETS. This was confirmed in paragraph 5.50 of the consultation document that accompanied the draft Climate Change Bill.

Our airports

The heating, cooling and powering of our airport terminals all requires energy that contributes to carbon dioxide emissions. Emissions from airports represent only a small fraction of aviation’s overall emissions. However, BAA Scotland recognises that our efforts to influence others within the industry to address their contribution to climate change is in part dependent on us demonstrating our own ability to reduce emissions from our buildings.

Each of our airports track and review the amount of CO2 produced in relation to energy used and each year, clear targets are set to reduce consumption against predicted levels. Energy efficiency measures are incorporated into new building design and refurbishments, ensuring
reductions in CO2 where possible. The airports will be included in the DEFRA Carbon Reduction Commitment, providing an additional incentive to cut our emissions.

The layout and operation of an airport can further influence aircraft ground emissions. By running the airports efficiently, aircraft have less requirement to run engines on the ground. As a result, our airports ensure that infrastructure is in place to reduce taxiing and queuing time for aircraft. We also promoting the use of fixed electrical ground power, which eliminates the need for more polluting generations whilst on stand.

Emissions from road traffic travelling to and from our airports are also important, both from a climate change perspective and in terms of local air quality. We have detailed surface access strategies in place at each of our three Scottish airports, which have set ambitious targets for increasing the proportion of passengers using public transport and minimising wasteful ‘empty’ car journeys.

We work closely with public transport providers, local authorities and the Scottish Government to improve access to our airports. In 2003, we introduced public transport levies at each of our Scottish airports, which places a charge on short stay car parking. This raises almost £500,000 a year to improve public transport and promote modal shift away from private car use.

We will be publishing a carbon footprint for Aberdeen, Edinburgh and Glasgow Airports in 2009, which will detail emissions sources at the airports and identify further areas for reduction.

The Scottish Climate Change Bill

BAA Scotland welcomes the publication of a Climate Change Bill that sets ambitious targets to reduce Scotland’s overall greenhouse gas emissions. We have consistently advocated a strong policy framework and welcome the Scottish Government’s commitment to create a set of clear, credible, long term targets.

We recognise the considerable debate there has been around the principle of whether to include emissions from international aviation within the scope of the Climate Change Bill and respect the strongly held views that were expressed on this during the consultation that preceded the final Bill.

However, paragraph 5.49 of the consultation document that accompanied the draft Climate Change Bill explained the difficulties associated with including emissions from international aviation within Scotland’s reduction targets.

Paragraph 5.52 of the consultation document specifically said the following:

“As methods for apportioning aviation and shipping emissions within an international framework develop and are agreed internationally, it may become possible for these emissions to be satisfactorily included in Scotland’s reductions targets and there will be scope in the Bill to include these sectors in the legislative framework at a future date.”

We respect the policy decision taken that has subsequently been taken by the Scottish Government to include emissions from aviation within the scope of the Bill. However, international agreement has yet to be reached on how to apportion emissions from international aviation. As a result, it will be important to ensure that no unilateral action is taken that either interacts badly with the EU ETS from 2012 or places the aviation industry in Scotland at a significant competitive disadvantage. Such action could risk the ongoing effort to attract new international routes into Scotland and simply shift aircraft emissions to other countries, rather than assist the important effort to tackle overall global emissions.

BAA Scotland will therefore carefully consider the specific regulations that are laid before the Scottish Parliament under Section 14 of the Bill and looks forward to engaging with the Scottish Government and the Scottish Parliament once these regulations have been published.
The Confederation of Passenger Transport (CPT) supports the requirement for action plans to improve the energy efficiency of buildings as well as measures to encourage behavioural change. Many of the ways in which public transport can aid the Scottish Government in achieving the ambitious targets for the reduction of greenhouse gas emissions were detailed in CPT’s response to the initial Climate Change Bill Consultation (Annex 1). However, the business of running Scotland’s bus and coach services extends beyond the actual rolling stock. CPT’s members are also responsible for the offices and depots they operate from and, to an extent, the behavioural attitudes towards climate change and energy efficiency expressed by staff.

One example of good practice is First Group, who are carrying out a series of initiatives to reduce energy usage from their depots, resulting in a drop in energy usage of 19% since 2004 (The 19% equates to 4,537 tonnes of carbon dioxide). This reduction has been achieved through behavioural changes, new and low cost energy reduction initiatives and investment in heating management systems.

First Group are also in the process of installing half hourly meters at all 600 locations with the energy being derived from 100% renewable sources - including on-shore wind, small scale hydro and biomass. The installation of smart meters will support the company in achieving further energy reductions in their buildings. Stagecoach has also signed a contract to source most of its electricity requirement for its UK bus operations from renewables. Energy generated from mostly small-scale hydro, as well as on-shore wind and biomass, will provide more than 70% of the company’s required supply, with the remainder coming from cleaner, low-carbon sources. Smart meters are also being installed to help cut energy use across its 240 UK sites.

Other operators are following suit by reducing energy consumption through investment in new buildings and workshops, temperature control systems and smart metering; sourcing electricity from renewables; reducing water consumption through investment in low usage/recycling devices; improving waste management by the recycling of passenger, maintenance and office waste and engaging staff in environmental management through training and development.

Public transport is rightly regarded as the greener alternative to the private car. Therefore, it would be remiss of our industry if we were not readily aware of the many ways in which an operator can reduce emissions, cut energy use and encourage behavioural change amongst staff and passengers.

Scottish Government action plans on these subjects would be welcomed to help spread these messages and to give examples of best practice to enable our members to attain the enhanced Energy Performance Certificate mentioned within the Climate Change Bill.
Question 20. Do you have any comments on the Bill?

CPT supports the Minister for Transport, Infrastructure and Climate Change, Stewart Stevenson's view that it is unfeasible to create sectoral targets as the relatively high margins for error would make it difficult to record sectoral progress in smaller sectors accurately. However, CPT has recently carried out some research that demonstrates the potential value of encouraging modal shift to achieving the Scottish Government’s 2030 and 2050 targets:

- Carbon Dioxide emissions from the surface transport sector are around 25% of the UK total. 54% of UK transport sector emissions are from cars with bus accounting for 3% and train 2% (source: Defra 2007).
- Carbon Dioxide emissions from the surface transport sector continue to rise.
- Carbon Dioxide emissions per passenger journey from buses and coaches are around one third less than those of cars.
- Around 63% of carbon dioxide emissions from cars arise from journeys of less than 25 miles which can readily be made by bus.
- Use of public transport helps reduce congestion, which in turn improves road safety and local air quality.
- Moving buses produce far less emissions than an idling bus. In fact, increasing average road speed by just a couple of km/h reduces emissions significantly while also increasing reliability and punctuality.
- If every bus in the UK took just one more car driver we could save up to 1.2 million tonnes CO2 per annum.

Public transport, by its very nature, is a greener solution. However, operators in Scotland are not resting on their laurels:

- The average fleet age in Scotland compares favourably to the rest of the UK and is decreasing further as operators gear up to run full accessible fleets by 2017.
- The introduction of the Driver’s Certificate of Professional Competence (CPC) means that all bus drivers will receive continuous professional development with training on subjects including how to drive more efficiently and economically. This includes smoother braking, slower acceleration, more efficient gear changes and less idling.
- The UK’s first bio-buses, which run on 100% biodiesel, are running in Kilmarnock.
- Scotland’s first carbon neutral bus network is in operation between Fife and Edinburgh; and,
- Hybrid vehicles will shortly be introduced in Glasgow.

Scotland is really leading the way in several of these areas. CPT welcomes the Climate Change (Scotland) Bill and hopes that the action plans and guidance that will inevitably follow will take note of the work that Scotland’s bus and coach industries are already undertaking and will consider measures to support investment in emerging transport technologies; encourage partnership working with the public sector to improve local bus infrastructure; and promote modal shift.
ANNEX 1

The Scottish Government Climate Change Bill Consultation
1-G North, Victoria Quay
Edinburgh
EH6 6QQ

Dear Sir/Madam,

Climate Change Bill Consultation

I am writing to you on behalf of the Confederation of Passenger Transport (CPT). CPT is the trade association for the bus, coach and light rail industries and in Scotland our members run over 90% of the registered bus network.

Buses can play an important role in facilitating Scotland’s renewed focus on the climate change agenda. Buses offer the best combination of energy efficiency and space consumption in urban streets. One double-deck bus can take 75 cars off the road, giving a potential annual carbon saving of 67,200kg.

The bus industry in Scotland is committed to providing a clean and efficient fleet for Scotland’s passengers and has invested over £450 million in new vehicles over the past ten years. The industry has also been quick to trial new technologies and fund research and development. In May 2006 First switched to using ultra-low sulphur diesel for its Scottish fleet of over 1,500 buses and coaches as part of its aim to minimise First’s impact on the environment. In October 2007 Stagecoach began trialling 8 bio-buses in Kilmarnock which run on 100% bio-diesel manufactured from used cooking oil and other food industry by-products, resulting in an expected 82% cut in CO2 emissions.

CPT Scotland welcomes this consultation on proposals for a Climate Change Bill and hopes that the final bill will recognise the role that the bus industry can play and will make positive steps towards tackling congestion and encouraging modal shift. The Consultation makes the point that hard policy measures, such as those reserved to the UK Government on taxation and regulation of product standards, may have more potential than softer devolved measures to reduce emissions. CPT believes the Scottish Government needs to utilise the devolved powers at its disposal effectively in policy areas such as planning, development and transport to compensate for an inability to amend reserved matters.

There are many measures that could be introduced within devolved policy areas that would make a considerable impact on Scotland’s emissions. This consultation needs to focus on what the Scottish Government can do and not dwell on what it cannot. With regards to transport, the Government can place a renewed impetus on encouraging modal shift through promotion of public transport above private car use. Consideration of public transport at the outset of planning decisions, the limitation of car parking spaces in town centres and shopping outlets and investment in park and ride schemes and enforced bus priority measures are all steps that can be taken to encourage public transport use and limit emissions generated by private car journeys and the associated congestion these journeys bring.

The consultation identifies the need for new technologies to reduce emissions. Bus manufacturers are constantly working towards providing even greener vehicles. Bus manufacture uses modern materials and construction and maintenance techniques that have much in common with aviation engineering. Work is continuing on Environmentally Enhanced Vehicles (EEVs), biofuels and hybrid technology.

As well as setting emissions targets into law, the Government should consider methods to provide funding to bus operators willing to invest in emerging technologies. As with all new technologies there is a financial risk in the form of the initial costs and the ongoing costs of maintenance. Only through the proper funding of the bus industry can the Scottish Government hope to encourage continuing research and development. However, the Government must temper their demands on the bus industry with the realisation that there is a global demand for the latest clean technologies – vehicle manufacturers are limited in the quantity of new vehicles they can provide to operators.
The consultation states that the Scottish Government is addressing the environmental impacts of transport through a package of funded measures that promote more sustainable travel. CPT feels that more can be done by Government. As well as promoting sustainable travel the Government should consider methods to discourage car use. For example, car parking charges should reflect the true impact of motoring on the environment. Rather than removing tolls the Government should be looking at increasing elements of road-charging.

The consultation states, ‘the small changes that each of us make are important. Walking, cycling and taking public transport rather than the car when we can.’ This message needs to be enforced through governmental actions and funding decisions. To encourage people to leave their cars at home the alternative modes of travel must be made as attractive and reliable as possible.

Local authorities are responsible for funding initiatives such as Statutory Quality Partnerships, Punctuality Improvement Partnerships and Bus Route Development Grant schemes. These initiatives involve local authorities working with bus operators to improve the bus services within the council area; improving reliability and tackling congestion. Such initiatives need to be encouraged to bring about further modal-shift and the associated environmental benefits.

CPT is supportive of the Scottish Government’s intent to ensure Scotland reduces its impact on the climate. CPT members are already working to improve the environmental credentials of the industry and hope the Climate Change Bill acknowledges the great importance of the transport sector and dedicates appropriate funding and attention to make Scotland’s public transport network an example of best practise for quality and reliability with minimal environmental impact.

Yours faithfully,

Paul White
Public Affairs Executive, CPT Scotland
The Chamber of Shipping is the trade association for the UK shipping industry (including deep-sea bulk, short-sea bulk, containers, ferry, cruise, offshore support and specialised operators), working to promote and protect the interests of its members both nationally and internationally. With 144 members and associate members, the Chamber represents over 860 ships of about 23 million gross tonnes and is recognised as the voice of the UK shipping industry.

Question 5: The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

Question 20: Do you have any other comments on the Bill?

Summary

In the climate change debate shipping should be regarded as the best available solution to the global need for transportation. Shipping is the most energy-efficient mode of transport and the backbone of global trade – carrying 90% of all world trade and 92% of the UK’s goods. Furthermore, the carbon cost of carrying a tonne of freight by ship is 10 times less than by road and 100 times less than by air. Seen in light of the enormous volume of goods carried by ships, the CO2 emissions from shipping is small. The reason for this is that shipping for many decades – even without regulation – has had a strong market-driven incentive to focus on reduction of fuel consumption. However the Chamber of Shipping fully acknowledges the need for further reduction of air emissions from shipping and believes that the way to achieve environmental protection must be found in a holistic manner. To be successful, such an approach should take into consideration the availability of technology to reduce emissions, the need to encourage innovation and the economics of world trade.

International shipping’s contribution to global carbon emissions

Precise figures concerning the contribution of international shipping to global carbon emissions are hard to come by. A variety of studies put the figure at anywhere between 1.5 and 5%. The International Maritime Organization (IMO) – the UN regulatory body for shipping – and most scientific commentators agree that a figure in the range 2 - 4% is realistic with an authoritative IMO study published in October 2008 putting the figure at 2.7%. While a precise figure would be helpful for measurement purposes, it is not necessary to wait for this before taking policy decisions. This is for two reasons; firstly, even at the higher end of the estimates of shipping’s contribution to carbon emissions, when seen in the context of the enormous amount of work performed, shipping remains by far the most efficient way to move bulk cargoes of goods and this position is unlikely to be usurped in the medium term. Secondly, despite its excellent carbon performance, the shipping industry is absolutely committed to reducing its carbon footprint in line with society’s expectations.

Looking at future trends (and regardless of the current economic conditions), it is likely that – in absolute terms – emissions from shipping will grow steadily for the foreseeable future despite efforts to improve the carbon performance of individual ships. This is because shipping is a service industry which responds directly to growth in world trade (without which expansion in the world economy could not occur) and that growth is likely to be greater than the achievable carbon reductions. It is worthy of note that no serious politician or government body has ever called for shipping’s carbon emissions to be reduced at the expense of slowing down the world economy. Any reductions in ships’ carbon emissions must therefore be achieved in a way that permits growth in the volume of goods shipped by sea.
Measuring Scotland’s share of international maritime emissions

Measuring Scotland’s share of international maritime emissions is extremely difficult, with almost all of the options failing to provide an accurate representation. Do we, for instance, wish to measure the relative contribution of the Scottish shipping industry (however defined) to that of the global shipping industry? Or do we wish to measure the amount of carbon generated by shipping in order to provide Scotland with the goods and services required? Or should Scotland accept responsibility for all carbon emitted by ships within its territorial waters? When considering the most appropriate methodology for allocating the share of global shipping emissions to Scotland’s Carbon Budgets, it should be remembered that shipping is the only truly international industry. Not only will ships make multiple calls in any one voyage, but they will often carry cargo destined for onward transport to a number of other countries. This makes allocating emissions extremely difficult and carries with it the distinct possibility of introducing error into the Scotland’s overall Carbon Budgets.

Measuring Scotland’s share of international carbon emissions will also be made more problematical for it is only the UK, as a nation state, which has a duty to report bunker fuels sales (even if only as a ‘memo item’) under the Kyoto agreement. Similarly, bunkers that are recorded by the UK as being used for domestic voyages would include fuel used on voyages between the constituent parts of the UK. There would therefore be a significant risk of double counting if both the UK Climate Change Act and any similar legislation in Scotland were to seek to account for the same emissions. It is not clear how this issue could be easily overcome except by utilising some broad measure of disaggregation.

When considering questions of measurement, the other side of the coin – enforcement – must also be borne in mind. The UK Climate Change Act, the Kyoto agreement and the EU Emissions Trading Scheme have all excluded mandatory carbon reductions from shipping for the same reason – it is virtually impossible to legislate for such a mobile and international industry except at the global level. For any country to impose unilateral legislation on a global marketplace is to deliberately impose additional costs on its own stakeholders which will not be shared by their competitors.

Measurement only or mandatory reductions also?

It is unclear to the Chamber what mechanisms for the enforcement of any national measures will not be capable of being easily and legitimately avoided by operators. This means that the total emissions reductions will, in practice, be less and may paradoxically be even higher if legitimate avoidance measures result in longer voyages. For instance, if Scotland were to impose a carbon charge on a ship’s final voyage into Scotland, a ship coming from China may decide to make an otherwise unnecessary call in France or Ireland in order to minimise the technical ‘final voyage’ into Scotland or, more likely, would call at an English port and move the goods across the border by another less carbon efficient transport mode such as road or rail.

If the Climate Change (Scotland) Bill was clear that it only wished to measure Scotland’s contribution – a position that the Chamber of Shipping could support – to international shipping emissions this could be done as soon as an agreed methodology was decided upon. A ‘bottom-up’ approach (i.e. obtaining data from individual ships) would yield more accurate data than a ‘top-down’ (e.g. averages of bunker fuel sales etc) approach, but it should be recognised that this would place a considerable burden on both shipowners and administrations alike.

The Committee will doubtless be aware that the UK Climate Change Act has mandated that the government in Westminster must take account of emissions from international shipping when considering its carbon budgets. In order to assist this process the Chamber of Shipping has teamed up with WWF-UK (formerly the World Wildlife Fund) to assist the UK government in quickly developing a methodology for measuring carbon emissions from ships that is truly reflective of those emissions that can appropriately fall within the UK’s responsibility. Should the Climate Change (Scotland) Bill end up recommending a similar approach it may wish to consider whether our joint proposal to the Office of Climate Change might assist the body responsible for delivery north of the border. A copy of our joint proposal has been appended to this submission for ease of reference (see Annex 1 below).
A word on international agreements to control and reduce carbon emissions from global shipping

Measurement and control mechanisms for carbon are being actively discussed within the IMO and its Secretary General has announced his wish for that body to have agreed upon a concrete package of proposals in readiness for the UNFCCC Conference of the Parties (COP15) meeting in Copenhagen in December 2009. Meanwhile the EU have indicated that, should IMO not deliver a satisfactory package of measures by 2011, then they will look to include international shipping within the EU ETS by 2013. It is therefore clear that shipping will be included within some form of international / regional regime within a very few years.

The UK Government has played an active and constructive role in the negotiations at IMO and its policy position reflects well the realities of dealing with this particular sector. The Chamber of Shipping is keen that the UK Government should remain committed to an international solution delivered through the IMO. While we accept that measures delivered either unilaterally or through devolved administrations will always be an option open to governments, we would stress that these should be seen as options of last resort both in terms of effectiveness and ease of administering. To that end we would consider the inclusion of international shipping in the Climate Change (Scotland) Bill (while negotiations are building to a climax in the international arena) to be a retrograde step and one likely to hinder rather than help the broader discussions and efforts to reduce carbon emissions.

Carbon emissions trading and market-based instruments (MBIs) e.g. a fuel levy are politically very sensitive topics within the IMO. A significant number of developing, non-annex 1 countries (i.e. China, India, South Africa, Brazil etc) are of the opinion that they are not duty bound to seek carbon emission reduction measures through either the IMO or UNFCCC. Furthermore, they are also less willing to discuss measures to improve operational and technical efficiency and are extremely unwilling to contemplate the introduction of MBIs. The Chamber of Shipping, however, is firmly of the opinion that MBIs must play a part in efforts to reduce the sector’s carbon footprint and has openly called for international shipping to be subject to a global, open emissions trading scheme in December 2008. The Chamber is also actively working with its international parent body – the International Chamber of Shipping (ICS) – and sister associations throughout the world to develop consensus for this approach on the understanding that it delivers the necessary environmental outcome while maintaining the necessary level playing field and ensuring that any solution does not discriminate between national shipping registers.

Prospects for developing new engine technologies and fuels, as well as more fuel-efficient operations

Shipping is a mature technology and the scope for improvement by full application of existing technologies is limited. Ships engines have improved steadily since their inception while hull and propeller designs are almost fully optimised. For instance, new hull coatings may provide some enhanced fuel efficiencies (and hence carbon reduction) in the order of 5% - 10%. While there is always room for improvement (and much is dependent on what constitutes an ‘existing’ ship), it is thought that a modern, well-maintained vessel may be able to improve its performance by about 5% if cost/benefit is considered immaterial. Given that fuels costs account for 30-50% of total voyage costs it should be recognised that shipowners have long had every possible commercial incentive to optimise fuel efficiency.

New technologies will certainly come on stream in time. But they are not available now and, no matter how many prototypes or concepts are developed, shipowners cannot be expected to invest in anything other than robust, proven technologies that are commercially available. However, shipowners are keen to see new technologies emerge and are willing to offer ships to assist in trials and development processes. Again it should be stressed that, given the direct link between fuel efficiency and carbon emissions, shipowners also have a direct commercial interest in the development of fuel saving technologies.

Alternative fuel sources may also have a role to play and bio-fuels can be used in ships engines. However, given the volume of fuel used by the c50000 merchant ships trading internationally (transporting every kind of cargo) and the current uncertainty surrounding the net benefit of bio-fuels, the industry would consider it prudent for legislators to better assess
the impact of a substantial take-up of bio-fuels by such a large consumer as international shipping before reaching any decisions.

Fuel cells, solar-power, wind kites etc are all theoretically possible alternative technologies but they are best viewed as supplementary power sources rather than alternatives to the main propulsion systems on board. Nuclear power is technically feasible for ships and there are examples of nuclear-powered merchant as well as military ships. Issues of security and acceptability are, of course, dominant in that particular debate.

Reducing the speeds at which ships travel is often seen as a ‘quick win’ in terms of reducing carbon emissions from ships. While it is true that reducing ships’ speed has a dramatic effect on fuel consumption, the full range of underlying factors which have hitherto determined the speed at which ships generally travel remain relevant. It should be noted that shipowners / operators have relatively little say over the speed of their vessels as this is invariably determined by the charterer. Any reduction in ships’ speed would therefore require the consent of customers as they would in general have to wait longer to receive their goods. Shippers seek to maintain supply continuity and time of delivery is an essential competitive parameter. To maintain an acceptable service at slower speeds would mean an increase in the number of ships required negating much of the fuel savings otherwise expected. Furthermore, very little can be achieved on traditional slow-steaming bulk carriers as these already steam at little more than thirteen or fourteen knots. For ferries, travelling time for the passenger is a key issue in the extensive competition with other (less carbon efficient) transport modes; many Scottish ports are tide-bound which further reduces the flexibility of port arrival / departure times and; they should also be considered, especially in Scotland, as a bridge between outlying areas forming essential and reliable infrastructure. Any policy decision requiring vessels to slow down would need to be underpinned by a robust and detailed analysis of all the implications of such a measure.

Additional Industry Comments

The shipping industry has been working through the IMO, EU and national governments on how best to reduce carbon emissions for some time. As a result, it may be helpful for the Committee to note the broad principles which we feel will deliver a mechanism that delivers its environmental objectives while maintaining the competitiveness of the industry.

- Firstly, and perhaps obviously, industry is only interested in delivering a solution that is effective in contributing to the reduction of total global greenhouse gas emissions.

- In order to achieve this and avoid evasion, such a system must be binding and equally applicable to all Flag States.

- Across all maritime legislation, the shipping industry consistently argues for a goal-based (as opposed to a prescriptive) approach, as being better suited to such a diverse industry and also allowing shipowners the flexibility to meet their environmental responsibilities in the most cost-effective manner.

- Linked to cost-effectiveness are considerations that seek to limit or at least minimise competitive distortion and that, within the parameters of sustainable development, do not penalise trade and growth nationally or globally.

- It has been suggested that shipping suffers from the lack of a Formula 1 to lead and drive technological improvements. Whereas the aviation industry has benefited from the civilian application of military technologies and also from the space-race, shipping has had no such high-end sector motivated by a completely independent set of cost considerations. We would therefore suggest that any control measures for shipping should actively support and encourage the promotion and facilitation of technical innovation and R&D in the entire shipping sector.

- In addition, it is clear that any regulatory mechanisms adopted must be flexible in order to accommodate likely future technologies in the field of energy efficiency.

- Finally in our checklist, the industry would look to ensure that the ‘back-office’ side of any regulation is given due thought. For any system to be workable, and for true
environmental benefit to be gained, it is clear that the approach must be practical, transparent, fraud-free and easy to administer.

Domestic Shipping

We note that the subject of this inquiry is the possible inclusion of international shipping emissions within Scottish Carbon Budgets. However, the Chamber has concerns that emissions from domestic shipping (which can take place as part of an international voyage) should be properly attributed. We are unclear how this will be done. For example, it is not clear how foreign-owned competitors, which have had the opportunity to refuel abroad before making Scottish domestic voyages, will be treated? We would ask the Committee to satisfy itself that the methodologies for including domestic shipping (and its definition) within the Climate Change (Scotland) Bill are likely to achieve the stated objectives.

January 29, 2009

Robert Ashdown
Head of Technical Division
Chamber of Shipping
Dear Ben,

**Shipping and the Climate Change Act**

Following the decision of the UK Government to include carbon emissions from international shipping within the Climate Change Act for measurement purposes - a position which both WWF and the Chamber of Shipping endorse – the two organisations, the leading stakeholders in this field, have committed to working together in its implementation. Our common objective is to assist the UK government to quickly develop a methodology for measuring the carbon emissions from ships that is truly reflective of those emissions that can appropriately fall within the UK’s responsibility.

During our initial discussions we have reached some broad conclusions which we hope you will find useful in developing your own thinking. These are very much our preliminary thoughts and we remain eager to participate in the development of the methodology for measuring this most complicated of sectors.

**Overall Coverage**

‘International shipping’ is imprecise in meaning and its coverage will need to be defined. In general terms it would be taken to mean commercial shipping engaged in international voyages (ie not ‘domestic shipping’). We assume that it is not intended to encompass leisure yachts, military or other Government vessels or installations at sea that are not otherwise regarded as ships such as fixed installations used for the production and pumping of oil. It should be noted that existing IMO legislation contains definitions of many relevant terms (‘ship’, international voyage’ etc) and it would be sensible to use these wherever possible. It is not clear whether fishing vessels should be included, perhaps depending on whether their activities are encompassed elsewhere within the fishing industry itself.

Data on virtually all seagoing internationally-trading merchant ships of over 100 gross tons, including fishing vessels, is held within the Lloyds Register-Fairplay database and are allocated internationally-recognised unique numbers (IMO numbers). This would facilitate the inclusion of fishing vessels but we are not in a position to comment on whether similar methods of reporting and verification would be appropriate. Nonetheless, a clear definition of which vessels/installations are included will be necessary.

Consideration will also need to be given to an appropriate cut-off point for vessel size. Existing international maritime regulations, primarily from the IMO, apply only above certain levels of gross tonnage, though the levels vary for different purposes. For example, MARPOL, which deals with marine pollution, only applies to ships of more than 400gt; SOLAS, dealing with marine safety, applies to vessels of 500gt and over, while other conventions and agreements apply to vessels down to 100gt. Gross tonnage is considered the simplest and most appropriate measure for applying de minimis provisions.

In practice no commercial vessel below 100gt would be engaged in international trade, and very few in the next bands up. (As before, different considerations may well apply to fishing vessels.) The UK government will need to take a view on the most appropriate lower limit recognising the limits of the various data sets, the cost/benefit of measuring very small vessels and any effect the limit chosen may have on subsequent negotiations at EU or IMO level.

**Possible Measurement Methodologies**

Given that the Climate Change Act will, initially, only measure, rather than restrict, carbon emissions from international shipping, greater flexibility can be applied as to the methodology as there is a much reduced risk (so long as any associated administrative burden is low) that ships will choose to reflag as a result of any measurement requirements. Indeed, given that we would expect the methodology chosen to be flag-blind and non-discriminatory, reflagging for this reason alone would be pointless. However, it should be noted that methodologies which will work for measurement purposes will not necessarily work if mandatory reductions are later required. It will also be important that any methodology takes into account the risk of
'double counting' where other countries follow the UK’s lead and seek to take responsibility for their share of emissions from international shipping.

There are numerous ways in which carbon emissions from international shipping could be measured. For example, by ship, by location, by voyage, by fuel sales, by number of port calls. However, the more accurate methods of measurement are considered to fall into two broad approaches, one based on physical activity and the other based on economic activity.

**Physical Activity** would be essentially a voyage calculation, relying on data such as point of origin, ship type, fuel type and distance sailed. There are two particularly difficult aspects to take into account:

- if outward voyages are to be included there is a clear difficulty in determining what the next voyage is to be; the UK has a much lower level of export cargos than imports, and consequently many ship leave the UK empty to seek their next employment – a bulk carrier in ballast may go to Rotterdam to load scrap metal or to Argentina to load grain, depending on market opportunities at the time, and often when on the high seas. If this general approach is chosen, it would be simpler to take account of inward voyages only (of course, where a ship arriving in ballast for an export cargo has come from is equally arbitrary, it is at least known);

- an appropriate methodology would need to be developed to fairly deal with vessels that have multiple loading and/or discharge ports. This is particularly relevant to the container trades, though applies also to other unit loads (such as new motor vehicles or refrigerated cargos) and some bulk trades in both petroleum/chemicals and dry commodities. For example, a containership on Far East service may have its first European port of call in the UK, with short voyages to Continental discharge ports or vice-versa; in addition there may be mid-voyage calls at container hubs in the Mediterranean. As well as the difficulty of determining an appropriate length of voyage, the split of cargo between that for the UK and that for elsewhere would be problematic (and touches on the need to avoid potential double-counting referred to above).

Measuring the **Economic Activity** could either be based on imports/exports or a percentage of GDP; or on shipping company economic activity. A significant advantage of the former approach is that it is better suited to providing the statistical base at the level needed to inform political policy-making whether in the UK, the IMO or elsewhere. In particular, it does not prejudge the approaches that might be adopted should specific instruments need to be developed later. Last, and by no means least, is the avoidance of a significant burden on business, much of which is not located in the UK and much of which is run by SMEs, as the Government already collects very extensive data on the UK’s sea-borne trade.

If the location of the shipping company’s activities were to be considered when assessing ‘economic activity’, the acknowledged difficulties of allocating that activity to the UK or elsewhere needs to be addressed. In that connection, we would draw your attention to work that is currently being undertaken by the Office for National Statistics (ONS) and the Department for Transport together with Lloyds Register-Fairplay to allocate ships within the world fleet according to “country of economic benefit” (COEB). It seems to us that, should the government wish to pursue a methodology based on economic activity, this work could be directly applicable and add to the range of different policy needs to which it might be usefully applied.

It is clear that both of these broad approaches (economic & physical activity) will give rise to a number of questions and queries and that these will need to be considered fully if the finally-adopted methodology is to have credibility as an appropriate measure of international shipping emissions. We conclude, however, from our initial examination that measurement by economic activity is likely to provide the Government with the data it requires to meet its responsibilities under the Climate Change Act with the lowest administrative burden on business.
Specific Considerations Related To Sections of the Shipping Industry

In addition to the application of different methodologies to conventional cargo-carrying merchant ships considered above, it is likely that there will be some sectors that are more problematic than others, depending on the broad approach chosen. For instance, measurements based on imports and/or exports would exclude most ships engaged in carrying passengers (whether cruise ships or ferries) or in the service sectors (offshore support vessels, dredgers etc). It would be possible to develop a statistical approach for some of those activities, for example relating passengers to the voyage concerned or to the numbers embarking/disembarking; though there would be difficulties to be addressed in relation to ferries where most are multi-purpose, carrying both freight and passengers in markedly different proportions according to time of day or seasonal demand.

For specialist service vessels it is recognised that a different method of assessment may be required, compared with those carrying passengers or freight. While any methodology decided upon will need to meet the circumstances of the majority of internationally trading ships, there are some significant sectors where credible measurement is important; for example, in the cruise sector, where passengers may base their purchasing decisions on the environmental performance of the vessels in question.

Definition of Domestic Shipping and Emissions Measurement

At present the UK measures the carbon emissions of domestic shipping based on bunker fuel sales as determined by the IPCC under the Kyoto framework. It is widely recognised that this measure under-records emissions. Given that many domestic voyages will be part of a sequence involving international legs (and such ships will purchase their bunkers wherever most economic), and that there are no significant differences between domestic or international ships except for their voyage patterns, it may be more appropriate for all shipping to be treated as ‘international shipping’, with the proportion of domestic shipping being separately assessed. Again, this would be less burdensome, fairer (as it would include internationally trading vessels performing a domestic leg) and be more accurate than the current arrangements.

Next Steps

The WWF and CoS hope that, by taking our thinking forward jointly on these important issues, we can assist you better as you move your own thinking forward. We would like to emphasis once again our willingness to be engaged in the detailed work going forward so that the most suitable methodology can be devised and applied as soon as practicable.

Yours sincerely

WRITTEN EVIDENCE FROM TRANSFORM SCOTLAND

Introduction

Transform Scotland is the national sustainable transport alliance. We are a membership organisation bringing together rail, bus and shipping operators; local authorities; national environment and conservation organisations; local environment and transport campaign groups; and individual supporters.

We strongly welcome the principle of Scottish climate change bill and the aspiration of the Scottish Government that Scotland lead the way on reducing climate change emissions.

We are a member of Stop Climate Chaos Scotland (SCCS), and are in broad agreement with the evidence presented by SCCS to the TICC Committee at its meeting held on 3rd February 2009.

We are particularly concerned with four elements of the Bill as currently drafted, and we set out our views on these matters in the section on specific comments on the Bill set out below.

This paper represents our interim view on the Bill. We intend to respond to the TICC Committee’s call for views in full before the 27th February deadline.

Transport’s current contribution

In 2006, the Scottish transport sector was responsible for 24.4% of all greenhouse gas emissions.\(^8\)

It is likely that this underestimates the impact of the Scottish transport sector. As expressed by the UK Department for Transport in 2007, government estimates of the impact of the transport sector “are likely to be an understatement of the full climate impact of UK related transportation [because of] the full climate impact of aviation emissions at high altitudes”.\(^9\)

Transport is the principal sector where emissions continue to rise. Greenhouse gas emissions from the Scottish transport sector rose by 14.3% between 1990 and 2006, whereas all Scottish emissions fell by 12.3% over this same period.\(^10\) Clearly, if the transport sector played its part in reducing emissions then there would be a significantly better chance of hitting future targets.

The current level of emissions from the transport sector alone is currently above the total level of emissions that can be emitted under the 2050 target level. In 2006, total Scottish transport emissions were 4.08 MtCe,\(^11\) while the 2050 target will require emissions from all Scottish activity to be below 3.81 MtCe.\(^12\) Hence, current transport emissions represent 107% of the total emissions allowable from all Scottish activity in Scotland in 2050 under the Bill proposed in the Bill.

Current transport priorities

Current Scottish transport expenditure priorities are systematically biased towards large infrastructure projects; current priorities are, on the whole, contrary to achievement of greenhouse gas emission reduction in the transport sector.

The proposed Scottish Budget 2009-10 sets out a large increase in spending on motorways and trunk roads, whilst support for existing public transport networks is static or in decline, and funding for the most sustainable modes of travel - walking and cycling - remains at the

---

\(^8\) AEI(2008)<http://www.airquality.co.uk/archive/reports/cat07/0809180941_DA_GHGi_1990-2006_v1r.xls> and www.airquality.co.uk/archive/reports/cat07/0811180855_International_aviation_and_shipping_1990-2006_final_v5.xls. This figure is for all transport emissions (including, e.g., aviation and shipping). It is calculated as 15001 tCO2e (transport emissions) divided by 61359 tCO2e (total emissions including international emissions).

\(^10\) NAEI figures. Transport emissions were 13128 tCO2e in 1990 and 15001 tCO2e in 2006. Total emissions including international emissions were 70002 tCO2e in 1990 and 61359 tCO2e in 2006.

\(^11\) NAEI report total Scottish transport emissions in 2006 as 15001 tCO2e, or 4.08 MtCe.

\(^12\) NAEI report total Scottish emissions in 1990 as 70002 tCO2e, or 19.07 MtCe. 20% of this baseline figure implies a 2050 target of 3.81 MtCe.
pitifully low level of £20m per annum (around 1% of the entire transport budget). In December 2008, the Scottish Government published the Strategic Transport Projects Review (STPR) and its National Planning Framework for Scotland 2: Proposed Framework (NPF2). STPR, amongst other things, sets out a £9 billion spending programme on roads, while NPF2 provides for airport expansion and a £2.1 bn Second Forth Road Bridge.

Even if we accept the optimistic claim that the STPR projects will cut emissions (a 1% cut by 2022 on business-as-usual is asserted), this programme is not compatible with the climate change trajectories set out in the Bill, even in its current state. Current forecasts for the year 2022 indicate that, in the absence of significant technological or behavioural change, total road transport carbon emissions will increase from 2005 levels by some 10%. This is fundamentally at odds with the Government’s climate change ambitions: a 10% increase in emissions from the transport sector (at 2022) is patently not compatible with the acknowledged requirements for deep cuts in total emissions (by 2020).

Specific comments on the Bill

The Bill must set annual emission reduction targets of at least 3% from 2010

Bill §3 (2) (b): The Bill allows the Government the option of setting emission reduction targets for the period up to 2020 that would barely reduce emissions during this period (or continue with business-as-usual reductions of approximately 1% per annum as seen across the period 1990-2006).

The interim target (50% reduction by 2030) is similarly unacceptable; it compares unfavourably with the UK Committee on Climate Change’s Intended budget (42% reduction by 2020). We support the SCCS recommendation of an interim target of 50% reduction by 2020.

It is imperative that the Bill establish annual emission reduction targets of at least 3% from 2010, not just from 2020, and that the interim target be amended accordingly. This would allow Scotland to keep its cumulative emissions within sustainable levels; an early start in delivering emission reduction would also help focus minds in sectors - such as transport - that are currently failing to contribute.

The Bill must include International Aviation and Shipping from 2010

Bill §14: The Bill fails to include emissions from International Aviation and Shipping (IAS), instead providing only that the Scottish Ministers “may” make provision for this at a later date. This is not in accordance with the statement made by the Cabinet Secretary for Finance and Sustainable Growth John Swinney MSP on 27th October 2008.13

“This Government has taken the bold decision to include emissions from international aviation and shipping within its targets. Scotland benefits greatly from international trade and travel and we believe it is right to take responsibility for the Scottish share of these emissions.”

Given the rapid increase in emissions from the aviation sector, the omission of IAS emissions would damage the credibility of the Bill.

The Bill should be amended to specifically include IAS emissions from the start.

The Bill must establish a duty on all public bodies to reduce emissions in line with the national targets

Bill Part 4: The Bill fails to place upon public bodies a duty to reduce climate change emissions, providing only that Ministers “may” choose to do so at a later date.

The Bill should be amended to establish a duty upon all public bodies to reduce emissions in line with the national targets.

The Bill must include mechanisms for enforcement of the emission reduction targets

The Bill contains no mechanisms for enforcement. As such, we question what will make Scottish Ministers (and public bodies) comply with the emission reduction targets that are set. We would like to draw the Committee’s attention to the example of waste water and drinking

water quality. Both of these are regulated and enforced by specific bodies. This mechanism has proved a highly successful model in helping meeting targets for water quality, and the meeting of climate targets will require similar levels of scrutiny and sanctions. The Bill should be amended to include measures for effective enforcement of the targets.

Conclusions

The Bill is generally welcome, but requires improvement if there is any chance of action being taken to reduce climate change emissions within Scotland by 80%. Specifically, we recommend:

- The Bill must set annual emission reduction targets of at least 3% from 2010
- The Bill must include International Aviation and Shipping from 2010
- The Bill must establish a duty on all public bodies to reduce emissions in line with the national targets
- The Bill must include mechanisms for enforcement of the emission reduction targets.

More fundamentally, the Bill must be followed by a fundamental review of all existing and new policy decisions, and new legislation, in order that they comply with the requirements of the Bill. In essence, we require the Government to produce a national plan for emission reduction.
Thank you for the opportunity to answer questions from members of the Transport, Infrastructure and Climate Change Committee on 10th February. I hope the answers I provided during the session, in addition to the written evidence submitted in advance of the meeting, was of assistance to the Committee in its inquiry into the Climate Change (Scotland) Bill.

During the evidence session, I committed to providing some additional written evidence in response to specific questions as follows.

**Technological improvements**
In response to a question from Shirley-Anne Sommerville MSP (Official Report, Column 1494-5), I agreed to provide written evidence on the strategy agreed by the aviation industry to reduce emissions down to 2005 levels by the year 2050.

I have enclosed a copy of a paper that was published in December 2008 by the industry body Sustainable Aviation entitled ‘Sustainable Aviation CO2 Roadmap’. [Click here to access](#)

This document presents an assessment of carbon dioxide (CO2) emissions from UK aviation over the period 2000 to 2050 and provides information on the reductions that can be achieved through improvements in operations, technology and the introduction of sustainable fuels.

**Emissions at altitude**
In response to a question from Shirley-Anne Sommerville MSP (Official Report, Column 1495), I agreed to provide additional written evidence on the impact of emissions at altitude and the multiplier that needed to be applied to fully take account of aviation’s contribution to climate change.

I have enclosed a copy of the paper published by Sustainable Aviation in November 2008 entitled “Non-CO2 climate change effects of aviation emissions”. [Click here to access](#) This details the non-CO2 effects of aviation emissions at altitude and what is being done to address these impacts. The paper also addresses the issue of multipliers, taking into account scientific evidence.

**Public Transport Mode Share Trend**
In response to a question from Des McNulty MSP (Official Report, Column 1497), I agreed to provide written evidence, detailing the trends in modal share for our airports over recent years. I have enclosed a paper that provides this information along with some additional commentary.

**Car Parking Income**
In response to a question from Des McNulty MSP (Official Report, Column 1497) I agreed to provide written evidence, detailing the share of our airport income that is derived from car parking. I have enclosed a paper that provides this information, along with some additional commentary.

I hope this further evidence is of interest to the Committee. Please do not hesitate in contacting me should you require any further information or clarification.

Yours sincerely,

Gordon Dewar
Managing Director
Edinburgh Airport
BAA Scotland
PUBLIC TRANSPORT

Background

BAA Scotland is committed to increasing the percentage of our passengers travelling to and from our airports by public transport. We have produced a detailed surface access strategy at each airport, which sets clear targets to increase public transport usage and minimise private vehicle movements by 2011/12. The strategy documents also detail the actions that will be taken to meet these targets and copies are available from our airport websites.

Modal split

The percentage of passengers travelling to our airports by public transport is shown in the following table.

Figures for 2001 and 2005 were obtained from CAA surveys. Figures for 2008 were obtained from BAA’s own retail profiler survey, which does not distinguish between private vehicle, taxi and hired car. A new CAA survey is currently underway at each of the three airports.

Public Transport Targets

The targets for public transport mode share at each airport by 2011, as detailed in our surface access strategies, are as follows.

Aberdeen 8.5%
Edinburgh 27.0%
Glasgow 15.0%

The 2011 targets do not take into account of publicly funded infrastructure projects that will provide new public transport links to Edinburgh and Glasgow airports.

Once operational in 2011, the Edinburgh tram will link Edinburgh Airport with Edinburgh Park, the city centre and Leith. BAA Scotland is committed to working with the City of Edinburgh Council and TiE to agree a new public transport mode share target prior to the commencement of tram operations.

Similarly, preparatory works are now underway ahead of the construction of the Glasgow Airport Rail Link (GARL). This will provide a heavy rail link between Glasgow Airport and
Glasgow Central train station. As with the Edinburgh tram, BAA Scotland will work with Transport Scotland to agree a new public transport mode share target prior to the opening of GARL.

Air Transport Forums

The UK Government White Paper “A New Deal for Transport”, which was published in 1998, required all airports in England handling in excess of 1,000 air transport movements per annum, to set up Airport Transport Forums (ATFs). Although this requirement was not mandatory in Scotland, BAA Scotland believed the establishment of ATFs was good practice and should be followed. We now have ATFs at each of our airports, which meet every six months and are comprised of representatives of surface transport providers - including bus,, rail and taxi operators, local authorities - the Scottish Government and other transport regulatory bodies.

The ATFs oversee their airports' strategies to increase public transport mode share and manage private vehicle movements. These bodies independently monitor the ongoing progress in meeting the targets set out in our airport surface access strategy documents.

Public Transport Levy

As highlighted in our original written submission, BAA Scotland introduced the Public Transport Levy (PTL) at each of our three airports in 2003. The PTL is charged on short-stay airport parking, with an average contribution of 20p per car. The monies raised, which total almost £500,000 per year, are used to promote public transport or minimise private vehicle movements. Funds from the PTL have been used for a number of key projects. At Edinburgh, money is currently being invested in a detailed feasibility study into a possible bus interchange on the A8, which would allow for coach passengers from Glasgow, Stirling and Falkirk to connect with airport bound bus services.

At Glasgow, PTL money has been invested in bus stances adjacent to terminal building, allowing bus services to return to the inner forecourt following the July 2007 terrorist attack. At Aberdeen, money has been invested in the promotion of the new bus service set up by NESTRANS connecting Aberdeen Airport with Dyce train station.

These are just three example of a range of projects that will allow our airports to meet, and if possible, exceed the public transport targets set out in the strategy documents.
CAR PARKING

Income from car parking

Income from car parking represents a comparatively small share of airports’ overall income, averaging 10.1% in 2008. This information has been broken down in the following table.

Table 1.1 – Car parking income as a share of total income.

<table>
<thead>

</tbody>
</table>

Car parking is however an important generator of income for our airports. It is important to stress that, as a private company, BAA does not receive and does not seek money from local or national government for the development or operation of our airports. Income generated from ‘non-aeronautical’ sources, including car parking, property rents and retail, has therefore been important in allowing BAA Scotland to significantly reduce its aeronautical charges, attracting new airlines and new routes to Scotland.

Specifically, we have reduced our aircraft landing charges in real terms every year, year on year, for the last 15 years. These consistent reductions in prices, coupled with the BAA Scotland Route Development Fund that has invested over £130 million in new services, have led to a considerable growth in the number of international destinations being directly served from our airports.

Car parking and congestion

There remains a complex relationship between the provision and pricing of car parking and road congestion. The least desirable surface access mode is where passengers are dropped off and picked up by friends and family – so called ‘kiss and fly’. For each passenger who uses ‘kiss and fly’ for a round trip, a total of four private vehicle access journeys are created. For a passenger who drives to the airport and parks, there are only two access journeys created. Experience in recent years has shown the provision of high quality car parking can reduce the number of passengers being dropped off and picked up by friends and family. Conversely, a lack of parking spaces can lead to increased “kiss and fly”, as passengers fear missing their flight because of a lack of available parking spaces.

It is also important to strike the right balance in terms of car park pricing. Setting prices too low could encourage passengers away from using public transport. Conversely, setting parking prices too high could encourage passengers to ‘kiss and fly’ rather than park at the airport, increasing vehicle movements. Our airport surface access strategies detail our targets and actions to increase public transport use and minimise private vehicles movements. The provision and pricing of car parking has an important part to play in these efforts.
Evidence of the Aviation Environment Federation/Green Skies Alliance to the Scottish Parliament's Transport, Infrastructure and Climate Change Committee on the Scottish Government's Climate Change (Scotland) Bill, February 2009.

The Aviation Environment Federation is a UK-based NGO working solely on controlling and reducing the negative environmental impacts of all forms of commercial air transport and general aviation. Our work programmes include working with communities at grass root level; research and policy development across noise, air quality, public health, land use planning, public safety, rail/air substitution, aerospace technology and climate change issues; and communication activities designed to influence industry, policy makers, politicians, opinion formers and institutions as well as the general public.

We have set up and administer three umbrella networks, AirportWatch throughout the UK; the Europe-wide Greenskies Alliance, with observer status at the European Civil Aviation Conference; and the International Coalition for Sustainable Aviation comprising European and US NGOs, with observer status at the UN International Civil Aviation Organization.

We welcome the Committee's decision to scrutinise the Bill and comment as follows.

Section 1: Key overarching recommendation – the Bill’s budgets, reporting and targets must include aviation and shipping emissions.

We support the Climate Change (Scotland) Bill generally in line with the comments the Committee has received from Scottish environmental NGOs with this crucial recommendation on our specialist topic as follows:

Recommendation 1.

The Climate Change (Scotland) Bill must include an unequivocal commitment to measuring and monitoring all Scotland’s aviation-derived CO2 emissions and including these figures as part of Scotland’s rolling annual budgets and 2050 targets from day one. Domestic aviation emissions are already included and a proportionate allocation of the emissions from international flights, using an acceptable methodology such as the UNFCCC recommended reporting of bunker fuels which allocates the emissions from all departing flights to the state they have left, is simple, effective and above all, established.

One of the Bill’s supporting documents, the Technical Note: Climate Change (Scotland) Bill: Greenhouse gas (GHG) Emissions, Annual Reductions and Targets, sets out the path to achieving a reduction from 1990’s 70.12 MtCO2e to 14.02 in 2050, and quite rightly, the 1990 starting point includes both domestic and international aviation emissions.

We cannot understand why a substantial and growing amount of climate-change inducing emissions should somehow be put to one side to return to as and when. This seems to be the Bill’s current intent. This is as much about numeracy as it is climate change – if the starting point includes Scotland’s international aviation emissions then both the end point and all stops along the way must do so too.

For the record, the same applies to shipping emissions.

Section 2. What are Scottish aviation emissions and why are they important?

Figure 1 in the Annex to this memorandum shows a comprehensive range of global aviation CO2 emission forecasts from published regulator, institutional and academic sources. Actual totals are currently in the region of 700 million tones right now and are approximately 2.31% of man made CO2. Note that by way of context, this figure is substantially more than the entire UK’s CO2 emissions – one sector, aviation, emits more CO2 than the world’s 5th largest economy.

Aviation emissions are forecast to rise to around 2500 MtCO2 by 2050, a figure which includes reasonable estimates of continuing efficiency gains via better aerospace technology and operational and ATM improvements. It is universally recognized that the forecast growth
in air traffic of 3-4% per year unfortunately outpaces the best we can expect from efficiency gains which is why the forecast curves continue upwards. Accommodating aviation emissions growth on this scale represents a significant challenge for all national and international control strategies for GHG reductions between now and 2050.

We would point out that the 4.1% “Fraction of total (SRES)” annotation could be a little misleading – the UN IPCC Special Report on Emissions Scenarios referred to is an unrestrained “worst case” business as usual world with no carbon constraints. As carbon reduction policies are implemented worldwide, aviation growth on this scale would automatically become a much larger percentage of the global total by 2050.

Within these global forecasts, and in the context of Scotland’s aviation emissions growth and the Climate Change Bill, it is therefore vital to understand what Scottish aviation emissions could be through to 2050.

Annex Figure 2 shows the UK Department for Transport forecast methodology for forecasting aviation CO2 emissions as detailed in January 2009’s “UK Air Passenger Demand and CO2 Forecasts”.

Under pressure to “green” out-of-control greenhouse gas emissions from unrestrained airport expansion, the Department for Transport has come up with a cunning statistical sleight of hand they have termed re-casting. At least 46 Million tonnes of CO2, and potentially as many as 105 Million tonnes, have been rendered non-existent by this process, studies of Government background documents by the AEF have revealed.

- In 2004, the Department for Transport itself forecast total UK civil aviation CO2 emissions in 2050 as a maximum of $106.8$ million tonnes.
- In a 2006 report for DEFRA’s Global Atmosphere Division, by a team of well-respected UK aviation climate change experts, the UK 2050 figure had risen to a forecast maximum of $165.5$ million tonnes of aviation-related CO2.

The Westminster Parliament’s authoritative Environment Audit Committee put it succinctly in a March 2007 report when analysing these same figures, saying that they:

“...illustrate the difficulty - and, depending on certain growth projections - impossibility of meeting tough carbon reduction targets for 2050 and accommodating the ongoing expansion in flights.”

But Governments can do difficult before lunch and the impossible by tea time.

For in November 2007, the DfT’s “UK Air Passenger Demand and CO2 Forecasts” background document contained a revised 2050 figure for aviation CO2 that had miraculously gone down to $60.3$ (now 59.9 as of January 2009) million tonnes, because:

“After 2030, the growth in emissions is projected to slow, partly due to capacity constraints slowing demand growth”.

So if the forecasts are an embarrassment, just do some desktop re-casting, and make 46 or 105 of CO2 just vanish, instantly as follows:

- DfT 2004 forecast 106.8 MtCO2 minus DfT 2007 60.3 MtCO2 = **46.5 MtCO2 disappeared**
- Defra 2006 forecast 165.5 MtCO2 minus DfT 2007 60.3 MtCO2 = **105.2 MtCO2 vanished**
- Latest DfT 2009 forecast for 2050 is now 59.9 MtCO2 - little different

We may ourselves have underestimated the scale of this problem as we have used only the mid-range figures from the DfT’s documents.
By 2050, total UK CO₂ emissions must be 80% lower than 1990’s 590 MtCO₂, around 118.43 million, and all UK domestic and international aviation emissions clearly have to fit within that total.

But with some of these earlier forecasts for 2050 ranging from 106.8 to as high as 165.5 for aviation alone there’s clearly a problem. Aviation emissions could be some 47 MtCO₂ greater than the entire UK carbon budget in 2050 if this is cut by 80% from 1990 levels.

The sources setting out these figures are:

- DfT 2004 forecasts from Department for Transport Aviation and global warming London, January 2004
- DfT 2007 forecasts from Department for Transport UK Air Passenger Demand and CO₂ Forecasts, November 2007
- DfT 2009 forecasts from Department for Transport UK Air Passenger Demand and CO₂ Forecasts January 2009

CO₂ emissions of domestic and international flights from Scotland’s airport are as follows:

- Latest actual from NAEI is 1,122,000 MtCO₂ in 2006, international flights only
- DfT 2005 all flights domestic and international figure is 1.5 MtCO₂
- DfT central forecasts all flights are 3.2 MtCO₂ in 2030, rising to 4.4 MtCO₂ in 2050

We have outlined previously the DfT’s efforts to finesse aviation CO₂ forecasts by constraining growth, in our view artificially, beyond 2030. We believe this dangerously underestimates the likely growth in aviation emissions through to 2050. In 2005, Scottish aviation CO₂ emissions were around 4.3% of the UK total. This is expected to rise to 4.8% by 2050 according to the DfT.

However, if we take the DfT 2004 UK total for 2050 of 106.8 MtCO₂ as one baseline, then 4.8% of that would mean Scottish aviation emissions could rise to 5.1 MtCO₂ by 2050.

If we then take the DEFRA 2006 forecast UK total of 165.5 MtCO₂ then 4.8% of that figure is 7.9 MtCO₂ by 2050.

Recommendation 2.

We have analysed a series of Government department aviation CO₂ forecasts to 2050 which differ significantly. Because of this wide variation and the scale of these potential outcomes and their impacts when set against Scotland’s 2050 target of 14.02 MtCO₂ from ALL sources, we cannot recommend strongly enough that the Scottish Executive carries out an urgent review of these forecasts to ascertain an agreed trajectory for the country’s aviation CO₂ emissions from 1990 through to 2050 to inform policy measures emanating from the Climate Change Bill.

But it could be much, much worse. Aviation emissions have significantly larger climate change-inducing impacts over and above that of CO₂ alone. For example, Annex Figure 5 is a satellite image of aircraft condensation trails over Europe which make a large additional contribution to aviation’s negative impacts. The most up-to-date chart detailing these impacts can be seen at Annex Figure 4. We are very pleased to endorse the DfT’s view regarding the best metric for assessing the range and scale of these impacts, shown in Annex Figure 7, that:

“...it would not be right to exclude consideration of the non-CO₂ climate change effects of aviation, and there is currently no better way of taking these effects into account.”

The TRADEOFF project gave weight to a multiplier range of 1-4 with a central case using 1.9. Again, we are happy to endorse this figure. But this means that in policy terms it would be wise to acknowledge that the CO₂ equivalent impact of Scotland’s aviation emissions is
almost twice that of CO$_2$ alone. This has profound and severe implications for the 14.02 MtCO$_2$ target.

**Recommendation 3.**

Policies designed to control and reduce ALL aviation’s scientifically validated non-CO$_2$ climate change impacts need to robustly reflect the current best available multiplier of 1.9. A clear understanding of how these impacts are being addressed at EU level is vital and as control polices develop, Scotland’s GHG reduction plans should at least mirror these.

**Section 3: Apart from “forecast finessing” what other policy options and mitigation strategies exist to control and reduce aviation emissions that the Committee should be aware of?**

**Including aviation within the European ETS is the major policy option underway right now.** This is a synopsis of the scheme’s components and forecast outcomes:

- Cap and trade scheme for airlines – cap will be 97% of 2004/6 average CO$_2$ emissions starting in 2012, decreasing to 95% from 2013 onwards
- % auctioned will be 15% but market growth of 25-30% between 2005-2012 (4% p.a. average) expected
- An average airline will be paying for 40% of its CO$_2$ emissions (15% auctioning + 25% permits)
- Share of permits to airlines based on overall %share of EU emissions in 2010/11 – airlines to report this data, details/methodology “in development” and awaited
- Applies to all arriving and departing flights within EU Member States airspace unless foreign airline’s country of origin has a similar scheme in place
- Environmental “benefit”, CO$_2$ reduction from sector is -36% or 122 MtCO$_2$ by 2015
- -46% or 183 MtCO$_2$ by 2020
- These figures include all the “savings” from bought credits
- EC cost pass through estimated at €4.6 to €39.6 for a return trip, trip length dependent at an allowance price of €30
- Demand impact:135% growth over period instead of 142% - or not very much!

However this somewhat simplistic “robbing Peter to pay Paul” mentality is, as it stands, innumerate and dangerous, putting UK climate change targets at risk.

All emissions trading schemes, we are told, have an end point – eventually you’ve managed to trade down to your target. Their theoretical design is supposed to allow a carefully controlled contraction, and along the way, possibly some cross-sector re-allocation of CO$_2$, the main greenhouse gas, across all fossil fuel users over time - in this case, 41 years time. The so-called market place for CO$_2$ will be controlled by Governments and blocs setting targets and allocations, and is not a licence to pollute for ever and ever, a misconception the airline industry and some policymakers clearly suffer from.

It’s clear to us that aviation is still getting very special treatment. The cap given to the aviation sector is much more lenient than that given to other sectors. For 2012 aviation emissions will be capped at 97% of the sector’s average emissions between 2004 and 2006 (roughly double 1990 levels). From 2013 onwards a fixed cap of 95% will apply. Meanwhile, other sectors are expected to reduce their emissions in line with the EU’s commitment that by 2020 total emissions will be reduced by at least 20% compared with 1990. The UK’s carbon reduction targets are tougher still - yet another example of special treatment for air transport.

Our analysis shows that the cap isn’t really a cap. The supposedly binding cap imposed on the scheme as a whole is in fact very dodgy. If European polluters find it too difficult to reduce their emissions, and no sectors in the scheme have credits to spare, then permits can simply be bought from elsewhere in the world - from ‘low emission’ factories in China, for example. While some restrictions have been applied to the proportion of these ‘project credits’ that ETS participants are allowed to surrender, quite what these restrictions are remains very hazy (the UK Government’s own negotiators involved in the EU Climate and Energy package claim not to know what the restrictions will mean for aviation.)
The ETS trades in carbon and as we have highlighted above, the additional climate damage from aircraft emissions at altitude is currently not accounted for. Because of this additional ‘radiative forcing’ from aviation, the European Parliament argued that either emissions from aviation needed to be multiplied by 2 when drawing up the carbon accounts, or a separate policy covering nitrogen oxide emissions from aircraft needed to be drawn up. The EC is about to report on how NOx in particular might be dealt with.

We strongly hold the view that emissions trading was never going to be enough to get soaring aviation emissions under control. It is widely acknowledged that markets don’t work without Government regulation and intervention. The current crisis caused by Governments failing to adequately regulate the banks is just a recent example of this. Similarly, carbon markets can’t work on their own. Lord Turner, chair of the FSA as well as of the Committee on Climate Change has made this very clear. The CCC’s first major report, in December 2008, considered wide-ranging policy measures that could help drive the dramatic cuts in the UK’s carbon emissions that the Committee has recommended. Emissions abatement from the road transport sector, for example, could be achieved through a combination of mandatory efficiency standards for manufacturers, higher taxes levied on more inefficient vehicles, and explicit consideration being given to transport emissions when planning decisions are being taken. For aviation, the report noted that abatement was very much more difficult and that emissions are set to increase, and yet it concluded that emissions from international aviation should not be included in the UK’s carbon budgets for the time being. This what Lord Turner said last December:

“Second, I would like to be clear about our recommendations on international aviation and shipping.

Aviation and shipping are both rapidly growing sources of emission. And in the case of aviation in particular, there may be less potential to cut emissions via new technologies than there is, for instance, in electricity generation. Therefore aviation and shipping would, under business as usual scenarios, amount by 2050 to a very significant proportion of the maximum emissions that the world can safely emit - perhaps as much as 6-8 gigatonnes – about 30% of all acceptable GHG emissions and about 50% of acceptable CO2 emissions.

And even these forecasts assume either significant technological progress or per capita aviation travel in developing countries in 2050 well below the level in developed countries today. If today’s per capita aviation emissions for the developed world applied across a world population of 9.8 billion, total aviation emissions of CO2 would total 5 gigatonnes - about 40 per cent of total global acceptable emissions in 2050 and something like 100 percent of acceptable 2100 emissions.

It is therefore essential that aviation and shipping are covered by targets and by policies which encourage technological and energy efficiency improvement, and which constrain demand below business as usual projections."

We readily acknowledge that aerospace technology can deliver continuing and worthwhile efficiency improvements via these mechanisms:

- Airframe/aircraft design
- Aero engine design and in-flight performance
- Air Traffic Management systems
- Operational techniques – better maintenance, low drag approaches for example
- Alternative fuels

But we can also predict reasonably well what the first 4 bullet points together can be expected to deliver as outlined in the seminal UN IPCC Special Report “Aviation and the Global Atmosphere” 1999:

- Efficiency gains would be 50% by 2050 approx 1% p.a.
- Operational gains inc. CNS/ATM would be 18% over the same period
- Average efficiency gain of around 1.3%
We have seen no hard evidence that would indicate these forecasts are anything other than realistic and accurate. With forecast emissions growth at the levels we have indicated previously, efficiency improvements are always outpaced by growth.

But in the last few weeks, the Society of British Aerospace Companies have had the remarkable claims presented in their December 2008 Sustainable Aviation CO₂ Roadmap taken up by Government Ministers and passed to the Committee for Climate Change for investigation and analysis as part of the go-ahead for the construction of Heathrow's 3rd runway. The CCC have to report on the feasibility of these claims in a January 15th press release thus:

“CC to report on new aviation emissions cap - 15 January 2009

The Committee on Climate Change (CCC) has been asked by the Government to conduct a review into how UK aviation emissions can be limited to below 2005 levels in 2050. The aviation target will play a useful role in buttressing the UK’s overall commitment to an 80% reduction in greenhouse gas emissions (below 1990 levels) in 2050.

As the Committee set out in its initial report, an 80% overall reduction does not require that all sectors reduce emissions by that amount. The report sets out a possible scenario in which aviation emissions would be at 2005 levels in 2050, while emissions across all other sectors of the economy would be reduced by an average of 89%, which together would deliver an overall 80% reduction.

The optimal mix of effort needs to be decided over time in light of the relative costs of emissions reduction across sectors. But given the danger that unconstrained aviation emissions growth would make required reductions in other sectors impossibly large, it makes sense to establish an absolute cap on aviation emissions.

The CCC has been asked to provide a report by December on the measures required to ensure that aviation emissions can be constrained within the limit set by the Government, and will keep under continual review the appropriate balance between different sectors’ emissions reductions required to ensure that the 80% target is met.

Chair of the CCC Lord Turner said:

“We are pleased to have been asked to conduct this very important review into aviation emissions. In order to avoid dangerous climate change it is vital that emissions of greenhouse gases in the UK are reduced by at least 80% in 2050. International aviation and shipping must be part of the Government’s climate change strategy and commitments should be made to reduce emissions in these sectors”.

This is what the SBAC had to say when outlining this CO₂ Roadmap in their press release on December 12th last:

“UK’s leading aviation environmental body today projects how CO₂ emissions from air traffic will fall back to 2000 levels by 2050 despite continued growth in number of flights.

Sustainable Aviation (SA) has today (Friday) published its first report mapping the industry’s carbon dioxide (CO₂) emissions to 2050. The report concludes that CO₂ from all UK civil aviation can return to 2000 levels by 2050, after having reached a peak around 2020, against a background of threefold growth in passenger numbers.

The assessment takes into account the UK air transport market maturity and efficiencies that are expected from new airframe and engine technology, cutting edge air traffic management and operations, as well as the development of sustainable fuels. In making this assessment no allowance is made for the additional contribution to CO₂ reductions that will be achieved through airlines’ participation in international emissions cap and trade schemes, the details of which have yet to be fully defined.

The report highlights that:
• Improvements in current airframe and engine design plus new technologies such as blended wing bodies and open rotor engines are expected to reduce CO2 emissions by 62 per cent compared with a ‘constant technology’ baseline.
• A further 10 per cent reduction is envisaged from improved air traffic management and operations that will be delivered by 2020.
• Lower carbon alternative fuels are expected to provide a further 10 per cent reduction in CO2 emissions from 2030, following a period of increasing deployment from 2020.
• Given these initiatives, overall absolute levels of CO2 from UK aviation are expected to be brought back down to 2000 levels by 2050."

We view the claims made in the SBAC CO2 Roadmap as frankly, risible nonsense designed not so much to manufacture aircraft but manufacture consent for aviation’s unrestrained growth.

Recommendation 4.

We would expect Scottish Ministers, Parliament and the Scottish Executive to keep a very close watch on the UK CCC’s study of the Sustainable Aviation CO2 Roadmap, which is due to report by December 2009. Any subsequent policy outcomes will need to be reflected in Scotland’s own policies to control and reduce aviation emissions.

Conclusion.

With no realistic alternative to kerosene, the air transport industry is locked in to fossil fuel use in ever-increasing volumes for at least the next 40 years. The European Environment Agency estimates the total external environmental costs of air transport, including climate change, at around 5.4 pence per 1000 passenger kilometres, or £54 each time an individual passenger clocks up 1,000 kilometres. Adding these costs to tickets wouldn’t mean airports closing or the end of tourism or businessmen unable to fly where they want to, when they want to.

Environmental taxation at this level would however mean reducing the UK Government’s future growth forecasts for aviation by 50%, matching emissions growth to technology and other efficiency improvements. The Government wants to see almost 500 million passengers passing through UK airports by 2030. It claims too that it wants to add air transport’s external costs to ticket prices. A sensible and fair green levy on tickets of around 5.4 pence per kilometre, a congestion charge of the skies if you will, would instead cap passenger numbers at around 320 million by 2030, avoiding all the new runway construction the Government, airports and airlines promote so aggressively. This still wouldn’t make air transport environmentally benign or sustainable but it would be a start.

One transport sector, aviation, now emits more CO2 worldwide than the entire UK economy. We understand that Scotland is serious about not ignoring greenhouse gas emissions as a nation whatever their source and quite right too – we need to work hard to control and reduce those from air travel as well. 3.6 pence per kilometre on ticket prices is an equitable way forward.

We hope this submission is clear and we hope too that the Transport, Infrastructure and Climate Change committee is able to give due weight to the recommendations we make.
Figure 1. Comprehensive range of global aviation CO$_2$ emission forecasts 1990-2050 from published regulator, institutional and academic sources.

**Current and projected global aviation CO$_2$ emissions**

![Graph showing aviation CO$_2$ emissions from 1990 to 2050 with various sources and projections.]

Figure 2. Extracts from Pages 6, 7 & 60 DfT “UK Air Passenger Demand and CO$_2$ Forecasts”, January 2009 showing forecasting methodology

**Method**

1.18 Our method of forecasting aviation CO$_2$ emissions to 2030 combines:
- detailed forecasts of air transport movements (ATMs) and trip length from UK airports from our demand forecasts;
- the European Environment Agency’s CCRNAIR methodology for estimating aviation fuel burn by specific aircraft types; and,
- a detailed fleet turnover model.

1.19 Beyond 2030, we use simpler, yet still robust, methods to project aviation carbon dioxide emissions. This longer term view is important given the timeframe of our climate change policies and the long lifetimes of large infrastructure projects such as airport capacity$^9$.

**Results**

1.20 The action on overall UK CO$_2$ emissions in the Climate Change Act means that national emissions are expected to fall substantially to 2050. Within that, the demand forecasts and technological assumptions outlined

---

$^8$ CO$_2$ Roadmap, Sustainable Aviation, December 2006.

$^9$ For example, the projections extend to 2030 to inform our analysis of the airport developments supported by the Air Transport White Paper.
above mean that UK aviation CO₂ emissions (covering both domestic and international aviation) are forecast to grow from 37.5MtCO₂ in 2005 to 58.4MtCO₂ in 2030, within the range 51.8MtCO₂ to 61.6MtCO₂. After 2030, the growth in aviation emissions is projected to slow, partly due to market maturity and capacity constraints slowing demand growth. By 2050 aviation emissions are projected to have stabilised, and reach 59.9MtCO₂ within the range 53.0MtCO₂ to 65.0MtCO₂.

1.21 Figure 1.4 illustrates this forecast of aviation CO₂ emissions alongside the projected domestic greenhouse gas emissions consistent with the Climate Change Act 2050 target. The aviation line and the domestic economy line are shown independently in this figure, reflecting that no decision has yet been taken on how international aviation relates to any UK targets in the long term. Nevertheless, it can be seen that falling overall UK emissions mean that – even with aviation emissions stabilising after 2030 – aviation’s share of UK greenhouse gas emissions rises to 2050.

1.22 Figure 1.4 shows the forecast profile of emissions from UK aviation under the assumptions of fuel efficiency described earlier. As explained in this chapter, because aviation will be joining the EU ETS from 2012, any emissions growth above the aviation cap will be matched one-for-one by reductions in other sectors, through the purchase of allowances. Across the EU, there would therefore be no overall increase in emissions from sectors included in the EU ETS.

Figure 1.4: UK national and aviation emissions forecasts 2005-2050
3. Aviation Carbon Dioxide Emissions Forecasts

- International aviation accounted for 1.5% of global CO$_2$ emissions in 2005.
- The UK’s total CO$_2$ emissions were 2.0% of the global total in 2005.
- UK domestic aviation accounted for 0.4% of the UK’s carbon dioxide emissions in 2006.
- If international emissions from shipping and aviation are added to the UK total for 2006, UK aviation (domestic and international) accounted for 6.4% of the UK’s CO$_2$ emissions.
- UK aviation’s CO$_2$ emissions have grown strongly in past decades, rising from 12.5 MtCO$_2$ in 1985, to 21.5 MtCO$_2$ in 1995 and 37.9 MtCO$_2$ in 2006. This reflects demand growing faster than fuel efficiency.
- Significant developments have taken place in climate change policy and it is important to understand these when interpreting UK aviation emissions forecasts. They include the Royal assent given to the Climate Change Act which sets a target for UK greenhouse gas emissions for 2050 and the inclusion of aviation in the EU ETS from 2012, meaning aviation’s CO$_2$ emissions will be capped.
- The Government’s comprehensive strategy to address climate change means that overall UK emissions are expected to fall significantly over the period to 2050. Within the overall level of emissions, emissions by sector will be expected to differ.
- In aviation, emissions are forecast to continue rising in the next two decades, as demand continues to grow faster than fuel efficiency. By 2030, emissions are forecast to rise to 58.4 MtCO$_2$, within the range 51.8 MtCO$_2$ to 61.6 MtCO$_2$.
- After 2030, the growth in aviation emissions is projected to slow and stabilise, as demand matures and is constrained by airport capacity. By 2050, UK aviation CO$_2$ emissions are projected to stabilise and reach 59.9 MtCO$_2$, within the range 53.0 MtCO$_2$ to 65.0 MtCO$_2$.
- The inclusion of aviation in the EU ETS from 2012 will place a cap on its emissions. Growth in this sector will require it to secure reductions in other sectors through the purchase of allowances, so that overall EU emissions will not grow.

Figure 7. Page 69, DfT “UK Air Passenger Demand and CO₂ Forecasts”, January 2009, Non-CO₂ impacts discussion

3.21 On the other hand, it would not be right to exclude consideration of the non-CO₂ climate change effects of aviation, and there is currently no better way of taking these effects into account.

3.22 In order to recognise the varying scientific views on radiative forcing and to demonstrate the potential magnitude of significance of these other effects, in line with the most recent evidence we apply a multiplier value of 1.9 to the figure for carbon dioxide emitted as the central case, with sensitivity tests to define a range using a multiplier of 1 and 4.

3.23 Although these factors were derived from different sources and on the basis of different modelling, we believe that for the purposes of illustration, they reflect the best available evidence. Over time, as aircraft and fuel technology develops and operational practices change, the current relationship between aircraft CO₂ and non-CO₂ emissions may change. It is not possible to quantify this at present, but as any potential changes become apparent this would be taken into account in future forecasts.
CLIMATE CHANGE (SCOTLAND) BILL

Thank you for the opportunity to discuss my thoughts on the Bill with the committee on Tuesday 10th February. This note summarises the key points of that discussion and some additional referencing.

I Chair the transport thinktank, STSG (www.stsg.org) which facilitates knowledge exchange in Scottish transport. STSG hopes that its members from across the industry are better able to evidence their responses to the Transport Infrastructure and Climate Change Committee as a result of knowledge exchange through its activities. STSG has arranged events and published views on transport and climate change, but no one individual speaks for STSG, and the Group does not respond to consultations. I am therefore pleased to have the opportunity to present my own views as a Director of DHC and to share my own knowledge with the Committee.

General

The Bill needs to be more focused on delivery and less on process. It would be helpful if the Bill was scattered with a few more qualifying clauses e.g. “Scottish Ministers may by regulations ………provided they can demonstrate that there is a reasonable prospect that such action will contribute to reducing emissions”.

Better evidence can be a powerful lever for action, but at present there is a danger that the Bill will create an industry of analysis rather than of emissions reduction. Unless action is taken to develop the markets for delivering a low carbon economy, business survival and competitiveness will depend on the ingenuity of avoidance. This could have significant unintended consequences.

Targets only work well as a trigger for action if the downstream mechanisms are in place to deliver the desired changes. In transport, these mechanisms are not yet in place, so it is important to keep the Bill simple to ensure the necessary flexibility. Some of the detail in Part 3 of the Bill would be better left to the Advisory Body particularly in relation to electricity use, given the expected growth in electricity as the main fuel for transport.

Transport and the wider economy are inextricably linked. Current carbon trading does not yet reflect this close relationship. With the new targets, there could be pressure to reduce emissions in traded sectors which could transfer emissions to transport e.g. the balance between warehousing costs and freight costs. Within transport, international aviation and shipping will be traded sectors, so perverse incentives are likely to emerge. A key role of Scottish Ministers will be to build from the international frameworks, and to use the powers of regulation in the 2008 UK Climate Change Act to smooth out the irregularities that could affect Scotland.

Improved Delivery Mechanisms as a Condition of Setting Targets

The best way to predict the future is to shape it. In the absence of a detailed strategy for reducing emissions from transport, the recent Scottish strategic transport projects review relied more heavily on established strategies for railways, roads, buses, ferries and freight. As a result, its conclusions are not particularly strategic in relation to climate change, viewing emissions as an impact rather than as a planned deliverable.

There is a need for strategic projects to be considered to deliver energy change and reduced emissions, whilst growing the Scottish economy. These might include a programme to reshape towns and cities for low carbon vehicles, perhaps including electric charging points and investment in streetscape, and improvements in local access to replace motorised transport with walking trips for many short journeys.

The King3 review demonstrated that zero emission car travel will be a rapidly growing market between now and 2050, provided renewable electricity generation is used. Scotland is well
placed to set ambitious targets for early delivery, given its high share of renewable generation. However the potential for plug in electric cars can only be exploited if the charging infrastructure for cars is developed rapidly. Cars could charge up at night on cheap electricity. The increasing proportion of renewable energy such as wind and tidal power will result in growing energy losses at night unless massive new storage facilities are constructed, and using the Scottish car fleet as an energy store could make renewable generation more economically attractive.

1 Note also that STSG is a charity registered in Scotland and all of my inputs to the Group as Chair and as Editor of the quarterly newsletter Scottish Transport Review are undertaken on a voluntary basis
3 UK Treasury 2007 – The King review of Low Carbon Cars
4 The first plug in hybrid cars will be on sale to a mass market in 2009/10 complementing the growing market for electric cars. 50% of new cars sold for use on Scottish roads could rely mainly on electricity for energy by 2020 if the charging infrastructure is available.
6 Making the Connections 2003 – Transport and Social Exclusion. Cabinet Office and ODPM.
7 The Eddington Transport Review 2006 – How Transport can Contribute to Economic Success. Treasury and DfT
8 Scottish Transport Statistics 2007 Page
9 BCSC 2006 – Access, Information and Flexibility – The Future of Retail Travel, DHC for the British Council of Shopping Centres

However, technology change alone will not deliver the emissions required. All infrastructure and vehicles have a carbon footprint from their construction and maintenance. There is overwhelming research evidence, including high profile reviews for Cabinet Office and Treasury that public funding should seek improved end to end journeys for people and businesses. However, in Scotland most transport budgets are still managed separately by mode.

A better administrative framework is urgently needed. Well connected and accessible places for people and businesses should be central to future government spending. Currently, transport policy remains dominated by the unstable measure of perceived congestion as viewed by fickle consumers. The large increases in emissions from transport are not in the most congested places, and relate more to shopping, leisure and business travel than commuting. Transport policies still focus excessively on peak capacity issues where there has been much less change in emissions. The fastest growing trip purposes are shopping and leisure where over 85% of trips are by walking and car. For these two modes policies are not always clear, and often conflict with practice but reduced car emissions will be needed.

A Regulatory Framework for Funding Reduced Transport Emissions

Taking forward strategic projects for energy change will be very expensive and well beyond what could be publicly funded. In any case, Government investment in Scottish transport each year is less than 10% of total transport investment. The future will be more influenced by the purchasing behaviour of people and businesses than of Government. Reduced emissions from transport cannot therefore be achieved by a “command and control approach”, but by creating a framework within which people and business can invest in a more sustainable future.

In 2007, an STSG seminar reviewed how to create these new business structures. One conclusion was that the dominant transport markets and revenue streams of the last century such as car sales and parking revenue, would be complemented or progressively replaced with new markets in more flexible and efficient transport, used by better informed travellers. This will require a fresh approach to policy.
There is also scope for greater use of emissions trading schemes. Carbon trading is already investing large sums in lowering transport emissions across the world, and a Scottish carbon trading scheme could ensure that rather than simply buying cheap credits on international markets, people and businesses would be able to invest in sustainable solutions in their own country. If Scottish Government created obligations for transport users to trade within a Scottish marketplace then there could be a significant increase in investment to reduce emissions. This approach could also improve business competitiveness by tackling an important area of market failure. Currently there is economic value if someone takes the bus or uses a car, but no economic value is captured if they walk or cycle for the same trips. In principle it would be possible to create markets to grow footfall in town centres, or build attractive street environments with less motorised travel, provided these projects were able to demonstrate verifiable reductions in emissions.

Scotland, with its leading position in some renewable energy sectors is very well placed to grow low carbon travel and transport solutions, but only if Government creates a framework within which people and businesses can engage and trade successfully. Transport accounts for more than 15% of household expenditure. Unless people and businesses buy sustainable transport it will be hard for the Government to achieve its emissions targets.

Conclusion

The success of the Climate Change Bill is predicated on the development of a wider framework for transport emissions reduction. Top down target setting will only be effective if supported by a new regulatory and administrative system that enables people and businesses to engage in the delivery of a sustainable transport economy.

Derek Halden
Scottish Parliament

Transport, Infrastructure and Climate Change Committee

Tuesday 24 February 2009

[THE DEPUTY CONVENER opened the meeting at 14:01]

Climate Change (Scotland) Bill: Stage 1

The Deputy Convener (Cathy Peattie): Good afternoon and welcome to the seventh meeting in 2009 of the Transport, Infrastructure and Climate Change Committee. I remind members and the public to turn off their phones and pagers. I have received apologies from Patrick Harvie.

Item 1 is our fifth evidence session on the Climate Change (Scotland) Bill. Today, we will hear from three panels. The first will consist of representatives of the Convention of Scottish Local Authorities and the sustainable Scotland network. The second will consist of representatives of the Carbon Trust, the Energy Saving Trust and the Association for the Conservation of Energy. Finally, we will hear from the trade unions.

I welcome the first panel. We have Ken Gibb, chair of the sustainable Scotland network; and Alison Hay, spokesperson for regeneration and sustainable development, and Anil Gupta, leader for environment and regeneration, from COSLA. We will be asking questions, but you are welcome to make brief introductory statements.

Councillor Alison Hay (Convention of Scottish Local Authorities): I will be brief. I do not want to say much, other than that we realise the importance of climate change. We sent you a submission, on which we are happy to answer questions. Thank you for giving us the time to do so.

Ken Gibb (Sustainable Scotland Network): I echo those sentiments. On behalf of all the local government officers and practitioners whom the network represents, I welcome and support the aspirations of the bill.

We will be asking questions, but you are welcome to make brief introductory statements.

Councillor Alison Hay (Convention of Scottish Local Authorities): I will be brief. I do not want to say much, other than that we realise the importance of climate change. We sent you a submission, on which we are happy to answer questions. Thank you for giving us the time to do so.

Ken Gibb (Sustainable Scotland Network): I echo those sentiments. On behalf of all the local government officers and practitioners whom the network represents, I welcome and support the aspirations of the bill.

Councillor Hay: In relation to consulting the public?

The Deputy Convener: Yes, in terms of the bill.

Councillor Hay: COSLA has been through quite a wide consultation. My regeneration team, which represents the 32 local authorities, has examined the bill. We have also set up a COSLA climate change task group, which includes representatives of not only councils but the Society of Local Authority Chief Executives and Senior Managers and the SSN. We have been through the bill and the consultation almost line by line. Our submission reflects quite a thorough consultation process and is a fair representation of the views that we heard.

The Deputy Convener: You are content with the consultation process.

Councillor Hay: Yes.

Ken Gibb: We took the opportunity to have a pre-consultation session at our annual conference in November 2007, which included 160 delegates from throughout Scotland. Not just local authorities but people with an interest in sustainable development had the opportunity to contribute to that session before the consultation was officially launched. We found that very beneficial—I hope that the Scottish Government did, too. Subsequently, we held a major seminar during the consultation period involving our network members and carried out an in-depth assessment of all the issues in the bill. From those two events and the individual responses that I know the committee has received from individual local authorities, I am content that you have an accurate reflection of the general views of local government.

The Deputy Convener: In a sense, you have answered my next question. I assume that you are content with the development of the bill and the consultation process. I am interested in how you have been consulted on public sector duties, about which we will hear more later. It is clear that such duties would have major implications.

Ken Gibb: That issue has certainly been considered. At the network, we are quite relaxed about the concept of public duties if they are properly framed. We recognised from the outset that there is already a general sustainable development duty under the Local Government in Scotland Act 2003. Any further duties would be a development of that concept.

Other duties potentially link to climate change, such as statutory responsibilities around energy efficiency under the Home Energy Conservation Act 1995, and the forthcoming carbon reduction commitment will be a duty, in a sense. We are relaxed about the overall concept. I do not wish to engage in the detail, as it might arise in relation to further questions, so I will leave it there at this stage.
Councillor Hay: Ditto. COSLA is not opposed to duties per se, but in light of our current duties, such as the sustainable development duty that Ken Gibb mentioned, and the biodiversity duty—there are a number of duties in the environment field—it would be useful to examine and rationalise them all, rather than impose a duty right away. The proposed enabling powers are a good way forward.

The Deputy Convener: There will be more questions on that later.

I am interested in targets. Do you feel that the 2050 target is ambitious enough?

Councillor Hay: The target is an 80 per cent reduction in emissions by 2050, which is ambitious enough. If we take into account what the United Kingdom Committee on Climate Change has suggested, 80 per cent is quite a tight target.

Ken Gibb: It is certainly ambitious, but whether it is ambitious enough is another issue. The indication is that if aviation continues to grow, we might, even with a 3 per cent cut in emissions, have to consider a 90 per cent target in order to beat the 80 per cent target. I think that 80 per cent is ambitious in moving us to the lower end of what we need to achieve to get the result that we seek.

Anil Gupta (Convention of Scottish Local Authorities): Given the way in which the bill is framed to enable advice to be sought from the UK Committee on Climate Change, we would accept upward revisions being made, as we are not experts in the area. How we position ourselves overall will also depend a great deal on international treaties. The target is useful, and we are also keen on the idea of a 2020 target as something for which we should aim.

The Deputy Convener: In a sense, that answers my next question. Do you agree that there should be an interim target? I am interested in alternatives—Mr Gibb has already proposed an alternative target. Do you have a view on that?

Ken Gibb: Again, it depends largely on the international scenario. The bill sets an interim target for 2030, but we should probably think about setting a target for 2020, in line with existing legislation and international obligations. With regard to the level of the reduction, whether we consider a 42 per cent target or a 34 per cent target depends on what happens at the Copenhagen conference and elsewhere. I know that that issue has been well aired. In a sense, the interim target is in the lap of bodies that are outwith the Scottish scenario. I presume that we can reflect on the advice as it develops in the months to come.

Councillor Hay: I agree.

Shirley-Anne Somerville (Lothians) (SNP): I apologise for missing the start of the meeting. I had to deal with an urgent constituency case.

Are annual targets the most appropriate mechanism for achieving carbon emissions reductions?

Councillor Hay: We are not opposed to annual targets, but we need to be careful not to set a carbon emissions reduction target of 3 per cent per council, as has been suggested. The 3 per cent target should be for the whole of Scotland, because people are at various stages in reducing their carbon emissions.

Ken Gibb: We are fairly agnostic on annual targets and on the level at which they should be set. I echo the comments that were made on sectoral targets. Setting a mandatory 3 per cent target for local authorities across the board would be a step too far; we are not yet at that stage of the game. We have yet to find out whether we will move towards such an approach as we move towards the 2030 scenario that is envisaged in the bill. We should certainly consider budgetary targeting, which would give us time to adjust authorities’ performance over the piece in light of their individual circumstances. Much good work is being done, as I am sure members know, but we would be nervous about committing to an annual reduction for local government. That is currently too big an ask.

Councillor Hay: We would be happier with a rolling programme over a number of years—perhaps five years—than with a rigid approach.

Anil Gupta: Councils are concerned that unforeseen factors might result in our not being able to achieve reductions. For example, climate issues, such as a particularly cold winter, might cause problems. That is a reason for proposing a five-year rolling target. Councils would report every year, but the longer timeframe would enable the inevitable ups and downs to be averaged out. Indeed, future technological advances might allow for decarbonisation or a reduction in greenhouse gases.

We foresee quite lumpy progress towards the 2050 target, which must be taken into account, particularly as there will be increasing pressure on individuals to meet targets. There is a possibility that there will be mandatory cap and trade schemes, for example, so we should be careful not to create a rigid system that puts too great a burden on people.

Shirley-Anne Somerville: The pressure will exist from the start, and it is important that we make changes from the start: the issue is how much change we can make and how we make it. I would like there to be pressure on people to accept that change is required.
The challenge is to set annual targets that are challenging enough to ensure that people do not put off difficult decisions and no one is let off the hook, whether they are in the public sector or the private sector, and that are realistic and achievable enough to ensure that there is buy-in from local authorities and individuals. How do we strike that balance?

Councillor Hay: Councils are doing a number of things—I am not so sure about the general public, in relation to which there is a mixed picture. There is no doubt that local authorities are conscious that they must reduce carbon emissions. Authorities are all working with the Carbon Trust to measure emissions from their buildings, and they know that the ability to purchase or sell carbon credits will heave in sight on the horizon. We have all signed up to Scotland’s climate change declaration, as has the Scottish Government. Public bodies are all working hard to do what we can to try to reduce carbon emissions.

As far as members of the public are concerned, it is important that local authorities and other public bodies show a lead, but people’s homes vary in construction and some are easier to sort out than others, which opens up a whole new discussion.

14:15

Ken Gibb: Alison Hay mentioned the carbon management plans that all councils are delivering with the Carbon Trust. I think that we are now in the sixth phase of a process that has been around for about five years. Over the piece, councils are reducing their emissions by the equivalent of 3 per cent per year. Over the period of the carbon management plans that are in place, that averages out at a 15 per cent reduction in emissions, which is an indication of our commitment.

As has been indicated, we are all committed to delivering on the climate change declaration. In addition, in the current single outcome agreements, 21 local authorities refer to reductions in carbon emissions, on which there are 36 indicators, half of which are SMART—specific, measurable, attainable, relevant and time-based—so we can report on what we do.

Efforts are being made on a voluntary basis. We are concerned that if mandatory percentages are set, certain local authorities will have difficulty meeting them. We think that the current process is in the spirit of the bill and that progress is being made towards the numbers that the bill aims to achieve. We will continue to refine, tighten and improve that process as we move further along the spectrum. I am quite content that we are okay in that regard.

Anil Gupta: You mentioned the setting of targets. Inherent in that is our capacity to deliver realistic targets. The majority of our emissions can be broken down into three sectors. Greenhouse gas emissions, which include methane emissions from waste disposal, probably account for between 40 and 45 per cent of local authority carbon dioxide equivalent emissions. The figure is the same for emissions from buildings. The remaining emissions are from transport. It is quite clear that with the targets for landfill diversion and the reduction in methane emissions from landfill sites, we will probably achieve reasonably rapid progress over the next 10 to 15 years.

Beyond that, we require fairly considerable investment in infrastructure to make buildings more energy efficient. We need to be sure that we have in place long-term loan arrangements that help us to invest now to save in future, because we do not have such capacity in our finances at the moment.

On transport, we will have to wait for technological advances to provide alternatives to existing fuels. That will involve more use of batteries and electric vehicles and developments on the hydrogen front. We would probably want to seek advice about realistic targets in negotiation with the UK Committee on Climate Change or with a Scottish committee on climate change.

Shirley-Anne Somerville: My colleagues will ask about single outcome agreements and the climate change declaration, so I will leave that to them. Should targets on emissions from aviation and shipping be included in the bill?

Councillor Hay: From COSLA’s point of view, yes.

Ken Gibb: The sustainable Scotland network believes that such emissions should definitely be in the bill.

Charlie Gordon (Glasgow Cathcart) (Lab): Mr Gupta began to comment on advisory functions in his response to question 3, but do you have a view on the bill’s proposals in that area? In particular, what is your view on the idea of using the UK Committee on Climate Change in the first instance?

Councillor Hay: I think our submission says that COSLA is happy for the UK Committee on Climate Change to be used for advice, but that we will need to review the situation after a period of time to ensure that the advice that we get is relevant and pertinent to Scotland and its particular needs.

Charlie Gordon: Indeed. Can the UK committee adequately understand the unique Scottish model for local authorities and the wider public sector?
Councillor Hay: That is what we have to find out. I am not an expert on the people who are on that committee, but I looked at the list the other day and they are all eminent people. I hope that they have a broad knowledge of the UK that enables them to sit on the committee and ensure that it gives a UK perspective when it gives advice. As I said, we are content at the moment, but we must review the position in a year or so to see whether the committee's advice is helping.

Ken Gibb: I entirely support those comments. We have no reason to suspect that the UK committee will not pay due attention to particular Scottish circumstances, but time will tell.

Charlie Gordon: If views change and a decision is taken that we should look to Scottish expertise from the start, how confident are you about being able to step up to the mark professionally?

Ken Gibb: Are you asking us as a network or are you talking about Scottish—

Charlie Gordon: Well, what is your view on the professional capacity that is available to the Scottish public sector?

Ken Gibb: There is no doubt that the experience and knowledge that we have in Scottish local government would make us more than capable of making a meaningful contribution to the discussions that any group would have.

Councillor Hay: It is not just a question of Scottish local government. In Scotland generally, we have the expertise to set up a committee should we need to do so, but in the meantime I am content to let the UK committee have a go.

Charlie Gordon: Do you have a view on the proposed reporting arrangements? Do you anticipate any problems with the collation of information locally?

Councillor Hay: I am not sure what you mean.

Charlie Gordon: The bill requires annual reporting to Parliament on proposals and policies to meet any future annual emissions targets.

Councillor Hay: We are happy with reporting to the Scottish Government.

Ken Gibb: Our only concern is about areas over which local government does not have direct control or influence, such as some of the consumption data and what are known as area-wide emissions. Clearly, those are outwith the control and, to a large extent, the influence of local government. That is our only reservation. We have a fairly well-established system for and track record of recording, monitoring and, if necessary, reporting on our own emissions, so I am content that that aspect will not cause us any difficulties.

Councillor Hay: Local government is required to do a lot of reporting. We get a lot of people coming into councils to write reports on how well we are doing on various things. Particularly if Audit Scotland is to audit what we are doing, some training will be needed, but let us try to keep things as tight as possible when it comes to being audited and reporting.

Charlie Gordon: Those are useful comments. Thanks.

The Deputy Convener: We move on to some questions on the duties of public bodies. Are single outcome agreements and the climate change declaration leading to the required cuts in emissions? Can you give us any examples of best practice or indeed any examples of barriers to the success of voluntary agreements? What is happening at the moment? Is there good practice or are there barriers?

Ken Gibb: You will probably not be surprised to hear that the strengths are in energy efficiency and management. There is a well-established track record. The approaches to energy efficiency and management are fairly objective and reasonably well funded, and what has happened can be measured and recorded. That is not to say that energy efficiency and energy management—certainly in the context of some of the emissions targets—are particularly easy to deliver, but at least reporting and resource mechanisms are in place to move towards that.

Obviously, other issues are more contentious. Transport in general is an issue. A number of authorities are struggling to get to grips with local authority transport fleet management and business mileage. We have recognised for some time that we need to get involved with that agenda. A number of authorities are moving towards green travel plans, which we are keen to see developed. Excellent partnership work has been done with local partnership groups on funding and resourcing appropriate studies and facilitating the required infrastructure to help to move towards green travel. Such work needs further support.

The other issue, of course, is procurement, which is a major issue for us. We are fairly clued up on energy procurement—there is a fairly good set-up through Scotland Excel—but we have to get to grips with other possibly more difficult procurement issues.

I have given members a fairly wide indication of where we are strong and where we are weaker and need to improve. We recognise where we need to improve and have sought to address matters through our various single outcome agreements and the climate change declaration.
Anil Gupta: On reporting on the climate change declaration, we are quite happy that after a couple of years of a voluntary arrangement, more than half of the councils are reporting on how their commitments are being implemented. Obviously, we are aware that that does not necessarily represent a full glass, but given that the arrangements are voluntary and that what is happening here is far in excess of what is happening in Wales and England, we are keen to encourage the voluntary approach, which allows a diversity of practice to develop.

We want to engage further with the SSN and others in the not-too-distant future to address how we can consolidate best practice and produce internal arrangements to ensure that more people come on board, but we think that we have a success story that indicates a useful and sustainable way of proceeding in the meantime. Ultimately, if a public sector duty is developed under the powers that are given to ministers, we will expect the experience that we have developed to feed actively into the process, similar to the way in which experience fed into the public sector equality duties process, which members know about. There was considerable engagement by councils in that process. They tried to show their practices and have them incorporated in the legislation.

Councillor Hay: Things should move forward at a slightly quicker pace than they did under that process, however.

The Deputy Convener: That process was very slow.

Mr Gibb spoke about measuring. What process do you use to evaluate whether a job has been done properly?

Ken Gibb: We have a range of options. Earlier, I mentioned objective issues. We can use hard sums and measure hard deliveries in energy management, but with a lot of the other stuff, particularly moving towards the adaptation end, we can use an indicator that assesses where we are in the process—whether we have started it, whether we have started a consultation, or whether we have a fully developed, all-bells-and-whistles strategy that is under constant review. Those are the two ends of the spectrum. Most options sit in the middle. A combination of two approaches that involves what we can measure and assess fairly subjectively is often used. The other aspect is a general assessment of how the public perceive things to be being delivered locally.

There is a range. There is no simple answer, but we are seeking to make our indicators as firm as we can. That is part of what is at times a painful process that we are all going through with the review of the SOAs, to ensure that we capture all our objectives with indicators that are as firm as possible. As I am sure the committee recognises, that is happening throughout Scotland. I hope that the new SOAs will be much better than the previous ones at identifying the issues that you have flagged up.

14:30

Councillor Hay: The SOA process is certainly the way to go. The second round of SOAs encompasses the agreement of the community planning partnerships. Sitting on those partnerships are all the groups that you would hope would be involved in what we have just been discussing. The SOAs are the way forward.

The Deputy Convener: We spoke earlier about the duties of public bodies. How successful do you think those duties are in relation to biodiversity, equalities and so on? Are local authorities and others able to deliver the ambitions of the duties or is that difficult for you?

Ken Gibb: The key to an effective duty is first of all that it is clearly defined. As I indicated earlier, that encompasses the full spectrum from what you have control over to what you might only be influencing to an extent. You will not be surprised to hear me say that there also needs to be appropriate support and resources for any duties that are introduced. A duty is all very well, but it needs to be properly defined, relevant to what is being asked for, and appropriately resourced.

Councillor Hay: Councils have a number of duties. You do not just set an action plan, then walk away and leave people to do things. You have to ensure that there is regular monitoring. As long as you keep the regular monitoring going, you are able to say, at the end of a year or whenever, whether something is working and whether it needs to be re-examined.

Anil Gupta: It is important that there is a clear role for an external body—probably Audit Scotland—to take a view on best value in relation to the public sector duty. We do not envisage a new climate change commission being set up in Scotland specifically to pore over all the public sector duties, from the police, health boards, colleges and so on. I do not know whether you have considered a particular route, but within the current arrangements, the Audit Scotland approach focuses our minds. Audit Scotland is involved in the evaluation of the SOA process, and it seems to fit very well.

Rob Gibson (Highlands and Islands) (SNP): Do you believe that placing climate change duties on public bodies is necessary in order for local authorities to contribute towards the targets of the bill?
Councillor Hay: As we indicated, although we do not oppose the imposition of duties in principle, it needs to be done in such a fashion that it takes into account everything that we are doing at the moment. To impose a duty just for the sake of imposing a duty is not a good idea. I hope that you agree that, as Ken Gibb has indicated, we have our minds fairly focused on what the Climate Change (Scotland) Bill entails. In principle, duties are fine, but there should be enabling powers to begin with and consideration should be given to what other duties we have, so that there is no overlap or contradiction and we do not take our eye off the ball. In principle, I would say yes to duties, but let us not rush into this.

Ken Gibb: I support that. Clearly, as Alison Hay has said, duties have value, but they need to be properly defined and consulted on so that we are in full partnership with the Government on them.

Anil Gupta: I want to expand on what Ken Gibb said about area-wide emissions. We have material from the Scottish Government that suggests that public sector bodies in Scotland are probably responsible for about 2 per cent of greenhouse gas emissions, so we need to keep things in proportion. If we wish to go beyond our own immediate emissions, we need to think about how easy it is to influence those with whom we have partnerships, including the private sector. If there is a public sector duty that goes beyond what we are currently doing, there must be ways and means to achieve a broader impact.

Rob Gibson: COSLA’s written submission states:

“We are open to the development of a process that would identify the gaps and barriers to action within present structures and how any future duty might seek to overcome them.”

In terms of the targets, if there are gaps and barriers, you ought to hint at what those might be.

Councillor Hay: Our submission goes on to say:

“One possible way forward would be the convening of a high-level … Climate Change Steering Group bringing together key partners”

so that we can look at all this. I maintain that view, and I have been talking about that for quite some time. A cohesive Scottish drive to implement the Climate Change (Scotland) Bill must be led from the top. We do not have all the answers at the moment—there will be gaps and barriers somewhere. However, we need to look at it in an holistic way with all the public bodies, the private sector, which plays an important part in this, and the voluntary sector. All of us need to sit down and look at what we can do to ensure that the bill is as watertight as we can get it.

Rob Gibson: Therefore, you do not think that a specific duty should appear in the bill.

Councillor Hay: No.

Rob Gibson: Let us turn to adaptation and mitigation. The bill requires the development of a climate change adaptation plan. What are you already doing, which we have not discussed before, to increase resilience to climate change? That is a duty that local authorities can be involved in. What else could the bill define on that matter?

Ken Gibb: A range of things could be done. We are still catching up with the agenda and we have had difficulty in properly assessing and measuring adaptation. We are mindful of the fact that the second stage of the consultation on adaptation is due to begin, and we will have a chance to give the matter further consideration then.

As far as adaptation is concerned, our mind is very much focused in the here and now on the increased risk of flooding. That is a serious issue now for many Scottish local authorities, which requires consideration of significant investment in roads infrastructure and the appraisal of assets. For example, a number of local authorities own reservoirs, some of which are quite old and, with an increasing number of climatic events, are becoming more prone to damage or flooding. Therefore, we also have concerns about our responsibilities for reservoirs under the Flood Risk Management (Scotland) Bill.

The appraisal of such assets is now of concern to us. Whereas, in the past, they were perhaps fairly peripheral to a local authority’s concerns, they have suddenly become quite central in terms of concerns over risks to infrastructure and human life. That is a whole new area, which goes beyond the simple consideration of emergency planning. That is a first stage in the process, but we need to move beyond that to strategic risk assessment not only of our infrastructure, which is quite costly, but of the maintenance of the key services that we deliver. Key services are often linked to appropriate infrastructure, especially in rural authority areas. We are concerned about a range of issues that are important here and now, without beginning to consider the problems that may become more prevalent as a result of increased heat events and prolonged periods of drought, which we may well face in the years and decades to come.

Councillor Hay: A number of local authorities are already looking at the matter. I have just come from giving a short presentation on flooding at the Scotland and Northern Ireland Forum for Environmental Research conference in Glasgow. SNIFER is looking at the Flood Risk Management (Scotland) Bill, which is apposite as that bill and the Climate Change (Scotland) Bill go
hand in hand. The issue of flooding is linked to emergency planning to some extent, but there is no doubt that we must examine the impediments to natural flooding in our areas and what we need to do to allow that to occur.

It is also apposite that we have new planning legislation. We need to ensure that what we approve as planners does not cause more problems and that developers and house builders do not submit applications to build on flood plains without giving due consideration to mitigation, adaptation and so on. Local authorities are looking at many issues at the moment and will continue to do so, along with their partners. However—dare I mention it—resources will always be a problem for us, even if we identify what is wrong.

**Alison McInnes (North East Scotland) (LD):** You have touched on the issue that I want to raise. You have spoken a lot about the role of local authorities and the work that they do. I am particularly interested in the step changes that they can make as planning authorities. Could you say a little more about the role of local plans in moving forward the climate change agenda?

**Councillor Hay:** It is extremely helpful to focus on planning. When we construct local plans, we talk not just to planners but to the Scottish Environment Protection Agency, Scottish Natural Heritage and other bodies; we also look at transport infrastructure. All of those discussions have an impact on how we draw up local plans. Planning has an extremely important role to play in enabling us to identify where the problems and risks may be. We must take those into account when drawing up local plans.

**Ken Gibb:** The committee may be interested in hearing more about the local climate impacts project that the network is promoting in association with SNIFTER, of which I am sure members are aware, and the UK climate impacts programme. We have run a successful pilot in four authorities in Scotland, which is about to be reviewed with a view to its being rolled out much more widely. The project focuses on the current and historical impacts of intense weather events, how those are likely to change in the future and how local authorities should consider responding through planning, to which Alison Hay alluded, and service delivery. That piece of work is on-going, and we hope that the Scottish Government will continue to support it. We are sure that it will bear fruit and benefit local authorities and the Scottish public sector.

**Rob Gibson:** The pilot scheme is to be rolled out to other authorities. Is that a good example of local authorities sharing best practice on climate change mitigation and adaptation?

**Ken Gibb:** Undoubtedly.
Anil Gupta: The whole picture will have to be considered, because things are getting confusing. It is a bit of a moveable feast. We expect that energy performance certification from Europe will cover buildings with a floor area that is quite drastically smaller than the present specified floor area of 1,000m². We would like some sort of floor, if you like, to be put on such reductions, so that we can size our tasks and plan properly. Councils will have a big role in enforcement and will have to recruit more staff. That will have to be taken into account, as well as the capital side.

When the powers come to be used, it would be good to be sure that an holistic view has been taken of all the legislation—whether European, UK or Scottish.

Ken Gibb: I concur with what has been said.

Alison McInnes: You have expressed concerns about resourcing, and it is clear that capital budgets are under heavy pressure. Have you any suggestions on how we can move forward?

Councillor Hay: I do not want to steal anybody’s thunder, but I have mentioned that a central loan scheme might be set up. That idea can be elaborated on by others.

Alex Johnstone (North East Scotland) (Con): I understand that several local authorities provided the Finance Committee with written submissions on the financial memorandum but that that committee was unable to hear evidence from either COSLA or a local authority. Let me take the opportunity to ask a couple of questions on issues that arose from those submissions. First, a number of local authorities criticised the information that was included in the financial memorandum for being vague and for being based on assumptions that were merely best guesses based on disaggregated UK costs. Do you have any views on that?

Ken Gibb: I concur with that. I must confess that I read the questionnaire that came with the financial memorandum with a view to trying to provide a response, but I found it difficult to give a meaningful response to any of the questions. Therefore, I felt that it was inappropriate for me to provide a written response. I recognise the point that has been made.

Anil Gupta: We found it quite difficult to get advice on how we could respond. That is one reason for the gap. The task involved was quite difficult, so we did not submit a response specifically on the financial memorandum.

Alex Johnstone: Part 5 of the bill includes various regulation-making powers that could have a significant impact on local authorities. Do you have any view on the cost implications of those, or are those issues to which councils do not want to commit?

Anil Gupta: It is not so much that we do not want to commit. Our impression was that it is difficult even to start sizing the job at this stage. We expect to be fully involved in discussions and consultations on any secondary legislation that is proposed to cover those issues. However, the provisions are too vague at the moment.

Ken Gibb: I seem to recall that quite a lot of the issues were predicated on dealing with waste, which I felt was in the remit of another network.

Alex Johnstone: The submissions from Glasgow City Council and Highland Council highlighted their particular circumstances that might result in greater challenges and costs for them in meeting the targets under the bill. Do you have any views on how the various costs on local authorities could be accommodated equitably through the various funding allocations?

Councillor Hay: In general terms, each council receives a funding allocation. We are grateful that an awful lot of money that was previously ring fenced is no longer ring fenced, so we have a budget that we can use flexibly. It will be up to each council to prioritise how it spends its money. With funding becoming ever tighter and with our priorities in social work and education and so on, it is difficult to see how councils will be able to fit in everything that is expected from what is a very limited budget. However, each council must take its own decisions on how it spends its budget, based on local priorities.

Alex Johnstone: Do you expect national Government to consider the implications that such responsibilities will have on how the Government allocates funding to individual local authorities?

Councillor Hay: If we continue to work under the concordat, that will need to be done in conjunction with discussions with local government. It is up to local authorities how they spend their budgets. National Government has a set of priorities to which we try to align our priorities through the SOAs. By and large, I think that national and local government are not too far apart. However, at the end of the day, the budgets must be set by the councils, which need to allocate resources as they feel appropriate, based on what they feel are the needs of the local populace. For example, Moray Council and Perth and Kinross Council are faced with a big burden in trying to mitigate the effects of flooding, which happens quite a lot in their areas. That will become a priority for them and I assume that they will spend money on it. Councils do not all have the same priorities, so they will allocate money as they see fit.

Anil Gupta: If additional responsibilities are imposed on councils because of the bill and secondary legislation, the resources will need to
follow and we will want to be engaged about that and to have an open dialogue about what we require—that may be what Alex Johnstone is asking about. However, there is no great detail at this stage about what the obligations might end up being and what actions will be required, so we cannot start talking meaningfully about the resources that will be required. That is one of the difficulties that are caused by the amorphous nature of what is in the financial memorandum. We will need to discuss that in detail at some point, but we are not there yet.

Des McNulty (Clydebank and Milngavie) (Lab): I hear loud alarms. What you have just said reminds me a bit of single status agreements, which have been a financial catastrophe for local government. The bill is wide ranging, with arduous targets, and it will be delivered only through significant changes to local government’s duties and practices. Is it not local government’s responsibility to ask central Government, which wants the bill to be passed, to spell out in clear detail what it needs local government to do and the price of doing that because, otherwise, local government might not be able to guarantee to deliver the bill, although it might support it in principle? I am surprised that COSLA could not give evidence to the Finance Committee on the bill, or that the committee could not hear evidence from COSLA. It is axiomatic that we should not pass such a comprehensive bill, with so many implications, without clear understanding from local government of what is involved and the associated price tag.

Councillor Hay: Much of the detail will come out through the UK climate impacts programme—

Des McNulty: No, I am sorry, but you cannot do it that way. You cannot say that we will pass the legislation and then sort out the detail; it must be done the other way. We must have the detail before accepting the legislation.

Councillor Hay: I do not have a problem with saying that local authorities need to reduce the carbon emissions from their buildings, draw up plans to mitigate the effects of flooding and stop throwing all their rubbish into tips. I have no quibble with doing that sort of thing. It is implicit in signing up to such generalities, if you like, that there will be deep discussion between the Government, local authorities and their partners about how we go forward with the detail. I am not signing up to this just so that the Government can tell us what it wants us to do and expect us to fund it from budgets that are not going to rise. I would have thought that the sheer magnitude of the bill indicates to everyone that there is a cost attached. It is difficult to work out what that cost will be because there is so much in the bill and so much detail that councils and other organisations will have to draw up. We cannot put a price tag on that at the minute.

It is a responsible way forward for local government to say that we are content with the generalities in the bill and are starting to do certain things already. There will be costs, but we need to sit down and talk about them.

Des McNulty: I will put on the hat that I formerly wore as convener of the Finance Committee. If you, as local government, say that you are prepared to sign up to a measure in principle but will come back and discuss the costs later, the Government—whatever Government it happens to be—will turn back to you and say that you signed up to the measure and it is under no obligation to fund the costs because they have not been prequantified. There must be a deal that concerns not aspirations, but concrete delivery mechanisms. Otherwise, we are just playing.

15:00

Councillor Hay: In that case, we will have to do nothing until we have had all those discussions. I do not know how long it will take until we sit down and discuss in intimate detail how much all the proposals will cost.

This is not in our submission and perhaps I am speaking out of turn, but I would like local authorities to continue along the voluntary track that they are on—to continue to draw up the plans that they have in train through the sustainable development duty, examine what their buildings emit and consider how they can improve transport infrastructure—and sit down responsibly with a responsible Government to discuss how we take all that forward for the future. Climate change is too big a topic and is too important to Scotland—to the world, in fact—for us to stop doing all that until we work out down to the last ha’penny how many pounds, shillings and pence we will need. If we do that, nothing will be done. I would far rather continue doing what we are doing and talk in a mature manner with everybody concerned about how to make progress.

Ken Gibb: I, too, hope that I am not talking out of turn, but we all realise that we could consider a range of spend-to-save proposals. For example, we are just beginning to get to grips with the carbon assessment of capital investment projects and the real return on investments. There is still a fair degree of scope to work within our existing budgets, which we clearly have to do at the minute, unless new resources are made available. However, there is scope for us to be more imaginative about how we make capital investments and spend revenue. We are engaged in that almost daily. That is the only situation that we can live with at the minute.
Des McNulty: There is uncertainty about how aspects of the bill might be delivered. However, the one thing that is certain is that it is not cost free. We are a responsible legislature and, if we are to pass legislation—particularly legislation that is as broad ranging as the Climate Change (Scotland) Bill—we require at least an outline delivery plan to enable us to understand what the proposals actually mean.

Local authorities account for something like 34 per cent of the budget. If, with all the expertise that is at their disposal, the bodies that spend 34 per cent of the budget are not able to provide us with an assessment of the bill’s implications, how are we expected to perform our function? That is not about whether we are willing to tackle climate change or are in favour of tackling it, but about making a proper, rational and systematic assessment and asking what the bill means. With respect, Councillor Hay, if I was in government—

Councillor Hay: As I understand it, the bill is broad ranging. I agree that we need to know the cost. You were not here when we talked about the need for a minister-led body that could examine the issue, including the gaps, the barriers and where new resource will be needed. Such a discussion needs to be led from the top, because budget planning is associated with the bill. That is Parliament’s point of view.

Councillor Hay: The bill is broad ranging. I agree that we need to know the cost. You were not here when we talked about the need for a minister-led body that could examine the issue, including the gaps, the barriers and where new resource will be needed. Such a discussion needs to be led from the top, because budget planning is associated with the bill. That is Parliament’s point of view.

Shirley-Anne Somerville: A few different percentages have been bandied about, such as that local government gets 34 per cent of the budget. I think someone said earlier that it accounts for 2 per cent of emissions. Given the scale and importance of the issue, is it not advisable that we do not delay or seek to put barriers in the way of this important bill before the Copenhagen summits, simply because of 2 per cent of emissions? Given that we are talking about a framework document rather than policy directives, there is room for each local authority to come back with specific proposals. Each authority will be affected differently and can adapt to some of the climate change issues.

Councillor Hay: Yes. That is a sensible way forward.

Ken Gibb: Absolutely.

Alison McInnes: I want to return to something that Councillor Hay said earlier. She was at pains to stress that the investment that local authorities will make is really up to them—she stressed their autonomy. Given my background, the witnesses will understand that I respect that autonomy. However, we are talking about tackling something unprecedented. I want to explore with you the tension between local autonomy and the need to address a much wider issue. You stressed that all local authorities had signed up to the climate change declaration. I would like an assurance that that is not something that is done and dusted and put away in the cupboard. Choices have to be made about social work, education and so on, but surely the commitments that you have made must underpin that. I would like to hear that assurance from COSLA.

Councillor Hay: We have set up the climate change task group, which I chair through COSLA. That group involves Ken Gibb’s organisation, SOLACE and finance officers. We are monitoring anything to do with climate change—in other words, the declaration. We have taken an active interest in the bill and the adaptation consultation. We are doing what we can at our level, if you like, to ensure that we take forward the declaration, which the Government has signed, too.

Ken Gibb: It might be useful to say that the declaration is very much alive and developing. A number of authorities are looking at rolling it out across community planning partners and other public sector organisations. Some other organisations have used it as a starter for developing their own similar, but not identical, work. Some of the universities and other academic institutions are about to launch something in the same spirit that is allied to the declaration and which, to all intents and purposes, is seeking to achieve the same ends. The declaration is very much a developing piece of work. We seek to continue to expand and develop it.

Alison McInnes: I suppose that the proof of the pudding will be when we start to see changes in budget provision. When will those high-level commitments start to flow through into significant changes in budget spend?

Councillor Hay: They are already starting to come into the SOAs. If you look at them, you will see commitments to the climate change declaration.

Ken Gibb: There is a small caveat in that a lot of the climate change declaration stuff sits below the waterline in terms of action planning, so it might not appear as a high-level indicator in all the SOAs. In a significant number, it will appear more appropriately in the action planning part, which is the working end of the SOA, if you like.

Anil Gupta: On the carbon reduction commitment, about three quarters of our members are covered by the cap and the carbon trading
scheme, albeit that they are not terribly pleased to be involved in the trading scheme. The effect of that is that the councils that have been involved in the carbon trading councils programme that was launched by the Local Government Information Unit are taking it very seriously. Carbon use within councils’ service functions is starting to become a main consideration alongside finance. We envisage that that is likely to roll out across a number of councils as the finance managers start to look at carbon as a mainstream consideration in their input to policy.

The Deputy Convener: I thank the witnesses for their evidence this afternoon. If there are issues that have been missed out of our discussion this afternoon, witnesses should write to the committee.

Councillor Hay: Thank you for listening.

The Deputy Convener: You are welcome.

15:10
Meeting suspended.

15:12
On resuming—

The Deputy Convener: I welcome the second panel. The witnesses have given evidence to the Economy, Energy and Tourism Committee on part 5, chapter 3 of the bill, which is on energy efficiency. The panel consists of John Stocks, who is the Carbon Trust’s manager for Scotland; Mike Thornton, who is the Energy Saving Trust’s Scotland director; and Chas Booth, who is the senior press and parliamentary officer for Scotland for the Association for the Conservation of Energy. Before we move to questions from the committee, does any panel member wish to make a short opening statement?

Chas Booth (Association for the Conservation of Energy): I will, for committee members who do not know us, briefly introduce the association. The association undertakes research and campaigns to reduce overall energy demand as part of a secure and sustainable energy future. Our work reflects the interests of our members—the major manufacturers and installers of energy-saving equipment across the United Kingdom—and is funded largely by them. We are members of the Stop Climate Chaos Scotland coalition and the Scottish fuel poverty forum.

Mike Thornton (Energy Saving Trust): The trust works to persuade the domestic audience—householders and citizens such as you and me—to save carbon and energy in our daily lives, and hence to save money. We always figure that we have to engage with millions of people to produce mass change. Our interest in the bill focuses on that area.

John Stocks (Carbon Trust): We work largely with the business audience, helping businesses to deliver emission reductions now and in the future through the use of existing and future technologies.

We welcome the bill. We are particularly pleased about its emphasis on the numbers and on quantitative and not qualitative targets. We are also pleased about the rigorous approach that the Government has taken in setting annual targets and asking for detailed annual reports.

In our discussions with small businesses on how to set their carbon footprints, we say up front that they must spend time on careful consideration of the boundaries of their emissions footprints—what is in and what is out—and on careful setting out of those boundaries.

15:15
I see little detail in the first four parts of the bill about sorting out the boundaries of Scotland’s footprint, nor do I see that a lot of thought has been given to the calculation methodology. Once you have that boundary, how do you calculate the footprint? You could argue that the detail can be worked out as time goes by and we progress with the bill.

It is important to any organisation that is presenting its carbon footprint that it knows what its data sources are and that those data are available. One concern I have is about whether there is a need for statutory obligations on energy suppliers and utilities to provide the right sort of data to Government and local authorities so that they can properly calculate their footprints.

The Deputy Convener: I am keen to get on to questions. You can perhaps address in your responses issues that you want to bring up.

Do you have general views on how consultation on the bill has been carried out, including on part 5?

Mike Thornton: The Energy Saving Trust feels that the consultation process was helpful and informative for all parties. I do not know what committee members think, but we definitely think that it is good that there were so many consultation responses—a phenomenal number—because one of the key targets for the bill and for the agenda that it sets out is engagement of organisations and the public. We definitely seem to have made a good start, which is encouraging, as far as it goes.
Chas Booth: I echo Mike Thornton’s comments. The consultation was excellent. We attended a couple of events at which a number of stakeholders were encouraged to give their views. That was fantastic—the bill team is to be congratulated on how it consulted on the bill.

Our only concern is the lack of consultation on specific measures to tackle emissions from existing buildings. In February last year, the Scottish Government gave notice on its website of a forthcoming consultation on emissions from existing buildings. There was a consultation in, I think, November of last year on non-domestic buildings, but there is still to be a consultation on domestic buildings, which account for a third of Scotland’s emissions, so there is a major gap. That is the only concern that I would highlight about the consultation process.

The Deputy Convener: You feel that that is “a major gap” in the consultation process.

Chas Booth: Yes. The bill as drafted wills the ends—the emissions reductions—but does not deliver the means to deliver them. Energy efficiency is the cheapest, quickest and most cost-effective way of delivering those emissions cuts, so there should be something in the bill on domestic energy efficiency. That is a major gap.

The Deputy Convener: I am interested in the targets. Are the 2050 and interim targets achievable? Will the bill work and achieve what it is meant to?

Mike Thornton: The trite answer is that if it does not, we are all in trouble. The previous panel made comments about new technologies, particularly in transport and so on, and there is no doubt that new technologies have a part to play, but in respect of saving carbon and reaching the targets in the bill, we do not need magic bullets: we need to apply consistently techniques, approaches and technologies that are already here, over the period for which the bill sets targets. If we do that we can achieve them.

I echo Chas Booth’s comments that energy efficiency is very much part of the armoury that will be needed.

John Stocks: I could not be certain yet. I am not sure that I can stack up the sums to say, “Yes—I can see an 80 per cent reduction being achievable.” However, I see some very significant measures that together can start to produce very deep reductions. It will not be one action that will deliver a cut of 80 per cent; it will be a number of actions across the board because of how they add together.

If we can cause the energy consumption—heat demand and electricity demand—of buildings to fall dramatically through increased energy efficiency, we can start to use low-carbon sources to meet that residual requirement for energy. If we add together the effects of a decarbonised electricity supply and of using renewable sources for heat, we will start to deliver the deep cuts that are needed if we are to achieve the 80 per cent target by 2050.

Chas Booth: We think that a target of at least 80 per cent by 2050 is right for Scotland. That is in line with what the Intergovernmental Panel on Climate Change recommends. It is important to keep that target under review. Clearly, there will be a role for a Scottish advisory body to ensure that the target reflects current science.

We believe that the target can be achieved with the right policies. The Scottish Government recently commissioned a report from AEA Technology on mitigating climate change in Scotland, which contained an assessment and identification of initial policy options. From memory, I think that it identified policies that would deliver a reduction of around 78 per cent in carbon emissions, which is only 2 per cent less than the target.

The Deputy Convener: What is your view on annual targets and the Scottish Government’s suggested emission tracks?

Chas Booth: We think that annual targets are vital and that they should be set in statute from the start.

Our industry needs time to invest in the processes and the manufacturing equipment that we need in order to deliver insulation products and highly energy-efficient products. If our industry is to have the confidence to invest in that, we need to be certain that Government is serious about delivering those cuts. We think that the best way to do that is for Government to set annual targets in statute right from the start, which would be a way of saying that it is absolutely serious about delivering the cuts and that it wants the entire economy to help it to do that.

Statutory annual targets of at least 3 per cent, which I think is what was promised in the SNP manifesto, should be delivered from the very start.

Mike Thornton: We, too, support the use of annual targets. As the committee has been told on many occasions, the early cuts count most, because the sooner we start to make cuts, the smaller will be the area under the line on the graph of carbon emissions between now and 2050.

The bill takes the right approach, but we have to bear in mind what that approach means. Annual targets can lead to a temptation to meet each annual target in turn and to forget about the background question on how you will meet the annual targets in 15 years. There must be a twin-
track approach. That is implicit in the bill, but it is worth stating explicitly. There are elements that are on different timescales that need to be done at the same time as one another. For example, next year, we will have to work to meet the short-term annual targets at the same time as we are doing things that will put us on track for medium-term and longer-term targets. That way of thinking must be taken on board.

John Stocks: Until recently, our growing economy and our business-as-usual approach have meant that there has been growing energy consumption. However, we have to turn that around so that there is declining energy consumption. It is therefore essential that we have routine and regular data to measure that. I strongly welcome annual targets and annual reporting.

Des McNulty: There are three basic criticisms of the bill. Earlier, with COSLA, I dealt with one of them, which is the issue of financial costings. I would like to raise the other two with you. One of them concerns the reductions in the medium term, and the fact that, between now and 2020 there is a flexible target, as it were, rather than an annual target of a 3 per cent reduction. Could we set a higher bar for the period between now and 2020? If so, where should the bar be set?

It has been suggested that the bill should include a commitment to public engagement and that consideration should be given to a framework for the delivery of public engagement. Should public engagement figure in the bill? That is an appropriate question to put to your organisations.

Mike Thornton: Engagement is key. Public awareness of climate change and the need to do something about it by cutting carbon emissions is high, but engagement as a result of that awareness is relatively low. The trick is to get people to understand that the issue is real and matters to them and that they will need to take action personally. The bottom line is that the country cannot make carbon savings of 80 per cent unless pretty much everybody agrees that they must play a part in that. People have to see that they must act and that benefits will be gained by their doing so.

Many of the benefits are to do with finance and lower energy bills, but there are also many benefits to do with quality of life. People often think that climate change means that they will not be able to have a car. They think, “No car—can’t travel”. We need to put the proposition that other forms of travel and public transport will be more convenient than driving oneself. There is a big job to be done to make people understand that the hair-shirt model of responding to climate change is not necessarily the future for them.

In the context of public engagement, the duties that the bill will place on public bodies are vital. Nobody can expect individual members of the public to engage unless the bodies that work for them are seen actively to be pulling in that direction.

John Stocks: I touched on the issue that Des McNulty raised in his first question when I talked about how it was business as usual, with rising demand, until about 18 months ago.

We need to turn that round by getting on to a trajectory of reductions of 3 per cent per year, but we must go through a transition if we are to reach that point. I agree with Mike Thornton that we need to do that as soon as possible. My guess is that we ought to be able to reach that point sooner than 2020; we should certainly aim to get there much sooner. Long-term action is needed, because before we start to see big changes we will need to have designed, built and put into operation buildings that have smaller carbon footprints. There will be a time lapse before we get onto a trajectory of 3 per cent annual reductions, but I doubt that it needs to take until 2020 for us to get there.

I agree with Mike Thornton on public engagement. Most private householders are also employees. We need to engage with people at home and at work on delivery of reductions.

Chas Booth: I also agree with what Mike Thornton said about public engagement. One of the best ways of engaging the public is for the public sector to take a lead. For example, we were pleased by the Westminster Government’s commitment to procure only public buildings that are in the top quartile of energy performance. It would be extremely useful if the Scottish Government could match that commitment. That would be one way of ensuring buy-in from the public.

Des McNulty asked where the bar should be set in the middle distance. At the committee’s meeting a few weeks ago, a witness suggested that the target should be for a reduction of about 50 per cent by 2020. We think that that is about right. However, annual targets are also essential.

The previous panel of witnesses today suggested that annual targets are not appropriate because of the so-called cold-winter effect, but we do not believe that that argument holds water because the variability that a cold winter would bring would not be sufficient to knock us out of the 3 per cent threshold. If the Government misses its 3 per cent target, it has to come back to Parliament and explain how that happened and how it will ensure that it gets back on track. It is not as if somebody is going to take the Government to court for missing its 3 per cent
target. All that has to happen is that the Government must focus on why it missed the target and on what it is doing to get back on track. We do not believe that the cold winter argument holds water.

15:30

Alex Johnstone: I bet you are surprised that I am raising the subject of aviation and shipping. Given your organisations' experience in benchmarking in both the business and domestic sectors, can you contribute anything to the measurement processes, which are currently discouraging some people from pushing for aviation and shipping to be included in the bill?

Chas Booth: I watched over the internet when transport industry representatives gave evidence to the committee a couple of weeks ago, and I was surprised, to put it mildly, that they argued, in effect, for a special case to be made. My understanding is that aviation and shipping emissions are already measured and reported to the IPCC under so-called bunker fuels. I fully accept that that measurement process might not be perfect, but it is better to have an imperfect process than no process. We entirely reject the idea that there should be special pleading for one sector of the economy simply because it contributes a great deal to Scotland's economic growth. Our sector contributes to economic growth. Our sector contributes to economic growth. Our sector contributes to economic growth. Our sector contributes to economic growth. Our sector contributes to economic growth. Our sector contributes to economic growth. Our sector contributes to economic growth. Our sector contributes to economic growth. Our sector contributes to economic growth. Our sector contributes to economic growth. Our sector contributes to economic growth.

On your specific question, there are measurements in place to establish emissions resulting from the aviation and shipping sectors, so I cannot see any justification for leaving those sectors out of the bill.

Mike Thornton: You must think about the signal that you will send to other sectors if you exempt a sector in practice or in principle. Either the target is for everybody or, probably, it is for nobody.

John Stocks: Aviation and shipping have significant footprints in their own right—about 3 per cent—but the more important factor is probably their rate of growth. You must include them in the bill because you have got to curtail that growth. You need to put them under the same disciplines as every other sector.

On the point about our experience, we have done a lot of work on the carbon footprinting of products, and when we do that work we often consider transport costs. We begin to see one or two myths being broken as we factor in the emissions from transportation.

Charlie Gordon: I have a supplementary question on that point. Mr Booth said that, in the context of the bill, his sector could contribute to economic growth and additional jobs. Do you have any figures to show in net terms what the bill could mean for the creation of jobs?

Chas Booth: Off the top of my head, no. I would need to get back to you on that. The one figure that springs to mind is that the Scottish Government announced that it aims to create—I think—16,000 jobs from the renewable energy sector. In my view, energy efficiency and insulation can do a lot more than that.

I do not know whether my colleagues have any figures on jobs.

John Stocks: No.

Mike Thornton: I have no specific statistics on that.

Chas Booth: I can certainly research that and get back to you.

The Deputy Convener: That would be helpful.

Alex Johnstone: What roles do your various organisations already play in advising the Scottish Government on emissions reductions?

Chas Booth: I can probably answer that in a very short space of time. The Association for the Conservation of Energy is a member of the Scottish fuel poverty forum—obviously, tackling fuel poverty in the right way can also reduce greenhouse gas emissions. We are also in fairly regular discussions with Scottish Government officials on, for example, the energy efficiency loan scheme that the Government hopes to introduce in the near future. We are in regular dialogue with the Government, but I hand over to my colleagues to comment on advice.

Mike Thornton: As I said at the beginning, the Energy Saving Trust delivers many programmes on the Scottish Government's behalf, most of which integrate with households to get them to reduce emissions through transport, microrenewables and energy efficiency. In delivering those programmes and discussing them with the Scottish Government, we feed back much experience on what works and does not work and we offer what we hope are insights and advice on pathways to make initiatives more effective.

The Energy Saving Trust has a strategy and policy team, two members of which are based in Scotland. We produce strategy and policy reviews and reports in our own right, which we present to and discuss with the Scottish Government in the hope of adding to the policy debate. We also have a wide range of expertise and statistics, which we place at the Scottish Government's service.

John Stocks: The Carbon Trust advises the Scottish Government in two ways. First, as the Scottish Government is a large administrative
organisation with a large footprint in its own right, we are taking it through carbon management in the same way as we have taken and are taking local authorities through it. We advise the Scottish Government in the same way as we advise any other large business client.

Secondly, our insights team considers policy options, and the output of its work is available to the Scottish Government. We routinely brief officials on that work and its implications for Scottish policy.

Alex Johnstone: I will move on to the main question on which I would like your opinions. The bill provides for the possible creation of a Scottish committee on climate change, but initial reliance will be on the UK Committee on Climate Change. Does the UK committee have the necessary expertise to perform the advisory role for the Scottish Government? With the benefit of your experience, do you feel that a Scottish committee would fulfil that role more appropriately?

Mike Thornton: Our view is that, as a previous panellist said, the UK committee provides a large centre of expertise. Some of the policies that affect UK and Scottish climate targets are UK policies, so the sensible default position is to wait and see. If the UK committee can focus on Scottish needs and circumstances, we see no reason why it should not deliver what the Scottish Government needs. The committee has the expertise, and we hope that it will also have the focus. If that proved not to be the case or if Scottish circumstances and needs required something that was closer to and more centred on Scotland, the option of the Scottish committee would exist. We would judge that on the evidence. Reinventing the wheel is not necessarily the most cost-effective strategy if another wheel is not needed. We cannot judge that yet.

Chas Booth: I disagree slightly with Mike Thornton, given what the UK Committee on Climate Change’s first report says about Scotland. When this committee took evidence from the Committee on Climate Change’s chief executive and one of its researchers a few weeks ago, they admitted that their first report took a broad-brush approach to Scotland—it might also be described as cursory.

I understand that, because we do not yet have a Scottish climate change act, the Committee on Climate Change’s focus is on Westminster, but the initial report’s broad-brush approach suggests that that committee does not have the resources to give independent advice in Scotland. I also question whether the UK committee has sufficient insight into the Scottish situation. On energy efficiency, for example, Scotland’s building stock has a different profile. That means that the challenges are different in achieving the energy efficiency savings targets.

We would prefer a separate Scottish committee. It is of course important that, as Mike Thornton says, we do not reinvent the wheel, and that the Scottish committee has close links with the UK body, but at the moment the evidence suggests that the UK Committee on Climate Change does not have the expertise or resources to enable it sufficiently to perform the role that is envisaged for it in Scotland.

Mike Thornton: Perhaps that is the challenge that the committee faces. The question is, will it achieve focus and rise to that challenge?

John Stocks: On its website, the Committee on Climate Change sets out four priorities: to “Provide independent advice to Government on setting and meeting carbon budgets and targets”, to “Monitor progress”, to “Conduct independent research and analysis” and to “Engage with representatives”. In at least two of those areas, there is benefit for Scotland in getting the same output of independent research and analysis of global issues as the rest of the UK. I am a little more nervous about whether the committee, with its UK-wide structure, has the resources and time to dedicate to the large amount of Scotland-specific reporting that will be required to meet the bill’s objectives.

Rob Gibson: My question relates to our improving knowledge of how progress will be measured through the annual reporting process. Do you think that the mechanism for reporting is sufficiently robust? How it could be improved?

John Stocks: I answered the question in part in my opening comments. I see little detail of the reporting and data-gathering mechanisms and calculation methods that will be used. I am uncomfortable about saying that we know that they are sufficiently robust. I am particularly concerned about data gathering, an issue with which our clients routinely have difficulties. You might think that it would be easy to get good data, but it is not. Unless we focus on data, know which data we want and put in place adequate provisions to ensure that they are made available, reporting will be weakened.

Rob Gibson: Has the Government not already indicated that data will be sourced from the IPCC? Is it not looking to provide the industry standard level of data? When we asked it about particular kinds of data procurement, that was the default position. Are you criticising the level or detail of those data?

John Stocks: I would have to look at the data to which you refer.

Rob Gibson: They relate to many of the issues that we are discussing. Are there specific points
about which you are uncomfortable? Can you identify a particular area in which the data hold no water?

John Stocks: I am particularly interested in data relating to the energy that is delivered in Scotland and whether there is provision for us to get robust data from the utilities.

Rob Gibson: Would anyone else like to comment on the issue?

Mike Thornton: My point relates not to data but to reporting. We are pretty supportive of the mechanisms for reporting, but those are limited to what the bill defines as Scottish emissions and will not take into account Scottish consumption of goods and services that generate emissions abroad. The Welsh Assembly Government is proposing to report separately on Wales’s total consumption emissions. We float the idea that doing the same here might add to the picture that the Scottish Government gets of Scotland’s overall carbon footprint. In earlier evidence-taking sessions, the point was made that there is potential for us to get that information out of the carbon footprinting tool, which might be a way forward. We think that it is important to take exported emissions into account.

Rob Gibson: We can certainly ask the minister about the matter.

15:45

Chas Booth: I agree with Mike Thornton that it is important to measure exported emissions. The international standard is that targets are set in terms of production, but we think that consumption should also be reported, to ensure that we are not exporting all our emissions to China. The point has been made that, although Scotland’s emissions dropped substantially when Ravenscraig closed down, we continued to use steel—we just imported it from China.

Rob Gibson: Okay. Let us move on to the duties of public bodies. We have just heard evidence from the local authorities. Do you think that the public sector generally is delivering the required emissions reductions just now, given the current knowledge?

Chas Booth: No, I am afraid not. I will give you two pieces of evidence that show that the public sector generally is not doing quite enough. Scottish planning policy 6 was introduced more than two years ago and requires that all new developments over a certain size incorporate on-site microgeneration in order to reduce the CO₂ emissions from those buildings. It is required that local authorities implement that national policy in their local plans. Nevertheless, recent research found that only eight of Scotland’s 32 local authorities have done that. To me, that suggests that local authorities are not taking action where they can.

Rob Gibson: I wonder why some authorities are slower than others in implementing the policy. Are there difficulties for authorities in applying SPP 6?

Chas Booth: I recognise and sympathise with the comments of the previous panellists about finance. If local authorities cannot access finance, that is a key issue. There is a central energy efficiency fund to which local authorities can apply for money to make energy efficiency improvements. We would like that funding to be increased and we would like the processes by which local authorities can apply to the fund to be streamlined and made less bureaucratic. Nevertheless, our perception is that local authority planners have not had the support and guidance from central Government that they should have had to ensure that SPP 6 was rolled out smoothly and effectively.

Some local authorities in England have been running similar planning policies for nearly a decade. There is lots of expertise out there and we would be more than happy to train up local authority planners in how to implement SPP 6. Unfortunately, we have encountered a certain resistance from the Scottish Government to our rolling out that guidance to local authority planners. We would not lay all the blame for the slowness of the roll-out on local authorities; some of the blame must lie with the Scottish Government.

Rob Gibson: This is opening up a whole can of worms that it could take a long while to get to the bottom of. We need some data. If local authorities are not delivering the required emissions reductions, should specific duties appear in the bill to ensure that they do?

Chas Booth: Yes, absolutely. The previous panel’s main objection to that was the fact that funding is not available. We think that it is crucial that funding is made available to them, especially in the present credit-crunch climate. That is why we would like the central energy efficiency fund to be increased.

It may be a little cruel, but I would paraphrase the view of the previous panel as, after St Augustine, “Oh God, give me responsibility for climate change emissions, but not yet.”

Rob Gibson: We do not need the hyperbole; we are trying to take people with us. We ought to be asking ourselves whether there are specific duties that should appear in the bill. We can talk about the money when the secondary legislation is introduced. Do you think that there are specific duties that must be in the bill now?
**Chas Booth:** Yes. As I said, there should be duties in the bill. The only objection that the previous panel raised was about the lack of finance. If finance is made available, there can be no reasonable objection to the bill placing duties on public bodies.

**Rob Gibson:** I am interested in teasing out of you the specific duties. What should they be?

**Mike Thornton:** I do not quite follow the question. Are you inviting us to suggest specific measures that local authorities should take to reduce emissions by 3 per cent a year?

**Rob Gibson:** I am talking about public bodies in general, not just local authorities. Many other bodies have a part to play.

**Mike Thornton:** The specific duty should be expressed as a sectoral or organisational target, so that it conforms to the target approach in the bill. That is my answer to the question. I agree that it is non-specific, but I think that that is the right approach. It is up to the organisations and bodies concerned to decide how they will achieve the target, but they must achieve it.

**John Stocks:** Local authorities and health boards must achieve the same level of cuts as everyone else, so if we need to achieve an 80 per cent cut, that is what they will have to achieve.

It is not long—it is two years, I think—since the Scottish climate change declaration was signed. There has been a lot of movement since then. Many organisations have come through carbon management. Some of the leaders that went through that process a few years ago are on a trajectory that makes it begin to look as if emissions reductions of between 2 and 3 per cent will be achieved each year. A large number of organisations are now going through carbon management; they are starting out on that path and are beginning to make cuts. From what I have seen of the plans that they are preparing, they are ambitious and plan to get on to the same trajectory. We know that some organisations have got there and that many others are moving in that direction, but it is a little too early to say whether they will succeed in making those reductions on a voluntary basis. They are on the right path. Huge changes have been made over the past two years.

**Rob Gibson:** Those were extremely helpful remarks; thank you very much.

**Alison McInnes:** The deputy convener pointed out that the Economy, Energy and Tourism Committee took detailed evidence on the bill’s provisions on energy efficiency and renewable heat, but rather than simply requiring that an energy efficiency action plan be drawn up, should the bill include more specific legislative proposals?

**Mike Thornton:** Our overall view on the domestic sector’s path to achieving an 80 per cent cut in carbon emissions is that, over time, regulation of some form will be required. A lot can be done voluntarily and through engagement, but if such deep cuts are to be achieved, some form of regulation will eventually be required, so we think that it might be appropriate to include in the bill a provision that would allow such regulation to be made in the future. Our view is that that is a necessary tool to have in the box as we move forward.

**John Stocks:** Buildings—business buildings, public sector buildings and domestic dwellings—make up the biggest single part of our carbon footprint. If we do not tackle buildings, we will not tackle climate change, but the bill makes little reference to them. As well as building new buildings to strict low-carbon standards, we need to start thinking about refurbishing the existing building stock to the same low-carbon standards. If the bill were to contain additional measures on energy efficiency and renewable heat, we would like them to be on buildings and the building regulations, particularly in relation to the refurbishment of existing buildings.

**Mike Thornton:** I do not want us to be too much of a double act, but the building regulations offer a pathway to greatly reducing carbon emissions from new build. When I mentioned regulation, I was referring to the need to regulate existing buildings. Two thirds of the buildings that will be standing in 2050 have already been built. When it comes to carbon emissions, retrofit is the big game in the domestic sector.

**Chas Booth:** I agree with many of my colleagues’ comments. As I said earlier, the bill as it stands wills the end, but not the means. There are two energy efficiency provisions in the bill, one of which is for an energy efficiency action plan, which was first promised to us in 2004. Primary legislation is not needed to bring such a plan forward. In November last year, the Scottish Government promised that it would bring forward a plan by the end of 2008. We are extremely frustrated that it has delayed publishing a plan by at least another year. Of course, we welcome the statutory requirement for the Government to bring forward a plan, but such a requirement was not needed; the Government could have just got on and done it. We are frustrated because many things that do not need to be statutory have been put into the bill, whereas some provisions that should be statutory—such as giving ministers powers to require minimum energy efficiency standards at point of sale or rental; Mike Thornton mentioned that—are not in it. A number of studies show that such a provision will be needed for us to
achieve the 80 per cent cut that is required by 2050 and the fact that it is not in the bill is a major omission.

The Scottish Government cannot simply wish emissions away by setting targets; it must enable us—the wider Scottish economy—to deliver on those targets. The bill is hollow. It does not include measures that can help us to deliver on its targets and is, as it stands, doomed to failure. We will get nowhere unless amendments are lodged at stage 2 to tackle emissions from domestic buildings and strengthen the existing provisions for non-domestic buildings.

The second energy efficiency provision in the bill relates to non-domestic buildings. All that it does, as the previous panel made clear, is expand the provision for those buildings that will be required to have an energy performance certificate. The European Commission is already discussing going beyond that in considering what it wants from the energy performance of buildings directive, which is currently being recast. We think that it would be useful to include in the relevant section of the bill a measure that was included in the consultation that the Scottish Government put out last year, which is to require that certain cost-effective improvements that are listed on the energy-performance certificate will be put in place by the building owner over a certain period of time. We think that that would be non-controversial as long as finance was available. An energy efficiency loan scheme already exists for small and medium-sized enterprises. It is not big enough—it should be bigger—but finance is available, so we cannot see any reasonable objection to such a measure being included in the bill at stage 2.

Stephen Boyd (Scottish Trades Union Congress): I thank the committee for the opportunity to give evidence on this very important bill.

I would like first to highlight the reporting on our submission by BBC Scotland this morning. I do not know whether anyone here heard it, but it was based on something of a misapprehension that our written evidence speaks only about energy workers. I hope that it is reasonably clear to everyone that our submission covers the potential for the bill and climate change generally to impact on all the workers whom we represent. I would not like people to labour under the misapprehension that we are focusing on one sector only.

Our written submission refers to the work that has already been carried out by the joint forestry trade unions on the adaptation part of the bill. The forestry trade unions are sending a further written submission to the Rural Affairs and Environment Committee, so that evidence will be provided to you in due course.

The Deputy Convener: Thank you. I will start with the questions.

How much engagement did the STUC have during the development of the bill?

Stephen Boyd: Are you asking about internal engagement?

The Deputy Convener: I am asking about consultation around the bill and its development.

Stephen Boyd: We did not respond in writing to the first Scottish Government consultation, which reflects the considerable pressure that we were under last year, as you can imagine, with the deteriorating economy. We have looked quite closely at the bill now, and have had the opportunity to address it through our democratic structure. It has been discussed by a number of our committees, so I am quite confident that the written evidence that we have provided to the committee has the full backing of the STUC and our affiliated trade unions.

Anne Douglas (Prospect): I completely agree with Stephen. As part of that democratic committee structure, I was involved in the consultation along with the other affiliates.

The Deputy Convener: How does the STUC develop a coherent policy on climate change? How do you respond to the issues around climate change and the bill?

Stephen Boyd: We have done a number of things during the past few years. Although it pains me somewhat to say it, we have relied on the work that has been carried out by the Trades Union Congress at UK level. It has put a considerable amount of resource into the greening the
workplace agenda. The TUC benefited from Carbon Trust funding—which we have been unsuccessful in obtaining to date—which has allowed it to promote a very progressive agenda on the issues that we discussed in our written submission, including greening the workplace, the just transition framework, the transitional skills strategies, and so on. The TUC has developed a lot of material, with which I would be more than happy to provide to the committee.

Last year, we also held our first annual climate change conference at which we had a number of speakers from the Government and other stakeholders. It was an important event for pushing climate change up the trade union agenda in Scotland. We are looking to hold another similar event later this year. It is fair to say that unions are now far more engaged in the issue than they were previously.

Anne Douglas: If I may, I will just supplement that slightly. Different affiliates will do different things, but the committee might be interested to know that Prospect has run two pilot schemes on greening the workplace. One was with Scottish Power in Motherwell in an office environment, rather than a power station. A number of employees wanted to become environmental reps, which was interesting and good, as was the company’s buy-in on working jointly to try energy efficiency measures in the workplace. Within a year, that Scottish Power site managed to reduce by 10 per cent its carbon emissions through jointly agreed initial measures. It has identified more measures and, if they were implemented—some, if not all, would have costs—the company would reduce its carbon footprint by 40 per cent.

The second pilot organisation is public sector rather than private sector—the National Library of Scotland, here in Edinburgh. We have one training course and are about to embark on another. Fifteen employees in the National Library have expressed an interest in becoming environmental reps. Again, management has agreed to set up a joint committee, and we hope to develop that.

I want to pick up on something that a previous witness said about public engagement. We have found that members who are not normally active in trade unions want to become active in environmental campaigns that we run, which clearly pleases us as trade unions. However, trade union members are not just employees; they are also householders and, in many cases, shareholders, either directly or indirectly. To go back to Stephen Boyd’s point about funding, we believe that trade unions and the environmental reps, of whom we are appointing increasing numbers, are a good way to get to an audience that goes much wider than just employers and fellow employees. They reach a much wider social landscape in Scotland and, indeed, in the rest of the UK.

Charlie Gordon: Do you believe that the emissions reduction targets in the bill are achievable?

Stephen Boyd: Yes. As we said in our written submission, they are challenging, but achievable—given appropriate investment.

Charlie Gordon: I asked the previous panel whether they had a feel for what the net increase in jobs might be from implementation of the bill’s proposals. We hope to get information in due course about that. Do you have a feel for what the bill’s impact on existing jobs might be or for what new jobs might be created? Should we have a debate—in the context of the bill—about development of new skills, or about adapting skills as will be required to move to the low-carbon economy that is needed to hit the bill’s targets?

Stephen Boyd: Yes, I think we should. For a number of years now, we have heard extravagant rhetoric from politicians of every persuasion about the potential jobs dividend from developing our renewable energy and environmental sectors. We are supportive of that agenda and believe that jobs can be derived from that. On balance, we expect that to be beneficial to Scotland. However, I do not think that the detailed work has been done that would allow us to make a properly informed estimate of the net jobs impact. There are bound to be pluses and minuses, but it is difficult to give detail.

Charlie Gordon: I am interested in the minuses, too. Is there a potential downside or threat to existing jobs from the bill?

Stephen Boyd: If the bill’s implementation is not properly managed through our just transition strategy, as we outlined in our written submission, and if people are not sufficiently engaged in the agenda—I do not think that they are, at present—I can envisage situations developing whereby difficult decisions are made to close energy-intensive workplaces in order to meet targets. Clearly there is a potential downside.

One of our concerns is that, for a number of years and in Administrations of all persuasions, the underlying philosophy appears to have been that if we get the market broadly right, the jobs will appear—the market will deliver them. We do not believe that that is the case. There has to be a far more interventionist strategy. For a number of years, we have spoken at length about the need for a low-carbon industrial strategy for Scotland. Government has to act; it has to intervene to ensure that the jobs appear as we develop the sector.
Charlie Gordon: The Prospect witness has already given examples of the involvement of workers and trade union members in environmental activities in their workplaces and has reminded us of their wider role as citizens. Does the STUC have a system of communicating climate change messages to its affiliates? Are you aware of other programmes of behaviour change that are being driven by the unions?

Anne Douglas: On how the STUC communicates, a fairly extensive report was written after the conference last year to which Stephen Boyd referred. The report and the various contributions that were made by speakers at the conference were circulated widely among our affiliates.

I cannot talk for all unions, but when Prospect meets members of branches at annual conferences, we always have a session on the environment, just as we always have a session on international development. We do not talk just about pay and overtime rates; the discussion is wider than that. I have no doubt that other affiliates do similar things.

I hope that I understood your question on behaviour change correctly. I would point to the example of health and safety reps. Union reps have improved the health and safety performance of their employers to the extent that research says that those workplaces are more productive as well as being healthier for people to work in.

The other example to which I would point is union learning reps—the lifelong learning agenda has come to the fore. Employers, as well as the STUC, would argue that workplaces where there are union learning reps working with colleagues and employers are more productive, and people are more geared up to be flexible and to move as jobs change. On the low-carbon industrial strategy to which Stephen Boyd referred, having union learning reps in place is key to our beginning to change the skills of employees so that they do not lose out as a result of the climate change agenda.

Shirley-Anne Somerville: I want to follow up on one of the points that Charlie Gordon made. Anne Douglas gave the example of Scottish Power in Motherwell. I assume that the management was fully on board and was working in partnership with the union in that case. Are there other areas where you—Prospect or the STUC—would have liked to do more work, but where management has put up barriers or does not see the advantages to itself, never mind to wider society?

Anne Douglas: I am not aware that we have come across any examples of management saying no, but I am also honest enough to say that we have targeted the approaches at mantagements that we think will be sympathetic, in order to try to get some success stories under our belt, which we can then roll out to other employers with which we deal. The two cases that I mentioned are in Scotland. There are a number of other examples in the private sector and the public sector in the rest of the UK. I am happy to let the committee have the details, if you would find that helpful.

Shirley-Anne Somerville: That would be useful.

16:15

Stephen Boyd: The STUC tends to hear the good-news stories; stories about arrangements collapsing tend not to filter through to the centre. I have attended various conferences but I have not heard many stories about arrangements collapsing, which reflects the fact that the approach has tended to be targeted at workplaces in which working relationships are good, as Anne Douglas said. The approach has been taken in a number of workplaces in the manufacturing sector down south, where relationships tend to be more positive than they were in the past.

An interesting aspect of the agenda, which Anne Douglas mentioned, is the very positive benefit to trade unions in the context of our organising agenda and recruitment of new members—early work has been done on that. Perhaps there will be a different response from employers as we go forward, but we can only hope that that will not be the case.

Shirley-Anne Somerville: Has the STUC taken a position on the inclusion in the bill of emissions from international aviation and shipping?

Stephen Boyd: It seems entirely reasonable for the bill to include Scotland’s share of emissions from both sectors. We did not go into detail on the matter in our submission because we have not done detailed work on how emissions might be measured and assessed, which would enable us to comment on the provisions in the bill. However, if the bill is to have credibility, it would be reasonable to include emissions from aviation and shipping.

Des McNulty: In paragraph 2.3 of your submission you said:

“It is somewhat disappointing that the Bill has not been accompanied with more detailed work on potential economic and employment impacts.”

Do you agree that it is imperative that there should be a systematic job impacts evaluation before the bill is implemented? Would the STUC have an important role to play in such an evaluation?

Stephen Boyd: Such an evaluation would be desirable. As you can imagine, I spend a lot of time discussing the economic downturn with a
range of stakeholders in various forums, and a pretty constant refrain from some quarters is that there should be no new legislation that will impact on business. That is not a position that we support. As members know—Rob Gibson, in particular, will be bored of hearing this in the Economy, Energy and Tourism Committee—Scotland, as part of the UK, is a lightly regulated economy, and it is entirely proper that legislation should be introduced on important issues such as climate change.

However, it is imperative that in legislating we are as clear as possible about a bill’s potential impact, so that we can negate the inevitable arguments about the dangers of taking strong unilateral action. Therefore, we would support work on job impact evaluation.

Des McNulty: Does the STUC have a position on whether nuclear energy should be part of Scotland’s energy mix? What is your reaction to the view of the UK Committee on Climate Change that Scotland’s not having nuclear power would put the country at a competitive disadvantage due to higher energy costs?

Anne Douglas: The STUC’s position on energy is that a balance of generation sources is needed to ensure security of supply. That should include nuclear, and there should be further development of renewables and coal—clean coal, where possible—as well as oil and gas.

In the context of the bill, it is clear that because nuclear power does not produce CO₂ the continued use of nuclear power can only help us to achieve the targets that have been set UK-wide, and the targets that the committee is considering. I am not able to respond on higher energy costs, but I can say that we cannot in the future have a secure energy supply in Scotland in which nuclear is not part of the mix.

Des McNulty: Paragraph 4.1 of your submission states:

“The STUC tends towards support for a separate Scottish Climate Change Commission to advise the Scottish Government”.

If goes on to say that that commission

“should be charged with determining whether or not any reduction in emissions has been consistent with wider economic and social objectives”.

Will you comment further on that?

Stephen Boyd: The previous panels demonstrated that everyone understands that we need to engage the public in the whole agenda. From the STUC’s perspective, in engaging the public we have to help people to understand that they have a stake in change, and that that change is not being undertaken in a way that is actively detrimental to their interests. It is potentially quite unhelpful to have the main advisory body advising only on meeting the targets. It is entirely consistent with the wider aims of the Scottish Government and, in particular, of the Parliament, that the reporting mechanism should seek to address the wider economic and social agenda and not just the stark emissions targets in the bill.

Des McNulty: That is an interesting argument. Is your view, therefore, that the technical expertise of the UK Committee on Climate Change might be more appropriate in relation to considering the strictly scientific aspects of the issue, and that there is a need for a Scottish advisory body that is more involved with issues such as public engagement and the economic and social implications of climate change? Is that the kind of balance that you are pointing to?

Stephen Boyd: We are open-minded about it. There is a case to be made for a separate Scottish advisory body, given that there is a different legislative framework. A substantial part of the relevant policy is devolved and the public sector landscape is different in Scotland. If, as you suggest, the UK Committee on Climate Change were to provide the technical expertise, and a separate Scottish advisory body was established, we would look on that with interest.

Des McNulty: One of the criticisms of the bill is that the 3 per cent year-on-year reductions will not kick in until 2020. It has been suggested by witnesses that we need to get up to 3 per cent earlier than 2020. Does the STUC agree with that? What are the practicalities of introducing a higher interim target, in terms of climate change and perhaps also in economic and social terms?

Stephen Boyd: There is a compelling case for the emissions reductions to be front-loaded. That goes back to my earlier comments about the need to be far more robust in relation to the evidence base and the potential net jobs impact and so on. If we were to move towards a more front-loaded approach, it would make that all the more imperative.

Rob Gibson: Leaving aside for a moment the issues in relation to the bill that we have dealt with in the Economy, Energy and Tourism Committee, as you know, the bill sets requirements for annual reporting to Parliament, and on proposals and policies to meet any future annual emissions targets. The STUC believes that the reporting mechanism is robust, but you might want to expand on that. Can the STUC and Prospect suggest ways in which it can be improved?

Stephen Boyd: I was interested in the comments from the previous panel, particularly those from the Carbon Trust. If I can digress slightly, I attended a meeting of the national textile forum a week ago last Friday. The forum has
introduced a sustainability strand to its work, and I was keen to interrogate that a wee bit. I asked the employers around the table which of them had used the services of the Carbon Trust. All of them had, and all had found the service to be excellent, but only one thought that it derived real benefits. The others’ perception was that the interventions that the Carbon Trust suggested they should implement would be far too expensive for them. However, under further interrogation it appeared that there is very little understanding of the net CO₂ emissions savings. I have some concerns about how it will all pan out, if we look at this as a stark cost-driven issue and consider the reporting elements and the data capture that John Stocks from the Carbon Trust mentioned. It could be extraordinarily difficult to engage companies in ensuring that what they are doing in the workplace to reduce emissions is properly reported and collated at the Scotland level. That should not stop us trying, but we should be aware of the difficulties.

Rob Gibson: It struck me that John Stocks was saying that as we are going along we are improving both our understanding of how to collect the data and the accuracy of the data. Given the enabling powers that we have in respect of annual reporting, some of the data will improve over the years. Is it not a case of suck it and see?

Anne Douglas: To some extent, that is right, but it is important to have the mechanisms in place. The danger is not that some organisations will not go along with their responsibilities but that we end up with the lowest common denominator of reporting. It is therefore important that a robust mechanism is in place so that everyone’s reporting is up to the same standard, and comparisons can be made within industries and within sectors.

When we embarked on the programme with the Scottish Power office, getting to the position where we and Scottish Power were confident about the size of the carbon footprint was not a straightforward exercise. Because such reporting will be—assuming that the bill is passed—such a new experience, it is important that the mechanism is robust and simple so that everyone can comply with it.

Stephen Boyd: The work that the TUC and the Carbon Trust in England have carried out jointly on emissions reductions is clearly tightly audited. However, the myriad ad hoc workplace relationships between employers and trade unions on emissions reduction are probably not being audited at all. There is a job to do there to provide such support.

Rob Gibson: We can see from previous evidence that collaboration with people who collect the information is central to our making a better job of emissions reduction. Given that, the duties on public bodies are an important part of reducing carbon emissions and so on. Stop Climate Chaos’s evidence was unequivocal in saying that climate change duties should be placed on public bodies. Does the STUC have a view on why the bill is vague in this area?

Stephen Boyd: I do not have a view about the bill being vague, but I certainly support the duty being imposed on public sector bodies. Previous experience, particularly in relation to equalities, suggests that the imposition of duties is necessary to provoke the required action.

Rob Gibson: The previous panel referred to local authorities, health boards and the like. Should we have an extensive list of public bodies that should have a duty to report?

Stephen Boyd: The starting point should be that the duty should apply to all public sector organisations.

Rob Gibson: It is as simple as that.

Stephen Boyd: Yes.

Rob Gibson: If that is understood, is there a need to spell it out?

Stephen Boyd: Yes.

Rob Gibson: Have you any specific ideas on what such public duties should be? We are talking about annual reporting. In the light of your experience of working with Scottish Power employees, can you suggest better ways of establishing how to cut carbon emissions?

Anne Douglas: I am not sure in respect of reporting. A number of matters can form part of an audit. If the audit is done and the actions that are identified by the audit are carried out, the most important issue is the output—the difference between the position at the start and that at the end. I am not sure about reporting the whole audit action-plan process. It is necessary to report what has been done, but it is more important to report what has been achieved rather than how it has been achieved.

16:30

Rob Gibson: We are interested in outcomes. We can anticipate a rolling programme, as all parts of all organisations have to work out what they are achieving every year. The experience that you described is important but limited; we are aiming for a situation in which all organisations go through such a process. Trade unions, employees and employers, whether they are in the public or private sector, will have to undertake an exercise that will become pretty well standard if we are to gather meaningful data.
Anne Douglas: The exercise will be pretty well standard, but I am not sure that the approach will be different from the approach that organisations currently take to governance or corporate social responsibility, which to a large extent includes environmental measures. The better organisations are probably already halfway there, in that they consider that they have a duty to report on corporate social responsibility.

The Deputy Convener: I want to pursue Rob Gibson's line of questioning about duties on public bodies. You mentioned the importance of corporate governance. Is the approach that is envisaged in part 4 already best practice for local authorities and public bodies? As Stephen Boyd said, placing a duty on bodies in relation to equalities made a difference, because although people had been saying for a long time, "We're doing equality and it's fine," there had been no way of measuring what was being done. Local authorities and public bodies have a responsibility to institute best practice, but is it also important to place a duty on them in relation to performance on climate change targets, so that Audit Scotland can consider what they are doing to meet the targets?

Anne Douglas: It is important that public bodies demonstrate best practice. However, I am concerned that if reporting is mandatory we will end up with reports that meet only the minimum requirement. I would not want authorities to end up doing the least possible reporting.

Alison McInnes: Are the provisions on the promotion of renewable heat and energy efficiency appropriate and sufficient to deliver what is needed?

Stephen Boyd: Your previous witnesses made apposite comments in that regard. There is a massive job to be done, particularly given the legacy of poor quality housing in Scotland. That aspect of the bill could be made more robust.

Des McNulty: The bill covers a range of matters, and a criticism that has been made is that although parts 1 to 4 cover the principles of responding to climate change, other issues have been just tacked on in part 5. You made clear to another committee your views on the provisions on forestry. Do you have reservations about other aspects of part 5?

Stephen Boyd: Nothing is jumping out at me at the moment. There are aspects of part 5 on which we have no view, such as the provisions on muirburn. The gaps that we perceived in the bill are to do with public engagement and how the proposed approach can be reconciled with the Government’s wider economic and social agenda. Those are the matters on which we would like more work to be done.
WRITTEN EVIDENCE FROM COSLA AND SUSTAINABLE SCOTLAND NETWORK

Introduction
This paper is a joint statement by the Convention of Scottish Local Authorities (COSLA) and the Sustainable Scotland Network (SSN).

COSLA is the political representative body of Scottish local government. SSN is the national network of sustainable development officers and advocates from Scotland’s 32 local authorities. Both COSLA and SSN welcome the opportunity to give evidence on Scotland’s Climate Change Bill to the Transport, Infrastructure and Climate Change Committee.

SSN and COSLA have worked collaboratively on climate change for a number of years. In 2006 a national Development Group was established involving COSLA, SSN and other key organisations, which developed and successfully launched Scotland’s Climate Change Declaration. All of Scotland’s local authorities signed the Declaration within the first quarter of 2007 and SSN and COSLA have continued to work together to support local authorities as they work to implement their Declaration commitments.

Last year saw the creation of the COSLA Climate Change Task Group which is a standing elected member group chaired by Cllr Alison Hay, COSLA Spokesperson for Regeneration and Sustainable Development. The Task Group is supported by an Officer Support Group to which SSN provides the lead support function. The Officer Support Group also brings together representatives from other local authority officers’ networks, including those on energy, waste, planning, transport, finance etc.

COSLA and SSN both responded to the Scottish Government’s consultation on the Climate Change Bill in early 2008, as did many individual local authorities. We also responded to the consultation on the Scottish Climate Change Adaptation Framework. These consultation responses have been informed by participative seminars and active collaboration with many of Scotland’s local authorities.

The work undertaken on climate change by Scotland’s local authorities is extensive and becoming increasingly well informed and coordinated. Key activities by local authorities includes:

- All of Scotland’s local authorities have been, are currently, or will very soon be working with the Carbon Trust on their Local Authority Carbon Management Programme. This initiative supports local authorities in measuring their own direct greenhouse gas emissions and agreeing an emissions reduction plan which includes emissions reduction targets and a programme of policies and initiatives designed to meet those targets.
- 21 local authorities included ecological and carbon Footprinting in their 2008 Single Outcome Agreements. Many council are now using the footprint approach to understand their area-emissions profiles and to undertake policy scenario planning. This work is supported by the Local Footprints Project (a joint project between SSN and WWF Scotland) which assists local authorities using the Resources and Energy Analysis Programme (REAP) software to measure consumption-based emissions from their communities and to assess the effectiveness of various policy interventions.
- In 2008, four local authorities developed their Local Climate Impacts Profiles as a practical step in the process of addressing climate change adaptation. This work is now due to be rolled out to other local authorities, with support provided by the Scottish Government as part of the Scottish Climate Change Impacts Partnership.
- SSN and COSLA have held national events on the Carbon Reduction Commitment, in order to help support the preparations being made by Scotland’s local authorities for the introduction of the CRC scheme in 2010;
- work on energy efficiency and micro-renewables in buildings as well as building regulations;
- our work on waste diversion from landfill, reaching all targets for BMW and on course for the 2010 40% reduction target;
- efforts towards more sustainable and active travel under the Cycling, Walking, Safer Streets grants and the Smarter Choices, Smarter Places projects.
Supporting education about climate change and more sustainable lifestyles, most notably through the widespread support for the Eco Schools Scotland programme.

Both COSLA and the SSN support the principles behind the Bill and welcome the target of reducing greenhouse gas emissions by 80% by 2050, as well as the inclusion of Scotland’s share of international aviation and shipping.

This paper outlines our views on key aspects of the Climate Change Bill. We look forward to discussing these issues and any others relating to the role of local government at the Committee session on 24th February.

**Views on the Key Aspects of the Scottish Climate Change Bill**

**Targets**

**The 2050 Target**
COSLA and SSN recognise the scientific and political reasons why it is important for Scotland to be aiming for an 80% cut in emissions by 2050, and agree that this should be altered only if the international (IPCC) assessments justify. We also recognise that, based on current understanding of emissions trajectories and climate change modelling, 80% should be regarded as a minimum long-term target. COSLA and SSN support the Scottish Government’s approach of addressing the United Nations Framework Convention on Climate Change (UNFCCC) ‘basket’ of six greenhouse gases and the inclusion of Scotland’s share of international aviation and shipping in our emissions account.

COSLA and SSN also recognise the scientific importance of securing early and significant action on emissions reductions; one tonne of CO2 saved in 2010 is more important than one tonne of CO2 saved in 2040. COSLA and SSN also recognise the important of cumulative emissions and would suggest that this be recognised in the body of the Bill.

**Interim Targets**
COSLA and SSN recognise the important of realistic and meaningful planning timescales, and we are supportive of the principle of interim targets. Both are useful in determining the direction of travel and the urgency of action. We welcome the 2030 interim target of 50% emissions reduction, but would suggest that the Bill should also take cognisance of the recent recommendations of the UK Climate Change Committee which has proposed cuts of at least 34% by 2020, and 42% depending on progress in current international climate negotiations. COSLA and SSN would suggest that the Scottish Bill’s interim target or targets should be reviewed and amended where necessary to reflect the recommendations made by the UK Climate Change Committee. If the Scottish interim targets are lower than the Climate Change Committee’s recommendations, we would expect the Scottish Government to explain clearly why the Climate Change Committee recommendations had not been accepted.

**Setting Targets in Batches**
COSLA and SSN welcome the principle of setting targets in batches. This approach should provide the medium-term clarity that local authorities, other parts of the public sector and private sector organisations require to take informed planning and investment decisions. We are supportive of the conditions established in the Bill for setting the target batches. From the proposal in the Bill we would expect that in setting the ‘batches of targets’ attention would be given to Scotland’s cumulative emissions and the carbon budgets recommended by the UK Climate Change Committee (or any alternative ‘relevant body’). Scotland’s ‘batches of targets’ should be set with due regard to the emissions trajectory of the UK Climate Change Committee’s budgets (or those of any alternative ‘relevant body’) and the agreed allocation which relate to Scotland.

**Annual Targets**
COSLA and SSN recognise that a 3% per year overall emissions reduction target is highly ambitious, necessary and will require some lead-in time to achieve. Moreover, a rigid 3% per year target applied across the board to specific sectors such as local authorities may be difficult to achieve in the face of differing local circumstances and fluctuation in performance due to variable conditions, including weather events, etc. We respect the Scottish Government’s initial analysis in delaying the annual targets till 2020 but we also recognise that many quick wins could be tackled to achieve substantial in-roads in early years. We
submit, therefore, that early impact is more an issue of political will and financial investment than technical capability. The evidence from the recent UKCC report on the significance of early emissions reductions for a successful trajectory as advised by IPCC, Tyndall Centre and others merits due reflection in the final form of the Bill.

Further, while local authorities will no doubt play a significant part in achieving these targets recent sectoral breakdowns being used in the ongoing Scottish Government Strategic Overview Project looking at how the 80% reduction in emissions by 2050 could be achieved suggest that the two smallest contributors to emissions are the public sector and the waste sector. Other sectors such as business, transport, residential, energy supply, agriculture and land use make up the bulk of the contributors to emissions in Scotland. However given the significant levels of employment and the wide powers vested in the public sector, it seems likely that a larger proportion of emissions are under the influence of local authorities and the public sector than might appear on first analysis. We do not therefore attempt to discount the role of local authorities but rather to point out the limited benefits to be achieved by targets on the public sector alone, given the uncertainties in emissions allocations attributable to it and the need for progress across all parts of Scottish society.

At a local authority level, many Scottish local authorities have been working with the Carbon Trust to develop carbon reduction implementation plans which require carbon reduction targets to be set, monitored, and reported on. These have seen local authorities aiming to move in line with 3% annual reductions. It is evident that some Scottish local authorities are already seeking to make similar levels of annual reductions. This process, and its linkage to the Single Outcome Agreement process, more accurately reflect the situation that councils will vary in their ability to deliver carbon emissions reduction. The Single Outcome Agreement process should therefore be the vehicle for any such delivery and reporting. In addition to these voluntary efforts to set local authority targets, the Carbon Reduction Commitment will establish a legislative driver encouraging annual emissions reductions and reporting. It is estimated that at least two-thirds of Scottish local authorities will be participating in the CRC scheme.

We are aware that some have called for local authorities to be subject to area-wide emissions reduction targets. While we accept there are concrete actions that can be taken with regards to councils own estates we are concerned about area-wide targets given that councils only tool with respect to public behaviour is that of influencing and providing information. Meeting local area based targets will be difficult given the considerable variability in overall and per-capita emissions between local authority areas. Should an area-wide reduction target be set for local authorities or Community Plan Partnerships, COSLA feels this would need not only to be resourced but paired with the appropriate powers to require carbon accounting at an individual or community basis, though we recognise this will cross over into reserved territory.

In conclusion with respect to targets, while we accept the need for early action we are not convinced that strict 3% per annum sectoral targets to 2020 as have been advocated by some are the best way forward. A simple modification allowing a 5 year rolling arrangement might represent the best approach, delivering progress with flexibility. The longer term achievements will rely on technological change and it is for the Scottish and UK Governments to drive this forward. Sectors will also be vulnerable to missing targets if external circumstances intervene. An example would be alternative energy sources failing to meet predicted output. It may be more appropriate to have a rolling target to account for such fluctuations.

We agree there should be at least three budget periods in statute at any one time. This will assist the planning of successive carbon budgets against circumstances. The Government must show leadership by ensuring that targets are challenging but also realistic and achievable against current technological progress and other external factors that will influence the meeting of targets. Emission budget periods should be set for a long enough time period to permit investment in energy generation to be scheduled and financed in a manner acceptable to industry. Major infrastructure projects are normally financed over 25 years. It would be useful to have certainty in terms of CO2/GHG targets over the same period.

However, we are very aware of the fact that achieving these targets, nationally and within local authority areas and estates, will be challenging and will require us to allocate resources in different ways or to identify new resources. COSLA and SSN would recommend that local
government and the Scottish Government, along with other parts of the public sector, need to work together with renewed urgency and commitment to address the resource requirements of achieving Scotland’s emissions reduction targets. The Scottish Government’s current Strategic Overview and Carbon Assessment Projects potentially offer good bases upon which a Scottish Government-Local Government exercise could be established.

In addition to the urgent need to address the resource and investment requirements associated with meeting annual emissions reduction targets, SSN and COSLA would stress the need to fast-forward and expand public sector capacity building (tailored training, information provision, technical advice, peer learning, etc) so that the Scottish public sector quickly becomes better able to achieve emissions cuts.

**Scottish Emissions Account**

COSLA and SSN are supportive of the general principles of the Scottish Emissions Account, as proposed in the Bill.

**Using Carbon Credits**

With regards to the purchasing of carbon credits, SSN and COSLA would recommend that the use of such credits should be limited and regarded as a measure of last resort. We would also suggest that permissions to use these credits be subject to scrutiny by the Committee on Climate Change (or other related Scottish body) and the Scottish Parliament to ascertain whether the Scottish Government of the day is doing enough to stimulate domestic action and is not using international credits for ‘quick hits’ against emissions targets. We want to avoid a situation where companies and governments are prepared to pay to cut down on their own emissions.

**Defining ‘Scottish Emissions’**

COSLA and SSN support the definition of ‘Scottish emissions’ used in the Bill; based as it is on the UNFCCC ‘basket’ of the main six greenhouse gases plus the inclusion of Scotland’s share of international aviation and shipping. We also welcome the recognition of the importance of Scotland’s ‘carbon sinks’ within the account, thereby encouraging climate-aware management of land assets. The definition of Scotland’s emissions should be continually informed by internationally recognised good practice and scientific understanding.

COSLA and SSN accept that the Scottish target should be based on the proposed ‘Scottish Emissions Account’, which addresses the greenhouse gas emissions produced within Scotland.

SSN and COSLA would also welcome a provision in the Bill requiring the Scottish Government to report regularly (though possibly not annually) on Scotland’s consumption-based emissions. We were encouraged by the inclusion in the Scottish Government’s Bill consultation paper of the potential inclusion of consumption-based reporting. It is noted that this has not been included in the Bill. The TICC Committee may wish to explore how the Bill could be amended to include such a provision. We recognise that consumption-based emissions reporting is complex and is in many respects a ‘developing science’, but we feel that it is developing to the extent that it could be included as part of the Scottish Climate Change Bill’s reporting regime. Reporting our consumption emissions simply recognises the reality that responsibility for emissions can be accounted for in two legitimate ways and that Scotland is part of a global economy. Reporting consumption emissions would also encourage Scottish citizens to be more internationally aware and would foster an open and honest engagement with the inherent challenges of reducing greenhouse gas emissions.

Scottish local authorities are already addressing consumption-based emissions through participation in the Local Footprints Project and by using the Resources and Energy Analysis Programme provided by the Stockholm Environment Institute. We would not expect consumption-based emissions to form the basis for targets, but believe that such reporting would add greatly to the quality of the Scottish Climate Change Bill and would be another indication that Scotland intends to have ‘world leading’ climate change legislation.

**Public Sector Duty**
We have no issue with the proposal to bring forward enabling powers so long as any duty imposed on the public sector to take specified actions on climate change or other specified environmental issues delivers the appropriate resources to enable those responsibilities to be carried out. Reporting on any new duty should be fully integrated into the Single Outcome Agreement process and any Public Sector Duty should be developed jointly between COSLA and the Scottish Government.

All 32 of Scotland’s Local Authorities have signed up to Scotland’s Climate Change Declaration, a voluntary agreement to work towards climate change mitigation and adaptation. This high level commitment is expected to be increasingly reflected in the new Single Outcome Agreements and in partnership with Community Planning Partnerships. Information gathered on work towards the declaration commitments is providing valuable material to inform the SOA process and will effectively roll out the principles within the Declaration to the wider public sector as COSLA has previously recommended. In time, with adequate resources provided through the local government settlement, more specific local indicators with regards to climate change work could and should be integrated into these agreements and the management delivery arrangements beneath these to ensure that they address the range of climate change activity agreed by local authorities under the Declaration. Any duties with regards to Local Authorities would, in accordance with the Concordat, need to be developed jointly between COSLA and the Scottish Government and be integrated into the Single Outcome Agreement process.

We are open to the development of a process that would identify the gaps and barriers to action within present structures and how any future duty might seek to overcome them. One possible way forward would be the convening of a high-level Ministerial Climate Change Steering Group bringing together key partners across Scotland including Local Government to not only look at a potential public sector duties but to provide needed national leadership, appropriate guidance and public awareness.

We would also note that local government is already subject to duties that cover much of what might be expected to be included in a Public Sector Duty, e.g., Carbon Reduction Commitment (CRC), Home Energy Conservation Act (HECA), Energy Performance of Public Buildings (EPPB), Landfill Allowance Scheme (LAS), etc.

Adaptation

A number of local authorities are examining ways of identifying and reporting on how their communities require to adapt to the impacts of climate change. There is an understanding that this is about managing strategic risks to local communities and their assets, and that more is required than simply reviewing Emergency Planning arrangements. Pilot studies jointly arranged by the Scottish Climate Change Impacts Programme (SCCIP) with Scotland & Northern Ireland Forum for Environmental Research (SNIFFER) and UK Climate Impact Programme (UKCIP) on developing Local Climate Impact Profiles have taken place, with guidance due to be published shortly, and further opportunities are intended to be rolled out. Some authorities are including process-led objectives and indicators in their SOAs to track their level of response to climate change impacts to key services and infrastructure.

Forestry – COSLA Views

With regards to the forestry proposals within the bill COSLA accepts that the national forest estate is likely to include a number of locations suitable for wind, hydro and micro-renewable energy generation. Locating windfarms and hydro schemes within forestry can help to reduce detrimental impacts, in that both activities can share the same road systems; commercial conifer forests are already man modified landscapes so impacts are likely to be less than in wildland areas; and forests can help to limit the potential for close views of turbines, dams and other structures by reducing the availability of open views across the landscape.

However COSLA does have some reservations with regards to the proposals to offer leases and cutting rights over parts of the national forest estate. Our main concerns are:

- Lack of business case in the bill.
- Impact on the function and funding of the remaining part of the national forest estate.
- Loss of regional presence.
Impact on the stability and development of timber markets as presently underpinned by FCS.

Impact (immediate and longer term) on FCS employees and the communities they live in.

Loss of community acquisition opportunity through the National Forest Land Scheme.

Loss of a wider range of non-market community benefits as provided through FCS and which will be greater than provided through any lease arrangement.

No guarantee that funding raised will be placed specifically to forestry related climate change measures.

Potential for further leases.

Member states of the E.U. have generally supported and protected their national forests.

Any proposal will need to go through the usual process of public consultation as well as early consultation with the affected local authorities to ensure for adequate compensation with regards to local income from timber production, recreation or indeed potential future uses.

COSLA would expect there will be a need for negotiation and management of appropriate community benefit and would look for efforts to be made to provide opportunity for partnerships with Local Authorities to provide heat and power for local communities from any new renewables projects on the National Forest Estate.

We would also advocate a national strategy on renewables to map out suitable locations across Scotland rather than looking at this on a piecemeal basis.

Any proposed future developments would also need to consider the implications of the Land Reform (Scotland) Act 2003, with the need to retain access rights for the general public.

Energy / Buildings

The energy efficiency measures included in the Bill are to be welcomed but do raise some practical issues with regards to financial resources, additional capacity and consistency with activity at the EU level. There is already some concern on the part of Scottish councils following the review of the EU Energy Performance in Buildings Directive around the added up front cost to councils of extending the scope of this directive to smaller premises. We would have similar concerns of a resource and capacity nature with any such Scottish proposal.

Our member Councils are already functioning at full capacity to fulfil the requirements of the existing EPBD, having committed budgets and allocated staff time to completing the Energy Performance Certificates (EPCs) for the buildings covered in the scope of the existing Directive. Similarly, additional workload dealing with applications etc. is likely to force an increase in fees passed down to the public; otherwise Councils will face even more pressure to deal with the applications. There is also already a concern that the extension of the EPBD might necessitate extensive re-training for Building Standards Officers. A concern which would also apply to any new proposals at the Scottish level.

While councils are highly in favour of the principle of addressing energy efficiency in Scotland’s buildings and see it as a key tool in both saving carbon and lowering running costs to building owners and tenants, they are very mindful of the added costs and any proposal to improve the energy performance of buildings in Scotland needs to be paired with the appropriate resources to carry it through as well as the decarbonisation of electricity and heating.
WRITTEN EVIDENCE FROM STUC

Introduction

The STUC welcomes the opportunity to contribute to the Transport, Infrastructure and Climate Change Committee’s scrutiny of the Climate Change (Scotland) Bill. This is an important piece of legislation and one that could have profound implications for our 640,000 trade union members in Scotland.

The STUC concurs with the widely held view that climate change will be humanity’s greatest challenge in the 21st century. The Trade Union Sustainable Development Committee (TUSDAC14 – a joint TUC/DEFRA body) offers a cogent explanation of why environmental issues have assumed real importance for the trade union movement:

“‘Sustainability’ is not something we put in a separate box marked ‘green’. It is a core trade union and workplace issue. It directly impacts on jobs, in numbers, types, skills and locations. The employment and training implications of the transition to a low carbon economy are profound, as is the need to manage the changes fairly – through the so-called ‘just transition’”.

The STUC believes that the current global economic crisis provides an opportunity to build a new economic and social model that better protects the interests of both workers and the environment and distributes the proceeds of sustainable economic growth far more equitably than has hitherto been the case.

The following submission does not attempt to answer all the detailed questions posed by the Committee but rather focuses instead on areas of particular concern/interest to the STUC.

Targets

The STUC broadly supports the targets as set out in Climate Change (Scotland) Bill and believes the 2050 target is achievable through investment in:

- Low carbon technologies including renewables (on/offshore wind, marine, solar & sustainable biomass), nuclear, CCT & CCS;
- Energy efficiency including enhanced building standards and new technologies; and,
- Cutting transport emissions through:
  - Improving the carbon efficiency of vehicles
  - Introduction of electric vehicles powered by low carbon electricity production;
  - Increased use of hydrogen; and,
  - Sustainable biofuels.

The STUC notes that the targets proposed are more challenging than those in the UK Bill but believes that Scotland can benefit from being a global leader in environmental standards. However, there are risks as well as opportunities in targets that are more challenging than other nations. It is vital that risks are properly understood.

Therefore, it is somewhat disappointing that the Bill has not been accompanied with more detailed work on potential economic and employment impacts. This omission plays into the hands of those who argue that strong unilateral action necessarily constitutes a barrier to competitiveness.

As we have already witnessed with renewable energy development, matching rhetoric to effective action and measurable outcomes will be difficult and specific actions required to reduce emissions must be the subject of wide consultation with all stakeholders: trade unions, employers and civic society.

The STUC believes that challenging targets can be reconciled with sustainable economic growth but does not believe that the economic and employment benefits of greening the economy will be maximised by simply establishing targets and leaving it to the market to deliver.

14 http://www.defra.gov.uk/environment/tusdac/
The potential economic and social impacts of reducing emissions are too often overlooked in public debate. Witness the Committee on Climate Change’s report *Building a Low Carbon Economy* which reduces ‘wider social impacts’ to the single issue of fuel poverty. There is no consideration whatsoever of the economic and employment consequences for individuals and communities.

**Duties of Public Bodies Relating to Climate Change**

The STUC believes that Government and the wider public sector must be seen to lead the way in helping to meet targets for emissions reduction and therefore supports the imposition of statutory duties in relation to climate change.

It is recognised that other measures such as the Carbon Reduction Commitment will have an impact on parts of the public sector but the pressing need for action across the whole public sector makes a compelling case for a statutory duty in primary legislation. It is important that any additional responsibilities are sufficiently funded and that workplace change is subject to negotiation with the relevant trade unions.

**Scottish Committee on Climate Change**

The STUC tends towards support for a separate Scottish Climate Change Commission to advise the Scottish Government given that relevant policy is substantially devolved and that the legislative framework will be distinct.

The STUC is of the view that as well as providing advice on how to achieve the targets and determining whether the targets have been achieved, the Committee should also be charged with determining whether or not any reduction in emissions has been consistent with wider economic and social objectives (for instance – the Scottish Government’s ‘golden rules’ on solidarity and cohesion).

**Forestry**

The joint Forestry Trade Unions have submitted joint written and oral evidence (11 February 2009) to the Rural Affairs and Environment Committee on this matter. ![Link to the Rural Affairs and Environment Committee](Link to the Rural Affairs and Environment Committee).

**Trade Union priorities**

The STUC believes that, in order to gain widespread public buy-in and to combat negative perceptions over the potential economic impact, targets for emissions reduction should be accompanied by four interlinked strategies:

- A green workplaces strategy;
- A robust and comprehensive low carbon industrial strategy for Scotland;
- A transitional skills strategy for Scotland;
- A Just Transition Strategy for Scotland.

Although the detailed scenario planning work on economic impact does not appear to have taken place, it is safe to assume that the impact on the Scottish economy will be great. Energy intensive sectors will have to change their ways and with that comes the prospect of major changes in the nature and location of jobs. Also, these sectors will have to compete in global markets transformed by carbon trading, international treaties and environmental regulation. For those working in these sectors, the prospect of change can be worrying. The industrial restructuring of the last 30 years, whether necessary or not, was allowed to occur in a deeply unjust fashion that saw some lose everything while others reaped huge rewards. It was an injustice that still scars Scottish society. And while the Scottish economy remains one of the least regulated and planned in Europe, fears that green restructuring will fall much harder on some than others must remain justified.

The STUC believes that the Scottish Government, working with social partners, must start planning now so that all the conditions exist for a genuinely ‘just transition’ to a low carbon economy. The right consultation mechanisms, the right training, the right innovation policies, and the right financial support need to be in place. But most importantly we need the type of
green enterprise and growth, already seen in countries such as Germany and Denmark, to ensure that greener jobs are available when transition becomes a reality.

**Green Workplaces**

Following the success of initiatives such as the TUC’s Greenworkplaces project, there should be an extension of schemes to help employers and employees work together to set and meet environmental targets. These goals could relate to simple environmental measures (e.g. basic energy saving practices) or more complicated schemes such as efforts to increase the sustainability of production processes. *(It is also vital that the UK Government provides legal rights to green reps to give them time off for training and environmental activity at work).*

Workplaces are responsible for the 80% of emissions and much more must be done in Scotland to support workplace change. Learning from the successful lifelong learning model, funds should be made available to help trade unions resource workplace environmental programmes. It is hugely unfortunate that the Scottish Government’s Climate Change Fund does not consider the ‘workplace’ as a ‘community’ for the purposes of the fund.

**Low Carbon Industrial Strategy for Scotland**

The Bill should be accompanied by the development and implementation of a low carbon industrial strategy for Scotland. This should include specific plans for each of Scotland’s priority industry sectors.

---

To date, maximising the wider economic and employment benefits from developing Scotland’s renewable energy sectors has appeared to be an afterthought to, rather than an integral component of, energy policy. During the last decade of economic growth this lack of progress was a disappointment to trade unionists, environmentalists and others. As we now enter a potentially lengthy recession, the failure to grasp the growth opportunities presented by the green economy should concern all with an interest in the sustainable development of the Scottish economy.

Given that Scotland’s renewable energy resources are widely recognised to be the most abundant in Europe, our performance in generating jobs has been disappointing. Denmark, Spain and Germany have all built large, job-rich renewable sectors through a variety of means.

The STUC believes that the UK and Scotland’s poor performance in this respect reflects an unwarranted faith in markets to deliver socially beneficial outcomes and a deeply embedded antipathy to anything that smacks of industrial policy – other countries better understand that intervention is required in the early stages of development in order to secure technologies and grow employment.

Maximising industrial opportunities from the development of Scotland’s energy sectors should be a core strand of economic strategy. Some initial actions could include:

- Using business support mechanisms (such as RSA and innovation support programmes) strategically to help develop technologies and secure these technologies within Scottish industry;
- A comprehensive research project to learn the lessons of other European countries;
- Within the context of the Planning Bill, and working within EU Competition Law, consider ways in which developers can be encouraged to use local content; and,
- Improve links between developers and Scottish manufacturers – we are not convinced FREDS or the Energy Community are effective mechanisms for this activity.

However, much more can be done now within existing budgets to address the main barriers to growing environmental industries:

- The low price of environmental impacts;

---

Transport, Infrastructure and Climate Change Committee, 2nd Report, 2009
(Session 3) – ANNEXE C

- Weak investment and demand for green products and services;
- System failures that slow green transformation.

For instance, the Scottish Government should examine:

- Creating lead markets through ‘Forward Commitment’ procurement initiatives – learning from examples in Sweden and the US, the Government can play a key facilitatory role in developing programmes to design and sell innovative green products. Forward Commitment programmes draw together a group of organisations to define a need (i.e. a more energy efficient IT system). Bids are then sought to deliver a product or service that meets this need. The specification of the need will include a range of criteria that must be met and the procurement group commits to purchasing a minimum amount of the new product or service provided these criteria are met;
- Developing markets through public procurement – there are currently good initiatives at national and local authority level but these are often implemented in a piecemeal way and more needs to be done to ensure consistent use of environmental criteria in purchasing decisions;
- Better integration of public policy priorities to boost job creation – for example, Scotland could aim to develop an indigenous hydrogen economy for promotion at the Commonwealth Games in 2014: hydrogen facilities linked to Scottish wind farms could generate the power for a fleet of hydrogen fuelled buses for use at the games. With the appropriate level of ambition and support, there is no reason why these vehicles should not be designed and manufactured in Scotland.

A Transitional Skills Strategy for Scotland

A successful low carbon shift needs to be accompanied by sector-based skills and training strategies. For instance, one of the main barriers to increasing the uptake of new microgeneration devices is the shortage of appropriate skills and training courses for each of the emerging technologies. The development of new technologies in manufacturing industries and the development of our environmental industries, including clean-coal, will require investment in the right skills and specialities. A number of skills issues need to be addressed:

- Stakeholders should be involved in a comprehensive survey of labour and skills requirements in the energy sector;
- A transitional skills strategy is required for moving to a low carbon economy which provides support both for well-qualified staff at all organisational levels and for lower skilled employees who may lack a portable or adaptable skills base; and,
- Environmental literacy in relevant Modern Apprenticeships must be improved. The Gas industry workbook initiative prepared by the Energy and Utilities Skills Council is an example of good practice.

Just Transition

A Just Transition\textsuperscript{16} Strategy for Scotland will involve:

\textit{A national framework or mechanism to ensure long-term planning and representative decision making on environmental transition} - The framework would outline how the Government planned to engage with trade unions and other key stakeholders on Just Transition. It could involve the creation of a new body or bodies to plan for, and advise ministers on, the transition process. It may also stipulate consultation requirements for subnational bodies and companies involved in environmental transition.

The STUC proposes that the TICC Committee should consider ways in which this framework might be given a statutory basis in the Climate Change (Scotland) Bill.

\textsuperscript{16} For more detail see the TUC pamphlet \textit{A Green and Fair Future} (2008) \url{http://www.tuc.org.uk/touchstone/Justtransition/greenfuture.pdf}
Education and training to aid sustainable employment - It is vital that adequate planning and provision of education and training takes place to protect jobs in the sectors that will be most affected by environmental transition. From a Just Transition perspective, key priorities must include the following: a genuine partnership approach to negotiating skills strategies that are fit for purpose; development of employer support for a new apprenticeships strategy; a new diversity strategy for the energy sector; and employers fully recognising the role of union learning representatives (ULRs).

Decent jobs - Just Transition must not just be about creating ‘green jobs’ to meet the direct material needs of those workers affected by the shift to a low carbon economy. It must also be about ensuring the jobs are decent jobs. While the transition process in sectors such as energy is meeting this goal, other environmental industries – in particular, waste and recycling – are not. A combined effort is required by employers, government and unions to address insecure and dangerous working conditions.

Greening the workplace - As outlined above.

Flexible transition packages for workers - Support for workers whose jobs may be lost or may face significant change due to environmental transition is crucial to any Just Transition programme. Although support packages would need to be flexible – in order to take account of the different situations in which workers find themselves – a general outline or timeline for such a scheme could be agreed. It might include: consultation requirements; education/training/re-skilling; compensation to cover relocation costs or living costs for those finding new work or who are facing significant change in the nature of their work.

Achieving such a programme of support packages will require significant interdepartmental working from the Government, with particular involvement from the enterprise networks, SDS and Job Centre Plus.

Support for communities - It is likely that some areas will face more challenges than others because of the geographically concentrated nature of many energy-intensive industries. Responsibility for a clearer understanding of which areas need to be monitored and the likely impacts of environmental transition on those areas must fall to the Scottish Government, the relevant local authorities and enterprise networks, employers bodies and trade unions with high densities of membership in the key communities.

Funding - Many elements of a Just Transition programme, while paying for themselves in the long-term, will require an initial – or indeed an ongoing – investment to make them possible.

Monitoring and further research - The lack of research regarding many areas of environmental transition needs to be addressed. In particular, information needs to be collated on (1) the skills base required in a low carbon economy; (2) the effect that the extra costs of environmental regulation is likely to have on pay, conditions and levels of employment; (3) the impact of environmental transition on job equity; and (4) the regional impact of environmental policies on jobs and skills.

Scottish Parliament

Transport, Infrastructure and Climate Change Committee

Tuesday 3 March 2009

[THE CONVENOR opened the meeting at 14:00]

Climate Change (Scotland) Bill: Stage 1

The Convener (Patrick Harvie): Good afternoon and welcome to the eighth meeting in 2009 of the Transport, Infrastructure and Climate Change Committee. I remind members and everybody else present that all mobile devices should be switched off. We have received apologies from Alex Johnstone and from Shirley-Anne Somerville, who expects to arrive a little late.

The first and only item on the agenda is continuation of our consideration of the Climate Change (Scotland) Bill at stage 1. This is the penultimate evidence session. Next week, we will take evidence from the Minister for Transport, Infrastructure and Climate Change. Today we have our last two panels of external witnesses, so to speak. First, we will hear from the Confederation of British Industry Scotland, the climate change business delivery group and Scottish Renewables. After that, we will hear from Scottish Natural Heritage, the Scottish Environment Protection Agency and Scottish Water.

I welcome the first panel: Matthew Farrow, head of the environment group at CBI Scotland; Brendan Dick, director of BT Scotland, and Grant Hodges, of PricewaterhouseCoopers, who are both here to represent the climate change business delivery group and Scottish Renewables. After that, we will hear from Scottish Natural Heritage, the Scottish Environment Protection Agency and Scottish Water.

I welcome the first panel: Matthew Farrow, head of the environment group at CBI Scotland; Brendan Dick, director of BT Scotland, and Grant Hodges, of PricewaterhouseCoopers, who are both here to represent the climate change business delivery group; and Jason Ormiston, chief executive of Scottish Renewables. I am aware that Brendan Dick might have to leave before we finish questioning the first panel.

Brendan Dick: Climate Change Business Delivery Group: I have to leave around 3 o’clock.

The Convener: That is understood.

First, I thank you all for the written evidence that you have submitted. Today is an opportunity to explore some issues beyond that and to develop further the points that you raised.

CBI Scotland has taken an interest in climate change, for example by creating a website and holding regional and national events. What is CBI Scotland doing to educate its members on climate change and to develop that agenda?

Matthew Farrow (Confederation of British Industry): Just to clarify, I am based at the CBI offices in London. I am head of the United Kingdom-wide environment team and work closely with colleagues and members in Scotland.

Climate change is a huge issue for British and Scottish business. We are committed to working with the Government, at both Scotland and UK level, to meet the very ambitious targets that we have. Although meeting those targets is a challenge for us all, it can be done at an achievable cost and there are real business opportunities in it.

We raise awareness among our members in two or three ways. We run a series of climate change forums throughout the UK, whereby we look to work with particular companies on particular issues. We will be running a forum on energy efficiency fairly soon. Our website has a climate change section—a sort of microsite that updates members on the reports that we are putting out and on the issues with which they can engage. E-mail communications go to members to update them on policy lines that we are working on, or things that the UK Government or the Scottish Government is doing.

In working with companies, I tend to find that there is broad support for the line that we have taken, which is that, despite the financial turmoil and recession, climate change is a key issue that Governments and business have to ensure remains a priority. There is a desire among businesses to understand what climate change means for them. They hear about the overall targets and measures such as the bill that we are discussing, but they want to know what they can do on the energy efficiency of their operations, or to understand what support there is for innovation from Europe or the UK Government and the Scottish Government.

The Convener: Some businesses that are involved in marketing green products tend to break down their potential customers into groups, depending on how easy they are to bring on to the agenda, and whether they are true believers or sceptics. Do you take the same approach to educating the business community and your members? Do you have a sense of the balance between those who are keen to sign up to the climate change agenda and learn more, and those who are a bit more resistant?

Matthew Farrow: Some companies are in the thick of the agenda and have been for some years; I am thinking, for example, of the big energy companies—climate change has been a huge issue for them—and companies that manufacture environmental technology, such as insulation products. Then there are the companies that use a lot of energy, such as heavy industry and big
retailers. They are interested in understanding how they can improve their energy efficiency; increasingly, they are also getting pressure from customers and shareholders about their carbon liabilities and policies.

We find that some companies, although they are not opposed to acting on climate change, find it much harder to relate it to their business. I am thinking of a small media company or a small tourism company. It can take longer to connect a small tourism company to the issues relating to tourism, such as moving people differently—adaptation is a huge issue. With media companies, there are issues around information technology and energy efficiency. Inevitably, though, some companies find it harder to relate the debates in the media or among the broad business community to their operations.

**Rob Gibson (Highlands and Islands) (SNP):** Are any of the more reluctant companies members of the group that Brendan Dick is a member of?

**Brendan Dick:** The climate change business delivery group?

**Rob Gibson:** Yes.

**Brendan Dick:** I do not detect any sense of reluctance in any of the members of my group. First, it is fundamentally a group of people who, on a personal and a corporate level, understand that doing nothing is not an option. The group’s members must have a commitment to doing something. Secondly, however, there is the challenge—the hard bit—which is twofold. First, how do we, as organisations and as companies, achieve the objective of changing our environmental impact in a way that is economically sensible? Secondly, one of the fundamentals that we are about, as a group and as individuals, is trying to champion the cause. In effect, we are all giving up free time because there is no serious infrastructure behind the group. In many respects—this relates to what Matthew Farrow said—that can be the hard part.

I do not detect many organisations or individuals who do not believe that we need to do something—the challenge is what. That is quite complex. Large organisations have some capacity to deal with it. In BT we are trying our best, but one of the big challenges for the group is promulgating the messages and the ease of use going forward. That is, arguably, a challenge for Government as well.

**Des McNulty (Clydebank and Milngavie) (Lab):** A tension seems to exist in the business responses between, on the one hand, concerns about impacts and risks of legislation and, on the other hand, a sense that there are some significant opportunities to be had. In that context, do you think that we need to have an analysis of the impacts, risks and opportunities, prior to the introduction of the legislation? If you do, what would be the best role for business in conducting such an analysis?

**Brendan Dick:** I can certainly give a view; I am sure that others can, too. The idea has merit. By coincidence, the reason that I have to dash off is that I am going to Inverness to jointly host a dinner this evening with Highlands and Islands Enterprise, for businesses in the Highlands that are trying to engage in the business of delivering green services, in the UK and abroad. There are clear opportunities.

A number of businesses that are engaged in the issue, including BT, are learning from what we have been doing in Scotland, the UK and abroad, and turning it into physical products or services such as consultancy that we think will have a market. There is merit in their doing that. Business can play a role, because many of us have experience of looking at the risks and challenges. If we start from the premise that doing nothing is not an option, the question is not just how we can identify the risks but, critically, how we can find ways of dealing with them. That is the key thing that business can bring to help the Government and the committee to take the debate forward.

**The Convener:** I want to explore a little bit further the various activities that are happening at the moment. Brendan Dick is the Prince of Wales’s ambassador for corporate responsibility in Scotland. What does that role involve in relation to climate change, and has it given any additional weight to the work that the business delivery group is doing?

**Brendan Dick:** Each year, the Prince of Wales has an ambassador for corporate responsibility in Scotland. That individual can pick a theme, and I chose the environment. Being in the role has been interesting and in some respects quite challenging.

As you can see from the membership base, the climate change business delivery group comprises mostly large organisations that are already engaged in the challenge, although there are some exceptions. I have learned from what I am doing as Prince Charles’s ambassador that there is a challenge in getting smaller businesses involved. I am sure that many of you are familiar with the May day network, which he set up and which operates here in Scotland and in the UK. Both the business delivery group and Scottish Business in the Community are using that network as a tool to engage organisations in the agenda. Within the May day network, there are steps that businesses can sign up to, or commit to. Network members can be local authorities, voluntary sector organisations, or others.
To be honest, the frustration has been not in getting big businesses engaged—that is doable, and I think they are all engaged—but in getting the mass of smaller businesses in Scotland engaged. Organisations that are at the leading edge of the challenge—either because of the industry that they are in, as Matthew Farrow mentioned, or because they are large—are doing things, but how can we get the mass of small and medium-sized enterprises in Scotland engaged, and indeed how can we get the mass of consumers at home engaged? That is the big challenge in the short term.

When we examine the targets that have been set and what can be done, our experience at BT is that we can begin by going for the low-hanging fruit. We can start to get people and businesses engaged in better, more efficient uses of energy by encouraging people to do simple things such as changing their travel patterns and buying low-energy light bulbs. The frustration in my year as ambassador has been that more people have not become engaged in the May day network. However, with some help from the Government, we managed to find funding for a post to drive that forward next year.

The Convener: It has been suggested that Scotland is well placed to respond to the climate change agenda and maximise the benefits that can come from the transformation that climate change requires of us. Does Jason Ormiston agree with that, and if so, why?

Jason Ormiston (Scottish Renewables): I represent the renewable energy industry in Scotland. We have 240 members who are keen for renewables to be successful in Scotland, the UK, Europe, and more widely. It is clear that Scotland enjoys the natural resources that are necessary for us commercially and economically to exploit the potential with a range of different technologies in all three energy sectors—heat, electricity and transport. We know from the historical legacy of our hydro stations that affordable and reliable green electricity can be supplied from those power stations.

We know from our experience since 2000 that the renewable electricity sector has been able to step up to the plate. There has been significant investment in the development of renewable energy technologies, especially onshore wind, and we are now getting signals about the significant potential of offshore wind, and similarly of wave and tidal power.

14:15

Although the desire and the aspiration exist to provide heat as sustainably as we possibly can—that means reducing our demand for heat and then supplying the heat that is needed from as green a source as possible—it is fair to say that we are not there yet. An awful lot of work needs to be done to create the framework, which—to repeat a phrase that Brendan Dick used—needs to make economic sense for SMEs and others, so that they can make the case to themselves for installing those technologies and promoting energy efficiency. The UK Government has a long way to go before it can put that framework in place.

However, if the framework is put in place, we are talking about a green industry that could employ tens of thousands of people, if not more, by 2050. It would be a major sector that could show some world leadership. On that basis, we are talking about jobs and significant economic benefits, and about businesses reducing their own energy bills.

We have published case studies of businesses that are off the gas grid. Previously, they had to use petrol and oil for heating purposes, but they have now switched to biodiesel and biogas—and to anaerobic digestion, ground-source heat pumps and other such technologies—and have subsequently saved tens of thousands of pounds a year, based on last year’s high oil price. People are making that switch because it makes economic sense, and the frameworks that we put in place must make economic sense for such action to take place.

The Convener: The committee will spend some time over the coming weeks on getting the legislative side of the framework—the bill—right, but even if the bill is perfect, Government action is required to ensure that we meet the targets. Would you care to say anything about the Government action on, for example, investment in marine, in relation to investment by Government or incentives for business to invest in that sector?

Jason Ormiston: There is a missed opportunity in part 5, chapter 3 of the bill. There is—rightly—a focus on energy efficiency and a strong commitment to action, but the chapter is a little weak on renewable heat, and it could be strengthened to promote determined activity from the Scottish Government. There is nothing on electricity or transport, but there is an argument for trying to deliver through the bill a commitment from the Scottish Government to have action plans for all three energy sectors.

On a wider scale, I do not expect the bill to pinpoint financial support for things such as wave and tidal, but the Scottish Government, the UK Government and Europe could do more to support fledgling technologies in that sector. The level of finance is not sufficient to build an industry quickly. There are opportunities through the renewables obligation—the financial support mechanism—to bring forward wave and tidal, and it might provide a strong market pull, but that would require a great
deal of capital investment up front, which the RO might not deliver. More could be done by the Scottish Government, the UK Government and in Europe.

Charlie Gordon (Glasgow Cathcart) (Lab): Should—or could—the bill have considered the skills that will be required to move to a low-carbon economy?

Grant Hodges (Climate Change Business Delivery Group): Throughout the process, business needs—according to our group—some clear signals about the areas in which Government believes the targets should be met. We need a road map that tells businesses which targets will be met from heat, and which will be met from renewables technology, and which gives them a steer on where the Government wants effort to be focused.

That would naturally lead to the question whether we have the skills now, or whether we need to consider different sorts of training. We need to think about the skills that are needed, but first we need to work out the road map for meeting the targets so that we can find the skills gap.

Charlie Gordon: It is clear that certain skills might be needed to take advantage of what, presumably, might be opportunities for expansion in some of the technologies that are associated with new types of energy, but is there a potential downside? Could it lead to loss of jobs in the real economy?

Grant Hodges: The potential exists for the creation of green jobs to result in a net positive. Many more jobs will arise from a sensible and well-thought-through programme that meets the targets. We are going through tricky economic times. The challenge is to ease the switch of jobs from the old economy to the new economy. There is a risk but, to go back to what Jason Ormiston said, I would argue that Government can do more to encourage investment in renewables, particularly in heat. If Government does that and those industries flourish, that will greatly ease the employment risk that the current financial problems have created.

Charlie Gordon: Can the CBI provide us with some data that points to a net increase in the number of jobs? Other witnesses have criticised the fact that there is no net job impact evaluation associated with the bill.

Matthew Farrow: There are a number of points that I would like to make on skills. Whether the bill should address the issue is an open question. It might be a risk to include everything in the bill; often, we just want to get on and do things.

Skills are a huge issue. You are right to point out that the picture is not all positive. I agree with what Grant Hodges said. There will be just as many jobs in a low-carbon economy as there were in the old economy but, as we all know, transitions are often painful. Specific measures need to be, and are being, taken at European level on the emission trading scheme to ensure that while we reduce emissions across Europe as a whole, we do not put the sectors that are competing internationally in an impossible position by making them pay a carbon price that their competitors in China and India do not have to pay. The result of that will be that they simply cannot compete and those jobs will be lost. The emissions will not reduce; they will just migrate. There are risks, which having the right policy—at the European and UK levels, as well as the Scottish level—will allow us to address.

As regards upskilling, it is important to ensure that Scotland and the UK get the skills benefit. If we set ambitious targets and pull through the technology to deliver on the targets, there is a risk that the supply chains might be overseas—wind power is often given as an example of that. We cannot avoid that happening. Our view is that we need to do as much as we can to meet the targets across all the technologies. It is impossible to say that we will be able to source everything that we need from within the UK. It is important that the Scottish Government and the UK Government think quite hard about the areas in which the UK and Scotland have a particular advantage. The marine sector is a good example, as is carbon capture and storage. As Grant Hodges said, we need to have a road map for the development of those sectors. Specific measures can be taken on skills, but I am not sure whether they should be included in the bill.

When it comes to job numbers, there are many estimates floating around, from President Obama and the Prime Minister, as well as from particular sectors. My view is that one could spend a long time trying to come up with a big number. We know that the opportunities and the jobs are there, so let us just get on with taking action. However, there are data that can be examined. The UK Government is to bring out a low-carbon industrial strategy, which will have a lot of numbers in it.

Jason Ormiston: I would like to provide some perspective. To answer your question, it would be possible to deliver a skills action plan through a renewable heat action plan. To deliver on the 11 per cent target that the Scottish Government is committing to, we will need to increase the number of installations of renewable heat technology— solar panels and so on—from 1,500 a year to 25,000 a year. We do not have the skilled workforce to deliver that number of installations. We need to reach that installation capacity quickly. I view the development of a renewable heat action plan as an important subset of action on skills.
would prefer delivery on that front, instead of skills being dealt with in a distinct part of the bill.

Grant Hodges: I have another point on job numbers. Last week, I was at a meeting that Patrick Harvie chaired and at which there was an interesting presentation that said that the flow-through of jobs from the proportion of the American fiscal stimulus that was spent on green industries was much higher than it was from the stimulus in other areas. You could take that as an indication that there are more jobs to come from spending money on green infrastructure than from other areas of the fiscal stimulus.

Rob Gibson: Matthew Farrow made a point about certain industries being exempted from the ETS. What industries?

Matthew Farrow: I was not saying that some industries should be exempted from a European Union ETS. The way we think that an EU ETS should work—this is broadly how the new deal that was done with the European Commission in December has taken it forward—is by setting an overall cap on emissions for all sectors within the scheme, and then having a debate about whether those allowances should be auctioned or issued free. Our view is that sectors that have evidence that they are subject to carbon leakage and cannot compete on paying a carbon price should get a free allocation on the basis of a benchmark.

I am afraid that this will get quite technical. The European Commission’s approach is that the benchmark should be set for the most efficient 10 per cent of installations throughout Europe. An installation that was in that 10 per cent band would get free, not all but most of, the allowances that it needs. That would allow it to compete internationally and it would not have to buy additional allowances. If an installation was below that top 10 per cent—if it used older or less efficient plant, or whatever—it would get only enough free allowances to enable it to operate as if it had the most efficient plant. Therefore, there is a massive incentive to invest in more carbon-efficient technology.

It is important to recognise that a free allocation against a benchmark for particular sectors is not a get-out-of-jail-free card—the task that is faced is still very difficult—but it would allow them to compete internationally until we have some breathing space. The sectors that we are talking about include the cement sector, the steel sector and parts of the chemicals sector.

Rob Gibson: Those sectors are not noticeably represented on the climate change business delivery group.

Brendan Dick: No.

Matthew Farrow: The CBI had a climate change task force that was made up of about 15 chief executives of UK-wide companies who put together our climate change report about two years ago. It included Philippe Varin from Corus and Tom Crotty from INEOS Chlor. The CBI’s advantage is that, because we are a cross-sectoral body, our work on climate change must be informed by—as the convener said—the whole range of companies at the leading edge and in different sectors. If we are to make the low-carbon economy a reality, we must transform the whole economy; therefore, we must have a debate that includes the wider business community. That is what we tried to do.

The Convener: I think Rob Gibson’s point is understood.

Charlie Gordon: Can the CBI give some examples of best practice in businesses encouraging behavioural changes in this area of policy, in terms of both their staff and their customers?

Matthew Farrow: I will kick off, but I am sure that others will want to come in.

There are some good examples of that. One company—I think that it is General Electric—has a personal carbon calculator on its company intranet. Its employees are encouraged to calculate their own carbon footprints, including from their lives outside work. Other companies send energy efficiency information to their employees’ home addresses to reinforce the fact that energy efficiency should happen not just in the workplace, but outside it as well. There are some good examples around, but I do not have a list of them with me.

When I talk to the big employers, they recognise that, as major employers in Scotland and throughout the UK, they have an important role to play in trying to enthuse large parts of the population. Car fleets are another example. Some companies whose employees have company cars incentivise employees to choose cars that produce lower emissions. Videoconferencing is also encouraged.

I am sure that my colleagues will want to provide some more examples.

14:30

Brendan Dick: There are two aspects to the issue, and the mention of employees is important.

BT and, I am sure, other large organisations have done a lot in recent years to drive the climate change agenda in a way that makes sense for us. We have saved a lot of money by doing that, but there are many other side benefits. Matthew Farrow referred to flexible working, of which we do
a lot—it is how we live. Flexible working saves money and, significantly, an awful lot of carbon.

There are a lot of other examples. In Glasgow, which is Charlie Gordon’s home patch, we have successfully trialled an electronic van for Openreach field engineers. Recycling and other initiatives have helped us to make a massive step change since we started measuring emissions in 1996: we have not yet touched on the key issue of measurements.

Employee involvement is critical. We have a number of initiatives, but our main focus internally is on carbon clubs. Using carbon calculators as a basis, we encourage colleagues—whoever and wherever they are—to set up clubs on a variety of issues that deliver environmental benefits. Those include cycling clubs, clubs that are active in the community and clubs with green agendas. That approach has two or three benefits: first, it benefits the company; secondly, it changes behaviours at home—people in carbon clubs at work are more likely to think about environmental issues when they are at home with their families; and thirdly, if people in large organisations such as BT are more aware of environmental issues, they are more likely to talk about them to friends who work in small businesses. That drives change and also relates to the issue of broader business engagement. Our carbon clubs are internal, but we are exploring whether we can externalise them in a city or geography, so that everyone can take part. We have not done it yet, but larger organisations could help in that regard.

Grant Hodges: I will offer the committee a couple more examples of best practice. Reflecting the fact that people are competitive by nature, we have extended the idea of carbon clubs to competitions between different offices and business units, which are challenged to come up with and implement the best ideas. That approach has the benefits that Brendan Dick outlined, in that it gets people to take changes in behaviour home with them.

Nearly every partner in PWC has been through a three-day programme on the sustainability agenda at Cambridge University. The aim is to increase every partner’s awareness of environmental and sustainability issues, so that the environment becomes a mainstream topic of conversation when they talk to their clients. An audit partner who, historically, has had no interest in the environment can facilitate change by raising awareness of the issue with the finance director of their FTSE 100 company.

Charlie Gordon: What is your view of how the Scottish Government engaged the business community during development of the bill? Do you have any views on the consultation processes that were employed?

Brendan Dick: From our point of view, the processes were successful. I cannot say much more than that.

Jason Ormiston: We have had every opportunity to engage—we are sitting in front of the committee engaging. The renewables industry does not think that it has been left out in any way. The industry is seen as being key to delivery of the bill’s objectives, so we have deliberately engaged with the process in a proactive and positive manner.

Matthew Farrow: I have nothing to add. We responded to the consultation and were involved in discussions about particular concerns.

Cathy Peattie (Falkirk East) (Lab): The bill proposes cuts in emissions of 80 per cent by 2050 and 50 per cent by 2030. Does the panel think that those targets are ambitious enough?

Matthew Farrow: Broadly, yes. The fundamental point is that the targets must be led by the science. The value of the Committee on Climate Change is that it provides advice on that. When the UK Climate Change Bill was being debated, there was a lot of discussion about raising the 2050 target for the UK from 60 per cent to 80 per cent—it had already been raised to 80 per cent for Scotland. The CBI’s view was that we should consider what the Committee on Climate Change said: if its analysis of the science suggested a target of 70, 80 or 90 per cent, that would be what the target should be. From that point of view, the 80 per cent target for the Scottish bill mirrors the UK target, which seems appropriate. As Adair Turner has pointed out, there is an issue about international aviation and how its emissions are counted. If it continues to grow, it will be necessary to cut by 90 per cent emissions in the rest of the economy. Broadly, the 2050 target is ambitious enough.

In a sense, the 2030 target feels a little bit arbitrary, although it is broadly on the trajectory towards 2050, which feels right. I guess that the value of having a target for 2030 is that it emphasises to people that there is a lot to do by 2020, which is where the UK act interim target is focused. However, the following decade is pretty important, too, particularly in relation to energy. Some of the big-ticket items, such as carbon capture and storage, and nuclear power—which I know is a controversial issue, particularly in Scotland—will not come into play until the 2020s.

As the bill emphasises, 2020 is a tough staging post, but in the following decade you have to at least keep up the pace. The 2050 target is extremely challenging and it is science led. Rather than have a long debate about whether the target should have been to reduce emissions from the
1990 level by 82, 85, or 78 per cent, we just need to get on and do some of this stuff.

Brendan Dick: I agree with Matthew Farrow. To start with the getting-on bit, the Government’s role is to work hard and facilitate the creation of a way of measuring everything. That is where a lot of people struggle; it is very difficult to hit a target if you do not know where you are starting from. If an individual or business can measure different causes of climate change, they can start to do something about it. My company has done that and—trying to get early wins is key. Grant Hodges and I were talking about this earlier.

Although using credits might be in the mix on the journey, at the key staging points of 2030 and 2050, the ambition for the country ought to be genuinely to hit the 80 per cent target, not to hit 70 per cent and have bought 10 per cent. That is important, but it is going to be pretty challenging.

We are a nation of 5 million people and we should take a common approach. Some parts of the country—certain towns and cities—are starting to say that they will achieve a 100 per cent reduction. That is perfectly understandable, but we are not in favour of that approach. It is hard enough to get a system and methodology to achieve the 80 per cent target collectively, so distractions, such as I have just described, are probably not helpful.

Grant Hodges: I totally agree that we should ensure that trading exists only to help soothe the pain of the journey, not to mitigate the result at the end point. We have to ensure that we are consistent and honest about what we measure as Scottish emissions, and that we do not run into the danger of, in effect, offshoring our emissions by importing carbon that is being produced elsewhere. The definition of emissions must be purely what we make, plus aviation emissions. We must ensure that we do not offshore our emissions. I cite the example of Ravenscraig.

Grant Hodges: I am very much in favour of a 2020 target. A route map was mentioned earlier. I am really keen on our turning things around and working out what we are going to do and where it should get us for 2020. We could have a sense check of whether the things we think that we could realistically do between now and 2020 will really put us on the trajectory to achieve the 2030 target. That way, we would have a realistic map—we would know what we are doing. We should have a target for 2020, but I do not think that we should just set a top-down number; we should try to work out how we will realistically achieve the target.

Brendan Dick: I am not an expert in the methodology; plenty of people are more expert in it than I am. My primary observation is that a standard process should be created as quickly as possible. What we have tried to do in the May day network, and in other initiatives to encourage smaller businesses to get started, is to make some of the basic stuff simple. That can be refined.

It is important that the experts whom the Scottish and UK Governments can call in come up with something that all of us can sign up to and move forward with and the key is to do that quickly. Things might become more complex and sophisticated as time goes on, but if most people have something that is relatively simple to work to—at work or at home—they will at least know what to aim at.

Jason Ormiston: Cathy Peattie’s original question was whether the targets of 50 per cent and 80 per cent are ambitious enough. We must see those targets as being ambitious, because we are unlikely to achieve them from where we are now. An awful lot of things must happen—in renewable heat, for example, which I talked about—before we are likely to achieve the targets. We are cutting carbon emissions by 1.5 per cent per year, but we need to cut them by 3 per cent per year.

Another issue is the trajectory of carbon cuts. It is important to cut as much as we can, as soon as we can. If we do not do that now, more expensive and more politically difficult action might have to be taken later, if members follow my logic. Early and effective action needs to be promoted.

Flexibility on the science is needed. Many commentators say that a cut of 80 per cent is needed by 2030. If the science says that in the next few years, will the Scottish Government be ready to set the target of an 80 per cent cut by 2030? How on earth would that be achieved?

The Convener: Given those comments, I will ask about something that Brendan Dick said. Some of the news about the science is increasingly shocking, week on week. We know that global emissions have been higher than the Intergovernmental Panel on Climate Change’s worst expectation when it published its assessment report, so the situation is urgent. Brendan Dick talked about community work. I was not clear what you were referring to—did you mean the idea of carbon-neutral communities or transition towns? In my experience, such activity turns the agenda into something positive for people to participate in.

Brendan Dick: My observation is based on my experience. The ambition to be carbon neutral by...
2050 is fine if how it is to be measured and attained is clear locally. The challenge in a nation of our size, where people are broadly starting to pull together to achieve the 80 per cent objective, is to avoid the danger of being diverted. Edinburgh says that it wants to be 100 per cent clean by 2050. That will be fine as long as we apply to that the methodology that we apply nationally—a standard to which everyone is working. If we can squeeze that further in Edinburgh, Biggar or wherever, that is good. However, to run a completely separate process in parallel would be unhelpful because people would have to be engaged in two or three ways.

**The Convener:** I do not understand why that would be any more of a distraction than the concept of carbon-neutral buildings or housing is, when other parts of the economy do not think that they can achieve that level.

**Brendan Dick:** From a business perspective, if we focus all our efforts on the 80 per cent target and the process to reach it, having resources diverted to a different process will be challenging. There is nothing wrong with the aspiration, but I question the practicalities—the resources, to be frank—for dealing with it.

**The Convener:** If the result of various strategies is early, quick and deep cuts, that is what we are looking for.

**Brendan Dick:** If we can implement some of that—with a different hat on, I am engaged in that in Edinburgh—we can make early cuts. If a city in Scotland was to come up with a process to which we could subscribe for hitting 100 per cent, why not use it throughout Scotland?

**Matthew Farrow:** Can I just add a point on measurement?

**The Convener:** Briefly.

**Matthew Farrow:** We found that companies want, in order to measure their carbon footprints, a user-friendly tool that is uniform and applicable to all sectors, so the CBI is working with companies to produce that. We also work closely with the UK Department of Energy and Climate Change because the UK Climate Change Act 2008 requires the Secretary of State for Energy and Climate Change to implement that sort of approach. We hope that within three or four months we will produce a draft that will at least give all companies a standard method of measuring their carbon footprint.

14:45

**Cathy Peattie:** I am interested in what the witnesses believe the level of annual emissions cuts needs to be between 2010 and 2019. Do you believe that a 3 per cent year-on-year cut from 2010 is achievable in the business sector? Do you throw your arms up in horror at that proposal?

**Brendan Dick:** The important thing is that at least we have targets. Obviously, we can debate whether there should be annual targets or another process for getting to our ultimate objective by 2020, 2030 or 2050. Different people will have different views, but what is most important is to have targets to aim at so that people can get on with delivery.

**Grant Hodges:** Many of the available initiatives do not even have up-front capital costs, but are not being undertaken because businesses are busy doing other things. However, there is a lot of low-hanging fruit that would allow businesses to cut their carbon footprint radically and quickly. As we have just discussed, early action is important because of the chilling statistic that a bit of carbon that goes up in the air this year will stay there for 100 years. It is therefore much better to take carbon out of the environment this year than next year. I believe that it is possible for all businesses and all parts of Government to reduce their footprint quickly.

**Jason Ormiston:** That is more likely to happen in the business sector than in the domestic sector. It makes economic sense for a business to cut its energy bill at the moment, but it is much more difficult for householders to respond to such pressures because they are not incentivised to do so and some homes are difficult to insulate. Retrofitting 2.2 million homes in Scotland will be tough because we do not yet have in place the framework to deliver that. However, it is true that businesses are responding.

**Matthew Farrow:** The bill’s approach to the target for 2020 is, in a sense, a bit clumsy. I am not a big fan of annual targets because it is difficult to guarantee year-on-year falls. The yearly figure can bounce around and particular factors can affect it; for example, generators burn more coal if there is a particularly harsh winter, so the emissions rate moves up. The short-term trend is what matters—I think we all agree that we need early cuts. The bill says that we must have annual targets, but because it recognises that it is hard to guarantee immediate and steady cuts year on year until 2020, it says that emissions just have to be less than they were the year before. In theory, that requirement could be met by making only a small reduction in emissions between now and 2020, which is clearly not the way to go.

Our view is that the UK 2008 act takes a good approach. It has five-year carbon budgets that will not lock people into achieving precise reduction levels every year, which are hard to guarantee. However, there is a guarantee that a slice will be taken off emissions over each five-year period. There was a big debate during the progress of the
UK Climate Change Bill about whether there should be annual targets. In the end, the Government approached the matter in a way that works reasonably well. A trajectory must be published for each five-year carbon budget that will show how emissions will fall year on year. Those are not formal targets, but part of a trajectory. If there is a deviation from the trajectory, it must be justified.

That approach makes sense from a Scottish point of view because figures can bounce around one year due to circumstances that are not policy or business failures and which no one in Scotland can affect easily. We would want to note that but not change policy. However, if the figures were off course because the policy was not working, something would have to be done about that. MSPs, for example, would need to hold the Government to account for that.

I feel that the 2008 UK act’s approach is reasonable, but that of the Climate Change (Scotland) Bill is a bit clumsy because it wants annual targets while not locking itself into them too much.

Jason Ormiston: Whether to have annual or five-year targets is an interesting debate. However, it would be a big mistake to use weather patterns as a justification for missing a target. The problem is that we have poor-quality, badly insulated homes. That problem does not exist in Scandinavia. If we had high-quality, 100 per cent perfectly energy-efficient homes—zero-energy homes—weather patterns would not be a problem in the context of cutting carbon emissions. There is a problem only because of the poor quality of the housing stock. Heating accounts for 50 per cent of our energy use. That is a key point. I would hate to hear weather patterns being used as an excuse for targets being missed.

The Convener: We must move on. I ask people to be brief.

Matthew Farrow: The question is how we get from where we are to Scandinavian levels of housing-stock quality. The UK commitment on zero-carbon homes must be achieved in Scotland, but the real problem is the existing housing stock. Scotland has worse housing stock than the rest of the UK, in the context of energy efficiency rating.

Dramatic action is needed, but there is so much inertia in the system. There is an issue to do with skills, as Charlie Gordon said, and people do not want people to come into their houses and rip out the walls. It will take pretty powerful incentives, such as council tax rebates, to get action beyond that of the few per cent of people who go out and find grants to put energy efficiency measures in place. I agree with what has been said, but the issue is how quickly we can get to where we want to be. That brings us back to the road maps—I think that that has been a common message for the committee from witnesses.

Cathy Peattie: We need to start somewhere. I will not be around in 2050, but I hope that my grandkids will be. How soon can we start measuring what we do, so that we can say, “That worked, but that didn’t work”? Can we start doing that in five or 10 years? Is it realistic to start measuring progress in 2010, or should we put off doing that for another five years or until we have got the infrastructure right?

Jason Ormiston: The target should be based on 1990 figures. We should think retrospectively about how we have performed—we have performed poorly—and then consider the trajectory from now, based on a 3 per cent annual cut, as long as the science justifies that. That is the benchmark that we require.

A few weeks ago, the Scottish Parliament had an opportunity to support Patrick Harvie’s call for increased spending on energy efficiency. Although more money is going into the energy efficiency pot, we need to do an awful lot more. Careful thinking about that is needed.

The Convener: I must ask that questions and answers be kept brief and to the point, so that we can make progress.

Des McNulty: I am interested in action between now and 2020. Would it be reasonable and appropriate for Scotland to set the higher of the two targets that will be discussed at Copenhagen, whatever happens at that conference?

Matthew Farrow: We need to work towards the higher target. That is the advice of the Committee on Climate Change, although it acknowledges that it will almost certainly be necessary for the UK to buy credits, because the higher target is simply not achievable through domestic action. The right approach in principle is to aim for the higher target and get as close as we can to it, even though we will need to buy some credits and even if nothing happens at Copenhagen. I suspect that a deal will be reached at Copenhagen, but I do not know how robust it will be. We must hope that whatever happens we will get closer to achieving a robust deal in succeeding years. If the whole system fails apart, there will be a different debate, but our not getting what we want at Copenhagen should not be used as a justification for dropping the higher target altogether.

Des McNulty: Can Scotland achieve the higher target? You said that the UK probably cannot do so.

Matthew Farrow: I do not know. I would seek advice from the Committee on Climate Change, which does good analysis of what different sectors
can do—it will do more for the autumn report. The Scottish Government partly funds the CCC, whose purpose is to provide such advice.

Jason Ormiston: If the question is whether Scotland can meet the target—as opposed to whether we will do so—the answer is that we absolutely can deliver an 80 per cent cut by 2050. We have expressed a desire to show leadership, so even if Copenhagen decides against the higher target, we should remain committed to it, because we have the resources to do so—others can soon catch up.

Rob Gibson: We heard about route maps for businesses and we need action plans for different sectors. Have the witnesses calculated the contributions that different types of business will have to make to help Scotland to reach its targets?

Matthew Farrow: We have done some work on that at a UK level, although the results of one of the two pieces of work have not yet been published. We have done a cost curve for the UK as a whole, which shows what each technology and policy option needs to deliver in terms of tonnes of carbon, and in about two months’ time we will publish a series of road maps that spell out what needs to happen in various sectors—buildings, industry, energy and transport.

Those pieces of work are at a UK level. We are considering whether we can produce the data at the Scottish level, but it is sometimes difficult to disaggregate them. However, the Committee on Climate Change is doing a similar analysis, so it might be a source of specific advice.

Rob Gibson: Has it, too, not had a problem with disaggregating the data for Scotland? We are trying to find out what the Scottish emissions are. How can we do that if the UK Committee on Climate Change is unable to be precise?

Grant Hodges: That is a difficult question. I suspect that all four of us will say that we do not know the answer. However, I will make a couple of points. First, you asked about different sectors of industry, but I would turn that matrix round and say that it is clear that we should focus on the major area of heat. My statistic will be slightly wrong, but heat accounts for roughly 50 per cent of carbon emissions. A huge amount of the efforts that have been made so far have been in other areas and have not touched on heat, so if we focus on heat, we can achieve a lot quickly.

Secondly, we should focus on demand. We have talked a lot about energy efficiency, which is great, because we should certainly focus on insulation and the energy efficiency of buildings, but we also need to change people’s behaviour. We should try to do that quickly, because there is a risk that people will consume energy efficiently but in large quantities, whereas what we need is for them to consume less energy.

I accept that I have not answered your question about different sectors of the economy, but if we focus on heat and demand, we can make huge strides.

Rob Gibson: I am sure that some businesses will be unhappy that they are unable to provide their services in order that people can consume all that electricity or heat or whatever, but other businesses can benefit from that. That is why I asked the question. Are there businesses of different types that we know have done the calculations?

Brendan Dick: Grant Hodges is right to say that the area has been challenging. We have been at the game for quite some time—we have been measuring components for years—and it is only now that we are getting granular. We are now focusing on the figures for individual locations—not just the offices that we populate but exchanges and so on in our network.

We are probably getting to a stage where UK and global businesses that already have measures at a high level are becoming quite granular. I am sure that the same is true of many public sector organisations, such as local authorities that have properties all over the place. They are facing the same challenges.

Rob Gibson: Indeed. I am sure that you want support from the Government and other agencies, but how should they offer assistance? Surely it is not just through targets. It must be more than that.

Jason Ormiston: Initially, we would prefer incentives for people to respond to the problem in sensible ways. That will require some money, but things such as the UK Government’s initiatives on renewable heat and the feed-in tariffs that it proposes to promote for the installation of microgeneration, especially in retrofit, will make a difference. We hope that the UK Government will set the incentives at the right level so that a significant difference is made.

It is important to promote cultural change. People sometimes hold up their hands in despair and say that, although people talk a good game on climate change and their own activities, how that translates into day-to-day activity is another matter. We are probably all guilty of that from time to time. Trying to get that kind of cultural shift among people is probably the biggest challenge that we face. It comes back to the need to incentivise people to do what makes economic sense.

That shift will eventually occur, especially given the ways in which schools are tackling the issue. Kids are getting it, but people from the older
generations generally do not get it as much, which is an issue that needs to be addressed. There need to be financial incentives for action.

15:00

**Rob Gibson:** The Carbon Trust has done a good job in calculating carbon management for some businesses, as John Stocks reminded us last week, but it does not have the resources to roll that out for all businesses. Is that the kind of thing that needs to happen?

**Brendan Dick:** Jason Ormiston was right to mention incentives, but I think that there are two things that the Government can do in the short term. It must somehow find a way—the Carbon Trust is a good example—to get every business, public sector organisation and voluntary sector organisation to understand how to start the journey. A basic capability has to exist in relation even to simple measures, and that extends into the home too.

To extend that forward, one thing that Government can do is relatively unique is to enable cultural change, working with other organisations but acting as a catalyst itself. Individual organisations are less capable of doing that, and even for big organisations it is difficult to pull things together. People need to be given the capability to understand and measure, and to see the way forward. There are some simple technologies—as I am sure you know better than I do—that can be deployed in the home to help with that. The big thing is just to get us started on that journey.

**Jason Ormiston:** In the longer term, pricing environmental impact into people’s activity will be useful. I am talking about the cost of climate change and carbon. Everything that we buy may have a carbon impact and, if that is the case, we have to pay for it. That will perhaps lead people to take a more sensible route.

**Rob Gibson:** That is what the Office of Gas and Electricity Markets would say that it is doing to you at the moment.

**Jason Ormiston:** That is another debate.

In the longer term, we have to move towards that type of carbon marketplace. There are many different ways to do that, but carbon needs to be priced into people’s activity. That does not happen yet with regard to the externalities of climate change.

**Matthew Farrow:** Given that public resources are limited in Scotland and throughout the UK, there is a risk that every lobby group will say that they want incentives for their particular activity.

You need to do two things. You need to look at where you can get most bang for the buck. You should also consider schemes that are revenue neutral but which provide incentives or disincentives. We have looked quite hard at whether it is possible to have green business rates, for example. That is complicated and it is not clear that it is possible—the carbon reduction scheme, which might achieve similar effects, is coming in anyway—but the idea is that very energy efficient buildings get a cut in business rates, while the least energy efficient get an uplift. The Italians have a scheme for buying appliances in which people get a grant if they buy a very energy efficient appliance and pay extra if they buy the least efficient one. At a time when public authorities do not have a lot of cash to spend on some of this stuff, it is worth considering those issues.

**Alison McInnes (North East Scotland) (LD):** Matthew Farrow mentioned aviation earlier. Can you give us a clear view on whether aviation and shipping are correctly identified in the bill and on how they are tackled?

**Matthew Farrow:** I will kick off, as I mentioned the issue. There is not a huge amount of disagreement. As I understand it, the bill says—as the UK act does—that Scotland’s share of international aviation and shipping is a legitimate part of what we are trying to cut and has to be included in a target in some way. There are complex issues to do with how that is done methodologically, particularly with regard to shipping and how we account for the ships that come to our ports, for example in terms of a proportion of their journey.

The bill says that we will seek to include aviation and shipping in formal targets as quickly as possible once the methodology has been sorted out. In the meantime, we will carry on doing everything that we can to address aviation and shipping emissions, and to ensure that the rest of the economy is doing as much as it can. As Adair Turner said—and as I mentioned before—if we find that aviation and shipping cannot or do not reduce very much, it must be recognised that, as a society, we have to do more elsewhere. That seems to be a rational way to approach the issue.

**Grant Hodges:** This goes back to Jason Ormiston’s earlier comments about pricing and externalities. The price of aviation has to reflect fully the carbon cost and there have to be viable alternatives. There will always be a sensible rationale for taking long-distance flights, but what about flying to and from London? We need the carbon—the externality—to be priced and we need good, viable alternatives, so that people can make rational decisions. That should reduce the carbon impact of that mode of transport.
**Des McNulty:** The Scottish Government has said that it wants to take advice from the UK Committee on Climate Change in the first instance, but there is a mechanism in the bill that would allow it to set up a separate Scottish committee in due course, if that were needed. Is that the right approach? Is there an argument for having a Scottish committee now, or should we suck it and see, as the Scottish Government suggests?

**Brendan Dick:** I think that the current approach is right. The UK committee seems to be doing the right things. Keeping the option of filling in the gaps, whether via a Scottish committee or through some other body, is the best thing to do at this stage.

**Jason Ormiston:** This is not a huge issue for the renewables sector, but my experience of engagement with some institutions that are based down south is that they do not have as much exposure to Scottish issues as they should and that their analysis and decision making can therefore be a problem. Given that we represent only 10 per cent of the population and impact, I am concerned that we might get lost in the bigger picture for the UK committee. That would be a mistake, because we reckon that a third of the renewable electricity that is required to deliver the 2020 target is going to come from Scotland. As we move towards 2050, that proportion is likely to increase, so it would be a mistake for the UK committee to ignore Scotland. The suck-it-and-see approach might be the most sensible. If there are signs that we cannot count Scotland's impact, because the UK committee is not able to focus its resources on that, there should be a quick switch to an independent committee.

**Matthew Farrow:** I think that that is the right approach. In my experience, the UK committee's work is of a very high quality. The report that it has put out is independent and is sobering stuff. It is there for politicians, business and the whole population. As Jason Ormiston said, there might be a capacity issue. If there are specific issues that have a Scottish dimension that is not captured by the UK work and the UK committee does not have the resources to look into them, I guess that you in Edinburgh would want to commission particular research. I am not sure that recreating the UK committee at a Scottish level would be the best use of your resources, so it is probably right to take a suck-it-and-see approach.

**Des McNulty:** We heard last week from the Scottish Trades Union Congress that, although it had some doubts about whether we should try to replicate the scientific expertise role of the UK Climate Change Committee, there might be some scope for taking a specifically Scottish approach to the application of the recommendations in a Scottish context, given the specific circumstances of the Scottish business and regulatory landscape. Do you foresee that we will end up with a different division of the committee's functions in Scotland compared to the rest of the UK?

**Brendan Dick:** A different Scottish approach to application might well evolve. If we get knowledge at a UK level, why not use it? However, if, over time, the application in Scotland seems different, a different approach to that is fine. My industry, telecommunications—I know that Rob Gibson looks at this—has unique challenges in Scotland. We have managed to work on those in a Scottish context but within an overall UK regulatory framework and using UK understanding and knowledge.

**Rob Gibson:** The bill sets out annual reporting duties to Parliament on progress towards emissions targets and on proposals and policies to meet future targets. Do you have a view on the proposed reporting arrangements and can you identify any potential issues relating to collating information from the business sector and small and medium-sized enterprises in particular?

**Grant Hodges:** There will always be difficulties in collecting the data. The issue of consistency has been raised a few times. You must give a clear signal on how you want data to be collected and must provide clear methodologies, so that there is consistency. The bill includes provisions on waste, for example, that should lead to consistent data. Inconsistency of data was one of the big problems that we faced three or four years ago, when we were trying to put together area waste plans. Collecting the data will be a problem, but it needs to be tackled head on.

The other big problem that I foresee is the “So what?” question. If reporting shows that targets are not being achieved, what is the sanction? Who is the policeman—is it the Transport, Infrastructure and Climate Change Committee or Audit Scotland? At the moment, it is not clear to me that we can be confident of delivery against the targets. That goes hand in hand with reporting, because it does not matter what we report if there is no one to take that on.

**Jason Ormiston:** We must have some faith in the ability of the Scottish Parliament to scrutinise performance and to put pressure on the Scottish Government if it is not delivering—that is members' role. What will you do to ensure that the Scottish Government delivers on its targets?

The quality of statistics in the energy sector is not great; much more work needs to be done on the issue, especially in Scotland. I hope that the Scottish Government energy team is thinking about how it can tackle the issue of statistics,
because we struggle to get a handle on the situation, especially in the heat sector.

Rob Gibson: You are asking us to scrutinise performance, but we need to have good data. We are asking how you will collect data. Through your involvement in carbon management, surely you are evolving methods that will allow data to be more accurate.

Grant Hodges: Yes.

Brendan Dick: We are putting a vast amount of effort into examining how we capture data; as I said earlier, we are now getting down to a granular level. Grant Hodges is right. For various reasons—because we are bigger and have been collecting data for longer—we are probably a bit ahead of other organisations. During the early stages of the process, data capture requirements need to be relatively straightforward, or it will be really tough for all organisations—not just businesses—to meet them.

Jason Ormiston: The accountancy profession may shoot me for this, but the annual audit process for a business could include assessment of its carbon impact over the year. If we could find a way of measuring that, it could be included in general accepted accounting practice—I think that is what it is called, but I am not an accountant. In the longer term, that would allow us to measure how businesses are responding to similar pressures.

Grant Hodges: As an accountant, I think that that is what we need. Another factor that will be an ally in data collection when it is implemented is the carbon reduction commitment, which requires records to be kept and systems to be in place by spring 2010 and starts to have financial bite in spring 2011. Every business with a utility bill of £1 million and more will be captured by the CRC, which will provide a good chunk—although not all—of the data that members will need.

Rob Gibson: Can we re-educate accountants to deal in carbon as well as pounds or euros?

Grant Hodges: Yes.

Rob Gibson: Good.

The Convener: That is the kind of answer that we rarely get.

Matthew Farrow: We must distinguish between two issues. The first is monitoring of the absolute amount of emissions from the economy. I am not sure that we want a bottom-up way of doing that—the main concern is timeliness of data, on which we have already touched. The second is monitoring of why emissions are not being reduced fast enough. That is where bottom-up evidence from business is beneficial. We see our role in that as crucial, and we publish an annual document on UK-wide policies on climate change in which we specify what is working, what is not working and what should be done to fix that. That is different from trying to count every unit of carbon that comes out of Scotland. There are ways in which to do that already.

15:15

Cathy Peattie: There has been some discussion about what can be done locally and the importance of that. Do you think that the placing of duties on public bodies is an appropriate mechanism for driving change in the public sector? How might such duties have a knock-on effect on the business sector?

Jason Ormiston: I can answer your first question, on the duties on local authorities. Some local authorities have tried to undermine some of the national policies on the delivery of renewable energy that have come out of the Scottish Executive and the Scottish Government over the past few years. It is important that the bill gives the Scottish Government the powers—if it does not already have them—to impose a way of thinking or decision making on local authorities, so that they support the effort rather than undermine it. That has been a problem, but the bill could have a big impact there. I was therefore pleased to see the duties in part 4. That part of the bill is very important. A third of the budget is given to local authorities, and if they do not play ball, that causes a problem.

Brendan Dick: Local authorities are key to this. It comes back to the need to engage the broad base of small organisations and, critically, consumers. The Government can set the juggernaut running, but it cannot drive the juggernaut everywhere. Maybe I should not use the word "juggernaut"—it should be something smaller, such as an electric van, perhaps. Local authorities are a key channel for delivery, but there is a need for action across society—it is not just about local authorities or other public sector bodies.

My understanding, from talking to people offline, is that the Convention of Scottish Local Authorities is starting to look at the issue pretty hard. It is possible to achieve consensus and, at a local level, you will find that local authorities and businesses are at one in trying to make it happen. Some local authorities deliver services through local offices. That certainly happens in Edinburgh, where I live. Therefore, there may be a role for local authorities' local offices to play in securing a street-by-street culture change by telling people what they can do, which we have not quite cracked yet.
Grant Hedges: There is another role for local bodies in dragging through technologies by being a purchaser of those technologies. Local authorities should be early adopters of new heating technologies, for example, which generate off grid. Through their buying power, they can help to bring such technologies through.

Cathy Peattie: Do you believe that the duties on public bodies should be stated in the bill? Are there any examples from the business experience to suggest what such duties might incorporate?

Brendan Dick: I do not have a strong view on that.

Cathy Peattie: Are there any examples from the business sector that it might be helpful to consider in deciding how the duties should be applied?

Brendan Dick: In terms of just getting to the baseline measures?

Cathy Peattie: Yes.

Brendan Dick: Having been through the journey ourselves—we are not the only organisation to have done so—we are now offering a consultancy service to any external body, whether in the private or the public sector, on how to get baseline measures started. That tends to be for large organisations—we have not worked with the SME sector yet, but it is possible to do that. I had a conversation with a local authority in Scotland about that but, by extension, it is about how business can work in partnership with local authorities to start to have an impact through culture change in broader society. There are things that can be done.

In terms of the particulars in the bill and so on, it is maybe not quite that structured.

Alison McInnes: As you know, the bill requires the development of a climate change adaptation plan. What are you doing to increase the resilience of business to changes in the climate? Do you think that the Scottish Government is leading in that area? Is there anything else, in relation to adaptation, that we need to define in the bill?

Jason Ormiston: Adaptation is not a core area of focus for Scottish Renewables, as we try to prevent the problem in the first place. I am speculating a bit here, but I wonder whether our ability to invest in our housing stock to respond to climate change is well enough understood. That might well be associated with some of the energy efficiency measures that we are making. If we are going to get damper in the decades to come, there could be health issues and housing problems. If we bring in energy efficiency, we could also adapt to some of the problems that climate change might bring.

Matthew Farrow: Adaptation has been the Cinderella of the climate change debate for a long time, and politicians and business groups are all guilty of that. We are trying to redress the balance in the CBI. We have a cross-business working group looking at adaptation and we will produce some thinking on that later this year.

The bill contains a requirement to produce a report for Scotland. I am not sure that the bill can go much further than that, but I guess that the question is about how good the report is when you are scrutinising it. Should a timescale be set for the report? I do not know whether the bill has such a requirement, but such reports tend to be delayed. The basic point is that it is important that the Scottish Government puts adaptation further up the agenda.

Businesses such as utilities are thinking very hard about this, because they have to when they are making 30-year investments. They are often looking for a better framework from Government. The bill is probably okay, but you need to make sure that you get that report, that it is good quality, and that you challenge it when it comes out. I am sure that businesses will do likewise.

Grant Hedges: Matthew Farrow is absolutely right. Adaptation has been overlooked and needs to be taken more seriously. Business premises will be taken care of through the carbon reduction commitment, which will provide businesses with an incentive. Utilities companies which are looking at generation will be driven by another agenda to do with renewables obligation certificates and so forth. That leaves domestic dwellings, which is the area that Jason Ormiston touched on. Scotland has a phenomenal proportion of old housing stock. Whatever we can do on energy efficiency and reducing demand in the existing domestic housing stock is an obvious area on which to focus adaptation.

Shirley-Anne Somerville (Lothians) (SNP): As the witnesses will be aware, the Economy, Energy and Tourism Committee is taking most of the evidence on renewable heat and energy performance in domestic buildings. However, as you have not had the opportunity to give oral evidence to that committee, would you like to make any comment on those parts of the bill while you are here today?

Jason Ormiston: I have had three opportunities to give evidence to that committee, so that question is probably not directed at me.

Grant Hedges: I cannot really add to what I have just said about heat efficiency.

Matthew Farrow: We have all made brief comments on that this afternoon. I was going to say that heat is an undercooked element of the bill, but that would be an appalling pun. Heat is the
part of the bill on which more could be done. It produces a big chunk of emissions and there is not much policy around on it. At the UK level, the Government has recognised that it needs to do a lot more on heat, and it is talking about a renewable heat incentive. The question is whether Scotland wants to do something in addition to and more quickly than that, but we certainly need to make much more progress on heat.

On energy efficiency, we have all made points about the desperate urgency to improve the quality of the housing stock. Domestic housing is going to need some sort of dramatic incentive such as council tax rebates or something like that to get the thing moving.

For business premises, I mentioned earlier that you could consider business rates. At the moment, only public buildings have to display an energy performance certificate. We think that there is a case for requiring private commercial buildings of a certain scale to do that as well, just to raise the profile a bit. There are things that can be done.

Jason Ormiston: I made a comment earlier about the bill being a little bit lopsided in its desire for action plans and energy efficiency. Perhaps that is a good model to follow, but it is not followed in the heat section, and there is nothing on electricity or transport. We would like to see some commitment to action planning in all three energy sectors.

It will be interesting to see what comes out of the action plan on energy efficiency. We did some work a couple of years ago on delivering 60 per cent carbon cuts by 2050—at that point, that was considered the target to go for. Scotland would need to reduce its energy demand by 36 per cent by 2050 to achieve that target. The level of roll-out of generating technologies that would be necessary to fulfil the usual energy demand, which has increased significantly, would be politically unacceptable. It would be more politically acceptable to reduce energy demand by 36 per cent by 2050.

I would like the energy efficiency action plan to consider what trajectory we want that curve to be on, how to achieve it and how to do it as quickly as possible. At the minute, energy demand is probably creeping up year by year, as opposed to flatlining and then falling, which is a concern.

Shirley-Anne Somerville: Do the witnesses have any comments on the forestry, waste or muirburn provisions, which Rural Affairs and Environment Committee is considering?

Jason Ormiston: I have no comment on the muirburn provisions. We submitted a consultation response on the Forestry Commission measures, but we do not have a clear view on the leasing proposals. Our members are more interested in joint ventures with the Forestry Commission: they have worked with it on a number of significant projects in the past, but the joint venture approach would be more formalised. We support a move towards joint ventures between our industry and the Forestry Commission.

Matthew Farrow: I will comment on the waste proposals. The power to require the procurement of recyclate-based materials is important because, although recyclate markets have not collapsed, they have been badly hit by the recession, which has affected the economics of many recycling processes. I hope and imagine that the consistent public sector procurement of recyclate-based materials would prop up that market.

The carrier bag issue is endlessly rehearsed and is a symbolic issue, and to be honest I would say that the proposal for carrier bag charges is probably not the best way to increase diversion from landfill. The effort that would be put into that policy could be better expended elsewhere.

Grant Hodges: The idea that we will get better standardised waste data is a positive, and overdue, step forward. The reduction of packaging is important, and the provisions on that are valuable but will need huge co-operative work with the EU. I am not sure what stand-alone measures we can take in Scotland, but we should certainly do everything that we can to, for example, thin down the amount of metal that is used in Coca-Cola cans.

I suggest that the debate on carrier bags has moved on. A few years ago, the introduction of a tax on carrier bags would have been good, but many retailers have now come up with their own solutions. I wonder about the costs of enforcement and whether the tax is necessary now.

The Convener: Do you have any comments on the financial aspects of the bill—either the costs of setting up the framework and achieving the targets or the cost of not meeting the targets—in addition to the written evidence that you have submitted?

Grant Hodges: Businesses need clear signals. That brings me back to the route map, which we have often mentioned. We need really clear signals of the behaviour that the Government wants to incentivise so that we can all get on that bus. It will be costly to us, so we will not make the investment unless we have clear signals and know which way to go.

Another cost is the cost of compliance. We have touched a couple of times on the carbon reduction commitment that will come into force in a year or so, and I make a plea to ensure that any obligations that are imposed under the bill are consistent with that commitment. There is no reason why they should not be, but we need to ensure that we do not have two different measures
that are intended to achieve the same objective but duplicate work and achieve only one reduction in carbon. That would be pointless.

A possible cost, which we touched on earlier, is to Scotland’s reputation. We must ensure that we do not achieve the targets by offshoring our production and using trading schemes. We need to protect Scotland’s clean, green reputation.

15:30

Matthew Farrow: It is important that people recognise—I think that they do—that the recession has not changed the Stern report’s basic point, which is that it is cheaper to tackle climate change than not to tackle it. The message that I get from CBI members is that that remains true, despite the huge problems and distractions right now.

The recession makes some things easier and some things harder: Governments are willing to think more radically—for example, the debate about fiscal stimuli opens up opportunities to make progress on some agendas—but it is much more difficult and expensive for business to raise funds for investment. Ernst and Young published a report last week that indicated that decarbonising the whole UK electricity system, which we have to do, will cost the UK about £274 billion. There is no alternative to that, but it has to be paid for.

The message from us all is that we need a clear policy framework, as is broadly the case in the UK bill, and we need road maps for delivery to reduce uncertainty, make it a bit easier for business to get on and do things and, I hope, cut out some of the risk capital element.

Jason Orniston: We have something like 93 months to get on the pathway to radical cuts in carbon emissions. The bill will be enacted towards the end of the year, so we have to wait eight months for it to be enacted, but how long will it be after that until it has an impact? The issue is urgent, so we must keep going. The bill must be as tough as it can be because we are looking for transformational change throughout Scotland—a big cultural shift is required and the bill will underline that.

The Convener: That is a positive note on which to end. I thank you all for the time that you have spent answering questions.

We will suspend the meeting briefly and resume with the second panel at 15:35.

15:35

On resuming—

The Convener: We will crack on with panel 2. I welcome Colin Galbraith, the director of policy and advice, and Clive Mitchell, the strategy and communications manager, from Scottish Natural Heritage; Dr Chris Spray, the director of environmental science, and David Gorman, the head of environmental strategy, from SEPA; and Geoff Aitkenhead, the asset management director, and Mark Williams, the business strategy and climate change manager, from Scottish Water.

Dr Spray must leave early to catch a train, so I am sorry that we are starting to take your evidence a little late. We will crack on with general questions. What role have your organisations played in helping Scotland to combat and adapt to climate change? We will start with whoever would like to kick off.

Professor Colin Galbraith (Scottish Natural Heritage): SNH has worked for a number of years on climate change and, in particular, on its possible impact on the natural heritage. We are picking up definite signs of that impact now.

We have also begun to examine how the natural heritage can help with adaptation to climate change. It is quite exciting to consider how we can manage our woodland, peatland and coastal areas to help us to adapt to any changes that might occur. I am sure that that sounds nice, but when we think about where all our communities are—especially in the west and the north—and where our road system is in relation to the coast, we can see that managing coastal areas might be important for the economy as well as the natural heritage.

We have worked with the Government and other agencies in the past year or two to develop our plans, and we are developing an action plan that we hope to launch later this spring and which will fit alongside the wider adaptation framework and the bill.

Dr Chris Spray (Scottish Environment Protection Agency): Similarly, SEPA has worked closely with the Scottish Government on climate change. In December, we published our climate change action plan, which focuses on several key elements that we can bring to the party. We have been heavily involved in flooding and flood risk management. We have thought long and hard about that and the ramifications of climate change for flooding with other parliamentary committees.

We are keen to develop ideas on the science, the data from monitoring, regulatory aspects in which we can help, advice to business and communication. We have a climate change plan, which we are happy to send to committee
members if they have not seen it and which is available on the web.

**Geoff Aitkenhead (Scottish Water):** Scottish Water has worked on adaptation and mitigation for some time. On adaptation, we have developed a 25-year water resource plan that considers the security of supplies for all our customers throughout Scotland, and we have also worked on and given evidence on the Flood Risk Management (Scotland) Bill. We are working on flooding issues with other agencies, particularly local authorities—I single out the work that we are doing with Glasgow City Council on the Glasgow strategic drainage plan, which concerns adaptation and coping with future rainfall.

On mitigation, as a big energy user, we are considering various ways of reducing our energy consumption and contributing more to renewable energy.

**The Convener:** As fairly high-profile bodies, how have your organisations tried to improve their records on emissions? By what level have your organisations’ emissions reduced in recent years?

**Professor Galbraith:** Two issues come to mind. First, I think that our relatively new corporate building in Inverness still has the lowest carbon emissions of any office building in Scotland, if not in the UK. The emissions level is about 8kg per square metre per year, so it is well below the 40kg per square metre per year that is regarded as normal. That was achieved within an economic costing done by Government, and we are very proud of the building.

Secondly, we are closely considering the overall carbon budget. We have an annual reduction target of 4 per cent, on which we want to build year on year and which will quickly become serious for us. We have introduced videoconferencing as a routine way of holding meetings: we have many staff on the islands and in remoter parts of the country, so videoconferencing achieves huge savings in staff time, cost and carbon. We are making a start, but there is a big job to be done and it will take a year or two to pick up pace.

**Dave Gorman (Scottish Environment Protection Agency):** We think that we must lead by example, and I will give a few examples of what we are trying to do. We initially set a target to reduce our CO₂ emissions by about 10 per cent. We joined the local authority carbon management programme, which the Carbon Trust runs, because we thought that it would provide a good, structured approach. On advice from the programme, we set a target to reduce our emissions by 25 per cent. The target is proving to be a challenge, but it is the right way to go.

We have a general internal environmental policy, as part of which we try to maximise biodiversity around our estate. Another significant thing that we have done is to cut the number of UK flights that we take by 50 per cent—there are pretty draconian rules on what staff are allowed to do.

We think that we have made a good start, but we do not own all our buildings, and persuading landlords to let us do as much as we would like to do is an issue. It is not straightforward, but we think that we are doing okay.

**Dr Spray:** SEPA and SNH are promoting a new joint laboratory in Aberdeen, which is being built as we speak. We hope that the new building will be even greener than the SNH headquarters.

**The Convener:** It is nice to see some healthy competition.

**Geoff Aitkenhead:** Scottish Water, in common with the rest of the UK water industry, is on a rising emissions trend. For a number of years we have been improving the quality of our product and the quality of discharges to the environment, and each four-year regulatory period—2002 to 2006 and 2006 to 2010—will add approximately 10 per cent to our energy consumption.

We are doing a variety of things inside the building—we are trying to drive down travel and energy use as much as we can do, and we purchase energy-efficient equipment and build energy-efficient features into the design of new plants—but the bottom line is that we are on a rising trend.

**The Convener:** What can be done about that?

**Geoff Aitkenhead:** We take every opportunity that we identify. When equipment reaches the end of its life we replace it with energy-efficient equipment, and new facilities are designed to be energy efficient. For example, the new water treatment works for Edinburgh—just north of Penicuik—has turbines built into the raw water mains and will generate up to 65 per cent of its own energy requirements. We take opportunities to build efficient plants whenever we can, but we have a huge stock of long-life assets, and in recent decades we have invested in order to comply with European directives and regulations, which have driven up energy consumption. That situation is common to the water industry throughout the UK.

**The Convener:** Is that experience common to the water industry throughout Europe, or is it to do with how directives have been transposed?

**Geoff Aitkenhead:** I think that it is common to the water industry throughout Europe. We are all endeavouring to comply with the same directives,
and by and large we use the same technology to do so.

Mark Williams (Scottish Water): For a number of years, the industry has acknowledged that it must get to grips with the issue. We have been proactive in trying to ascribe where emissions come from throughout our processes, and I would describe the industry as being quite well advanced in carbon management and in the context of understanding where, among all our activities and technological processes, there might be opportunities to reduce emissions.

Scottish Water has been proactive and up front. We will publish our carbon footprint every year, and the information will be clearer and more open to scrutiny: it will show where we are going, why emissions have been rising, and what we are doing about it.

At present, our figure is around 470,000 tonnes of carbon dioxide equivalent a year, which covers the power that we use in all our activities, such as pumping and treating water, providing the public service and protecting the environment. However, we have to get to grips with the process emissions from our asset base—the methanes, the nitrous oxides and all the other emissions that can sometimes be neglected. As I say, Scottish Water is being up front: we will publish our figures so that we can be open to scrutiny.

15:45

Shirley-Anne Somerville: I have a question for the witnesses from Scottish Water. You mentioned your Edinburgh plant. I have heard that work on energy efficiency was not ingrained in the planning process—questions on energy efficiency and microgeneration were not considered right at the start. Will you assure us that, in any new capital projects, decisions that are taken at the start of the planning process will be based on your work to address climate change?

Geoff Aitkenhead: I can assure you of that absolutely. I am not sure of the background to your comment, but the Edinburgh plant was designed with sustainability in mind. We are very conscious of the plant’s location in the green belt, and in energy use and other ways it is designed to be sustainable. Such principles are being applied to our other projects and, as I said earlier, we take every opportunity to adhere to the principles of sustainable development.

Alison McInnes: Both SEPA and SNH have talked about improvements in their buildings and organisations. How effective have you been in managing change and influencing your supply chain? Could we learn from any of your procurement practices?

Dr Spray: We have certainly started incorporating into our procurement practices many of the ideas that we have discussed.

Dave Gorman: It is a difficult issue, but we try to buy equipment that is energy efficient, we use recycled paper, and we send out a questionnaire when we buy goods from suppliers to push them hard on the issue. When Chris Spray considers his laboratories, he tries to buy efficient equipment. As others have suggested, many such measures are simply what you would always do when considering something new. It is natural that things improve as time goes by.

Something that we have been trying to do—something that we thought would be more influential—is help the Scottish Government with better procurement from a sustainable point of view. I would not say that it is easy, but every time we look at things we see steady progress.

Professor Galbraith: SNH has similar programmes for the sustainability and traceability of any equipment that we buy. When working on a scale such as ours, it can be difficult to be crystal clear that we are buying the best option for cost effectiveness and low-carbon use. Work will have to be done in the years ahead so that we can focus more clearly on what we are purchasing, but we have moved in that direction.

Alison McInnes: Is there anything that we could put in the bill to speed up the progress?

Professor Galbraith: Whether measures go in the bill or the adaptation plan that will accompany it, leadership will be required if we are to change behaviour in SNH and SEPA and in organisations more widely. The adaptation plan might allow for more focus; without a steer, things can become quite difficult.

Dr Spray: The procurement process for the two buildings that we have referred to has gone through detailed climate change consideration.

The Convener: This issue might come up again during our questions on public sector duties.

Rob Gibson: The SNH building used Scottish timber instead of Russian timber. The Russian timber would have been cheaper but, when carbon is taken into account, the picture looks very different. We would like to see more such decisions. Does Scottish Water use products from Scotland, or are there large carbon accounts for the bits and pieces of equipment that you bring here?

Geoff Aitkenhead: We have a wide supplier base, and we run a supplier development programme so that we get a full understanding of the performance and behaviours of all our suppliers. There are performance indicators in that
programme, part of which relates to the carbon-reduction agenda.

**Mark Williams:** The procurement and supply chain is tremendously important for us as an industry, and we are trying to understand what we need to be looking for within the supply chain, such as the pumps and the various bits of kit that we buy. The industry in the UK has tremendous buying power to influence the right behaviours and innovation of the right technology. There is quite a lot of collaboration at UK level—in which Scottish Water is just one player—that will I hope incentivise the right behaviour among a number of suppliers. The process of sharing data on equipment reliability and efficiency is quite strong at UK level.

Scottish Water’s standards and specifications for the kit that we want to buy are subject to rigorous scrutiny and are reviewed regularly. The most recent review focused on the energy performance of the kit that we buy. As Geoff Aitkenhead said earlier, we have long-lived assets. The best way that we can continue the evolution towards a more efficient asset base is to ensure that, as and when pieces of kit come to the end of their life, we procure the right pieces to replace them.

**The Convener:** I turn to the development of the bill and the process of consultation—both the formal consultation and the dialogue that the Government might or might not have had with you during that period. How was SNH’s and SEPA’s expertise, on the policy or science side, incorporated into the development of the bill? Do you feel that your organisations were involved in that sufficiently?

**Dr Spray:** We were delighted with the amount of work that we did with the Scottish Government. At various times, we had people working in Government areas and the Government came to ask us for information. We were more than delighted with the content, quality and extent of our work with the Government.

**Professor Galbraith:** Our experience was similar. We were heavily involved in the development of the thinking behind the bill and in the science in particular, and we are very comfortable with that. It is worth saying that the science is still evolving: we have heard increasingly doom-laden scenarios from various international bodies, but the reality is that the science is moving and being refined. We are happy with our involvement in the process.

**The Convener:** Do any members of the panel have anything to say about the strategic environmental assessment that has been carried out on the bill?

**Clive Mitchell (Scottish Natural Heritage):** We were involved from the pre-discussions on the scoping report all the way through the process. We found it to be a very engaging process. We worked closely with the Scottish Government and we feel that the process has added value to the bill. A clear report was produced in December that indicated how the comments from the various consultation authorities had been taken on board. Where necessary, those points have been reflected in the bill as it has been introduced to Parliament. We thought that the process was useful and very well done.

**Dave Gorman:** I reiterate what Clive Mitchell has just said. As a competent authority, SEPA sees plenty examples of bad SEAs, but the SEA on this bill was good. It was clear, it covered the issues and it seemed to respond when SNH and SEPA raised issues. We were very happy with it.

**Cathy Peattie:** Do you think that the 2050 target and the interim targets are achievable? If so, do you have any evidence for that?

**Professor Galbraith:** Given that I am an optimist by nature, I think that the targets are achievable. However, we as a country have a big job to do. We have the potential to deliver. We are small enough for the various sectors to be reasonably well integrated and we can deliver. My take is that we have to deliver, because climate change is an all-embracing threat. It is a threat not just to natural heritage and wildlife nationally and internationally: it will also impact on our lives in ways that we have not thought of. If we deliver the targets, Scotland will have the opportunity to play a leading role by example internationally not just in mitigation but in adaptation. The reality for us is that climate change is here, now. We are at the early stages, but it is here. We have to adapt as well as mitigate.

**Dave Gorman:** SEPA views the targets as being absolutely achievable, but the question of exactly how they are to be achieved is more difficult to answer. There is ample evidence to enable us to answer “Yes” when we are asked whether there is a pathway to the targets—we would simply point to the 500-page UK Committee on Climate Change report. Similarly, when we are asked whether the targets are achievable, we can point either to that report again or to the Stern report. A mountain of material has been published in the past few years.

The targets are achievable, but there are questions around the acceptability and feasibility of the pathways and the costs for various sectors of the economy. In sectors such as the electricity and power sectors, there are answers to those questions at the moment, but areas such as aviation and replacements for the fuel that aeroplanes use are more problematic.
In conclusion, we agree with Colin Galbraith that the targets had better be achievable and the solutions workable, because we do not seem to have much choice, in any case.

**Mark Williams:** Scottish Water believes that the targets are achievable, but we need a lot more clarity about the road map for achieving our aims. We need to understand exactly where we can most effectively spend our money in order to achieve the desired outcomes. However, that clarity is not there yet.

**Geoff Aitkenhead:** I should add that Scottish Water is determined to play its part in achieving the targets. Even from our position of being quite a high consumer of energy, we can see ways of becoming self-sufficient through renewable energy generation on our sites.

**Cathy Peattie:** A few minutes ago, Colin Galbraith talked about science moving on and developing. Is Scottish science robust enough to enable the targets to be met and to report against them?

**Colin Galbraith:** We are enormously lucky in having the resource that is our universities. We have the potential to play a leading role in global thinking in relation not only to adaptation and mitigation, but to measurement of that. As we heard earlier, we cannot measure accurately the whole carbon budget for the country at this point, but if we ensure that the universities, institutes and agencies across our country make a collective effort to do that, we will be able to do it. However, we would probably need to come up with a mechanism that would bring us together to measure progress on the targets. It sounds a little anoraky, but measuring is really important, as it will allow us to provide positive feedback as well as the doom and gloom. We have the potential to do what I describe, but it might need a bit of new thinking to ensure that the effort is appropriately gathered together.

**Dr Spray:** I fully agree. There are a number of elements to the issue. One is the importance of the quality of the data that we get, and our ability to audit those data and to challenge people in a positive way to prove them. Another element is the need to improve the evidence base relating solely to Scotland. Instead of sending the message that Scotland will be like the Maldives in 50 years, we can see ways of becoming self-sufficient through renewable energy generation on our sites.

**Professor Galbraith:** I can see merit in having annual targets, but work and efforts need to begin now. One of our concerns is that things may come very late in the cycle. It is important to achieve culture change and get changes in industries now, so some form of targeting early on is important. I take the point that there may be good reasons for annual variations, but the main thrust of the message must be to get on with things. It is encouraging that the CBI said a lot about that. We agree that there must be certainty and that we must get on with things.

**Dave Gorman:** The previous panel made many interesting points. I think that the targets serve a purpose. An 80 per cent emissions reduction target will tell us that people need to transform the nature of what they do and that every sector needs to do something. Some people from whom the committee has received evidence have said that they accept that every sector needs to transform, except their sector for certain reasons. The existence of an 80 per cent target means that everybody should understand that we will be in a very different place in 2050. However, 2050 is a long way off, and we tried to say in our evidence that we do not know at the moment what the right pathway is. Others, such as the UK Committee on Climate Change, have more expertise than SEPA on that.
I understand that the Scottish Government will ask about the right pathway. We know the wrong answer to its question: annual emissions reductions of 1 per cent would be no use. A 26 per cent reduction in the UK level by 2020 looks like a minimum now, and a 34 per cent reduction looks more sensible. There is enough to say that we need to get on with things, as others have said.

We have said in our evidence that the long period from 2010 to 2020 seems to be key—we want to get things right during that period. The Government must take its time and not pluck numbers out of the sky. The judgment that is to be made is between having a very stretching target and a target that we will fail to reach because it is too stretching, in which case the bill and the process that would be put in place would lack credibility for stakeholders. We do not know exactly what the pathway should be, but we recognise what it should not be.

**Clive Mitchell:** I think that a previous witness likened the situation to paying off a mortgage; the sooner the process is started, the easier things will be. We endorse all the messages that you have heard about the steep early reductions that are required in order to meet the challenge.

**The Convener:** Mortgages tend to be a bad model for pretty much anything at the moment.

I would like to follow up on what Dave Gorman said about reductions of 1 per cent a year not being enough—he used the phrase “no use”—and the period from 2010 to 2020 being key. Can you be a little bit more explicit? You said that you recognise what is not the right track. Were you referring to what is currently in the bill?

**Dave Gorman:** I was thinking particularly about the Scottish Government’s technical note, which gives a variety of scenarios. I gave a personal view. We have not done enough work on the subject to give a credible answer, but I think that the tracks to consider are the scenarios that push towards 2, 2.5 and 3 per cent reductions, not those involving 1, 1.25 and 1.5 per cent reductions. It was said earlier that it is a leadership thing. Stem made a point about getting on with things now, because doing so will be cheaper. That is what I had in mind.

**Dr Spray:** I would like to make a final personal point, which I realise is out of position—I apologise to the committee for having to go. I make a plea that when you discuss muirburn you consider our need for a national carbon strategy for soils in Scotland in particular. Scotland is in a unique place in the UK and globally in respect of the amount of carbon that is stored in its peatlands. The issue is not so much that one should look at muirburn; it is how we manage it.

Many other things damage peatlands, of which drainage is one. I think that my colleagues in Scottish Water will agree that the impact of the loss of dissolved organic carbons in autumn across virtually every upland in the UK is huge—and there is a fantastic cost to the water industry of stripping it out to give us good-quality water. In Scotland’s case, the peatland carbon stock is extremely important. I appeal to the committee that managing it accurately and stopping its loss is one of the most important of all the things that will be considered.

**The Convener:** I am sorry that we did not have time to explore the issue with you in more depth. Thank you for your time.

**Alison McInnes:** The committee has heard a good deal of evidence that international aviation and shipping emissions should be included in the bill rather than dealt with subsequently by order. Do you agree? Why should those sectors be singled out? I realise that that is not a policy area for the witnesses, but we are interested in your views.

**Professor Galbraith:** The more holistic the bill is, the better. It is important that we get a proper carbon account in due course, and that we consider our international responsibilities. Clive Mitchell might want to add something.

**Clive Mitchell:** I echo what Professor Galbraith said. All emissions end up in the same atmosphere, so all sectors must play their full role in reducing them.

**Dave Gorman:** I will sit on the fence. We do not have a strong view on whether the matter is dealt with by order or in the bill, as long as it is dealt with, as long as methodologies are developed quickly and as long as we start to see what will be done about such emissions. If the Scottish Government thinks that it is necessary to take a particular approach, we do not have a strong view on that.

**Geoff Aitkenhead:** Our focus is entirely on making our own contribution. However, everyone must make an equal effort.

**The Convener:** SNH and SEPA already have an advisory function to Government—that is less the case for Scottish Water, although the witnesses from Scottish Water might have views on the matter. Will you talk about your advisory functions in relation to climate change and whether they are linked in with the advisory functions of the UK Committee on Climate Change? How do you expect the situation to develop? Might it change if a distinct Scottish committee is established?

**Professor Galbraith:** SNH’s role relates to the natural heritage and enjoyment of it, which takes...
us clearly into areas such as habitat and species management and how people enjoy the natural heritage in the areas around their homes, or as tourists and visitors to the country.

In the past year or two I have been struck by how relevant our work, in particular on habitat management, is to mainstream Government. Chris Spray talked about the carbon store in peatlands. We have been considering the synergy between our traditional core natural heritage remit and carbon management. If we look after our peatlands and woodlands we get not only natural heritage benefits for local people and visitors but a carbon store—in the case of peatland we also get water retention, which can link with flood mitigation. We talk to Government departments regularly about climate change and our traditional areas, and the relationship is good.

On the UK Committee on Climate Change, we certainly need to link into its route map. We have not done that very clearly in the past. It is hard to say what would change if there were a Scottish committee. What I have taken from this meeting is that the relevance of the UK committee is perhaps greater than we have taken on board.

Dave Gorman: SEPA has much involvement with the Scottish Government and we hope that we give useful advice on many areas, from flooding to waste provisions and the design of good regulations, for example on the carbon reduction commitment.

Like SNH, we have tracked the UK committee, but we have no formal relationship with it. Our relationship is with the Scottish Government, although we would expect to attend UK committee events that are held in Scotland. It is difficult to see how the situation would change if there were a Scottish committee—I think that we would input to such a committee’s processes while remaining slightly at arm’s length from it. I do not think that our overall advice-giving role would change.

The Convener: Is there any danger that separate organisations, which would keep appropriate distance between themselves, might be seen to give conflicting advice?

Dave Gorman: The key to addressing that is their roles. I found it helpful that last year’s Scottish Government consultation on the bill defined three roles. One role, which is for the UK Committee on Climate Change, is concerned with setting the right level of target, based on economics, feasibility, need and science. The third role—which we think is perhaps a role for Audit Scotland, rather than SEPA—involves auditing and performance. The role in the middle involves some of the science of monitoring validation, data gathering and so on, in which our agency and SNH see ourselves playing a part. We talk about those sorts of issues with SNH all the time, so there would not be a big danger as long as we are clear about who performs which role.

The Convener: Do you have any views yet on whether a separate Scottish committee, or a separate advisory function that is given to an existing Scottish body, would be appropriate, or are you all, like the previous panel, saying, “Let’s wait and see”?

Professor Galbraith: We probably are still in that position, although we can make the obvious statement that we have to use the best available science on climate change. In my personal view, it does not matter whether that is in London, Brussels or Scotland: we need to use that expertise.

There may be a second level in relation to how we take that expertise and implement it in any part of the UK. There are particularly Scottish issues—even within SNH there are purely Scottish dimensions in relation to coastal management and woodland and peatland management—and we might need to consider how advice from that committee could be applied to our operational focus. I would certainly like us to link to the UK committee much more clearly than is the case with our other links.

Clive Mitchell: If we consider the distribution of reserved and devolved powers and the challenge of climate change, it is clear that a dedicated Scottish committee would have to work very closely with the UK committee. We need to see how the current arrangements work before we try to invent something new.

Geoff Aitkenhead: I have two observations. First, we strongly favour the multi-agency approach to dealing with the issues that relate to climate change, as we do for flooding and the other areas in which we are involved. We work at UK level with UK Water Industry Research and Water UK.

Mark Williams has personal experience of attending the UK Committee on Climate Change to report on what the water industry—and Scottish Water—is doing. It might be worth hearing his view on that.

Mark Williams: Scottish Water covers the whole of Scotland. We represent critical national infrastructure and we have real front-line experience of how climate change might impact on our business. It was useful to have the opportunity in the consultation exercise to advise and to share our experience. As an industry, and as Scottish Water, we have a voice and an input.

To pick up on the advisory roles that others have mentioned and the multi-agency way forward, I am encouraged by the Scottish Government’s
approach over the past few months to seeking advice on the way forward for adaptation and mitigation. Through a proper integrated partnership, we can cover the bases—which we do not all perhaps fully understand at the moment—so that we can arrive at the best solution. Scottish Water has to get more involved and we need to follow through on some of the understanding that we already have.

Rob Gibson: On reporting duties, which follows on from that, you have made it clear that we need accurate data. SEPA’s submission suggests that we need to move rapidly towards that, and Colin Galbraith talked about the universities and excellent scientific institutions in Scotland. How do we draw all that together? Is the proposed reporting mechanism robust enough? How can it be improved?

16:15

Dave Gorman: We wanted to say something reasonably firm about that. We have no particular issue with the Scottish ministers reporting to Parliament. We made our point through analogy with the waste sector, which I understand. In producing information on waste for the Scottish government 15 or so years ago, one got round to it as part of the list of things that one had to do. The information was reasonably accurate for the purpose of providing a notional account of what was happening with waste—sending waste to landfill cost £3 a tonne. Suddenly, waste cost more like £45 a tonne to send to landfill, so it became important to know what was going on and to have the data quickly and to verify and publish them quickly.

That is strongly analogous to dealing with climate change, when we are relying on top-down models, estimates and extrapolations of limited information. That will not continue when statutory duties to report are adopted and when we need to know more quickly how we are doing. We have tried to major on that by saying that somebody should be charged with gathering that information more quickly and with verifying and publishing it more quickly. Jason Ormiston made the same comment about energy; I would bet that it could also be made about agricultural emissions, aviation and several other sectors.

Professor Galbraith: SNH agrees with David Gorman. There must be a reporting mechanism, which must be seen as part of the culture change that we must put in place. If targets are set without a requirement to report effectively, it becomes difficult to measure whether progress has been made. A mechanism to draw the information together must be established. When a statutory approach is taken, the game will change a bit from where we are now—in the realms of modelling and so on, which I agree will be insufficient in three, five and 10 years.

Clive Mitchell: One of our practical difficulties when trying to understand Scotland’s emissions and when trying to marry the various UK and Scottish reports to energy reports is that comparing like with like quickly becomes difficult. Data are often presented slightly differently—they are aggregated or disaggregated differently—which makes some comparisons difficult. We would like the presentation of data to be standardised quite quickly.

As Dave Gorman said, we gather and present data for particular reasons—a one-size-fits-all approach is not taken. One word of caution is that we must avoid becoming lost in a data black hole because we are trying to find the perfect solution to quantifying and measuring greenhouse gas emissions and so on before we take action. We have enough data to know what we should do in the short term. We know that improvements to the presentation and content of the data need to be made, but we should not necessarily let that stop action.

Rob Gibson: Indeed. Reporting to Parliament allows the scrutiny that results in our saying that more action is needed, or whatever.

On standardisation, one argument is about collecting data in Scotland, but another issue is the ability to measure progress against British and European targets and, eventually, worldwide targets—we will deal with the emissions trading scheme in a moment. Do you agree that we should make efforts to ensure that the data that people collect in Scotland can be compared with those from other countries as well as with those from London?

Clive Mitchell: Yes.

Mark Williams: It is not easy to standardise reporting, but we are on a journey towards it. At UK level, water companies have agreed reporting protocols. We are trying to share those globally and to share our knowledge with North Americans and Europeans. There is much enthusiasm for not reinventing the wheel and for going with what seems to work. However, we should not become confused. Accuracy and precision are needed. We have some precision on our operational emissions, but we need to do much more on that.

As I said, our operational footprint is about 470,000 tonnes CO₂ equivalent. We have assessed the capital programme that we deliver, which contains much more—a ballpark figure for that is 1.4 million tonnes CO₂ equivalent over four years. However, more granularity is needed as we drill down into that, so that we understand what we need to examine. That touches on cross-sectoral boundaries. We all use the same types of concrete
and steel, so it is really important that we have the same standardised ways of reporting. We must recognise that we are at the start of a journey of standardisation. We must be prepared to take some measures now, but we must look to develop a common understanding in the future.

Rob Gibson: I should have thought that that would be quite easy for some of the water companies that are owned by the Compagnie Générale des Eaux.

Mark Williams: We are talking about the embedded footprints of capital infrastructure. Many different grades of steel and concrete are used, so we need to find a standardised way of working out the whole-life costs of the decisions of that we make. That standardisation involves identifying models that drive the right behaviours in the long term.

Rob Gibson: I mentioned the EU emission trading scheme. SEPA is already involved in administering some of that scheme and measuring emissions from many installations. What expertise in measuring and reporting has SEPA built up, and how could that be developed further to deliver the bill’s requirements? That is a major practical exercise that could help us enormously.

Dave Gorman: Others may disagree, but we think that some of our core expertise lies in the activities that you have described. We do such work not just for the emission trading scheme but for the Scottish pollutant release inventory, which is required by another European directive, and when reporting on waste data. The work comes down to persuading companies to make their submissions on time and checking those submissions for sense. If a company in West Lothian claims to have sent 1 billion tonnes to landfill in the previous year, we may suspect that there has been an error.

We also need to check that the assumptions that are made in processes are standardised, as we discussed earlier. Usually carbon dioxide is measured not directly but using a proxy such as fuel. Trying to understand the assumptions that should be made in complicated processes such as those at Grangemouth is meat and drink for certain of my expert colleagues, whose aim is to piece together the actual picture. We have expertise both in that work and in gathering and publishing data. We hinted in our evidence that SEPA might be one candidate for taking on more of that activity because we understand it.

Rob Gibson: A recurrent theme for the committee is the interval between the times when emissions occur and when data are presented. Has SEPA’s involvement in collecting data both under the pollution directorate and for the ETS helped people to speed up the use of data after their collection?

Dave Gorman: We aspire to publish all our information quickly. The SPRI data appear within eight months of the end of the calendar year to which they relate, which means that the data are much timelier and, we hope, people will take more interest in them and companies will react more quickly to their position in the league table of emissions. That is a bottom-up process—we gather and aggregate figures from individual sites—but much of the climate change information that we get comes from top-down disaggregation, which is more complicated and takes longer. The quicker information is published, the more interest and policy relevance it will have.

Rob Gibson: What is SPRI?

Dave Gorman: It is the Scottish pollutant release inventory. Under a European directive, larger companies are required to report emissions.

Rob Gibson: Can you imagine our using the bottom-up approach that you have described to build up a picture of the situation in Scotland that could inform a future Scottish committee on climate change more accurately on what we are emitting?

Dave Gorman: Absolutely.

Cathy Peattie: The bill allows for duties to be placed on public bodies via secondary legislation. What do you think climate change duties on public bodies might look like? What discussions have you had with the Scottish Government on the issue?

Professor Galbraith: We have not had many discussions about such duties with other bodies, but they seem sensible in principle. In other cases, such as biodiversity, duties have led in part to enhanced interest and activity. We therefore support the principle but, as with any new responsibility, we need to consider the impact that a duty might have. Our particular issue is how management for climate change would impact on or relate to the management of the natural heritage, although, as I said, we see great potential synergies in that. In many cases, on local authority land, management for biodiversity—the wildlife and habitat—would go hand in hand with tackling climate change. We support such public duties.

Dave Gorman: We have discussed that with people, although I am not sure whether we said what they wanted to hear. Basically, we think that there should be duties now and that we should not have a voluntary approach. In business, there are many voluntary approaches on environmental matters, but they are usually an assemblage of what was already going to happen.
We agree with Colin Galbraith that a duty would mean that the environmental folk in organisations could get the attention of the senior folk on what that duty means or might imply. If, as we have said, tackling climate change is urgent and we need to take action in the period 2010 to 2020, why wait to see whether the voluntary approach works? Some organisations will say that pound signs will be attached and that there will be difficulties, but let us face those issues later. We are happy to have a duty placed on us, and we think that a duty should be placed on every other body in the public sector.

I am sure that Cathy Peattie will ask what the duty should be. That can be discussed, but at least it should be clear and everybody should know that they have a part to play. Our simple view is, “Let’s do it now.”

Geoff Aitkenhead: We are content for duties to be placed on public sector bodies. We have a duty to adhere to the principles of sustainable development, which was enshrined in the act that set up Scottish Water. We might discuss further the detail of what the duties might be, but I believe that they should fall into two categories. One should be on direct emissions from public sector bodies, and the other should be on emissions from another body as a consequence of policies or regulation that a public sector body promotes. We all need to be encouraged to step back and take a holistic view.

Clive Mitchell: A third component of the duty should be on sustainable adaptation to climate change, to avoid the risk that one part of the climate change agenda might conflict with another.

Cathy Peattie: I am interested in what the duty should be, but I am more interested in how compliance would be measured. Public bodies can have the best intentions but, as Dave Gorman said, delivering might be a different question.

Dave Gorman: I agree with the points that Geoff Aitkenhead and Clive Mitchell made—this is a question of horses for courses.

Direct emissions reporting should be straightforward. The single outcome agreements could be used for local authorities, and there are other processes for other bodies, such as the Scottish Government’s greener leadership programme. A duty relating to policy decisions would be less straightforward, but statutory guidance could be issued to require bodies to design a framework that shows how they will take account of climate change. The framework could then be checked.

The key is that the process should be testable in court as that always sharpens the mind. People should be able to take a decision to judicial review if they think that a body has not taken account of climate change. As a regulator, SEPA is always aware of whether we have taken into account the issues that our founding statute says that we should take into account. For example, we must take account of economic impact and rural issues and, if we do not, a citizen is within their rights to test our decision in the courts.

On the point about policy impact, Government guidance that bodies are required to follow is the way forward. That is less easy to test, but it is still visible.

The Convener: Before we move on, I have a supplementary question on duties on public bodies. We have discussed procurement. Is it achievable to have a substantial public duty that relates to green or sustainable procurement? Anything that was done would have to be permitted under the relevant EU directive, but that is broader than it was a couple of years ago. Is there scope for a stand-alone duty?

Geoff Aitkenhead: There is. It is incumbent on us, duty or not, to pursue a sustainable development strategy. It would be subject to definitions and consideration of the details, but the concept is right.

16:30

Clive Mitchell: I agree. We spoke earlier about measuring emissions on our estate and about procurement. We have recently discussed approaches to the carbon management plan with Carbon Trust. Such work is generally designed for local authorities or organisations with more than 1,000 people, which is somewhat bigger than Scottish Natural Heritage, but we are volunteering to take up the new carbonlite programme to validate the work that we have been doing to reduce our emissions. The programme will also cover procurement, and we hope that it will enable us to meet the target of a carbon reduction of 4 per cent that Colin Galbraith mentioned earlier.

Cathy Peattie: The bill requires the development of a climate change adaptation plan. What are the witnesses doing to increase the resilience of Scotland to changes in the climate, and what else could the bill do?

Geoff Aitkenhead: Adaptation is of primary importance to Scottish Water in the short term. We are experiencing the effects of climate change now, and we must be sure that we can safeguard public water supplies and deal with flooding and the run-off of surface water.

We have developed and published a 25-year water resource strategy. We finalised it after hearing comments on it, and we will refresh it annually as new data come to light. The strategy has led to investment proposals, which are in our
business plan for 2010 to 2014, to augment supplies in various parts of Scotland and to deal with compensation flows in rivers in certain areas. Those well-laid investment plans for between now and 2014 will see us investing tens of millions of pounds.

We have worked with a number of local authorities on the production of surface water management plans. Scotland has an extensive network of sewers—more than 40,000km—and we cannot renew all of them in our efforts to deal with the storms and rapid run-off that we get now. The run-off is partly a consequence of climate change and partly a consequence of surfacing in the built environment.

If we cannot renew the sewers, how do we deal with surface water? The answer is: on the surface. The Flood Risk Management (Scotland) Bill picks up a lot of issues in flood risk and surface water management plans, and we were really pleased that they were included. There will be a multi-agency approach involving Scottish Water, local authorities, SEPA and private developers, as we try to achieve the right specifications for porous surfacing and sustainable urban drainage systems. We are doing a lot on the adaptation front.

Professor Galbraith: The adaptation plan will be fundamental to the implementation of the bill. It is good to see that there is one, as it is unusual in the European context to see such a bill and plan together. That is an encouraging development.

I have mentioned our action plan, which will be divided into two parts. The first part will cover action that we at SNH will take on the running of our organisation on our own estate, in nature reserves for example. The second part will be more aspirational when it comes to adaptations and will consider habitats in various parts of Scotland. We acknowledge the importance of natural heritage in coastal management, but we also acknowledge the wider importance. How can we manage the coasts over the next 50 to 70 years when the reality of climate change will be more intense than it is at the minute?

I echo what Chris Spray said about the importance of Scotland’s peatland. We reckon that something between 170 and 200 years’ worth of Scottish emissions are locked up in our peatland. Part of the adaptation strategy is to look after the existing peatland resource in terms of drainage, overall exploitation and management. We must do that, and we are optimistic about what we are doing, including through landowner buy-in.

That wider, more holistic look at how we manage all our habitats needs to be linked to getting people involved in the issues at the local level. That is important as part of the wider culture change, and we are doing a lot, but we have a lot still to do to get the message out and make it more widely known than has been the case thus far.

Cathy Peattie: How do you get people involved? Other partners clearly need to become involved but, as we know, people can be dismissive of some of your plans. For my part, I agree with them, but people tell me, as the local MSP, that the plans are absolute nonsense and ask me why this or that is not happening. Who are your partners? How can you get over to people at the local level and elsewhere that things need to change and that your important plans need to be put in place?

Professor Galbraith: One of my fears is that we manage by disaster. There was a big change in public opinion in America after hurricane Katrina. It is unfortunate that we need a disaster of that nature before opinion changes.

It would be good to build partnerships with local authorities and, indeed, local non-governmental organisations. NGOs have a major role in tackling climate change and are articulate—they are good at putting out the message. We have to look at how we can build wider partnerships and, in getting out the message, we must take opportunities when they arise. The Parliament has a key role to play in doing that: politicians can tell people about the significance of the threat and the importance of the adaptation plan.

Dave Gorman: It is unfortunate that my expert colleague had to get up and walk out half an hour ago—as you know, he had to leave the meeting early.

We think that we have got off to a good start but know that we have more to do. We have published our climate change plan, in which we set out some of our actions. Flooding is clearly a big issue for SEPA, as is trying to point out its consequences. We are working with SNH and others to improve the data and get the information out to people—Chris Spray talked about that earlier—and we need to make things real for people by talking about floods not in Asia but in Scotland. Together with SNH and others, we have done some of that work. For example, in 2006 we published “A handbook of climate trends across Scotland” in which we set out the evidence that climate change is happening. It is probably time for us to look at producing another version of that publication.

We are keen that account is taken of adaptations in the river basin management planning process, which has been put in place to deliver the water framework directive objectives. We are considering how that might happen.

The key point for SEPA is that the science that Chris Spray’s folk do needs to be robust enough to take account of future climate change. If they
achieve that, the data can be used to underpin our regulatory assumptions. It is useless for us to ask Scottish Water to do things that are based on old models of how rivers behave or how much flooding and rainfall will occur. A large part of what we are trying to do is an assessment of whether the models that we use are fit for purpose. We are trying to put information that is currently available in paper form—historic old spreadsheets, ancient documents and the like—into a format that can be made more easily available to the public. We want to enable people to see the trends and understand them better. That is the stage that we are at.

Cathy Peattie also asked what more the bill could do. It could be used to amend the Water Environment and Water Services (Scotland) Act 2003, which requires the WFD implementation. In making that point, I should make it clear that adaptation needs to be reported on and built into the process.

Charlie Gordon: The bill includes a requirement for an energy efficiency action plan to be drawn up. Could or should the bill do more on energy efficiency and using renewables in heating?

Professor Galbraith: Energy efficiency should be the start point. We should be trying to save and reduce what we have at present—that is a useful wider environment principle—and anything that can be built into the bill to encourage that should be put forward.

Clive Mitchell: One recommendation in our submission was on the need to recognise the partial nature of part 5 of the bill. I refer to what needs to be done on heat, transport, renewable electricity and so forth, which the previous panel mentioned, too. The comprehensive Scottish climate change programme should be renewed in line with the provisions in the bill. We need to decide how to go about meeting targets up to 2022, in line with the first three budget periods and as recommended by the UK Committee on Climate Change.

It might be useful to develop energy hierarchies for transport and electricity along the lines of the well-established waste hierarchy, which prioritises avoiding use, efficient use, low-carbon use and so on, as the basis of the interventions that are required. The Scottish climate change programme should include the comprehensive package of mitigation and adaptation measures that is required across the board.

Dave Gorman: We do not have a particular role on energy efficiency apart from in process engineering, but we think that what is in the bill seems sensible and, as others have said, it will be nice to see the plan when it is eventually published.

We cannot help but contrast the provisions on energy efficiency with the ones on waste heat, and we believe that there should be a requirement for a similar renewable heat plan with a waste heat component. The European targets are for 20 per cent of energy production to come from renewable energy, with waste heat forming about 14 per cent of that. We are currently at about 1 per cent or less than 1 per cent, which means that we need to grow 1,000 per cent in 10 years. From that perspective, it is obvious to see that, as a minimum, there must be a commitment to a renewable heat plan with a waste heat component.

A lot of heat that is produced from fossil fuels is simply thrown away, and the UK’s performance on combined heat and power is not inspiring. We firmly believe that, if it is possible within devolved powers, we should examine waste heat as well as renewable heat. The two technologies should be developed in tandem because they both address the same issue.

Geoff Aitkenhead: Energy efficiency action plans are clearly important to us given our position but, as the previous panel said, we must consider total demand as well as energy efficiency and drive energy use down wherever we can.

On the point about public duties and the impact of policy on various areas in the public sector, the impact assessment of any new policy or regulation must take into account the demand for energy that it will create. In a sense, the water industry is a victim of that, as we are still implementing directives that were written in the 1980s, before the carbon reduction agenda was even thought of. Nobody at a European or global level has stood back and asked whether those directives should be rewritten or whether we should think about finding new ways of promoting energy-efficient and carbon-efficient ways of working.

Dave Gorman: We strongly agree with what Geoff Aitkenhead has just said. As a regulatory organisation, SEPA encounters difficulties in trying to protect local environmental quality without driving up the use of chemicals and energy as we do so. We have discussed that matter with Scottish Water, but the issue involves not only water but air and other aspects of the environment.

In addition to a duty on the public sector in general, there should at least be discussions about putting a duty on regulators. Many of the things that will drive the work of Scottish Water will come from the Water Industry Commission for Scotland and SEPA, and who knows what the conflicts are between, say, the need to protect food and the need to protect the environment? It is challenging to make regulators think about carbon. An obvious way of ensuring that they do would be...
to get Europe to issue directives, but that would involve years of discussions and we might get faster results if we explored the matter in Scotland.

**The Convener:** That is a helpful suggestion.

**Shirley-Anne Somerville:** The Rural Affairs and Environment Committee is examining the forestry and muirburn sections of the bill. Dr Spray, who wanted to talk about that, has left. Does anyone else want to talk about that or anything that is not in their written evidence?

**16:45**

**Professor Galbraith:** Muirburn is an important management tool for large areas of the uplands of Scotland. It has a long tradition behind it, and there is an issue in that tradition moving with the changing climate.

We support the inclusion of the concept of muirburn in the bill. In particular, given that spring is happening earlier in the uplands every year, it would be helpful if there were some flexibility to allow burning to take place in the autumn as well as in spring. Many land managers have difficulty getting all of the necessary burning done in a reasonable time, so some ability to allow burning at the end of the summer and into the autumn would be useful—I believe that it is intended that that will be included in the bill.

It might surprise members to hear someone from a conservation organisation talk about muirburn in that way, but we think that that technique—when it is done properly and conducted within the law—is an important part of the management of the uplands. Of course, that practice has to be well defined in the muirburn code.

**The Convener:** I want to ask about the financial resources that might be available or required to enable your organisations to meet the duties that might be imposed and to help Scotland achieve the targets. Is Government taking those resources into account sufficiently?

**Geoff Aitkenhead:** There is an opportunity to get that right. Anything that Scottish Water invests in or pursues comes as a consequence of objectives that are set for the business by the Scottish ministers. Once those objectives are set, the Water Industry Commission for Scotland determines the charges that Scottish Water can apply to finance whatever is required. The mechanisms are in place, and all that we need to know are the objectives that ministers wish to set.

**Professor Galbraith:** The science has moved on enormously in the past two or three years, and we have kept up with it. As the argument moves on, there is a great need for a clearer evidence base—that is one of the key messages that I will take away from today’s discussion. Resources will be needed for that, and they will need to come from Scotland, the UK and the European Union.

Some of the things that we have spoken about in discussing climate change adaptation have obvious resource implications. I do not think that the country is yet in a position to assess the need fully, but it is hard to see how we will be able to adapt to climate change without resources being clearly targeted in future years.

**Dave Gorman:** A couple of weeks ago, when I gave evidence to the Finance Committee about the bill’s financial memorandum, we said that it was a reasonable document given the uncertainties about exactly which direction we should go in. However, we were talking about the financial implications of the provisions rather than of the time and effort that need to be invested in persuading people to change. Jason Ormiston and others touched on that issue earlier. It is great to have incentives for microgeneration and waste heat, but what other incentives will there be and how quickly will they drive change? Those are not necessarily questions for the bill, but they are certainly questions that must be answered.

**The Convener:** And they are certainly among the many questions that we will have the opportunity to put to the minister next week.

I thank our witnesses for their attendance.

*Meeting closed at 16:48.*
WRITTEN SUBMISSION FROM CLIMATE CHANGE BUSINESS DELIVERY GROUP

Written views to the Transport Infrastructure and Climate Change Committee

The CCBDG welcome the opportunity to give evidence to the Transport, Infrastructure and Climate Change Committee on the Scottish Climate Change Bill. We have previously set out principles we believe should guide thinking on climate change in Scotland. We have been consistent in promoting those principles and believe they are worth repeating here.

Action on Climate Change – strategic importance to Scotland

Scotland has an international reputation founded upon a perception of a clean and green environment. Scotland’s attractiveness as a great place to visit, study, work and do business in part depends upon that image. Therefore it is of strategic importance to Scotland as a whole that efforts on climate change lead, rather than lag, world effort.

Carbon saved today is better than carbon saved tomorrow

Early reductions in carbon emissions are more important than reductions in years to come. The objective must be to ensure that the cumulative amount of carbon released into the atmosphere is as low as possible, as quickly as possible. In other words the greatest imperative must be on the tasks to be undertaken now to shift Scotland smoothly to a low carbon economy and society.

Consistency with the UK, EU and UN frameworks

Scottish businesses trade on a local, national, UK, European and global basis. Therefore it is important that the Scottish framework on climate change is consistent with UK, EU and UN frameworks. The greater international co-operation there is the better, and consistency between economies will ensure no new barriers to trade are erected.

Delivery

The powers of the Scottish Parliament, while substantial do not represent all the powers that can deliver carbon emission reductions. Therefore, to meet the aspiration of Scotland leading in the UK and Europe it follows that the powers that do lie in Scotland need to be used more effectively, more quickly and to a greater magnitude than anywhere else in Europe. We believe it is vital to ensure that this will be the case without putting Scottish business at a competitive disadvantage in the short term. In the long run we believe that making the right investments now, will put Scotland at a competitive advantage by becoming an advanced low carbon economy early, for example by making the most of the significant renewable resources we have on our doorstep.

Climate Change – priorities for action

1. First and foremost, the CCBDG believe the greatest role for government in Scotland is to help bring about a change in consumer behaviour in order to reduce overall demand for energy.

2. Beyond reducing overall demand for products and services that emit carbon, the three critical areas for reducing Scotland’s carbon emissions are decarbonising electricity, heat and transport. Despite all its challenges and the progress yet to be made, delivering renewable electricity looks relatively positive compared to the challenge that must be met in heat and transport.

3. Decarbonising energy for heating is one area where there has been little progress. The potential carbon savings are great and there is a clear role for government to stimulate markets. The UK wide Renewable Heat Incentive will clearly provide a
market intervention that should help the expansion of renewable heat. Nonetheless the CCBDG believe the Scottish Government must act to make sure heat in Scotland sees a dramatic revolution in the way it is generated. Government itself can take a lead in incorporating renewable heat and Combined Heat and Power systems into its own estate.

4. There remains a long way to go in delivering low carbon road transport. While we acknowledge that fiscal powers relating to VED and product standards lie with Westminster, there are international and UK examples where municipal and regional policy has stimulated a market for lower carbon combustion engine vehicles and electric vehicles. There is much the Scottish government could do, particularly in partnership with local authorities to move Scotland to the leading edge of low carbon road transport. For example procuring electric vehicles for public sector fleets which will stimulate both the infrastructure required and a market for electric vehicles in the UK.

5. Finally, we recognise the potential for conflict between Government priorities, particularly in terms of development and carbon emissions. The aim to deliver 35,000 new build houses a year is challenging in itself, and without absolute clarity and certainty in relation to policy it will be impossible to achieve. Planning policy, building standards, affordable housing policy and policy on future energy generation and consumption must become much better aligned. We believe that the incorporation of zero carbon home standards into new build social housing in advance of 2016 is an important lead the Scottish public sector can take now – particularly in this difficult economic climate.

Response to Call for Views

Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

In principle, the CCBDG believe scientific evidence should determine the rate of emissions reduction. We support targets and a framework consistent and aligned with the scientific recommendation of what is required to ensure global average temperature does not increase by two degrees Centigrade, widely acknowledged as a dangerous tipping point resulting in drastic impacts across society, nature and the economy.

The CCBDG therefore support both the Government’s minimum targets, although we recognise there may be a benefit in setting a 2020 target in law too.

Q2 The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

What are your views on the setting of targets in batches from 2010 to 2022?

We originally supported a carbon budgeting approach although we are content with this framework for grouping the targets into batches, provided they are aligned with UK and International targets.

Q3 The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

The difficulty of meeting a 3% annual target should not be underestimated. Our original preference was for a carbon budgeting approach and an alignment with the UK framework
would have been simpler. However, the spirit of what is trying to be achieved is the same and we believe it is more important to ‘just to get on with it’.

Q.4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

While trading has an important role to play in tackling global climate change and should not be artificially restricted, we strongly agree that the focus of this legislation must be to reduce Scottish Source Emissions. We note that the UK Climate Change Committee has recommended a set of figures up to 2020 that specifies domestic, traded and credit purchase. This amounts to a 34% cut predominantly through domestic emissions reduction, and 42% total through domestic emissions reduction and credit purchase. We would support the adoption of this model for the purposes of both consistency and effectiveness.

Q5 The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

We acknowledge the difficulty government has in defining the term ‘attributable’. We agree that greenhouses gases emitted from Scotland should be the spirit of this legislation, but we should not ignore the effect of Scottish demand on global emissions. For example, we may no longer manufacture most of the steel needed in the country, but we certainly import it and it is therefore an important factor in assessing pollution generated by the Scottish people. However, we also recognise the necessity for consistent measurement and we appreciate the difficulty in assessing the end to end carbon emissions associated with any given product. Ultimately, we hope that international agreements will ensure that the price of carbon is built into every stage of the production and distribution process.

Q6 The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government’s approach to obtaining independent, expert advice on climate change?

The CCBDG agrees with this approach and believes the Climate Change Committee’s first report has made very instructive reading.

Q7 The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

Once again, we agree with the arrangements for scrutiny. Given the extremely long term nature of these legislative targets, it is vital that government is held properly to account for
early progress towards them. Parliament has an extremely important job to do in protecting the interests of future generations.

**Q8** The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

**What are your views on this proposal?**

The CCBDG believe it is right to impose duties on public bodies with regards climate change, and we recognise there is an argument to do so in primary, rather than secondary legislation. We believe this is particularly relevant to Scotland given the scale and influence of the public sector.

Local authorities and the private sector may benefit from the universal application of policy measures and setting expectations as early as possible. Many of the potential requirements on local authorities for example, could include: a duty to meet specific targets and a duty to consider climate change impacts through all public procurement and planning. The remits of SEPA and SNH might also include an obligation to deliver cuts in climate emissions.

We also recognise the role of the Scottish Government in guiding local authorities in particular to ensure some consistency of approach across Scotland.

**Q9** The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

**What are your views on this proposal?**

We welcome this focus on adaptation, believing it has been somewhat overlooked until now.

**Q10** Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

**What are your views on this proposal?**

No specific view.

**Q11** The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

**What are your views on this proposal?**

Given that we believe all of Scotland’s agencies and public bodies should play their part in delivering action on climate change it follows absolutely that the Forestry Commission can have a particularly special job to do. We support the Scottish Government’s proposals.

**Q12** The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

**What are your views on this proposal?**

We believe the ultimate aim of energy efficiency must be to reduce energy demand but we are mindful of the complexities of affecting consumer behaviour.
Improving the energy efficiency of existing housing stock is paramount but the current rate of progress is insufficient to meet the carbon emission targets in this Bill. By 2050, only one third of housing stock will have been built between now and then. So two thirds of stock will be ‘old’ properties. The onus is on this current generation to bring about very significant change. To make that happen every tool at the disposal of the Scottish government (local tax incentives, business rates, planning changes, significant increase in grants for householders, etc) should be used to stimulate both the improved household energy efficiency and develop the potential for microgeneration. 

For example, measures could be developed to incentivise local authorities to deliver emission reductions and specific climate-friendly actions such as through procurement strategies, renewable energy development plans and energy efficiency initiatives. Business rates in respect of renewable energy developments such as wind farms could be payable directly to the local authority in which the wind farm is located for example. Permitted development rights could be incorporated in the bill to enable easier installation of low-carbon and renewable devices on buildings.

We also recognise that a ‘street-by-street’ area-based approach to energy efficiency measures may prove to be more effective and we are concerned that the current approach is inefficient, expensive and is less likely to complete the job efficiently and within the timescales required.

Finally, there is a role for government in ensuring that skills are enhanced in order to deliver the wholesale improvement of the energy efficiency of Scotland’s existing homes.

Q13 The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government’s thinking in this area.

What are your views on this approach?

The CCBDG agree with this approach for non-domestic properties. However, we believe there is much more yet to be done for both domestic and non-domestic building standards not least by developing much greater clarity in the standards that are expected.

Q14 The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

What are your views on this proposal?

The CCBDG welcome the Scottish Government’s nominal target of 11% renewable heat by 2020, although we note the UK government has an indicative target of 14%. Nevertheless, an 11% target represents a market expansion of over 1000% in just over ten years. This is very ambitious. We believe this is the area where the least has been achieved to date, but the area with the greatest potential to deliver significant reductions in carbon emissions.

We are not believers in government ‘picking’ technological winners but given the scale of the renewable heat target we believe that all sources of renewable heat need to ‘remain on the table’ and deployed where best suited. We do not believe at this stage it is appropriate to be backing one technology over another and believe there will be a role for all the main heat technologies in time, including ground, air and water source heat pumps, solar thermal, biomass and biogas.

Furthermore, we believe there is potential for renewable heat deployment in the industrial and commercial sectors and this should be given sufficient weight in policy development. The economies of scale are greater in industrial and commercial uses of heat and there may also be greater potential for closed loop waste to energy systems in these sectors. We also note that the carbon intensity of heating fuels is higher in these sectors, thus delivering better carbon savings per pound of investment in renewable alternatives.
Finally, we are strongly supportive of a market intervention at the UK level that would incentivise the generation of heat from renewable sources. Without a Renewable Heat Incentive, we do not believe the market will deliver a significant uptake of renewable heat technologies by 2020.

Q15 The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas: Waste prevention and management plans;
Waste data;
Deposit of recyclable waste;
Procurement of recyclate;
Reduction of packaging;
Deposit and return schemes;
Charges for carrier bags.
What are your views on these proposals?

The CCBDG is broadly supportive of additional measures to improve waste management and recycling, provided that measures are proportionate.

We welcome the very real progress that has been made in recent years, and believe Scotland’s dramatic increase in recycling rates over the past seven years is illustrative of what can be achieved by the right combination of a legislative framework and public resources. We are optimistic that further progress will be made in the next few years.

Q16 What are your views on the adequacy of the Scottish Government’s consultation in advance of publishing the Bill?

Generally positive, there appears to have been significant effort deployed at engaging with stakeholders and the wider public.

Q17 Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government out on the consultation proposals?

No specific comment at this stage.

Q18 Does the Bill raise any equalities issues you would wish to highlight?

No specific comment at this stage.

Q19 Do you have any comments on the impact of the Bill on sustainable development?

No additional comments.

Q20 Do you have any other comments on the Bill?

Above all else, the CCBDG is concerned about the potential for speedy delivery. It is fully committed to taking action on climate change, and member companies are investing hundreds of millions of pounds into low carbon technologies. We know first hand of the barriers, the complexities and the difficulties of moving to a low carbon business model.

We would use this opportunity to urge policy makers and government to pick up pace, focus harder on delivery and develop a greater sense of urgency - especially in the areas of renewable energy for heat, renewable energy for transport and renewable electricity.

The combination of measures to bring about energy demand reduction, incentives for renewable heat and renewable transport and further significant progress in waste management and renewable electricity mean it is perfectly possible for Scotland to meet its ambitious carbon reduction targets.
About the Climate Change Business Delivery Group

The Climate Change Business Delivery Group formed in early 2007. Representing a broad cross section of Scotland’s corporate and business sectors, with 100,000 staff employed either directly or indirectly in Scotland, the membership is convinced that climate change threatens future prosperity in Scotland and every other part of the world.

The group understands how hard it is to grow business and ensure significant year on year reductions of greenhouse gas emissions. They are, however, deeply committed to making a difference both within our businesses and as individuals – and firmly believe that Scottish specific climate change laws can help achieve that.

Current membership:

Ian Marchant, Scottish & Southern Energy and Chairman
Gordon Dewar, BAA
Brendan Dick, BT Scotland
Mary Grant, First Scotrail
Fergus McConnell, Taylor Wimpey
Peter Lederer, Gleneagles Hotel
Ian MacKay, Royal Mail
Grant Hodges, PWC
Susan Rice, Lloyds TSB
Ken Ross, Elphinstone
Satty Singh, MS Namara
Mike Straughen, Wood Group
Michael Tracey, William Tracey Ltd
Andrew Murphy and Lesley Ballantyne, John Lewis
Scottish Renewables welcomes the opportunity to provide written evidence on the Stage 1 scrutiny of the proposed Climate Change (Scotland) Bill which is one of the most significant pieces of legislation ever considered by the Scottish Parliament. Scottish Renewables is Scotland’s leading green energy trade body. We represent over 240 organisations involved in renewable energy in Scotland and include many environmental NGOs in our wider associate membership. Further information on our work and membership can be found on our website – www.scottishrenewables.com

Scottish Renewables believes that the harnessing of renewable energy sources in a sustainable manner provides a unique opportunity to not only tackle climate change but to provide economic benefits to Scotland. The setting of statutory targets to reduce emissions is vital if we are to send the right signals to industry and wider society that significant changes are required to establish a low carbon economy.

However the setting of statutory targets on their own will not deliver the kind of changes needed unless accompanied by strong action that can be scrutinised by the Scottish Parliament. This is why we are proposing a robust supporting framework to accompany the Bill which will involve aligning the consideration of the financial Budget Bill and the financial spending review to the delivery of climate targets.

If Scottish Renewables can be of any further assistance to the Committee, we will be happy to provide further written or oral evidence in support of our statements.

Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

Interim point targets will be useful in providing milestones on the way to delivering the 2050 goal, but the primary focus should be on the delivery of the target for the individual carbon budget cycle. The Bill should allow for subordinate legislation to adjust the level and year of any interim targets including the 2050 target. However this provision should only be included if there is an accompanying statutory purpose of the Bill to contribute towards a stabilisation of global average temperature levels at no more than 2 degrees celsius beyond pre-industrial levels. This important aim was adopted by the EU in 1996 and has been repeatedly reaffirmed including at the 2007 G8 conference. It is important that the purpose of the target is explicit on the face of the Bill, allowing flexibility to revise approaches and targets to deliver Scotland’s contribution to the global challenge in the decades ahead. Any proposed change in target levels should be supported by strong scientific consensus analysed and reported on through the UK Climate Change Committee and/or relevant Scottish body.

Q2 The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

What are your views on the setting of targets in batches from 2010 to 2022?

The setting of annual targets within batches over a 12 year period is feasible provided the targets are compatible with the first three 5-yearly budgets recommended by the UK Climate Change Committee. The danger in early batches failing to deliver, would result in disproportionate pressures to reduce carbon emissions in a shorter period of time.

The electoral cycle of the Scottish Parliament is likely to provide an ultimate form of scrutiny for governments but detailed scrutiny of the carbon budget must take place in parliament aligned with the carbon assessment of the spending review and annual Scottish Budget Bill.

Q3 The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020,
the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

The requirement to meet at least 3% annual carbon emissions in the period to 2020 appears to be questionable. There is insufficient explanation as to why the period up to 2020 is aspirational rather than mandatory in setting annualised carbon cuts. The perception is that annual carbon emission cuts of 3% is unlikely. If the Government does not have the confidence that annual cuts of 3% are achievable, then this should be identified and explained now, with a clear understanding that in certain future years the carbon emissions cuts will be considerably greater than 3%.

Q.4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

International trading in carbon has a role to play in providing flexibility but could undermine the need to act now in Scotland to reduce emissions across all sectors and to capitalise on domestic renewable resources. There are issues regarding the credibility and regulation of international credits that need to be resolved before they can play a significant role. If they are to be used in the future a strict limit should be imposed and we would support a limit of at least 80-90% of carbon emission reductions being achieved through domestic effort or elsewhere in the EU.

Q5 The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

Scottish Renewables supports the inclusion of a Scottish share of international aviation and shipping. The reality that Scotland is part of an ‘island nations’ and dependent upon air and sea transportation for its people’s travel and exchange of goods cannot be under-estimated. However, there are issues surrounding, for example, the arrival of imports at a Scottish port or airport for onward delivery to a destination outside Scotland (or in the case of goods passing through say from Stranraer to the Cumbrian border) and whether there will be sufficiently robust systems to record the end user of a carbon commodity.

Q6 The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government’s approach to obtaining independent, expert advice on climate change?

There is a growing body of opinion that the UK Climate Change Committee may not have the resources and/or stretch to provide detailed advice on Scotland-only carbon emissions and the consequences of climate change. Scottish Renewables would support an independent Scottish body, which will work closely with the UK Climate Change Committee and other public bodies such as Audit Scotland, and may incorporate the role of the Sustainable
Development Commission in Scotland. With increasing concerns about the need to secure carbon cuts in the first few years of the Bill’s passing, a stronger focus on what is happening and what corrective action should be applied, is more likely to be forthcoming in a dedicated Scottish body.

Q7 The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

The recent experience of minority government in Scotland has resulted in a shift of the balance of power in favour of the Parliament over the governing executive. This is a welcome development and in the current climate suggests that parliamentary scrutiny of carbon emissions cuts would be robust.

However, there is no guarantee that the current political situation will continue any time into the future and there are concerns that majority government can lead to parliamentary committees being less able to openly question the performance of the governing parties.

With this in mind, Scottish Renewables supports the reporting duties as stated in the Bill, but believes that the carbon assessment of individual budget lines in the spending review needs to also be comprehensively undertaken to enable scrutiny from parliamentary committees. There needs to be a form of legislative commitment in the Bill to this approach otherwise a meaningful way of assessing how government spending is directly supporting the delivery of targets will be opaque.

Q8 The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

Approximately one-third of the Scottish Government’s revenue is transferred to local government and a similar significant proportion funds the National Health Service in Scotland. The Local Government Concordat clearly shows that the Scottish Government has a strong belief that Scottish local authorities have their own responsibilities and priorities to decide upon. However, the difficulties in committing local authorities to delivering Scottish Government policies within the Single Outcome Agreement process, together with Community Planning arrangements having less binding obligations on a local authority area, would suggest that local government will require early direction on their key role in cutting carbon emissions. Whilst some local authorities have made clear and significant progress in both the delivery of policies and services with due cognisance to the impact of climate change, there are too many local authorities who appear to be dragging their feet with the complaint that they are insufficiently resourced to transform their services without additional government funding.

The Scottish Government and COSLA need to work together and urgently on changing this culture and if significant change has not come about within the next 3 years, early implementation of a duty on local authorities and/or other public bodies should be considered.

As much as this might appear as using a ‘stick’, there are ‘carrot’ incentives which the government could consider to encourage a more positive approach to combating climate change including incentives to reduce energy bills and establish locally owned or community owned Energy Service Companies.

Q9 The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change,
Transport, Infrastructure and Climate Change Committee, 2nd Report, 2009
(Session 3) – ANNEXE C

proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on this proposal?

Scottish Renewables broadly welcomes this approach and the experience of the past twelve months in consultation on such matters has been constructive.

Q10 Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are your views on this proposal?

Scottish Renewables does not have a view on this provision.

Q11 The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

The Commission owns and manages a very large estate which is likely to include a significant number of sites suitable for generation of electricity from hydropower and wind. Whilst the Commission has in-house project development expertise it may prove commercially sensible to work in partnership with other players in the renewables industry to realise any potential, especially where it is desirable to promote rapid deployment.

However we believe that the energy generation by any such joint venture should be limited ‘to generate power from wind, hydro and micro power’ and that there is no suggestion that the Forestry Commission would form joint ventures to develop bioenergy projects of any scale. If bioenergy Joint Ventures were proposed, these may allow a situation to arise where Forestry Enterprise Services is effectively selling timber to itself. Real or perceived, serious market distortion in the wood fuel market may arise.

Q12 The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?

Scottish Renewables is pleased to see that the issue of energy efficiency is included in the Bill, however, we are disappointed that an Energy Efficiency and Microgeneration Action Plan is long over-due. The action plan needs to set out what the current energy demand is and what it needs to be in order to reduce carbon emissions. Setting this out will clearly help industry and the general public to appreciate the scale of the challenge which we face.

Q13 The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government’s thinking in this area.

What are your views on this approach?

Scottish Renewables would support moves incorporated into the Bill to require minimum energy efficiency standards to be met within the public and private sectors in Scotland. However, all avenues should be explored, such as using fiscal incentives to reward energy efficiency and/or microgeneration.
The Scottish Government should progress the extension of General Permitted Development rights for air source heat pumps and wind turbine technologies as a matter of urgency, as well as turn its attention towards solutions for tenemental properties.

Q14 The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

What are your views on this proposal?

In our response to the Scottish Government’s consultation on the draft Renewable Energy Framework, Scottish Renewables set out a rationale of action which would further the promotion and deployment of renewable energy in Scotland.

Whilst we welcome the attention paid to renewable heat in the Bill and the recognition of urgent action in this area there is perhaps a missed opportunity to consider electricity and transport as well. Determined action needs to take place on all three fronts and would be keen to see the Bill promote this with clear, measurable actions from the Scottish Government (see following paragraph for an example).

In terms of the specific wording of the Bill, it could be more detailed by specifying the role of heat in domestic and commercial/industrial sectors and expectations of how each sector will reduce its carbon emissions over a period of time and indicating the powers that Ministers may implement to assist in that transition.

Q15 The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas: Waste prevention and management plans;

- Waste data;
- Deposit of recyclable waste;
- Procurement of recyclate;
- Reduction of packaging;
- Deposit and return schemes;
- Charges for carrier bags.

What are your views on these proposals?

Scottish Renewables is broadly supportive of these measures.

Q16 What are your views on the adequacy of the Scottish Government’s consultation in advance of publishing the Bill?

Scottish Renewables welcomes the opportunity to put forward the views of its members on both proposed legislation and policy development on specific measures. The consultation process for the Bill has been constructive and encouraging.

Q17 Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government out on the consultation proposals?

No specific comment at this stage.

Q18 Does the Bill raise any equalities issues you would wish to highlight?

No specific comment at this stage.

Q19 Do you have any comments on the impact of the Bill on sustainable development?

The Bill should have a positive impact on sustainable development as it will reduce emissions and also provide impetus to investment in a low carbon economy.
Q20 Do you have any other comments on the Bill?

The Bill contains highly commendable aspirations as a piece of enabling legislation, however it is the detail of the implementing legislation that will be more important and we look forward to seeing this. The Bill’s efficacy will be whether secondary legislation and government action will achieve the targets which are core of this legislation. There is considerable debate about what to do in the event that targets are not achieved. It is difficult to see how financial penalties against a government would be feasible, however, this legislation is not being enacted in isolation: international, European and UK obligations may come to bear on the performance of the devolved administration in Scotland.

Furthermore, the general purpose of the Bill should be to accelerate government action and delivery in the short term as well as the setting of targets for the long term. This means that areas such as carbon accounting of government action through the Scottish Budget, infrastructure planning, action on renewable energy and energy efficiency, building regulations and such like, are inter-related in making the Bill effective in practice. If the Bill is successful in truly facilitating the climate change proofing of Scottish public policy, then it will achieved far more than other initiatives aimed at mainstreaming core values and principles in Scottish life.

In the time since the Scottish Government was formed in 2007, amid a blaze of expectation for a Scottish Climate Change Bill and the subsequent ‘sustainable’ economic growth strategy, circumstances have changed. The UK Climate Change Act is now in place. Recession has hit most of the developed world and its implications for developing countries have barely featured on our horizon. The progress of the Climate Change (Scotland) Bill through its stages of parliamentary scrutiny may provide an opportunity to look again at how we approach ‘sustainability’ within our economic strategy. Even with the challenges of tackling climate change, Scotland has a strong competitive advantage to develop a low carbon economy, with economic benefits which are in balance with our natural environment and social concerns.
SNH views climate change as the most serious threat over coming decades to Scotland’s natural heritage. In addition to its environmental consequences, climate change is likely to have major social and economic implications for people in Scotland and elsewhere. SNH aims to understand the effects of climate change on the natural heritage, and to help deliver the contribution that the natural heritage can make in limiting it and adapting to it.

The impact of climate change on Scotland’s natural heritage is likely to be profound, causing very significant changes to our ecosystems and landscapes within a timescale measured in decades. Current indications are that by the 2080s Scotland will be warmer, especially in summer, with snowless winters in some parts; winters may become wetter and summers generally drier. The range of many species and habitats may shift northwards, or up hillsides. However many species and habitats may simply be unable to keep pace with the rates of climatic change, and some species may become extinct.

The most obvious changes in Scotland may be to coastal, marine and freshwater ecosystems. As sea levels rise, saltmarsh and machair habitats will be lost where man-made defences or natural topography prevent them moving inland. In the seas around Scotland there have already been shifts in ranges in algal, plankton and fish abundance. Rivers may become more affected by low flows in summer and by flash floods in winter washing out spawning beds for salmon. Wetlands may dry out in summer allowing woody species to colonise or causing peat to erode with consequences for greenhouse gas emissions.

Flexibility is likely to be key to making sure that infrastructure and land use are resilient to future climate, weather patterns and weather events. The natural heritage has an important role to play by making sure that ecosystems retain sufficient integrity so that they continue to provide essential services, such as flood mitigation, productive land capacity and water supply.

SNH is currently developing a policy statement and action plan on Climate Change and the Natural Heritage. A summary of the draft policy statement is annexed, which describes the main expected impacts of climate change on the natural heritage.

SNH’s key contributions in responding to climate change will be:

• helping to understand and publicise the effects and consequences of climate change for the natural heritage;
• advising on infrastructure and land management practices which help to mitigate climate change;
• guiding adaptation so that nature can, as far as possible, adapt to a changing climate and so that people can make best use of natural processes in preparing for climate change;
• promoting action by organisations and individuals by setting an example in the management of SNH’s own operations, and through our wider environmental education work.

Climate change should not only be considered ‘a problem of the future’. Its effects are already beginning to be evident in Scotland. Documented effects \(^\text{17}\) include:

• increasing average annual temperatures;
• increasing peak day temperatures (the 24-hour maximum);
• increasing length of the growing season;
• increasing sea surface temperatures;
• rising sea levels from thermal expansion of the oceans as well as melting glaciers and ice sheets;
• acidification of seas from increased carbon dioxide absorption.

We therefore strongly support the proposals for the Climate Change (Scotland) Bill.

Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

We welcome the 2050 target. As discussed in the policy memorandum associated with the Bill, this is based on the desire to avoid dangerous climate change. However, ‘avoiding dangerous climate change’ is not mentioned in the Bill itself. In contrast, the UK Act (Section 6, 3a) requires that the advice that ministers receive on targets is to be based on developments since June 2000, the date of the Royal Commission on Environmental Pollution report Energy – The Changing Climate, which is referenced in the UK Act. We recommend a similar clause be included in the Scottish Bill, to provide a firm foundation if there should be any need to vary targets in future. The reference to ‘avoiding dangerous climate change’ need not be quantified, as understanding of the thresholds is likely to develop with scientific knowledge.

The target to reduce emissions by 50% in 2030 should be tightened. The overall effect of interim targets should be to achieve marked early reductions in emissions to follow an overall emission reduction pathway like the lower curve in Figure 1 (as discussed in the consultation paper on the proposed Bill during 2008). This approach is consistent with scientific advice that what is most important is the total change cumulative emissions over the period – represented by the area under the curve.

Faster early reduction will help avoid the need for major annual reductions in later years. The Bill proposals for an interim target of 50% in 2030 only amount broadly to achieving a linear pathway between now and 2050. We recommend that a further interim target for 2020 be introduced, set in the light of the recommendations of the UK Climate Change Committee. In our response to the consultation on the Bill we recommended reductions of at least 40% by 2020. If such a target were set, it would put Scotland on track to achieve a 2030 target of 55-60%.

It should be borne in mind that some of Scotland’s emissions may be difficult or impossible to avoid, for example those arising from historical disturbance of peaty soils, including drainage, dehydration and erosion, for example by tree felling and draining certain peaty soils to plant forest. This legacy – arising from earlier land management decisions - could remain as a significant ‘hard core’ of emissions by 2050. Further work is required to establish in detail the nature and amount of such emissions. However, their existence means that emissions from other sectors will have to be reduced by much more than 80% in order to meet an 80% target overall.

An intended overall percentage reduction of only 3% in each of the final years of the period up to 2050 will require a much higher proportionate reduction in ‘controllable’ emissions.
The targets should avoid relying on uncertain technological advances to secure rapid reductions later on. Where reliance is placed on technological advances (e.g. on carbon capture and storage, nuclear fusion, wave power, hydrogen economy), firm policy frameworks should be put in place, including regulatory controls and expected timescales, to make sure that such technologies are operational by specific dates.

Otherwise there is a risk of lock-in to existing forms of high-carbon infrastructure. In particular we have recently commented that there should be a moratorium on new coal power plant until such time as a firm timescale can be set to implement carbon capture and storage requirements. We think that imposing a requirement for carbon capture readiness – meaning only that there is space on site and that general feasibility studies have been undertaken – is insufficient.

In contrast, there are many practical measures that can be taken now using existing technologies (such as energy management, combined heat and power, electric vehicles, and renewable energy development), and more effective use of measures to help change behaviour and lifestyles. Interim targets should reflect the availability in the short term of these many practical measures.

Finally, we note that Scotland could be a role model for the international community in delivering these challenging targets.

Q2 The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

What are views on the setting of targets in batches from 2010 to 2022?

We support this approach provided the targets are compatible with the first three 5-yearly budgets recommended by the UK Climate Change Committee (2008-2012, 2013-2017 and 2018-2022). For the reasons set out above, we believe that the annual emissions reductions sought in this period should be higher than the annual emissions reductions sought in the last decade leading up to 2050.

Part 5 of the Bill is limited in scope, covering only selected aspects of forestry, energy efficiency and waste. To give effect to the targets or budgets we suggest that the Scottish Government produce a new Scottish Climate Change Programme, initially covering 2009-2022. The programme should cover all major sectors over which the Scottish Government has direct control, especially:

- Heat;
- Transport;
- Renewable electricity;
- Land use and land use change (including forestry and agriculture).

It should also cover areas that are important to achieving emission reductions in Scotland but are administered by the UK Government or the EU (e.g. emissions trading, product standards).

It would be helpful to develop ‘energy hierarchies’ for energy use in buildings and transport, similar to the well-established ‘waste hierarchy’. These, for example, would give priority to demand management and avoiding energy use, followed by energy efficiency, renewable generation, low-carbon generation, through to higher emission generation as the least desirable. Emissions should be quantified on a life cycle basis. The less that is achieved at the top of the hierarchy, the more infrastructure may be needed to deliver solutions further down the hierarchy, with a likely consequence that there will be more conflicts with the natural heritage and other environmental factors.
Q3 The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

As discussed above, we favour emission reductions that lead to steeper reductions in the early years. We note that the provisions of the Scottish Bill are considerably less demanding over the period to 2020 than those of the UK Act which requires a minimum of 26% emissions reduction by 2020. We hope that the recommendations of the UK Climate Change Committee for 2020, for an ‘interim target’ of 34% and an ‘intended target’ of 42%, can be reflected in the final Bill.

Q4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

We agree with the principle that the Bill should ensure that action to reduce emissions is strongly weighted to domestic effort. We note that the UK Act contains a clause that limits the amount of carbon credits that can be purchased, and that the UK Climate Change Committee recommends limiting this to 10% for the ‘interim target’, so that 90% of the reductions are achieved through domestic effort or elsewhere in the EU.

Q5 The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

We agree with this definition, which is consistent with international reporting obligations. However, we recommend that the Bill also provides for reporting of emissions based on consumption of goods and services in Scotland. This issue was discussed in the consultation paper on the Bill. There is a risk that emissions associated with Scottish manufacturing might fall but only as a result of our importing similar goods from other countries, with the result that global emissions due to Scottish people might increase while Scotland satisfactorily meets its internal emissions targets. Scottish Government should keep itself well informed on such patterns of consumption so that mechanisms and policy measures can be designed to avoid this risk. Tracking emissions based on consumption is consistent with the adoption of ecological footprint as an indicator in the National Performance Framework, so most of the relevant data and information should be readily available.

Q6 The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

19 The ‘interim target’ of a 34% reduction by 2020 assumes that the EU target to reduce emissions from the EU by 20% in 2020 remains in force. The UK CCC set a more ambitious ‘intended target’ of a 42% reduction by 2020 to apply if the EU adopts a 30% target for 2020, as they have stated depending on post-Kyoto international agreements.
What are your views on the Scottish Government’s approach to obtaining independent, expert advice on climate change?

We agree with the approach to rely on the UK Climate Change Committee until such time as there is a demonstrable need for a dedicated Scottish Committee or equivalent body. It may be important to make sure that the UK Committee is resourced so that it is able to present its advice so that it is directly relevant to Scotland (e.g. relevant legal, regulatory, policy and governance context). If there is a need to establish a Scottish Climate Change Committee, it should either be founded as an extension of the UK Committee, or required to work closely with the UK Committee, adding supplementary advice as needed. The composition of any such body should reflect understanding of the impacts of climate change on the natural heritage, and also social aspects of climate change, including both the social impacts of climate change and issues such as facilitating behaviour change.

Q7 The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

We agree with the proposals. Improvements are required in both the timing and content of the Scottish inventory of greenhouse gas emissions. There is currently a lag of approximately 2 years between production of the UK emissions accounts and disaggregated accounts for the devolved administrations. On the content, we have found major presentational differences in various inventories and reports, for example the treatment of emissions associated with land management and energy sectors, which makes it difficult to compare like with like. It is important that the inventories and reporting of emissions of greenhouse gases inform policy decisions in Scotland. We welcome the development of the Carbon Impact Assessment methodology by the Scottish Government, which should help to remove these discrepancies and achieve better alignment and reporting across economic sectors, relating financial spending and greenhouse gas emissions.

Q8 The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

We welcome these proposals and would be content with any reasonable duties imposed, that is, consistent with the degree of action required to reduce emissions, adapt to the impacts of climate change and making sure that ecosystems retain sufficient integrity so that they continue to provide essential services. As indicated in our opening remarks, we aim to lead by example.

Q9 The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

What are views on this proposal?

We strongly support this. As indicated in our introductory remarks and answer to Q1 climate change is already happening and we need to adapt to a changing climate in the future. This means making sure that infrastructure and long term decisions about land management and land use are resilient to future climate, weather patterns and weather events. The natural heritage has an important role to play by making sure that ecosystems retain sufficient integrity so that they continue to provide essential services, such as flood mitigation, productive land capacity and water supply. This requires that approaches to adaptation allow the natural heritage to adapt to changing climate so that it can continue to support the ecosystem functions that help society to adapt. Further details on our approach and recommendations on adapting to climate change may be found in our policy statement and Action Plan on Climate Change and Natural Heritage.
We welcome the Scottish Government’s progress on developing a Climate Change Adaptation Framework and have assisted its development. We understand that after 2012 this will become the reporting and action framework required by the Bill following the first UK Climate Change Risk Assessment, expected in 2011 under the UK Act. We recommend that the Scottish Adaptation Framework should form part of the Scottish Climate Change Programme as suggested in our response to Question 2, so that the Climate Change Programme contains both mitigation and adaptation strategies.

We recommend that the timing of the requirement to report is tightened from “as soon as reasonably practicable” after the UK Risk Assessment to specify a number of months. We welcome the proposals for 5-yearly reporting: a good comprehensive report every 5 years is likely to be of more value than a less detailed but more frequent analysis. It is important that this process stimulates the action required and this aspect of the Bill may need to be subject to similar independent monitoring and scrutiny arrangements that prevail for emission reductions.

Q10 Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are views on this proposal?

We support this. Fire has been part of upland environments for many thousands of years. It occurs naturally as a result of lightning strikes and it is probably also one of the most useful, and oldest, land management tools. Each year, less than 5% of moorland is burnt for agricultural, nature conservation and sport interests to enable the provision of fresh food sources on rough grassland or managed moorland for livestock, game and wildlife, and the management of older vegetation, which can act as a source of fuel for wildfires. However, it is a powerful tool, which needs to be used with skill and understanding if it is not to do more harm than good. If not undertaken at an appropriate time, or according to good practice, muirburn can exacerbate erosion on some slopes and soils, damage peat-forming vegetation such as sphagnum mosses reducing the ability of the bog to sequester carbon, result in fire spreading to the underlying peat leading to severe erosion, cause displacement or death to wildlife, especially birds and reptiles and recolonisation rates. The Muirburn Code sets out the constraints to limit the potential damage to risk of damage to agricultural, forestry, game, biodiversity, landscape, and archaeological assets. Consequently, we recommend that there is a requirement for Ministers to consult with relevant authorities, including SNH, before varying the permitted times during which muirburn may be made. Consideration of changes to the dates of the muirburn season should not be in isolation, on the basis of one possible driver of change. In some cases it may be difficult to disentangle changes attributed to climate change from other factors including land management. Decisions would also need to take into account the extent to which restricting muirburn season would reduce the amount of muirburn undertaken. This may have detrimental impacts on some habitats, including Natura and Biodiversity Action Plan habitats that are maintained by rotational muirburn.

Q11 The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

We support the work that FCS does, and in particular we welcome the way that forest management has developed into a multi-use, public-benefit process over the last 20 years. We strongly support multi-benefit forestry and would regard moves to single benefit forestry, even for carbon sequestration, as a potentially retrograde step. The development of joint ventures for renewable energy projects would be covered by existing safeguards in the planning process, and could be compatible with the delivery of multiple benefits. Some of the...
income from renewable partnerships could be earmarked to secure continued management of the national forest estate for multiple benefits. We would support this.

The outcomes associated with the proposals to lease-off some forest areas are less predictable. It is possible that management for the natural heritage could be perceived as being less important in areas leased off. The lease-off could lead to less income for the remaining areas of the national forest estate and therefore fewer resources to support management for natural heritage benefits in those areas. This could lead to a weakened and ‘de-commercialised’ FCS, less able to lead by example and influence the private sector to undertake positive management for the natural heritage.

Establishing some firm principles to guide any leasing arrangements could reduce the likelihood of such undesirable outcomes:

• In the details of the lease and the use of any income, specify that the income should be spent in producing a balanced range of public benefits, not just carbon sequestration. The range of benefits should reflect the priorities, needs and outcomes sought in the areas that are being leased out.

• Require that the lease should be subject to formal review, for example through forest plans, every 10 years or so. It is extremely difficult to set the details of a lease for a period of 75 years which will cover all future options. For example, 75 years ago the most important use of timber from forestry was for pit-props, and decisions at that time could not have foreseen the management required for recent conservation issues or some of the difficulties associated with that, such as capercaillie leks and deer fences. Therefore, the terms of lease should provide for flexibility to require changed management for changing circumstances.

Q12 TO 16  (energy efficiency, waste, adequacy of consultation)

No comment.

Q17 Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government on the consultation proposals?

We are satisfied with the SEA process conducted by the Scottish Government, and its responses to the comments made by the consultation authorities. Consideration of the Screening Report commenced during pre-consultation stages of the proposals, with a report published in August 2007 and a determination in September 2007. A Scoping Report was published in September 2007, and the Environmental Report accompanied the consultation paper on proposals to introduce a climate change bill in January 2008, with comments invited in April 2008. A revised Environmental Report was published on the Scottish Government website on 4 December 2008, with clear responses to all of the comments made by the consultation authorities and relevant changes to the Bill (as introduced). We consider that the SEA has been a constructive process, adding value to the policy development.

Q18 Does the Bill raise any equalities issues you would wish to highlight?

No comment.

Q19 Do you have any comments on the impact of the Bill on sustainable development?

Despite our strong concerns about climate change and its impacts on Scotland’s natural heritage, we would be concerned if efforts to address it have the effect of narrowing down perspectives on sustainable development away from the broad suite of goals set out in the Scottish Sustainable Development Strategy and in Scottish Government’s 2007 Spending Review, to become overly focused on the single issue of carbon reduction.

Sustainable development has many angles, which are captured very broadly within the five strategic objectives of Government. Measures to address climate change will have to be designed sensitively, and with supporting policies and programmes, if they are to avoid making achieving these five broad objectives more difficult. Higher energy prices without improvements in energy efficiency could lead to greater levels of fuel poverty. Some approaches to restricting car use could make remote communities more fragile. Higher
energy costs could affect costs for business. The Stern Review and the UK Climate Change Committee both emphasise the need for integrated policy interventions to reduce the likelihood of adverse outcomes, and both emphasise the long-term costs of failing to make early reductions in emissions: these are issues to be considered and designed around, rather than barriers to taking action on climate change.

We believe the need is to think in terms of what a sustainable low-carbon society that is well adapted to our changing climate will be like in 2020 and 2050, and actively steer Scotland’s development towards that vision. Decisions on major infrastructure will be crucial, as they may set a pattern for decades ahead. That is what is needed if the aspiration of Scottish Ministers is to be fulfilled that Scotland should be a leading nation in dealing with the issue of climate change.

Q20  Do you have any other comments on the Bill?

No comment.
There is now a scientific consensus that the planet is warming and that the degree of recent changes can be explained only by the effect of human activities. The impact on Scotland's natural heritage is likely to be profound, causing very significant changes to our ecosystems and landscapes within a timescale measured in decades. This statement sets out SNH's perspective on climate change and our role in responding to it.

SNH views climate change as the most serious threat over coming decades to Scotland's natural heritage. In addition to its environmental consequences, climate change is likely to have major social and economic implications for people in Scotland and elsewhere. SNH aims to understand the effects of climate change on the natural heritage, and to help deliver the contribution that the natural heritage can make in limiting it and adapting to it.

Increasing amounts of greenhouse gases in the atmosphere are leading to increasing global average air and surface temperatures, widespread melting of snow and ice, and rising sea levels. The climate is becoming more chaotic with more frequent and more extreme weather events, such as heat waves, heavy rainfall, drought, and high winds. The severity of these problems in particular places will depend on a variety of local factors. Current indications are that by the 2080s Scotland will be warmer, especially in summer, with snowless winters in some parts; winters may become wetter and summers generally drier. The range of many species and habitats may shift northwards, or up hillsides. However many species and habitats may simply be unable to keep pace with the rates of climatic change, and some species may become extinct.

There will always be a substantial amount of natural variability, giving rise to a wide range of weather events and weather patterns over months to years. Flexibility is likely to be key to making sure that infrastructure and land use are resilient to future climate and weather conditions. The natural heritage has an important role to play by making sure that ecosystems retain sufficient integrity so that they continue to provide essential services, such as flood mitigation, productive land capacity and water supply.

Our key contributions will be:

1) Helping to understand and publicise the effects and consequences of climate change for the natural heritage.

There are huge uncertainties over the likely effects of climate change on Scotland’s natural heritage, or of how these changes can be influenced or managed. We aim to invest in research to improve that understanding, so as to enable our effort on adaptation to be well targeted.

2) Advising on infrastructure and land management practices which help to mitigate climate change.

We strongly support the need for major global reductions in greenhouse gas emissions in order to avoid a dangerous level of climate change – taken as a 2°C warming - beyond which there is potential for severe disruption of global ecosystems.

A wide range of measures is required, including energy efficiency, the use of renewable sources of energy, more sustainable modes of transport, and encouraging walking and cycling. In advising on such infrastructure, SNH will take into account its benefits in mitigating climate change and enabling adaptation to the impacts of climate change alongside the need to protect the natural heritage. We will advise on how Scotland’s rich renewable energy resource can be harnessed with least impact on the natural heritage.

We will encourage land management which protects the carbon stored in peatlands and other organic soils. These soils represent a very significant carbon reservoir, which if released into the atmosphere would be equivalent to around 170 years of greenhouse gas emissions from Scotland at current rates. We will also support the creation of new woodland with a view to carbon storage where it does not conflict with natural heritage interests.
3) Guiding adaptation so that nature can, as far as possible, adapt to a changing climate and so that people can make best use of natural processes in preparing for climate change.

We will support action to help both society and nature adapt to the effects of climate change. Climate change places new importance on considering the interdependence between species, habitats, and associated natural processes, and the benefits or services that people receive from these. SNH seeks to maintain the resilience of ecosystems so that they continue to provide the services that support human life as well as biodiversity. Restoring natural processes in freshwater systems can help in abating flood risks, and managed coastal realignment can allow natural habitats to provide protection against sea-level rise. Reducing other pressures on ecosystems, e.g. from pollution or habitat attrition, and maintaining diversity, will help nature to be more resilient to climate change.

As the climate changes, many species will need to be able to disperse into new areas where the climate remains suitable – usually northwards or upwards. Improving the connectivity between habitats through ecological networks can help species disperse into new areas. Protected sites will remain important for biodiversity conservation because characteristics such as greater habitat diversity and natural processes will continue to favour high biodiversity. They will also provide source populations and colonising habitat for dispersing species. For species that are unable to disperse, but still have suitable habitat within Scotland, their survival may be assisted by translocations but these can be high risk and costly and are a last resort. We will take a risk-based approach to eradication of invasive non-native species, taking account of both potential benefits and costs of action. For a few species, the effects of climate change may simply result in no suitable climate space in the UK and consequently their extinction.

4) Promoting action by organisations and individuals by setting an example in the management of SNH’s own operations, and through our wider environmental education work.

We will set an example in the management of our own operations. We aim to reduce our greenhouse gas emissions by at least 4% per year. We will work closely with Government and other public bodies to develop good practice and high standards in carbon reduction which can be applied elsewhere within the public sector. We will also review our operations to ensure that our offices, properties and visitor facilities on nature reserves are well prepared to withstand the effects and added risks associated with climate change. We apply sustainability criteria within our procurement processes, relating to energy and resource use, waste minimisation, recycling, and biodiversity impacts. We will encourage others to reduce their emissions too, and to take action to adapt to climate change, through our general environmental education work and by attaching conditions to the grants we give to other organisations.

These four roles will guide SNH’s work in responding to climate change. Our Climate Change Action Plan sets out in some detail the actions we intend to take over the next five years.
WRITTEN SUBMISSION FROM SCOTTISH ENVIRONMENT PROTECTION AGENCY

1. Introduction

1.1 SEPA’s main role is to protect the environment and human health. We do this by controlling activities that can cause harmful pollution and by monitoring the quality of Scotland’s air, land and water working to enable those we regulate to comply with the legislation as well as delivering a number of services such as flood warning and environmental business advice.

1.2 SEPA welcomes the Climate Change (Scotland) Bill and the strong framework it contains to address climate change in Scotland. SEPA feels that there are areas where further provisions are necessary to help Scotland achieve its targets. On balance, SEPA believes putting in place provisions for these measures now would further assist us on the pathway of reducing emissions towards the 80% target as well as protect Scotland’s environment and communities.

1.3 Flooding and floods management is clearly a key issue, and a major part of SEPA’s activity. However given the parallel development of the Floods Risk Management (Scotland) Bill, we have not commented further in this evidence.

2. Key messages

2.1 We need early action where possible and a Bill to support this.

2.2 To set a clear pathway for reductions of Scottish emissions and the move towards a low carbon economy, international credits must be a purely supplementary measure to firm domestic action.

2.3 Parallel reporting on consumption emissions and communication activity on end user demand is needed to provide an overall picture of our climate change impacts.

2.4 We need to measure and monitor Scottish emissions closely- existing systems are unlikely to be sufficient to meet changing demands.

2.5 We need statutory duties on local authorities, government departments and the wider public sector to consider the carbon impact of their decision making and procurement activities. We need provisions for regulators and planning authorities to take account of carbon impacts.

2.6 We need to greatly improve our utilisation of waste heat and underpin renewable heat and waste heat policy with firm and supportive action.

2.7 The Climate Change Bill should recognise the importance of Scotland’s carbon rich soils, and the need for their effective management. Scotland is in a unique position with a large amount of carbon in peatlands that need to be protected and managed sustainably.

Response to Call for Views

Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

SEPA welcomes the 2050 target of 80% emissions reduction and the setting of an interim target of 50% by 2030. SEPA feels that an interim target sends clear signals to business and will set us on the pathway to the 2050 targets.
There has been discussion since the Bill’s publication on the need for an earlier target, possibly for 2020, in order to strengthen these signals. SEPA notes that Scotland will be part of the UK 2020 target of at least 26%. This target is achievable based on the UK Committee on Climate Change’s recommendations set out in its recent report. The report further recommends a 34% interim target (and 42% intended target if international agreement on a global treaty is reached) going beyond the commitment in the UK Climate Change Act of at least 26% in 2020. SEPA understands that the UK government, after having consulted with devolved administrations, will respond to the UK Committee’s advice shortly.

Scottish Government's technical note on Climate Change Scotland Bill: Greenhouse Gas (GHG) Emissions, Annual Reduction and Targets notes that Scottish Ministers will be informed by the advice of the UK Committee on Climate Change before setting the levels of annual targets.

In addition to this, if Scotland reduces its share of emissions in line with the UK target and then continues on an annual 3% reduction to 2030, SEPA believes we would be well on the way to performing beyond the current interim target of 50%.

In summary, the picture on target setting continues to develop, and SEPA is not in a position to comment on the detailed trajectories at this stage, other than to re-iterate that a balance must be struck between early, sustained action, and economic and feasibility considerations.

Q2 The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

What are your views on the setting of targets in batches from 2010 to 2022?

SEPA supports the setting of targets in batches. Given the length of the first batch, it is important that not only are the targets credible but also crucial that they are as stretching as possible to avoid possible carbon lock in.

Q3 The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

SEPA notes that there are lead-in times for policies enacted now, but also that there are available measures that could set us on a strong downwards trajectory pathway before 2020. We recognise 3% reduction in the first years may not be attainable, but we need to make sure we don't carry on “business as usual” up to 2020. SEPA is concerned that reductions that could be made prior to 2020 may not occur without strong action.

In line with this, we need to recognise the purpose of the Bill is to reduce the concentration of greenhouse gases in the atmosphere and that earlier action makes this battle a lot easier in the long term. The sooner we start moving towards a low carbon economy and implementing measures that are making a sizeable contribution to emission reductions, the easier it will be to achieve the 2030 and 2050 targets.

Scottish Government’s technical note highlights a scenario up to 2020 that continues on the same pattern as we have done since 1990, rather than increasing the emissions reduction pathway. It is worth stating that such an approach, whilst not being proposed, approximates to only 1% annual reductions, and is completely inadequate.

Emissions reductions since 1990 have not always been attributable to mitigation measures and so to continue on this same pathway could be considered “business as usual”. For example, the decline of the manufacturing industry in Scotland has seen a decrease in Scotland’s emissions but not necessarily global emissions.

Q.4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

The net Scottish emissions account is an ideal concept to use as a point of reference against which the target for reducing greenhouse gases can be measured. SEPA welcomes the establishment of a carbon account for the tracking of carbon units and maintaining a database. SEPA has experience in this area as the body that enforces and administers the EU Emissions Trading Scheme (EU ETS).

As detailed in SEPA’s Bill Consultation response, SEPA believes that there should be limits on credits used by Scottish Government in meeting Scottish targets. SEPA recognises that it would be in contravention with the EU ETS to set a limit that applies to the traded sector before they have purchased international credits and therefore the limit should apply to the net Scottish emissions as a whole after the traded sector have been added to the Scottish emissions account.

International credits used for the net Scottish emissions account should be purely supplementary and applying limits is therefore a necessity. SEPA proposes a limit of one fifth of emissions reductions to ensure that efforts are focused in Scotland. This would strengthen the transition to a low carbon economy and energy efficiency measures and encourage investment in mitigation measures in Scotland.

Q5 The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

SEPA feels this is an accurate view of production emissions for the purpose of the target. However as Scotland’s influence goes far wider than the boundaries outlined as the definition of Scottish emissions, we would like to see provisions in the Bill for parallel reporting on consumption emissions. An end user inventory could illustrate the influence that Scotland’s domestic demand and imports has on international emissions. This could be made up of heat, electricity, transport, goods and services.

This would not only help with communication but also look at the influence that Scotland has on global emissions, for example, by looking at the impact of the steel we import has on emissions, the impact of the plastic goods we import and therefore provide at least an estimate of our influence on emissions globally. A key delivery challenge for this is to ensure the availability of acceptable data at an appropriate level from other countries.

Q6 The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government’s approach to obtaining independent, expert advice on climate change?

SEPA supports Scottish Government’s approach to obtaining independent, expert, advice on climate change.

SEPA also believes that there may be merit in exploring the potential for a body to undertake a wide ranging review of the impact of regulations and policies on climate change policy. A ‘Scottish Climate Change Regulatory Review Commission’ could actively invite submissions from stakeholders to identify inadequate, contradictory or outdated provisions. Such approaches have been used across a wide range of policy areas and have the advantage of allowing a transparent, consultative and considered approach. SEPA has in mind the sorts of processes used for the Hampton, Macrory and Davidson reviews (better regulation), the Crerar review of scrutiny, and so on.

Q7 The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

Reporting is clearly a key element of the policy cycle, as good performance reporting drives better performance and more timely intervention where required.

Many of the reporting requirements that SEPA called for in its response to the consultation have been incorporated, however, climate change science with a particular focus on Scotland (for example emissions for peat systems), could also be reported.

In the original Bill consultation there were three levels of duties proposed: advisory, monitoring and reporting/evaluation. However, direct monitoring no longer appears to be addressed on the face of the Bill. SEPA is also concerned about the lack of integration between monitoring from local authorities, the Scottish Government, SEPA and other reporting agencies. It is not clear that current climate change monitoring and reporting frameworks do in fact provide the necessary framework within which policy consequences can be explored.

In SEPA’s view, therefore, there is need to establish a more detailed, faster and more accurate picture of emissions of climate gases within Scotland in order to assist with planning, and meet increased demands for scrutiny. SEPA believes that this will need to involve both increased physical monitoring and assessment of some gases (e.g. nitrous oxides) and an increased capacity to assemble, verify and publish data.

This approach would also contribute to a more detailed understanding of the progress towards the targets and impacts of policies and other mitigation measures on greenhouse gas emissions. As a result this would lead to more robust and detailed reporting.

SEPA would be happy to respond further on the responsible body for this duty. In our response to the Bill consultation, SEPA put itself forward as the appropriate body for such a task. This was on the basis that, SEPA has carried out similar roles in measuring, assembling, verifying and publishing data, for example Waste Data, Scottish Pollutant Release Inventory (SPRI) and the EU ETS. However, clearly a debate is needed as to which body is best placed to carry out this task- from SEPA’s perspective it is difficult to see an alternative body that could logically carry out the task.
SEPA recommends the inclusion of provisions in the Bill to improve the measuring and estimation of emissions, verification and publishing of data, and a power for Scottish Ministers to require other organisations to cooperate with the central measuring/monitoring body.

Q8 The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

Statutory Provisions

SEPA fully supports the proposals in Part 4 and feels that statutory duties on the public sector (including central government directorates) should be part of the way forward in tackling climate change in Scotland. In particular SEPA feels that the duty should be placed on public bodies now, as part of the Bill, with statutory guidance on the meaning of the duty to be developed in due course.

Not only should the public sector lead by example but also the extensive influence that the public sector has on emissions via its own decision making should be recognised. Analogous voluntary agreements in the private sector and voluntary commitment in the public sector have been shown to deliver little more than business as usual in many cases.

Taking account of the carbon impact

As recognised above the public sector and government have a huge influence through their decision making on carbon emissions in Scotland (often referred to as indirect emissions). We are very much at the beginning when it comes to taking account of the carbon impact of policy decisions but there are some good examples of where progress is being made in this area. As our knowledge and skills develop in this area, provisions in the Bill requiring public bodies to take account of carbon impact in their procurement, policy and regulatory decisions would set us firmly on the pathway for reducing emissions and setting up a low carbon infrastructure to which we can build upon.

In addition, SEPA considers that there might be merit within the limits of devolved powers in placing a duty on regulators (including possibly SEPA, SNH, HSE, FSA, Marine Scotland, local authority regulatory services, Audit Scotland, CAA, Water Industry Commission and OFGEM) to consider carbon impact as part of their statutory duties. With regard to SEPA’s own regulatory functions, further provisions could be added to part 5, to amend the Environment Act 1995, to require SEPA to take account of climate change for all its regulatory decisions. Clear, consistent guidance on how to approach this would be needed and could be developed by the regulatory bodies in partnership with the Scottish Government.

Just as importantly, SEPA considers there should be specific duties on planning authorities and community planning partnerships to ensure that they consider greenhouse gas emissions in planning and policy decisions. The initial step in the majority of developments and redesigns is a planning application. Continually reducing emissions will be best achieved by adequately considering emissions at this stage. SEPA is already working with Scottish Government and the other responsible authorities under the requirements of Strategic Environmental Assessment (SEA) to improve the consideration of greenhouse gases at this stage in the process.

Q9 The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on this proposal?
SEPA note that there could be more pieces of legislation in addition to permitted times for muirburn that may require amendments in order to allow for adaptation to climate change impacts. A provision in the Bill recognising that as we develop our understanding and knowledge of climate change impacts we may need to amend other legislation would be useful.

Also, provisions could be included to amend the Water Environment and Water Service (WEWS) Act so that it is a statutory requirement to consider and report on adaptation under the WEWS Act, e.g. Wetlands Strategy and River Basin Management Planning (RBMP) in terms of adaptation.

SEPA feels that the section on adaptation should make a specific reference to sustainable development so that social, economic and environmental factors are all considered.

**Q10** Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

*What are your views on this proposal?*

SEPA has no specific comments to make on the muirburn proposals. However, as elaborated below, SEPA notes the vital importance of effective management of Scotland’s soil carbon resource in mitigating climate change.

SEPA’s view is that land management practices should aim for positive carbon impacts (or at least carbon neutral) and should aim to improve the resilience of Scottish soils in this respect.

**Q11** The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

*What are your views on this proposal?*

SEPA responded to the separate consultation on forestry provisions in the Climate Change Scotland Bill and our key points on the consultation on forestry provisions were:

- It is important that the provisions ultimately lead to helping Scotland achieve its climate change targets through a net reduction in carbon emissions.
- Renewable energy developments and woodland creation cannot be successful in isolation. Scotland must integrate a variety of mechanisms including: minimising woodland removal, conserving forest carbon stocks by low impact silvicultural systems, identifying core networks/areas to maintain biodiversity, establish energy crops, woodland creation and environmental protection through processes.
- In considering the consultation, SEPA would have welcomed more detail on the proposals and possible implications. For example, the consultation mentions remedying weaknesses in existing forestry legislation – it would be useful to have these weaknesses fully laid out in the consultation.
- Without an overall quantified carbon assessment of the proposals, SEPA has found it difficult to judge the merits of the proposals, and therefore restricted its comments to identifying issues for clarification/resolution.
- With the underlying objective being to help achieve the emissions reduction target in the Scottish Climate Change Bill, we would encourage conditions on the lease so that operators are required to take account of carbon impact.

Q12 The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?

It appears that the Bill could be unintentionally weakening Energy Efficiency legislation. The Climate Change Bill repeals terminology in the Housing Act 2006 to improve energy efficiency whereas the Climate Change Bill looks to promote energy efficiency.

SEPA would also like to draw the committee’s attention to SEPA’s response to the Economy, Energy and Tourism Committee’s call for evidence on determining and delivering Scotland’s Energy future. SEPA noted that measures to address energy demand for existing building stock will need to be addressed. Also, we are still seeing major public developments (hospital and schools etc) basing decisions on building costs (now) rather than future costs of carbon, resulting in the wrong boiler type or heating system and inadequate energy efficiency standards. The cost of carbon must be incorporated into the design, planning and decision stage of building projects. SEPA would like to see the provisions in Section 48, 49 and 50 reflect this need.

Q13 The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government’s thinking in this area.

What are your views on this approach?

No comment.

Q14 The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

What are your views on this proposal?

Key messages:

- Promotion and support could extend to the promotion of waste heat from fossil fuels use (working with the UK Government where appropriate).
- There is need to go further than ‘promote’ and to explore opportunities for improved coordination between key actors, use of the planning system and application of best practice standards to underpin the direction of the draft framework for the development and deployment of renewables in Scotland (includes Scottish Action Plan on renewable heat) and SEPA’s Thermal Treatment guidelines.

Waste heat

SEPA welcomes the provisions that Scottish Ministers must take steps to promote the use of heat from renewable sources. Promotion and support could also be expanded to cover the use of waste heat produced by fossil fuel power stations and other industrial processes. SEPA also highlighted this issue in its response to the Economy, Energy and Tourism committee’s call for evidence for determining and delivering Scotland’s Energy Future. SEPA explained that Scotland requires a huge and sustained increase in its ability to utilise heat from renewable sources as well as waste heat from industry, power supply and thermal

---

26 [Link no longer operates] SEPA’s Thermal Treatment Guidelines approved by the Agency Board 10th February 2009. Papers for the meeting page 67 to 110.
Legislation to underpin waste heat and use of renewable heat policy

Scotland’s Renewable Heat Strategy: Recommendations to Ministers\(^{27}\) recognises that there are particular opportunities in Scotland because of the extent of areas off the gas grid, and the existence of clusters of potential heat demand and existing waste heat or potential renewable heat sources.

SEPA’s Thermal Treatment of waste guidelines set out the approach that SEPA will take in planning responses to, and licensing of, waste treatment facilities. The thermal treatment guidelines note that the location of thermal treatment facilities needs to consider the future use of waste heat, as an integrated network of facilities will ensure energy from waste is recovered efficiently.

“SEPA recognises that Scotland does not yet have mature or extensive heat-use networks. However, there are immediate opportunities for reliable and extensive heat use by co-locating thermal treatment plants with existing energy and heat intensive industries, or near to public developments such as leisure complexes and shopping centres. Another alternative is to develop facilities in areas with the potential for the co-development of heat-using industries. Low grade heat could be a driver for the development of eco-industrial parks, with a focus on waste treatment, reprocessing and manufacturing using waste materials, renewable energy production and local food production.”

Regulators, government and the renewables sector need to work more closely together to ensure the development and application of best practice industry standards and methods of working. Scottish Ministers and Planning Authorities (working with the UK Government where appropriate) have a central role in putting in place mechanisms to increase the use of waste heat and renewable heat sources. Scottish Ministers will need to interact with the Planning System to take steps to increase the use of heat from renewable sources and the utilisation of waste heat.

Q15 The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas:
Waste prevention and management plans;
Waste data;
Deposit of recyclable waste;
Procurement of recyclate;
Reduction of packaging;
Deposit and return schemes;
Charges for carrier bags.

What are your views on these proposals?

With reference to the objectives of the Climate Change Bill, SEPA believes that there must be concrete evidence that the waste provisions provide an overall carbon benefit. SEPA would therefore advocate that a full life cycle assessment and carbon impact assessment is carried out in detail before the implementation of each waste provision to ensure they contribute positively towards the overall 80% emissions reduction target.

SEPA gave oral evidence at the Rural Affairs and Environment Committee on 4\(^{th}\) February and also submitted a consultation response\(^{28}\) in October 2008 to the consultation paper on potential legislative measures to implement zero waste.

Further to this, Section 58 of the Climate Change Bill as could expand so that it covers

Transport, Infrastructure and Climate Change Committee, 2nd Report, 2009  
(Session 3) – ANNEXE C

products as well as packaging in deposit return schemes.

A simple but effective example of the benefits of a more flexible approach would be energy efficient light bulbs (one could list many other products that are potentially problematic from an environmental resource and carbon impact perspective e.g. mobile phones and batteries). Energy efficient light bulbs will hit the waste stream in their millions in a few years and therefore provisions for an incentive to the public could help recover their metal, glass and plastic content as well as keep their mercury content, albeit low, out of landfills and energy from waste systems.

SEPA suggest the following approach to widen this potentially useful instrument:

- Make the powers general to any products and inclusive of packaging.
- Ensure the powers can be used for full or partial refund schemes. This will enable either, a full refund on return approach, or a partial refund and part subsidy for recovery approach, which for some potentially hazardous household wastes may be necessary. This is not an uncommon approach to deposit refund schemes. Care would be necessary to ensure retailers cannot pocket part of the deposit. A central clearing house approach would avoid this.

There are clear opportunities to ‘close the loop’ in terms of ensuring that a waste material can be used as the input fuel or raw material for other processes, either within the same overall manufacturing process, or as a valuable raw material for another organisation. This can be achieved one of two routes: (1) within a tiered, proportionate regulatory system that reflects the risks associate with a particular waste or end-use, or, (2) where a case can be made to show that the use of waste materials is no worse than the non-waste equivalent for the environment and human health, as a new product or raw material.

Dealing specifically with the second route, SEPA is relatively unique within the UK as it has provided publicly available guidance on the definition of waste since 2006. Our sister agencies in other parts of the UK are working on their own guidance at the moment but have still not published anything. We supplemented SEPA guidance with specific guidance on the recovery of waste oils in 2007 and it is a piece of guidance around which we have had some success:

- A drilling waste management company recovers waste oil from offshore drilling mud so that is no longer a waste when it is sent for reuse offshore.
- Working with the Quarry Products Association, SEPA published guidance on the recovery and re-use of road planings as a non-waste. This has reduced the costs and bureaucracy for civil engineering contractors and aims to encourage an approach that ‘closes the loop’ on up to 500,000 tonnes of road planings per year.
- We reached a successful end-of-waste conclusion for a company manufacturing biodiesel from used cooking oil and animal rendering wastes. Smaller biodiesel manufacturers are likely to benefit from a change in legislation in 2006 (i.e. an exemption from the requirement to hold a waste treatment licence) to allow small scale manufacturing under certain conditions.
- We are currently working with the Scotch Whisky Association on a framework document which looks at the reuse of outputs from distilleries in a range of activities, including their use as fuels, animal feed and soil conditioner.
- We are working in partnership with the Civil Engineering Contractors Association to develop guidance on the end-of-waste for clean soils from Greenfield sites.
- We are working with Scottish Power and ScotAsh to consider end-of-waste cases for the uses of the various waste ash streams from coal burning power stations.
- Working with the Quarry Products Association to see whether we can, on the basis of an end-of-waste case, allow the use of recovered waste oils as fuel in roadstone coating plants without requiring compliance with the EU Waste Incineration Directive.

Q16 What are your views on the adequacy of the Scottish Government’s consultation in advance of publishing the Bill?

The 12 week consultation period provided ample opportunity for SEPA to consider the proposals for a Scottish Climate Change Bill. SEPA organised several internal seminars to discuss the proposal and SEPA’s response was also considered by the SEPA Board in April
Q17 Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government out on the consultation proposals?

In our response to the Strategic Environmental Assessment Environmental Report consultation, SEPA welcomed the undertaking of a Strategic Environmental Assessment on the Scottish Climate Change Bill consultation and considered it to be a very comprehensive document that covers the issues in considerable detail and, importantly, identifies a comprehensive range of SEA mitigation measures.

In its original comments, SEPA recommended that a simplified report was prepared to support the introduction of the Climate Change Scotland Bill to Parliament which clearly sets out the key findings and SEA mitigation measures. SEPA noted that this would help inform decision making on the Bill as it progresses through Parliament; such a note was published on 23rd December 2008.

Q18 Does the Bill raise any equalities issues you would wish to highlight?

No comment.

Q19 Do you have any comments on the impact of the Bill on sustainable development?

SEPA believes that, taken as a whole, the provisions and policies to meet the targets should make a strong contribution to sustainable development. The advisory mechanisms established via the UK Committee have, as part of their definition, a requirement to take account of economic, social and environmental issues.

However, the same does not appear to be the case for adaptation measures. Adaptation measures should consider the social and economic impacts as well as the environmental impacts and there may be a case to re-examine section 45 of the Bill.

Q20 Do you have any other comments on the Bill?

SEPA sees the Bill as setting the framework (Part 1 - 3) but also facilitating the move towards the ambitious targets required. Part 4 tackles the huge amount of emissions influenced by the public sector and Part 5 could therefore possibly expand to include provisions for mitigation measures in other more carbon intensive sectors.

There are further key areas that Part 5 of the Climate Change Scotland Bill could address.

The transport and agricultural sectors make key contributions to emissions. To reduce emissions from vehicles, there is a need to promote sustainable transport and take into account the carbon impact of new transport infrastructure decisions.

In agriculture, this could particularly look at mitigation measures for methane and nitrous oxide and the need to protect carbon content of soils.

A paper published by National Grid in January 2009, The Potential for Renewable Gas in the UK, noted substantial opportunities from biogas. One of the two main biogas processes is anaerobic digestion. SEPA wishes to see a major drive to stimulate appropriate sectoral and on-farm anaerobic digestion utilising both farm wastes and other sources of waste biomass. This could provide a significant contribution to a decentralised micro-generation energy system as well as diversification for the agricultural sector.

Scotland’s per capita water consumption is increasing in contrast to consumption patterns for other developed countries. Supporting measures to require and/or enable more effort to reduce water demand and improve water efficiency across all sectors would help reverse recent trends for increasing energy consumption associated with the supply of clean water and disposal of wastewater.

SEPA has initiated a discussion with Scottish Water concerning future energy use, recognising the importance of this issue to mitigating climate change. It is clear that existing
regulatory needs and drivers will drive increased energy use in water and sewerage management in future, which are incompatible with climate change targets. It is SEPA’s view that radical solutions will be needed in future to avoid this materialising.

The Climate Change Bill should recognise the importance of Scotland’s carbon rich soils, and the need for their effective management. Scotland is in a unique position with a large amount of carbon in peatlands that needs to be protected and managed sustainably. Given the significance of carbon stores to Scotland’s carbon budget (our present carbon “store” is estimated as equivalent 200 yrs of present emissions) it seems reasonable for Scotland to legislate to protect these stores.

Given the sheer scale of the potential greenhouse gas emissions from land, there seems to be a gap in the range of powers and duties on public bodies to ensure effective management and protection.

Scottish public bodies already have a duty to further the conservation of biodiversity under the Nature Conservation (Scotland) Act 2004 and this would seem to allow Scottish Government to require the sustainable management of peatland via further guidance.

There is an opportunity in the Climate Change Bill Part 5 to emphasise the importance of the carbon stores by including provisions that ensure public bodies consider carbon explicitly when carrying out their duties in protecting Scotland’s soils.

Another way forward may be the inclusion of a duty on Scottish Ministers to issue a national carbon strategy for both peatlands and Scottish soils. The Bill could also include provisions for a statutory consultee in the planning process for soil carbon issues, and provision to enable a body to be given regulatory powers if necessary to ensure effective, sustainable management of soil/peatlands carbon.

---

29 Bradley et al. (2005) stated that Scotland’s soils contain an estimated 2196 million tonnes of soil carbon, to a depth of 100 cm, compared to a total of 4566 million tonnes for the whole of the UK.
Scottish Water Response to the Call for Views on the Climate Change (Scotland) Bill by the Scottish Parliament Transport, Infrastructure and Climate Change Committee

Introduction

We welcome the opportunity to provide evidence to the Committee on the proposed Climate Change (Scotland) Bill. During 2008 Scottish Water issued a detailed response to the consultation on earlier proposals for this bill setting out some of the challenges for the water industry in addressing climate change.

We are pleased to see additions to the current bill that take account of the need for adaptation. We believe that it is useful and necessary for both adaptation and mitigation to be considered together within the bill. The Flooding Bill promotes multi-agency approaches and surface water management planning and is an example of the sort of partnership approach across wider aspects of climate change adaptation – the requirement to produce a programme must be seen in the context of partnership.

General Statement

We are fully supportive of the aims and ethos of the bill. We understand the scientific basis on which the targets are decided and also the moral responsibility for developed nations to demonstrate leadership on this issue. Our vision is that Scottish Water always demonstrates responsibility in delivering its duties.

The water industry is at the forefront of climate change. We depend on a healthy environment for reliable, good quality water to treat and supply to customers. Further, we act to protect the aquatic environment by treating and safely returning society’s wastewaters without causing flooding or pollution. A changing climate challenges the provision of these services.

In respect of carbon it must be recognised that the water industry is an energy intense sector. The challenge of meeting public health and aquatic environmental quality imperatives has seen a step change in technology in recent years with the advent of tertiary wastewater treatments, membrane technologies and UV disinfection.

Rising Energy Demand

It is estimated that the £4bn we will invest between 2002 and 2010 to meet service, health and aquatic environmental imperatives will increase energy demand by 2.5% per annum. However, backtracking on quality is not an option. We need a good quality environment and we are a critical service supporting a healthy Scotland.

Legislators in Scotland and Europe collectively need to recognise that future quality enhancement must be balanced by holistic assessment of the net benefit or cost. Local enhancement must be considered in the context of the global impact from potential emissions increase.

There is a need for a full review of legislation written in a “pre-carbon” era to identify unintended carbon consequences from EU, UK and Scottish Law. Full carbon assessment should be demanded of all new legislation. Implementation of legislation must consider the wider impact and whether there are policy mechanisms etc by which carbon can be mitigated.

A Scottish Water Climate Change Strategy

Our strategy commits us to be proactive on behalf of customers, to seek to understand the impacts and secure service in a changing climate and to contribute appropriately to carbon mitigation by reducing our energy demand, becoming more efficient and generating renewable energy.
On adaptation we have taken steps to identify the work that will be required to properly assess the risk and respond appropriately. Our intention is that prior to physical investment we will work in partnership with others to understand the service risk, the timeframe over which impacts may be felt, and the response necessary to secure service. This will ensure we commit expenditure as efficiently as possible.

On mitigation, Scottish Water is committed to carbon management and to the production of annual footprint reports of operational activities. Our current footprint is circa 470,000 tonnes CO₂ equivalents. We have been a leading influence on the development of carbon assessment tools in the water industry, in particular to examine emissions associated with investment planning.

We are presently exploring tools that will support the assessment of the “whole life” carbon impact associated with investment planning. This may help ensure that future decisions properly accommodate the need to report, manage and reduce carbon.

We generate up to 5% of our electricity demand from renewables (predominantly hydro), and have assessed our capacity to increase this as part of our mitigation measures. We are currently developing a ‘Carbon Attainment Plan’ that seeks to identify the contribution that each part of Scottish Water needs to make towards managing carbon – making carbon part of ‘business as usual’.

Specific Points

The 2050, and interim 2030 carbon targets

We recognise the scientific basis on which the 80% reduction is predicated, and agree that a trajectory to achieve 80% by 2050 requires a challenging interim target. To do otherwise risks back loading action on emissions reduction, increases the risk of failure to achieve the target and allows a greater net emissions over the period. For this reason, it is sensible and right to introduce an interim target that would allow all sectors to begin planning their carbon management approaches.

We believe that a genuine multi-agency approach is required to agree and secure the necessary actions and funding to deliver emissions reduction cost effectively across all sectors of the economy. To do this will require significantly increased focus on the carbon abatement costs across the economy in order that attention may be focussed on areas where there is greatest opportunity and efficiency.

Annual Targets and Carbon Budgeting

The setting of annual targets that are appropriately scoped and costed presents a significant challenge to Scottish Ministers. This builds on the issue raised above, namely that greater clarity is required on the ability of the Scottish economy to make emissions reductions that will both contribute meaningfully to the long term goals, and do so in a manner that is both cost effective and equitable.

During our earlier consultation response, we expressed the view that clear budget periods over 5 years, with sufficient lead time would be necessary, and that a degree of flexibility in balancing budgets is required. This is because our industry has extremely long lived assets, 8 year objective setting periods and 4 year regulatory investment plans. We need sufficient sight of budgets and the implications for Scottish Water in order to make appropriate plans. The ability to vary targets annually, along with the significant work required on cost effectiveness brings a degree of uncertainty to the process.

Annual targets offer a useful profile within a budget period, but we believe it is more important to produce longer term budgets that will cost-effectively drive the right opportunities and contribute to the overall trajectory of emission reduction.

Public Sector Duty

The public sector is a diverse range of organisations with differing carbon impacts and reduction opportunities. It is imperative that we consider (1) emissions associated with a public body in delivering its duties, and (2) emissions from third parties that are ‘caused’ by
the public body – the public body’s unintended impact on carbon in the wider economy through policy, legislation, planning decisions etc.

With respect to the operational emissions of a public body, an appropriate duty would require organisations to report carbon performance regularly, and develop carbon management plans that demonstrate how carbon is being ‘mainstreamed’ throughout its operational practices. Such a plan may be submitted for approval by the sponsor unit which would itself have a duty to mainstream carbon thinking across its remit. Periodic review of progress against the plan may then follow.

It is unrealistic to expect all public bodies to default to the same trajectory as the proposed targets. This is because each body will have a different mitigation capacity. The key focus must be on cost-effective reduction to ensure that tax and water charge payers get value for money for carbon abatement.

With respect to the carbon consequences of legislation, policy or decisions made by public bodies we believe there should be a duty to consider how, in the course of its activities, seemingly unrelated policies or decisions may drive unintended carbon consequences elsewhere in the economy.

Carbon management is interconnected with all parts of the economy and a multi-agency approach with government, regulators, authorities, NDPBs etc, to take account of the degree to which their decisions impact carbon emissions.

We believe that building the right carbon management tools to encompass whole life costing of carbon will allow us to see the most cost effective means by which carbon could be reduced. Added to which, proper evaluation of the capacity and cost efficiency of investment in renewables across public sector and cost efficiency will enable the identification of suitable carbon mitigation goals.

**Adaptation**

We are pleased to note the provisions for laying a programme for adaptation before Parliament. We believe that only through multi-agency partnerships particularly those associated with critical national infrastructure will we successfully integrate policy and action towards securing a well adapted Scotland. We are committed to continuing to work with Government and stakeholders toward achieving this.

**Waste Management**

Through our waste management facilities in our non-core business “Scottish Water Horizons” we have significant green waste composting and recycling capacity that we are looking to expand. We believe that there is scope to streamline the regulation surrounding such activities to promote sector expansion and the inclusion of carbon beneficial activities such as Combined Heat and Power units.
The Convener: This is the final evidence session in our stage 1 inquiry. We have heard from a large number of witnesses during the past six meetings. Today, we have the opportunity to put questions that have emerged from those discussions to the Minister for Transport, Infrastructure and Climate Change, Stewart Stevenson.

I will break down the session into two parts: first we will consider parts 1 to 4 of the bill, section 45 on “Programmes for adaptation to climate change”; and part 6; then we will concentrate on the provisions on forestry and waste in part 5. We will consider the provisions on energy efficiency in chapter 3 of part 5 when we receive a report from the Economy, Energy and Tourism Committee, which has been considering the matter in detail.

I welcome the minister and his Scottish Government officials: Philip Wright is deputy director of climate change, Fiona Page is head of the bill team, Cameron Maxwell is adviser on climate change policy and Madeleine Cusack is a policy officer on climate change adaptation.

Before we get into the nuts and bolts of the bill, I will ask a general question. How has the Government sought to get its house in order on climate change emissions? To what level have the Government’s emissions been reduced and what plans does the Government have to cut its emissions further, given that it has a key role in setting a good example when asking for substantial long-term reductions from the country as a whole?

The Minister for Transport, Infrastructure and Climate Change (Stewart Stevenson): The carbon reduction commitment largely encompasses what the Government has been doing and will do in the future. A carbon accounting tool is under development to ensure that we are able to carbon proof everything that we do in government to a detailed level. A number of things have been happening since the previous Administration was in office, which we have continued, in relation to how we compensate for some of our travel.

We have done some simple things. For example, at Victoria Quay, in Leith, we have installed an electronic board that shows when the buses are coming. As a result, as a team, we were able to tailor our travel here from Victoria Quay, because we knew that the bus that we were due to
catch—the number 35—was, of course, running on time.

We have also done quite a lot of work on the adaptation sector. We are facilitating discussions with the Scottish Environment Protection Agency, Scottish Natural Heritage, the Forestry Commission Scotland and Historic Scotland. We are working with local authorities on planning for extreme weather events, among other things. The climate change adaptation framework that we are developing has taken input from right across the Government. Also, the strategic board of the civil service has a shared responsibility to ensure that we have buy-in across all the Government’s activities.

The Convener: Are you able to put a figure on the reduction in emissions that the Government has achieved from within its own operations?

Stewart Stevenson: Not at this stage. However, the carbon balance sheet that we are developing will enable us to start to measure that in a way that makes sense and gives us credible figures for our accounting.

The Convener: Do you expect to have those figures before the bill is passed? By taking the lead, the Government can help to promote confidence among the wider public that long-term reductions are not only achievable but are already happening in Scotland.

Stewart Stevenson: You will forgive me for saying that when the bill will be passed is in the hands of Parliament, although there is a shared expectation that that should happen during the current calendar year and sooner rather than later. We will not have completed all the work that I have described within that timescale. However, people should take as earnest of the Government’s good faith the approbation that we have received from WWF Scotland, which has said that the bill is the most ambitious climate change legislation in the world. The process has seen the Government work with all strands of political opinion in the Parliament to common strategic purpose. Our debates and discussions are essentially taking place at tactical levels and do not show us deviating from the core direction in which we seek to move. In general, in everything that we do, we will seek to mainstream—to pick up a word that has been used in other contexts—consideration of the carbon effects of the initiatives that we take.

The Convener: Let us move on to the development of the bill. The formal consultation process followed a degree of informal dialogue with a range of stakeholders. Even now that the consultation has closed, I am sure that the Government is open to arguments from others as to the direction of its policy and the legislation. How have non-governmental organisations, the business community and public sector bodies, for example, been involved in that process since the bill’s introduction?

Stewart Stevenson: You qualified your question by saying, “since the bill’s introduction”. I would like to go back a bit further than that, if I may. The second engagement that I undertook as a minister—which I think was in the week beginning 20 or 21 May 2007—was to engage with the business community on the subject of climate change. The first engagement that I undertook as a minister, across the whole range of my responsibilities, was to engage with the scientific community on the subject.

We meet a range of NGOs regularly. I think that I met Stop Climate Chaos last week. I am getting a nod from my officials—it is sometimes difficult to remember in which week meetings took place. We had useful discussions with Stop Climate Chaos. I know that Mr Swinney has met other representatives of NGOs since then.

Engagement is a continuous process. You are quite right to point to the Government’s willingness to continue—up to 2050, one hopes—to engage with NGOs and a wide range of stakeholders to ensure that, as our scientific understanding and the observational data on what is actually happening to the climate as a result of our and other people’s interventions increase, we continue to modify what is happening.

Last week, I met the climate change business delivery group and Scottish Business in the Community hosted a May day network event in the Parliament. I believe that something of the order of 140 companies have signed up to that initiative so far, and last week’s event was geared towards increasing that number.

That is by no means a complete statement in response to your question, but I hope that it illustrates the activity and the general willingness on our part to continue to engage—and we are not finished.

The Convener: Since the closure of the formal consultation, and more particularly since the bill’s introduction, what impact have those discussions and engagements had on the Government’s intentions for shaping the bill?

Stewart Stevenson: I am in the committee’s hands as to how we approach this subject in detail. In a number of areas, we are looking to respond to the consultations with changes to the bill at stage 2 and further consideration of issues that we might pick up. Of course, the various committees have helped us to consider which areas of the bill could be sharpened. For example, on aviation and shipping, the bill currently states that the minister “may” do something, but it has been suggested that the bill should more properly
say that the minister “must” do something. We are actively considering making that change. That is merely one example; I am sure that we will come to others as we go through the bill.

The Convener: Thank you.

You mentioned the stage 2 process. It has been stated that the Government intends to lodge amendments at stage 2. I gather that you have expressed a general willingness to give further evidence to committees at stage 2, if that proves necessary. What amendments do you intend to lodge and do you expect any additional policy areas to be incorporated?

Stewart Stevenson: We are not currently considering incorporating additional policy areas, but we remain genuinely engaged. Nothing has emerged on that front so far. We have not completed our consideration of the stage 2 amendments that we will lodge, so I cannot give you a complete run-down of where we will get to. I think that, properly, you would expect me to say to the committee that we will, of course, engage with the committee and ensure that you are aware of our intentions at the earliest possible moment.

The energy efficiency of living accommodation is one area where we are considering making a change. Concerns have been expressed to me about the use of the word “promote” as against the word “improve”. We are looking at upping the ante to ensure that there is no ambiguity that could lead to people feeling that we want to dilute commitments that were made in the Housing (Scotland) Act 2006. We expect to lodge an amendment at stage 2 to address that point, so that there is clarity and certainty about the bill’s provisions.

14:15

The Convener: In debates in Parliament, the Cabinet Secretary for Finance and Sustainable Growth has indicated that he is open to the idea of a legislative commitment on a 10-year domestic energy efficiency programme. Is the Government still looking at that?

Stewart Stevenson: We are still looking at it.

The Convener: Thank you.

Members have a number of questions about the targets in the bill, the first of which is the target to reduce greenhouse gas emissions by 80 per cent by 2050. The Government set that target before the United Kingdom Committee on Climate Change was constituted even in its shadow form. What in-house scientific analysis was used to generate that target? At the time, some people argued for a lower target of 60 per cent, whereas others argued for a target of more than 80 per cent. What was the scientific basis for the target? Is it still the latest scientific analysis?

Stewart Stevenson: I have a couple of comments to make on that subject. The 80 per cent target came in with the Government—it was a manifesto commitment. I was not the spokesperson on climate change at that stage, but I think that, as a political party, we took the best advice that we could. It is important that I point to scientific advice because in government—you will have heard me say this elsewhere—we want to ensure that we are driven, both on targets and on other matters, by scientific advice and that we do not impose political overlays that seek to challenge that advice.

That is this Administration’s approach as we set off on the journey to 2050. As I have said before, I will be 104 in 2050, so there is a faint chance that I might not be the minister then. We need an approach that will survive changes of Administration and changes of minister. That is why we have taken the principled approach of being driven by scientific advice.

We are talking generally about the subject of targets. As you will be aware, as well as providing for an 80 per cent reduction in greenhouse gas emissions by 2050, the bill provides for the meeting of an interim target by 2030. It now appears that 2020 would be a more appropriate date for an interim target, so we are very likely to amend the bill on that basis. The 2020 target that we are likely to end up with on the basis of scientific advice—we have not yet come up with an exact figure—is likely to be more challenging than the 2030 target that we put as a minimum in the bill. That is an example of how we are responding.

The process whereby the UK Climate Change Bill started off with a 60 per cent target but ended up with an 80 per cent target was driven by the science. By the same token, we expect the targets in our bill to be driven by the science rather than by potentially short-term political considerations.

The Convener: It is useful to know that you are open to bringing forward the interim target and increasing the reduction in emissions that will have to be achieved. When will you be able to announce the new target? Will we simply have to wait for stage 2 amendments to be lodged to find out what the Government’s intentions are?

Stewart Stevenson: We would like to give the committee the maximum certainty on as many of the changes that we plan to make at stage 2 as we can, so that they can be taken into consideration as you prepare your stage 1 report. In other words, we will seek to give you the most up-to-date position that we can so that it can be reflected in your report. The final position will
probably not be determined until April, and there might be issues that we are unable to bottom out. In some cases, complicated legal drafting will have to be undertaken, whereas the position in other cases will be more straightforward and we will be able to provide an earlier indication of our proposals. It is certainly our intention to work with the committee and to give it as much information as we can as early as we can. We expect to change the 2030 figure, but I am not yet in a position to tell you what the new figure will be. There is no doubt about whether we will change it—we intend to do so.

The Convener: I understand your current position, but you will be aware that, as soon as you have finished giving evidence to us today, we will start to discuss our general approach to the stage 1 report, which we will draft over the coming weeks. If you are unable today to give us a clear timescale for the announcement of decisions, will you be able to do so in writing over the next few days?

Stewart Stevenson: Absolutely. However, you should not imagine that there will be a single decision on a single day. We will make a series of decisions, and some of the simpler ones will be announced early. Clearly, it is not in our interests for the committee not to have the fullest possible information about our intentions at stage 2, but I am seeking to manage expectations about whether we will be able to tell the committee everything that we plan to do at stage 2 in time for its report. My approach is intended to be helpful; I hope that you see it in those terms, convener.

The Convener: I note the position and look forward to seeing the timescale. I am sure that when members come to draft the report they will want to reflect on the issues in light of the facts that are and are not available to them. Clearly, it would be helpful for them to have as many facts as possible when doing so.

Stewart Stevenson: The committee’s first substantial discussions on the report’s content are likely to take place next week. We will seek to give members an update in time to allow them to take account of it in those discussions. However, I repeat that that update is not likely to represent the whole and final story. We are happy to work as a team with the committee clerks to ensure that we synchronise our efforts to the extent that we can.

Shirley-Anne Somerville (Lothians) (SNP): My first question is about cumulative emissions. We heard a lot of good evidence from the Tyndall centre for climate change research about the importance of taking early action to ensure that we cut our emissions as quickly as possible. One issue that the Tyndall centre highlighted was cumulative emissions. Do you intend to monitor and report on Scotland’s cumulative emissions from today onwards?

Stewart Stevenson: Our focus is implicitly on cumulative emissions. I say that because we will set annual budgets, which will enable us to see what will be in the bank from Scotland’s carbon reductions. The trajectory to 2050 will inevitably be lumpy. As I have said elsewhere, there will be a sudden jump when a major coal-fired power station changes technology, for example. There are many uncertainties, but by setting annual targets we will, in effect, be setting targets that relate to cumulative emissions. By the same token, reporting on what is happening will enable us to see how that is affecting cumulative emissions.

We are all aware that reducing emissions is simply a means of delivering control of the increase in temperature. If we postpone all the change to the last year, we will not get anything like the benefit that we would get from more ambitious change on a year-to-year basis. The 2020 target to which I have referred is part of the fairly early action that will get substantial emissions reductions into the budget at an early stage and enable us to start banking some of the cumulative emissions reductions on which we will depend.

Shirley-Anne Somerville: If the measurements are already being undertaken, will annual accounting include clear information on cumulative emissions, or will that be for others to work out?

Stewart Stevenson: Let me make a rather obvious point first: emissions are one thing, but sequestration is another. Sequestration is on the other side of the balance sheet. A range of factors has to be taken into account in understanding how much carbon is no longer in the atmosphere as a result of our action. For example, the increase in forestry planting is extracting carbon dioxide. I do not want to be unnecessarily picky, but the word “emissions” makes up part of the carbon balance sheet but does not tell the whole story.

If people thought that we could be helpful by adding up all the numbers across the reports, and if people felt that such a total would better inform parliamentarians and wider Scotland, it would not be difficult for us to include it in our reporting. We would certainly be open to doing that. In any event, we are already producing the numbers that would enable such a total to be calculated.

Shirley-Anne Somerville: What about the measurement of consumption? The general public can be confused, because they might assume that our emissions have reduced when, in fact, we have simply exported some of our heavy manufacturing and worst polluters to other countries. It might therefore be useful and...
educational if people had a tool for knowing exactly what Scotland is consuming. Does the Government plan to report on consumption?

**Stewart Stevenson:** At the moment, figures are produced on consumption, and they are broadly similar to the figures on our net emissions. Everything is based on working out a national indicator for Scotland’s carbon footprint.

Focusing on two measures simultaneously can lead to a real danger: confusing and conflicting messages can result. We are working internationally to ensure that we all count in the same way, so that we can get a picture for the whole world. Figures on our consumption will deviate from figures on our net emissions. What we propose to do conforms to international practice, in particular to the United Nations Framework Convention on Climate Change. That is appropriate; that should be our focus. We have to focus on the things that we do in Scotland that are responsible for CO₂ emissions.

If Scots consume things while abroad, should that count towards our consumption figures? If so, how could we measure that? It is more straightforward to estimate and measure our net carbon emissions.

**Shirley-Anne Somerville:** I take your point that different figures can appear contradictory. It is often too easy for people to blame developing countries such as China and India for emissions when, in fact, those countries are producing material for our consumption. Is the Government open to considering whether help is available from NGOs that work in carbon footprinting? We might explore that avenue.

14:30

**Stewart Stevenson:** I come back to the general point that we will work with NGOs and others. With divergent figures, there is a difficulty in determining what the Government’s policy and practical response should properly be. That could introduce the real danger of politicians being asked to make judgment decisions rather than rely on the objective, scientific advice that informs ministers’ policy-making decisions and is driven by changing views on how to measure and estimate and how best, ultimately, to deliver on the objective of keeping the increase in the earth’s temperature within certain parameters. Focusing on a single measure for policy and practice gives us significant advantages by decoupling decision making from politics and delivering it back to the scientists. It also enables us to advocate strongly with other countries for a shared basis for action in other jurisdictions throughout the world.

**Shirley-Anne Somerville:** My final question is about sustainable development. It is important that the targets in the bill are met in a sustainable fashion. Has the Government thought about including a sustainable development duty in the bill to ensure that that is the case?

**Stewart Stevenson:** As members will be aware, there are provisions to enable us to take powers over public bodies, which is key in focusing on sustainable development. Sustainable development is key to our maintaining the continuous reduction in our net carbon emissions that is necessary for us to meet our targets, and to meet the budgets that will be published as the legislation is implemented over the period to 2050. We are not alone in that. We need to work with a range of public bodies and local authorities, and to share responsibility with a wide range of other people.

Again, the clarity that comes from focusing on our net carbon emissions gives no place to hide for anyone. There is no great purpose in any sustainable development that increases carbon emissions. Our approach is to have a single purpose and to give no place for people to hide. We will continue to listen to the arguments, but that is where we are for the time being.

**The Convener:** I am a little unclear after that answer. Is the Government considering the option of a sustainable development duty in the bill?

**Stewart Stevenson:** We will consider it further, but we are not yet minded to include such an option in the bill.

**Des McNulty (Clydebank and Milngavie) (Lab):** I am interested in what you said about interim targets, and I want to probe you a wee bit on the substance. If you are considering a 2020 target, how will you determine it?

**Stewart Stevenson:** Using scientific advice.

**Des McNulty:** How will you get the scientific advice?

**Stewart Stevenson:** We will be informed by the first report from the UK Committee on Climate Change and, more fundamentally, by the UK Government’s carbon emissions budget. This is a team game: we are part of the international obligations that the UK Government has signed up to. There are substantial signs that we are working effectively together on that, which will inform our decision on a 2020 target.

**Des McNulty:** How might the target of a 42 per cent reduction in emissions by 2020, which was recommended for the UK by the UK Committee on Climate Change, translate into a Scottish target?

**Stewart Stevenson:** That is the stretch target, and it is predicated on the European Union moving to a 30 per cent reduction target. As yet, we do not know that that will be the UK’s target; there is
scope for more international and national discussion on the subject.

As we have done in relation to other matters, we would like to propose an “at least” target. As I said, it is important that we work with the rest of the United Kingdom on the targets, but we have to get more information on the UK target before we can say how the Scottish target relates to it.

There needs to be a new international agreement. The meeting at the end of the year in Copenhagen—which follows on from the meeting in Bali and, to an extent, the meeting in Poznań—will inform the numbers. The bottom line is that we can make the appropriate orders to set the targets in the light of emerging scientific information.

Des McNulty: You are right to say that the target of 42 per cent is a stretch target for the UK as a whole, but there is a general acceptance on the part of ministers and others that Scotland has some advantages over other parts of the UK in power generation and, to an extent, transport emissions. Setting aside the need for international negotiations, do you not consider that something that is a stretch target for the UK is a manifestly achievable target by 2020 for Scotland?

Stewart Stevenson: I accept the generality of what you are saying. We have certain advantages in that we have greater potential for renewable energy—that is an obvious factor that has been rehearsed in this committee and elsewhere. Nonetheless, it is not yet clear from the scientific advice exactly what steps would need to be taken to deliver a reduction in emissions of 42 per cent by 2020. For example, one of the range of things that we would need to do is quadruple the rate of forestry planting.

We await further advice on the subject. If it can be demonstrated based on scientific advice that such a figure is right for Scotland, we will take account of that, but we cannot discount the European trading schemes and the effects of those schemes that will be superimposed on the UK and Scotland. There is a certain amount of detail associated with the trajectory of effort around the UK trading schemes that will influence the figures that the UK Government chooses and the budgets that it sets for emissions and, therefore, the envelope within which we have to set our figures.

Des McNulty: On annual targets, you referred to the Government’s manifesto and the endorsement of a target for 2050. The manifesto committed the Government to annual reductions of 3 per cent, but that commitment has been set to one side as those reductions will not come in until 2019. Our current emissions reduction is about 1.3 per cent a year. How do we put pressure on your Government and the next Government to get to a 3 per cent rate of reduction well in advance of 2019? Should we reconsider the provisions in the bill to see whether we can achieve that?

Stewart Stevenson: The bill will set mandatory annual targets of at least 3 per cent from 2020, so we are introducing annual targets—that is important. In fact, the stretch target of 42 per cent gives us a more challenging trajectory than that.

We will set our annual targets based on auditable scientific advice from the UK Committee on Climate Change, which will be based on information that is available to us all. Our targets will balance science and achievability: they must be credible and deliverable, and we want to make the fastest possible progress. Our drawing forward of the 2030 target to 2020, and the implication that that will be more challenging than the 2030 target that we are setting, is evidence that our approach to targets and use of annual targets will drive early change.

Des McNulty: With respect, minister, I am not sure that that is right. The commitment to a 3 per cent year-on-year reduction from 2020 is commendable, as is the undertaking to consider the 2020 interim target, but there is no hard and fast definition of what the Government expects itself or its successors to achieve between 2009 and 2020. That is the issue. We have heard from a swathe of climate scientists and environmental groups that what is crucial is not so much what happens between 2020 and 2050 but early action between now and 2020. If we do not take early action and the hard targets kick in only from 2020, we could end up in the situation in which the runaway train has long since left the station.

What can we do between now and 2020? It is a question not only of setting a target for 2020 but about how we bind this Government and the next one to the early action that we all think desirable and necessary. The UK Government is doing that in the form of five-year carbon budgets. Should we do that in Scotland, or should we consider setting escalating targets of, for example, 2 or 2.5 per cent for the years between now and 2019?

Everything seems imprecise at present. I am not denying your good intentions, just highlighting the imprecision of what you are committing yourself to between now and 2020.

Stewart Stevenson: Mr McNulty said that there is no hard and fast target until 2020; that is far from being the case. In early course, we will set targets to cover that period to show exactly what has to be achieved each year. There is a figure for 2020 in the bill, but the targets that will take us to that will be set by secondary legislation. They will be informed by advice from the UK Committee on Climate Change and, like the UK Government’s
target for an 80 per cent reduction by 2050, informed by science.

The Climate Change Act 2008 does not contain anything different from our bill in that respect. We are more ambitious in certain other respects but, in this respect, we are following a similar trajectory to the UK Government and will, through the scientific advice that we will get, reflect the uniquely Scottish conditions in which we find ourselves.

14:45

Des McNulty: Let me just come back on that. The minister’s argument is that he can include in the bill statutory conditions that will not come into force until 2020—Governments 10 years from now will be required to meet those conditions—but, despite knowing less about the situation from 2020 onwards than about the situation between now and 2020, he is not prepared to include in the bill quantifiable year-on-year targets for that interim period. My question is why we can include statutory commitments in the bill for the period after 2020 but not for the period between now and 2020. The minister’s position seems illogical.

Stewart Stevenson: Our position is entirely logical. We have not received substantial suggestions from anyone about how to deliver a 3 per cent annual reduction over the next couple of years, and we await the scientific advice that will help us to set those targets through secondary legislation, which will be an essential part of the implementation of the bill all the way through to 2050. Indeed, as I said, the 2020 target will depend on scientific advice. It will be stretching but set a minimum: it is entirely possible that, on a year-on-year basis, the scientific advice could take us beyond the figure that is in the bill.

It would be no easier for us to include annual targets up to a particular date in the Climate Change (Scotland) Bill than it was for the UK Government to include such targets in its Climate Change Act 2008. The approach that we are taking and the scientific advice on which we will draw will lead to the setting of hard and fast targets, but we need to consider the timing for that process. If we were to make the completion of the primary legislation process await the scientific advice that will enable us to set annual targets, the bill would be substantially delayed. It is far better to progress with the bill by putting in place the infrastructures to take things forward so that we can use the secondary legislation provisions to set the annual targets.

Des McNulty: I have a final question. The Scottish Government committed itself to annual targets—

Stewart Stevenson: We are delivering annual targets.

Des McNulty: I recognise that.

I suppose that I am asking that we look at the issue rationally. It seems that we are nowhere near the 2020 baseline from which we could be confident that the 3 per cent annual reduction could be achieved—even though I support the general direction in having that strong aspirational target. We are much closer to the situation in 2013, 2015 and 2017, for which an informed calculation could be made about the year-on-year reduction that we might realistically expect to achieve. I accept that there might be some imprecision about what could be done in 2012 as opposed to 2013, but we are in a much better position, in terms of the information available, to make an informed assessment on achievable annual targets—or, indeed, on an achievable cumulative target over two or three years—between, say, 2012 and 2015 than we are to make that assessment for the years 2025 to 2028.

The minister’s confidence that he can achieve 3 per cent reductions in the 30 years between 2020 and 2050 seems at the very least inconsistent with his lack of precision about what he expects to achieve between 2009 and 2020. What does the minister anticipate can be done between 2009 and 2020 in terms of annual uplifts or aggregated annual uplifts? Based on the information that should be available now, what does he believe is practically achievable and able to give us some confidence that early action is being taken and that the measures that are being put in place will act as a lever to get real action each year from the current and next Governments?

Stewart Stevenson: I said that there will be annual targets, which makes it clear that we will have to deliver year-on-year reductions. We have not yet got scientific advice that will enable us to set figures for each year. That will be challenging for us and for the UK Government.

The way in which carbon trading will work across the European Union, the UK and Scotland has not yet bottomed out. Until it has, we cannot set the particular figures that Mr McNulty has asked for, but we have put a process in the bill that will enable us to do that. I am not aware of our having the information that would scientifically enable us to set the figures—indeed, the 2020 figure still requires to be scientifically informed. We have a source of scientific advice, and the best approach is to rely on what it tells us. We must deliver across a range of policy areas, but we must be informed by the scientific advice.

The member can be sure that we will set ourselves challenging targets as we go forward to 2020 and, indeed, 2050. The UK Government had
its Climate Change Bill passed last year, but it has not yet come up with its targets—indeed, it does not intend to set targets this year. Members will remember that we must set our targets in the context of the UK framework, which includes areas for which we will be responsible.

The Convener: Can you quickly clarify a point before we move on, minister? We all recognise that, although earlier cuts are harder to achieve, they are more important because they have a greater impact on our climate change performance in the long term. Given that you have indicated that the Government is considering the possibility of amending the bill to set a more ambitious target for 2020 than the current one for 2030, is the Government open to an amendment to the part of the bill that specifies that the annual targets in the first 10 years should be only reductions each year rather than specified reductions? Is the Government open to an amendment to toughen up the first set of targets?

Stewart Stevenson: I cannot give a clear answer to questions of that character without understanding the specific implications of any proposed amendment. The bottom line is that we will be informed by science rather than by politics—that is the important point. We must work with our partners in the UK and the EU to ensure that what we do is consistent with that. We are looking at the advice that the Committee on Climate Change is giving to the UK as a whole; we will watch how that relates to Scotland and how things progress. We already provide in the bill that there must be a reduction year on year.

I sign up to the convener's point—Mr McNulty possibly made it as well—that early action has a bigger impact because we bank the savings over a longer period. That is clearly true. I said to Shirley-Anne Somerville earlier that we cannot leave it until 2049 to do all the work because, if we did, we would not get the benefit of the change in greenhouse gas emissions over a long period. I therefore associate myself with the convener's remarks about the need for early action.

The Convener: I hear what you say about taking decisions that are based on science, and I am sure that the Government takes that seriously, but the committee will also be informed by science and, ultimately, political decisions will be made around this table and in the chamber about any amendments that are lodged. That is the only reason why I asked whether the Government is open to the kind of amendment that I described.

Stewart Stevenson: If the amendments were driven by science and, in particular, the UK Committee on Climate Change, we would of course consider them seriously.

I do not think that we are fundamentally at odds on the issue, convener, but I make the point again that the science is the important thing and that we should use it to move forward. I have a body of quite extensive information that is probably beyond what members would tolerate my reading to them. However, if it helps, I am happy to write to the committee to develop my point and allow it to take account of that information in its deliberations as it writes its report. If that raises further questions—I realise that it might do—we will be happy to respond further if we can within a timetable that is helpful to the committee.

The Convener: I am sure that we would appreciate further correspondence.

Alex Johnstone (North East Scotland) (Con): We have heard evidence from witnesses that suggests concern about the power in the bill to set annual targets in batches. Scottish and Southern Energy has said:

"to set one budget for 12 years may allow far too much leeway to project action into the future instead of the early action that is required".

It has a point, does it not?

Stewart Stevenson: The targets are a minimum. I know that, through its chief executive's leadership of the business delivery group, Scottish and Southern Energy is much seised of the agenda and determined as a company both to do as much as it can on its own initiative and to lead many other businesses to do what they can. Ultimately, it will be helpful if members of the business community who have an objective view of the factual information that will drive things forward are willing to work with the scientific advisers on whom the UK Government and the Scottish Government will depend.

We are talking about five-year batches of annual targets, although there may be targets as far ahead as you suggest. One would, of course, reflect every five years on the experience that one has. Initially, a bigger chunk would be set because we have to make a start, but over time the objective would be to set targets in five-year chunks, which—if I fully understand the point—may strike the balance that Scottish and Southern Energy seeks.

Alex Johnstone: Let us consider the first batch of targets that will have to be set. In its evidence, Stop Climate Chaos Scotland expressed concern that setting the first batch of annual targets by June 2010, which is halfway through a year, would seem to build in an excuse either to miss a target or at least to set a weak annual target for 2010. Is there any cause for concern about that?

Stewart Stevenson: We must create a window in which to get advice to be able to move forward on that. We are actively engaged with the UK
Committee on Climate Change as of now—it may be slightly presumptuous of us to assume that the bill will be passed, but that engagement is necessary. It may be worth making a point that I should perhaps have made earlier: we will have the power to revisit the targets if the science changes significantly.

**Alex Johnstone:** I want to move on to the slightly different subject of emissions tracks. Following a request by the committee, the Government provided analysis of possible emissions tracks, but none related to the stated policy intention of having 3 per cent emissions cuts year on year. Why was the stated policy intention not outlined in any of the seven scenarios that were presented to the committee? Do you agree with SEPA’s opinion that any emissions tracks should be towards the more ambitious end of the scale?

15:00

**Stewart Stevenson:** Excuse me while I get the numbers in front of me to remind me.

We want to be ambitious. The bill has been described as the most ambitious proposed legislation in the world, and we seek to sustain our position as climate change leaders. We provided the committee with a range of scenarios, and we expect to aim for the higher rather than the lower ambition.

For information, the UK Committee on Climate Change’s 42 per cent stretch target relates to scenario 6, which is the most ambitious scenario. There remains uncertainty about whether such a rate of reductions can be delivered in the context of European trading and other matters, but we want to be as far to the right of the table of scenarios as we can be—in political terms, you will identify with such an aspiration.

**Jim Tolson (Dunfermline West) (LD):** We should push for sectoral targets for transport, energy and enterprise, along with international targets. The bill does not include sectoral targets but will require electricity figures to be included in the report on annual targets. Why is electricity singled out for reporting? Could not energy efficiency also be reported on?

**Stewart Stevenson:** At this early stage it is probably important to realise that the means by which we account for greenhouse gas emissions is somewhat indirect. We consider activity in the economy and try to determine the greenhouse gases that are derived from that activity; we do not stick a sensor into the atmosphere to measure the CO₂.

Disaggregation to Scotland level of the big figures that are produced at UK level increases the margin of error, which is currently plus or minus 6 per cent, although it will narrow as we become more skilled at disaggregation. At this stage of scientific understanding, further disaggregation to sectors increases the margin of error to the point at which it is difficult to work out what is happening in reality. Year-on-year figures might suggest that we are travelling in the wrong direction, although such a conclusion might simply be an effect of variation within the margin of error.

On electricity and power generation, there are huge single-point emitters, in relation to which there have been allocations under the European Union emission trading scheme. Measuring emissions from a relatively small number of huge installations will, of course, give us a measure of energy efficiency, but efficiency in dwellings and business premises is an entirely different matter, given that we are talking about a huge number of point emissions.

The setting of sectoral targets will become more possible over time. The approach at this stage, including in the European trading scheme, is helping us to understand what is going on in relation to electricity, but there is not information that would support the development of sectoral targets. The important point is that no one should think that they have been let off the hook and that they need not do everything they can just because another sector must make huge reductions.

**Jim Tolson:** I am sure that you are familiar with this comment from “Strategic Transport Projects Review Report 1: Review of Current and Future Network Performance”. Chapter 4 states:

“On present trends, transport will not contribute to the reduction target.”

Has the Government calculated what contribution different sectors will have to make in helping Scotland to reach its emissions reduction targets?

**Stewart Stevenson:** That brings us back to the commitment to develop a carbon balance sheet, which no other country has made. We are leading the way. There remain uncertainties about exactly where we will end up, but we have to do it and the approach will be refined over time.

I directed the strategic transport projects review, which began before we came to office but on which a substantial amount of work was undertaken afterwards. I needed to ensure that it had an intrinsic net carbon benefit, but that is not the whole story, by any means.

Transport covers more than what is in the strategic transport projects review—for example, use of private cars, for which the curve is, if anything, the most adverse. We have also seen, for example, that buses’ CO₂ emissions have actually risen while the emission of particulates
from buses has been tackled during the past 10 years or so. Therefore, the next stage in improving the quality of the bus fleet must focus on things such as greenhouse gases.

It is clear that there is a series of challenges. We need to consider the nature of, and change people’s attitude to, the use of private transport. It is not simply about technology, however—change in people’s behaviour is needed. The carbon balance sheet will, as we develop it over a long time, be the most effective way of understanding and changing behaviours in transport. It will also, of course, help us in Government to plan actions as we move forward.

The Convener: Is it the case that several of the projects in the strategic transport projects review—which Jim Tolson mentioned—will have a negative impact on the transport sector’s emissions? If the Government still holds to the statement that “On present trends, transport will not contribute to the reduction target”, does it intend to reverse those trends and, if so, by when, or does it intend to allow the rest of the economy to take up the slack for transport failures?

Stewart Stevenson: Transport will make its contribution to the reduction of carbon emissions. We will ask the UK Committee on Climate Change for its advice on that, and it will make recommendations. We are not in a position in which every single thing we do in Government will lead to a reduction in carbon—there is a carbon cost in doing almost anything. The important thing is that we take account of that and make a balanced judgment on whether something is carbon affordable, just as we have to make a balanced judgment on whether something is financially affordable. That will increasingly be part of the decision-making processes for successive ministers and Administrations, which is why the carbon balance sheet will be so important in relation to understanding the minutiae of the effects of ministerial and Government decisions.

The Convener: Is that longhand for, “We do not know yet”?

Stewart Stevenson: There are many things that we do not know in relation to the period between now and 2050. That is one of the great challenges and the reason why it is so important that there is consensus—which I think has been achieved—on the strategic objectives, and proper engagement on the detail of whether individual actions will take us in the right direction.

Des McNulty: That is interesting.

I will move on to international credits. Do you intend—I presume that you do—that the vast majority of targets in the bill will be met through domestic efforts in reduction in Scotland, and not through international carbon credits? Unlike the UK bill, the Scottish bill does not, as it is currently drafted, have a mechanism for capping carbon credits. How can we ensure that the targets are met through domestic reductions rather than by purchasing credits?

Stewart Stevenson: It might be helpful for me to say that we are giving further consideration to ways in which we can limit use of carbon credits and, in particular, to whether we can lodge an appropriate amendment at stage 2 to do that.

I associate myself with Des McNulty’s point that our effort is more important than our ability simply to finance someone else to do things. That will not be a recipe worldwide for taking the agenda home. We must undertake greenhouse gas emissions reduction in Scotland—that is where we must apply both our effort and our money. We will give further consideration to carbon credit limits at stage 2.

Des McNulty: Would it be possible for Scotland simply to say that we are not going to use international carbon credits as a lever and that we will achieve the targets that have been set wholly and exclusively through our domestic effort?

Stewart Stevenson: One must be aware that the net effect of that would be nil. Because of the way in which the European trading schemes will work, other people would use the credits instead of us.

Credits are not core to what we have to do; however, they are an important part of smoothing out some of the lumpiness in the graph to which I referred. That lumpiness will play both ways. When a coal-burning power station changes technology, that will be a lumpy benefit. However, a very cold winter will potentially have an adverse effect as people increase their energy consumption.

We cannot, as a matter of principle, discount the use of credits as part of the process of ensuring that we make our overall contribution. However, I say again—others, I am sure, will echo this—that we must make actual reductions in greenhouse gas emissions if we are to play our proper part in achieving the 2050 target for the containment of the increase in the world’s temperature.

David Stewart (Highlands and Islands) (Lab): I have a couple of questions about the roles of aviation and shipping. I know that you have a great interest in aviation, minister, so you will be well aware that the emissions from planes in flight have a much greater climate change effect than the same emissions at ground level, through complicated factors—nitrogen oxides and so on—which accelerate the climate change effect. You will be aware that the UK Government uses a
multiplier of 1.9 when it comes to calculating the effects of aviation emissions. However, I do not think that that is in your seven scenarios. If it is not, do you consider that the use of such a multiplier could be an important way of measuring the effects of aviation?

Perhaps you can answer my second question at the same time. In evidence, BAA said that the contribution of aviation emissions is covered in the EU emission trading scheme. What is your feeling about how we should measure emissions from international aviation?

Stewart Stevenson: I will answer your second question first and then come back to the other one. There is a footnote to the figures that are produced on emissions that already covers that, based on bunkering—that is, fuel uplift. Your first point being set aside for the moment, it is a pretty good surrogate for working out how much fuel is being used. For both shipping and aviation that is, in general, what is measured.

We need further work to inform us how emissions should be allocated to different jurisdictions. There are a range of opportunities for us not to count everything that should properly be attributed to us and for us to count things that should properly be attributed to others. Nevertheless, at the moment, the figures are at least being counted and are available. I will not sign up to the idea that we can simply trade away aviation emissions. Several initiatives have tried to address aviation emissions.

15:15

This committee has considered high-speed rail and I have said elsewhere that the mood on that is changing. Lord Adonis, who is the UK minister with responsibility for rail, is actively engaged in the subject. I think that he will meet the committee, because he will meet me. High-speed rail would affect much of the aviation from Scottish airports—such measures will make an important contribution. Operational and engineering measures can also be taken. A general question is whether we will in the future need to travel as much as we do today. Aviation will undoubtedly have to—and will—contribute not just to buying credits, but to reducing outputs.

David Stewart’s other point was about the altitude at which aviation emissions are made—the part of the atmosphere that is involved. I am not sure whether it is clear to me that the UK Government uses multipliers for radiative forcing. I would be interested to hear whether that is the case, because I am advised that the UK Government does not use such multipliers.

For short-haul flights, the use of turboprops, which fly lower than and in a different part of the atmosphere from jets, can contribute. It is interesting that the shortest sector travel time between Edinburgh and London happens to be in a turboprop and not a pure jet, for a variety of reasons that are not wholly replicable. We can expect more aircraft to fly lower, which might change their effect.

On the operation of aviation, we must work with the UK jurisdiction, which is responsible for aviation and its legislative framework. Our direct influence on that is limited to planning issues and our ownership of the lifeline airports for the Highlands and Islands, where a broader range of interventions are available to us.

David Stewart: If I understand you correctly, you do not believe that you can account for the effect just through the EU emission trading scheme; Scotland must have a system to account for the effect of aviation on climate change. That is not easy. I am trying to determine how you would measure the effect on climate change.

Stewart Stevenson: I will give you a little clarity. You said that we in Scotland need a system. We have made the commitment to include international aviation and maritime emissions. As I said—to make our intentions clear—we are considering amending section 14 at stage 2 by changing the word “may” to “must”—that has been raised with the committee—to reinforce what ministers have said we will do.

We should not and cannot act alone. We need an internationally accepted methodology. For example, in the future, the cost of fuel might be higher in Scotland than in Amsterdam—I choose that place arbitrarily for the sake of argument. If a Dutch plane that flew from Amsterdam to Edinburgh and then from Edinburgh to Amsterdam picked up no fuel in Edinburgh because fuel cost more here and it had bunkered some in Amsterdam, the current way of counting would mean that the climate change cost to Scotland was nil. However, we would probably all agree that the cost to Scotland should be reflected, because Scottish passengers would be travelling and so on. We have a method that gives us a relatively crude view of the effects. That is useful, but we need international agreement on how we will more properly attribute costs. Similarly, a transatlantic cargo flight might put down at Prestwick just to refuel without offloading or loading anything. We count that although, arguably, we should not.

I am not taking a view on any of that; I am only pointing out some of the debates that will take place. If aviation does not play its part, everyone else has to pick up the slack.

David Stewart: I will send your officials the reference for the multiplier that is used by the UK Government—it is 1.9.
My second question—there are probably similar arguments on this issue—is about shipping. You will know that, throughout the world, many operators now use quite heavy fuel because it is much cheaper. Of course, the downside is that it causes a great deal more problems in respect of climate change emissions. The Chamber of Shipping told us that “Measuring Scotland’s share of international maritime emissions is extremely difficult”.

How would you measure it?

Stewart Stevenson: It is currently being measured by crude bunkering. You are correct that there is a range of fuels. I have not been able to confirm it with my officials, but my recollection is that three fuels are generally used: M30, M40 and M120. They have different amounts of, for example, sulphur in them. That is not a climate change gas, but it is a serious problem, and it is very important for me as an asthmatic, because it turns into sulphur dioxide in the atmosphere and harms the lungs of people like me and others. You are correct that some developments that are taking place in shipping run counter to environmental concerns. Ships are being laid up all round the world as economic activity has diminished and there is pressure on costs.

How would we measure shipping emissions? I repeat that we need internationally to understand how we measure the emissions. We have numbers that help to inform us, but they are simply bunkering numbers. For exactly the reasons that I mentioned in relation to aviation, there are difficulties.

The European Union is pressing the International Maritime Organization to address emissions from shipping and to develop a mechanism by which we can get sensible estimates. Of all the transport areas, shipping is probably the one in which least progress has been made. In relation to matters such as sulphur, a range of issues beyond climate change gases must be tackled.

The Convener: I have to ask for briefer answers if we are to make the progress that we need. Before we move off this issue, Dave Stewart asserted that the UK Government uses a radiative forcing multiplier of 1.9. If the question is whether the Scottish Government currently has a figure that it accepts, is the answer no?

Stewart Stevenson: We are not using a figure at the moment. I ask you to recall that the figures that inform us are coming from the UK Committee on Climate Change and the inventory that has been produced at UK level. We are not producing our own.

Shirley-Anne Somerville: I will move on to delivery of targets. We have heard from a number of witnesses that the bill can set up a very useful framework, but it is obviously the delivery that matters. Scottish Environment Protection Agency and Scottish Natural Heritage said that significant work would have to be done from the outset to deliver on our climate change objectives. Can you talk us through what is being done to ensure that there is rapid delivery on the ground, so that we fulfil the climate change targets?

Stewart Stevenson: SEPA is interested, among other things, particularly in the adaptation network. In the middle of the year, we will introduce the strategic overview, which I think will start to deal with the issue that SEPA and others have raised. I come back to the point that there is another aspect to all this; it relates to adaptation, which is also being pursued.

Shirley-Anne Somerville: We will come on to adaptation later.

Stewart Stevenson: I am sure that you will.

Shirley-Anne Somerville: The Royal Society of Edinburgh’s written submission suggests that the framework will not be enough and that there may be a need for a strategy to allow future Governments to meet the targets. Is the Government developing a climate change strategy or an updated climate change programme? If so, is it considering putting it in the bill?

Stewart Stevenson: I do not want to trade semantics, but I am not entirely clear on the difference between a framework and a strategy, both of which are not about tactics—the things that one does—but about that which one is trying to achieve. Let me give an illustration: scaffolding enables a building to be built; it constrains the shape of the building, but it is not the building.

Shirley-Anne Somerville: Perhaps I can assist. Will you include in the bill anything that will oblige the Government to develop an action plan on delivery of your framework?

Stewart Stevenson: I return to what I said earlier: we are not waiting for the bill. We are already working on our strategic overview. The publication of our annual targets will be accompanied by a report in which we will detail our progress. Under the bill, we have to report on the policy measures that we are delivering, which—of course—we will have to describe. That is our view at the moment, although we will continue to work in the spirit of engaging with people.

On adaptation, our action plan will shortly be issued for consultation.

Shirley-Anne Somerville: The bill contains a requirement for an energy efficiency action plan to
be published. Has the Government held discussions on whether action plans for other sectors could be required under the bill, for example on heat, electricity or energy-demand reduction?

Stewart Stevenson: Again, we are considering a stage 2 amendment—we have seized on the subject—and we will, of course, introduce secondary legislation, including on energy efficiency. We are already taking action.

The action plan for renewable heat will include consumer information, awareness raising, skills—particularly in terms of insulation measures—building regulations and the encouragement of heat mapping at local authority level.

Jim Tolson: My question is on enforcement and sanctions. The bill contains a number of ambitious targets that many of us hope will be reached within the given timescales, but there are no clear provisions on enforcement and sanctions. Friends of the Earth Scotland has said that sanctions should be included in the bill. Also, I understand that the climate change business delivery group has asked why the bill contains no sanctions for targets not being achieved. Have you and your team considered sanctions? Are you planning to add sanctions to the bill?

Stewart Stevenson: If, by sanctions, you mean financial sanctions on the Government, our view is that including them in the bill would simply reduce the amount of money that could be made available to address climate change. We are minded not to do that.

Jim Tolson: So, you have not looked at sanctions in any other theatre.

Stewart Stevenson: Well—

Jim Tolson: On targets, for example?

Stewart Stevenson: I am sorry, but I missed that—

Jim Tolson: I think my mike is working.

Have you looked at making sanctions not on financial but on any other bases?

Stewart Stevenson: We do not know what that would mean.

Jim Tolson: That sounds like a no.

The Convener: The Friends of the Earth proposal is for financial sanctions that would result not in less money for climate change-related activities but more money for such activities through a dedicated fund. Does the Government have a clear view on the proposal?

Stewart Stevenson: The effect would be to remove money from people who are underperforming on climate change thereby reducing their ability to perform, which is not an immediately obvious solution.

The Convener: If I understand the proposal correctly, it is that the parts of Government that failed could access the money specifically to address their failures on climate change.

15:30

Stewart Stevenson: The effect would, therefore, be financially neutral. It is not clear to me that the proposal would deliver any benefit. The interaction between the responsible minister—and, for that matter, the Administration—and parliamentarians, whose job is to hold ministers and the Government to account, is the real issue. What is important is the information that comes from that and the scientific assessment of how ministers are doing. Although we may appear to be disagreeing about how to achieve the targets, everyone in the room is seeking to ensure that we achieve them.

The Convener: I am not telling you what I think about the proposal—I am asking you what you think about it.

Stewart Stevenson: Forgive me if I am making assumptions about your position. We simply do not see how it makes much sense to remove money from a public body that is not making the necessary progress and then invite it to ask for that money back, which is one of the options.

Section 31 requires that,

"As soon as reasonably practicable" after reporting that an annual target has not been met, ministers

"lay a report before the Scottish Parliament setting out proposals and policies to compensate in future years for the excess emissions."

Basically, the bill states that ministers will be dragged to Parliament to account for their failures. We see that as the appropriate and proper way of proceeding. No minister, whatever the complexion of the Administration, is ever terribly keen to be dragged to Parliament for that purpose. Annual reporting and the annual statement that must be made to Parliament are pretty robust ways of ensuring that Parliament and the wider public are on the case of failure in this area.

The Convener: Thank you. I just wanted you to comment on the proposal on the record.

Part 2 of the bill concerns advisory functions. I assume that your intention is still to use the UK Committee on Climate Change, at least in the short term, as the advisory body for the Scottish Government. We have received evidence on the resources that are available to the UK committee. It has been suggested that the committee has one
person working on Scottish issues and that it may need to allocate one or two more people to that task. Are you content that so far the committee has demonstrated that it has the Scotland-specific expertise and resources—both financially and in personnel—to enable it to exercise advisory functions for Scotland, which may require a perspective that is distinct from that which the committee takes in relation to the UK Government?

**Stewart Stevenson:** I met Lord Adair Turner soon after he was appointed. I was also consulted before his appointment, which was made before the committee really got going. Since it was established, the Committee on Climate Change has been on the case in respect of Scottish issues. It is worth making the general point that, were we from the outset to seek advice from a source other than the committee, it would take us a further 18 months or, more probably, two years to get advice. There should not be too much debate on the subject in the first instance.

The committee’s December report was a good start. We should bear in mind that the Climate Change Act 2008 places a duty on the committee to provide advice to the devolved Administrations, including the Scottish Government. We work regularly and effectively with the committee and with colleagues in the Westminster Administration. In fact, I think that it is correct to say that in recent times there has not been a single week when there has been no interaction. Meetings take place broadly every fortnight. We think that we will get what we require. I point out that there is also an adaptations sub-committee that provides advice, analysis and information to each of the national Administrations.

All of this is a serious indication of our ability to work with other Administrations; after all, this of all policy areas is one in which we cannot row our own canoe. We have to work with others and using the UK Committee on Climate Change is one of the key ways in which we can ensure that, at all levels, we get the level of team working across jurisdictions that will be required.

**The Convener:** At a previous evidence session, Scottish Government officials confirmed that, at that point, no specific advice had been formally sought from the UK Committee on Climate Change. Notwithstanding the less formal on-going dialogue that is taking place, has any formal advice been sought since then on, for example, the appropriate level for a 2020 interim target, which was mentioned earlier? If advice has not yet been formally sought from the UK committee on that issue, is such a move being considered?

**Stewart Stevenson:** Our immediate focus is to work with the UK Committee on Climate Change on developing its 2009-10 business plan and ensuring that the plan contains provision to support the work that we will require it to carry out. It is aware of the kind of questions that we want to ask. However, those questions have to be asked in the context of what the UK Government will do and we are awaiting further information in that respect.

The issue is more to do with the general environment. After all, we in Scotland do not have administrative or legislative responsibility for everything to do with climate change in Scotland. We are on target to have our questions answered on the timescale that meets our needs.

**The Convener:** Which is?

**Stewart Stevenson:** We will require our questions to be answered in time to lay secondary legislation, which will have to be done certainly by the middle of the year. We are, in fact, seeking to introduce that legislation a little bit earlier, and we will have the information that we require from the UK Committee for Climate Change—

**The Convener:** Forgive me, minister, but in our earlier discussion on the potential for amendments to introduce a 2020 interim target and whether that would have an impact on requirements for annual targets, you put great emphasis on reaching those decisions and making those amendments on the basis of evidence from the UK Committee on Climate Change. Have you not sought that advice?

**Stewart Stevenson:** I apologise—I missed your reference to the 2020 target. I was making a more general point about budgets going forward. We are working with the UK Committee on Climate Change with regard to its first report to ensure that we have the right figure for 2020 in early course.

**The Convener:** And will that advice also be made available to this committee in considering those amendments?

**Stewart Stevenson:** Advice to ministers is advice to ministers. If you are asking whether you can see the advice that I get through my officials, my answer is that, as I say, that is advice to ministers.

**The Convener:** I will let other members in in a moment, but I have to say that I find that response a little odd given that, earlier in the meeting, you told the committee that, although you would not reach a view on them yet, you would happily look at and be open to other amendments, as long as they were based on advice from the UK Committee on Climate Change. However, you are not going to publish that advice.

**Stewart Stevenson:** The UK Committee on Climate Change has published its inaugural report; it also publishes advice that it gives. However, I do not wish to make too much of what is a very
narrow point, which is that advice to ministers is of a different character. The committee's first report lays out Scottish abatement potential to help us to meet the 34 per cent target that is being discussed. We await further advice.

Des McNulty: I want to pursue the point that Patrick Harvie made, but in a slightly different way. The UK Committee on Climate Change can provide advice on a very wide range of matters from global trends in climate science right the way across to implementation in a narrow Scottish context. It might be equipped to offer that full range of advice right across the spectrum. On the other hand, although it might be well equipped to offer advice at one end of the spectrum—or on the greater part of the spectrum—a different kind of advice might be required on implementation and adaptation strategies.

What advice have you had from the UK Committee on Climate Change about its perception of the range of advice that it can give and whether that meets the full range of your needs? Have you taken independent advice, perhaps from the chief scientist, about where the best scientific advice available to the Scottish Government could come from, given the range of tasks associated with the bill? To return to the point that Patrick Harvie made, which bits of that advice will be made public and which bits might it be inappropriate to make public? I can see no reason why advice from the UK Committee on Climate Change on global trends in climate science should be secret or withheld in any way. However, some of the issues to do with immediate science should be secret or withheld in any way. Do we have the range of areas of advice that are required right? Have we identified what they are? Is the UK Committee on Climate Change the best body to give advice right across the spectrum? How much of the information from that body, or any other body, should be put in the public domain so that it can feed into the scrutiny process of climate change target setting and delivery which, in the spirit of transparency, I am sure we all want to see?

Stewart Stevenson: The only omission will be advice to ministers, which is a narrow piece of advice.

The UK Committee on Climate Change is a source of independent advice to the jurisdictions that have access to it. Those are primarily the UK Government, but also all the devolved Administrations. Our response to the first report by the UK Committee on Climate Change has to be informed to some extent by carbon emissions budgets that the UK Government has to set. Is the UK Committee on Climate Change currently equipped with the resource to do everything that is required? Probably not, but that is precisely why we and other Administrations are working with it to ensure that its business plan for the forthcoming year reflects those needs and that it has the necessary resources to allow it to undertake the work that the various Administrations require it to do.

To seek advice from elsewhere in parallel carries the risk that we might be drawing advice from a set of data that is time-lined differently, which will lead to different conclusions, not as a result of the science being different but, rather, as a result of the data being different.

Unless the UK Committee on Climate Change becomes unwilling or unable to respond to the needs of this devolved Administration—and of the Wales and Northern Ireland Executives—it will be the best available source of independent advice for the Government. Core advice to the Scottish Government will, of course, be seen by the people.

15:45

Charlie Gordon (Glasgow Cathcart) (Lab): How will the current advisory functions of SEPA and SNH link to the work of the UK Committee on Climate Change or of any new Scottish committee on climate change?

Stewart Stevenson: Clearly, our environmental agencies have to work with Government. They are, of course, part of Government, and are therefore in a position to influence the questions that we would wish to ask the UK Committee on Climate Change or any other source of advice.

SEPA is concerned with flooding issues and with the adaptation strategy. Together with the environmental bodies of other jurisdictions in the United Kingdom, SEPA will be a source of the data that will be considered by scientists on the UK Committee on Climate Change.

Charlie Gordon: Therefore, in some situations, you would go first to SEPA or SNH for advice, and then decide to get a second opinion from the UK Committee on Climate Change.

Stewart Stevenson: SEPA, as part of Government, has a set of statutory duties to discharge. On the issue of climate change, we expect SEPA to inform UK risk assessment. That information will then inform scientific assessment by the UK Committee on Climate Change.

I am keen to ensure that our approach is consistent, open and auditable. SNH also has environmental responsibilities, and SNH and SEPA are key to adaptation and to our response to climate change. Equally important, they will inform the UK Committee on Climate Change, so that it receives the best possible scientific view...
and is informed by the widest possible range of information.

**Charlie Gordon:** How might a judgment be made on whether a distinct Scottish climate change committee is needed?

**Stewart Stevenson:** The bill provides for that possibility: we envisage that it is possible. Thus far, the UK Committee on Climate Change has been responding.

Science is not geographically attached. Scientists around the world are used to working together on common causes, to shared standards. It is useful to have a single body that reflects the work of all the jurisdictions in the UK. On this agenda, as on others, it will be necessary to work with other jurisdictions.

The safety net exists, but it would take a substantial amount of time and money to set up a Scottish climate change committee. Committee members know my political persuasion, but I am here defending the UK’s approach. At this stage, we do not need to take a different approach. I do not yet see any warning signs that suggest that we need to go along that road.

**Charlie Gordon:** In describing the scenario of one day having a separate Scottish committee as a “safety net”, you are perhaps at variance with our understanding that there might be an organic development, as it were, of the range of advice available here in Scotland. It seems that you have in mind some criteria that would allow you, or one of your successors, to make a judgment on whether it is appropriate to have a separate Scottish committee. The fact that you describe it as a “safety net” perhaps indicates that, for the foreseeable future, you would prefer to stick with the relationship with the UK Committee on Climate Change.

**Stewart Stevenson:** That is the correct interpretation of the position that I am in at the moment. I used the term “safety net” simply in response to your positing future failure in the UK Committee on Climate Change and asking what the minister would do in that situation.

**Charlie Gordon:** With respect, I am not aware that I posited that. I simply wanted to get a feel for what criteria we might develop over time to allow us to make a judgment one day about whether we should have a Scottish committee.

**Stewart Stevenson:** It is early days on the subject. We have had one report from the UK Committee on Climate Change and will keep the situation under review. Statutory obligations on the UK committee to be responsive to our needs and to give us particular information are embedded in the UK Climate Change Act 2008. We have the option to ask for other advice outwith that, which we will seek to do from time to time. We will not be the only people who review how effectively the UK Committee on Climate Change is working. The NGO community, SEPA, SNH and all who are engaged in the agenda will keep a close eye on what is going on. That is intrinsically useful.

**The Convener:** Section 20 discusses the possibility of a Scottish committee on climate change. Does it keep open the option of a Scottish committee—if one were ever created—being appointed by and accountable to the Parliament rather than the Government in the manner of some of our commissions, instead of following the structure of the UK committee? Is that legislative door open and should it be?

**Stewart Stevenson:** The bodies that are accountable to the Scottish Parliament exist to represent and look after the public interest. They are independent of the Government and none of them provides advice to ministers.

**The Convener:** They are free to do so.

**Stewart Stevenson:** Yes, but they are not a source of advice for ministers. That is not their responsibility. In essence, they exist for scrutiny purposes. Therefore, what you suggest would be something of an entirely different character. If direct parliamentary supervision of the source of ministerial advice was the way in which the matter was approached, it would be a pretty radical departure that would need to be considered carefully—not that I am intrinsically opposed to radical departures, I hasten to add. If a Scottish committee were to be established, it would publish reports and respond to and report to ministers.

**The Convener:** I do not wish to explore your preference or mine among the options; I am asking a question of fact. Is it your understanding that section 20 leaves open the possibility of a Scottish committee being appointed by and accountable to the Parliament?

**Stewart Stevenson:** It leaves open the possibility of establishing a Scottish committee on climate change to advise ministers.

**Rob Gibson (Highlands and Islands) (SNP):** I will ask about annual reporting to the Parliament on progress towards emissions targets, which we have discussed before. What progress is being made on improving timescales for providing accurate emissions data?

**Stewart Stevenson:** There has not yet been any substantial progress in accelerating the timescale for annual reporting. Quite properly, the member used the word “accurate”. It would certainly be possible for us to get information earlier, but it is more likely that that information would be subject to revision. We have to make a
judgment about getting the balance right; it is not an absolute science.

We are considering how we can accelerate the process, which at the moment takes about 18 to 20 months. Disaggregation for Scotland of the data in the UK inventory results in an additional time lag. We are looking to make improvements, but there are areas in which we are still trying to understand how to do things. We have mentioned international shipping and international aviation, in relation to which the notes to the inventory include the bunkering figures that inform us to the degree that they can. It is clear that we will have to continue to work to improve that. We will do our best, but the progress that we are making at the moment is fairly modest.

Rob Gibson: In section 34, the bill proposes that the Scottish ministers will meet committee conveners after a report on targets has been laid before Parliament. Do you envisage the adoption of a more formal process, perhaps through a requirement to appear before relevant committees? Might that be a more effective means of encouraging accountability?

Stewart Stevenson: I do not think that the two proposals are alternatives. Requiring ministers to appear in front of the committee of committee conveners is probably quite an important provision because it emphasises the need to consider the issue in the round and across all policy areas. It will provide a good opportunity for committee conveners, who represent all the diverse interests of the various committees, to consider what is happening.

It will depend on the personalities involved and the convenership of the committees that will be responsible for overseeing climate change in the future, but I find it almost inconceivable that the relevant minister would not appear before the appropriate committee and other committees of the Parliament. I would be astonished if that did not happen.

The committee of conveners does not routinely sit in public, although I am not aware that standing orders would prevent it from doing so. It is not, of course, a statutory committee of the Parliament—I accept that. That is a matter on which Parliament could take action at its own behest. The provision whereby ministers will appear before the committee of conveners is an important addition to our appearance in front of those committees whose work is formally part of the parliamentary process. We will be guided by Parliament’s view on such matters.

Rob Gibson: So you would not object to the committee of conveners making it a more formal process.

Stewart Stevenson: Certainly not. If that were felt to be helpful, this minister would not feel uncomfortable with that, and I cannot imagine that any other minister would, either.

The Convener: I should clarify that we are discussing the Conveners Group, which is not a committee.

Stewart Stevenson: I stand corrected and abide by what you have just said.

The Convener: It is not just the case that the Conveners Group does not routinely meet in public; it never meets in public. It meets in private. It would be unfortunate to give a mistaken impression in that regard.

What engagement did the Government have with the Conveners Group or the chair of the Conveners Group before it decided to incorporate the duty in question in the bill? Did it discuss whether such a process would be appropriate?

Stewart Stevenson: We have had discussions at official level.

You are correct that the Conveners Group—on which I sat, from time to time, in a previous session of Parliament—meets in private. By the same token, as it is not a formal parliamentary committee, it could choose to do what it wanted. We are simply trying to make a genuine offer to reflect the cross-cutting—if I am allowed to use that word—nature of climate change in our engagement with Parliament. It is an offer that is genuinely made and which probably goes further than any that has been made in relation to any other legislation. If there is another way of achieving the same objective, we are entirely open to discussing it further.

16:00

The Convener: It would be helpful if you could provide in writing some detail of the discussion that you are saying took place before the proposal was incorporated in the bill. I am not sure that the Conveners Group was aware of that.

Stewart Stevenson: We can do that.

Des McNulty: My recollection is that, when it was started up, the Conveners Group was explicitly designed not to be a formal committee. I would have no objection to an informal briefing being given to committee conveners, but I am concerned about that group being given a formal status by being written into a particular piece of legislation. That is the problem that we have with the provision.

Stewart Stevenson: It has just been drawn to my attention that the exact words in the bill are:

"Scottish Ministers ... must ... meet with the persons who convene and chair such committees".
That means that the bill does not attach to any particular way of organising things.

I should make it clear that, although officials have clearly been involved in the process, the suggestion that we are making is, essentially, a political one. We are making an offer. If the Parliament or the committee thinks that the activity that is proposed in section 34(3) is not particularly useful, that is fair enough. If there is another way of achieving the same end, I am quite relaxed about responding to the committee’s views on the subject.

The Convener: Your state of relaxation is noted.

Rob Gibson: The bill provides for the Scottish ministers to produce a plan to compensate in future years if annual targets are not met. How is that substantially different from the approach that is provided for in the UK Climate Change Act 2008, which involves banking and borrowing from five-yearly budgets?

Stewart Stevenson: It is about the minister having to respond when people say, “You didn’t get it right last year. How are you going to fix that?” That is what it boils down to. That approach ensures that policies that address failures will be new and additional and will not simply continue in the direction that has been taken previously. That is the approach that we have come up with to deal with the matter; I am not going to make remarks about the approach of any other jurisdiction.

Rob Gibson: It seems to me a good deal more informal than the approach that involves banking and borrowing.

Stewart Stevenson: Banking and borrowing is simply about the budgets; it is not necessarily about the action that is required to address the problem. Ministers would have an overdraft, in carbon terms, and it is not terribly easy to deal with that when you are working on an annual reporting cycle. Our approach is intended to be quite a challenging one for ministers and their teams to deal with, as it forces an immediate response. It is like a letter from the bank manager that says, “You are overdrawn, and we require you to settle the account by the end of the month.” The timescale in the bill is slightly longer, but that is the flavour of the approach.

Rob Gibson: I would not want to compare Government ministers with bank managers at the moment.

It would be interesting if we could see some more specific details of how that reporting would take place.

Stewart Stevenson: There is provision for annual reporting in the bill. Perhaps you can draw me closer to what you think we might do beyond that.

Rob Gibson: I was trying to coax you into suggesting the sort of things that might be reported on.

Stewart Stevenson: Ah! We will describe the structure of the reports, if I recall correctly, in secondary legislation. In fact, section 28 states that we “must lay before the Scottish Parliament a report in respect of each year in the period 2010-2050 for which an annual target has been set”.

The report must state whether the annual target has been met and, if not, why not. It must contain the information that is set out in section 29, which has a fair list of different things in seven subsections. Section 29(5) states that the report “must be laid before the Parliament no later than 31 October in the second year after the target year.”

Section 29 describes what information must be in the report, but section 29(7) states:

“The report may contain such other information as the Scottish Ministers consider appropriate”.

In other words, the report is not limited to what is listed in section 29.

Section 31 states that, when annual targets are not met, we must report on “proposals and policies”. There will, of course, be further reports on the interim target for 2030. There is a long list in section 29 of what must be in the annual reports, but I am conscious of the need to make my answers more concise. However, I can read out the list in section 29, if you wish.

Rob Gibson: No—I was just testing.

Stewart Stevenson: It was quite proper to do so.

Jim Tolson: I believe that a sustainability duty should feature in the bill to encourage groups such as public bodies to act with future emissions in mind. More specifically, do you agree with SEPA that duties on public bodies are needed immediately because voluntary approaches will not deliver the required emissions cuts?

Stewart Stevenson: Public bodies include local authorities, and it is important that we sit down and discuss with them, as equals, what we want to do. I hope that the powers to mandate in the bill will have great power, even if they are never exercised. In other words, they provide a fall-back position.

I think I am correct in saying that all 32 councils signed up to the climate change declaration under the previous Administration. We therefore have consensus at that level. Having powers in reserve in the bill is the right thing to do. At this stage, it is
not terribly clear what we would force people to do, if we used powers to mandate. By having a
general power to fall back on, we are more likely
to get innovative and imaginative thinking in public
bodies. Of course, the opportunity for cross-
fertilisation among bodies provides for good
experiences to be learned and implemented.

Jim Tolson: From some of the evidence that
the committee has taken, it seems that public
bodies are not clear about what the duties might
look like. The Government has not fleshed out
what duties it wants to include in the bill and
secondary legislation. What work has been done
to develop ideas about duties and what discussion
has taken place with public bodies?

Stewart Stevenson: The bill is cast in such a
way that it does not specify duties at this stage.
Essentially, we have a framework bill that takes us
up to 2050. The way in which the bill is
constructed in that regard gives us sufficient scope
over a long period to respond to the circumstances
in which we find ourselves. Including a list of
activities in the bill would carry with it the real
danger that the responses of public bodies would
be restricted to what was on the list. It is much
more appropriate that we approach the issue in
the way that I have described.

The public bodies that we are talking about
include the Convention of Scottish Local
Authorities, Audit Scotland, Scottish Water, SEPA
and the Sustainable Development Commission.
There is a wide range of bodies with different
missions, which will therefore have to do different
things. A list can be an excuse for not doing
something—because it is not on the list—whereas
we would rather that those bodies were firmly
engaged in the agenda and came up with activities
that were appropriate for them. Our ability as an
Administration to take powers in that regard is a
fall-back position, which we hope will never be
used.

Jim Tolson: You mentioned SEPA. It is keen
that the duties should apply to regulators such as
the Water Industry Commission for Scotland.
Should that be the case, in your view?

Stewart Stevenson: The Water Industry
Commission is a regulator that represents the
public interest. Although I sometimes might wish to
do so, I cannot instruct the commission. The
legislative framework does not allow me to do that.
Part of our work with the water industry involves
annual discussions and agreement with the
commission about the sort of things that it will do.
That separation is quite important.

Jim Tolson: SNH has a target of reducing
emissions by 4 per cent, year on year. Should that
be the benchmark for all public bodies?

Stewart Stevenson: As I have said, each must
do what it is possible for them to do. I am
delighted that SNH shows that ambition and is
working up the processes by which it can deliver
on that target. However, it is for each body to look
at what it is responsible for and what activities it
undertakes, and to come up with appropriate ways
in which it can reduce the greenhouse gases that
it might have some influence on. Different bodies
will have different abilities to influence greenhouse
gas emissions. SNH, being an environmental
body, has particular opportunities that other bodies
will not have.

Des McNulty: We heard from Scottish Water
last week that its energy use is on an upward
curve, partly as an unintended consequence of
other policies, including European directives. A
good example might be Milngavie water treatment
works, which was previously gravity fed but which
now does a significant amount of pumping. How
will we take account of the unintended
consequences of directives and balance the
intentions that are set out in that legislation with
what we are trying to achieve with climate change
legislation?

Stewart Stevenson: The member is absolutely
right. Scottish Water's energy needs are rising,
and they are substantial. Much of the modern
water and sewerage infrastructure depends on
pumping material around. Scottish Water has
considerable real estate around Scotland and it is
considering installing renewable energy sources
directly on site, which it hopes will make a
significant contribution to its energy consumption.

The carbon reduction commitment is part of the
issue under consideration here, but we also need
to persuade the public generally of the importance
of making careful use of water supplies. One such
green action—which, although a simple little thing,
presses that particular button—is turning off the
tap when you are cleaning your teeth. That single
action will not save the world, but it is a way in
which people can be engaged on the issue. We
take water for granted but, in the future, we will
have to think about our water usage more
carefully.

We are beginning to have an influence over
European Community regulation in the context of
both its implications for energy use and the
European Union and the European Commission
understanding that their policies must be carbon-
proofed. Nevertheless, we aren't finished with some
of what the European Union is requiring us to do
that will increase Scottish Water’s energy
requirements.
Des McNulty: I am trying to remember the name of the minister who suggested in the midst of the water shortage crisis that people should share bath water. I do not think that he lasted very long.

The Convener: All in the name of good fun, surely.

Des McNulty: Absolutely.

Stewart Stevenson: It would depend on whether the water was shared serially or in parallel. People can do either.

The Convener: Each to their own.

David Stewart: Does the minister share my view that Scottish Water must set a good example? Until recently, it was losing half of all the water that it treated; now, it is losing a third of it. I give Scottish Water credit for moving in the right direction, but there are massive climate change implications to that.

Stewart Stevenson: David Stewart is absolutely correct. The target for water leakage was the one target that Scottish Water did not meet last year, although it missed it by a pretty narrow margin. It is an issue of considerable focus, and I look forward to Scottish Water not missing its targets. Because of its huge energy usage, Scottish Water is seeking to account more broadly for its carbon footprint and to use that information to test engineering and other initiatives that it proceeds with.

Des McNulty: Let us turn to the financial memorandum and the issues that were raised by the Finance Committee, which I think need to be addressed. When the Cabinet Secretary for Finance and Sustainable Growth and I were members of the Finance Committee, we were hard on financial memoranda that said that there would be relatively little cost involved in setting up a framework, although the bill in question put in place a mechanism that allowed the Government to produce secondary legislation that was uncosted in that bill but was a necessary consequence of delivering the bill.

Bearing in mind what the Finance Committee has said and the criticisms that it has made, do you consider it possible that you can deliver a significantly improved financial memorandum in time for stage 3, as has happened for a number of previous bills?

Stewart Stevenson: It is important and self-evident that the bill has always been, quite properly, about creating a framework to 2050. However, we do not know what our scientific understanding of the climate change agenda is likely to be in, for example, 2030 or 2040. The work of Sir Nicholas Stern has probably given us the most rigorous insight that is available at the highest level into not only the cost of dealing with climate change but, more fundamental, the cost of not dealing with climate change. However, even Sir Nicholas Stern, with the considerable expertise on which he could draw, had to come up with bands of outcomes and bands of costs that do not absolutely pin things down.

The cost of not dealing with climate change is clearly very high—it is 10 times or so the cost of dealing with climate change. I thought that Adair Turner put it well when he appeared in front of a Westminster committee—I think it was a House of Lords committee, but I am not certain. He said, with reference to the cost of 2 per cent of gross domestic product that Sir Nicholas Stern mentioned—I hasten to add that this was before the credit crunch came in—that the effect of climate change would be that, with a 3 per cent growth in the economy, the growth that we would expect to be delivered in January 2050 will instead be delivered in June 2050. I think that that is more or less what he said. That gives us a sense of the impact of dealing with climate change and illustrates that it is not quite what we might otherwise think.

Will we update the financial memorandum? As a matter of course, we certainly expect to update it to reflect any changes that we make at stage 2. However, it is inevitable in such a bill that we are dealing with estimates. The figures are not undebatable and they cannot be made so. They give the best ranges of figures that we can give. We will create the cost framework as we proceed to set budgets and annual targets, and we will have to bring forward a description of what the costs will be at that point. I do not think that there is any way in which we can import into the financial memorandum certainty about all the costs. I am afraid that I do not accept that that will be possible. We will have to introduce substantial secondary legislation during the period to 2050, and we will have to bring forward the financial costs of what is done at that stage.

I return to my point that Sir Nicholas Stern has given us a clear understanding—it is probably the best available understanding, and it is being relied on in other jurisdictions outside the UK—of what the costs are.

Des McNulty: Budgeted costs for the period between 2020 and 2050 could hardly be anything other than speculative. However, as I said at an earlier stage, I regard early action as the single most important thing in taking the agenda forward. Obviously, we are much closer to 2012, 2015 or even 2020 than we are to 2050. A substantial body of evidence is available to us—including in the reports that you have mentioned—that shows
that what is required is a spend-to-save exercise, whether that is in transport, energy efficiency or alternative means of energy generation.

In that context, it does not seem inconceivable that we could come up with a five-year budget for taking the climate change agenda forward or that we could make regulatory assessments that reflect what you expect to introduce within a foreseeable budgetary period. I am talking not about the period to 2050 but about a period of five to seven years. It seems to me that that is eminently reasonable, but you have not attempted to do that. In principle, Parliament should not make big commitments to things that will be very expensive to deliver without some systematic attempt to quantify the costs.

The Convener: Briefly, please, Des.

Des McNulty: I accept that the bill is a framework piece of legislation, but it contains some specific proposals that have direct cost implications. You propose a regulatory assessment regime, and the bill will have a significant impact on the budgetary decisions of the Government and other public bodies. Some public bodies are vague about that, as we heard from COSLA last week. Do you accept that it is imperative that we get a much stronger financial memorandum than we have at present?

Stewart Stevenson: The member used the phrase “much stronger”. What I am being asked for is something that gives us a better insight into the costs than what is on the table. It is clear that we will gain further information, and we will update information. We will update the financial memorandum in the light of changes to the bill at stage 2 and publish further financial information as part of our policy response in the middle of next year. Therefore, quite a lot will happen.

On the range of costs relating to non-domestic buildings, for example, it is clear that the consultation on the next generation of building regulations will change things. Indeed, things will change quite dramatically in all sorts of areas, and they will change the numbers. The UK Committee on Climate Change will give information on costs and cost effectiveness.

The member mentioned spending to save. Doing so is, of course, correct. He also returned to what he said earlier about the need for early action. We need to get the balance right. Counterintuitive things will undoubtedly emerge, and we must be confident that taking a particular action will not cost us money that could be better spent in other ways. There are issues around that. Activities relating to adaptations are also being undertaken in the UK risk assessment that is due for delivery in around two years’ time.

Costs will continue to evolve, develop and be reported on. We will change the financial memorandum as we proceed and seek to respond to the comments of the Finance Committee and to those of the Transport, Infrastructure and Climate Change Committee when it reports.

The Convener: Des McNulty should be very brief.

Des McNulty: If you will the end, you have to will the means. It is not impossible to quantify within a relatively short timeframe what the means might be to get to the first step. I am looking for a sense of the financial commitment that the Government is prepared to make to tackle climate change, because doing so is not free.

Stewart Stevenson: Of course, Sir Nicholas Stern would say that it is cheaper to tackle climate change than not to do so. I am not suggesting that doing so is free—neither option is free; both will cost money—but until we table annual targets, for example, we cannot start to home in on key numbers that relate to the targets. There will be one financial figure if target A is set and a different figure if target B is set—members should note that I am not using numbers so that I do not create an opportunity for misunderstanding.

We will consider matters, but a great deal of work will take place over the period to 2050 and ministers will constantly have to report on costs. Indeed, ministers will need to produce budget lines in their annual budgets that will support and sustain what needs to be done to tackle climate change.

Charlie Gordon: In recent oral evidence, the Scottish Trades Union Congress expressed disappointment that a bill of such a magnitude is not accompanied by a jobs impact evaluation. Will you consider trying to develop such an evaluation?

Stewart Stevenson: We have been clear that we see significant opportunities for new jobs in Scotland because of our unique advantages, particularly in energy. We do not want to raise false hopes, but it is clear that there will be substantial employment benefits if we exercise leadership here, get engaged with the new industries, particularly the tidal energy industry, and continue to develop our hydro power and wind power resources—we have increasing offshore wind power resources. We do not see the bill as being a negative for employment; indeed, we take quite the contrary view.

16:30

Charlie Gordon: You make a familiar point. A number of witnesses have pointed to the potential that you describe, but none has been able to quantify it. I share your hopes of additional employment opportunities in Scotland. The STUC expressed the view that, if the bill is enacted, it is
entirely possible that some jobs may be lost in enterprises with intensive energy use. I am interested in hearing about where the potential downside for jobs may lie. Can we try to get to grips with both the net and gross positions?

Stewart Stevenson: We are looking at a potential uplift of 16,000 jobs. The Government’s central purpose is sustainable economic growth.

Charlie Gordon: Is that a net figure?

Stewart Stevenson: The figure is for 16,000 new jobs—I do not claim that it is a net figure. However, in industries that will have to make changes in response to the climate change agenda, there will be considerable work in conversion and adaptation, as we add technologies. There will be the potential for employment opportunities even in the industries in which the greatest amount of change takes place.

I cannot give the member absolute certainty, but I can point to the UK Government’s low-carbon initiative, which suggests that there may be 400,000 jobs in the low-carbon economy. In the longer term, the 16,000 figure that we have identified probably represents the least of our ambition and the least of the outcomes that we can expect, as the Administration in Scotland probably has the greatest set of opportunities in the UK. There will clearly be changes to carbon-intensive industries such as coal-fired generation. However, we are likely to continue to be a net exporter of energy; the proportion of our energy that is exported should rise even in the coal-fired sector. Although the specific skills may change, there is every chance that employment will continue to grow.

Charlie Gordon: I am looking not for absolute certainty—that would be unreasonable—but for the avoidance of uncertainty in the minds of thousands of people, given that we are in a recession. I am not suggesting that we abandon the bill because we are entering a recession, but we must understand that the recession has created a great deal of uncertainty in the minds of the working population. I ask you and your officials to consider doing a bit more work to identify all the potential job impacts of the bill—the downside as well as the upside.

Stewart Stevenson: The recession creates a set of challenges—that is why this is precisely the right time for us to focus our efforts on the bill’s potential to create new jobs. In his report, Nicholas Stern focused on the opportunities that a low-carbon economy creates for any country that signs up to it.

Mr Gordon is correct to suggest that absolute certainty cannot reasonably be delivered. I am happy for us to do more work on the subject, but I do not want unduly to raise expectations about the outcome. I repeat that there are likely to be considerable opportunities even in industries that are carbon intensive—perhaps more than in less-affected industries.

Rob Gibson: Under the Climate Change Act 2008, the UK secretary of state is required to report to the UK Parliament with an assessment of the risks for the UK of climate change. The bill provides that when that happens, Scottish ministers must, “as soon as reasonably practicable”, lay before the Scottish Parliament a programme that addresses the risks for Scotland that are identified in the report.

I am aware of the analysis of responses to the consultation on the Government’s proposed climate change adaptation framework. People made the point that mitigation is a central issue and should not be regarded as simply complementary to adaptation. In theory, the Scottish Government might not need to produce a programme until at least 2012. Are you minded to publish detailed climate change adaptation documents before such documents are statutorily required to be laid before the Parliament?

Stewart Stevenson: You were referring to the first consultation on the adaptation framework, which was the first stage of our engagement with NGOs and wider Scotland. We propose to have annual progress reporting on the implementation of the action programme in the framework.

We seek to go somewhat further than does the UK Committee on Climate Change’s adaptation sub-committee, in which scrutiny is limited to monitoring and commenting on progress of implementation. That is a narrow remit for oversight and I suspect that the UK Government will reconsider it—of course, that is entirely a matter for the UK Government. Three Scottish regions are used in the UK climate change projections. Our studies will be ambitious and we will push the methodology for real-life understanding of what is going on.

In general, adaptation has been running second to other matters in priority. It is good that it is rising up the priority list in the UK and in Scotland.

Rob Gibson: You said that you will be more ambitious. People think that the development costs that are associated with implementing climate change adaptation must be quantified at an early stage. There will surely be an impact on jobs, which Charlie Gordon asked about. It would be well worth being much more specific, so that you can gain people’s confidence.

Stewart Stevenson: We will undertake a second consultation on adaptation, which will be based on what emerged from the first consultation
and will play an important role in developing a way forward. In the meantime, the Scottish Government is part of the UK adaptation sub-committee and is working co-operatively with a broader community of experts.

We will publish the adaptation framework later in the year. As part of the second consultation, there will be much direct engagement, for example through workshops with various bodies, to take matters forward and address the issues that you raise.

Rob Gibson: The committee heard evidence that there is a missed opportunity to increase resilience to the effects of climate change. What other options is the Government considering, which could be included in the bill?

Stewart Stevenson: It is not quite clear to me what those missed opportunities might constitute. Can you flesh out your question?

Rob Gibson: In the context of adaptation to increase resilience, we have been considering the work of the Scottish Environment Protection Agency and Scottish Water, for example. Government agencies and bodies might be able to take a lead. We have also heard about businesses that are gearing up more quickly than others for climate change. Spelling out the opportunities for increasing resilience could cover those matters and many others.

Stewart Stevenson: I made early reference to the May day network, which is involving businesses—the number that I mentioned was 140, which I think from memory is correct—in making commitments that are specific to their businesses. Sometimes, simple but important commitments are made. For example, a restaurant stopped using linen on its tables, because the linen had to be laundered. It went for a different arrangement to reduce its costs and adapt to the situation.

A key Government measure, with which members are familiar, is the Flood Risk Management (Scotland) Bill, which is making its way through Parliament. That deals with a huge mitigation issue that involves working with industry.

We have facilitated discussions with a range of public bodies. A lot of work is going on. We are supporting the May day network and working with the climate change business delivery group. We are seeing the progress that we need. Transport Scotland has just completed a study on landslides and we will work up an appropriate response to that. A range of activities is being undertaken throughout the Government to address the issue.

Rob Gibson: I attended the event on Thursday evening, which was inspirational. It showed that business leaders are taking an important stance that is in some ways far ahead of what we had thought possible.

A plea was made in evidence for the Water Environment and Water Services (Scotland) Act 2003 to be amended to include adaptation. Will the Scottish Government consider that?

Stewart Stevenson: I do not think that we have considered that suggestion, but I am happy to take it away and examine it.

Legislation is one way of doing things, but it is important to work with industry, agencies and NGOs to ensure that things happen. I have just been told—I did not know this before, that is for sure—that sustainable flood management is already part of something that is called the WELLS act—[ Interruption. ] I beg your pardon—it is the WELS act. Philip Wright’s writing is becoming a bit unclear.

Des McNulty: When we first debated the issue in the chamber, I said that the bill’s major deficiency was its lack of a public engagement strategy and targets. Have you had time to reflect on that? Do you intend to propose anything at stage 2 on public engagement? Are you willing to consider amendments on that?

Stewart Stevenson: Public engagement is not about primary legislation, if I may say so. It is a natural and normal part of the process. I make the general point that the consultation on the bill elicited 21,000 or so responses. Every one was considered individually, although a substantial number were part of an integrated campaign and were none the worse for that. Many responses were on pre-printed postcards that individuals who wanted to add information had annotated, so we engaged with that.

A substantial process of engagement has been undertaken. As I mentioned, we will run a series of workshops for the second consultation on adaptation. We will engage with a range of sectors, because different sectors have different needs—the business sector has a different set of needs from the voluntary sector. We will step up the game on engagement.

The Convener: Round 1 has lasted a little longer than we expected, but the subject is important and I am glad that everyone had a chance to explore the issues.

I suspend the meeting for five minutes, after which we will proceed with round 2, which is on the forestry and waste aspects of part 5.
On resuming—

The Convener: The second part of our evidence session will focus on forestry and waste issues. The minister wants to say a brief word before we get started.

Stewart Stevenson: I just want to clarify something that I said earlier. I was misled by reading someone else’s writing and, hence, I have potentially misled the committee. I clarify that there was not engagement at official level in relation to the Conveners Group. In other words, as I said later in my remarks, the offer that we made was essentially a political one. To avoid allowing that misstatement of facts by me to go any further, I correct it now for the record.

The Convener: Thank you. I appreciate that correction. You were under a bit of a blizzard of notes at the time, so the mistake is understandable.

To an extent, forestry and waste issues have been dealt with by secondary committees—the issues have been discussed here and in the other committees. Frustration has been expressed that the policy areas that are covered in the bill are still the subject of consultation processes. Does the Government consider it good practice to introduce legislation in policy areas for which the consultation process has not yet been completed and the results are not yet known by parliamentary committees, whose job it is to scrutinise that legislation?

Stewart Stevenson: We would certainly prefer to have completed the consultations, wherever we can, not simply to inform the deliberations of committees. Frustration has been expressed that the policy content is not added to the bill at stage 2, substantive changes to the legislation will put us in a similar position, in that we will not have the full range of responses from stakeholders or an analysis of their positions?

Stewart Stevenson: I absolutely accept that, although I could draw some parallels. I recall that, in opposition, I was intensively involved in the Land Reform (Scotland) Bill, which was the subject of more than 1,000 amendments—I cannot remember the exact number, but it was very substantial—by the end of stage 3. Substantial policy changes were made to that bill at stage 3 because the dynamics of the process of developing a bill can lead to that sort of position. However, I do not think that we are in that position with the Climate Change (Scotland) Bill.

The convener asked me at the outset whether I accepted that it would be better that consultations were not undertaken at this stage. I absolutely acknowledge that, in an ideal world, that would be the case. However, I think that we are doing as well as we can. We will work closely with the parliamentary committees.

The Convener: I have a final question on the matter, which I recognise is an issue of process. Does the Government accept that, if it proves necessary for committees—either this committee or other committees—to take further evidence at stage 2, the need for further evidence taking will

the range of stakeholders that might want to contribute to the consultation process.

Stewart Stevenson: We have sought to engage with committees by putting up the appropriate officials and ministers to ensure that we inform Parliament of the decision-making processes behind the inclusion—or, for that matter, omission—of different provisions in the bill. A wide range of issues can emerge, given that quite a lot of research is taking place. For example, the AEA Technology study “Mitigating Against Climate Change in Scotland: Identification and Initial Assessment of Policy Options” was only recently produced.

It might be helpful to confirm—I think that I said this before the suspension—that we do not intend to make any new policy additions to the bill at stage 2. That should give ministers some reassurance. It is also worth pointing out that the Rural Affairs and Environment Committee was given access to the preliminary analysis of the forestry consultation responses within two weeks of the close of the consultation period. However, I do not seek to dismiss the substantive point that the convener has made.

The Convener: Thank you. Can I take it that the Government also understands that, even if new policy content is not added to the bill at stage 2, substantive changes to the legislation will put us in a similar position, in that we will not have the full range of responses from stakeholders or an analysis of their positions?

Stewart Stevenson: We have had a range of consultations of one sort or another on the cases that we are talking about. Nonetheless, we are continuing to get new information on a range of subjects, which will continue to inform the way forward. I made the point before—I think that the convener acknowledged this before the suspension—that we are willing to engage in further evidence sessions at stage 2 if that is felt to be of assistance to the committee. That is part of how we would seek to ensure that the existence of consultations that are as yet incomplete does not materially inhibit Parliament’s ability properly to deal with the policy areas that have been referred to.

The Convener: I find it a little hard to see how committees can be expected to endorse the inclusion or implementation of measures in the bill when we are not yet aware of the full responses of
conflict to some extent with the Government's ambition for a speedy legislative process?

Stewart Stevenson: I want to have the speediest possible process—I suspect that that view is probably widely shared—but, given that we are putting in place legislation that will cover the period to 2050, I do not think that ministers should get unduly aerated about an additional week or two. It will be helpful to both parties if the committee and the Government can communicate in a way that gives each the earliest possible indication of any change that might be thought to be of such concern that people might wish to consult on it. If the committee can give Government an early indication of areas of concern arising from our stage 2 amendments—the committee will be in a position to take a view on that as we lodge those amendments at stage 2—I am sure that we can work together on that.

17:00

David Stewart: As you are well aware, there has been a lot of controversy about the forest leasing scheme that one of your fellow ministers proposed. Under the scheme, 25 per cent of the forest estate would be leased out over a 75-year period. You may also know that I lodged a series of parliamentary questions on the subject and that period. You may also know that I lodged a series of parliamentary questions on the subject and that I have raised the issue a number of times, including in the recent debate.

Time does not allow me to go into the proposal in detail, so I will keep my remarks brief. From the answers that I received, the bottom line is this: the idea came from City of London bankers Rothschild, which—as the minister knows—was Margaret Thatcher's favourite privatisation bank. The proposal has been widely condemned across the political fold and the vast majority of consultation responses were extremely critical.

As the Rural Affairs and Environment Committee report shows, all the evidence that it received on the issue was critical. That committee recommended to this committee that the Government should not progress the leasing proposal and that it should amend the enabling section of the bill to that end. As the minister knows, the unions and rural and urban communities, too, have widely condemned the proposal. My instinct on this, albeit that it could be wrong, is that the Government will pull the proposal; the question is simply when that will happen. I give the minister the opportunity today to withdraw the proposal, which is badly thought through. Leasing would be disastrous for rural communities, damaging for jobs and—frankly—would not do a lot for climate change.

Stewart Stevenson: It is important to consider what the Government is trying to achieve with Scottish forestry. We are trying to ensure that we up the ante on planting. Of course, we have a new Minister for Environment who has, under her portfolio, primary responsibility for this part of the bill. We received more than 500 responses to the consultation on the forestry proposals. Many parts of the proposals have been welcomed, particularly those on joint ventures.

The consultation closed on 27 January. The Minister for Environment has said, quite properly, that the proposal is a key area for her consideration. She is reviewing the consultation processes and discussing the issue with officials. I am sure that she will come to an appropriate decision. We have, quite properly, to allow the new minister time to consider the consultation responses and the objectives that the Government had in mind when it made the provision to which the member refers.

David Stewart: My next question is linked to the first one. The vast majority of people who took part in the consultation on the bill were highly critical of the leasing proposal. However, there is a bit more support for joint ventures. As the minister knows, that aspect was supported by the Labour-Liberal Democrat Administration. The minister and his fellow ministers have my support for the work that is being pursued on that front, particularly in renewables projects. Could you bring forward only that aspect of the proposal, perhaps by way of a stage 2 amendment?

Stewart Stevenson: Unless I have misunderstood the situation, the provision on joint ventures meets needs. Support for that provision is shared across the Parliament. Indeed, political representation can make a contribution in going forward on the issue. If members consider that it would be useful for amendments to be lodged, I would be interested in engaging with them on the subject. I broadly welcome the acknowledgement that the inclusion in the bill of the forestry provisions is a good thing, and something that will help the climate change agenda.

As I said, on this aspect, as on all of the provision, the Minister for Environment is looking at the issue. I welcome the member's broad acknowledgement that, on this aspect, the Government is aiming in the right direction, even if he remains substantially sceptical on one particular provision.

Rob Gibson: The minister mentioned the consultation responses. Did any of the people who opposed the leasing proposals, which have been controversial, make any other proposals that might help us to raise funds so that we can help to plant more forests at an early stage to mitigate climate change?
Stewart Stevenson: The comments in the consultation have focused largely on what should not be done. However, to bring a sense of balance, I should say that there has been substantial support for the proposals on joint ventures and substantial acknowledgement of the important role that forestry plays in Scotland’s climate change agenda. Our forests represent a huge way by which carbon is extracted from the atmosphere. We are planting something in the huge way by which carbon is extracted from the climate change agenda. Our forests represent an important role that fore...
that provision, and there are a number of strands to the criticism. One is the fact that a similar proposal was examined by the former Environment and Rural Development Committee and unanimously rejected.

Another argument is that, whatever case you make for taking such an approach to plastic bags, you cannot make a climate change case, because the substitution of paper bags or higher-density bags for single-use plastic bags generates higher emissions. Given that your arguments are so heavily based on evidence and are geared towards reducing emissions, will you reconsider whether the proposals in section 59 are appropriate in a bill on climate change?

Stewart Stevenson: I draw the member's attention to the fact that the provision is not about plastic bags but about carrier bags in general, whether they are paper, plastic, woven, hessian or whatever. It is about focusing on individual users of shops and supermarkets and getting them to reuse their bags.

It is interesting that the public and supermarkets have already responded to the issue. Action is being taken: there has been a 26 per cent reduction in the use of bags over the past couple of years—2006 to 2008—which has been very much driven by the large supermarkets. The provision in the bill is a backstop to ensure that progress continues to be made.

We must remember that the feed stock that is used to produce plastic bags is oil, which we will increasingly want to use for other purposes—not necessarily transport, but the chemicals industry generally. Although the provision is a backstop, it is an important part of the bill. In a sense, it pushes at an open door, but its inclusion ensures that the progress that is being made will continue.

17:15

Des McNulty: The Cabinet Secretary for Rural Affairs and the Environment stated that there are signs that, as you suggested, progress is being made through the voluntary agreement on reducing the number of carrier bags given out by 50 per cent by May 2009. If that target is achieved or looks like being achieved, will you reconsider the charging proposal?

Stewart Stevenson: The proposal would give ministers the power to make regulations, which would be subject to the usual parliamentary process. It is a good opportunity to pick up on an agenda that has widespread, if not unanimous, support. We are not minded at present to make any changes to section 59 as it is important for ministers to have the power to use in future. A 50 per cent reduction by later this year, which is possible, would be good progress, but it would not make the provision redundant because 50 per cent would remain to be dealt with. It is sensible to have such a provision, and surveys have shown that a substantial majority of the population is in favour of charging for carrier bags.

Des McNulty: The measure was the most criticised and negatively received in the consultation. You said that it is valuable as a backstop but have not made a substantive case for its inclusion in the bill. You said that you might wish to use it if other measures do not work, but you have not provided any justification for its effectiveness. You are proposing legislation that is fundamentally about climate change, but it is hard to tie the measure to positive climate change outcomes. Is its inclusion in the bill justified? If you want to introduce it, there is an argument for introducing separate legislation on it, but I am not sure that it is justifiable to include it in the bill.

Stewart Stevenson: I will make a number of responses to that. First, charges for carrier bags are part of the UK Climate Change Act 2008. In itself, that does not justify our introducing charges, but it gives me a little political cover with the member, if I may so put it. On a consensual occasion such as this, I will not push that point particularly hard.

The need for early action has come up on two or three occasions. The carrier bag issue is multifaceted: it certainly concerns the consumption of carrier bags but it is also of broader relevance to the consumer society. If, for whatever reason, people had less bag space to fill when they went to the supermarket, they might be more focused on whether they needed to make purchases. I do not know whether charging for carrier bags would have effects beyond the consumption of carrier bags and would mean that less waste food was purchased because there was less space but, over the long term, it could influence behaviours much more widely than simply encouraging people to stick a couple of old carrier bags in their pockets before they go down to Tesco.

The provision has the potential to influence behaviours in ways that undoubtedly support the climate change agenda by reducing the consumption of what are perhaps unnecessary quantities of goods. That feeds into the reduction of the manufacturing carbon cost of the associated items and the transport costs of goods going from wholesalers and distribution centres to supermarkets. Although the provision seems like a small part of the bill and not to have a large impact when we consider it in a narrow sense, it is in fact one of those interesting measures that opens the door to a wide range of second-level and third-level effects that might deliver quite a bit. I therefore have no great difficulty in justifying its inclusion in a bill about Scotland's climate.
Des McNulty: You would be on much firmer ground, quantifiably, if you banned packaging associated with pre-packed food or if you introduced measures in your role as planning minister to prevent supermarkets from having such large car parks. Either measure would deliver much better climate change outcomes.

I will move on to discuss commercial and industrial waste, which comes under sections 52 and 53. How will you balance the need to be sensitive to the requirements of business with the need to address climate change? More specifically, what is the Government’s latest thinking on waste for energy, which has a double benefit in this context?

Stewart Stevenson: I am delighted to have the implied support of the member for expanding the powers of the Scottish Government so that we could ban packaging, which we cannot do with our current powers.

The member talks about converting waste to energy. As it happens, yesterday I visited Artemis Energy near Motherwell, where I saw a wide range of materials—some of which I would not wish to discuss in public, because they’re no very nice things—that are converted into energy. We are very interested in further progress being made on that. The support for biofuels through the tax regime has changed a bit, but they can still make a useful contribution.

The issue of waste is important for business. The more waste any business produces, the more material it is paying for but not using, and the more material it is having to dispose of and pay someone to take away. Business in general is pretty much seized of the waste agenda. I visited the Tesco distribution centre in West Lothian a few months ago, and I saw that huge efforts are being made to get cardboard in from all the branches and to deal with waste issues. If the company had less cardboard, it would cost less to deal with it.

One of the Ayrshire councils has the highest rate of recycling at the moment, with a 25 per cent cap on the initial—[Interruption.] I beg your pardon: the cap of 25 per cent is for energy from municipal waste. The issue is about recycling and prevention rather than anything else and, as such, it is proper that we should deal with it in the bill.

The Convener: There are no further questions for the minister, in which case we have got through round 2 rather more quickly than we got through round 1. I thank the minister and both the groups of officials who joined him for their time and for answering our questions.

We have already agreed to take item 3 in private.
At the Transport, Infrastructure and Climate Change Committee meeting on 10 March I offered to write to you to provide more detailed information about Scotland’s potential emissions reduction trajectory. This technical information is contained in Annex A to this letter.

I also agreed to set out further detail on amendments to the Climate Change (Scotland) Bill which the Scottish Government is considering bringing forward at Stage 2. This information is contained in Annex B.

It is my intention that the Scottish Government will, as far as possible, seek to lodge its amendments in the Scottish Parliament at the start of the Stage 2 process to increase the time available for consideration. A factual briefing note will also be provided for Committee members ahead of the first Stage 2 session to clarify the purpose of the Scottish Government amendments.

In terms of expert advice requested by Scottish Ministers prior to bringing forward an order to establish annual targets, I can confirm that Scottish Ministers intend to seek advice for the first batch of annual targets from the UK Committee on Climate Change and that it is my intention that this advice be published.

It may be helpful if I clarify that it is my intention to formally request this advice when the Bill completes its Parliamentary passage. I feel it would be premature to seek that advice formally when the Parliament is still in the process of scrutinising the Bill and the final format of the Bill remains to be determined.

In the meantime the ongoing liaison at official level will continue to ensure the UK Committee on Climate Change is kept up to date with developments on the Bill.

I hope the Committee find this information useful.

STEWART STEVENSON MSP
MINISTER FOR TRANSPORT, INFRASTRUCTURE AND CLIMATE CHANGE
CLIMATE CHANGE (SCOTLAND) BILL

INTRODUCTION

1. Scottish Government officials have been undertaking analysis of the deliverability issues surrounding the proposal to introduce three percent, year on year, annual reductions to 2019, into the Climate Change (Scotland) Bill. Annual targets must be set which will ensure that we meet our interim and 2050 targets but these targets must be deliverable. Given the importance of this issue we see it as useful to provide the Committee with an insight into this analysis.

2. It is stressed that the figures set out in this paper are early estimates of potential savings and work is ongoing to produce more refined information.

3. A Strategic Overview project is underway which will deliver a high level discussion document for publication later in 2009. This will set out in broad terms the key sectors for abatement in the short, medium and long term and high level policy options around these, highlighting the key milestones in policy development and delivery and barriers to implementation. This work is a prerequisite for the more detailed statutory Report on Policies and Proposals (section 30), to be published in 2010, which will set out how Scottish Ministers will meet their annual targets over the period 2010 to 2022.

BACKGROUND

4. To achieve our 80% emissions reduction target will require an average annual reduction of more than 3% per year to 2050.

5. In 1990, Scotland emitted 70 Mt CO\textsubscript{2}e, including international aviation and shipping. Taking account of the EU ETS, this had fallen to 58 Mt by 2006, a reduction of 18% in 16 years.

6. Scotland’s emissions are split between the traded and the non-traded sector. The traded sector is a reference to that sector which is covered by the EU Emissions Trading Scheme (ETS), an EU-wide carbon trading scheme. Scotland’s power stations and other energy intensive industrial installations fall within the scope of the ETS. These installations currently account for just under half of Scotland’s emissions.

7. Carbon emissions reductions to be achieved through the ETS are now to be agreed at an EU level and the proposed reductions are consistent with delivering the UK Committee on Climate Change’s (CCC) proposed “Interim Target” of a 34% reduction in emissions in 2020 from 1990 levels.

8. In offering its advice in December 2008 on the UK’s carbon budgets, the Committee on Climate Change presents two scenarios for emission reductions to 2020:

   - **Interim Target - 34% emissions reduction - Extended Ambition (all synonymous)** – based on measures costing less than the forecast carbon price (£40/tCO\textsubscript{2}e in 2020) plus measures costing more than the forecast carbon price that are important stepping stones on the way to 2020. These are mostly policies to which the Government/EU has already committed in principle. The CCC has produced a **Scottish Abatement Potential** which broadly equates to an “Extended Ambition” for Scotland.

   The Extended Ambition is based on current international circumstances, under which the EU has a target to reduce emissions by 20% by 2020. The EU has committed to raising its target to 30% if a new international agreement is reached at Copenhagen. In this 30% world the CCC estimates that the UK should reduce emissions by 42% by 2020. Also in this 30% world, the traded sector would be expected to achieve much greater emissions reductions. The CCC’s second scenario is therefore:

   - **Intended Target - 42% emission reduction - Stretch Ambition (all synonymous)** – based on Extended Ambition plus further feasible abatement where there is no
current policy commitment. This includes more radical new technology deployment and more significant lifestyle adjustments. This target is proposed on the basis that there is a new international agreement. The CCC notes that, in the non-traded sector, the contribution to the 42% target can be either by increased domestic abatement or through the purchase of international credits.

**KEY POINTS**

9. A trajectory based on 3% annual reduction in Scotland’s emissions from 2010 equates, roughly, to a 43% reduction in 2020 against 1990 levels.

10. Given that emission reductions from the traded sector are, in effect, pre-defined at the level of the Interim Target (34%), for Scotland to achieve 3% annual reductions between 2010 and 2019 would require the bulk of the savings to come from the non-traded sector, by which we mean very significant carbon savings from energy use in heating buildings, from transport, waste, agriculture or forestry.

11. Emissions in the non-traded sector would need to be reduced by 4 - 5% each year, with emissions in 2020 needing to be around 12 MtCO\(_2\)e lower than in 2009. Based on current trends, emissions are projected to rise by 2 MtCO\(_2\)e by 2020. The total annual saving required in 2020 is therefore some 14 MtCO\(_2\)e.

12. The CCC estimates that the measures it recommends to meet its Interim Target, to reduce UK emissions by 34%, could deliver a saving in Scotland of around 5 MtCO\(_2\)e in 2020.

13. Savings obtained by Scotland adopting a pro rata share of the measures to meet the CCC’s more radical, Intended Target, to reduce UK emissions by 42%, would only add a further 1.4 MtCO\(_2\)e in 2020. Not all of these savings would be available because some of them relate to UK and EU measures which are not currently being implemented.

14. At best, this leaves a gap of over 7 MtCO\(_2\)e in 2020 which would need to be filled by much more radical measures in the non-traded sector.

15. Examples of the measures that could contribute to the delivery of the CCC’s Interim and Intended Targets are set out in Columns 1 and 2 of Table 1. These are the type of measures which would have to be taken even before attempting to fill the 7 MtCO\(_2\)e gap with more radical measures. Column 3 gives some examples of such radical measures.

16. To note that the savings identified are all additional savings. For example, the savings identified in Column 1 are additional to the savings that the CCC has identified as being delivered by current policies and incorporated into their baseline emission figures.

17. It is important to note the relatively small savings that these measures deliver in comparison to the 7 Mt shortfall.

18. These more radical measures are also likely to be significantly more costly that those included within the Extended (34%) or Stretch (42%) Ambitions. Whereas for the Extended Ambition, costs are largely at or below £40/tCO\(_2\)e, radical options for buildings, which would necessarily focus on renewable heat and microgeneration, could have costs up to and beyond £300/tCO\(_2\)e. Additional eco-driving measures are likely to have no or negative costs (i.e. save money) across society in the long-term. However, there may be up-front costs to government to stimulate the initial adoption of eco-driving practices and the additional savings are relatively small.

19. It is also worth noting that although there may be a net cost saving over the lifetime of measures, there may well be considerable up-front costs in delivering cost effective measures.

20. A further point is in respect of the supply side. In most, if not all, carbon savings measures, there is the need to increase the capacity of the supply chain to deliver. This cannot happen overnight and it would be unreasonable to expect it to. There is little point in having targets that we fail in year one. An acceleration of effort is required but we need time to ramp up our efforts.
CONCLUSION

21. Policy levers and agreements at the UK, EU and international level are crucial in assisting Scotland to meet its ambitious climate change targets.

22. The CCC recommended that, if there is an international agreement at Copenhagen later this year, then the UK should move to the Intended Target of 42%. The Scottish Government will review its position in light of any new international circumstances and advice that it receives.

23. Scotland’s annual emissions reduction targets must be stretching and ultimately, deliver 80% reductions by 2050. However, they must also be achievable in order to retain credibility. The Bill requires that we set our annual targets following receipt of advice from the “relevant body” which in the first instance is to be the Committee on Climate Change. This advice will be in the context of the 2020 interim target to be inserted into the Bill. The CCC has already shown that it will not shirk from recommending demanding targets. Crucially, though, their advice will be based on expert and independent analysis of real emissions abatement potential, and that seems the sensible way to go forward.

Proposed Stage 2 Amendments

2030 interim target

In recognition of the growing support for the inclusion of a 2020 interim target in the Bill and the ambition expressed in the first UK Committee on Climate Change (CCC) report for the first set of UK carbon budgets (published on 1 December 2008), Scottish Ministers intend to bring forward amendments to section 2 at Stage 2 to replace the 2030 target with a 2020 target. This has two benefits:

First, an ambitious 2020 target will help incentivise early abatement action because it sets a key target that the annual targets must deliver.

Second, it aligns Scotland with our partners in the UK Climate Change Act and with the timelines for key EU targets on climate change, renewable energy and energy efficiency. Significantly, policy levers are held at an UK and EU level and Scotland will not be able to deliver its ambitious targets on its own.

Scottish Ministers are currently considering the level at which the 2020 target should be set. In deciding upon the level of the target, Scottish Ministers will have regard to:

- Advice on targets and on emissions abatement potential set out in the CCC’s December 2008 report which identifies savings at a UK and Scotland level;
- Analysis of the Scottish emissions abatement potential identified in the CCC report and ongoing analysis within the Scottish Government of the key areas;
- Other publicly available advice, including the AEA report Mitigating Against Climate Change in Scotland;
- Carbon budgets and the 2020 target adopted by the UK Government - important because of the emissions reduction policy levers held at the UK level and the very close economic, infrastructure and geographical ties Scotland has with other parts of the UK; and
- Current and future international agreements on emissions reductions and the prospect of the EU adopting a 30% emissions reduction target for 2020 in the event of an international agreement being reached at Copenhagen.

International aviation and international shipping emissions

Scottish Ministers are aware that concerns have been expressed that section 14(1) of the Bill does not commit Scottish Ministers to include greenhouse gas emissions from international aviation and international shipping. Scottish Ministers will therefore seek to amend the Bill at Stage 2 to:

- remove any ambiguity that an order will be brought forward in this regard; and
- introduce a deadline by which the Scottish Ministers must lay the first order under section 14(1).

Scottish Ministers will require the power to make subsequent orders under section 14 (1) to allow the methodology for Scotland to be changed in line with any future international agreements on the apportionment of emissions from international aviation and international shipping.

Duty of public bodies to take action on climate change

Section 36 of the Bill contains powers which enable the Scottish Ministers to make provisions by order imposing on public bodies duties relating to climate change. You will be aware that there has been considerable discussion with Committee witnesses on whether the Bill should contain an explicit duty on public bodies rather than enabling powers. Scottish Ministers are considering options in this regard including linking a potential duty with sustainable development. This will be discussed further with COSLA whose support will be required.
Limit on the use of carbon units

As it has always been Scottish Ministers’ intention to prioritise domestic emissions reductions, options are being considered for limiting the amount of carbon units which may be used to credit the net Scottish emissions account for any given period including when such limits may be introduced. This would restrict the amount of emissions which Scottish Ministers may offset, thereby placing greater emphasis in achieving emissions reductions within Scotland.

Scottish Ministers are aware that this is a complex area, and that any limit on carbon unit use must be drafted in such a way that it does not interfere with the operation of trading schemes such as the EU Emissions Trading Scheme.

Muirburn

It is Scottish Ministers intention to bring forward an amendment to section 46 of the Bill (which contains a new section 23A of the Hill Farming Act 1946), so the order making power is subject to affirmative parliamentary procedure, and so that the power cannot be exercised so as to reduce the current number of days comprising the permitted muirburn season.

Forestry

As you will be aware, following the announcement made on 13 March by the Minister for Environment, the Scottish Government has decided not to take forward the provision in the Bill which would enable parts of Scotland's national forest estate to be leased. An amendment will therefore be made seeking the removal of section 47(4).

Energy Efficiency

Scottish Ministers will seek to amend section 48(2) to replace the word “promote” with the word ‘improve’ to change this provision to “improve” the energy efficiency of living accommodation. The action plan prepared under section 48(1) will therefore aim to promote energy efficiency, having particular regard to improving the energy efficiency of housing.

Energy Efficiency of Non-Domestic Buildings

Following the conclusion and analysis of the consultation on the proposals for improving the energy performance of non-domestic buildings, Stage 2 amendments will be brought forward to amend section 50 to enable, through secondary legislation, mandatory implementation of cost-effective improvements to existing non-domestic buildings. Any SSI made under this provision would be subject to affirmative resolution.

It is not intended that this provision would be utilised immediately and as announced in the response to the consultation, a voluntary approach will be adopted initially to the implementation of cost-effective improvements to existing non-domestic buildings. This regulation making power is intended for future use if a voluntary approach is considered inadequate for delivering emission savings.

Draft ‘mock’ regulations for this will be provided for the Transport, Infrastructure and Climate Change Committee to consider before Stage 2 of the Bill process begins. These draft regulations will also be shared with the Economy, Energy and Tourism Committee.

Renewable Heat

Scottish Ministers will seek to amend section 51 to introduce a commitment to produce a renewable heat action plan and to update it regularly.

Waste Reduction and Recycling

Amendments to section 58 will be sought at Stage 2 to refine the deposit and return provisions in the Bill to do the following:

- ensure that any deposit and return scheme can be operated under a clearing-house system;
- extend deposit and return schemes to items other than packaging; and
- address splitting the deposit, or making charges, to ensure that the costs of running a scheme can be covered.

**General technical amendments**

In addition to the amendments in key areas which are detailed above, Scottish Ministers intend to introduce a small number of technical amendments to existing Bill provisions.
ANNEXE D

List of other written submissions in response to the call for views from the Transport, Infrastructure and Climate Change Committee and the Rural Affairs and Environment Committee.

Transport, Infrastructure and Climate Change Committee responses which focussed primarily on the main provisions of the Bill as set out in parts 1-4:

Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

Aberdeen City Council is fully supportive of the ambitious proposals for an 80% reduction target for 2050 and the inclusion of aviation and shipping emissions.

Q2 The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

What are your views on the setting of targets in batches from 2010 to 2022?

The Council supports the achievable interim targets set out from 2010 to 2022. These are essential to promote early and continued action however it must be stipulated that for a Local Authority budget reporting periods should be in multiples of four to reflect the political cycle.

Q5 The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

The Council accepts that the definition of Scottish emissions is to be based on source emissions due to the complexity of other emission accounting proposals. The Council is also supportive of the inclusion of international aviation and shipping emissions.

Q6 The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government’s approach to obtaining independent, expert advice on climate change?

The Council agrees with the Scottish Government gaining expert advice from the UK Committee on Climate Change in the short term. However, it may be required to clarify when the Scottish Ministers intend to review the effectiveness of the advice from this Committee.

Q7 The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?
Aberdeen City Council would like to emphasise that the reporting mechanism regarding electricity generation should exclude any electricity generated from renewable sources for example Photo Voltaic or biomass CHP as this displaces electricity drawn from the grid or any electricity that feeds carbon neutral electricity into the grid. After all the aim is to report on electricity that adds to carbon emissions.

Q12 The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?

Aberdeen City Council welcomes the proposed action plan but would like to see a commitment that Scottish Local Authorities will be given the lead responsibility for achieving carbon emission reduction in the domestic sector. This legislation will form the basis for the next stage in the Home Energy Conservation Act. The Council is aware that responsibility for this may fall to a non profit organisation such as the Energy Saving Trust, and are concerned that they may not be able to deliver.

Q14 The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

What are your views on this proposal?

The Council agrees with the proposal for renewable sources of heat however believe that the provision should be extended to incentivise the utilisation of waste heat even when it comes from non-renewable sources for example to heat buildings or greenhouses in market gardens. If this were included, waste heat from centralised electricity generation or from a range of industrial processes could be captured and used in district heating schemes in the short-term to displace other forms of space and water heating. That displacement would reduce carbon emissions and should therefore be included in the provision.

Q15 The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas:

- Waste prevention and management plans;
- Waste data;
- Deposit of recyclable waste;
- Procurement of recyclate;
- Reduction of packaging;
- Deposit and return schemes;
- Charges for carrier bags.

What are your views on these proposals?

Aberdeen City Council is fully supportive of measures to reduce waste and increase recycling as part of an integrated strategy to divert waste from landfill. Currently the Council is developing a Citywide Waste Strategy to deliver this.

Reduction of packaging
The Council agrees with the Policy Memorandum to reduce packaging, however feels that the duty should not primarily fall to retailers. Sufficient duties must also be put on producers to eliminate waste before it is produced in accordance with the Waste Hierarchy. Producers should be required to modify products to encourage refills, recycling and bulk buying.

Deposit and return schemes
Aberdeen City Council supports the provision to set up a statutory deposit and return scheme and has in the past written to the Cabinet Secretary to ask for appropriate legislation to be included in the Climate Change Bill. The Council believes deposit return schemes address many sustainability and waste management policy themes and reinforces the polluter pays principle.

From a Council perspective return and deposit schemes are encouraged as they not only reduce litter but they may also reduce the volume of waste that local authorities are required to handle, thus reducing costs. If such schemes are introduced to the Bill, the Council would lobby for any unclaimed deposit funding to be distributed proportionally to Local Authorities to be used for waste and climate change actions, as seen in similar schemes in California, USA.

**Charges for carrier bags**
Aberdeen City Council fully supports the introduction of charges for single use carrier bags and has in the past fully endorsed the introduction of a tax on single use plastic bags. The Council has been campaigning to reduce the environmental damage caused by plastic bags since 2003.

As a Council we offer re-useable jute bags for a small charge. Dog fouling collection bags are biodegradable and offered for sale. Similarly the bags intended for food waste collection are also biodegradable and made from cornstarch. Aberdeen EcoCity offers cloth bags as a giveaway to encourage reuse and sustainable shopping.

Q16 What are your views on the adequacy of the Scottish Government’s consultation in advance of publishing the Bill?

The Council are happy with the consultation process.
Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

These targets are in line with those in the Council’s previous consultation response.

Q2 The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

What are your views on the setting of targets in batches from 2010 to 2022?

In its previous response the Council submitted that targets should be reviewed every 3 years to ensure they remained realistic. Reasonable advance notice provides an appropriate basis for decision-making.

Q3 The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

Any revision of targets should be based on scientific advice. Delivering these targets will depend on the technological and economic feasibilities, as well as efficiency gains and behavioural change. Building towards the 3% annual reduction prior to then is a realistic goal and would enable business to adapt.

Q.4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

The vast majority of the reduction in emissions at least should take place within Scotland, with offset used as a last resort. Setting a limit on units which can be purchased would ensure the appropriate balance in reduction measures is maintained.

Q5 The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?
The Council acknowledges the practical aspects of using this definition but notes that it has limitations. It ignores the emissions associated with imported goods by being based on production rather than consumption measures. No account is taken of the import/export balance of trade. The Council endorses the inclusion of aviation and shipping, as recommended in its previous response.

Q6 The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government's approach to obtaining independent, expert advice on climate change?

The Council endorses this approach on obtaining independent, expert advice.

Q7 The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland's emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

Regular reporting is an appropriate method of monitoring progress and enabling any changes in measures to be made.

Q8 The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

The proposals are broadly in line with the comments provided previously. However, there remains no duty on the Scottish Government to fund any additional duties imposed on public bodies, including local authorities. The Council considers that there should be a duty on the Scottish Government to provide additional funding. In addition, it would be preferable if there was a duty to consult on the reporting mechanism as well as the duties. This could be through CoSLA.

Q9 The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on this proposal?

The Council previously recommended that adaptation was one specific topic where guidance should be provided. This proposal will set a framework for this.
Q10 Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are your views on this proposal?

The Council would be supportive of this, subject to decisions being based on scientific advice.

Q11 The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

The Council has submitted a separate response to the Forestry Commission Scotland (FCS) on its consultation on the potential legislative changes contained in the Climate Change (Scotland) Bill. The Council agreed that FCS could enter into joint ventures in renewable energy projects on the national forest estate. The Council raised a number of points, including: leased land should be retained for forestry; ring fencing funds for woodland creation; maintaining biodiversity and access standards, community relationships and partnership working; and support for the existing forest sector.

Q12 The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?

The early production of an action plan would be welcomed. The action plan should provide clear, realistic guidance and supporting mechanisms, including on the ‘hard to treat’ existing buildings.

Q13 The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government’s thinking in this area.

What are your views on this approach?

It is appropriate that Scottish Ministers are able to make regulations on energy performance of, and emissions from non-domestic buildings. These regulations should ensure that specified requirements not only cover disclosure of data but lead to improved performance. The adoption of the methodology used in England and Wales, by incorporating Display Energy Certificates (DEC’s) alongside Energy Performance Certificates (EPC), will add further credibility to this legislation, enabling actual energy usage to be monitored, reported and ultimately reduced.

Q14 The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

What are your views on this proposal?
Given the high proportion of energy required for heating in Scotland (around 45%), the Council welcomes the duty on the Scottish Government to promote heat from renewable sources. The incentives will need to be appropriate, in funding and timescale, to give sufficient support to installations in this sector.

Q15 The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas: Waste prevention and management plans;

Waste data;
Deposit of recyclable waste;
Procurement of recyclate;
Reduction of packaging;
Deposit and return schemes;
Charges for carrier bags.

What are your views on these proposals?

Section 52. Waste Prevention and Management Plans.
A waste prevention plan should be a plan which implements a strategy to reduce the amount of waste produced. To be effective the wording of section one needs to be adjusted to “to prepare a plan for the prevention of waste produced by or otherwise associated with their activities”

It is clear who would be covered by the term ‘persons of a specified kind’.

To be effective these regulations would have to include or be primarily aimed at manufacturers. This has been done in the past by extending producer responsibility, so the producer is responsible for the whole life cycle of their goods (Waste Electrical and Electronic Equipment Regulations are a prime example). This would follow the ‘polluter pays principle’. Again there is no indication as to responsibility for meeting the costs of such a plan.

The requirement to produce a Waste Management Plan should be part of a reduction plan, not a separate entity. A waste prevention plan is a waste management plan.

The guidance notes do nothing to encourage lateral thinking in terms of waste production. For example, “On a different scale, they might require an office to prepare a plan showing how it will minimise waste – for example by adopting double-sided printing. A person might be required by virtue of subsection (2)(a) to prepare more than one plan, for instance to deal with different types of waste.”

The term “showing how they will minimise waste” is not consistent with section 52 on waste prevention. Printing on both sides of a piece of paper indicates that waste is still acceptable. Replacing the need to use the printed form in the first place is waste prevention. Although the Council has an extensive computer network it still relies on paper forms and publishes committee papers. The latter, for example, could be replaced by electronic reports to be read on ebook type device or laptops in committee.

Section 53. Information on waste.
This information should be readily available as all movements of waste by law must be recorded and all waste facilities have to submit data to SEPA on a quarterly basis.
Section 54. Recyclable Waste Facilities.
This would be difficult to enforce. The waste prevention plan would cover the instances given in the guidance notes such as offices having paper collections. The original discussion on this included requiring shopping complexes and public buildings to provide separate containers for the collection of recyclables. This may conflict with anti-terror initiatives which have seen the removal of litter bins in some public places. A Waste Collection authority already has a duty to arrange the collection of business waste if requested to do so. Again this could be covered in the waste prevention plan without the need for additional regulation.

Section 56. Procurement of recyclate.
There is some concern with the term ‘recyclate’. Often production companies will include some of the processing waste back into the manufacturing process and class that as recycled material. The term ‘post consumer recyclate’ should be considered. In some cases there is also a down side to the inclusion of recyclate in the form of a loss of, or a reduction in warranty. Consideration will have to be given to allow those covered by this to make a life cycle judgement on the benefits of inclusion of recyclate.

Section 57. Targets for the reduction in packaging.
The EU presently leads on packaging waste targets through the Packaging Waste Directive. Consideration would have to be given on the possible negative impacts on manufacturing in Scotland should companies face greater cost in compliance compared with any other EU country.

Section 58. Deposit Schemes.
A regulation requiring a deposit and return scheme should only be considered after a full life cycle analysis has been carried out on the options available. Returnable bottles are normally quoted as a prime candidate for such schemes, but the environmental impact of the storage, collection and transportation, as well as the environmental impact of the processing of such products needs to be considered. In the past chemicals were used to wash out bottles for reuse, which in turn produces an effluent. There is also the potential to move some goods from packaging which could not be recycled into packaging which can, thereby side stepping the associated costs involved in deposit schemes. ‘Tetra Paks’ have a better carbon footprint and fare better in a life cycle analysis than glass bottles.

A second consideration should be contributions from the deposit scheme being used to subsidise local authority waste management. Not all returnable goods will be returned; therefore unclaimed deposits should be available.

Section 59. Charges for carrier bags.
The assumption is that customers are not charged for carrier bags by supermarkets. The costs for the provision of carrier bags are already passed back to the customer in an indirect form. Plastic supermarket carrier bags are probably the most widely reused item in any domestic property. In many cases they are made from recycled material. Where they have been restricted the overall use of plastic bags may not have dropped at all. Customers merely buy other plastic bags for the secondary use that a carrier bag would have been put to. There is no indication as to what would be considered or who would benefit from the charges. The only beneficiary may be the regulator of such a scheme.

Q16 What are your views on the adequacy of the Scottish Government’s consultation in advance of publishing the Bill?
The consultation was adequate.

Q17 Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government out on the consultation proposals?
No comment.
Q18 Does the Bill raise any equalities issues you would wish to highlight?

No.

Q19 Do you have any comments on the impact of the Bill on sustainable development?

The Bill should assist Scotland in working towards sustainable development by reducing the use of finite resources.

Q20 Do you have any other comments on the Bill?

It is clear that the Bill will result in additional duties for local authorities. However, although the Financial Memorandum takes steps to costing the impact of some aspects, it is not clear what additional costs will be imposed on the local authorities and how these will be funded. Consultation/dialogue between the Scottish Government, CoSLA and the local authorities should take place on the resource aspects.

The issue of funding is equally applicable to businesses and residents as they seek to reduce emissions and costs. This should be recognised and addressed.

The Council welcomes the aim of the Bill and acknowledges the commitment necessary on all sides to the successful implementation.
WRITTEN SUBMISSION FROM THE ASSOCIATION OF BRITISH INSURERS

The Association of British Insurers (ABI) is the voice of the insurance and investment industry. Its members constitute over 90 per cent of the insurance market in the UK and 20 per cent across the EU. They control assets equivalent to a quarter of the UK’s capital. They are the risk managers of the UK’s economy and society. Through the ABI their voice is heard in government and in public debate on insurance, savings, and investment matters.

Summary

- The ABI supports the Scottish Parliament’s efforts to develop comprehensive climate change legislation for Scotland.
- We broadly agree with the proposals for climate change mitigation and we encourage the Scottish Parliament to pursue this approach in times of economic challenges and budgetary constraints.
- Preparing Scotland for our changing climate (‘adaptation measures’) needs to happen now. This should be achieved through integration into existing policy areas. We would welcome more focus on the need to set clear adaptation targets and a regular adaptation reporting requirement.

Introduction

1. It is essential that through these tough economic times climate change remains at the top of the Scottish Parliament’s agenda. Climate change is a reality, it is happening now and the impacts are being felt across the world – now is the time to adapt to, as well as mitigate the causes of climate change.

2. The ABI supports the Scottish Parliament’s efforts to develop comprehensive climate change legislation for Scotland, but more needs to be done to integrate adaptation and mitigation. An integrated climate change strategy needs to be implemented coherently across national, devolved, regional and local boundaries and it needs to maximise the synergies between emissions reduction (dealing with the causes of climate change) and climate risk management measures (tackling the consequences of climate change).

3. Achieving sustainable development is dependent on adequate protection of the environment, jobs and services as well as people and property. Most policies do not recognize these linkages and only focus on one aspect.

4. Climate risk, in particular the frequency and severity of extreme weather events, will continue to increase over the next 30-40 years, irrespective of action to reduce emissions. This inevitable climate change results from historic emissions and could only be reversed by taking carbon back out of the atmosphere and oceans. However, the current generation has justifiable expectations that the effects they are already experiencing and will increasingly experience from inevitable climate change should be reduced even while they are bearing the costs of avoiding further climate change that will affect future generations.

5. The ABI is working very closely with the authorities in Scotland in certain areas of climate risk management, such as flood risk management and we are encouraged by the commitment to develop effective long-term flood risk management strategies for all sources of flooding in Scotland.
Response to consultation questions

6. The ABI broadly agrees with the proposals for climate change mitigation in the policy statement and we encourage the Scottish Parliament to pursue this approach in times of economic challenges and budgetary constraints. Both mitigation and adaptation should not be perceived as a cost, but as an investment that will reduce the future losses caused by climate change. Below are our detailed responses to those consultation questions that are most relevant to us:

Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

7. The ABI welcomes the targets set out in the Scottish Climate Change Bill. It is important to make early progress towards realistic but ambitious targets for emissions reductions. We are pleased to note that all greenhouse gases are considered, not just Carbon Dioxide.

8. Long-term targets are particularly valuable in offering certainty to investors and encouraging technological innovation. The opportunities to revise targets should, therefore, be limited, available only in clearly defined circumstances. We recognise that some flexibility is essential, but the proposed approach re-introduces too many uncertainties. No change in the target except through primary legislation should be allowed.

9. The Scottish Climate Change Bill should include targets not just for mitigating our impact on the climate, but also for adapting to the changing climate: it should set a series of targets to reduce flood risk across Scotland, for example by setting a maximum number of households and businesses at high risk of flooding from all sources, and the Scottish Government should be required to report on progress in achieving this target annually. Adaptation policy needs to be guided by clear objective - and target-setting. Adaptation objectives and targets need to focus on building adaptation capacity at local, regional and national level. It is very important to continue developing adaptation metrics to allow the monitoring of adaptation measures and to assess if action is achieving intended objectives.

Q6 The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government's approach to obtaining independent, expert advice on climate change?

10. We support the establishment of an independent, credible, expert body to assess the level of future targets and progress on their delivery, but this should not lead to more ineffective bureaucracy.
11. The remit of this new Scottish Committee should be extended to cover adaptation issues and its composition should reflect this. Its status should be similar to certain expert committees advising Government on health issues, commissioning research as needed to support its analytical work, publishing reports independent of ministers and adopting a transparent approach in its deliberations. The Committee should hold regular discussions with the UK Committee to ensure that resources are used efficiently and that there is the maximum amount of knowledge exchanged on these issues.

Q7 The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

12. The ABI welcomes the annual reporting arrangements proposed in the Bill. However, as well as a check on emissions, in each annual report there needs to be a re-appraisal of adaptation progress to inform each spending review. The report should consider external shocks and issue warnings if there appears to be insufficient banking or very heavy borrowing.

13. The Scottish Government should publish on an annual basis detailed interim plans and report on progress along the 25-year strategic plan (proposed under question 1), outlining the planned investment in flood defences and drainage systems over the following three-year period and the analysis underpinning these investment and prioritisation decisions, as well as initiatives taken in response to other climate risks, such as storm and heatwaves.

14. Periodic reviews of impacts and adaptation should occur on a cycle compatible with the Government’s spending reviews, providing an evidence base for decisions on departmental programmes and spending needs, rather than a fixed five-year cycle.

Q8 The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

15. We welcome the enabling powers to introduce a duty on certain parts of the public sector (i.e. local authorities and large public bodies) to take specified actions on climate change. We propose that the statutory duty placed on local authorities to reduce flood risk is extended to also include a wider duty to adapt. SEPA should be made the competent authority with responsibility for ensuring that flood risk from all sources is assessed and mapped, that plans are prepared to achieve agreed targets and that delivery to plan by all relevant bodies is monitored and reported. In particular, it is important that this national body works with all other stakeholders, especially at the local level to ensure that the Scottish framework reflects local needs and can be delivered locally, right through to involving the public and resident associations in being the front-line in the fight against flooding.

16. We welcome the provision in the Bill for local authorities and large public bodies to be required to report to the Scottish Government, however, these should be regular reports on their adaptation as well as mitigation measures.

17. These reports should be published annually, setting out progress towards the long-term targets and achievements of the milestones.

Q9 The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on this proposal?
18. The predicted changes in the climate pose a threat to our current way of life as well as the resilience of the economy. It is therefore encouraging to see that the Scottish Government has begun to recognize the significance of adaptation. The ABI welcomes the decision to prepare a Climate Change Adaptation Framework for Scotland as an important step in dealing with climate change.

19. We support the approach to ‘mainstreaming adaptation’, something the ABI has been calling for years. Due to the holistic nature of the challenge, climate adaptation should be achieved through integration into existing policy areas. This ‘mainstreaming’ is the best strategy to ensure that climate risks are taken into account in all relevant decision-making processes.

20. The Bill should also have specific adaptation reporting requirements, along side the reporting on emission reductions. This would create the necessary accountability for adaptation.

Q12 The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?

21. We welcome the requirement to produce an action plan for energy efficiency of buildings. It is very important to capture synergies and to avoid policy conflicts.

22. Understanding climate risks and the consequent investment in adaptation should not be a separate activity but should be integral to the consideration and delivery of emissions reductions. The cost of impacts and adaptation measures will soar in the second half of the century if inadequate action is taken to reduce emissions now. The two strands are complementary and additive - only rarely substitutable. At the same time, some measures to reduce emissions could actually increase the effect of climate impacts in the immediate future and reduce the scope for adaptation. For example, the more compact towns and high density developments needed to reduce transport and housing emissions lead to higher risk of flash flooding and heat island effects. This raises the importance of building in resilience to flooding as part of mitigation actions. Cavity wall insulation to improve energy efficiency results in much more costly and lengthy flood repairs. Therefore it is important to use different insulation products to achieve the necessary climate mitigation in flood risk areas. Solutions, which will often entail the same policy and regulatory instruments, need to find synergies between mitigation and adaptation measures, avoiding conflicts.
23. The action plan would need to focus on new buildings as well as retrofitting existing buildings - both with a view to enhance energy performance, but also resilience to climate risks. The public sector through its purchasing power should take a leadership role in this area. In this context we suggest a reference to the development of incentives to drive behaviour change and the need to minimising perverse incentives, both within a public and private sector context. The missing integration between mitigation and adaptation is also creating problems with regards to incentivising behaviour change. Some of the levers adopted to encourage energy efficiency could similarly be used to encourage climate resilience.
WRITTEN SUBMISSION FROM ASSOCIATION FOR THE CONSERVATION OF ENERGY

Introduction

The Association for the Conservation of Energy (ACE) is a lobbying, campaigning and policy research organisation, and has worked in the field of energy efficiency since 1981. Our lobbying and campaigning work represents the interests of our membership: major manufacturers and distributors of energy saving equipment in the United Kingdom. Our policy research is funded independently, and is focused on four key themes: policies and programmes to encourage increased energy efficiency; the environmental benefits of increased energy efficiency; the social impacts of energy use and of investment in energy efficiency measures; and organisational roles in the process of implementing energy efficiency policy. We welcome this opportunity to offer our views on the Climate Change (Scotland) Bill as introduced. ACE is a member of both Stop Climate Chaos Scotland and the Scottish Fuel Poverty Forum.

Stop Climate Chaos Scotland

Stop Climate Chaos Scotland is a coalition of more than 30 organisations campaigning together to tackle climate change. The coalition members include environment and development NGOs, faith groups, trade unions, community councils, student societies, women’s organisations, a mental health charity, and many others. In Scotland, the members have a combined supporter base of over 1.5 million people.

The Stop Climate Chaos Coalition Scotland priorities for the Climate Change (Scotland) Bill are that it must:

1. Set out a framework that will achieve at least an 80% reduction in greenhouse gas emissions by 2050.
2. Establish in statute annual emission reductions of at least 3% year-on-year from the start, not just from 2020, compatible with a fair and safe cumulative budget identified by the advisory body (see 4).
3. Include emissions from all sectors in the framework and targets set out in the Bill, including those from international aviation and shipping, from the very start.
4. Establish a Scottish advisory body, a Scottish Climate Change Commission, in the primary legislation to support delivery of the Bill when it is enacted.
5. Ensure that at least 80% of the effort to cut emissions takes place in Scotland.
6. Establish duties on all public bodies to reduce greenhouse gas emissions in line with the national target.
7. Set in place robust, transparent reporting measures so the Scottish Parliament is well informed on progress in meeting targets and Government is held to account on mitigation and adaptation.
8. Ensure that strong enforcement measures are set in place in statute.
9. Ensure Scotland counts all its emissions and reports on those produced by products and services we consume as well as emissions produced domestically.
10. Be explicit that sustainable development is core to the purpose and delivery of the statute in relation to mitigation and adaptation.

Summary

ACE welcomes the Scottish Government’s ambition in introducing a Climate Change Bill which sets statutory targets for reductions in greenhouse gas emissions and which supports the delivery of those targets. We also welcome the overall target of an 80% reduction in emissions by 2050 on 1990 levels, which is broadly in line with the current scientific consensus, and we welcome the fact that the Bill will cover all six Kyoto gases. However, we believe some crucial details about how these emissions cuts will be achieved are missing – in particular the lack of sectoral targets on the face of the Bill is a major failing. In addition, the section of the Bill focussed on energy efficiency (Part 5, Chapter 3) falls far short of what is needed to achieve the emissions reductions envisioned in earlier sections of the Bill. The Bill must be strengthened if it is to deliver a fair and equitable reduction in Scotland’s emissions and give business and industry the certainty we need to invest for emissions cuts.
There are, in our view, a number of conspicuous shortcomings in the proposals that will hamper the Bill’s effectiveness. Principle among these is the lack of any limit on the number of carbon credits that can be purchased from abroad. The Scottish Government should be aiming for 100 percent internal provision to achieve the Scottish target. This would allow the Scottish economy to benefit from early action to reduce emissions, and, if investment is suitably targeted, would also help to achieve existing Scottish Government targets on fuel poverty.

ACE believes strongly in the effectiveness of statutory targets, with a variety of incentives and sanctions including the option of affordable legal challenge. Statutory targets will not only give direction to Government, but are vital to give business the certainty it needs to make the appropriate investment decisions. For building materials (including energy efficiency materials), the investment required to increase production is immense, and local workforces must be trained up and retained. This is not a business where imports can be relied upon to make good a shortfall in domestic production – imports are more expensive because of the bulky nature of the materials. For this reason and several others, ACE supports sectoral targets, as set out below.

While the proposal for annual emissions reduction targets is welcome, it is disappointing that these annual targets are not set in statute from the start. A cycle of annual reports to Parliament on progress towards meeting the annual targets, ideally given by the First Minister, would help to deliver the required level of accountability.

Finally, it is essential that all greenhouse gas emissions, including those from aviation and shipping, are included in the Bill.

Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050. What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

ACE welcomes the 2050 target, which we believe to be broadly in line with current scientific consensus. We also welcome the inclusion of all six Kyoto gases in this target. However, it is important that this target is kept under review by an independent Scottish Climate Change Commission, and if necessary, strengthened.

We do not believe that the interim target is sufficiently ambitious. If we are to tackle our contribution to climate change, it is crucial that we make early and deep cuts in our emissions. We would therefore prefer an interim target of a 50% cut by 2020. Choosing 2020 as the date for the interim target would bring Scotland into line with other UK, European and international targets.

It is also essential that the Bill include a cumulative emissions target as well as an end-point target. Indeed, without an overall cumulative budget the Bill will not guarantee keeping within a fair contribution to a two degrees Celsius target. A cumulative target would show global leadership.

Q2 The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive. What are your views on the setting of targets in batches from 2010 to 2022?

(see answer to question 3 below)

Q3 The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year. What are your views on this approach or any possible alternative approaches?
It is disappointing that the SNP Government have not delivered on their 2007 manifesto commitment for annual statutory targets of at least 3% emission cuts from the start. Delaying implementation of the statutory annual targets will fail to deliver the political accountability that is required, and allow politicians to blame preceding governments for missed targets. Ministers cannot be allowed to avoid taking tough decisions on large new emissions sources, or on measures which are seen as politically unpopular. Shorter periods, and targets set in statute, make impacts of poor decisions obvious sooner, and provide a clear link between the Minister or administration that makes any poor decision and the emissions implications of that decision. Allowing a longer budget period would let Ministers ‘off the hook’ for the emissions implications of their decisions, and would therefore create an incentive for Ministers to make bad decisions. Increasing accountability would also increase the public confidence in Ministerial decisions and increase the credibility of Government action.

The annual targets would fit within longer budget periods. These longer-term budgets, along with a 2050 target and an interim 2020 target, would help deliver the certainty that business needs in order to plan ahead and ensure the required investment.

For all the reasons above, we believe it is essential that the Bill include statutory emissions reduction targets of at least 3 percent per year from the very start. The current wording is inadequate and will lead to a delay before the deep emissions cuts are delivered. Such a delay, in the face of what is a global emergency, is entirely unacceptable.

**Sectoral targets**

In addition to statutory annual targets from the start, it is essential for the Bill to require Government to consider emissions at the sectoral level. If each sector is not given specific targets upon which they must report, individual companies and businesses will present excuses as to why they should not have to reduce their emissions, and will try to ‘pass the buck’ to other sectors. Indeed, there is evidence that this is already happening within the Scottish Government: transport in particular appears unwilling to accept its responsibility in this regard. Each sector is trying to pass the responsibility for reducing emissions on to other sectors: the problem of ‘free riders’ is already developing.

This is particularly important in the case of the commercial and public services sector. This sector emits around 15 million tonnes of carbon per year UK-wide, with 13 percent of total UK carbon emissions arising from energy use in buildings in the service sector. Electricity consumption in this sector is especially high, due to excessive lighting, air conditioning and ventilation systems. Commercial sector energy use is growing fast and is projected to grow faster than any other sector under business as usual, apart from transport. According to the Carbon Trust, Scottish business wastes £100 million per year in lost energy.

For the above reasons, ACE supports the inclusion of sectoral targets on the face of the Bill. Specifically, we would advocate the following targets:

- By 2020 the general level of energy efficiency of residential accommodation has been increased by at least 20 percent compared with the general level of such energy efficiency in 2010.
- By the end of 2010 the general level of energy usage in the commercial and public services sector has reduced by at least 10 percent compared with the general level of such energy usage in 2005 and by the end of 2020 by at least 10 percent compared with the general level of such energy usage in 2010.
- 1 gigawatt of combined heat and power shall be installed in Scotland by 2010.
- By the end of 2016 so far as practicable all existing homes shall be low carbon.

The above are all targets or Scottish equivalents of UK targets to which the UK Government has committed itself but which are currently non-binding. By including them in the Scottish Bill, the Scottish Government would demonstrate clear leadership over the UK Government on this important issue. By failing to include them, the Scottish Government would in our view be effectively ceding leadership on this issue to Westminster and demonstrating a lack of ambition for Scotland.
In addition to the above, we would advocate the following targets, which would also demonstrate clear leadership from the Scottish Government:

- Emissions reductions from the public sector as a whole, and in particular from the Government’s own estate, of at least 5 percent per annum.
- Carbon emissions from the built environment in Scotland should be reduced by a minimum of 3 percent per annum.

Q.4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

In our view the Government should aim to deliver the Scottish target solely through domestic emissions reductions, thus maximising the benefit to Scottish business of preparing for the opportunities of a low-carbon economy. Such an approach would also reflect the moral position noted in the consultation paper last year: namely that cumulative per capita emissions since 1751 are higher in the UK (and, we presume, in Scotland) than anywhere else in the world, including the US and China, due to the fact that we industrialised before the rest of the worldiv.

Q5 The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

It is essential that the Scottish share of emissions from international aviation and shipping are included in the definition of ‘Scottish emissions’, and are covered by the Bill from the very start. To give this sector a free ride would be completely unacceptable and grossly unfair on other sectors of the economy which, rightly, are required to deliver their fair share of emissions reductions.

While we acknowledge that the current ‘bunker fuels’ method of calculating emissions from these sources is not perfect, it is better to have an imperfect method to calculate these emissions than no method at all. If and when there is international agreement on how these emissions should be calculated, the Bill (or associated secondary legislation) can be amended accordingly. Until such an agreement is in place, this sector should not be excluded from the Bill.

It is also important that the Bill requires Ministers to report annually on consumption-based emissions figures, to ensure that Scotland is not simply exporting its greenhouse gas emissions. The annual report to parliament should also include an indication of emission by sector, to ensure that all sectors are playing their part in achieving emissions cuts.

Q6 The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government’s approach to obtaining independent, expert advice on climate change?
We would prefer the Scottish Government to establish its own Scottish advisory body which would ensure that advice and scrutiny of progress was sufficiently focussed on Scotland. Since the Scottish context is markedly different to elsewhere in the UK, we are unconvinced that the UK committee on climate change is sufficiently well resourced or has sufficient expertise to fulfil this role. Needless to say any Scottish body would need to work closely with the UK committee.

Q7 The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

Parliamentary scrutiny is certainly essential and reports on progress should be on an annual basis to Parliament, ideally in the form of an oral statement by the First Minister.

Speaking to a meeting of the Scottish National Party conference in October 2007, John Swinney MSP, Cabinet Secretary for Finance and Sustainable Growth, described his aspiration that the process of parliamentary scrutiny set out in the Climate Change Bill should be as terrifying for Ministers as “going to the dentist to have all your teeth pulled out, without anaesthetic”. His vision will only become reality if an effective system of annual reporting to Parliament against annual targets is set out. The reporting duties in the Bill do not yet meet the so-called ‘dentist standard’.

Reporting duties should be strengthened in order to meet this now famous ‘dentist standard’ so that they specify reports from the First Minister to Parliament not only on the annual emissions reduction, but also against an annual report from the independent advisory body on how well the Government should have done against its targets in the same period. This report should also specify the emissions cuts that have been achieved by each sector over the preceding 12 months. At the same time the First Minister must also set out any policy changes that will be made in the forthcoming year in order than emissions reductions are brought back on track. Only if all three of these conditions are met would the so-called ‘dentist standard’ be met.

We also agree with Stop Climate Chaos Scotland (SCCS) that the most appropriate forum within the parliament for scrutiny of any statement is not the convenor’s group, since this group does not meet in public.

However, while parliamentary scrutiny should be the primary means of holding the government to account, it should not be the only means.

The UK Government’s Climate Change Act provides for sanctions for failing to meet targets through judicial review. In addition, in the event of failure to meet targets, Ministers will be required to bring forward new policies to Parliament.

ACE believes that alongside tough parliamentary scrutiny, there must be strong incentives and effective sanctions. In addition we believe that a regime of financial incentives and penalties for government departments and other public bodies would prove an efficient way to promote compliance.

We propose that as in Westminster, in the event of a failure to meet a target or budget the responsible minister must come forward with new policies designed to compensate for any shortfall, regardless of its cause.

We also propose that by amendment of Strategic Environmental Assessment rules Parliament establishes a “call in” mechanism for new plans, programmes or strategies that would increase greenhouse gas emissions, so that both the Minister responsible for the plan, programme or strategy and the Climate Change Minister would have to justify approval of such a plan programme or strategy to parliament in advance of giving approval.
In addition to the measures set out above, we suggest a rolling ‘Climate Fund’ mechanism. The fund would be used to pay for mitigation and adaptation in Scotland and overseas, and would be open to be bid into by all Government Departments and public bodies (amongst others). It would be replenished through direct Government funding, and through fines levied against Government Departments and public bodies for failure to meet relevant climate emissions targets. This fund should be additional to, and not a replacement of, existing funds to promote energy efficiency and tackle fuel poverty.

Q8 The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

In the 2007 SNP manifesto, a clear commitment was given to ensure that the public sector sets an example on environmental matters. In the section headed ‘A Greener Scotland’, the manifesto states:

“Government, its agencies and other public bodies including the NHS and Local Authorities have a responsibility to take a lead.”

The Government can deliver on this pledge by ensuring that public bodies procure only buildings in the top quartile of energy performance, and that the public sector as a whole, and the Government estate in particular, delivers emissions reductions of at least 5 percent per annum and reports annually to Parliament on progress towards making those reductions.

In our view the Scottish Government must introduce duties on public bodies. Those duties should include a duty for public bodies to procure only buildings in the top quartile of energy performance, and to ensure that all existing buildings reach an energy performance certificate banding of ‘B’ by 2016 at the latest. This will ensure consistency between public sector rhetoric and public sector action. As Futerra Communications have found, the credibility of communications from the public sector on climate change and sustainability is undermined unless the public sees consistency between words and deeds. Setting a requirement that all public sector buildings are in the top quartile of energy performance would help to show that consistency.

We agree with SCCS that engagement with other public bodies by the Scottish Government is crucial. We also agree with SCCS that the way statute is currently drafted on this issue is unhelpful.

Finally, public bodies should be subject to a financial regime of incentives and sanctions as mentioned previously.

Q9 The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on this proposal?

Since this is not our area of expertise, we refer the committee to the SCCS submission in response to this question.

Q10 Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are your views on this proposal?
Q11  The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

Since this is not our area of expertise, we refer the committee to the SCCS submission in response to this question.

Q12  The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?

The energy efficiency section of the Bill as it stands at present is woefully inadequate. If the measures contained within this section of the Bill are intended to deliver the emissions cuts envisioned earlier in the Bill, then the Bill is doomed to failure from the start. This section must be strengthened. Specifically, a number of studies have shown that voluntary measures to improve the energy efficiency of our building stock will not deliver the required emissions cuts vii: Ministers must take powers to require mandatory improvements in the energy efficiency of buildings, either at point of sale / rental or as part of a mandatory energy performance certificate, or ideally both of these. More detail on this is included at question 13 below.

While we welcome the fact that the energy efficiency action plan will now be set in statute, it is frankly embarrassing that we have been waiting for action on this from the Scottish Government (then the Scottish Executive) since 7 December 2004, and that it still has not been published except as a consultation. It is essential that an energy efficiency action plan is brought forward at an early date – we would recommend that the 12-month timetable in the Bill for initial publication of the plan is considerably shortened: 3 months would in our view be more than adequate. We do welcome the annual report to parliament on progress and the three-yearly review of this document, however.

We are also very concerned that the current drafting of this section would actually lead to a weakening of the duty on Scottish Ministers so far as energy efficiency is concerned. In section 179 of the Housing (Scotland) Act 2006, Ministers have a duty to improve energy efficiency in domestic housing. In contrast the drafting of this section of the Bill merely gives Ministers a duty to promote energy efficiency, while section 179 of the Housing (Scotland) Act would be repealed by the passage of this Bill. Such a weakening of the duties on Scottish Ministers is unacceptable. We would prefer that the duty on Ministers was to improve energy efficiency throughout its work – not merely in domestic housing.

Q13  The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government’s thinking in this area.

What are your views on this approach?
We welcome the proposals in the Bill, which confer on Ministers the power to make regulations providing for the assessment of the energy performance of non-domestic buildings and emissions associated with such buildings. These changes are in line with the current recasting of the EU Energy Performance of Buildings Directive (EPBD), so will probably need to be implemented in Scotland sooner or later anyway. It is prudent of the Scottish Government to bring these measures in before they are required to do so, especially given the difficulties and delays encountered in implementation of the EPBD first time around.

However, we believe the extended powers do not go far enough since they still rely on a voluntary approach to energy efficiency which will not deliver the required reduction in emissions. While obtaining an energy performance certificate will be required for a wider range of public buildings than at present, there is nothing to require the building owner to actually carry out any energy efficiency improvements, and presently few incentives for them to do so. The measures set out in the Bill appear to be approximately the same as those set out as ‘option 2’ in the Scottish Government’s consultation on emissions from existing non-domestic buildings published last year. According to the partial regulatory impact assessment issued as part of that consultation, option 2 is estimated to deliver a cut of 2.12 MtCO2e by 2020. This appears to us to be a very ambitious figure given the measures proposed, but it nonetheless falls far short of the 3% per annum reduction required.

For comparison, research conducted by AEA technology suggests that the measures in the EPBD will deliver emissions savings of around 0.2 MtCO2e by 2020 in the domestic sector. No comparable figures exist for non-domestic but we can see no reason why non-domestic savings would be any higher. More recent research from Denmark, which has had an energy performance certificate (EPC) system in place since 1996, has found that the carbon emissions reductions from EPCs on their own (i.e. without any parallel fiscal or regulatory incentives) have been negligible. While we believe EPCs based on an operational rating to be a very useful tool in empowering tenants and building buyers, and that in combination with other incentives can certainly be useful in tackling emissions, we would advise against the Scottish Government relying upon EPCs in isolation to deliver the required emissions cuts from non-domestic buildings.

In order to deliver the level of emissions cuts set out in the earlier section of the Bill from the non-domestic sector Ministers must take powers to require building owners to improve the energy efficiency of their buildings. We believe the most prudent way to do this would be as set out in the Scottish Government’s consultation on this subject in late 2008: to make the ‘recommended improvements’ section of each energy performance certificate mandatory. We were very disappointed not to see these measures included in the Bill, since they appear to us eminently sensible and will help to deliver the level of carbon cut that the Bill envisages.

We were very surprised to hear officials from the Scottish Government, in giving evidence to the Economy, Energy and Tourism Committee on 4 February 2009, say that the proposals in their consultation document for a mandatory element to energy performance certificates were controversial. That is not our experience. We ran a consultation event on 22 September 2008 along with the Built Environment Forum Scotland and Thirdwave Consultancy Ltd, with some input from the Scottish Government. The event looked at the measures contained in the Scottish Government’s non-domestic consultation, and more than 50 people attended from public, private and voluntary sectors. The overwhelming majority of those building owners attending agreed that without the mandatory element, the sector could not achieve the envisaged cut in emissions. So long as finance in the form of grants and/or soft loans were available to building owners, those attending the workshop were supportive of the mandatory element. Both public-sector (Central Energy Efficiency Fund) and SME-sector (Energy Saving Scotland Small Business Loans Scheme) energy efficiency finance schemes already exist, though in our view these should be expanded and made much more widely available. We therefore fail to see any genuine reason not to implement the compulsory element to EPCs.

Since many non-domestic buildings are in the public sector, it would seem prudent to include further provisions in the Bill about the energy efficiency of public sector buildings. The Westminster Government has committed to only procure buildings in the top quartile of energy performance, and it would be disappointing if Scotland fell behind Westminster in this regard.
Q14 The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

What are your views on this proposal?

As mentioned above, we do not believe that ‘promoting’ renewable heat is sufficient. We believe a duty must be placed on Scottish Ministers to deliver a renewable heat strategy and action plan, which should include specific targets for renewable heat. Given the background of an EU target that 20% of the EU’s energy (not merely electricity) be met from renewable sources by 2020, it is imperative that the Scottish Government prioritise action in this area.

In addition, we refer committee members to the submissions of SCCS and the Scottish Renewables Forum in answer to this question.

Q15 The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas:

Waste prevention and management plans;
Waste data;
Deposit of recyclable waste;
Procurement of recyclate;
Reduction of packaging;
Deposit and return schemes;
Charges for carrier bags.

What are your views on these proposals?

Since this is not our area of expertise, we refer the committee to the SCCS submission in response to this question.

Q16 What are your views on the adequacy of the Scottish Government’s consultation in advance of publishing the Bill?

The consultation on the Bill itself was passable, though it is somewhat puzzling that the so-called ‘campaign responses’ were treated in a separate category to other responses. We should have expected all responses to be treated equally in a truly democratic system.

However, the major inadequacy in terms of consultation has been the lack of consultation on measures to reduce emissions from existing buildings, which were first promised back in February 2008. While the Scottish Government did consult in late 2008 on emissions from existing non-domestic buildings, this consultation did not involve any stakeholder events. Indeed, ACE along with the Build Environment Forum Scotland and Third Wave Consultancy Ltd organised our own consultation event around these proposals, since it became apparent that the Scottish Government were neither willing nor able to do so. Since domestic buildings account for approximately one third of our greenhouse gas emissions, it is deeply worrying that we are still waiting for a consultation on emissions from existing domestic buildings.

Q17 Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government out on the consultation proposals?

No view.

Q18 Does the Bill raise any equalities issues you would wish to highlight?

Yes, it raises issues of international equality: we therefore refer the committee to the SCCS response to this question.
Q19 Do you have any comments on the impact of the Bill on sustainable development?

We refer the committee to the SCCS response.

Q20 Do you have any other comments on the Bill?

Yes, we do.

The Bill as it is currently drafted sets out a useful framework for emissions cuts. The framework is far from perfect, as set out above, but it is a useful start.

However, the Scottish Government is in danger of willing the ends without delivering the means to those ends. This Bill appears to be setting in statute where Scotland should be, without identifying how we should get there. The reality is that getting there will require some difficult political decisions, even in the area of energy efficiency in buildings. It remains to be seen whether the Scottish Government is willing to make those difficult decisions. We sincerely hope that it is.

Conclusion

In our view the credibility and effectiveness of the Bill is paramount, and depend on three key issues:

- Setting the right targets in statute (80 percent reduction by 2050, with a cumulative target based on global equity; 50 percent by 2020; and at least 3 percent in any given year).
- Taking a comprehensive and inclusive approach – including emissions from all sources and all sectors including international aviation and shipping; and aiming to achieve 100% of the cuts domestically.
- Ensuring strong incentives and sanctions to deliver accountability and compliance.

Despite many welcome elements, the Bill falls short of a fully credible and effective package under all these headings, and we urge the committee to rectify these shortcomings at stage two. We trust you are able to take these views into account.

Submission to the Transport, Infrastructure and Climate Change Committee

CLIMATE CHANGE (SCOTLAND) BILL

In response to the calls for evidence on Questions 1 - 20 I submit the following for consideration.

OVERALL TARGETS

Question 1

The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

It is nigh impossible to achieve such unrealistic targets such as 50% and 80%. In order to get anywhere near those targets all air freight and air travel would need to come to a complete standstill thereby depleting our country of inward investment and as a consequence uncompetitive in world markets.

Question 2

The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

No government should set those unrealistic targets without the full and equal support of other countries.

Question 3

The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

It has been scientifically suggested that greenhouse gas emission will decline by a few percent but start to rise in 2010 so yet again this is an unrealistic target to set.

NET SCOTTISH EMISSIONS ACCOUNT

Question 4

The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

No country should be allowed to buy and sell carbon units as this diminishes the whole point of the exercise.

Question 5

The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

Exactly the point I make in answer to Question 4.
The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

Why are we extending Edinburgh Airport in order that it can take more aircraft?

The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

In order that figures are not in anyway massaged, reporting frequency should be set in stone.

The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

No more quangos, we taxpayers already pay through the nose for what we have at the moment.

The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

As in answer to Question 8, far to many reports are delayed in order that figures can be massaged.

Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

We already have in place, why do we need more powers to vary the times when Muirburn takes place, surely this can be done through common sense dialogue.

The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The
The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

In other words, grow more trees. Do we really need more powers to do this.

ENERGY EFFICIENCY
Question 12

The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

Not before time, let's make a start with the Scottish Parliament Building which seems to think that energy grows on trees.

Question 13

The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government’s thinking in this area.

Will this mean an end to (a) the floodlighting of Edinburgh Castle and (b) an end to the fireworks display at Festival time. Just what we need to encourage tourism.

Question 14

The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

No more windfarms, which are not only costly and poor value for money, they are a blight on our countryside. We need to invest in wave power using the currents available in the Firth of Forth for example and to a certain extent we need to seriously ignore all the "green" factions and consider converting waste to energy.

WASTE REDUCTION AND RECYCLING
Question 15

The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas:

* Waste prevention and management plans;
* Waste data;
* Deposit of recyclable waste;
* Procurement of recyclate;
* Reduction of packaging;
* Deposit and return schemes;
* Charges for carrier bags.

I have forwarded a full and concise submission on this question which can be found on the RAE Committee calls for evidence page.
GENERAL ISSUES
Question 16

What are your views on the adequacy of the Scottish Government’s consultation in advance of publishing the Bill?

Utterly disgraceful, given that the only specified consumer product within the Bill is carrier bags (it has yet to be defined what is meant by a carrier bag) not one single invitation has been sent out to anyone within this sector of the industry which is singled out for legislative powers.

Question 17

Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government on the consultation proposals?

No.

Question 18

Does the Bill raise any equalities issues you would wish to highlight?

The fact that no other bags other than carrier bags are included within the Bill is discriminatory under EU Legislation. Furthermore, any national agreement by retailers to charge a minimum price – even one requested by the Government itself – is likely in principle to be anti-competitive and would need to demonstrate it's exemption from the Competition Act to avoid the risk of a successful legal challenge.

Question 19

Do you have any comments on the impact of the Bill on sustainable development?

I refer to the answer at Question 14.

Question 20

Do you have any other comments on the Bill?

Scotland's Environmental and Rural Development Committee rejected proposals to introduce a charge for plastic carrier bags, Scotland's Rural Affairs and Environment Committee rejected proposals to introduce a charge for plastic carrier bags in 2008, both committees understood that to introduce a charge would increase not only waste in Scotland but increased emissions in Scotland. Section 59 contained within the Climate Change (Scotland) Bill should be removed.

CLIMATE CHANGE (SCOTLAND) BILL

MEMO TO THE TRANSPORT, INFRASTRUCTURE AND CLIMATE CHANGE COMMITTEE

The Chamber of Shipping is the trade association for the UK shipping industry (including deep-sea bulk, short-sea bulk, containers, ferry, cruise, offshore support and specialised operators), working to promote and protect the interests of its members both nationally and internationally. With 144 members and associate members, the Chamber represents over 860 ships of about 23 million gross tonnes and is recognised as the voice of the UK shipping industry.

Question 5

The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

Question 20

Do you have any other comments on the Bill?

Summary

1. In the climate change debate shipping should be regarded as the best available solution to the global need for transportation. Shipping is the most energy-efficient mode of transport and the backbone of global trade – carrying 80% of all world trade and 92% of the UK’s goods. Furthermore, the carbon cost of carrying a tonne of freight by ship is 10 times less than by road and 100 times less than by air. Seen in light of the enormous volume of goods carried by ships, the CO₂ emissions from shipping is small. The reason for this is that shipping for many decades – even without regulation – has had a strong market-driven incentive to focus on reduction of fuel consumption. However the Chamber of Shipping fully acknowledges the need for further reduction of air emissions from shipping and believes that the way to achieve environmental protection must be found in a holistic manner. To be successful, such an approach should take into consideration the availability of technology to reduce emissions, the need to encourage innovation and the economics of world trade.

International shipping’s contribution to global carbon emissions

2. Precise figures concerning the contribution of international shipping to global carbon emissions are hard to come by. A variety of studies put the figure at anywhere between 1.5 and 5%. The International Maritime Organization (IMO) – the UN regulatory body for shipping – and most scientific commentators agree that a figure in the range 2 - 4% is realistic with an authoritative IMO study published in October 2008 putting the figure at 2.7%. While a precise figure would be helpful for measurement purposes, it is not necessary to wait for this before taking policy decisions. This is for two reasons; firstly, even at the higher end of the estimates of shipping’s contribution to carbon emissions, when seen in the context of the enormous amount of work performed, shipping remains by far the most efficient way to move bulk cargoes of goods and this position is unlikely to be usurped in the medium term. Secondly, despite its excellent carbon performance, the shipping industry is absolutely committed to reducing its carbon footprint in line with society’s expectations.
3. Looking at future trends (and regardless of the current economic conditions), it is likely that – in absolute terms – emissions from shipping will grow steadily for the foreseeable future despite efforts to improve the carbon performance of individual ships. This is because shipping is a service industry which responds directly to growth in world trade (without which expansion in the world economy could not occur) and that growth is likely to be greater than the achievable carbon reductions. It is worthy of note that no serious politician or government body has ever called for shipping’s carbon emissions to be reduced at the expense of slowing down the world economy. Any reductions in ships’ carbon emissions must therefore be achieved in a way that permits growth in the volume of goods shipped by sea.

Measuring Scotland’s share of international maritime emissions

4. Measuring Scotland’s share of international maritime emissions is extremely difficult, with almost all of the options failing to provide an accurate representation. Do we, for instance, wish to measure the relative contribution of the Scottish shipping industry (however defined) to that of the global shipping industry? Or do we wish to measure the amount of carbon generated by shipping in order to provide Scotland with the goods and services required? Or should Scotland accept responsibility for all carbon emitted by ships within its territorial waters? When considering the most appropriate methodology for allocating the share of global shipping emissions to Scotland’s Carbon Budgets, it should be remembered that shipping is the only truly international industry. Not only will ships make multiple calls in any one voyage, but they will often carry cargo destined for onward transport to a number of other countries. This makes allocating emissions extremely difficult and carries with it the distinct possibility of introducing error into the Scotland’s overall Carbon Budgets.

5. Measuring Scotland’s share of international carbon emissions will also be made more problematical for it is only the UK, as a nation state, which has a duty to report bunker fuels sales (even if only as a ‘memo item’) under the Kyoto agreement. Similarly, bunkers that are recorded by the UK as being used for domestic voyages would include fuel used on voyages between the constituent parts of the UK. There would therefore be a significant risk of double counting if both the UK Climate Change Act and any similar legislation in Scotland were to seek to account for the same emissions. It is not clear how this issue could be easily overcome except by utilising some broad measure of disaggregation.

6. When considering questions of measurement, the other side of the coin – enforcement – must also be borne in mind. The UK Climate Change Act, the Kyoto agreement and the EU Emissions Trading Scheme have all excluded mandatory carbon reductions from shipping for the same reason – it is virtually impossible to legislate for such a mobile and international industry except at the global level. For any country to impose unilateral legislation on a global marketplace is to deliberately impose additional costs on its own stakeholders which will not be shared by their competitors.

Measurement only or mandatory reductions also?

7. It is unclear to the Chamber what mechanisms for the enforcement of any national measures will not be capable of being easily and legitimately avoided by operators. This means that the total emissions reductions will, in practice, be less and may paradoxically be even higher if legitimate avoidance measures result in longer voyages. For instance, if Scotland were to impose a carbon charge on a ship’s final voyage into Scotland, a ship coming from China may decide to make an otherwise unnecessary call in France or Ireland in order to minimise the technical ‘final voyage’ into Scotland or, more likely, would call at an English port and move the goods across the border by another less carbon efficient transport mode such as road or rail.
8. If the Climate Change (Scotland) Bill was clear that it only wished to measure Scotland’s contribution – a position that the Chamber of Shipping could support – to international shipping emissions this could be done as soon as an agreed methodology was decided upon. A ‘bottom-up’ approach (i.e. obtaining data from individual ships) would yield more accurate data than a ‘top-down’ (e.g. averages of bunker fuel sales etc) approach, but it should be recognised that this would place a considerable burden on both ship-owners and administrations alike.

9. The Committee will doubtless be aware that the UK Climate Change Act has mandated that the government in Westminster must take account of emissions from international shipping when considering its carbon budgets. In order to assist this process the Chamber of Shipping has teamed up with WWF-UK (formerly the World Wildlife Fund) to assist the UK government in quickly developing a methodology for measuring carbon emissions from ships that is truly reflective of those emissions that can appropriately fall within the UK’s responsibility. Should the Climate Change (Scotland) Bill end up recommending a similar approach it may wish to consider whether our joint proposal to the Office of Climate Change might assist the body responsible for delivery north of the border. A copy of our joint proposal has been appended to this submission for ease of reference (see Annex 1 below).

A word on international agreements to control and reduce carbon emissions from global shipping

10. Measurement and control mechanisms for carbon are being actively discussed within the IMO and its Secretary General has announced his wish for that body to have agreed upon a concrete package of proposals in readiness for the UNFCCC Conference of the Parties (COP15) meeting in Copenhagen in December 2009. Meanwhile the EU have indicated that, should IMO not deliver a satisfactory package of measures by 2011, then they will look to include international shipping within the EU ETS by 2013. It is therefore clear that shipping will be included within some form of international / regional regime within a very few years.

11. The UK Government has played an active and constructive role in the negotiations at IMO and its policy position reflects well the realities of dealing with this particular sector. The Chamber of Shipping is keen that the UK Government should remain committed to an international solution delivered through the IMO. While we accept that measures delivered either unilaterally or through devolved administrations will always be an option open to governments, we would stress that these should be seen as options of last resort both in terms of effectiveness and ease of administering. To that end we would consider the inclusion of international shipping in the Climate Change (Scotland) Bill (while negotiations are building to a climax in the international arena) to be a retrograde step and one likely to hinder rather than help the broader discussions and efforts to reduce carbon emissions.

12. Carbon emissions trading and market-based instruments (MBIs) e.g. a fuel levy are politically very sensitive topics within the IMO. A significant number of developing, non-annex 1 countries (i.e. China, India, South Africa, Brazil etc) are of the opinion that they are not duty bound to seek carbon emission reduction measures through either the IMO or UNFCCC. Furthermore, they are also less willing to discuss measures to improve operational and technical efficiency and are extremely unwilling to contemplate the introduction of MBIs. The Chamber of Shipping, however, is firmly of the opinion that MBIs must play a part in efforts to reduce the sector’s carbon footprint and has openly called for international shipping to be subject to a global, open emissions trading scheme in December 2008.
13. The Chamber is also actively working with its international parent body – the International Chamber of Shipping (ICS) – and sister associations throughout the world to develop consensus for this approach on the understanding that it delivers the necessary environmental outcome while maintaining the necessary level playing field and ensuring that any solution does not discriminate between national shipping registers.

Prospects for developing new engine technologies and fuels, as well as more fuel-efficient operations

14. Shipping is a mature technology and the scope for improvement by full application of existing technologies is limited. Ships engines have improved steadily since their inception while hull and propeller designs are almost fully optimised. For instance, new hull coatings may provide some enhanced fuel efficiencies (and hence carbon reduction) in the order of 5% - 10%. While there is always room for improvement (and much is dependent on what constitutes an ‘existing’ ship), it is thought that a modern, well-maintained vessel may be able to improve its performance by about 5% if cost/benefit is considered immaterial. Given that fuels costs account for 30-50% of total voyage costs it should be recognised that shipowners have long had every possible commercial incentive to optimise fuel efficiency.

15. New technologies will certainly come on stream in time. But they are not available now and, no matter how many prototypes or concepts are developed, shipowners cannot be expected to invest in anything other than robust, proven technologies that are commercially available. However, shipowners are keen to see new technologies emerge and are willing to offer ships to assist in trials and development processes. Again it should be stressed that, given the direct link between fuel efficiency and carbon emissions, shipowners also have a direct commercial interest in the development of fuel saving technologies.

16. Alternative fuel sources may also have a role to play and bio-fuels can be used in ships engines. However, given the volume of fuel used by the c50000 merchant ships trading internationally (transporting every kind of cargo) and the current uncertainty surrounding the net benefit of bio-fuels, the industry would consider it prudent for legislators to better assess the impact of a substantial take-up of bio-fuels by such a large consumer as international shipping before reaching any decisions.

17. Fuel cells, solar-power, wind kites etc are all theoretically possible alternative technologies but they are best viewed as supplementary power sources rather than alternatives to the main propulsion systems on board. Nuclear power is technically feasible for ships and there are examples of nuclear-powered merchant as well as military ships. Issues of security and acceptability are, of course, dominant in that particular debate.
18. Reducing the speeds at which ships travel is often seen as a ‘quick win’ in terms of reducing carbon emissions from ships. While it is true that reducing ships’ speed has a dramatic effect on fuel consumption, the full range of underlying factors which have hitherto determined the speed at which ships generally travel remain relevant. It should be noted that shipowners / operators have relatively little say over the speed of their vessels as this is invariably determined by the charterer. Any reduction in ships’ speed would therefore require the consent of customers as they would in general have to wait longer to receive their goods. Shippers seek to maintain supply continuity and time of delivery is an essential competitive parameter. To maintain an acceptable service at slower speeds would mean an increase in the number of ships required negating much of the fuel savings otherwise expected. Furthermore, very little can be achieved on traditional slow-steaming bulk carriers as these already steam at little more than thirteen or fourteen knots. For ferries, travelling time for the passenger is a key issue in the extensive competition with other (less carbon efficient) transport modes; many Scottish ports are tide-bound which further reduces the flexibility of port arrival / departure times and; they should also be considered, especially in Scotland, as a bridge between outlying areas forming essential and reliable infrastructure. Any policy decision requiring vessels to slow down would need to be underpinned by a robust and detailed analysis of all the implications of such a measure.

Additional Industry Comments

19. The shipping industry has been working through the IMO, EU and national governments on how best to reduce carbon emissions for some time. As a result, it may be helpful for the Committee to note the broad principles which we feel will deliver a mechanism that delivers its environmental objectives while maintaining the competitiveness of the industry.

20. Firstly, and perhaps obviously, industry is only interested in delivering a solution that is effective in contributing to the reduction of total global greenhouse gas emissions.

21. In order to achieve this and avoid evasion, such a system must be binding and equally applicable to all Flag States.

22. Across all maritime legislation, the shipping industry consistently argues for a goal-based (as opposed to a prescriptive) approach, as being better suited to such a diverse industry and also allowing shipowners the flexibility to meet their environmental responsibilities in the most cost-effective manner.

23. Linked to cost-effectiveness are considerations that seek to limit or at least minimise competitive distortion and that, within the parameters of sustainable development, do not penalise trade and growth nationally or globally.

24. It has been suggested that shipping suffers from the lack of a Formula 1 to lead and drive technological improvements. Whereas the aviation industry has benefited from the civilian application of military technologies and also from the space-race, shipping has had no such high-end sector motivated by a completely independent set of cost considerations. We would therefore suggest that any control measures for shipping should actively support and encourage the promotion and facilitation of technical innovation and R&D in the entire shipping sector.

25. In addition, it is clear that any regulatory mechanisms adopted must be flexible in order to accommodate likely future technologies in the field of energy efficiency.

26. Finally in our checklist, the industry would look to ensure that the ‘back-office’ side of any regulation is given due thought. For any system to be workable, and for true environmental benefit to be gained, it is clear that the approach must be practical, transparent, fraud-free and easy to administer.
Domestic Shipping

27. We note that the subject of this inquiry is the possible inclusion of international shipping emissions within Scottish Carbon Budgets. However, the Chamber has concerns that emissions from domestic shipping (which can take place as part of an international voyage) should be properly attributed. We are unclear how this will be done. For example, it is not clear how foreign-owned competitors, which have had the opportunity to refuel abroad before making Scottish domestic voyages, will be treated? We would ask the Committee to satisfy itself that the methodologies for including domestic shipping (and its definition) within the Climate Change (Scotland) Bill are likely to achieve the stated objectives.

January 29, 2009

TO: COMMITTEE ON CLIMATE CHANGE
CC: DfT, DEFRA, DECC

Dear Ben,

Shipping and the Climate Change Act

Following the decision of the UK Government to include carbon emissions from international shipping within the Climate Change Act for measurement purposes - a position which both WWF and the Chamber of Shipping endorse – the two organisations, the leading stakeholders in this field, have committed to working together in its implementation. Our common objective is to assist the UK government to quickly develop a methodology for measuring the carbon emissions from ships that is truly reflective of those emissions that can appropriately fall within the UK’s responsibility.

During our initial discussions we have reached some broad conclusions which we hope you will find useful in developing your own thinking. These are very much our preliminary thoughts and we remain eager to participate in the development of the methodology for measuring this most complicated of sectors.

Overall Coverage

‘International shipping’ is imprecise in meaning and its coverage will need to be defined. In general terms it would be taken to mean commercial shipping engaged in international voyages (ie not ‘domestic shipping’). We assume that it is not intended to encompass leisure yachts, military or other Government vessels or installations at sea that are not otherwise regarded as ships such as fixed installations used for the production and pumping of oil. It should be noted that existing IMO legislation contains definitions of many relevant terms (‘ship’, international voyage’ etc) and it would be sensible to use these wherever possible. It is not clear whether fishing vessels should be included, perhaps depending on whether their activities are encompassed elsewhere within the fishing industry itself.
Data on virtually all seagoing internationally-trading merchant ships of over 100 gross tons, including fishing vessels, is held within the Lloyds Register-Fairplay database and are allocated internationally-recognised unique numbers (IMO numbers). This would facilitate the inclusion of fishing vessels but we are not in a position to comment on whether similar methods of reporting and verification would be appropriate. Nonetheless, a clear definition of which vessels/installations are included will be necessary.

Consideration will also need to be given to an appropriate cut-off point for vessel size. Existing international maritime regulations, primarily from the IMO, apply only above certain levels of gross tonnage, though the levels vary for different purposes. For example, MARPOL, which deals with marine pollution, only applies to ships of more than 400gt; SOLAS, dealing with marine safety, applies to vessels of 500gt and over, while other conventions and agreements apply to vessels down to 100gt. Gross tonnage is considered the simplest and most appropriate measure for applying de minimise provisions.

In practice no commercial vessel below 100gt would be engaged in international trade, and very few in the next bands up. (As before, different considerations may well apply to fishing vessels.) The UK government will need to take a view on the most appropriate lower limit recognising the limits of the various data sets, the cost/benefit of measuring very small vessels and any effect the limit chosen may have on subsequent negotiations at EU or IMO level.

Possible Measurement Methodologies

Given that the Climate Change Act will, initially, only measure, rather than restrict, carbon emissions from international shipping, greater flexibility can be applied as to the methodology as there is a much reduced risk (so long as any associated administrative burden is low) that ships will choose to reflag as a result of any measurement requirements. Indeed, given that we would expect the methodology chosen to be flag-blind and non-discriminatory, reflagging for this reason alone would be pointless. However, it should be noted that methodologies which will work for measurement purposes will not necessarily work if mandatory reductions are later required. It will also be important that any methodology takes into account the risk of ‘double counting’ where other countries follow the UK’s lead and seek to take responsibility for their share of emissions from international shipping.

There are numerous ways in which carbon emissions from international shipping could be measured. For example, by ship, by location, by voyage, by fuel sales, by number of port calls. However, the more accurate methods of measurement are considered to fall into two broad approaches, one based on physical activity and the other based on economic activity.

Physical Activity would be essentially a voyage calculation, relying on data such as point of origin, ship type, fuel type and distance sailed. There are two particularly difficult aspects to take into account:

- if outward voyages are to be included there is a clear difficulty in determining what the next voyage is to be; the UK has a much lower level of export cargos than imports, and consequently many ship leave the UK empty to seek their next employment – a bulk carrier in ballast may go to Rotterdam to load scrap metal or to Argentina to load grain, depending on market opportunities at the time, and often when on the high seas. If this general approach is chosen, it would be simpler to take account of inward voyages only (of course, where a ship arriving in ballast for an export cargo has come from is equally arbitrary, it is at least known);
an appropriate methodology would need to be developed to fairly deal with vessels that have multiple loading and/or discharge ports. This is particularly relevant to the container trades, though applies also to other unit loads (such as new motor vehicles or refrigerated cargos) and some bulk trades in both petroleum/chemicals and dry commodities. For example, a containership on Far East service may have its first European port of call in the UK, with short voyages to Continental discharge ports or vice-versa; in addition there may be mid-voyage calls at container hubs in the Mediterranean. As well as the difficulty of determining an appropriate length of voyage, the split of cargo between that for the UK and that for elsewhere would be problematic (and touches on the need to avoid potential double-counting referred to above).

Measuring the Economic Activity could either be based on imports/exports or a percentage of GDP; or on shipping company economic activity. A significant advantage of the former approach is that it is better suited to providing the statistical base at the level needed to inform political policy-making whether in the UK, the IMO or elsewhere. In particular, it does not prejudge the approaches that might be adopted should specific instruments need to be developed later. Last, and by no means least, is the avoidance of a significant burden on business, much of which is not located in the UK and much of which is run by SMEs, as the Government already collects very extensive data on the UK’s sea-borne trade.

If the location of the shipping company’s activities were to be considered when assessing ‘economic activity’, the acknowledged difficulties of allocating that activity to the UK or elsewhere needs to be addressed. In that connection, we would draw your attention to work that is currently being undertaken by the Office for National Statistics (ONS) and the Department for Transport together with Lloyds Register-Fairplay to allocate ships within the world fleet according to “country of economic benefit” (COEB). It seems to us that, should the government wish to pursue a methodology based on economic activity, this work could be directly applicable and add to the range of different policy needs to which it might be usefully applied.

It is clear that both of these broad approaches (economic & physical activity) will give rise to a number of questions and queries and that these will need to be considered fully if the finally-adopted methodology is to have credibility as an appropriate measure of international shipping emissions. We conclude, however, from our initial examination that measurement by economic activity is likely to provide the Government with the data it requires to meet its responsibilities under the Climate Change Act with the lowest administrative burden on business.

Specific Considerations Related To Sections of the Shipping Industry

In addition to the application of different methodologies to conventional cargo-carrying merchant ships considered above, it is likely that there will be some sectors that are more problematic than others, depending on the broad approach chosen. For instance, measurements based on imports and/or exports would exclude most ships engaged in carrying passengers (whether cruise ships or ferries) or in the service sectors (offshore support vessels, dredgers etc). It would be possible to develop a statistical approach for some of those activities, for example relating passengers to the voyage concerned or to the numbers embarking/disembarking; though there would be difficulties to be addressed in relation to ferries where most are multi-purpose, carrying both freight and passengers in markedly different proportions according to time of day or seasonal demand.

For specialist service vessels it is recognised that a different method of assessment may be required, compared with those carrying passengers or freight. While any methodology decided upon will need to meet the circumstances of the majority of internationally trading ships, there are some significant sectors where credible measurement is important; for example, in the cruise sector, where passengers may base their purchasing decisions on the environmental performance of the vessels in question.
Definition of Domestic Shipping and Emissions Measurement

At present the UK measures the carbon emissions of domestic shipping based on bunker fuel sales as determined by the IPCC under the Kyoto framework. It is widely recognised that this measure under-records emissions. Given that many domestic voyages will be part of a sequence involving international legs (and such ships will purchase their bunkers wherever most economic), and that there are no significant differences between domestic or international ships except for their voyage patterns, it may be more appropriate for all shipping to be treated as ‘international shipping’, with the proportion of domestic shipping being separately assessed. Again, this would be less burdensome, fairer (as it would include internationally trading vessels performing a domestic leg) and be more accurate than the current arrangements.

Next Steps

The WWF and CoS hope that, by taking our thinking forward jointly on these important issues, we can assist you better as you move your own thinking forward. We would like to emphasis once again our willingness to be engaged in the detailed work going forward so that the most suitable methodology can be devised and applied as soon as practicable.

Yours sincerely

Robert Ashdown

Chamber of Shipping

Peter Lockley
Head of Transport Policy
WWF-UK
1. Introduction

This response represents the view of Changeworks, an environmental charity that exists to improve quality of life and to protect the environment. We work with passion, integrity and in collaboration to develop and deliver innovative projects and businesses in energy, waste prevention and transport that inspire and empower people and communities to make a difference.

2. Reason for comment

Scotland’s housing stock remains largely energy inefficient despite existing programmes that are attempting to tackle this issue. The residential sector is Scotland’s biggest contributor to greenhouse gas emissions, accounting for around a third of all emissions. In addition to contributing to climate change, this inefficiency condemns large swathes of society to fuel poverty. Therefore raising the level of energy efficiency in the home is absolutely critical if Scotland is to meet the greenhouse gas reductions proposed in the Climate Change Bill, and to tackle its statutory commitment to eradicate fuel poverty by 2016. A radical overhaul of existing energy efficiency legislation is needed to achieve this, as the policy emphasis till date has been on low and zero carbon housing for new homes and largely fails to tackle the current housing stock, 85% of which will still be used in 2050.

Changeworks has for many years promoted innovative waste prevention projects aimed at both the public and small businesses. We understand the critical role of efficient resource use in delivering carbon savings. We are therefore keen to see a framework, which rolls out best practice and promotes the zero waste approach. We have chosen not to respond specifically on this and instead would like to lend our support to the response submitted by CRNS (Community Recycling Network Scotland – click link); this captures the experiences of organizations in the sector.

3.0 Specific comments

3.1 Setting the right context (Questions 1-5)

To be effective the Bill must establish an appropriate framework based on clear targets for reducing carbon emissions. In this respect Changeworks accepts the arguments presented by a wide range of organisations that as a minimum the Bill should:

A) Require a reduction of greenhouse gas emissions of at least 80% by 2050, reflecting the latest scientific evidence. However, the government should consider a cumulative emissions target as opposed to a point target as the basis for carbon budgeting.

B) Include annual statutory annual targets of at least 3% year on year reductions. At the moment, the draft Bill proposes delaying annual targets of at least 3% until 2020. There is an urgent need to reduce emissions now, so the Bill must require at least a 3% reduction in emissions per year starting immediately. Delaying this requirement until 2020 will stymie initial progress and require more drastic action in future years. Additionally if the cumulative approach to carbon budgets is adopted then the total emissions ceiling is likely to be breached.

C) Include emissions from international and domestic aviation and shipping. The Bill currently states emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should be absolutely clear that all emissions must be included at the outset. Failure to do this will require either punitive or less cost effective reductions in emissions in other areas, such as domestic housing.
3.2 Duties on public bodies (question 8)

Changeworks works closely with local authorities to develop projects that help to tackle fuel poverty and climate change. Although we believe the authorities we work with are also highly committed to tackling these issues, we are aware they face a number of challenges in managing competing priorities and allocating resources for climate-related projects. Clearly statutory functions are given priority in the overarching strategies of local authorities and this is reflected in current single outcome agreements. Unless local authorities have a statutory remit in relation to reducing climate change emissions, then there will be no greater action than at present. Such a duty would build on current voluntary action but highlight the need for greater urgency. The same case can be made for many other public bodies, especially those delivering services to the public or promoting economic development.

The Bill should therefore contain an immediate overarching duty on public bodies in relation to climate change. Any duty should be positive in nature. It should also be broad and empower local authorities to take action across their entire geographic area not just within their own services and properties. For instance local authorities should promote measures that influence the behavior of the public by rewarding actions that reduce carbon. Delivery of the duty would be taken forward through mechanisms such as community partnerships. The detailed implication requirements relating to the duty should be set out in guidance and regulations established through the Bill.

Currently councils are designated as Energy Conservation Authorities through the Home Energy Conservation Act 1995. This act must not be repealed unless a broader and stronger duty in relation to climate change and fuel poverty is put in its place first.

3.3 Tackling emissions from domestic housing (question 12)

We welcome the provisions requiring the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change. We believe the Scottish Government should provide much greater detail on specific action, in some cases this will require legislative changes that should be considered by the committee.

Changeworks has many years’ expertise working on household emissions. It is clear there are considerable opportunities for improving the energy efficiency of the housing stock to secure substantial carbon savings. However the current institutional framework does not lend itself to achieving this goal, and requires revision to improve the existing rate of progress in the housing stock. The problem is less a technical issue and more of a socio-economic one. The following issues must be addressed as a priority in any action plan that results from part 5 chapter 3 of the Bill. For the topics that require legislative changes by the Scottish Parliament it would seem prudent to do this during the passage of the Bill to create the necessary impetus for action. The issues that must be considered in the context of the Bill, are ensuring:

A) Scottish Government sets a clear framework of progressive targets to improve the energy performance of existing housing, reducing emissions by 35% by 2020 and 80% by 2050.

B) The Scottish House Quality Standard (SHQS) currently sets a minimum NHER of 5 for efficient central heating and insulation. This target needs to be more exacting to improve energy efficiency and cut emissions in the current housing stock. Furthermore the target should be increased to require a minimum NHER of 8 (or equivalent on the EPC scale) by 2016. This would be aligned with statutory fuel poverty targets. Ministers should be pressed to make this commitment during the passage of the Bill.
C) Any policy package is delivered in a way that is equitable and progressive, so that those at risk of fuel poverty do not bear further costs. A review of the current UK energy efficiency policies (EU ETS, Renewables Obligation and CERT) is essential as the costs are borne by all gas and electricity consumers through billing. Although the existing schemes are designed to improve energy efficiency and reduce fuel poverty they also have the capacity to increase fuel poverty by reducing the disposable income in low-income households through higher fuel bills. Furthermore, those on low incomes are far more likely to have a prepayment meter and consequently pay far higher prices for their energy. At current prices, prepayment meter customers pay £127 a year to £340 a year extra (depending on fuel supplier) compared to those who pay for example by direct debit. In essence the poorest members of society are subsidising the environmental costs of direct debit consumers. This practice needs to cease immediately and it is only fair that low income and vulnerable households benefit from climate change policy rather than being penalised by it. This argument is further supported by strong evidence that suggests that low-income households have a smaller carbon footprint than average. To ensure the appropriate balance is achieved specific clauses relating to fuel poverty should be considered, possibly updating the provisions in the Housing (Scotland) Act 2001.

D) Over time the roll-out of Energy Performance Certificates (EPC) to all households, not just those that have been subject to a recent rental or sale. This will promote the implementation of energy efficiency measures across all the housing stock. Greater adoption of measures would also be likely if council tax reductions were granted for energy efficient properties as established through an EPC rating. Another opportunity to roll out EPCs exists when a property owner is seeking a building warrant for improvements or extensions to the property. Landlords should be required to produce a valid EPC when they register with local authorities. The period of an EPC should be reduced from ten to five years, given the pace that standards in energy efficiency will change at, in coming years. The Bill should ensure that Ministers have the powers to do this after consulting stakeholders.

E) A requirement that properties being sold, rented, upgraded or extended meet an accepted energy efficiency standard (for example an E-rating on the EPC scale) before the property can be transferred. Rental income for energy inefficient properties should be capped given the high levels of fuel poverty associated with this sector and the ongoing failure of landlords to invest in their properties. Stricter energy standards should be required for accredited landlords.

F) Update the Home Energy Conservation Act (HECA). Firstly, integrate reporting and monitoring requirements on energy efficiency in housing with other duties in relation to carbon reduction and fuel poverty. Secondly, retain and reinforce local authorities’ responsibilities as energy conservation authorities, empowering them to co-ordinate the improvement of the housing stock across all tenures including the setting of targets.

G) Extend local authority powers in relation to Housing Act 2006 to include a range of basic energy efficiency measures (e.g. loft top ups and cavity fill) when enforcing household repairs. Meeting energy efficiency standards should be viewed as an essential repair not an improvement.

H) Revising communal repair clauses in the Tenements (Scotland) Act 2004 to include energy efficiency improvements. The barrier to improving flats must be addressed or these buildings will never be upgraded. Presently it is impossible in the majority of cases to secure the agreement of all the tenants to allow such works to proceed. Without this

1 http://www.energyhelpline.com - February 2009
amendment the majority of properties in Scotland’s cities will remain untreated, and upgrades will continue to be blocked by a minority of tenants.

I) Provisions to allow either the Scottish Government to arrange for very low interest loans to households for the purpose of energy efficiency improvements. Costs should be spread over a 10 – 20 year period, or repaid when the property is sold. This should be in addition to concerted promotion of Loan Action Scotland throughout the private rented sector and residents associations. Other schemes such as the Landlords Energy Saving Allowance should also be promoted, given the dire energy efficiency standards across this sector.

3.4 Promoting micro-generation

Changeworks sees merits in the further measures to promote micro-generation. Whilst there has been significant progress in recent years, particularly the SCHRI grants scheme, much more needs to be done to secure the roll out of these technologies. Early adoption of these legislative measures would clearly provide the necessary tools for delivering the targets in the Bill. These include:

A) Providing incentives, such as reduced business rates or reductions on Council tax, for business premises and domestic households who install new energy efficiency improvements and microgeneration measures.

B) Require Scottish Government to set targets for energy efficiency and micro-generation and local authorities to consider such technology by setting targets and strategies to take this forward.

C) Require all new building developments to ensure energy efficiency measures are installed as standard and include capacity for microgeneration (to initially deliver at least 15% reduction in projected emissions building regulations, rising to 100% by 2016).

D) Require annual reporting to Parliament on progress and implementation of these measures, including progress at a local authority level.

E) Empower councils or energy advice centres to bulk buy micro-renewables, which drives down costs, and offer extended low interest loans to households that offset the payback periods.

3.4 Zero Waste (question 15)

We are part of the CRNS network and endorse the views already submitted to the committee.

4.0 Conclusion

To be effective the Climate Change Bills must first set a clear and unambiguous framework, which works towards achieving the 2050 goals. To allow these targets to be met a retrofit strategy, including new legislative measures which remove current barriers to action, that addresses the energy efficiency standards of all existing properties, including hard-to-treat properties will be needed. Failure to take bold action will ensure that targets are missed and future generations will continue to suffer fuel poverty and health inequalities. Furthermore, tackling the energy efficiency standards of the current housing stock will create jobs, which is an added bonus in the current economic downturn. Similar benefits will be achieved in relation to concerted action to deliver a zero waste Scotland.
Robust legislation, strong leadership, and a complete package of measures that includes delivery, increased funding and capacity are all needed to ensure that emissions targets are met. Financial support will need to double from current levels to around £500-600 million per year. However this investment is minimal compared to the long-term cost of inertia. Similar costing and increased action to promote zero waste will also be needed if Scotland is to move beyond the status quo.

The Stern Review was explicit in recommending action now, rather than trying to mitigate the consequences of climate change. Failure to take adequate steps at this stage will have far greater costs for the economy and the planet in the future. Such a programme would also deliver social and economic benefits by ensuring that the legacy of substandard housing, and inefficient and wasteful use of resources is tackled. In this respect the Climate Bill points Scotland to the right way forward, but what is also needed are rapid steps along the path to lower emissions.
Children’s Climate Change Project 2008

"Which world would we want? One all burned up or one all lovely and equal? It’s your choice".
(MCP)

The Project: In spring 2008, 20 Members of the Children’s Parliament in Scotland were invited to take part in the Children’s Climate Change Project. This innovative project was brought together by WWF Scotland, the Children’s Parliament and Children in Scotland, to engage young people in the global debate on climate change and particularly the national debate on the Scottish Climate Change Bill which was being developed by Scottish Government.

Young people were not directly targeted in the formal consultations around the Bill. The organisations that developed the project felt that children should be engaged in this debate, not only as citizens in their own right, but also because they have arguably the biggest stake in the decisions made about what we do to tackle climate change. The project was kindly supported by Scottish Government and the Scottish Commissioner for Children and Young People.

In advance of a Climate Change Project Camp, all the children received packs of information and some tasks related to the project were undertaken at home. Over the weekend camp in Kinghorn, Fife in June 2008, the children learned about climate change, how Parliament works and the Climate Change Bill. They stayed in yurts, role played as scientists, historians, politicians and activists and discussed their aspirations for Scotland’s Climate Change Bill. The children’s views were captured in a mural which showed their own journey over the project and the journey of the Bill to being strong and delivering a green, happy ‘eco world’ or too weak (or thrown out) and resulting in a ‘burned up’ world. On return to their communities across Scotland, they talked with more children and adults, reaching around 200 children in the whole exercise of the project. The children exhibited the mural and presented their findings to the Scottish Climate Change Minister, MSPs and the Children’s Commissioner in the Festival of Politics in Edinburgh in August 2008.

The children have been supported to submit this short report of their conclusions as written evidence to the Transport, Infrastructure and Climate Change Committee of the Scottish Parliament and hope to continue to contribute to the debate on the Climate Change (Scotland) Bill on its journey through Parliament.

About the children: Twenty children from diverse social backgrounds and from across Scotland signed up for the Children’s Climate Change Project. They were aged between 9-14 years old and are Members of the Children’s Parliament (MCPs) in the Western Isles, Fife, North Edinburgh and South Ayrshire.

Key messages

The strongest message from the project is one of individual and shared responsibility:

Now is the time to make a difference and help stop climate change and Scotland should lead with a strong climate change bill.

Taking responsibility; taking action.

1. Children are worried about the future if we do nothing about climate change.
2. Children are concerned about how climate change affects people in Scotland, their health and wellbeing, as well as people in other countries.
3. Children are concerned how climate change affects other living creatures, particularly endangered species.
The children learned some important things:

4. The children became more familiar with the language and terms used when adults are talking about climate change. They also learned about the language of Parliament: a Bill, the role of a committee, MSPs and citizens.

5. They have learned about the nature of our atmosphere, about the causes and effects of greenhouse gases. They have explored energy production, transportation, and how our consumer choices affect climate change.

6. The children learned about how our lives have changed from hunter-gatherers to traditional and now modern farming, to use of machinery, to international travel and demands for food and other products from all over the world.

7. The children have learned about a growing world population, and how our history and industrial development here in Scotland has played its part in today's climate change.

8. The children learned about the damage that is done by plastics, packaging and oil based pesticides.

9. We use a lot of landfill. Children learned that anything that is biodegradable can break down, and that composts release less methane than landfill rubbish.

10. The children discussed how active citizens have been successful in changing things for the better throughout history.

Children want their voices heard. They want to be active citizens and have their say about climate change

11. The children would like to influence what politicians and Government decides about climate change.

12. The children had lots of discussion about different ways to do it.

Children have identified some important debates and dilemmas

13. The children said there should be more education and debate to inform children and adults about climate change.

14. The children explored and debated the pros and cons of various technologies in helping to reduce CO2 emissions.

15. The children felt that sometimes technology is too expensive.

16. There were concerns about environmental impact.

17. The groups were divided about nuclear power. Some children agreed that nuclear power is OK if “the waste could be dealt with safely” but others were strongly opposed to it.

18. The children debated whether laws or punishing people if they do not follow rules about things like composting or saving water is necessary.

19. The children considered how to get people off aeroplanes and on to other transport.

The children identified things we need to do about climate change:

20. The children identified things that individuals can do to reduce energy use and their impact on the environment. Individually, and in their family life, people can cut down on their personal energy use if they:

   a. walk and cycle more
   b. use their cars less or share your car
   c. use less household energy
   d. compost and recycle
   e. buy locally produced food or grow your own
   f. buy locally made products
   g. use public transport more
   h. fly less
The children concluded that:

21. We should use technology to help reduce the damage we do.
22. There should be more use of sustainable energy technologies like wave, hydro, tide, solar and wind power.
23. These should be affordable. They should be developed in a way that is sensitive to local people’s opinion and the environment.
24. We must protect forests.
25. The Government should help people use less energy by improving public transport
26. The Government should make laws that affect what people can do, if what they do is damaging the planet.
27. The Government could:
   a. ration petrol
   b. encourage people not to fly
   c. ban products that are bad for the environment
   d. make sure new buildings meet energy efficiency standards
   e. help people understand their own personal energy use and any damage they might be doing.

What should be in the Scottish Climate Change Bill?

The children came up with and discussed the following ideas for the Climate Change (Scotland) Bill. During role play as Members of the Scottish Parliament considering the Scottish Climate Change legislation they debated many of these ideas. The two marked ** were selected in particular, discussed and approved by the children’s own version of the Transport, Infrastructure and Climate Change Committee.

**Transport:**
- Each bus should have more than 20 people
- Scotland should spend more money on public transport
- The number of people in a car should be 3-4 people
- Make petrol that does not pollute the earth
- If they don’t have 3-5 people [in a car] they would get a fine of £100
- You should be paid to cycle (over 2/3 hours)
- Prices of short distance planes should go up to discourage people from going from Edinburgh to London by plane **
- Scotland should spend money making our public transport better
- They should lower the price of eco-friendly cars: electricity, hydrogen, etc.
- Make electric-normal hybrid buses
- Increase car tax/prices and reduce price of eco-friendly rural public transport
- The government should look into new, alternative fuel sources i.e wave, hydro-electric. Also, invest in hydrogen fuel cell cars. They are the way forward! **
- Cars have to be very fuel efficient by law
- In the suburbs, promote lanes for bicycles. This is safer.
- Car companies should be paid grants to invent cars that run on water or hydrogen
- Planes should fill up the whole plane with people before leaving the airport and if not all seats, most of them.

**On waste:**
- Recycle all plastic, cans, glass etc.
- Everyone should have an organic bin scheme like in the Western Isles
On energy:
- Turn off all electrical appliances when not using
- Scotland should encourage people to buy solar panels and wind turbines by making them cheaper.
- There should be a fine for people who waste energy
- An eventual ban on normal light bulbs to allow for energy-saving ones

General:
- Local food should be served in school dinners, hospitals and prisons
- Get a filtration system to save on water (recycle)
- Plant better trees in inner cities
- Cut the Scottish carbon dioxide emissions by 80%
- Earthship schools

Steering Group and Funders
This learning and consultation project was designed, facilitated and supported by a number of organisations. The Steering Group members are WWF Scotland, Children’s Parliament, Children in Scotland and Scottish Commissioner for Children and Young People. The Steering Group are most grateful to Scottish Government and Children’s Commissioner for the financial support to the project.

Thank you to all the children and adults who participated in and made this project possible.
WRITTEN SUBMISSION FROM CHRISTIAN AID

Introduction

Christian Aid believes climate change is a social justice issue. Poor countries have done the least to contribute to climate change yet are suffering its effects, first and most severely. Moreover, climate change is threatening to undermine development gains and make poverty permanent.

We therefore welcome the introduction of the Climate Change (Scotland) Bill as an acknowledgement that developed countries need to lead the way in drastically reducing their carbon emissions if we are to secure an equitable global deal to avoid dangerous climate change.

Christian Aid believes the Scottish climate change bill has the potential to be the most ambitious climate legislation in the world and could pave the way for Scotland to demonstrate international leadership ahead of the UNFCCC talks in Copenhagen in December 2009. However, the bill needs to be strengthened in a number of areas which we have outlined in our response below.

Christian Aid is a member of Stop Climate Chaos Scotland. Stop Climate Chaos Scotland is a coalition of more than 30 organisations campaigning together to tackle climate change. The coalition members include environment and development NGOs, faith groups, trade unions, community councils, student societies, women’s organisations, a mental health charity, and many others. In Scotland, the members have a combined supporter base of over 1.5 million people.

The Stop Climate Chaos Coalition Scotland priorities for the Climate Change (Scotland) Bill are that it must:

1. Set out a framework that will achieve at least an 80% reduction in greenhouse gas emissions by 2050.
2. Establish in statute annual emission reductions of at least 3% year-on-year from the start, not just from 2020, compatible with a fair and safe cumulative budget identified by the advisory body (see 4).
3. Include emissions from all sectors in the framework and targets set out in the Bill, including those from international aviation and shipping, from the very start.
4. Establish a Scottish advisory body, a Scottish Climate Change Commission, in the primary legislation to support delivery of the Bill when it is enacted.
5. Ensure that at least 80% of the effort to cut emissions takes place in Scotland.
6. Establish duties on all public bodies to reduce greenhouse gas emissions in line with the national target.
7. Set in place robust, transparent reporting measures so the Scottish Parliament is well informed on progress in meeting targets and Government is held to account on mitigation and adaptation.
8. Ensure that strong enforcement measures are set in place in statute.
9. Ensure Scotland counts all its emissions and reports on those produced by products and services we consume as well as emissions produced domestically.
10. Be explicit that sustainable development is core to the purpose and delivery of the statute in relation to mitigation and adaptation.

While Christian Aid supports the Stop Climate Coalition Scotland position in relation to annual reduction of at least 3%, we believe more ambitious annual reductions of at least 4% are needed to increase our chances of avoiding dangerous climate change. See response to questions 1 and 2 for further details.
Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

Christian Aid welcomes the target in the bill to reduce emissions from all greenhouse gases by 80% by 2050. It is widely agreed that to keep below a 2°C rise and avoid dangerous climate change, global emissions reductions of at least 80% by 2020 are essential.

However, the emission reductions pathway to reach 2050 target, and thus the cumulative emissions between now and 2050, are as important as the target itself. According to IPPR¹, global emissions need to peak between 2010 and 2013, and then decline at an annual rate of at least 4% by 2015-2020², if we are to have a ‘very low to low risk’ of exceeding the 2°C threshold. The current bill requirement that, between 2010 and 2019, Scotland’s emissions must be less than the previous year is therefore inadequate. If Scotland is to contribute its fair share of the global effort required to keep below the 2°C, the bill should set annual targets to cut emission reductions by at least 4% from the outset.

Christian Aid believes it would make more sense for the bill’s interim target to be set at 2020, in line with the interim targets of the UK and the European Union, rather than at 2030. In addition, to meet the need for early and deep cuts as outlined above, Christian Aid believes the interim target should be to cut emissions by 50% by 2020.

Once the temperature increases above 2°C, scientists say the risk of exceeding ‘tipping points’ where global warming will become catastrophic and irrevocable will dramatically increase. This would mean up to 1-3 billion people will face water shortages, millions will go hungry, and tens of millions could be at risk as diseases such as malaria spread. If the aim of the bill is for Scotland to contribute its fair share towards avoiding dangerous climate change this aim should be made explicit in the long title of the bill.

Q.4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

Christian Aid believes it is disingenuous to refer to a Scottish net emissions account unless a figure is put on how much of the bill’s reduction target is met through domestic effort i.e. emission reductions that are made in Scotland.

As it stands, the bill allows for an unlimited level of carbon credits to be purchased to meet the emission reduction targets. For reasons of global equity and international leadership, Christian Aid believes the at least 80% of the effort to meet the bill’s targets should take place in Scotland and not be ‘bought in’ from other countries.

Global equity
To avoid dangerous climate change, not only do all countries need to reduce their emissions by 80% by 2050 but industrialised countries need to lead the way in making deep, rapid cuts. A transition to low-carbon development in developing countries (through mitigations funds of the UNFCCC), needs to happen in addition to and not instead of, emission reductions in wealthy nations such as the UK.
Developing countries have contributed the least to climate change, are disproportionately suffering its effects and are the least able to finance mitigation and adaptation. In contrast, industrialised nations like Scotland, which bear the historical responsibility for climate change, have the greatest capacity to reduce their emissions to deliver an equitable global solution to the problem. The overall objective of the Bill must therefore be to guide Scotland to a low carbon economy and not to simply set targets which can be met by paying others to cut their emissions.

Quality of credits
In addition, Christian Aid has serious concerns about the quality of carbon credits generated outside the EU. It is questionable whether some of the projects from which carbon credits are generated are truly ‘additional’ (i.e., delivering emission reductions which would not otherwise have occurred) or contribute to sustainable development in the host country. Moreover, there is evidence to suggest that some “offsetting” projects have produced substantial social and environmental harm.

Therefore, if the bill allows for the purchase of carbon credits, it should specify the criteria that will be applied to ensure they are truly additional, purchased from projects, which have been certified as making a measurable, reportable and verifiable contribution to sustainable development, and benefiting the local community.

International leadership
Placing a requirement in the Bill, that limits the proportion of emission reductions bought in from elsewhere, would make Scotland the first industrialised nation to demonstrate its willingness to make deep cuts at home. This would place Scotland at the forefront of generating greater trust and confidence, particularly amongst developing countries, which is desperately needed in advance of the international talks in Copenhagen in December 2009.

Incentivising the traded sector
Stating in the bill that at least 80% of the emission cuts is met through domestic effort is entirely compatible with the operation of the European Union’s Emissions Trading Scheme (ETS). The ETS is a potentially valuable mechanism but both Stern and Turner have acknowledged it will not in itself deliver the required cuts in the timescale required, nor drive investment in a renewable power sector. The traded sector in Scotland accounts for approximately 50% of Scotland’s emissions and includes the power sector which is critical to the delivery of a low-carbon economy. The traded sector can therefore make a significant contribution to meeting the bill’s targets.

It has been suggested that because emissions from the traded sector are fixed by the number of allowances allocated through the ETS scheme, there is no reason to focus on these sectors. Followed through to its logical conclusion that would mean there would be no point in using available policy levers to reduce emissions from the electricity sector, such as energy efficiency measures or support for renewables.

It has also been argued that if the ETS sectors in Scotland reduced their emissions below the scheme’s cap that would only shift the emissions elsewhere in Europe through the sale of credits. Christian Aid acknowledges this argument but believes it is preferable that the ETS sector in Scotland is incentivised to show leadership by demonstrating how early deep reductions can be made at home and thus, the capacity for the ETS cap to be tightened.

Q 5 The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?
Christian Aid supports the inclusion of Scotland’s share of emissions from international aviation and shipping in the definition of Scottish emissions. We would like to see these emissions included in the primary legislation but allow for the methodology used to calculate these emissions to be revised in the future (through secondary legislation) in line with international reporting methods.

Christian Aid would also like to see a commitment in the bill to regular reporting on the emissions produced elsewhere that result from consumption in Scotland. By reporting on consumption, the Scottish Government would be able to identify appropriate levers to address all emissions arising from the behaviour of individuals in Scotland. Such reporting would also encourage individuals to address their behaviour and consumption to make a contribution towards reducing global emissions.

Q6 The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government’s approach to obtaining independent, expert advice on climate change?

Christian Aid would want to ensure that the body advising on the bill’s targets has sufficient expertise to understand the impact of climate change on vulnerable communities around the world and a comprehensive understanding of the policy levers available in Scotland to bring about early deep cuts in emissions.

Q7 The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

Christian Aid believes that in order that the targets set out in the bill are met and that Scotland makes its fair contribution towards avoiding dangerous climate change, there must be robust reporting arrangements that are transparent and accountable.

Q19 Do you have any comments on the impact of the Bill on sustainable development?

The bill sets out a framework to reduce greenhouse gases. However, it is important that the reductions in greenhouse gases are not achieved by undermining the long-term sustainability of vulnerable communities. For example, one of the solutions that has been sought to cut emissions in rich countries is substituting biofuels for oil. This “solution” will need vast tracts of land for plantations, leading to biodiversity loss, food insecurity, conflict, and the forced ejection of millions of rural and peasant farmers from their lands.

As Christian Aid does not wish to see the targets in the bill met at the expense of vulnerable communities, it strongly supports a general duty on sustainable development in the bill.
Q20 Do you have any other comments on the Bill?

It has been suggested that there is a contradiction in the positions advocated by international development agencies in pushing for deep cuts in emissions and promoting fair trade from developing countries. However, this suggestion is a red herring as it is rich countries that dominate international trade and between which the majority of goods are exchanged. For example, the International Institute for Environment and Development has stated that the total emissions associated with the export of fruit and vegetables from Africa is the equivalent of 0.1% of the UK’s total emissions. Moreover, local or regional trade does not necessarily incur more emissions than international trade. Growing flowers in Kenya and flying them to the UK can be less than a fifth of those grown in heated and lighted greenhouses in Holland.

\[1\] High Stakes: Designing emissions pathways to reduce the risk of dangerous climate change IPPR 2006
Introduction

1. The Church of Scotland welcomes the Climate Change (Scotland) Bill and endorses the proposal to cut emissions of greenhouse gases by 80% by 2050.

2. For the Church of Scotland climate change is primarily an ethical issue and our interest in the bill is in its overall impact and its implementation rather than in the technical detail. However the Church of Scotland is a member of the Stop Climate Chaos coalition and supports the submission made by the coalition covering technical aspects of the bill (see appendix below). This submission is therefore confined to those questions that deal with broader issues. These are primarily questions 1-3, 7-9, 12, 13, and 20.

The Ethical Imperative

3. The church’s position is summarised by the following statement.

   The Church of Scotland is concerned that climate change poses a serious and immediate threat to people everywhere, particularly to the poor of the earth; and that climate change represents a failure in our stewardship of God’s creation. We accept the need to reduce the emissions of greenhouse gases urgently to avoid dangerous and irreversible climate change; and to promote a more equitable and sustainable use of energy.

4. For these reasons we strongly support the Bill and the contribution it can make to reducing greenhouse gas emissions. Although Scotland is responsible for a small share of global greenhouse gas emissions the example it sets through this legislation is admirable and the Scottish Parliament and Government are to be commended in jointly bringing forward this Bill.

Public Involvement, Engagement and Commitment

5. Our main concern is whether people in Scotland feel involved, engaged and committed to the legislation. The evidence from meetings with eco-congregations around Scotland is that many people are concerned about climate change and its impact but few people are aware of the Bill or how it might affect them. In the face of other more immediate and pressing demands in their lives most people tend to forget about climate change. Climate change is of general concern to many people but when major proposals arise such as the development of a new luxury golf course or a new bridge over the Forth the lure of new development is usually more powerful than concerns about climate change.

6. The importance of public engagement and support was highlighted in the debate on the Eco-Congregation Scotland programme held in the Scottish Parliament on 19 December 2008. Members contributing to the debate identified the importance of community involvement and how congregations can lead community responses to climate change. The Minister for the Environment, Michael Russell, identified that communication, along with mitigation and adaptation is one of the three aims of the Government’s climate change programme. We therefore believe that if it is to be effective the Bill should include provisions to require the Scottish Government to promote public awareness about the legislation and its targets; and to promote public involvement and engagement in meeting those targets.

Overall targets (Questions 1-3)

7. The Church of Scotland strongly supports the target of an 80% reduction in greenhouse gases by 2050. However the evidence from meetings with eco-congregations, presbyteries and other groups, is that this target is too large and too remote for most people to understand. Faced with such a distant and such a huge target people tend to recoil from the challenge. To aid understanding and engagement short term targets are essential. In meetings with eco-congregations we have identified that an annual target of 5% a year is helpful and generally welcomed by congregations as being challenging but realistic.
8. This approach was agreed unanimously by the General Assembly 2008 in response to a deliverance proposed by the Iona Community in 2008 and is now being used by Eco-Congregation Scotland as a target for eco-congregations across Scotland. This experience is relevant to the Bill. A target reduction of 5% each year is consistent with the 80% target by 2050 and would help deliver on this. As a tool of public engagement and involvement short term targets will be useful, if not essential, to help the Government move forward.

**Reporting duties (Question 7)**

9. The clauses on reporting duties need to be stronger to require the Scottish Government to set out how it has provided advice and information to the public, how effective that advice and information has been; and how it has promoted engagement and involvement in the delivery of targets. If the Government is not effective in this regard the Bill is likely to fail in its purpose. By way of example consider the impact of legislation that has been successful: the Smoking, Health and Social Care (Scotland) Act 2005. This legislation introduced the smoking ban that led to immediate and significant behaviour change in Scotland, change that has had a huge and positive health impact. The context of the Act was different and the requirement it made of people was very specific, but it would not have been successful without a government led campaign of advice and involvement, including a nationwide consultation exercise.

10. On the other hand there are other examples of legislation that warn what might happen if the Bill fails to achieve public support. The UK Equal Pay Act of 1970 sought to secure equal pay for men and women, yet nearly 40 years after its enactment there is still public debate and legal action surrounding its implementation. In both the public sector and in business equal pay has not been clearly and unequivocally achieved. We cannot afford to be in this position in 40 years time with climate change. The uptake and effective implementation of the legislation must be immediate if it is to be effective. And for this to happen one of the preconditions is widespread public acceptance and involvement. The Bill needs to embody this requirement and it may be that this section is an appropriate place to do this.

**Duties of public bodies relating to climate change (Question 8)**

11. Duties on public involvement and engagement could usefully be extended to all relevant public bodies. Local authorities and community planning partnerships in particular have a duty under best value to promote public engagement in their policy planning process and have now developed substantial experience and expertise in implementing this duty. They could take on public engagement on climate change issues relatively easily and play a major role in helping the government implement its proposals. Churches, congregations and other voluntary organisations could also play an important role and it would be helpful for the legislation to embody a requirement for public bodies to engage with voluntary organisations in the delivery of this duty.

**Adaptation (Question 9)**

12. As with mitigation, communities will have to be at the centre of strategies to promote adaptation. In its response to the Scottish Government consultation document on adaptation the Church of Scotland identified the importance of the Scottish government supporting communities across Scotland to help them formulate their own response to climate change. This would lead to consideration of the role of education; community learning and development; and of community and voluntary organisations. In this context the Climate Challenge Fund is an example of how the Government can reach out to voluntary organisations and help them engage in the action to respond to climate change. The Bill could include more specific reference to the need to engage with communities in developing programmes for adaptation; along the same lines as those suggested for mitigation above.
Energy efficiency (Questions 12-13)

13. The promotion of energy efficiency is a crucial response to climate change and the clauses are welcomed. However it may be appropriate to relate these duties to the need to tackle fuel poverty as the two issues are closely related. It might be appropriate for the bill to require the Government to take on a more specific duty to promote energy efficiency and tackle fuel poverty by including targets that will lead to a systematic improvement of the housing stock and to reduce the proportion of the population living in fuel poverty. Such targets would be challenging and would need to be supported by a substantial budget to be effective, but would lead to a measurable reduction in carbon emissions and of fuel poverty.

General issues (Question 20)

14. In conclusion, the Church reasserts both the importance of the legislation and its impact on people across Scotland. In the coming century climate change will change lives and while technical measures contained in the Bill are important, first and foremost, people across Scotland need to be engaged and committed to the challenge of responding to climate change. The Bill must therefore seek to involve and engage people and communities and set out clearly how the Government will be expected to do this.
Appendix

Stop Climate Chaos

Stop Climate Chaos Scotland is a coalition of more than 30 organisations campaigning together to tackle climate change. The coalition members include environment and development NGOs, faith groups, trade unions, community councils, student societies, women’s organisations, a mental health charity, and many others. In Scotland, the members have a combined supporter base of over 1.5 million people.

The Stop Climate Chaos Coalition Scotland priorities for the Climate Change (Scotland) Bill are that it must:

1. Set out a framework that will achieve at least an 80% reduction in greenhouse gas emissions by 2050.
2. Establish in statute annual emission reductions of at least 3% year-on-year from the start, not just from 2020, compatible with a fair and safe cumulative budget identified by the advisory body (see 4).
3. Include emissions from all sectors in the framework and targets set out in the Bill, including those from international aviation and shipping, from the very start.
4. Establish a Scottish advisory body, a Scottish Climate Change Commission, in the primary legislation to support delivery of the Bill when it is enacted.
5. Ensure that at least 80% of the effort to cut emissions takes place in Scotland.
6. Establish duties on all public bodies to reduce greenhouse gas emissions in line with the national target.
7. Set in place robust, transparent reporting measures so the Scottish Parliament is well informed on progress in meeting targets and Government is held to account on mitigation and adaptation.
8. Ensure that strong enforcement measures are set in place in statute.
9. Ensure Scotland counts all its emissions and reports on those produced by products and services we consume as well as emissions produced domestically.
10. Be explicit that sustainable development is core to the purpose and delivery of the statute in relation to mitigation and adaptation.
Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

The Council acknowledges that the proposed reduction targets are ambitious by international standards. Nevertheless, they are achievable with a robust supporting package provided by Scottish Government.

The Council believes that an emission reduction by 90% from 1990 levels will be needed to avoid runaway climate change if the growing international consensus on this issue is correct.

The Council believes that an interim target set at 2020 rather than 2030 would be better as this would tie in with dates set in other international agreements and the UK Climate Change Act and the recommendations of the UK Climate Change Committee.

The Council has set its own targets of 20% carbon reduction by 2015, 30% by 2025 and a target of a zero carbon economy by 2050. This commitment is backed by a detailed Carbon Management Plan and perhaps something similar should be considered in a Scotland wide context.

Q2 The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

What are your views on the setting of targets in batches from 2010 to 2022?

It is the Council's view that setting targets in batches would allow a degree of flexibility in meeting the annual targets, but that this may not be desirable in the long run. It may lead to minimum levels of achievement in the earlier years and little hope of achieving the overall batch target. This strategy may carry a high risk of failure unless carefully managed. It may be more effective to set batches in 5 year terms to reduce the risk.

The Council also suggests that public accountability may be served by setting four year carbon budgets which run alongside Parliamentary terms; however these would need to be based on published annual carbon targets.

The Council believes that budgets should be set two to three years in advance.

Q3 The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

The Council believes that the impact on the climate of carbon emissions depends on total emissions, so delays in achieving emission reductions will exacerbate climate change. A very early move towards statutory 3% annual reductions is critical if a meaningful and adequate level of emission reduction is to be achieved.

The Council notes that the Scottish Government's own Council of Economic Advisers issued the following warning on 5th December 2008: "To reduce emissions by 80% will require an annual rate of reduction averaging more than 3%. The reduction likely to be achieved by 2011 is not sufficient to put Scotland on that downward trajectory”.

The Council believes that the implications of lower target reductions in the early years for meeting the 2030 and 2050 targets, and for overall carbon emissions over the period 2010 to 2050, should be clearly stated. This approach is in line with the principles of the Carbon Reduction Commitment (CRC) and is achievable. Consideration should be given to linking this proposal to the CRC in this respect.
Q4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

The Council is concerned that there is no reference as to the potential impact that the emissions scheme will have on SMEs in Scotland and the timeline when such a scheme may be implemented. New resources would be required to ensure that businesses in the capital can meet any new regulations and be fully equipped to take part in an emissions scheme. Edinburgh has been consistently ranked highly in quality of life and quality of environment (key determinants in choosing a business location) assessments in the Cushman & Wakefield UK cities monitor which tracks business perceptions.

The Council suggests that a weighting be taken into consideration for businesses in Edinburgh when setting any future carbon quotas that may be imposed. This should recognise the additional carbon burdens which local SMEs incur through their role or location within a vibrant capital city.

The Council believes that there is a need for a benchmark against which future reductions can be measured and there needs to be more local accountability and measurement of the performance of individual organisations or businesses.

It is the Council’s position that the purchasing of carbon units to offset failure to meet targets is contrary to the aims of the Bill and should not be allowed, or at the very least restricted. Attributing carbon units to the country of origin will encourage development of renewable resources. Buying in credits to set against Scottish emissions cannot be a substitute for effective and meaningful action within Scotland itself.

Q5 The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

The Council believes that emissions from international aviation and shipping must be included in the definition of ‘Scottish emissions’. The shift in the Bill which moves towards their inclusion is welcomed. Emissions attributed to Scotland should have a direct link to the country. In the case of emissions from aviation, such emissions should be attributed to the country of the airport of the origin of the flight, with some offset where multiple stopovers of the aircraft are part of the flight. It should not be applied in passenger terms; rather it should be the individual flight. This would have a major impact on the way hub airports are developed and would encourage consideration to be given to additional pollution from airport expansion, for example. No detriment should be applied to a country where international flights over fly their territory. The same principle should be applied to shipping using the port of origin of the voyage.

It is essential that the calculation of emissions fully accounts for emissions arising from production as well as from consumption; ecological footprinting may be useful in this respect.
Q6 The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government's approach to obtaining independent, expert advice on climate change?

The Council believes that independent, expert advice is essential. The Council welcomes proposals in the Bill to use the UK Climate Change Committee to provide scientific advice as there are many common issues that need to be addressed. The provision in the Bill to allow Ministers to create a Scottish version, if they see fit, may be acceptable if additional advice is limited to specific areas of climate change interest relevant to Scotland. The strong support from NGOs for the establishment of a new Scottish Climate Change Committee is noted.

The fact that membership of a Scottish Committee on Climate Change would include members with expertise/experience in business competitiveness, financial investment and technology development and diffusion is welcomed. However, it is of concern to the Council that this committee would, if the Bill is not amended, be appointed by Scottish Ministers, not Parliament. This may reduce public and private sector acceptance of its independence and scientific credibility.

Q7 The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

The Council believes that reporting requirements should be more specific and should include the performance of public bodies rather than a generic overview. CRC figures could be used as a comparator.

It is of concern to the Council that the Bill currently contains no consequences or sanctions for Ministers who miss their targets. Given that they are responsible for their success or failure, Ministers need to know what will happen if they fail. Ministers must be accountable.

Scottish Ministers should also report on the consequences for relevant emissions of all policy initiatives/programmes that can reasonably be expected to have a significant impact on emissions.

Q8 The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

It is the Council’s view that, given their central role in Scottish society, it is important that climate change mitigation and adaptation duties are placed on public bodies. Local authorities, in particular, are key to delivering reductions in emissions. However, adequate guidance and support will be essential to ensure that public bodies know what is entailed by new duties and what is expected of them in terms of reporting. Guidance should detail whether new duties extend to local government arms length organisations. Realistic resources provision from government to assist with implementing and fulfilling the requirements of new duties will be essential if local authorities are to play their part.

The Council believes that in the current economic climate, where new policies to address the economic downturn are being drawn up, it is fundamental that early guidance and realistic resources are outlined so that economic policies can be aligned with the overall carbon reduction policies promoted by the Bill.
The Council believes that major changes to behaviour will not happen without regulation. The first cities in Europe to make the necessary changes will have a huge competitive advantage over those lagging behind, which will benefit Edinburgh’s economy. Green credentials will also benefit the city in terms of tourism. There should be mitigation and adaptation incentives as well as penalties, e.g. many businesses would like to recycle but the facilities are not there.

Q9 The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on this proposal?

The Council welcomes the preparation of a Scottish Government report on objectives relating to adaptation. This report should include the impact that introduced regulations on energy performance of non-domestic buildings, waste reduction and recycling may have on SMEs.

We believe that there needs to be some form of regulation available to the Scottish Government, particularly in the case of those public bodies which fail to address adaptation issues. A robust reporting and audit procedure needs to be adopted. The use of the CRC reporting structure would reduce duplication.

The Council is concerned that it will be impossible or very difficult to successfully ‘adapt’ to many of the predicted global impacts of climate change at both a local an international level. Therefore efforts should be focused on reducing Scotland’s emissions and demanding that other countries to do the same.

Q10 Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are your views on this proposal?

The Council is not directly concerned with muirburn or similar land management practices at this time. However, it is aware of the predicted changes to the climate of South East Scotland and of the potential impact of these changes on traditional land use practices. In this context it is entirely reasonable that the muirburn season, which is generally restricted to the period between 1st October and 15th April, may need to be varied to reflect future changes in weather conditions and growing seasons.

We believe that on this and similar land management practices effective ongoing consultation with relevant stakeholders is essential.

Q11 The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

The Council does not have a direct role or interest in the public or national forestry industry. However, the Council is generally supportive of measures that aim to promote renewable energy development and the diversification of energy supply at a national and local level.

Effective ongoing consultation with relevant stakeholders is essential.
Q12 The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?

The Council welcomes this proposal as energy efficiency can be a rapid and cost effective way of reducing emissions. It is our view that it should detail measures for both existing and new buildings. Links need to be made to the recent introduction of Energy Performance Certificates; this could be a robust additional tool to tackle emissions from buildings. With regards to new buildings, The Edinburgh Standards for Sustainable Building states that “The Council will require all new build developments with floor space of 1000sq m or more, or ten residential units or more, or a site area of 0.5 ha or more, to reduce predicted CO₂ emissions by a Buildings Emission Rating (BER) which attains a Target Emissions Rating (TER) minus 5%”. (Equivalents to be explored in the case of conversions).

We believe that support through funding mechanisms such as CEEF should be improved and made more widely available.

The Council welcomes the recent Scottish Government report on Low Carbon Buildings. However, significant levels of government investment will also be required to achieve the potential for energy efficiency in older buildings.

Q13 The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government’s thinking in this area.

What are your views on this approach?

The Council welcomes these provisions. The non-domestic sector represents a significant proportion of the built environment and therefore will have to be included to achieve even the 80% reductions proposed by government.

It is important that any measures should complement the existing E.U. legislation and should not impose additional burdens that would disadvantage Scotland within an E.U. context.

Q14 The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

What are your views on this proposal?

It is the Council's view that additional incentives are needed as many renewable projects are discounted as not financially viable, and many having payback periods outwith their lifecycle.

Current Scottish Government funding schemes should be expanded to include larger projects.

As a major proportion of energy demand is for heat, it is therefore vital that heat be generated from non-fossil fuel, renewable sources. A scheme, such as the Renewable Obligation Certificates for renewable electricity, should be developed to encourage this switch by the energy providers.

It is the Council’s view that energy from waste should not be considered as a sustainable way of generating electricity and heat. As well as generating CO₂ emissions, incineration burns useful resources that could otherwise be conserved or recycled.
Q15 The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas:
Waste prevention and management plans;
Waste data;
Deposit of recyclable waste;
Procurement of recyclate;
Reduction of packaging;
Deposit and return schemes;
Charges for carrier bags.

What are your views on these proposals?

Section 55 - Recyclable waste: facilities for deposit at events etc. Proposed regulations should be framed in such a way as to maximise waste streaming and recycling while minimising risk of preventing smaller groups from holding events. Account should be taken of the practicalities of ensuring that waste is segregated with as low a contamination rate as possible, and also of allowing sufficient frequency of uplift without health and safety risk to event visitors.

Section 58 – Deposit and return schemes: subsection (6). Use of packaging that can be re-used should be preferred to packaging that requires to be recycled, as this potentially reduces GHG emissions.

Section 59 – Charges for carrier bags. Action under this section could be enhanced if a life-cycle assessment for different options (e.g. biodegradable carrier bags, paper carrier bags, ‘bags for life’ made from different materials, printing inks used etc) were made available for consideration.

Q16 What are your views on the adequacy of the Scottish Government’s consultation in advance of publishing the Bill?

The Scottish Government provided a number of consultation opportunities covering different aspects of the Bill prior to its publication, this was positive. However, longer consultation periods and significantly more detailed consultation documents should have been provided which would have enabled the Council to consider all relevant issues more fully. There has been a marked lack of detail during the Bill’s consultation period as to the financial resources that would be required to support and meet the requirements of the Bill by the public sector.

Q17 Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government out on the consultation proposals?

No response submitted

Q18 Does the Bill raise any equalities issues you would wish to highlight?

The Council welcomes the inclusion in the Bill of an Equal Opportunities duty (Section 62). It is widely acknowledged that vulnerable groups in society such as children, elderly people, people who are poor, those in ill-health or who have disabilities or mental health problems are particularly likely to suffer from the consequences of wide-ranging dis-benefits arising from climate change. Such dis-benefits may arise both directly from the impacts of climate change but may also be the result of ill thought out or inappropriate adaptation initiatives.

For example, recent research by the Stockholm Environment Institute at the University of York confirmed that by 2031 the over 50s will make up approximately 41% of the UK’s population - a total of 27 million people. This research identified that older people are likely to be physically, financially and emotionally less resilient to climate change. The cost of heating and cooling of homes, storm damage, floods and poor access to public services due to extreme weather events were all identified as being of particular concern for older people. Similar negative impacts can be associated with other vulnerable groups. The Bill and secondary legislation arising as a result of the future enactment of the Bill must address issues such as these.
The Council notes that the Bill identifies specific initiatives on renewables and household waste management. These and others that may result from secondary legislation may all present particular difficulties and issues for elderly people and other vulnerable groups. It is essential that these and all other new projects, initiatives and secondary legislation arising as a result of the Bill are subject to meaningful equalities impact assessments which identify appropriate actions to address the needs of the most vulnerable in society.

Q19 Do you have any comments on the impact of the Bill on sustainable development?

The Council believes that the sustainability agenda has always emphasised the need to take account of interrelated economic, social and environmental issues. However, sustainable development actions have often been one-off in nature and have failed to draw these three strands together.

The potential speed and scale of climate change, and the need for an effective reaction to it, calls for wide-ranging initiatives that are firmly integrated into all three core sustainable development issues. Unless the provisions of the Bill are successful in progressing reductions in carbon emissions and a shift to non-fossil fuel based sources of energy, development cannot be regarded as sustainable development.

If a statutory duty in respect of sustainable development is added to the existing Best Value requirements, clear guidance will require to be given as to how this factor should be reconciled with existing duties, particularly where the environmentally-optimal outcome may not accord with other obligations.

Q20 Do you have any other comments on the Bill?

The Council is pleased to see that the Bill proposes including emissions from international shipping and aviation within the definition of 'Scottish Emissions'. On the other hand, it is disappointing that no specific duties are placed on Scottish Ministers relating to transport, other than the reduction of transport packaging.

The Council therefore suggests that Scottish Ministers are given a duty to:

- ensure that the climate impact of proposed major transport infrastructure investments is taken into account in their appraisal;
- promote the use of the most energy efficient modes of transport for passengers and freight in Scotland.

The Council believes that guidance is necessary to address the growing pressure of airport expansion to support economic growth and how this sits with policy targets of 80% carbon reduction by 2050 and the Government’s vision that ‘economic development should raise the quality of life of the Scottish people through increasing economic opportunities for all, on a socially and environmentally sustainable basis’. Edinburgh airport is important to the Scottish economy and the city benefits from the added value of business routes to and from the capital. Government direction is required to balance economic growth and environmental capacity so that policy contradiction does not take place. It is vital that local authorities align policies in order to work towards the above vision.

The Council would like to emphasis again that financial assistance will need to be provided to Edinburgh not only to resource the management/implementation of new duties but also to fund any major capital works that might require to be undertaken. This might be an area where a pooling of expertise and/or financial leverage through, for example, the Scottish Futures Trust or Scotland Excel would be helpful. The issue of funding, however, will become ever more critical as the comparatively easier energy efficiency measures, which offer a reasonably short payback period, are exhausted and attention by necessity turns to other more resource intensive measures that, while reducing emissions, may not offer the same financial savings.
The Council is also concerned that there may be implications arising from the Bill for its Pension Fund: the main issue here being related to property holdings, as the property market would presumably take additional requirements arising from the Bill into account in pricing of properties. A more general point is that the councillors have "trustee" responsibilities for the Pension Fund; these could potentially conflict with the Bill’s provisions in this area.

The Council would like to highlight the fact that the extent to which local authorities may assume new duties arising from the Bill through their lead community planning role, and the resulting accountability for the delivery of targets, is unclear.
Written views to the Transport Infrastructure and Climate Change Committee

The CCBDG welcome the opportunity to give evidence to the Transport, Infrastructure and Climate Change Committee on the Scottish Climate Change Bill. We have previously set out principles we believe should guide thinking on climate change in Scotland. We have been consistent in promoting those principles and believe they are worth repeating here.

Action on Climate Change – strategic importance to Scotland

Scotland has an international reputation founded upon a perception of a clean and green environment. Scotland’s attractiveness as a great place to visit, study, work and do business in part depends upon that image. Therefore it is of strategic importance to Scotland as a whole that efforts on climate change lead, rather than lag, world effort.

Carbon saved today is better than carbon saved tomorrow

Early reductions in carbon emissions are more important than reductions in years to come. The objective must be to ensure that the cumulative amount of carbon released into the atmosphere is as low as possible, as quickly as possible. In other words the greatest imperative must be on the tasks to be undertaken now to shift Scotland smoothly to a low carbon economy and society.

Consistency with the UK, EU and UN frameworks

Scottish businesses trade on a local, national, UK, European and global basis. Therefore it is important that the Scottish framework on climate change is consistent with UK, EU and UN frameworks. The greater international co-operation there is the better, and consistency between economies will ensure no new barriers to trade are erected.

Delivery

The powers of the Scottish Parliament, while substantial do not represent all the powers that can deliver carbon emission reductions. Therefore, to meet the aspiration of Scotland leading in the UK and Europe it follows that the powers that do lie in Scotland need to be used more effectively, more quickly and to a greater magnitude than anywhere else in Europe. We believe it is vital to ensure that this will be the case without putting Scottish business at a competitive disadvantage in the short term. In the long run we believe that making the right investments now, will put Scotland at a competitive advantage by becoming an advanced low carbon economy early, for example by making the most of the significant renewable resources we have on our doorstep.

Climate Change – priorities for action

1. First and foremost, the CCBDG believe the greatest role for government in Scotland is to help bring about a change in consumer behaviour in order to reduce overall demand for energy.

2. Beyond reducing overall demand for products and services that emit carbon, the three critical areas for reducing Scotland’s carbon emissions are decarbonising electricity, heat and transport. Despite all its challenges and the progress yet to be made, delivering renewable electricity looks relatively positive compared to the challenge that must be met in heat and transport.

3. Decarbonising energy for heating is one area where there has been little progress. The potential carbon savings are great and there is a clear role for government to stimulate markets. The UK wide Renewable Heat Incentive will clearly provide a
market intervention that should help the expansion of renewable heat. Nonetheless the CCBDG believe the Scottish Government must act to make sure heat in Scotland sees a dramatic revolution in the way it is generated. Government itself can take a lead in incorporating renewable heat and Combined Heat and Power systems into its own estate.

4. There remains a long way to go in delivering low carbon road transport. While we acknowledge that fiscal powers relating to VED and product standards lie with Westminster, there are international and UK examples where municipal and regional policy has stimulated a market for lower carbon combustion engine vehicles and electric vehicles. There is much the Scottish government could do, particularly in partnership with local authorities to move Scotland to the leading edge of low carbon road transport. For example procuring electric vehicles for public sector fleets which will stimulate both the infrastructure required and a market for electric vehicles in the UK.

5. Finally, we recognise the potential for conflict between Government priorities, particularly in terms of development and carbon emissions. The aim to deliver 35,000 new build houses a year is challenging in itself, and without absolute clarity and certainty in relation to policy it will be impossible to achieve. Planning policy, building standards, affordable housing policy and policy on future energy generation and consumption must become much better aligned. We believe that the incorporation of zero carbon home standards into new build social housing in advance of 2016 is an important lead the Scottish public sector can take now – particularly in this difficult economic climate.

Response to Call for Views

Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

In principle, the CCBDG believe scientific evidence should determine the rate of emissions reduction. We support targets and a framework consistent and aligned with the scientific recommendation of what is required to ensure global average temperature does not increase by two degrees Centigrade, widely acknowledged as a dangerous tipping point resulting in drastic impacts across society, nature and the economy.

The CCBDG therefore support both the Government’s minimum targets, although we recognise there may be a benefit in setting a 2020 target in law too.

Q2 The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

What are your views on the setting of targets in batches from 2010 to 2022?

We originally supported a carbon budgeting approach although we are content with this framework for grouping the targets into batches, provided they are aligned with UK and International targets.

Q3 The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?
The difficulty of meeting a 3% annual target should not be underestimated. Our original preference was for a carbon budgeting approach and an alignment with the UK framework would have been simpler. However, the spirit of what is trying to be achieved is the same and we believe it is more important to ‘just to get on with it’.

Q.4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

While trading has an important role to play in tackling global climate change and should not be artificially restricted, we strongly agree that the focus of this legislation must be to reduce Scottish Source Emissions. We note that the UK Climate Change Committee has recommended a set of figures up to 2020 that specifies domestic, traded and credit purchase. This amounts to a 34% cut predominantly through domestic emissions reduction, and 42% total through domestic emissions reduction and credit purchase. We would support the adoption of this model for the purposes of both consistency and effectiveness.

Q5 The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

We acknowledge the difficulty government has in defining the term ‘attributable’. We agree that greenhouses gases emitted from Scotland should be the spirit of this legislation, but we should not ignore the effect of Scottish demand on global emissions. For example, we may no longer manufacture most of the steel needed in the country, but we certainly import it and it is therefore an important factor in assessing pollution generated by the Scottish people. However, we also recognise the necessity for consistent measurement and we appreciate the difficulty in assessing the end to end carbon emissions associated with any given product. Ultimately, we hope that international agreements will ensure that the price of carbon is built into every stage of the production and distribution process.

Q6 The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government’s approach to obtaining independent, expert advice on climate change?

The CCBDG agrees with this approach and believes the Climate Change Committee’s first report has made very instructive reading.

Q7 The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress
being made towards the emissions reduction targets set in the Bill. The Bill sets out
details of these reporting requirements.

What are your views on these proposed reporting arrangements?

Once again, we agree with the arrangements for scrutiny. Given the extremely long term
nature of these legislative targets, it is vital that government is held properly to account for
early progress towards them. Parliament has an extremely important job to do in protecting
the interests of future generations.

Q8 The Bill contains powers to allow the Scottish Government, by regulations, to
impose duties on public bodies in relation to climate change, to issue guidance to
those bodies relating to their climate change duties and to require that they report
upon the discharge of those duties.

What are your views on this proposal?

The CCBDG believe it is right to impose duties on public bodies with regards climate change,
and we recognise there is an argument to do so in primary, rather than secondary legislation.
We believe this is particularly relevant to Scotland given the scale and influence of the public
sector.

Local authorities and the private sector may benefit from the universal application of policy
measures and setting expectations as early as possible. Many of the potential requirements
on local authorities for example, could include: a duty to meet specific targets and a duty to
consider climate change impacts through all public procurement and planning. The remits of
SEPA and SNH might also include an obligation to deliver cuts in climate emissions.

We also recognise the role of the Scottish Government in guiding local authorities in particular
to ensure some consistency of approach across Scotland.

Q9 The Bill places a duty on the Scottish Government to produce a report for
Scotland, setting out its objectives in relation to adaptation to climate change,
proposals and policies for meeting them and the timescales within which they will be
introduced.

What are your views on this proposal?

We welcome this focus on adaptation, believing it has been somewhat overlooked until now.

Q10 Muirburn is the act of controlled burning of vegetation on open semi-natural
habitats such as muir (Scottish word for moor) or moorland, and includes the burning
of plants such as gorse, heather and grass. The Bill contains an enabling power to
allow the Scottish Government to vary the permitted times during which muirburn may
be made where they consider it necessary or expedient to do so in relation to climate
change.

What are your views on this proposal?

No specific view.

Q11 The Bill will allow modification by order of the functions of the Forestry
Commissioners to enable the Forestry Commission in Scotland to play a greater role in
tackling climate change. The immediate intent of the Scottish Government is to take
forward proposals relating to renewable energy development on the National Forest
Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?
Given that we believe all of Scotland’s agencies and public bodies should play their part in delivering action on climate change it follows absolutely that the Forestry Commission can have a particularly special job to do. We support the Scottish Government’s proposals.

Q12 The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?

We believe the ultimate aim of energy efficiency must be to reduce energy demand but we are mindful of the complexities of affecting consumer behaviour.

Improving the energy efficiency of existing housing stock is paramount but the current rate of progress is insufficient to meet the carbon emission targets in this Bill. By 2050, only one third of housing stock will have been built between now and then. So two thirds of stock will be ‘old’ properties. The onus is on this current generation to bring about very significant change. To make that happen every tool at the disposal of the Scottish government (local tax incentives, business rates, planning changes, significant increase in grants for householders, etc) should be used to stimulate both the improved household energy efficiency and develop the potential for microgeneration.

For example, measures could be developed to incentivise local authorities to deliver emission reductions and specific climate-friendly actions such as through procurement strategies, renewable energy development plans and energy efficiency initiatives. Business rates in respect of renewable energy developments such as wind farms could be payable directly to the local authority in which the wind farm is located for example. Permitted development rights could be incorporated in the bill to enable easier installation of low-carbon and renewable devices on buildings.

We also recognise that a ‘street-by-street’ area-based approach to energy efficiency measures may prove to be more effective and we are concerned that the current approach is inefficient, expensive and is less likely to complete the job efficiently and within the timescales required.

Finally, there is a role for government in ensuring that skills are enhanced in order to deliver the wholesale improvement of the energy efficiency of Scotland’s existing homes.

Q13 The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government’s thinking in this area.

What are your views on this approach?

The CCBDG agree with this approach for non-domestic properties. However, we believe there is much more yet to be done for both domestic and non-domestic building standards not least by developing much greater clarity in the standards that are expected.

Q14 The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

What are your views on this proposal?

The CCBDG welcome the Scottish Government’s nominal target of 11% renewable heat by 2020, although we note the UK government has an indicative target of 14%. Nevertheless, an 11% target represents a market expansion of over 1000% in just over ten years. This is
very ambitious. We believe this is the area where the least has been achieved to date, but the area with the greatest potential to deliver significant reductions in carbon emissions.

We are not believers in government ‘picking’ technological winners but given the scale of the renewable heat target we believe that all sources of renewable heat need to ‘remain on the table’ and deployed where best suited. We do not believe at this stage it is appropriate to be backing one technology over another and believe there will be a role for all the main heat technologies in time, including ground, air and water source heat pumps, solar thermal, biomass and biogas.

Furthermore, we believe there is potential for renewable heat deployment in the industrial and commercial sectors and this should be given sufficient weight in policy development. The economies of scale are greater in industrial and commercial uses of heat and there may also be greater potential for closed loop waste to energy systems in these sectors. We also note that the carbon intensity of heating fuels is higher in these sectors, thus delivering better carbon savings per pound of investment in renewable alternatives.

Finally, we are strongly supportive of a market intervention at the UK level that would incentivise the generation of heat from renewable sources. Without a Renewable Heat Incentive, we do not believe the market will deliver a significant uptake of renewable heat technologies by 2020.

Q15 The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas: Waste prevention and management plans;
Deposit of recyclable waste;
Procurement of recyclate;
Reduction of packaging;
Deposit and return schemes;
Charges for carrier bags.
What are your views on these proposals?

The CCBDG is broadly supportive of additional measures to improve waste management and recycling, provided that measures are proportionate.

We welcome the very real progress that has been made in recent years, and believe Scotland’s dramatic increase in recycling rates over the past seven years is illustrative of what can be achieved by the right combination of a legislative framework and public resources. We are optimistic that further progress will be made in the next few years.

Q16 What are your views on the adequacy of the Scottish Government’s consultation in advance of publishing the Bill?

Generally positive, there appears to have been significant effort deployed at engaging with stakeholders and the wider public.

Q17 Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government out on the consultation proposals?

No specific comment at this stage.

Q18 Does the Bill raise any equalities issues you would wish to highlight?

No specific comment at this stage.

Q19 Do you have any comments on the impact of the Bill on sustainable development?
Q20  Do you have any other comments on the Bill?

Above all else, the CCBDG is concerned about the potential for speedy delivery. It is fully committed to taking action on climate change, and member companies are investing hundreds of millions of pounds into low carbon technologies. We know first hand of the barriers, the complexities and the difficulties of moving to a low carbon business model.

We would use this opportunity to urge policy makers and government to pick up pace, focus harder on delivery and develop a greater sense of urgency - especially in the areas of renewable energy for heat, renewable energy for transport and renewable electricity.

The combination of measures to bring about energy demand reduction, incentives for renewable heat and renewable transport and further significant progress in waste management and renewable electricity mean it is perfectly possible for Scotland to meet its ambitious carbon reduction targets.

About the Climate Change Business Delivery Group

The Climate Change Business Delivery Group formed in early 2007. Representing a broad cross section of Scotland’s corporate and business sectors, with 100,000 staff employed either directly or indirectly in Scotland, the membership is convinced that climate change threatens future prosperity in Scotland and every other part of the world.

The group understands how hard it is to grow business and ensure significant year on year reductions of greenhouse gas emissions. They are, however, deeply committed to making a difference both within our businesses and as individuals – and firmly believe that Scottish specific climate change laws can help achieve that.

Current membership:

Ian Marchant, Scottish & Southern Energy and Chairman
Gordon Dewar, BAA
Brendan Dick, BT Scotland
Mary Grant, First Scotrail
Fergus McConnell, Taylor Wimpey
Peter Lederer, Gleneagles Hotel
Ian MacKay, Royal Mail
Grant Hodges, PWC
Susan Rice, Lloyds TSB
Ken Ross, Elphinstone
Satty Singh, MS Namara
Mike Straughen, Wood Group
Michael Tracey, William Tracey Ltd
Andrew Murphy and Lesley Ballantyne, John Lewis
The Confederation of Passenger Transport (CPT) is the trade association for bus, coach and light rail operators across the United Kingdom. In Scotland our members run over 90% of the registered bus network. CPT has already submitted a response to the Climate Change Bill Consultation but is grateful for the opportunity to make a further response to the Transport, Infrastructure and Climate Change (TICC) Committee in advance of the Committee’s consideration of the Bill at Stage 1.

This response only addresses the questions outlined by the Transport, Infrastructure and Climate Change Committee that are relevant to the interests of our members. The earlier CPT response to the Climate Change Bill Consultation, which gives more detail on areas not specifically referred to in the questions outlined by the TICC Committee, is attached as an annex to this response.

Issues on which the Committee is seeking views:

Question 12. The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change. What are your views on this proposal?

The Confederation of Passenger Transport (CPT) supports the requirement for action plans to improve the energy efficiency of buildings as well as measures to encourage behavioural change. Many of the ways in which public transport can aid the Scottish Government in achieving the ambitious targets for the reduction of greenhouse gas emissions were detailed in CPT’s response to the initial Climate Change Bill Consultation (Annex 1). However, the business of running Scotland’s bus and coach services extends beyond the actual rolling stock. CPT’s members are also responsible for the offices and depots they operate from, to an extent, the behavioural attitudes towards climate change and energy efficiency expressed by staff.

One example of good practice is First Group, who are carrying out a series of initiatives to reduce energy usage from their depots, resulting in a drop in energy usage of 19% since 2004 (The 19% equates to 4,537 tonnes of carbon dioxide). This reduction has been achieved through behavioural changes, new and low cost energy reduction initiatives and investment in heating management systems.

First Group are also in the process of installing half hourly meters at all 600 locations with the energy being derived from 100% renewable sources -including on-shore wind, small scale hydro and biomass. The installation of smart meters will support the company in achieving further energy reductions in their buildings.

Stagecoach has also signed a contract to source most of its electricity requirement for its UK bus operations from renewables. Energy generated from mostly small-scale hydro, as well as on-shore wind and biomass, will provide more than 70% of the company’s required supply, with the remainder coming from cleaner, low-carbon sources. Smart meters are also being installed to help cut energy use across its 240 UK sites.

Other operators are following suit by reducing energy consumption through investment in new buildings and workshops, temperature control systems and smart metering; sourcing electricity from renewables; reducing water consumption through investment in low usage/recycling devices; improving waste management by the recycling of passenger, maintenance and office waste and engaging staff in environmental management through training and development.

Public transport is rightly regarded as the greener alternative to the private car. Therefore, it would be remiss of our industry if we were not readily aware of the many ways in which an operator can reduce emissions, cut energy use and encourage behavioural change amongst staff and passengers.
Scottish Government action plans on these subjects would be welcomed to help spread these messages and to give examples of best practice to enable our members to attain the enhanced Energy Performance Certificate mentioned within the Climate Change Bill.

Question 20. Do you have any comments on the Bill?

CPT supports the Minister for Transport, Infrastructure and Climate Change, Stewart Stevenson’s view that it is unfeasible to create sectoral targets as the relatively high margins for error would make it difficult to record sectoral progress in smaller sectors accurately.

However, CPT has recently carried out some research that demonstrates the potential value of encouraging modal shift to achieving the Scottish Government’s 2030 and 2050 targets:

Carbon Dioxide emissions from the surface transport sector are around 25% of the UK total
54% of UK transport sector emissions are from cars with bus accounting for 3% and train 2%
(source: Defra 2007)
Carbon Dioxide emissions from the surface transport sector continue to rise.
Carbon Dioxide emissions per passenger journey from buses and coaches are around one third less than those of cars.
Around 63% of carbon dioxide emissions from cars arise from journeys of less than 25 miles which can readily be made by bus.
Use of public transport helps reduce congestion, which in turn improves road safety and local air quality.
Moving buses produce far less emissions than an idling bus. In fact, increasing average road speed by just a couple of km/h reduces emissions significantly while also increasing reliability and punctuality.
If every bus in the UK took just one more car driver we could save up to 1.2 million tonnes CO2 per annum.

Public transport, by its very nature, is a greener solution. However, operators in Scotland are not resting on their laurels:

The average fleet age in Scotland compares favourably to the rest of the UK and is decreasing further as operators gear up to run full accessible fleets by 2017.
The introduction of the Driver’s Certificate of Professional Competence (CPC) means that all bus drivers will receive continuous professional development with training on subjects including how to drive more efficiently and economically. This includes smoother braking, slower acceleration, more efficient gear changes and less idling.
The UK’s first bio-buses, which run on 100% biodiesel, are running in Kilmarnock.
Scotland’s first carbon neutral bus network is in operation between Fife and Edinburgh; and, Hybrid vehicles will shortly be introduced in Glasgow.

Scotland is really leading the way in several of these areas.

CPT welcomes the Climate Change (Scotland) Bill and hopes that the action plans and guidance that will inevitably follow will take note of the work that Scotland’s bus and coach industries are already undertaking and will consider measures to support investment in emerging transport technologies; encourage partnership working with the public sector to improve local bus infrastructure; and promote modal shift.
Dear Sir/ Madam,

Climate Change Bill Consultation

I am writing to you on behalf of the Confederation of Passenger Transport (CPT). CPT is the trade association for the bus, coach and light rail industries and in Scotland our members run over 90% of the registered bus network.

Buses can play an important role in facilitating Scotland’s renewed focus on the climate change agenda. Buses offer the best combination of energy efficiency and space consumption in urban streets. One double-deck bus can take 75 cars off the road, giving a potential annual carbon saving of 67,200kg.

The bus industry in Scotland is committed to providing a clean and efficient fleet for Scotland’s passengers and has invested over £450 million in new vehicles over the past ten years. The industry has also been quick to trial new technologies and fund research and development. In May 2006 First switched to using ultra-low sulphur diesel for its Scottish fleet of over 1,500 buses and coaches as part of its aim to minimise First’s impact on the environment. In October 2007 Stagecoach began trialling 8 bio-buses in Kilmarnock which run on 100% bio-diesel manufactured from used cooking oil and other food industry by-products, resulting in an expected 82% cut in CO2 emissions.

CPT Scotland welcomes this consultation on proposals for a Climate Change Bill and hopes that the final bill will recognise the role that the bus industry can play and will make positive steps towards tackling congestion and encouraging modal shift.

The Consultation makes the point that hard policy measures, such as those reserved to the UK Government on taxation and regulation of product standards, may have more potential than softer devolved measures to reduce emissions. CPT believes the Scottish Government needs to utilise the devolved powers at its disposal effectively in policy areas such as planning, development and transport to compensate for an inability to amend reserved matters.

There are many measures that could be introduced within devolved policy areas that would make a considerable impact on Scotland’s emissions. This consultation needs to focus on what the Scottish Government can do and not dwell on what it cannot.

With regards to transport, the Government can place a renewed impetus on encouraging modal shift through promotion of public transport above private car use. Consideration of public transport at the outset of planning decisions, the limitation of car parking spaces in town centres and shopping outlets and investment in park and ride schemes and enforced bus priority measures are all steps that can be taken to encourage public transport use and limit emissions generated by private car journeys and the associated congestion these journeys bring.

The consultation identifies the need for new technologies to reduce emissions. Bus manufacturers are constantly working towards providing even greener vehicles. Bus manufacture uses modern materials and construction and maintenance techniques that have much in common with aviation engineering. Work is continuing on Environmentally Enhanced Vehicles (EEVs), biofuels and hybrid technology.
As well as setting emissions targets into law, the Government should consider methods to provide funding to bus operators willing to invest in emerging technologies. As with all new technologies, there is a financial risk in the form of the initial costs and the ongoing costs of maintenance. Only through the proper funding of the bus industry can the Scottish Government hope to encourage continuing research and development. However, the Government must temper their demands on the bus industry with the realisation that there is a global demand for the latest clean technologies – vehicle manufacturers are limited in the quantity of new vehicles they can provide to operators.

The consultation states that the Scottish Government is addressing the environmental impacts of transport through a package of funded measures that promote more sustainable travel. CPT feels that more can be done by Government. As well as promoting sustainable travel the Government should consider methods to discourage car use. For example, car parking charges should reflect the true impact of motoring on the environment. Rather than removing tolls the Government should be looking at increasing elements of road-charging.

The consultation states, ‘the small changes that each of us make are important. Walking, cycling and taking public transport rather than the car when we can.’ This message needs to be enforced through governmental actions and funding decisions. To encourage people to leave their cars at home the alternative modes of travel must be made as attractive and reliable as possible.

Local authorities are responsible for funding initiatives such as Statutory Quality Partnerships, Punctuality Improvement Partnerships and Bus Route Development Grant schemes. These initiatives involve local authorities working with bus operators to improve the bus services within the council area; improving reliability and tackling congestion. Such initiatives need to be encouraged to bring about further modal-shift and the associated environmental benefits.

CPT is supportive of the Scottish Government’s intent to ensure Scotland reduces its impact on the climate. CPT members are already working to improve the environmental credentials of the industry and hope the Climate Change Bill acknowledges the great importance of the transport sector and dedicates appropriate funding and attention to make Scotland’s public transport network an example of best practice for quality and reliability with minimal environmental impact.

Yours faithfully

Paul White
Public Affairs Executive
CPT Scotland
WRITTEN SUBMISSION FROM CONSUMER FOCUS SCOTLAND

Call for Views on the Climate Change (Scotland) Bill – Submission from Consumer Focus Scotland

Consumer Focus Scotland welcomes the opportunity to respond to the committee's call for views on the Climate Change (Scotland) Bill.

Consumer Focus Scotland was formed through the merger of three organisations – the Scottish Consumer Council, energywatch Scotland, and Postwatch Scotland.

We work to secure a fair deal for consumers in both private markets and public services, by promoting fairer markets, greater value for money, and improved customer service. While producers of goods and services are usually well-organised and articulate when protecting their own interests, individual consumers very often are not. The people whose interests we represent are consumers of all kinds: they may be patients, tenants, parents, solicitors' clients, public transport users, or shoppers in a supermarket.

We have a commitment to work on behalf of vulnerable consumers, particularly in the energy and post sectors, and a duty to work on issues of sustainable development.

Consumer Focus Scotland recognises the importance of climate change as a policy area, and the profound effects on existing patterns of consumption implied by substantive reductions in emissions. We have a particular concern around the issues as they affect consumers. Accordingly, this response sets out some guiding principles which, in our view, should help ensure that consumers are able and encouraged to participate in actions to help reduce emissions, and also provides specific comments on some of the detailed questions raised in the call for views.

General Approach

Descriptions of the source of greenhouse gas emissions are commonly given at national level by source, such as electricity generation, or transport. Alternatively, emissions can be linked to the activities of individual businesses, households or public services. If the latter approach is taken, the scale of existing use of carbon-intensive energy in all aspects of consumers' lives becomes more apparent, and, by implication, the scale of change implied by the targets set out in the Bill. Four points follow from this:

Firstly, there is a clear need to ensure that actions to reduce emissions take account of the needs and views of consumers, and in particular, the position of vulnerable and disadvantaged consumers. As with change in other areas, such consumers are likely to require assistance to make changes, especially where long term gains require considerable short term investment – the wider adoption of renewable heat technologies is an example.

Secondly, previous work undertaken jointly by one of our predecessor bodies, the National Consumer Council, and the Sustainable Development Commission suggests that consumers are willing to make these changes as long as they are seen to be contributing in a balanced way alongside government and business, as well as with other consumers. Work on behaviour change for all consumers therefore depends on consistency of approach across all sectors, together with clarity of respective roles. The roles of infrastructure and of consistency of approach are both important here. Decisions which are seen to increase emissions, or which influence consumer choices to do so (such as airport expansion) can undermine the credibility, and therefore delivery, of overall approaches.

Thirdly, we recognise that moves towards greater consideration of emissions will create markets for new products and services with lower carbon footprints. There is a need to ensure that claims made about such products and services are transparent and justifiable, so that consumers have confidence in the difference they make by choosing them. Again, this is an area in which one of our predecessor organisations, the National Consumer Council, has worked.

1 National Consumer Council / Sustainable Development Commission, 2006
Finally, there is a need for a long term communications and behaviour change strategy to underpin the emission reduction aims. Such a strategy should be directly targeted at the consumer viewpoint and link explicitly and progressively to other government aims. This is already the case in some areas – for example, the contribution to economic development and energy security made by the expansion of the renewable energy sector is often highlighted by Scottish Ministers. Further examples of the way in which a low-carbon future will deliver economic and social benefits are needed.

Our responses to the detailed questions follow.

Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050. What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

See answer to Q3.

Q2 The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive. What are your views on the setting of targets in batches from 2010 to 2022?

See answer to Q3.

Q3 The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year. What are your views on this approach or any possible alternative approaches?

We accept the need for long-term targets which are set by the science of climate change. We also note that, as the science has become more robust, predictions of the likely speed and scale of climate change impacts have increased, and accept that targets may need to be revised if this trend continues.

In terms of presentation for consumers now, however, the changes implied are so large and so distant in time, that they are effectively meaningless at an individual level. Smaller, shorter term targets are preferable. These should be published together with action plans showing how they will be achieved, and describing the likely costs and benefits for different groups.

Q.4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

From a consumer perspective, the main issue is that any trading is transparent, and has credibility so that consumers can see the impact of their actions. It would also be helpful, if credits are to be purchased from developing countries, to link the activities funded to the Scottish Government’s overseas development aims.
Q5 The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

Presentation of the data is important in this case. We appreciate that there is a balance to be struck between practicality of data collection and accuracy; the proposed approach will deliver (comparatively) robust, consistent data, but, at the same time, would seem to exclude the emissions associated with the production of many day to day consumer goods, including imported food, clothing and household goods.

We would therefore support the publication of emissions data in this way as long as it is accompanied by material which explains that there are many actions which can be undertaken by consumers, and which can help reduce emissions at global level, even if they are not, in the short term, captured in the Scottish emissions data.

In the longer term, we would support the development of revised data of this type.

Q6 The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government’s approach to obtaining independent, expert advice on climate change?

We would suggest that any advisory committee, regardless of its location, needs to involve representatives of all groups, including consumer groups, whose actions will be affected by moves to a low carbon economy. In particular, the interests of disadvantaged consumers should be considered explicitly. In that respect, membership of such a group should include those with expertise in the social sciences, including marketing and behaviour change, in addition to scientific expertise.

Q7 The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

We welcome the reporting proposals, and support the inclusion of the requirement to include changes in policy to deliver emissions reductions and to explain variations, should they occur.

Q8 The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

In line with our initial comments, we believe that a consistent approach to reducing emissions across all public sector organisations is an essential component of delivery of emissions reductions overall. It is critical that all parts of the public sector are seen to lead by example.
Appropriate resources for investment may be needed to accompany this duty, so that public agencies are supported to make energy savings, and to adopt new, low carbon technologies. Public accounting practices should also be made consistent with this duty.

We would also favour the extension of this approach so that it applies to all bodies delivering public services. For the purposes of its recent report, the Fit for Purpose Complaints System Action Group suggested that where public expenditure is used to oversee or deliver services, the organisation using that expenditure should be publicly accountable. 2 This definition of public services (rather than public sector/public bodies) provides a useful starting point in considering which providers should be specified to comply with climate change duties.

Q9 The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on this proposal?

We support this approach as part of that outlined above – a clear adaptation plan is part of the process of demonstrating that the Scottish Government is taking action on climate change.

Q10 Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are your views on this proposal?

No submission.

Q11 The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

No submission.

Q12 The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?

See Q13

Q13 The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government’s thinking in this area.

What are your views on this approach?

---

2 Fit for Purpose Complaints Action Group (July 2008) Report to Ministers
Consumer Focus Scotland has duties and powers under the Consumers, Estate Agents and Redress Act 2007, to promote consumer interests, and in particular the interests of vulnerable consumers, in issues around domestic energy use. As an example, we were very much involved throughout the development of the recently-launched Home Reports in Scotland, and welcomed the inclusion of the energy report as part of the package. We strongly support the development of an action plan which comprehensively addresses measures to be taken to help address this issue in domestic buildings. In addition, we have recently commissioned a series of focus groups to help explore attitudes, behaviours and barriers to improving energy efficiency for these consumers, the findings from which, when available, may be of interest to the Committee in this respect.

We would also suggest that addressing energy efficiency issues in public buildings is an integral part of demonstration of action on the part of the public sector. Because of this, we would welcome the extension of this action plan so that, ultimately, it covers all buildings in which public expenditure is associated, as the approach we have outlined in our answer to question eight suggests.

We are concerned that there appears to be very little detail about the ‘behavioural change’ aspects of the action plan in the Bill. We believe that public engagement is absolutely fundamental to the achievement of reductions in emissions in two respects.

Firstly, there will be a need for consumers to use existing technologies or products in ways which reduce carbon impacts – taking public transport rather than driving, for example. We would also reiterate that the infrastructure put in place by the public sector has a critical, long-term influence over the choices made by consumers in examples of this type.

Secondly, there will be a need for consumers to adopt lower-carbon products and services as they are developed. One of our predecessor organisations, the National Consumer Council, undertook a great deal of work in assessing green claims associated with new products and services (including, for example, the credibility of ‘green electricity’ tariffs). Lessons from those studies show that credibility and consistency are critical in the adoption of new products.

We would strongly suggest that the issue of behaviour change receives considerably more attention.

Q14 The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

What are your views on this proposal?

We strongly support an approach to the promotion of heat from renewable sources which takes social factors into account. We recognise that heat from renewable sources can, in particular, have significant benefits for consumers in rural areas who do not have mains gas connections. In these locations, both carbon and financial savings are likely to be larger compared, to other forms of heat, than in comparison to gas central heating.

Given that the physical and financial impacts of installation of renewable heat sources can be significant, it makes sense for this to be done at the time of construction, of building renovation, or at the end of life of existing heating systems, and any approach should seek to influence consumer decisions on heating sources at these stages.

However, the initial cost of investment, as well as the innovative nature of the technologies involved, are likely to be barriers for consumers at present, and particularly so for low income consumers. As these groups would benefit most from the longer term financial savings, we would emphasise the need for work in this area to be, in part, explicitly targeted towards them.
Q15 The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas:

- Waste prevention and management plans;
- Waste data;
- Deposit of recyclable waste;
- Procurement of recyclate;
- Reduction of packaging;
- Deposit and return schemes;
- Charges for carrier bags.

What are your views on these proposals?

We have responded to the waste-related questions in more detail, as this is an area in which one of our predecessor bodies, the Scottish Consumer Council, commissioned more detailed work. As a preface to our detailed comments, we would note that, although waste management forms a relatively small proportion of total emissions, recycling is consistently the single most important activity identified by members of public when asked about actions they have taken to reduce emissions. It is therefore critical for the credibility of work on climate change that sustainable waste management is addressed in this context, so that success in this area can be used as a springboard for wider changes.

**Waste Prevention & Management Plans**

We support this approach. Work commissioned by the Scottish Consumer Council, one of our predecessor bodies, found that some consumers were put off recycling because of the contrast between the actions they were asked to undertake at home and the experience of observing ‘piles of waste on the streets outside businesses’. This relates to our earlier comments on consistency of approach. For the same reasons, we also support the proposals to encourage collection of recyclable waste at public events or in workplaces.

**Waste Data**

Insofar as robust information is critical to good decision-making, we support the proposal to improve data collection.

**Procurement of recyclate**

There is a need to close the recycling loop by demonstrating to consumers that material they recycle is indeed used in new products – this helps reinforce recycling behaviour. We therefore agree with the Sustainable Development Commission for Scotland’s assessment that the Scottish Government has a clear leadership role in this area, to help develop the market for recycled products, as well as because of the demonstration value.

**Reduction in packaging**

This provision proposes to make regulations on packaging which would set statutory targets on retailers for packaging reductions. This is clearly an area where consumers have an interest, and Consumer Focus Scotland is a stakeholder in an initiative by Valpak and the Scottish Waste Awareness Group to help identify and reduce (at the point of manufacture and design) excess packaging. Voluntary measures such as this, the Courtauld Commitment and increasing media and consumer pressure, are all having an impact in this area.

---

4 A range of material at http://www.defra.gov.uk/evidence/social/behaviour/index.htm [Link no longer operates]
5 See reference 1.
Given that there are benefits to voluntary schemes and there are indications such schemes may be successful, this route should be sustained before considering statutory regulation. Regulation is costly and these costs are often passed onto consumers. However, if satisfactory progress is not forthcoming we would review the possibility of statutory regulation. We would also note that the provisions designed to allow consumer complaints about excess packaging under the Packaging (Essential Requirements) Regulations have not been effective, with only 4 successful prosecutions to date across the UK. Such forms of enforcement, which are reliant on action being taken by individual consumers, are unlikely to be effective.

Deposit and return schemes
Consumer Focus Scotland supports deposit and return schemes in principle, because they emphasise clearly to consumers the (financial) value of ‘waste’; this is particularly relevant to those for whom the environmental arguments are not currently sufficient to encourage participation. However, we would have concerns about the impact of including a deposit in the price of the some articles, particularly the effect this will have on low income consumers, and also the potential for consumer confusion and inconvenience.

Any scheme of this type would also have to consider potential effects on existing kerbside recycling services, particularly as such services are now bedding in and recycling rates are rising.

Accordingly, we would welcome further information and debate on the impact and success of voluntary deposit and return schemes currently running both in Scotland and elsewhere, and their likely impact in Scotland, before any new schemes were introduced.

Charges for carrier bags
As urged by one of our predecessor organisations, the Scottish Consumer Council, we support the introduction of a levy as a means to change consumer behaviour, as long as it is accompanied by a strong education and awareness campaign. Charging consumers for their use of plastic bags is often cited as an important element in raising awareness of environmental issues in general, and a potential catalyst for wider behaviour change.

In order to demonstrate support for suppliers ‘to charge for carrier bags at the place where the goods are supplied for the purpose of enabling the goods to be taken away or delivered’ we would also want more information on the suggested provisions, including, for example, the circumstances in which the requirement applies and the suppliers to whom the requirement applies.

We would need to consider the impact of this regulation on all groups, including low-income consumers and small businesses. Re-iterating the theme of the Zero Waste Consultation, there should be a threshold below which the regulations would not apply so that, for example, smaller businesses are not overburdened or disadvantaged.

The carrier bags to which the requirement applies: we would like to see paper bags included in the definition of carrier bags. A shift to paper carrier bags (which has already taken place in a number of large retail chains, including Primark) would lessen the impact of a future regulation. Paper bags have their own considerable environmental impact.

We welcome the objective that regulations would require that the charge for carrier bags would be used for the advancement of environmental protection or improvement or to any other purposes that may be reasonably regarded as analogous. We are aware that, among others, both Marks & Spencer and WH Smith are taking this approach, and would recommend that any future regulation should take account of such experience as it develops.

7 Scottish Consumer Council (2005) Written submission to the environment and rural development committee on the environmental levy on plastic bags (Scotland) bill.
8 See reference 8.
Q16 What are your views on the adequacy of the Scottish Government’s consultation in advance of publishing the Bill?
No submission.

Q17 Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government out on the consultation proposals?
No submission.

Q18 Does the Bill raise any equalities issues you would wish to highlight?
No submission.

Q19 Do you have any comments on the impact of the Bill on sustainable development?
No submission.

Q20 Do you have any other comments on the Bill?
No submission.
Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

COSLA members are supportive of the ambitious proposals for an 80% emissions reduction target for 2050 which is in line with recommendations at a UK level from the Climate Change Committee. We believe that it is right that Scotland should seek to lead the way in the United Kingdom on emissions targets and investment in renewable energy technologies. Progress on both will enable us to be even more ambitious in the years to come. Indeed, COSLA has long argued for an integrated Scottish Energy strategy and encouragement for the development of renewable technologies.

COSLA also supports the inclusion of international aviation and shipping in these targets as has now been proposed in the bill.

COSLA stated previously in its response to the Climate Change Bill Consultation that a useful interim target to highlight could be 2020 as this is the target point for EU climate change reductions and the EU package of actions and policies will have a bearing on Scotland. It would also be a useful early marker with time to take corrective action should this target not be met.

Q2 The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

What are your views on the setting of targets in batches from 2010 to 2022?

COSLA recognises the need to have human scale planning horizons and so agrees that phased reduction of CO₂ emission, to reach the 2050 target, will be essential to enable sectors to adjust their carbon budgeting accordingly to change processes, to re-invent and to modify inherent practices.

Our main concern is in the instance that such targets are applied to local authorities. In this case COSLA advocates four year carbon budget reporting periods for local authorities so that reporting periods can both use the inevitable political dimension to provide an additional driver for action on the part of each administration and avoid any overly onerous reporting process which might overly burden council staff should they be required to report more frequently. Any such reporting should be done through the Single Outcome Agreement mechanism on a local authority by local authority basis.

Setting carbon budget steps that tie in with the above will allow for short and medium term planning towards the 2050 target. The longer term achievement will rely on technological change and it is for the Scottish and UK Governments to drive this forward. Sectors will also be vulnerable to missing targets if external circumstances intervene. An example would be alternative energy sources failing to meet predicted output. However, while cyclical carbon budgeting set in secondary legislation is, in principle, a sound approach, the Government must ensure that the environmental, social and economic needs are in balance, and recognise through the implementation of this and other legislation that climate justice is a fundamental and increasing responsibility of Government.

COSLA members agree there should be at least three budget periods in statute at any one time. This will assist the planning of successive carbon budgets against circumstances.

The Government must show leadership by ensuring that targets are challenging but also realistic and achievable against current technological progress and other external factors that will influence the meeting of targets.

Emission budget periods should be set for a cycle appropriate in relation to our answer above and for a long enough time period to permit investment in energy generation to be scheduled and financed in a manner acceptable to industry.

Major infrastructure projects are normally financed over 25 years. It would be useful to have certainty in terms of CO2/ GHG targets over the same period.
Q3 The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

This is a reasonable approach, given that a 3% per year target is highly ambitious and will require some lead in time to achieve. However, a rigid 3% per year target seems like an unnecessary constraint in the face of inevitable fluctuation in success due to unforeseen circumstances, including weather events, etc.

Further, while local authorities will no doubt play a large part in achieving these targets COSLA would have concerns about aggregating these targets down to the local level again because the targets are not flexible enough to deal with unforeseeable circumstances. Also this would set in motion a process of reporting that would be difficult for councils to keep up with given current resources and staff capacity. Additionally some councils will be further ahead in the process of reducing emissions and thus would not benefit from the relatively low cost of initial emissions reductions measures which could be available to councils who are less advanced in this area.

See also answer to Question 2 with regards to reporting periods and potential implications for local authorities.

Q4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

COSLA is largely against the use of purchased carbon credits, but agree that if used, this should be limited and as a last resort. If international carbon credits are to be used towards reduction targets they should be used as a “clean development mechanism” or “joint implementation credits” as verified by international processes supporting the Kyoto Protocol and would be in line with the international principle of “supplementarity” i.e. that the primary focus would be emissions from Scotland and that only a minor amount of emission reductions would come from international credits.

We would also suggest that permissions to use these credits be subject to scrutiny by the Committee on Climate Change (or other related Scottish body) to ascertain that the Scottish Government has done enough to stimulate domestic action and is not using international credits for ‘quick hits’ against emissions targets. We want to avoid a situation where companies and governments are prepared to pay in exchange for the right to do nothing to cut down on their own emissions.

COSLA would also support the reporting of emissions from consumption information as a parallel process to the achievement of emissions reduction targets. We would not be looking for targets or caps on such consumption but would consider this a useful tool for informing the public of their role in reducing emissions worldwide through their consumption choices.

Q5 The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

In an ideal world COSLA would like to see targets based on end user inventories, as this will account for energy efficiency measures, renewable energy generation, as well as taking account of CO2 caused elsewhere by our consumption in Scotland.
For practical reasons however we accept that this would prove highly complex. Thus, ultimately, any system we are likely to have will be based on source emissions. COSLA would accept a measure based on production accepting that where such an approach would disadvantage Scotland (i.e. the export of renewable energy), there are other areas where such an approach would provide a ‘gain’ for Scotland (i.e. the export of highly pollutive industrial processes to other countries).

While such a measure may not be ideal there is a need for easily accessible measures in order to provide the political steer to this process. In the short term, these may not be entirely rigorous but will provide a starting point from which to focus political will, something which is urgently needed. In the medium to long term fuller measures will of course need to be developed, but we need a focal point for action in the short term and can not wait for these fuller measures to be developed.

Any system adopted needs to be based on scientific consensus and evidence based.

**Q6** The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government’s approach to obtaining independent, expert advice on climate change?

COSLA believes that actions are needed, not new bodies. The primary source of advice to the Scottish Government should in the first instance be the UK Committee on Climate Change, with an evaluation of its effectiveness after 3 years. It is most appropriate to use this source as it comprises leading experts from all sectors and will provide a consistent approach throughout the UK, this will aid the sharing of best practice. Using existing Scottish public bodies might prove problematic as they may not have sufficient skills, knowledge and expertise, and there would be the issue of resourcing and pressure on already stretched NGOs. Creating a new public body is not supported.

That said, Scotland has already begun to take a diverge from the UK with the inclusion of international aviation and shipping in the proposed bill. Should the Scottish agenda develop to include areas of climate change mitigation or adaptation outwith the scope of that covered by the UK Climate Change Committee terms of reference, Scotland would then need a way to secure expert advice. Further discussion is needed on where such expert advice would come from.

COSLA would also stress that the UK Climate Change Committee would be looked to provide advice on the scientific information needed to set targets appropriately, independent of the political process, while how to go about achieving Scottish targets will be an issue to be decided within Scotland.

**Q7** The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

Scottish Ministers should collect data on issues that are set out (Forecast emissions; an assessment of the effectiveness (measured or projected) of current and/or planned policies; a measure of the energy efficiency of domestic and non-domestic buildings in the public and private sectors; the capacity of Scotland’s renewable energy sector; emissions produced by the Scottish element of international aviation and shipping; and a measure of energy/ carbon consumption in Scotland such as carbon footprint) – should be reported with other factors to establish a clear picture. Advice could be sought from the UK Committee on Climate Change (or other related Scottish body) as to how often these ‘other’ issues should be reported, but should fit in with target and budget setting framework.

COSLA sees a need for flexibility within secondary legislation to allow for changes to the bill should international consensus change quickly. Similarly such flexibility is needed to allow for a situation where local adaptation needs in terms of climate change may also change quickly. There should be a mechanism for central funding of adaptation measures outside normal budgeting arrangements to meet unforeseeable demands. This would mean looking at contingency funds for developments/events which cannot be adequately addressed through adaptation measures and thus will result in an unavoidable increase in cost.
As mentioned below Scottish Ministers should be expected to report on the progress of the upcoming Adaptation Strategy.

Targets should be the responsibility of the First Minister and these should be subject to publicly published scrutiny in addition to Parliamentary scrutiny. This could be done by an independent Scottish audit body, such as Audit Scotland.

This is because political accountability also needs to be backed up by public awareness raising to ensure that the public is fully behind the targets, and the measures to meet them. Political scrutiny will only have meaning if it has the weight of public opinion behind it.

Q8 The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

COSLA has no issue with the proposal to bring forward enabling powers so long as any duty imposed on the public sector to take specified actions on climate change or other specified environmental issues is backed up with the appropriate resources to enable those duties to be carried out and that reporting on any new duty be fully integrated into the Single Outcome Agreement process.

All 32 of Scotland’s Local Authorities have signed up to Scotland’s Climate Change Declaration, a voluntary agreement to work towards climate change mitigation and adaptation. This high level commitment is expected to be increasingly reflected in the new Single Outcome Agreements and in partnership with Community Planning Partnerships. Information gathered on work towards the declaration commitments is expected to provide valuable material to inform the SOA process and inclusion within this process will effectively roll out the principles within the declaration to the wider public sector as COSLA has recommended in the past. In time, with adequate resources provided through the local government settlement, more specific local indicators with regards to climate change work could and should be integrated into these agreements to see that they address more fully the range of climate change activity agreed by local authorities under the declaration.

Any duties with regards to Local Authorities would, in accordance with the Concordat, need to be developed jointly between COSLA and the Scottish Government. Any new duty would also need to be integrated into the Single Outcome Agreement process.

Some thought might be worthwhile around the objectives of a climate change duty being best achieved by strengthening and re-focusing the existing Best Value and Community Planning legislation, wherein local authorities are required to discharge their Best Value and Community Planning duties in “a way which contributes to the achievement of sustainable development”. Achieving the objectives of a climate change duty through this approach would require improved, climate change-focused Best Value (and also Strategic Environmental Assessment) statutory guidance. This could be an iteration or extension of the Best Value and Sustainable Development Toolkit, which some local authorities are already using to inform performance management and improvement, and which has support from all key stakeholders.

Q9 The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on this proposal?

COSLA is in favour of this proposal. Adaptation must be an integral part of any climate change strategy. COSLA’s response to the Adapting Our Ways consultation reflected that some degree of climate change is already underway, and further change is inevitable even if substantial mitigation takes place. We need to promote strong national leadership and co-ordination to ensure that Scotland can face the ensuing challenges – by minimising risk and damage, ensuring there are arrangements for continuity of public services, and maximising opportunity and potential benefit. COSLA’s stated position is that there is a need to fully integrate mitigation measures as part of a comprehensive long-term adaptation strategy in order to minimise further necessary adaptation measures in the future.
If we are going to succeed in changing the way we live in order to mitigate against future climate change we need to adapt not only to changing weather patterns but to the need to reduce emissions wherever possible. This means adapting to sustainable methods of transport and reducing the amount we travel; adapting to the need to skill up Scotland’s workforce to grow the renewables industry and other green businesses; and adapting to new ways of daily living, including energy efficiency and waste minimisation – as a behavioural change and as part of the way we build and repair homes and other buildings, and the way we buy, deliver and dispose of products and services.

Along the way, as we adapt to inevitable environmental changes and to a lower carbon economy it is imperative that we effectively educate, inform and reassure communities about the plans and decisions that are being made to manage the impacts of climate change.

Producing a report as proposed will be one step in this communication with the public.

Q10 Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are your views on this proposal?

We have no comments on these proposals at this time.

Q11 The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

With regards to renewable energy development the national forest estate is likely to include a number of locations suitable for wind, hydro and micro-renewable energy generation. Locating windfarms and hydro schemes within forestry can help to reduce detrimental impacts, in that both activities can share the same road systems; commercial conifer forests are already man modified landscapes so impacts are likely to be less than in wildland areas; and forests can help to limit the potential for close views of turbines, dams and other structures by reducing the availability of open views across the landscape.

However COSLA does have some reservations with regards to the proposals to offer leases and cutting rights over parts of the national forest estate. Our main concerns are:

- Lack of business case.
- Impact on the function and funding of the remaining part of the national forest estate.
- Loss of regional presence.
- Impact on the stability and development of timber markets as presently underpinned by FCS.
- Impact (immediate and longer term) on FCS employees and the communities they live in.
- Loss of community acquisition opportunity through the National Forest Land Scheme.
- Loss of a wider range of non-market community benefits as provided through FCS and which will be greater than provided through any lease arrangement.
- No guarantee that funding raised will be placed specifically to forestry related climate change measures.
- Potential for further leases.
- Member states of the E.U. have generally supported and protected their national forests.
- A concern that private operators will not have the same sense of duty to the public.

Any proposal will need to go through the usual process of public consultation as well as early consultation with the effected local authorities to ensure for adequate compensation with regards to local income from timber production, recreation or indeed potential future uses.
COSLA would expect there will be a need for negotiation and management of appropriate community benefit and would advocate that efforts be made to provide opportunity for partnerships with Local Authorities to provide heat and power for local communities from any new renewables projects on the National Forest Estate.

We would also advocate a national strategy on renewables to map out suitable locations across Scotland rather than looking at this on a piecemeal basis.

Any proposed future developments would also need to consider the implications of the Land Reform (Scotland) Act 2003, with the need to retain access rights for the general public.

Q12 The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?

This proposal is to be welcomed but does raise some practical issues with regards to financial resources, additional capacity and consistency with activity at the EU level. There is already some concern on the part of Scottish councils following the review to the EU Energy Performance in Buildings Directive around the added up front cost to councils of extending the scope of this directive. We would have similar concerns of a resource and capacity nature with any such Scottish proposal.

Our member Councils are already functioning at full capacity to fulfil the requirements of the existing EPBD, having committed budgets and allocated staff time to completing the Energy Performance Certificates (EPCs) for the buildings covered in the scope of the existing Directive. Similarly, additional workload dealing with applications etc. is likely to force an increase in fees passed down to the public; otherwise Councils will face even more pressure to deal with the applications. There is also already a concern that the extension of the EPBD might necessitate extensive re-training for Building Standards Officers. A concern which would also apply to any new proposals at the Scottish level.

While councils are highly in favour of the principle of addressing energy efficiency in Scotland’s buildings and see it as a key tool in both saving carbon and lowering running costs to building owners and tenants, they are very mindful of the added costs and any proposal to improve the energy performance of buildings in Scotland needs to be paired with the appropriate resources to carry it through.

Q13 The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government’s thinking in this area.

What are your views on this approach?

See answer to Question 12.

Q14 The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

What are your views on this proposal?

COSLA as a general principle is in favour of pursuing options with regards to promoting renewable energy including renewable heat. We would of course expect any steps taken on this to be managed within a consultative process, including early engagement with includes COSLA and the Scottish Government.

Several local authorities have renewable heat programmes underway for some of their communities and are providing good practice examples of what can be achieved. (discussions with Glasgow Council, Island Authorities and elsewhere?)

There is great potential for the development of green jobs in Scotland should appropriate incentives to grow the industry be put in place. COSLA looks forward to further discussions on the potential in this area of work.
Q15 The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas:

- Waste prevention and management plans;
- Waste data;
- Deposit of recyclable waste;
- Procurement of recyclate;
- Reduction of packaging;
- Deposit and return schemes;
- Charges for carrier bags.

What are your views on these proposals?

COSLA is in favour of measures to reduce waste and increase recycling and re-use as part of an integrated strategy to divert waste from landfill. Comprehensive use of waste resources is a key part of the climate change mitigation process.

We would expect climate change to be one of the issues considered as part of ongoing Zero Waste discussions and as part of the review of the National Waste Plan.

COSLA would also expect that any regulations brought forward would be done so only following consultation and negotiation with Scottish Local Authorities and accompanied by the necessary resources to carry out any new burdens on local authorities that may result from such regulation.

Q16 What are your views on the adequacy of the Scottish Government’s consultation in advance of publishing the Bill?

We are content with the way the process was conducted.

Q17 Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government out on the consultation proposals?

No.

Q18 Does the Bill raise any equalities issues you would wish to highlight?

It would be useful to keep in mind that both within Scotland and globally climate change is likely to affect those with the least resources first. Thus any mitigation or adaptation strategy should take in to account the effect of policies on those living on lower incomes or with poor health or mobility, i.e. taxes on less fuel efficient cars or the effects of falling land values as a result of environmental changes. There will also be an unequal effect on those living in rural or remote communities when it comes to increased fuel costs as well as the increased costs of making some rural homes energy efficient.

Q19 Do you have any comments on the impact of the Bill on sustainable development?

COSLA believes that Scotland is well placed to adapt to the changing realities we now face. We are well placed to grow the renewables sector in Scotland, to take advantage of new green industries and become a good practice example for others. We see an opportunity for Scotland to make the best of the bad situation that is climate change. However we believe there is a need to temper widely accepted commitment to ‘sustainable’ economic growth. Many of our members doubt that a growth model can indeed be sustainable as mitigating and adapting to climate change will require decreasing consumption and emission producing activities. Instead of the traditional economic growth models we would want future sustainable economics to be based on replacing old high carbon industries with new green ones.
As we have stated in our response to Scotland's Climate Change Bill Consultation we are now in an era of tough choices and the time for procrastination on this is over. We need to be prepared to go further and seriously look at the effects of past, current and future consumption. If we are really to meet the challenges of social and environmental justice we need to be prepared for a debate on the fundamental values and priorities of our society and the effects these have on our stewardship of the planet. Support is going to be required for a range of complementary action across a range of governmental policy areas. Ultimately this will require difficult decisions to be made collectively affecting personal choice and responsibility, as well as individual aspirations and the general way we lead our lives. This includes looking at the choices we make in terms of infrastructure investment – we need to move away from investments that add to the problem of climate change and towards those that help to protect us from it. We must work with the people of Scotland to develop the consensus and political will that will be needed, so that we can act locally, nationally and as part of the international community. Clearly there are no genuinely simple answers, and acting alone will make no sense.

**Q20**  Do you have any other comments on the Bill?

No submission.
WRITTEN SUBMISSION FROM CROWN ESTATE

General Comments

The Crown Estate welcomes the opportunity to provide comments on the Climate Change (Scotland) Bill to the Transport, Infrastructure and Climate Change Committee.

The Crown Estate is committed to sustainable development and to working in Scotland, with the Scottish Parliament and the Scottish Government, to help meet the twin challenges of securing the energy needs of the Scottish people and reduction in greenhouse gas emissions, so as to minimise the magnitude and impacts of future climate change.

ABOUT THE CROWN ESTATE

The Crown Estate in Scotland owns and manages around 50% of the foreshore and beds of tidal rivers, together with almost all the seabed out to the 12 nautical mile limit. As landowner of the seabed The Crown Estate has a key role in the delivery of offshore wind, wave and tidal generation projects through the granting of site options and leases. There is approximately £20m of investment proposals in renewable energy in progress across The Crown Estate in Scotland. The Crown Estate has supported innovative energy initiatives, both stimulating and actively investing in the development of offshore renewable and alternative energy for nearly 10 years. Our Rural Estate in Scotland is responsible for 43,000 ha (106,253 ac) of land including 5,000 ha (12,355 ac) of forestry. The portfolio comprises five estates which include 185 agricultural tenancies and 102 residential properties. These are located in Dumfries and Galloway, Midlothian and Moray where our land management activities make a significant contribution to the economy of remote rural areas. We also manage important mineral resources and almost 140 salmon fishing tenancies.

The Crown Estate believes that the ambitions in Scotland to reduce Green House Gas (GHG) emissions through securing future renewable energy supplies, increasing forest cover, improving energy efficiency and dealing with waste are compatible with the aspirations for sustainable management and protection of Scotland's marine and rural areas, which are of direct interest to The Crown Estate. The Crown Estate is active in renewable energy in Scotland across a broad front and is working to identify mitigation and adaptation measures on our properties to help reduce GHG emissions. The Energy Act 2008 which received Royal Assent on 26th November 2008 conferred upon The Crown Estate the rights to the storage of both natural gas (NGS) and carbon dioxide (CCS) under the seabed on the UK Continental Shelf. The Crown Estate has been preparing for this development for some time, including playing its part in the outcome of the UK Government’s competition for a demonstration post-generation carbon dioxide (CO2) capture CCS scheme. Scotland has extensive resources of coal and also significant coal-fired generation plant (particularly on the Forth). The Stern Review (2006) showed that CCS has a very substantial and important role in achieving carbon reduction targets. The Crown Estate is very keen to work with the Scottish Parliament, Scottish Government and other stakeholders to facilitate the development of CCS in Scotland, so that Scotland’s reserves of coal may be used for future energy production but in a low-carbon ‘clean’ emission mode.

The Crown Estate has already invested in geological studies to identify possible safe storage sites around the UK but further detailed work will be required when specific carbon capture projects from designated sources have been identified. This will need partnership working between The Crown Estate, industry and the Scottish Government.

Energy supplies and distribution are an important part of The Crown Estate’s work in Scotland (and in the UK). The Crown Estate is involved in the development and facilitation of a very broad and diverse range of energies, with a strong focus on low-carbon, renewable technologies. There are excellent prospects for future energy security and reduced carbon emissions in Scotland, but The Crown Estate believes that more detailed strategic planning would assist conversion of these prospects into actual delivery. The Crown Estate wishes to work closely with the Scottish Government, Scottish Parliament and other stakeholders to realise the potential for a secure and low-carbon energy future for Scotland.
The Crown Estate therefore congratulates the Scottish Government for taking a proactive approach to the Climate Change issue and for the ambitious measures set out in the Bill to meet the carbon challenge. We strongly support the targets set out in the Bill and the statutory framework it establishes for the monitoring, accounting, reporting, reduction and mitigation of greenhouse gas emissions, subject to the comments we have made below in answer to the consultation questions.

Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

The Crown Estate acknowledges the serious threat posed by climate change and the scientific basis for the anthropogenic contribution to changing climatic systems. As a large landowner we further recognise the potential impact a changing climate will have on land use and the need to take action now to help reduce both present and future GHG emissions. We also acknowledge that as a global issue, climate change needs to be tackled at local, regional, national and international scales and Scotland and the UK as a whole have an opportunity to help lead the world in dealing with this issue. It is important to set ambitious targets to reduce GHG emissions to help reduce the possibility that significant changes to natural climatic processes are not amplified by man’s activities and to reduce the possibility that certain climate system thresholds are crossed (e.g. systems driving ocean circulation patterns). Such dramatic changes have real potential to make a significant difference to the UK climate.

Scotland has a large wind, wave and tidal resource and a fledgling industry – we believe that with strong political support these sectors can help achieve the targets. Without proper support there is a risk that the market could disappear overseas and the technological advantage we currently enjoy will be lost. The Crown Estate recognises that it has an important role in delivering Scotland’s renewable energy objectives. We are working with both the Scottish Government and the UK Government in advancing projects that have the potential to deliver significant energy supply. Planning and consenting, access to the electricity grid, onshore infrastructure (ports, etc) and supply chain are key constraints on the delivery of large-scale marine renewable energy projects. The Crown Estate is working with Governments, industry and others to help overcome these issues. We are also working to support the commercialisation of marine technologies in Scotland and investing in research on the vital improvements to access to the transmission network that would be needed to ensure the targets of the Scottish Government on renewable energy are met.

In Scotland, The Crown Estate supports innovative energy initiatives, both stimulating and actively investing in the development of offshore renewable and alternative energy for nearly 10 years. We are committed to sustainable development and to working in Scotland, with the Scottish Parliament and the Scottish Government, to help meet the twin challenges of securing the energy needs of the Scottish people and reduction in greenhouse gas emissions so as to minimise the magnitude and impacts of future climate change.

Therefore, The Crown Estate agrees with setting a 50% reduction target for 2030 and an 80% reduction target for 2050. We consider these targets very challenging but necessary if Scotland is to make a significant contribution to the mitigation of GHG emissions, to set global standards for emissions reductions and to stimulate the development of alternative technologies to secure a more sustainable future.

Q2 The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

What are your views on the setting of targets in batches from 2010 to 2022?

It is the view of The Crown Estate that significant changes to emissions are likely to occur in steps – rather than as a gradual reduction over time. E.g. if large scale renewable energy plants are commissioned during a relatively short timescale after several years of planning, research and development. If targets are set in batches as suggested as this will help focus government priorities within these defined timescales to ensure appropriate measures are being put in place to ensure the respective batch targets are met thereby advancing progress towards the ultimate target. If these are
not set there is a danger that successive governments might well put off making hard decisions on the basis that the target timescale is far in the future. This will also help drive technological advances and stimulate research and development which will be needed to help drive long term sustainable economic development and allow diversification into new business ventures.

Q3 The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

This approach sets statutory limits for targets beyond 2020 but not before then. It is important that there is sufficient flexibility in the approach towards target setting to ensure for sufficient focus to be made on adjustments in business processes and to allow for the effects of research and development (both on mitigation and adaptation technologies) and investment in renewable technologies to work through to the economy and impact on the net Scottish Emissions. The Bill provides for a year-on-year reduction in the net Scottish emissions account up to 2020 but there is a danger that a minimum 3% annual target up to 2020 and indeed the longer term targets might not be achievable unless the constraints to large scale renewable energy technologies are overcome. A non-statutory 3% annual emissions reduction target up to 2020 will provide flexibility for Ministers to adjust targets during this period but it is important that progress towards the 50% reduction target by 2030 is not compromised.

Q4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

The Crown Estate does not hold a particular view on this aspect of the Bill but is supportive of the concept of “net Scottish emissions account”. However we would urge that it is important that measures to balance the account in relation to reduction targets by carbon trading are not pursued in detriment to mitigation measures in Scotland. This would indicate that there should be a limit to the number of carbon units which Scotland can purchase.

Q5 The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

If genuine reductions in GHG are to be achieved to help reduce the concentrations of man-made GHG in the atmosphere, then it is important that ALL emissions attributable to human activity within defined geographical boundaries, and those associated with that areas economic or other activity, but which are emitted outside of that geographical boundary, are taken into account. In a globalised economy this can be extremely difficult to quantify. On this basis The Crown Estate would support the definition of ‘Scottish emissions’ in the Bill.
Q6 The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government’s approach to obtaining independent, expert advice on climate change?

The Crown Estate believes that Scottish Ministers should be able to take what action is necessary in order to obtain independent, expert advice on climate change issues that relate to Scotland.

Q7 The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

The Crown Estate supports the reporting details as set out in the Bill.

Q8 The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

It is important that public bodies help to lead the way in relation to responses to climate change and that they demonstrate ways forward to reduce GHG emissions and contribute to meeting the targets set out in this Bill. Public bodies are in a position to provide advice and support to the private sector and need to be proactive towards actions to mitigate against climate change. Without clear defined duties public bodies may fail to take appropriate action which might place them out of step with government and the private sector. The Crown Estate therefore supports these provisions in the Bill.

Q9 The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on this proposal?

The Crown Estate supports the provision to produce a report for Scotland setting out its objectives and proposals.

Q10 Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are your views on this proposal?
Given current understanding of climate change and its effects on moorland there appears to be no strong evidence that the current dates for muirburn need to be varied. The Crown Estate would maintain that issues associated with changing weather patterns and concerns over controlling fires in difficult conditions or burning when the ground is too dry can be addressed through stricter adherence to The Muirburn Code. Indeed by placing restrictions on burning moorland managers may be forced into undertaking burning activities at less than optimal conditions which may have adverse climatic impact than otherwise would be the case. The Crown Estate supports the view that not enough is known about how long-term trends in climate will affect muirburn and therefore we are not convinced that, at this stage, additional powers are required. It is also difficult to see how changes in permitted dates on a Scotland-wide basis would be appropriate, given that there is so much local variation in terms of weather conditions, fauna, vegetation and many other site-specific environmental or management factors.

Q11 The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

The Crown Estate responded separately to this aspect of the proposals. The Crown Estate supports measures that enable the Forestry Commission in Scotland to play a greater role in tackling climate change through joint ventures and through the development of renewable energy projects on its estate. In order to address issues associated with the provision of additional funding for woodland creation, The Crown Estate would support measures to increase the flexibility available to FCS to manage its assets to raise capital. However depending on how this was taken forward there are potentially significant consequences for the forest industry in Scotland that need very careful consideration. FCS are leaders in the implementation of integrated forest management combining commercial forest management with the delivery of substantial public benefits. Any move that threatens the integrity of the national forest estate through a transfer of a proportion of the estate to private control, would need to take full account of the impacts on future timber supply chains, rural employment, competition with other timber growers (particularly for limited public funding), investment in timber processing businesses and delivery of the Scottish Forestry Strategy, including delivery of biodiversity and environmental targets. The Crown Estate would recommend that if this option were adopted, any transfers (granting of leases) are considered over a phased and extended period, and subject to reservations that ensure sustainable forest management (including timber yields and biodiversity objectives) and consideration for local community needs, regional economic impact and local business activity. The Crown Estate would also urge the Scottish Government to address the issues associated with the Scottish Rural Development Programme to accelerate the uptake of planting and forest management grants to help meet the existing demand from the private sector to increase planting rates in Scotland.

Q12 The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?

The Crown Estate welcomes the production of such an action plan, particularly one that identifies support and incentives, which help to upgrade Scotland’s housing stock.

Q13 The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government’s thinking in this area.

What are your views on this approach?
The Crown Estate would support measures to improve the information available to business premises and other owners of non-domestic buildings to allow them to improve the energy efficiency of those buildings. Indeed The Crown Estate is working to improve the energy efficiency of its let housing stock and our business premises. However we would urge that regulation is used as a last resort and any legal requirements should be backed up by appropriate financial assistance or other incentives to ensure such requirements do not unacceptably compromise business enterprise.

Q14 The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources. What are your views on this proposal?

The Crown Estate supports the measures outlined in the Bill to promote the use of heat from renewable sources. We would also support the addition of a target to increase the amount of heat generated in publicly owned buildings from these sources so as to help stimulate investment in renewable technologies and biomass supply chains.

Q15 The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas:

- Waste prevention and management plans;
- Waste data;
- Deposit of recyclable waste;
- Procurement of recylcate;
- Reduction of packaging;
- Deposit and return schemes;
- Charges for carrier bags.

What are your views on these proposals?

The Crown Estate supports the provisions in the Bill to promote recycling and reduce waste.

Q16 What are your views on the adequacy of the Scottish Government’s consultation in advance of publishing the Bill?

The consultation was adequate.

Q17 Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government out on the consultation proposals?

The Crown Estate does not have a view on the SEA carried out on the consultation proposals.

Q18 Does the Bill raise any equalities issues you would wish to highlight?

No

Q19 Do you have any comments on the impact of the Bill on sustainable development?

It is important that any economically restrictive measures to combat climate change in Scotland are proportionate to the impact that they have on global atmospheric GHG concentrations and that fragile economic activities are not adversely affected in ways that will compromise sustainable economic development – particularly in rural areas. While it is important to reduce GHG emissions, it is also important to ensure that business competitiveness is not compromised disproportionately to the global benefits gained from mitigation measures. The Crown Estate would strongly urge that efforts to hit reduction targets are backed up by support and initiatives which focus on the economic opportunities presented by the climate challenge backed up by research and development rather than an inappropriate focus on regulation.

Q20 Do you have any other comments on the Bill?

No
Diageo welcomes the opportunity to provide the Committee with our views on the Scottish Government’s Climate Change (Scotland) Bill. Climate change is an important priority for Diageo. Scotland is the home of Scotch Whisky and therefore it is the home of a significant part of Diageo’s business. We produce over 30m cases of Scotch Whisky annually, making us the world’s single largest producer, and as global demand for our brands continues to grow, we have responded by investing £100m in expanding our whisky manufacturing capacity in Scotland.

Diageo also produces around 12m cases of white spirit brands in Scotland. As with our Scotch Whisky brands, the majority of these drinks are sold globally in over 180 markets, confirming Diageo as Scotland’s top manufacturing exporter. Diageo currently employs over 4,500 staff at around 50 sites throughout Scotland.

As members of the Scotch Whisky Association (SWA) we fully support the response to the Committee by SWA. In addition, we would request the Committee note the following points:

• **Introduction** – In the context of our CCA targets and the significant savings achieved since 2001/02 we would note that in addition to extensive capital investments, these improvements have also been achieved through investment in cultural change in organisations and companies such as Diageo. We have a comprehensive strategy for embedding a permanent carbon culture change within our business. Our overall commitment and results were recognised in October 2008 when we were awarded the Carbon Trust Standard for our Scottish operations.

• **Overall Targets** – Globally Diageo has set itself ambitious targets for reductions in greenhouse gas emissions – 50% in absolute terms by 2015. This is especially challenging given our (and other distillers) continued investment in increasing whisky production.

• **Energy Efficiency** – In the context of the energy efficiency of buildings, it should be noted that whilst incorporating energy efficiency measures into the design and construction of a new building, such as Diageo’s new distillery at Roseisle which aims to attain an excellent accreditation with Building Research Establishment Environmental Assessment Method (BREEAM), improving energy efficiency in existing, older buildings is significantly more challenging, especially if they are listed.

• **Deposit and Return Schemes** – We strongly support the SWA’s opposition to the proposed Deposit and Return Scheme, and would add the following as general points for all Diageo products:

  - The increased raw materials and energy required to increase the weight of bottles for multiple use would be substantial – as would the associated increase in greenhouse gases
  - Current kerbside collection and producer responsibilities are established schemes; the deposit system would work against these successes for many types of packaging waste
  - It is likely that the majority of materials collected through a deposit scheme would be diverted from the existing household collection schemes, rather than being new material that is not currently collected
  - Deposits could be seen to impose an additional cost to householders who are not easily able to participate.

We look forward to the opportunity to further contribute to the Committee’s work on this important issue.
Q1. The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed by the Bill?

Although ambitious, East Ayrshire Council is supportive of both the 2030 and 2050 targets as contained within the proposed Climate Change (Scotland) Bill which is in line with the UK Climate Change Bill.

Q2. The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

What are your views on the setting of targets in batches from 2010 to 2022?

East Ayrshire Council is supportive of the proposed methodology regarding the setting of targets, as importantly the budget setting timetable crosses Scottish Parliamentary cycles. And, whilst section 6(1) provides scope for Scottish Ministers to amend targets and dates if they consider it appropriate to do so, we support that advice of the relevant body must be sought in advance and that where Scottish Ministers make different provision from that recommended, they must publish a statement setting out the reasons why.

Q3. The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

East Ayrshire Council is supportive of this measured approach to the setting of annual targets. Further we fully support the reporting methods built into the Bill i.e. the production of an annual report by the relevant body which will take cognisance of not only the annual target but also the interim and 2050 target, and seek advice as to how to progress further, and the production of an annual report which assesses performance during the preceding “target year” – a reporting requirement which requires a response by Scottish Ministers to the Scottish Parliament.

Q4. The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

East Ayrshire Council in principle is supportive of the concept of the “net Scottish emissions account.” We support a framework which ensures that the focus is on achieving emission reduction and emission avoidance. Of concern is the support and framework required by businesses and industry to both invest and innovate, given that in establishing annual targets, each target must be less than the previous net Scottish emissions account level.
We do support the inclusion of a limit on the number of carbon units which can be purchased, and we would propose that this be aligned to the timeframes as established at section 4(2) which would allow for any unexpected or indeed planned spikes in emissions, to be offset during established timescales.

We are unable to provide a view on the number of carbon units which can be purchased.

Q5. The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

East Ayrshire Council is supportive of this view of Scottish emissions.

Q6. The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government’s approach to obtaining independent, expert advice on climate change?

East Ayrshire Council is supportive of the Scottish Government’s proposed approach.

Q7. The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

Whilst East Ayrshire Council is supportive of the proposed reporting framework contained within the Bill para 29 (4) relates only to gross electricity generation and consumption – why exclude other fossil fuel sources such as gas, coal and oil? The requirement on Scottish Ministers to produce time bound systematic and comprehensive reports on progress towards achievement of the Interim and 2050 targets; to detail corrective actions required in order to achieve these targets and to detail the justifications for identified course of action provides a reporting framework which is transparent and provides a consistency of approach.

Q8. The Bill contains a duty on the Scottish Government to produce a report for Scotland, setting its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on these proposed reporting arrangements?
East Ayrshire Council is supportive of the Bill having authority to impose duties relating to climate change on public bodies, and supports subsection (3) which enables different duties to be imposed on different public bodies thereby recognising the degrees of impact which different public bodies actions will effect on climate change. Further the publication of guidance which public bodies will be required to follow ensures accountability and clarity of reporting direction to public bodies and their partners and stakeholders. The Bill affords Scottish Ministers the opportunity to appoint a “monitoring body”, whose purpose will be to ensure compliance with reporting guidelines. We would envisage that such a role could be performed by Audit Scotland in line with the wider Best Value reporting framework.

Q9. The Bill places a duty on the Scottish Government to produce a report for Scotland, setting its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on this proposal?

This is a statutory obligation as required by the UK Climate Change Act which is triggered when the Secretary of State lays a report before Parliament under Section 56 of the Act. Following receipt of this report Scottish Ministers are obliged to report on any risks identified in the report and sets out Scottish Minister’s objectives, proposals and policies in relation to adaptation to climate change. East Ayrshire Council notes this position – it is anticipated that clear national guidelines will be forthcoming upon completion of the Adapting Our Ways consultation.

Q10. Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are your views on this proposal?

East Ayrshire Council agrees with this proposal but presume the needs of certain communities will be considered e.g. if grouse shooting areas are an important part of the local economy licenses to manage moors would be available. Additionally there will be biodiversity issues which will be required to be taken into account when determining at what times of the year muirburn would be acceptable. Further, international and national areas for nature conservation pose a question as to whether muirburn should occur. Cognisance should be made of local biodiversity action plans, in particular with regard to programmes for the conservation and enhancement of local species and habitat. We would suggest Scottish Natural Heritage be consulted by the Scottish Government.

Q11. The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

The woodland estate has an important role to play in energy conservation in that it can both create a renewable source of fuel (wood for fuel in burners) and provide an environment for CO2 consumption by standing forests in the process of photosynthesis. The conservation of forest land also protects and provides habitats for wildlife to thrive and destruction of habitat is a major symptom of climate change.
Q12. The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change. What are your views on this proposal?

East Ayrshire Council believes that behavioural change is essential to energy conservation. The most energy efficient building is of little benefit if its occupiers are ignorant of the effects their actions can have on the energy consumption of their premises. The energy efficiency of some older buildings is far more difficult to improve upon and we must ensure that the owners of some of the historic buildings are not over-burdened with implementing costly energy efficiency measures. A balance is required between what is economically viable and the desire to improve the build environment. Further recognition is required of the associated costs and resources needed to pursue and deliver this objective.

Q13. The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government’s thinking in this area. What are your views on this approach?

East Ayrshire Council has complied in full with the requirement to produce Energy Performance Certificates (EPCs) for non-domestic public buildings with an area >1000m2 which came into force on 4th January 2009. To date there has been no evidence of enforcement measures being implemented against those public bodies and local authorities who have failed to comply. Further we are of the opinion that premises under 1000m2 should also be required to produce EPCs. Compliance of the regulations should be rewarded by the awarding of green credits or a funding package to facilitate the introduction of recommendations which have resulted from the production of the EPCs.

Q14. The Bill places a duty on the Scottish Government to take such steps as it considers appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources. What are your views on this proposal?

East Ayrshire Council is supportive of the Scottish Government’s intention to encourage, incentivise and promote the generation of heat from renewable sources as we believe that Scotland is in a position to benefit from the wealth of natural resources which surround it.

Q15. The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas:

- Waste prevention and management plans;
- Waste data;
- Deposit of recyclable waste;
- Procurement of recyclate;
- Reduction of packaging;
- Deposit and return schemes;
- Charges for carrier bags.

What are your views on these proposals?
East Ayrshire Council is supportive of the provisions contained within the Bill and concludes that by including powers to make regulation for each of the provisions is designed to support Scotland in its efforts to reduce greenhouse gas emissions to the 2050 target levels. We concur with the viewpoint that whilst all provisions within the Bill are subject to a form of voluntary agreement, the tonnage of waste sent to landfill will reduce due to the success of introduced/emerging voluntary actions. However, we welcome the flexibility within the Bill to allow statutory intervention measures should progress be insufficient to meet either waste specific or wider climate change targets. We note and welcome that should regulation be required, the Scottish Government would intend to consult with stakeholders.

We note that the provisions reconfirm the Scottish Government’s commitment to becoming a “zero waste society” and acknowledge that the measures are designed to reaffirm the importance of the waste hierarchy with a focus on waste reuse and recycling activity. Further we support the opportunity that highly efficiency energy from waste plants may afford in utilising waste as source of energy.

Q16. What are your views on the adequacy of the Scottish Government’s consultation in advance of publishing the Bill?

East Ayrshire Council welcomes the opportunity to participate in the ongoing consultation process. The extent and wide ranging consultation undertaken has afforded maximum opportunity for interested parties to participate.

Q17. Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government out on the consultation proposals?

East Ayrshire Council does not have any views on this Strategic Environmental Assessment process.

Q18. Does the Bill raise any equalities issues you would wish to highlight?

There are no equalities issues which East Ayrshire Council would seek to highlight.

Q19. Do you have any comments on the impact of the Bill on sustainable development?

In order to achieve the exacting targets as established in the Bill, there is a clear requirement for Scotland to become more sustainable in its actions. Within the Bill the establishment of advisory bodies and the introduction of a clearly defined reporting framework which not only tracks progress, but requires that any corrective actions in the period to 2050 be defined, clearly demonstrates a requirement for all sectors of Scotland to be more sustainable in their actions, from concept through to delivery.

Q20. Do you have any other comments on the Bill?

East Ayrshire Council would comment that this is an important Bill for Scotland which will require to remain the focus of the Government’ commitments. Further, the Scottish Government will require the support and ingenuity of its partners both at home and internationally to successfully deliver the targets.
The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

**What are your views on the 2050 target and a 2030 interim target proposed in the Bill?**

The targets reflect the current best advice on the minimum emissions reductions required to mitigate Climate Change effects.

The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

**What are your views on the setting of targets in batches from 2010 to 2022?**

If Climate Change impacts are to be minimised then action is required now. So annual targets present a clear imperative to deliver. Setting these targets in batches seems sensible to allow both public and private sector organisations to include these targets in medium to long term plans.

**What are your views on this approach or any possible alternative approaches?**

The “at least” 3% lower than previous year annual emissions target is supported if the Bill’s overall objective of 80% GHG reductions by 2050 is to be achieved.

The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

**What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?**

Having a net Scottish emissions account may help to deliver targets, but carbon (or other GHG) trading should have a limited role to play to assist in meeting targets in the short/medium term, and only where there are definite commitments to emissions reduction projects that will deliver on the targets in the medium/ longer term. Scotland should not seek to buy its way out of emissions reduction targets in lieu of delivering actual emissions reductions. There should be a limit on purchase of carbon units.

The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.
What are your views on this definition of Scottish emissions?

This definition is supported.

The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government’s approach to obtaining independent, expert advice on climate change?

The Scottish Government approach is supported. The UK Committee on Climate Change has considerable expertise which should be able to meet Scotland’s needs as well as provide a focus for the global challenge of climate change. Only if that does not work should a separate Scottish Committee be established.

The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

These are satisfactory

The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

East Lothian Council recognises that there may be a need for Scottish Government to impose duties on public bodies, but would emphasise that the Council would wish to work in partnership to deliver the Bill objectives. It is noted that Scottish Government will issue guidance to public bodies, this is welcomed, but it is noted that there are considerable uncertainties in how targets will be met and paid for. The Council will be looking for a clear lead from Government in issuing such guidance.

The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on this proposal?

Supported
Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are your views on this proposal?

To protect moorland biodiversity, any future changes to muirburn operations should take place outwith the breeding seasons of moorland birds and animals.

The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

Although East Lothian has very little National Forest Estate the Council recognises that the Forestry Commission locally and nationally has done much in recent years to encourage public access and recreation, as well as develop biodiversity. This work should be further advanced in any proposals to develop renewable energy and release of capital from the National Forest Estate for woodland creation.

The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?

Supported. Improving energy efficiency in existing buildings will be a key measure in delivering GHG reductions. The action plan needs to clearly identify where the resources to implement the plan will come from, and where responsibility lies.

The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government’s thinking in this area.

What are your views on this approach?

The policy direction of requiring development of EPCs to improve energy efficiency, and inclusion of powers in the Bill is supported. There will clearly be resource implications for local authorities as many of the Council’s own buildings would come under the enhanced EPC regime.

The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

What are your views on this proposal?

The proposal is supported.
The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas:

- Waste prevention and management plans;
- Waste data;
- Deposit of recyclable waste;
- Procurement of recylcate;
- Reduction of packaging;
- Deposit and return schemes;
- Charges for carrier bags.

**What are your views on these proposals?**

The policy direction behind these is supported and the provision of the various powers in the Bill. These measures will only be really successful if they have wide public support and are in many ways self policing / reported. Alternatively it will require an army of enforcement staff to implement with probably mixed success in achieving the bill objectives.

**What are your views on the adequacy of the Scottish Government’s consultation in advance of publishing the Bill?**

There has been good opportunity to participate in the consultation process. The events run by Scottish government in 2008 appeared well supported.

**Do you have any comments on the impact of the Bill on sustainable development?**

Passing the Bill should help to raise the profile of the challenges of Climate Change and the need to develop more sustainable life styles, business practice etc. Meeting long term targets of 80% emissions reductions will be very challenging to the way we currently live and work, and will require in particular a reduction in our consumption patterns and dependence on fossil fuels.

**Do you have any other comments on the Bill?**

Delivering the targets will require a major awareness raising campaign of what these emission reductions will mean for the people’s lives. (see above) There is a real risk of being overwhelmed by the challenges ahead.

Government in particular, but also LA s, public sector and business need to envision what a low carbon economy looks like and the opportunities that should come forward. Getting public support for these measures will be critical for their success.
The Eco-Renovation Network is a voluntary initiative set up to encourage individuals to take action to increase the sustainability of their own homes. Our aim is to make it easier for people to find out and share information on eco-renovation and to reduce the costs to people through co-operative buying. We are based in Glasgow and our activities cover mainly Glasgow and the West of Scotland.

The Climate Change (Scotland) Bill is an opportunity to produce world-leading legislation to put Scotland ahead of the game in terms of reducing greenhouse gas (GHG) emissions, developing flourishing, low-carbon communities and cities, and demonstrating Scotland’s willingness to take the lead in moves towards a truly sustainable future.

We believe that we can drastically and quickly reduce Scotland’s emissions while building resilient and happy communities. This does, however, require a deep commitment from the Scottish Government in providing leadership, the right incentives and regulation, wise and innovative infrastructure development and having the confidence to address issues of equity.

The Bill, as it stands, is not ambitious enough. In order to avert dangerous climate change we need to make deeper GHG reductions sooner, with an immediate start and set an interim target for 2020 of at least 42%.1

Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

We welcome the adoption of a target of an 80% reduction in GHG emissions by 2050. However, recently evidence has emerged that the build up of greenhouse gases in the atmosphere is happening more rapidly than expected. We also know more about the dangers of positive feedbacks in accelerating climate change. We recommend that provision is made within the Bill to ensure that targets are consistent with current knowledge of the science of climate change.

The 2030 target is not sufficient to make the reductions needed to play Scotland’s part in avoiding dangerous climate change. In order to stabilise atmospheric concentrations of greenhouse gases, the key figure is the cumulative amounts of gases emitted, which depends on how quickly GHG emissions are reduced, as well as the level of interim targets. Since CO2 and many other greenhouse gases, are long-lived in the atmosphere, an early emission-reduction pathway is vital in minimising the cumulative effects of GHGs. Both the Stern Review and the UK CCC Report state that early reductions in GHG emissions are more effective, and that deeper cuts will be necessary later if we do not take immediate action.

Both the UK and European legislation have 2020 as a key reporting target. Given the importance of early reductions, this 2020 target gives a statutory commitment towards faster cuts in the short to medium-term. Scotland’s Bill should sit comfortably alongside legislation emerging from UK and Europe which have a 2020 target.

The UK CCC has recommended a reduction target below 1990 levels of 42% below 1990 levels, if a global agreement emerges at Copenhagen, and cuts of 34% if the UK acts unilaterally. We believe that we should adopt this tighter target to ensure that Scotland’s effort counts.

Q2 The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that

---

1 Below 1990 levels
2 31% below 2005 level
3 21% below 2005 level
these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

What are your views on the setting of targets in batches from 2010 to 2022?

No comments.

Q3 The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

The Bill allows for an effectively horizontal trajectory of emissions up to 2020. This is because there is no statutory 2020 target and the draft legislation asks only that emissions decline up to 2020 but does not define the speed of cuts. It is important that percentage reductions are set in the legislation up to 2020 as early cuts will reduce Scotland’s cumulative emissions, ensure that Scotland is ahead of the game in developing a low-carbon economy and demonstrate the leadership which will encourage the rest of the world to engage with immediate reduction of greenhouse emissions.

Q.4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

Cuts in Scotland’s greenhouse gas emissions should represent a true reduction of Scotland’s own greenhouse gas emissions. It is important that every nation plays its part in reducing global carbon emissions.

Within the Kyoto Protocol, permits can be purchased by Kyoto signatories from the non-signatory developing countries through the Clean Development Mechanism (CDM). This system is subject to leakage as there is no absolute global cap on emissions. We do not believe that Scotland should use permits from this mechanism, or similar, to ease their domestic commitments on GHG reductions.

Over the next few years, however, discussion for a successor for the Kyoto protocol, which will end in 2012, will take place. If a global cap on carbon emissions can be negotiated then a system of trading permits to emit between nations becomes practical.

Q5 The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

Greenhouse gases are emitted in order to provide goods and services to consumers. The consumers create the demand for the goods and services and are, therefore, responsible for the greenhouse gases emitted during production and transport of those goods and services.
It is estimated that the UK has a ‘carbon deficit’ \(^4\), this has not been broken down for Scotland. This means that our imports are responsible for more greenhouse emissions than our exports.

We acknowledge that conventional frameworks for attributing greenhouse emissions to nations work on the basis of gases emitted in the country and not those attributable to the consumption of a country’s citizens. This is governed by the availability of quality reporting data and the importance of reporting production-based figures such as GDP.

In the current system, where Scotland’s greenhouse gas reduction effort is not set within a truly global framework for reduction and reporting, we acknowledge the limits of the consumption-based approach for attributing emissions. However, we would like the Scottish Government to work towards a consumption-based reporting system for future global agreements and, until then, to monitor consumption-based emissions alongside those attributable to production and report on these alongside other climate change figures.

Aviation is the fastest growing source of greenhouse gas emissions, it has enjoyed the benefit of tax-free fuel, despite the increased damage that GHG emissions at altitude inflict on the climate. If aviation and shipping were excluded from the bill, low-carbon forms of transport would be at a competitive disadvantage which would damage research and development of low-carbon transport for the future and put food producers in Scotland at a disadvantage to overseas producers.

Q6 The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government’s approach to obtaining independent, expert advice on climate change?

No comments.

Q7 The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

No comments.

Q8 The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

No Comments

Q9 The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change,

\(^4\) Carbon Trust (2006) ‘The carbon generated in all that we consume’ http://www.carbontrust.co.uk/Publications/publicationdetail.htm?productid=CTC603
proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on this proposal?

No submission.

Q10 Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are your views on this proposal?

No comments.

Q11 The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

No comments.

Q12 The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?

Greenhouse gases from buildings account for up to 40% of total emissions, with domestic dwellings accounting for 25% of GHG emissions. Huge reductions can be made quickly and efficiently by increasing the energy efficiency of homes. We agree that an action plan to improve energy efficiency of buildings is essential, and this needs to include increased investment in energy efficiency measures for homes and more assistance for people to access the financial help that is available. This will tackle fuel poverty as well as reducing greenhouse gas emissions.

Building standards for energy efficiency should also be tightened with the inclusion of passive design for heating and cooling. We need an aspiration to make our housing stock in Scotland carbon neutral and the ambition and vision to make this happen.

Q13 The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government’s thinking in this area.

What are your views on this approach?

No Comments.

Q14 The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.
What are your views on this proposal?

Renewable heat is one of the areas where Scotland must start to make more progress. At present huge amounts of heat is wasted, including in the production of electricity and in the biomass that is left to decompose in landfill, which could be converted into heat for homes. It is vital that these, and other heat sources, are used for heating homes and businesses. It is right to note, however, that insulation and draft-proofing should be undertaken before a renewable heat project to ensure that the efficiencies are as high as possible.

Community heating projects should be encouraged and included in new-build developments, both private and public, where this is appropriate. Community heat and power leads to even more efficiencies, with the opportunity that the energy can be, not only efficiently used, but from 100% renewable resource if biomass is used to make the heat.

Q15 The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas:
- Waste prevention and management plans;
- Waste data;
- Deposit of recyclable waste;
- Procurement of recyclate;
- Reduction of packaging;
- Deposit and return schemes;
- Charges for carrier bags.

What are your views on these proposals?

No comments.

Q16 What are your views on the adequacy of the Scottish Government’s consultation in advance of publishing the Bill?

No Comments.

Q17 Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government out on the consultation proposals?

No Comments.

Q18 Does the Bill raise any equalities issues you would wish to highlight?

The most effective way of changing people’s consumption behaviour and decisions is to change the price signals so that higher carbon goods are more expensive. This can be done through a cap-and-trade system with the price being set by the availability of permits to emit, or by a carbon tax. People reacted to the summer rise in the cost of petrol by buying 20% less fuel and this shows that, even a small rise in the cost of carbon-intensive products can have an effect on consumption behaviour. However carbon taxes or cap-and trade will have a disproportionate impact on the poor. Although greenhouse gas emissions are closely related to income, poorer people are often tied into existing inefficiencies due to being unable to afford insulation, new appliances or other lower carbon technologies.

The solution to this is to redistribute the proceeds of a carbon tax or a cap and trade auction for permits to householders, alongside direct help for households to obtain insulation and other energy-saving technologies. Various mechanisms have been proposed for this and we propose a synthesis of some of these in the answer to Question 20.

Q19 Do you have any comments on the impact of the Bill on sustainable development?
It is important that the single goal of reducing our GHG emissions does not overshadow the broader goals of sustainable development for Scotland. It is true that ending our reliance on fossil fuels and drastically reducing our GHG emissions will contribute to making our planet more sustainable, however we need policy and practice that will bequeath a planet with all eco-system functions in tact to future generations.

Reductions in GHG emissions can be achieved in many ways and not all of these are equally desirable. We need to be careful in choosing the path that offers a sustainable future for everyone. Forum for the Future’s report ‘Climate Futures’ examines five sharply different scenarios for 2030. We need to ensure that our policy leads us to a future that fosters well-being for all at local and a global level, while maintaining our eco-systems and planetary support systems, including maintaining and enhancing biodiversity and places of wilderness.

In order to work within the earth’s capacity to provide energy, materials, ecosystem services, and biodiversity we need to focus on improving qualitative aspects of growth and leave behind the obsession with quantitative growth that has taken us into, not only an economic crisis, but a climate crisis and a looming resource crisis.

This means using our resources to improve people’s lives, rather than simply increasing national income, and involves both the sustainable use, and more equitable distribution, of those resources. Much of what is of most value to us as humans is invaluable (or immeasurable) and we need to acknowledge the limits of a metric such as GDP in guiding our decision making.

Q20 Do you have any other comments on the Bill?

In order to achieve the targets set out in the Climate Bill it is going to be necessary to set up a system of pricing carbon. At present, consumers do not pay the full price of the damage that greenhouse gases do in the prices of our goods and in some cases there is even a subsidy (for example no fuel tax on aircraft fuel). This means that we consume more carbon intensive goods than we would otherwise do if this price was internalised and there is less innovation in low-carbon technology than there should be. A price for carbon in the economy would encourage innovation to low-carbon technology, encourage conservation and efficiency and encourage consumers to make different consumption decisions.

We propose a carbon pricing system that is easy, effective, equitable and efficient. Since all greenhouse gases need to be included, but CO₂ is the major gas, when we use the term carbon, we mean all greenhouse gases as carbon equivalents.

1. **Easy**: Carbon is priced only when it enters the economy, which means only a few producers (coal/gas/oil/cement and fertiliser) will be directly affected. This reduces the transaction costs of the system, makes it easier to minimise leakage and to police effectively. The price will be determined by an annual auction of permits with a decreasing cap each year. The cap on permits will be determined by a scientifically established safe level and an achievable decent plan.

2. **Effective**: The additional costs will be passed down in the price of all goods. The advantage of a universal system like this is that the information on carbon content of the goods is automatically transmitted down the production and supply chain through the price. This leads to efficiencies at all levels, substitution of lower carbon alternatives, low-carbon innovation and changes in investment behaviour by individuals, government and companies. Price signals to the consumer will change consumer behaviour.

---

6 Several schemes internalise the costs of carbon emissions in a small way, for example, the Climate Levy on business, the European Trading Scheme and fuel tax. The ETS has not achieved as much as was promised due to the failure to auction permits and to have a low enough cap on the levels of carbon dioxide emitted. Caps should be decided with a view to the decent path and the carrying capacity of the planet, rather than companies own estimates of how much emissions they have had in the past.
7 The use of fertiliser on the soil leads to the production of Nitrous Oxide, N₂O, a greenhouse gas 298 times more potent than CO₂.
3. **Equitable:** The price for carbon will increase the costs for the consumer. To avoid this becoming a regressive tax on the poor, a proportion of the proceeds of the auction of the permits to the firms will be redistributed, through the existing tax and benefits system, to everyone to cover the basic increases in the cost of living. Because there is a close relationship between income and greenhouse gas emissions, poorer citizens will get more than they need to cover the increases in their bills. The wealthiest people, who are producing the greatest quantities of greenhouse gases will not be fully compensated for the increased prices. Because the payment is no longer acting as a subsidy on high carbon goods, people will switch to lower carbon goods and be able to pocket the difference.

The remaining portion of the proceeds from the auction of permits will be divided and used, firstly to support climate change adaptation measures for developing countries. And secondly, as an adaptation and mitigation fund for Scotland. This will go towards investing in energy conservation measures such as insulation, innovation and investment in alternatives and investment in infrastructure to support low-carbon living, such as transport infrastructure, community heating etc.

4. **Efficient:** Permits to emit are auctioned to the emitting companies, and these permits can be traded to ensure that the reductions are achieved in the most efficient way.

Annex 1 gives a diagrammatic representation of how the system works.

**Looking forward to the future:** As the cap on carbon comes down year on year, people will begin to invest in a low-carbon future. People will buy products that will last and repairing broken items will become the norm. An expectation of lower carbon caps in the future will lead to major decisions being made with a sustainable future in mind. For example: where to live, which house to buy/build, which transport options to choose.
Annex 1: An illustration of the process of the proposed scheme

- **Start Here**
  - Coal, gas, oil, cement, fertiliser companies

- **Government**
  - Auction of permits annually
  - Proceeds of auction

- **Providers of goods and services**
  - Pricing carbon results in incentives to invest in alternatives, conservation, efficiency and infrastructure to support low-carbon living
  - Increased costs passed on
  - Increases in prices of high carbon goods and services
  - Consumer demand for lower carbon goods
  - Investment in innovation

- **Consumer**
  - Payment to citizens to compensate for price rises on basic goods
  - Investment in energy conservation, innovation and infrastructure to support low-carbon living

- **Adaptation and mitigation fund**
  - For developing countries

- **For developing countries**
  - Investment in energy conservation, innovation and infrastructure to support low-carbon living

- **For developing countries**
  - Investment in energy conservation, innovation and infrastructure to support low-carbon living

Black arrows represent the cycling of incentives and benefits
Blue arrows represent investment
The Energy Saving Trust is grateful for the opportunity to respond to this consultation. Please note that this response does not necessarily represent the view of Energy Saving Trust members.

The Energy Saving Trust was established as part of the Government’s action plan in response to the 1992 Earth Summit in Rio de Janeiro, which addressed worldwide concerns on sustainable development issues. We are Scotland’s (and the UK’s) leading organisation working through partnerships towards the sustainable and efficient use of energy by households, communities and the road transport sector and one of the key delivery agents for the Government’s climate change objectives.

We have offices in each of the countries in the UK, and have had a dedicated office in Scotland since 1998 delivering programmes for the Scottish Government, which funds our work in Scotland.

Our response follows the format and order of the consultation document.

**Q1** The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

**What are your views on the 2050 target and a 2030 interim target proposed in the Bill?**

The Energy Saving Trust strongly supports the proposed 80% reduction target for 2050. We also welcome the inclusion of an interim point target. This is because early action is key in terms of reducing the absolute level of emissions in the atmosphere, and an interim target will help to ensure that a minimum amount of action is undertaken by a set date well before 2050. In terms of the level of the 2030 target we believe it is important that this puts Scotland on the necessary trajectory to ensure its 2050 targets are met, and ensures that it puts Scotland on the necessary trajectory to ensure it makes an appropriate contribution to the UK’s interim target of a of 26% (against a 1990 baseline) reduction target by 2020.

**Q2** The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

**What are your views on the setting of targets in batches from 2010 to 2022?**

It is important that policies to deliver each ‘batch’ of targets are viewed in context of meeting longer term targets. Otherwise there is a risk that policy options to deliver in the longer term might be discounted unnecessarily. The experience of the UK Climate Change Programme Review has shown that the focus on a particular timeframe (in this case 2010) can result in a sub-optimal analysis of options, including rejection of policies that have minimal impact in the given timeframe (but could have a significant impact beyond that timeframe). This is also well illustrated by the results of our recent microgeneration modelling work\(^1\), which shows that policies implemented now will result in limited savings in the shorter term (even with very supportive policies in place including some form of compulsion) but significant savings in 2050. This is not to say that interim targets are not important, simply that action in the short term should not be at the expense of longer term measures. It is important that short term actions are considered in parallel with actions that will deliver carbon savings in the longer term.

---

Q3 The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

The Energy Saving Trust agrees that a regular series of targets needs to be set for the reduction of greenhouse gas emissions in Scotland. We note that there are practical issues associated with annual targets – in that the ability to meet them can be unduly impacted by changes in weather or economic activity. On the other hand however, targets over a 5-year timeframe could be too infrequent to adequately assess progress towards meeting climate change targets. It is worthwhile noting that both approaches have been adopted across the UK, with the UK Climate Change Act adopting 5-year carbon budgets, and the Welsh Assembly Government proposing annual targets (of 3 per cent per year\(^2\) by 2011 in areas of devolved competence). In this context consideration could be given to the option of rolling targets outlined in our response to the UK Climate Change Bill\(^3\), but we note this would add a degree of complexity.

As noted above early action is key in terms of reducing the absolute level of emissions in the atmosphere, and as such we recommend that annual targets up to 2020 are as challenging as possible. In this context it is also worthwhile noting that we believe that a percentage reduction approach is better than a straight line approach since the scope for absolute savings now is higher than it will be once emissions approach the target figure.

Q.4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

We are supportive of the concept of a “net Scottish emissions account”. In terms of purchasing units and using these to offset Scottish emissions, we believe that ideally the focus should be on reducing Scotland’s emissions. Although credits from international projects have a role to play. However, these need to be robust and deliver real long term additional carbon savings. In this respect we note that major concerns have been expressed by many environmental NGOs on international projects, which has led to the creation of the CDM gold standard. In our view the best projects are energy efficiency and renewable projects that can be replicated elsewhere to deliver long term sustainable benefits to developing nations.

We see no reason why sectors that do not face international competition should not secure emission reductions in the Scotland, for example all reductions required of the household sector should be made by the Scottish household sector. International credits should only be able to account for a minority of Scotland’s emissions reductions, and we believe that a limit should be set on credits counted towards Scottish targets. This would ensure significant emissions reductions in Scotland. However, consideration needs to be given to the current framework of the EU Emissions Trading Scheme and the ability to use non-UK credits. We therefore believe that the use of international credits to meet Scottish objectives should be

---

\(^2\) Note: It is proposed that the target is a reduction in greenhouse gas emissions by an additional 3% of the baseline in each subsequent year.

\(^3\) See: http://www.energysavingtrust.org.uk/uploads/documents/aboutest/Defra%20Climate%20Change%20Bill%20120607.pdf [Link no longer operates]
limited to between 5 and 10 per cent, although we would like to reiterate that ideally Scottish carbon budgets should be delivered by Scottish carbon reductions. We would strongly advocate that the use of non-Scottish credits is reported in a transparent manner.

Q5 The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

We believe it is important that the targets are set in such a way as to encourage actual emissions reductions in Scotland, and as such we broadly agree that with the proposed definition of Scottish emissions, and are supportive of the inclusion of emissions from international aviation and shipping within Scotland’s climate change targets.

We note that actions in Scotland (e.g. importing and consuming goods and services from elsewhere in the world) will encourage the production of greenhouse gas emissions elsewhere in the world. In this context we note that the Welsh Assembly Government is currently proposing to ‘report separately on Wales’ total consumption emissions…’. We believe it might be appropriate to consider equivalent reporting requirements in Scotland.

Q6 The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government’s approach to obtaining independent, expert advice on climate change?

We strongly support the use of Committee on Climate Change for the provision of independent, expert advice on climate change. It is vitally important that the provision of such advice remains independent of Government. We agree it is sensible that the Bill contains provisions which allow the Scottish Government to establish a Scotland-specific Committee, but such a body should only be established if the advice from the Committee on Climate Change is deemed, after a certain period of time, not to be specific enough or useful enough to the Scottish Government. Because we believe that true independence is vital for any body that is to be monitoring the progress of the Scottish Government on reducing emissions we do not believe this is an appropriate role for any existing public body.

Q7 The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

We are supportive of the proposed reporting arrangements. As noted above we note that the Welsh Assembly Government is currently proposing to ‘report separately on Wales’ total consumption emissions…’. We believe it might be appropriate to consider equivalent reporting requirements in Scotland.
Q8 The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

We are supportive of the provisions within the Bill to allow the Scottish Government to impose duties on public bodies in relation to climate change.

Q9 The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on this proposal?

The issue of adaptation is outside of the Energy Saving Trust’s remit.

Q10 Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are your views on this proposal?

The issue of muirburn is outside of the Energy Saving Trust’s remit.

Q11 The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

The issue of forestry is outside of the Energy Saving Trust’s remit.

Q12 The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?

The Energy Saving Trust very much welcomes the provision within the Bill to require the Scottish Government to produce and energy efficiency action plan.

Energy efficiency has a key role to play in delivering Scotland’s climate change targets. The priority in meeting climate change targets in a secure, efficient and environmentally friendly manner in Scotland must be to reduce the level of demand. Demand side activity can be implemented far quicker than changes in the supply side and will allow delivery of carbon reductions with lower levels of low carbon supply. Energy efficiency also helps improve security of supply by reducing the demand for primary energy, and hence dependence on supply side investment and energy imports. Most energy saving options are more cost effective than investing in any new supply capacity. Energy efficiency also plays an important contribution in alleviating fuel poverty. It should therefore always be the number one solution.
Also of relevance is that it is more cost-effective to deliver carbon savings in the household sector than in any other (see table below).

**Figure 2: Cost effectiveness (benefits net of costs per tonne of carbon saved), by source (£/tCe)**

![Chart showing cost effectiveness by sector](chart.png)

Indeed the findings of the CCC's analysis highlight that "One key feature of the sectors covered, in particular of the residential sector, is that there appears to be scope for significant energy efficiency improvement at a cost to the economy and to individuals which is low, nil, or indeed negative (i.e. where upfront investment would be quickly repaid and give a good return)." Our own figures highlight that the average householder could save up to £340 per year on their energy years, every year based on current energy prices, simply by installing cost effective energy efficiency measures.

In the context of improving the energy efficiency of Scotland’s housing stock we therefore believe the Bill could and should go further. The Scottish Government may well find that household energy performance needs to be regulated in the future if it’s to meet climate change targets. Therefore it would seem sensible to include some provision within the Bill to make it easier for the Scottish Government to regulate energy performance improvements in the housing stock in the future. In this context we note that the Bill says that “Scottish Ministers may, by regulations, make provision relating to the assessment of the energy performance of non-domestic buildings”. Thus allowing future regulation to be applied to non-domestic buildings. We also note that the Scottish Government will (once the consultation report for the consultation relating the energy performance of non-domestic buildings has been published) consider whether the energy performance of non-domestic buildings section of the Bill should be amended, and that this could include consideration of the mandation of the implementation of action plans for the improvement of energy performance.

---

4 See: [http://www.theccc.org.uk/reports/](http://www.theccc.org.uk/reports/)
5 From (uncorrected) evidence provided by the Scottish Government at the Economy, Energy and Tourism Committee, Wednesday 4th February.
Q13 The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government's thinking in this area.

What are your views on this approach?

The issue of non-domestic is outside of the Energy Saving Trust's remit.

Q14 The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

What are your views on this proposal?

Homes in Scotland are responsible for around 34 per cent of Scotland’s energy demand, and around 85 per cent of a typical households energy demand is for heat. Therefore measures to reduce heat demand and to reduce the amount of carbon produced in the production of heat will play a key role in delivering Scotland’s climate change targets.

The Energy Saving Trust therefore very much welcomes the provision within the Bill for the Scottish Government to take steps to promote the use of heat from renewable resources. We note6 that at stage 2 the Scottish Government (subject to ministerial approval) plan include within the Bill an obligation to produce a renewable heat action plan. We very much support this intention and believe it will strengthen this part of the Bill.

Q15 The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas:
- Waste prevention and management plans;
- Waste data;
- Deposit of recyclable waste;
- Procurement of recyclate;
- Reduction of packaging;
- Deposit and return schemes;
- Charges for carrier bags.

What are your views on these proposals?

Waste is currently outside of the Energy Saving Trust’s remit in Scotland.

Q16 What are your views on the adequacy of the Scottish Government’s consultation in advance of publishing the Bill?

No submission.

Q17 Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government out on the consultation proposals?

No submission.

Q18 Does the Bill raise any equalities issues you would wish to highlight?

No submission.

6 From (uncorrected) evidence provided by the Scottish Government at the Economy, Energy and Tourism Committee, Wednesday 4th February.
Q19 Do you have any comments on the impact of the Bill on sustainable development?
No submission.

Q20 Do you have any other comments on the Bill?
No submission.
The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

Falkirk Council welcomes the proposal. It is essential that the Scottish Climate Change Bill establishes a statutory target for at least an 80% reduction of greenhouse gases in Scotland by 2050. But it is recognized that this will present significant challenges to all sectors. The Council notes that the UK emissions reduction target has been increased to match the Scottish target.

The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

What are your views on the setting of targets in batches from 2010 to 2022?

Falkirk Council supports the move with the provision that the targets can be revised if necessary, subject to recommendation by a wholly independent scientific body on the basis of changing scientific knowledge or consensus amongst the climate change lobby.

The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

Falkirk Council supports the proposal emphasising the importance of retaining flexibility in light of scientific developments and other international climate change targets.

The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

Whilst Falkirk Council supports the purchase of international CO2 units, recognising that this will allow the lowest cost methods of emissions reduction to be implemented, it believes that the purchase level should be limited to avoid complete dependence on this route which could result in no reduction in emissions. Clear identification of unit origins would, of course, be essential and desirable in such a scheme.

The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

Falkirk Council supports the proposal that “Scottish emissions” should be those emitted in Scotland. It also welcomes the move to include consideration of emissions arising from international aviation and shipping, in recognition of the significant quantities of greenhouse gases arising from them and the rate at which they continue to increase.
The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government’s approach to obtaining independent, expert advice on climate change?

Falkirk Council supports the move to initially seek guidance from the existing UK Committee on Climate Change to avoid unnecessary duplication. However, it also welcomes the option to explore other sources of guidance and advice should that prove necessary.

The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

Falkirk Council supports the proposed arrangements.

The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

Falkirk Council acknowledges the role that local authorities can and should play in reducing greenhouse gas emissions and also acknowledges that it is appropriate that national and international government commitments should be reflected by targets at local government level. The Council reiterates its request for additional funds to support such action. Installation of improved technology, retrofitting of energy inefficient buildings, CO2 budgeting and management, along with achieving fundamental behavioural change amongst staff cannot be delivered on existing resources. Additional duties require additional funding and support in the form of expertise and systems change support.

The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on this proposal?

Falkirk Council welcomes this proposal but with due consideration to the additional funding required to undertake the actions necessary to deliver the report objectives. Parts of the Falkirk Council area are recognised as being at high social, economic and environmental risk from climate change, in recognition of the combined issues of flood threat, housing and industrial concentration in the Grangemouth area.

Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are your views on this proposal?

Falkirk Council supports the proposal provided due regard is given to biodiversity considerations in the areas and ecosystems involved.
The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

Falkirk Council supports the twin objectives as expressed but recognises that environmental considerations in terms of landscape impact and community engagement will require to be managed effectively.

The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?

Falkirk Council welcomes this proposal and acknowledges the role local authorities can play in achieving greater energy efficiency in the built environment and the effect that behavioural change can have on that aim. This can be readily set out through performance target for buildings within the Building Standards (Scotland) Regulations. However, the mechanism for delivery of the proposal on existing properties will impact significantly on local authorities, should targets be made mandatory and enforced through statutory legislation applied by local authorities. The impact on existing service provisions, resources and ensuring compliance (due to the number, complexity and condition of existing properties) will require additional funding to adequately service such a proposal.

The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government's thinking in this area.

What are your views on this approach?

Falkirk Council in principal supports the twin objectives. The proposals could be enshrined within the Building Standards (Scotland) Regulations and administered through local authorities, again raising concerns over resources and funding. However, the number of properties this would impact on and the mechanisms for compliance require further development, before any direct comment could be offered. In this instance it may be that an incentive based scheme (tax based, rather than at a local level) to encourage owners / occupiers to engage with energy efficiency would be of greater benefit rather than relying on enforcement protocols and placing additional burdens on owners and local authorities given the impact of the economic downturn and the rate of recovery.

The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

What are your views on this proposal?

Falkirk Council supports the proposal in principle, but would highlight that the initial increased cost and the time frame for a return on the initial investment may preclude people from adopting new technology in this area.
The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas:

- Waste prevention and management plans;
- Waste data;
- Deposit of recyclable waste;
- Procurement of recyclate;
- Reduction of packaging;
- Deposit and return schemes;
- Charges for carrier bags.

What are your views on these proposals?

Falkirk Council welcomes the inclusion and recognition of the key role that these issues play in terms of the contribution to climate change, but are cautious until supporting legislation detailing the roles and responsibilities of each key stakeholder are available for further review.

What are your views on the adequacy of the Scottish Government’s consultation in advance of publishing the Bill?

Falkirk Council considers that consultation in advance of the bill was adequate.

Do you have any views on the Strategic Environmental Assessment (SEA) which was carried out by the Scottish Government out on the consultation proposals?

Falkirk Council considers that the SEA on the consultation proposals was adequate.

Does the Bill raise any equalities issues you would wish to highlight?

No

Do you have any comments on the impact of the Bill on sustainable development?

The bill should include a sustainability duty to ensure that measures taken in pursuit of its objectives do not lead to perverse environmental, social or economic consequences. This sustainability duty should be firmly based on the definition provided in the Scottish Sustainable Development Strategy.

Do you have any other comments on the Bill?

No
WRITTEN SUBMISSION FROM FIFE COUNCIL

Q1  The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

Fife Council supports the 2050 and 2030 targets with the proviso that these may need to be adjusted according to best available scientific knowledge.

Moreover, an additional interim target for 2020 could be useful as this is the target point for EU climate change reductions. 2020 would also be a useful early marker with time to take corrective action should this target not be met.

Fife Council supports the practice of reducing carbon emissions not only as a useful proxy for improving the technical efficiency in the generation and use of carbon-based fuels and improving the economic use of such fuels across the areas outlined in the Bill, but also working to achieve a massive emissions reduction in transportation fuel consumption.

Fife Council encourages a clear relationship between the amount of effort and resources dedicated to routes to meet the targets and the projected proportion that is likely to achieve. Moreover, other likely impacts should be borne in mind to ensure broader sustainability is not sacrificed to reduce carbon emissions.

Meeting the targets may require a total rethink on the mechanism of achieving these targets, which is not made clear in the Bill. While a large proportion of current efforts is to task the power companies, this does not comply with a proper view of sustainability, in terms of both international security of supply (political stability) and native security of supply (constancy of guaranteed supply), including economic viability.

The use of carbon trading allows developed countries to abrogate much of their responsibilities for real reductions and improvements in sustainability, makes meeting targets an end in itself and does nothing for the aim of long-term sustainability. Carbon trading should be tightly controlled and be allowed only where a real carbon reduction is achieved through actions that would not be achieved in normal trading or environmental improvement – in other words it must be demonstrable that any potential negative environmental impact is being addressed.

Fife Council reiterates the view expressed in our response to the Financial Memorandum: viz. that there must be consideration by the Scottish Government of the costs associated with the scrutiny, measurement and reporting incurred. Fife Council urges the consideration of full costs associated with the Bill, not reliance on market changes or efficiencies savings making it possible for public bodies (or others) to cover the costs incurred in execution, monitoring and compilation of the reports to be analysed by the Scottish Government. A lack of sufficient resources for the implementation, enforcement, scrutiny, measurement and reporting will put achievement of the targets in jeopardy.

Q2  The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

What are your views on the setting of targets in batches from 2010 to 2022?

Fife Council supports the setting of batches of targets, 12 years in advance. It is essential for local authorities to have interim targets and prior notice of the targets will help to monitor progress and give guidance on what actions are working. The Council does however encourage full consideration of the complication and bureaucracy that could arise, and urge the Scottish Government to ensure that planning, monitoring and reporting is set with common units of measurement and formats across the issues covered by the Bill.
Local authority target setting should be aligned with Single Outcome Agreements (SOA), which themselves represent the priorities for Community Plans. In this way, reporting tied to the Climate Change Bill could be incorporated into Community Planning, although full reporting would have to remain outwith the SOA to facilitate detailed coverage of areas of progress and challenges and future intentions.

Q3 The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

Fife Council have committed to achieving a 3% reduction in Council emissions year on year, as a drive to making a sufficient and equitable contribution to the global emissions reduction effort. The Council however, seeks clarification on how the annual 3% reduction targets will be applied in relation to the longer term ‘batch’ targets and is of the view that any penalties imposed for not meeting targets should relate to periods of longer than a year.

A focus solely on annual 3% reductions could be seen to promote the adoption of short term views and is not desirable. Striving to achieve reductions in a planned manner over a number of years, and allowing some elements to achieve lower reductions in some years, could be in the best long-term interest. It would also allow organisations to iron out unforeseen circumstances. However, it should still be borne in mind that the 3% reduction is a minimum and that the “at least” element should not be airbrushed out by common usage.

The urgency of the climate change challenge is masked by not requiring significant action (i.e. targets of at least 3%) until 2020. The earlier that emissions reductions are achieved, the less the impact of climate change will be. To encourage much earlier implementation of measures to reduce emissions, it is recommended that targets of at least 3% per annum are required much sooner, while still allowing a sufficient period for forward planning (e.g. from 2012). In that regard, Fife Council urges the Scottish Government to take steps to ensure that those Councils and other organisations that are currently progressing with work to reduce emissions are not penalised in future. In other words, the progressive Councils and other organisations would not benefit from the relatively low cost of initial emissions reductions measures from 2020, should that target date for reductions be retained, whereas Councils and other organisations, who are less advanced in this area, would benefit.

Q4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

Fife Council would support a limit on the number of carbon units that Scotland can purchase to avoid creating a disincentive for ‘home’ emissions reductions. The emissions account is a necessary reference. However, the “offset” mechanism makes meeting targets an end in itself and detracts from the aim of long-term sustainability. Wealthier countries should not be able to buy themselves out of reducing carbon units.

Q5 The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?
Fife Council accepts this definition and welcomes the inclusion of emissions from aviation and international shipping.

Targets based on end user inventories would account for energy efficiency measures and renewable energy generation, as well as taking account of carbon generated elsewhere by our consumption in Scotland. The council also supports the reporting of emissions from consumption information as a parallel process to the achievement of emissions reduction targets and believes that this could prove to be a useful tool for informing the public of their role in reducing emissions worldwide through their consumption choices.

Q6 The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government’s approach to obtaining independent, expert advice on climate change?

Fife Council supports the above approach and encourages the early setting of parameters for the decision of whether and how a Scottish Committee on Climate Change should be created. This is a global issue that requires joined up thinking: if a Scottish Committee is established it will still need to work closely and positively with the UK Committee.

Q7 The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

The monitoring and reporting are an important factor in assessing target achievement and need to be as detailed and accurate as possible. Fife Council supports the reporting set out and asks the Scottish Government to ensure that meaningful and efficient reporting is achieved by timely issue of guidance to facilitate the efforts of those bodies who will inform the reports. There may be resource implications attached to such reporting requirements and these should be addressed.

Fife Council suggests that reporting on meeting targets should include statements on sustainability and the way in which the achievement of elements of the Climate Change Bill targets, meets the aspirations of the Government and local authorities regarding the component parts – e.g. energy conservation, transport emissions, etc.

Q8 The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

Public bodies should have a duty imposed on them to take leadership on this agenda, but must be given the role and resources to do so effectively.

In order to ensure that public bodies are able to meet the duties imposed by the Scottish Government in relation to climate change, Fife Council encourages the allocation of realistic resources, clear guidance, and cross-reference between the reporting and scrutiny of the various elements covered to facilitate the successful execution of the duties assigned to public bodies. Clear duties and a “level playing field” would be preferable to vague expectations.
Local authorities’ climate change duties could be supported by strengthening and re-focusing the existing Best Value and Community Planning legislation, wherein local authorities are required to discharge their Best Value and Community Planning duties in “a way which contributes to the achievement of sustainable development”. In order to ensure a real reduction in emissions, these improvements would need to work concurrently with local action plans.

The Scottish Government should encourage collaborative working between bodies (including through the community planning process as above) to tackle this challenge. Real progress will require joint efforts between the public, private and voluntary sector, and engagement with the public.

Q9 The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on this proposal?

The Bill is correct to place a burden of duty on the Scottish Government in terms of producing a report and setting out achievable objectives and more importantly the necessary time frames within which adaptation proposals and policies will be introduced and duly measured. The early issue of guidance in those regards would be to the benefit of local authorities.

Q10 Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are your views on this proposal?

Muirburn is a conservation activity which should consider broader sustainability, including preservation of wetlands and protection of soils. In setting additional regulation protection against loss of carbon from soils should be taken into account.

Q11 The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

Fife Council has already responded to the specific consultation that was effected in this regard. The Council’s main concerns are that:

The proposals could be interpreted as turning over the control of substantial portions of the national forest estate to commercial interests at the expense of other benefits. This could potentially impact negatively upon biodiversity, access and other public benefits, and also upon the Forestry Commission’s strategic priority to sustain sufficient regional presence to exercise policy development, exemplar and leadership roles.

While broadly in favour of Scottish Ministers having the ability to lease land and for the Forestry Commission to grant cutting rights, this should be on the advice of the Commission and on the basis of professional judgement taking into account all aspects to ensure a net public benefit. As outlined, the proposed arrangements could provide too much flexibility for leases and cutting rights to be entered into on the basis of purely financial considerations. Fife Council urges the introduction of formal safeguards that are adequate and effective in protecting public benefits in respect of nature conservation, public access opportunities and rights, and community involvement.
Fife Council does not wish to see a diminution in any public benefits as a result of changes in management responsibilities and forestry practices being undertaken by a third party. It is essential that the Commission retains appropriate accountability and have the necessary powers on behalf of the public for ensuring that any safeguards that are put in place are effectively applied, monitored and publicly reported through a process that is robust, accessible and transparent. The benefits establishing a-not-for-profit trust to act as a potential delivery mechanism to invest the income from leases and cutting rights are unclear. Moreover, there would be a number of governance issues that would require to be adequately addressed. More information on why this is the preferred option would have enabled a clearer view to be given.

In discharging its functions it would be essential to ensure that the proposed trust, and any other new proprietors, would be prepared to work with or be receptive to the views of local people and organisations.

An alternative approach might be to keep the national forest estate under direct public control and ownership, avoiding the ambiguities inherent in endeavouring to release capital while safeguarding public interest via a trust. It is unclear, given that the Forestry Commission is already a public body serving the public interest, why the Commission cannot undertake this re-investment role. In this instance might it not be more effective to use an existing body, extending its powers if needed?

A programme of increased forestation should not lead to emissions increases such as through disturbing peatland. The consultation paper makes reference to rigorous selection of appropriate areas in other contexts: a logical further step is the identification of an appropriate public interest body for such selection.

Developing supply chains for local markets is of high importance particularly in regard to fuel wood. With regard to renewables, there should be a presumption in favour of using wood for local heat.

Measures such as the Freight Facilities Grants to reduce road miles of timber are also important.

Consideration should be given to revisiting contracts where building operators are currently locked into high carbon heating regimes.

In addition to fuel, wood has enormous potential for lower-carbon buildings. Increasing the availability of wood for renewable energy should not be at the expense of research and development in improving timber quality.

Forest crofts and enhancing public transport to forests should not be overlooked.

In addition to carbon emissions, planting and felling should be planned with regard to climate change adaptation (particularly but not exclusively flooding) as well as other environmental, social and economic factors.

The Council wishes to underline its view that all developments that may arise in this regard will be subject to the normal planning process and will be considered in the light of relevant planning parameters. There should not be any presumption in favour of such development and all proposals must be considered on their merits as is the usual case.

Q12 The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?

The waste section of the Climate Change Bill sets out in detail the issues that should be covered in efforts and reporting. However the energy efficiency section of the Bill states there will be an action plan, with no parameters set. The elements of the energy efficiency action plan would benefit from being set out in the Act. For example, the energy efficiency action plan should be required to state for each proposal:
• The type of actions that will contribute to the reduction of energy associated emissions (similarly to the outline of efforts on waste later in the Bill);
• Resource implications and associated anticipated impact on emissions;
• Projected timescales for production and publication of relevant guidance, and monitoring and reporting requirements;
• Projected timescales for implementation and impacts.

Reducing emissions from energy use is an essential part of any attempt to tackle climate change. There is a real need for continual encouragement and engagement of all sectors of the community for real change to be achieved. It is submitted that it is only through the proper education of all these sectors together with their partners, that the Scottish Government will achieve target emissions reductions. To date, efforts to persuade organisations and householders to improve efficiencies and encourage behavioural change have produced varied results. Real change may require greater elements of compulsory action and improved financial input.

The fiscal and organisational improvement of energy conservation of new and existing buildings in Scotland is paramount. Clear links between energy efficiency and broader sustainability standards for existing housing stock in all tenures and buildings in other uses should be tackled, beyond the current reliance on Energy Performance Certificates driving of market forces to create improvements.

It should not be assumed that concurrent targets to eradicate fuel poverty and tackle rising fuel costs will contribute to carbon emissions reduction targets. Those policies may indeed not save any carbon as, instead, they facilitate increased warmth in homes, with less waste of energy but not necessarily less energy use (because homes are warmer). The Policy Memorandum makes reference to “possible carbon savings”, but no solution is suggested or even said to be required, and so Fife Council seeks clarity from the Government on how differentiations between carbon saving energy efficiency and fuel poverty energy efficiency will be made.

**Q13** The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government’s thinking in this area.

What are your views on this approach?

The gathering and use of such information could be useful for baseline setting and monitoring of government policy. However as noted in the response above, achievement of emissions reduction targets for both domestic and non-domestic buildings will require a marked increase in support/incentive schemes, and stronger regulation to facilitate actual energy efficiency improvements and emissions reductions.

**Q14** The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

What are your views on this proposal?

The Scottish Government could usefully explain how it proposes this duty to be translated and applied through planning policies and building standards, and the extent to which this duty is discharged through promotional policies or more stringent requirements. There is an obvious need to ensure the focus on minimising resources in conjunction with using renewable sources, both in relation to achieving high energy efficiency levels prior to installing renewable heat technologies, but also to ensure that refurbishment with such technology is taken into account in early refurbishment which could incorporate the renewable heat technologies at a later date.

Renewable technologies are not yet at all at a point where they make economic sense for individuals or many organisations. Clear links should be established on existing resources, such as the Carbon Emission Reduction Target for domestic installations.
Fife Council also urges a clear plan relating the acquisition of fuel to ensure that broader sustainability is not disadvantaged by efforts to cut Scottish emissions, such as may be disastrous for world food production and globally as well as locally important habitats.

Q15 The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas:

- Waste prevention and management plans;
- Waste data;
- Deposit of recyclable waste;
- Procurement of recyclate;
- Reduction of packaging;
- Deposit and return schemes;
- Charges for carrier bags.

What are your views on these proposals?

Fife Council is of the view that the need to minimise waste at source cannot be overstated. Such minimisation, if complemented by similar action on the part of the retail sector, will produce significant and, therefore, meaningful benefits for society. The Council is of the further view, therefore, that the Scottish Government should take the lead in that regard also. It is also the Council's view that by doing so the Government would be augmenting and complementing the good work that is being done by local authorities by way of recycling. In short, what is required is a strong shift in focus from recycling to reduction of waste across all sectors of the community: public, commercial and industry.

The Council would welcome a consideration of "deposit and return" schemes, which work well in other countries and questions the degree of focus on carrier bags in proportion to the impact this will have on emissions targets.

Collection and separation of a broader range of dry recyclates (including bulky uplifts and dirty materials) at central facilities would improve performances but is likely to need central funding.

Procurement with carbon reduction in mind, should go far beyond recycled and recyclable materials. Procurement portals that public bodies are bound to use currently gives little weighting to sustainability, and indeed many procurement systems give no value to carbon impacts. Fife Council is currently trialling a methodology to build carbon into elements of procurement.

Q16 What are your views on the adequacy of the Scottish Government's consultation in advance of publishing the Bill?

Fife Council is satisfied with this.

Q17 Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government out on the consultation proposals?

No submission.

Q18 Does the Bill raise any equalities issues you would wish to highlight?

Financially disadvantaged households and low/no profit organisations will find it difficult to attain efficiency targets without a major change in support/incentive schemes. In the longer run, such groups may benefit from spinoffs from mitigation such as better energy efficiency, fuel security and lower carbon transport but this will require planning and direction rather than reliance on an invisible hand or trickle down of benefits.

In addition to global and historical equity issues, failure to mitigate adequately would have significant equalities consequences: the tendency for many of the most vulnerable sectors of society to be sited in areas most at risk from flooding provides one example, as cited in Scottish Planning Policy 7: Planning and Flooding, Scottish Executive February 2004.
Q19  Do you have any comments on the impact of the Bill on sustainable development?

Fife Council encourages clearer consideration of broad sustainable development issues, and not solely a focus on carbon. This should be reflected in guidance, implementation plans and in reporting requirements.

The Council also believes that instead of traditional economic growth models, future sustainable economics should shift the focus from traditional industries to those based on environmental protection and energy efficiency. This comes from doubt that a growth model can indeed be sustainable, as mitigating and adapting to climate change will require decreasing consumption and emission producing activities, contrary to the aims of traditional economic growth models.

Q20  Do you have any other comments on the Bill?

Until the actual detail of the targets/proposals/timescales and the ‘how’ of the implementation are developed, prior to the agreement of secondary legislation and setting regulations, it is difficult to comment on the real potential for the success of the Climate Change Bill.

As part of Fife’s 2008/09 Single Outcome Agreement, an ‘Ask’ was submitted to the Scottish Government. This sought increased investment in measures to tackle climate change, highlighting that any substantial increase in implementation of community heating schemes would require new funding mechanisms such as grant funding for the required infrastructure. The November 2008 response from the Scottish Government cited the Climate Challenge Fund as a key part of the response to this. Fife Council urges further consideration of the costs of infrastructure to facilitate carbon emissions reductions as the Climate Challenge Fund is not open to local authorities, yet many communities will rely on the initiative, support, motivation and coordination by their local authorities to achieve the carbon reduction targets.

Fife Council believes that it is critical to ensure there is enforcement of the range of measures and clear associated penalties for failure. In many areas, such as private sector housing energy efficiency, a national joined up approach is essential. Throughout the Bill references are made to enforcement agencies and roles. Fife Council urges the Scottish Government to ensure that the units of measurement, plans and formats, timescales and standards applied are standardised, clear and draw on current best practice. This would be essential to minimise the burden placed on local authorities and to increase the efficiency of the monitoring and reporting systems employed.

Fife Council is concerned by the lack of acknowledgement of the impact of transportation in the Climate Change Bill. Even if the intention is to draw efforts to reduce emissions associated with transportation through other routes, this should be clearly stated in the Bill.

We should look at how we embed ‘sustainability’ as part of what we do in everyday life rather than always using it as a ‘badge’ to justify add ons. Sustainability should be intrinsic to everything we do; one example is developers not adding a few environmental benefits at the end to tick a box, but looking at it from the start of a project. To this end greater awareness raising and education would be beneficial, but the design of schemes and processes should also require consistent consideration of sustainability.

Another example of essential integration to achieve the Climate Change Bill targets is the development of clear links and relationships between carbon budgets and financial budgets. While Fife Council has started to tackle some of the challenges in this area, guidance from Government is essential to ensure a consistent value of carbon being adopted across organisations.

Fife Council reiterates the need for care in relation to carbon trading so that people are not encouraged to maintain current emissions and off-set this elsewhere. There must be a clear and consistent focus on reducing emissions.

An overall emphasis needs to be placed on a simplified message, effectively promoted and communicated to all individuals. Everyone has an important part to play in the areas of climate change, sustainability and energy conservation.
WRITTEN SUBMISSION FROM FIRST GROUP

FirstGroup plc is the largest bus and rail operator in the UK. We are therefore ideally placed to work with the Scottish Government to deliver carbon reductions from the transport sector. The Confederation of Passenger Transport has indicated in their response the opportunities from bus and light rail services. The Sustainable Rail Programme has produced a number of documents setting out the case for rail. In developing their strategy to deliver the carbon reduction targets proposed in the Bill we would encourage the Scottish Government to work with the industry to promote modal shift through partnership working and measures to support investment in emerging transport technologies.

In relation to the questions outlined by the Transport, Infrastructure and Climate Change Committee we would provide the following observations.

We have no particular comments to make in relation to the long-term targets. We agree that interim targets will need to be established in batches as it is difficult to project beyond a certain timeframe. We are unsure as to the wisdom of setting 3% year on year reductions unless there is a clear strategy by which such annual reductions can be achieved. Our own carbon projections show relatively small gains in the short term becoming greater over time as technology develops and becomes more commercially available.

This approach should not, however, override the need to act now in particular in relation to promoting behaviour change whereby we can achieve the most significant reductions in the short-term.

We understand the Scottish Government’s rationale in relation to establishing a Committee for Climate Change. It is, however, important that climate change is addressed in line with other broader sustainability goals as, for example, those set out for transport by the Department for Transport in “Towards a Sustainable Transport System”. We appreciate this does not apply to Scotland but the document illustrates the need to consider climate change within a broader social context if we are to deliver a truly sustainable transport network.

Within this context we also consider it important that independent, expert advisors on climate change maintain an overview of the broader sustainability agenda and ensure their advice does not conflict with this.

We support the need for reporting duties and the powers for regulation to impose duties on public bodies in relation to climate change.

Overall the Bill appears to provide an appropriate framework for driving greenhouse gas emission reductions in Scotland. The challenge moving forward will be to develop the appropriate strategies and action plans to deliver the carbon savings required and we look forward to being involved in that process in relation to the transport sector.
WRITTEN SUBMISSION FROM FRIENDS OF THE EARTH SCOTLAND

Introduction

Friends of the Earth Scotland (FoES) is an independent registered Scottish charity (SC003442). We empower people to take individual and collective action to deliver positive and fair solutions to pressing environmental problems. Friends of the Earth Scotland is an independent member of the Friends of the Earth International network.

We wholeheartedly welcome the introduction of the Climate Change (Scotland) Bill and much of the framework it contains. As a member of an international network, we are particularly proud that Scotland has brought forward legislation which has the potential, if strengthened in key areas, to be world leading. We are aware that countries both inside and outside the EU are taking a keen interest in legislation which reaches statute before the vital UN climate negotiations in Copenhagen in December 2009.

The importance of this Bill, both as one of the first pieces of legislation on climate change and in terms of its timing before Copenhagen, means it is vital to get it right. The Bill should ensure Scotland makes its full and fair contribution to preventing dangerous climate change. Friends of the Earth Scotland believes that, in order to do this, there are a number of key amendments that need to be made to the Bill.

We are also a member of Stop Climate Chaos Scotland and agree with the contents of its response, in particular that the Climate Change (Scotland) Bill must:

1. Set out a framework that will achieve at least an 80% reduction in greenhouse gas emissions by 2050.
2. Establish in statute annual emission reductions of at least 3% year-on-year from the start, not just from 2020, compatible with a fair and safe cumulative budget identified by the advisory body (see 4).
3. Include emissions from all sectors in the framework and targets set out in the Bill, including those from international aviation and shipping, from the very start.
4. Establish a Scottish advisory body, a Scottish Climate Change Commission, in the primary legislation to support delivery of the Bill when it is enacted.
5. Ensure that at least 80% of the effort to cut emissions takes place in Scotland.
6. Establish duties on all public bodies to reduce greenhouse gas emissions in line with the national target.
7. Set in place robust, transparent reporting measures so the Scottish Parliament is well informed on progress in meeting targets and Government is held to account on mitigation and adaptation.
8. Ensure that strong enforcement measures are set in place in statute.
9. Ensure Scotland counts all its emissions and reports on those produced by products and services we consume as well as emissions produced domestically.
10. Be explicit that sustainable development is core to the purpose and delivery of the statute in relation to mitigation and adaptation.

The following is provided to the Committee as additional evidence, reflecting Friends of the Earth Scotland’s particular concerns and expertise.

Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050. What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

Friends of the Earth Scotland welcomes the long-term reduction target of at least 80% by 2050. We do not regard this as an end-point, but as a critical milestone in progress towards a zero-carbon Scotland. The science of climate change continues to develop in ways that – on balance – imply tougher targets. Friends of the Earth Scotland therefore believe the Bill should both enable the potential to achieve 80% earlier (for which the annual targets procedures currently provide capacity) and provide enabling powers to stipulate greater effort by 2050, should the science so indicate.
Moreover, we would stress that with regards to averting dangerous climate change it is not just the percentage reduction target that matters, but also the total cumulative level of emissions that are released. A cumulative budget is one that takes account of the total level of emissions that we can emit between now and 2050. The lifespan of greenhouse gases in the atmosphere means that such cumulative budgets are best defined over multi-decade periods. The Tyndall centre has estimated UK cumulative budgets for the period 2000-2050 based on an equitable convergence of global budgets between countries.

To illustrate the significance of cumulative budgets, using one of the Governments own emissions reductions trajectory scenarios (Technical Note, scenario 1) and attributing a Scottish share of a UK budget by population, our calculations suggest the 2050, 2030, and ongoing annual targets could all be met whilst still over-shooting a fair cumulative budget by 37% or 542mtCO2e.

Meeting a fair cumulative budget for Scotland will be critically dependent on early emissions reductions before 2020 (see below). Early action is essential not only to ensure Scotland is making a fair contribution to the international cuts needed to avoid a two degree warming of global average temperatures, but also to maximise the potential benefits of low-carbon technologies to the Scottish economy.

Other countries and the EU have set interim targets for 2020 (which is also half-way between 1990 and 2050). We do not see any justification why Scotland should set its interim target later.

The interim target, as it stands, does little to ensure anything like a cumulative budget would be met. For these reasons, we believe the interim target should be brought forward to 2020 in order to push early and significant emissions reductions that ensure we keep within our cumulative budget. A 50% 2020 target, while ambitious, is achievable in Scotland. The UK has an ‘intended’ 42% target for 2020 (to which Scotland must contribute) and Scotland’s unique renewables potential suggests we can go above this. An interim target of 50% by 2020 would go a long way towards making Scotland’s legislation genuinely world-leading.

We also believe that a fair cumulative budget, should be considered alongside the 2050, and interim, targets that the Bill provides for, as a vital consideration on the annual targets set by Ministers – in other words, that the Bill should establish a duty on Ministers to set annual targets that are compatible with a fair and safe cumulative budget. We recognize that there are uncertainties in the methodologies to link particular emissions levels and consequent atmospheric concentrations of greenhouse gases to particular climate outcomes (temperature rises); and in the ways in which emissions budgets might be fairly allocated between countries. We therefore reiterate that the Bill should require the relevant advisory body to provide its advice on what would constitute a fair and safe cumulative budget for Scotland, through to 2050, so as to enable Ministers to take this factor into account when setting targets.

Q2 The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

What are your views on the setting of targets in batches from 2010 to 2022?

The need for early and significant emissions has been demonstrated both scientifically and environmentally, as well as economically by the Stern review. In light of this, and as Stop Climate Chaos Scotland has argued, annual targets need to be set to at least 3% from 2010. Without this safeguard, the Bill runs the risk of back-loading effort, postponing action, and failing to ensure emissions are kept at a safe cumulative total.

Friends of the Earth Scotland does however support the setting of annual targets in multi-annual periods, with appropriate legal constraints established by the Bill, as this provides the flexibility through which to revise targets upwards in light of the latest science. The setting of annual targets in multi-year periods should therefore remain, so long as it is implemented alongside a requirement that annual emissions reductions be at least 3% from 2010 and a duty to ensure that the annual targets are compatible with the delivery of a fair and safe cumulative budget.

However we fear that the periods proposed in the draft Bill have two flaws. First, the Bill proposes that the first batch of targets is set in June 2010 – half way through the first target year. This seems to build in an excuse for missing the first annual target (or, if not missing, for setting a weak target). Second, the 12-year period set for the first batch is too long to enable Ministers to respond swiftly to the latest science – notably that of the next major IPCC assessment, the fifth assessment report, expected in 2014.
Friends of the Earth Scotland would advocate that subsequent to an initial one-year target for 2010, set as soon as possible, annual targets should be set covering periods of 4-5 years. They would however have to be set with regard to a fair cumulative budget. Ministers would therefore be able to set annual targets of their choosing so long as:

- each was above the basic 3% baseline; and
- each had regard to the cumulative budget as recommended by the advisory body
- each had regard to an interim target of 50% by 2020

This would have the advantage of ensuring business and other important sectors are aware of the scale of emissions required (at least 3% per annum), while Government would have the tools to adjust targets upwards if needed. We believe this appropriately bridges the gap between flexibility and certainty.

Q3 The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

FOES believe failing to ensure cuts of at least 3% between now and 2019 runs counter to the purpose of the Bill in setting an effective framework to cut greenhouse gas emissions at a national level. It therefore also runs counter to ensuring Scotland plays its part in contributing to a global effort to prevent dangerous climate change.

A Bill that does not ensure emissions reductions of at least 3% from the start would fatally damage the claim that Scotland was leading on climate change. With the world waiting on a deal in Copenhagen, both developed and developing countries are looking to Scotland to see what can – and will – be done. Annual emissions reductions of at least 3% throughout would demonstrate this leadership; a Bill that only provided 3% per annum from 2020, and delayed significant action in the meantime, would not.

Rather than delaying serious action and relying on administrations from 2020, annual targets of at least 3% should be on the face of the Bill from 2010. This would have the benefit of providing the framework for the ‘easy wins’ - policies that pay for themselves over a short space of time – such as action around energy efficiency, to be implemented straight away. These have the added benefit of multiplying up into large savings against the cumulative budget if carried out promptly. Research from the OECD suggests significant action is perfectly achievable with cuts in energy use in the region of 10-15% over 2-3 years – both in the fields of energy and transport - being achieved in countries and regions such as Sweden, New Zealand, Brazil and California.7

We do not accept the argument that it will take up to a decade to reach the necessary sustained rate of emissions reduction, and do not see adequate reason to claim that significant cuts cannot be made promptly. The previous Scottish Executive introduced plans to contribute to a goal of Scotland cutting emissions in the period up to 2010 by 1mt-C more than a ‘Scottish share’8, and businesses have continued to develop and improve emissions saving technologies and techniques in response to UK and Scottish policy measures. We are not starting from a blank sheet, but from a position in which accelerated and widespread deployment of existing solutions – especially relating to efficiency - can be achieved rapidly with the necessary political will and relatively small additional expenditure9. Moreover Scottish Ministers enjoy wide-ranging executive powers, and have the opportunity to establish others in the present Bill, to be able to accelerate rates of emissions reduction. For instance powers to introduce road-user charging are available to Scottish Ministers, and could be implemented well before 2020.

We would also here like to comment on the criteria that Ministers will be expected to take into account when setting targets under the Scottish Climate Change Act.

In particular we are concerned that, among the long list of factors ministers have to take into account 4(4), all measures are given equal weight. We believe that science should be the over-riding factor and primary driver in the setting of annual targets. This was the rationale behind the Bill’s introduction and should therefore be the rationale behind the annual targets set. As a result we believe the long title of the bill should make direct reference to the intention of the Bill in avoiding dangerous climate change.
Additionally, we have concerns about the process in which annual targets are set. While Ministers have to take advice from the advisory body before setting annual targets, that the Bill appears to envisage Ministers initially proposing targets on which the relevant body then comments (see section 22). In order to ensure that targets are science based and avoid political framing, we believe that the process should re-ordered with the relevant body first providing advice, including recommendations on the appropriate targets, and Ministers then determining the statutory targets in the light of that advice. This is in line with the UK process where the UK Climate Change Committee suggests targets, and Ministers then respond with their decision.

Q.4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

As stated in the policy memorandum, the main purpose of a climate change Bill should be to reduce Scottish emissions by 80% by 2050 (or, as FOES might phrase it, playing Scotland’s part in tackling climate change by keeping within a fair cumulative total of emissions). We recognise and welcome the aspirations expressed by Ministers to avoid the use of traded credits to fulfil their obligations. We also acknowledge that the definition and creation of the net Scottish emissions account is probably necessary to account properly for the traded sector (those operations in Scotland able to buy and sell EU ETS credits). However we believe the Bill must introduce measures to ensure that domestic action predominates over the use of credits, or else risk not fulfilling its overriding objectives.

Friends of the Earth Scotland believes that the best way to implement Ministers’ welcome aspirations in this respect is to set a ‘domestic effort target’ as part of the mechanics of delivering the Bill’s objectives. A legislative cap or limit on the number of credits that can be bought by Scottish entities might be open to legal challenge by bodies in the traded sector. An effort target would not.

The Bill should establish such a target (defined in terms of the proportion of the total annual reduction achieved which has resulted from domestic effort), and require Ministers to report on it in tandem with reports on annual targets, and to present compensatory measures if it is breached (as with annual targets).

The domestic effort target should be set at a level which reinforces and buttresses the effects of the EU Emissions Trading Scheme (ETS). FoES suggests it should begin at the level of 80%, and be progressively increased to reach 100% by 2040. This follows the reasoning set out by the UK Climate Change Committee that, as 2050 approaches, no countries will have credits for sale, and all effort will need to be domestic. The Committee’s recent report stated that: ‘The majority of the 80% cut will in the long term need to be achieved via domestic action’.

The purposes of such an approach are two-fold. First to ensure that the economic benefits of action to cut emissions are realised within the Scottish economy, and second to minimize the extent to which credits generated outside Europe - and legally allowed into the ETS, despite their questionable quality – are used by Scotland. Researchers at Stanford University recently estimated that as many as two thirds of projects paid for through the Clean Development Mechanism (CDM) would have happened anyway. Moreover, there is a significant body of research identifying negative social impacts arising from projects designed to generate credits.

The UK Climate Change Committee recommended a limit of 10% on the number of overseas credits the UK Government can buy directly. This is welcome advice, yet it pertains only to those domestic sectors not operating under the European emissions trading scheme (EU ETS). Given that the EU Climate package, agreed in December 2008, allows up to 50% of the traded sector’s emissions reductions to be met through the CDM, and given that the EU package is not of a sufficiently ambitious trajectory (either of that required or that of the Scottish and UK Bills); FOES are calling for the ratio of effort to be substantially domestic across the whole Scottish economy.
In practice, if it seems likely that the target will be missed because businesses choose to buy more ETS credits, there are two routes open to the Scottish Government to rectify the problem. First, already identified as necessary for other reasons by the UK CCC, are measures to buttress the ETS and stimulate the traded sector to do more domestically (such as an emissions performance standard for new power stations). This will reduce the extent to which the ETS sector purchases credits through the auctioning process or from other registered bodies in the ETS. Second, is to take opportunities to increase effort elsewhere in Scotland, outside of the traded sector, such that the overall balance meets the target.

While we acknowledge that additional emissions savings within the traded sector could be bought up in the form of credits by other European countries, domestic action would have significant benefits for Scotland and further afield. In particular it would:

- allow Scotland’s unique renewables potential to be fully harnessed
- place Scotland at the forefront of the move to a low-carbon economy
- demonstrate leadership at both a European level – by demonstrating that significant cuts need to be made in all sectors of the economy by 2020; and internationally - given climate science dictates the developed world has to reduce its own emissions as well as fund green development in the South.

We believe this is not only desirable, it is also entirely possible within the parameters of the Scottish Climate Change Bill. The Bill already provides for the measurement of net Scottish emissions (not including credits) and the inclusion of credits in the net emissions account. It is therefore easy to present these figures as a ratio, which represent the share of domestic effort. This will allow Ministers to report on - and implement policies that ensure - the majority of Scottish emissions reductions are actually made in Scotland.

**Q5** The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

**What are your views on this definition of Scottish emissions?**

Friends of the Earth Scotland are concerned about three issues in relation to the definition of ‘Scottish emissions’.

Firstly, we are concerned that, as drafted, international aviation and shipping emissions are not actually included within the targets set by the Bill. Instead, the Bill makes provision for Ministers to include emissions from international aviation and shipping 'by order'. This harms credibility and could delay practical action. Given the scale and rapid growth rates of emissions from international aviation and the sheer scale of emissions from international shipping, it is vital that these emissions are included in the annual and long-term reduction targets on the face of the Bill.

Aviation is the fastest growing source of greenhouse gas emissions in the UK. Globally, one in five flights departs from or arrives at a UK airport. In 2005 aviation accounted for 6.3 per cent of total UK CO2 emissions. In Scotland the figure is 2.4%, and rapidly growing (at an average of almost 8% per year for the decade to 2006 and over 10% a year from 2004 to 2006). However, due to the extra warming effects of non-CO2 emissions released at high altitude, aviation’s real contribution to climate change is probably closer to 15-20 per cent. The Tyndall Centre for Climate Change has predicted that unless government policy changes, CO2 emissions from UK aviation will more than double by 2030 and treble by 2050. By 2050, aviation could be responsible for over 30 million tonnes of CO2 a year, meaning that to deliver an 80 per cent reduction every other sector would have to reduce emissions to zero.

According to a recent UN report, international shipping accounts for an estimated 4.5 per cent of global GHG emissions. This is more than double the amount previously reported by the International Maritime Organisation. Projected growth rates mean that unless measures to reduce emissions are introduced, world shipping could see a 72 per cent increase in fuel consumption and consequent emissions between 2000 and 2020.
It is entirely practical to include these emissions from the outset. There is no need to wait until international agreement on apportioning emissions is reached, as states are currently required to report international aviation and shipping emissions as a 'memo item' under the terms of the Kyoto Protocol, and do so using internationally agreed International Panel on Climate Change (IPCC) guidelines.27 The UK GHG inventory now uses the most accurate IPCC methodology to calculate international aviation emissions; however international shipping emissions are based solely on fuel bunker sales,28 and therefore underestimated in the inventory as relatively little fuel is sold in the UK. In the long term a more robust methodology based on consumption should be sought to ensure that Scotland does not simply export emissions.

The Bill should include emissions from international aviation and shipping based on data from the recently available regionally disaggregated International Aviation and Shipping Emissions 1990-2006 GHG Inventory, but include provisions to allow for revised methodology to be sought and used. Failure to include emissions from international aviation and shipping from the outset of the implementation of the Bill – as inclusion by order risks – undermines the credibility of the entire framework.

It has been suggested by some that IAS emissions should not be included. Two contradictory reasons have been suggested – first that Scotland lacks the devolved powers to affect such emissions; and second that including such emissions would disadvantage the Scottish economy (presumably because of the delivery of effective measures to reduce air travel and shipping).

Neither argument is valid. Scotland can influence emissions through – for example - planning powers relating to airports or ports, and the surface travel links to them, and through public education and other measures, ranging from the promotion and marketing strategy of Visit Scotland, to government policy on travel by civil servants. In this respect international aviation is little different to energy generation and use, where key powers are reserved, yet others devolved – and no one has seriously suggested that we could tackle climate change without including energy sector emissions!

The idea that measures to reduce IAS emissions would harm the Scottish economy is based on a misconception that Scotland gains more from incoming visitors, than outgoing Scots spend elsewhere. The available comparative evidence suggests that the net balance of economic activity is strongly negative.29 Even though the currently weak pound might temporarily reduce this effect, the conclusion to be drawn is that further indiscriminate increases in air connectivity to Scotland would further damage our economy; and that measures to discourage non-essential aviation would clearly benefit the economy.

Secondly, Friends of the Earth Scotland believes it is vital to ensure that in reducing emissions from domestic sources, Scotland does not simply export its emissions. Therefore, we would like to see included in an alternate definition of Scottish emissions, calculated on the basis of Scottish consumption (adding emissions associated with imports, and subtracting those associated with exports). This would help demonstrate international leadership in establishing valuable foundations for future international climate negotiations, particularly with China, a country which is legitimately concerned about being expected to take full responsibility for emissions associated with products exported for consumption elsewhere (accounting for fully one third of China’s total emissions according to recent reports)30.

We agree that the Bill’s targets should be defined according to production emissions, but that in addition, Scotland should develop and report on full annual consumption side accounts for GHG emissions. While consumption and production figures are relatively close at present, it seems plausible that this could change, especially as North Sea oil and gas activities decline and import trends continue. The development of consumption side accounts would ensure that we were promptly alerted to any future increase in ‘exports’ of emissions; and would help clarify how changes such as the closure of Ravenscraig genuinely affect emissions.

This would provide a massive step towards proper accountability for GHG emissions. In economic policy, national income is calculated both by production and consumption, and the difference is a critical check on the balance of trade. This is not considered a duplication of effort but a valuable tool in economic understanding, policy making and accountability.

Thirdly and finally, as noted above, we are concerned that despite the definition of ‘Scottish emissions’ the use of the ‘Net Scottish emissions account’ to measure progress against targets means that inadequate domestic emissions reductions may be hidden by increased use of credits. As proposed above, a domestic effort target should be incorporated into the Bill to avoid this risk.
Q6 The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government’s approach to obtaining independent, expert advice on climate change?

Friends of the Earth Scotland supports the collective view of SCCS that the Scottish Government should establish a new Scottish Commission on Climate Change to advise it on emissions targets and budgets from the start. Constitutionally, politically, socially, economically and environmentally, Scotland’s specific circumstances make it imperative that the Scottish Government be able to seek advice from and be held to account by an independent, arms length body.

The provision of effective independent advice is essential to the functioning of the Bill. In this evidence, under question 3, we have already raised concerns about the way advice is sought.

The Bill should therefore establish a Scottish Climate Change body with duties to advise Ministers, Parliament and as appropriate, any monitoring body or bodies appointed under the Act, on:

- the current scientific understanding of appropriate targets, and the distribution of effort to deliver them (including between sectors), carbon budgeting, policy options, reporting standards,
- the scale of Scotland’s fair cumulative budget, and compatible annual targets (see previous answers regarding a cumulative budget)
- any tightening of the proposed domestic effort target;
- whether public bodies were effectively fulfilling duties imposed on them within the Bill

Q7 The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

Friends of the Earth Scotland believes that stringent annual reporting to Parliament is an essential component of a strong Bill, and welcomes the reporting duties the Bill places on the Scottish Government. However, we share the collective view of SCCS that these can be further strengthened – in particular by making certain reporting duties under Part 3, section 30, subject to affirmative procedure. We also believe the reporting duties should include detail on key measures such as energy demand reduction, and parallel consumption side reporting (see answer to question 5 above).

We are also concerned that the effectiveness of the reporting regime may be hampered by delays in obtaining up-to-date information. However, as GHG emissions grow in significance to the economy we can expect enhanced investment in measuring and accounting for them. The Bill should provide for powers to tighten the deadlines for reporting in line with improved procedures in data gathering and provision. The relevant advisory body should be mandated to advise when such changes would be required.

Q8 The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?
Friends of the Earth Scotland believes it is crucial that the basic provisions set out in Part 4 of the Bill relating duties on public bodies should be implemented from the start. The IPCC’s 4th assessment report demonstrates the need for early action – with their estimate that global emissions will need to start declining by 2016. The Turner Committee report is based on the same aspiration yet expects developing country emissions to continue to increase for some years: the reductions in developed countries such as Scotland therefore must be rapid and significant. In this context the wait and see approach that relies on ‘hope’ to ensure public bodies start delivering emissions reduction targets in line with the Bill is simply not sustainable. The unnecessary delays implied by using secondary powers and further consultation could seriously hamper the delivery of the Bill’s aims. We strongly support a general duty on public bodies to reduce their emissions annually in line with the national targets and report on the progress made.

The mechanisms foreseen by the Bill to ensure delivery of any public duties are weak. We believe that the advisory body should be given a remit to refer a public body to the monitoring body for investigation of its compliance; and that a public body failing to comply must – like ministers – provide a report of the new and additional measures it plans to achieve compliance.

Further, we believe the Bill should provide enabling powers to establish more specific duties on public bodies, and in particular, like other SCCS bodies, we support amendment of the Bill to ensure that specific powers to establish financial incentives for public bodies - through the setting and (re)allocation of carbon budgets with commensurate financial transfers between public sector budgets - are available as an option for Ministers.

This would ensure that Ministers could adopt effective measures to ensure delivery of public duties. In this context we would refer to our recent joint report with Oxfam on models for a public sector climate fund which explores how such an approach might be implemented. This proposes that the Bill divides up responsibility for all Scottish emissions between Government portfolios, local authorities and public bodies, and that Ministers establish a fund to create a mechanism for incentives and sanctions to reduce emissions. Government departments, local authorities and public bodies would be allocated an annual emissions allowance for the sectors for which they are responsible: bodies emitting more than their allocated share would make a payment into the fund proportional to the extent to which they had exceeded their allowance; however, bodies could also bid into the fund for support to cut their emissions.

While ideally public bodies would meet their targets every year, any revenue raised from financial sanctions would provide an additional resource pool for public bodies to bid into for assistance in making further emissions cuts. Though the fund would require pump-priming from Government initially, the circular flow of incentives and sanctions could make the fund self-sustaining over time.

A Climate Fund could also be used to compensate the international community for the damage done by any failure to meet targets, proportional to the extent to which any allowances were exceeded. Any compensation paid would be in addition to existing overseas aid budgets and reserved for mitigation and adaptation measures in developing countries. This would help mainstream principles of ‘climate compensation’ within public policy and, at a time of crucial global climate talks, demonstrate genuine international leadership and solidarity for those worst affected by climate change.

In addition to implementing a general climate change duty on public bodies, and providing enabling powers to introduce others, such as a public sector climate fund mechanism, a list of specific duties for public bodies should be drafted in the event that public bodies do not meet their general duty. This could encompass measures such as the adoption and meeting of energy demand management and efficiency targets, a tightening fleet average emissions limit for public bodies’ vehicle fleets, a limit on use of domestic aviation by public sector staff and a requirement to use procurement powers in ways which support emissions reductions. While prescriptive, and we would favour a general duty under which public bodies can choose their own emissions reductions policies, a list of specific duties could be used as back-up in the event that public bodies fail to meet their general duty.

Q9 The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on this proposal?
Friends of the Earth Scotland supports the collective view of SCCS that while Ministers should be required to produce a report on their Adaptation Programme for Scotland, the Programme as detailed in the Bill will not be adequate to deal with Scotland’s adaptation needs.

We also endorse Scottish Environment Link’s proposals on adaptation, that the Scottish Government should produce a Scottish Adaptation Programme every three years including an assessment of the impacts of climate change on Scotland; Scottish Government adaptation objectives; proposals, policies and timescales for meeting these objectives; and key indicators to measure progress by. Scottish Ministers should be required to report annually to Parliament on its programme for adaptation. The Bill should ensure that Scottish Ministers are obliged to seek independent assessment of their progress on implementation of their adaptation programme at least every two years; and to report annually to Parliament on progress.

Q10 Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are your views on this proposal?

FoES endorses the Scottish Environment Link view on muirburn.

Q11 The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

FoES supports the proposals for renewables joint ventures. We believe this would help with developments relating to biomass, small hydro-power and other renewables and is not controversial.

However, we do not believe that the other main proposal - to lease off a chunk of the forest estate for commercial logging, and use the financial returns to extend the forest area - has been properly evaluated. It appears to assume that the private sector can make the forests more profitable than Forestry Commission Scotland (FCS), and carries risks to the sustainable management of the estate. This might be the reason profit rates could be raised by such a transfer. It has not been made clear whether lessees would be bound by UK Woodland Assurance Standards standards, and it is also possible that they might be able to claim Scottish Rural Development Programme grants that the Forestry Commission Scotland can't. This would not only reduce the money available for environmental land management elsewhere, it would also mean the state was paying indirectly for the higher profit rate. Overall this appears an unnecessarily complex approach.

Secondly, and critically, the carbon saving claims for Scottish forestry at large are still poorly substantiated. We would be concerned that this approach would raise emissions in the short term (from commercial harvesting, and new planning on organic soils), and not deliver as large a sink as anticipated. We welcome additional appropriate woodland planting for all sorts of reasons (enhanced biodiversity, hydrology, recreation etc) but are concerned about the validity and accuracy of counting it against national carbon targets regardless of current Kyoto rules. The Carbon Accountability Project (hosted by FoES, see www.carbonconfidence.org.uk) is examining the quality of carbon claims for landuse change in Scotland amongst its early projects. While, on balance, new Scottish forests would probably be a carbon sink, how great, how sustainably, and over what timescale are still too uncertain to reliably count towards our targets.

However, although new forests planted by a not-for-profit trust might be good for biodiversity and landscape, the large areas of leased forests would probably see harvesting and replanting of exotic conifers on a large scale. Private companies will not want to lease the most marginal upland forests, and if they are not allowed to lease forests of major recreation and biodiversity value; the replanting they undertake will be mainly in the broad swathes of mid-altitude forestry away from towns and cities.
Thirdly, we would question whether these arrangements are the most effective way of moving towards the desired outcomes. Putting FCS under a clear climate change or broader sustainability duty, may be a better way of ensuring the forest estate is managed to maximize climate change benefits. This could require them to take a number of actions which might include: requiring FCS to restore peat bogs where that is better for carbon management than planting trees; manage forests to produce construction grade timber to replace carbon intensive steel and concrete in construction; and, where appropriate, buy new land for afforestation.

In light of this we support LINK’s view that the forestry leasing proposals should be withdrawn from the Climate Change Bill and analysed in their own right as part of a land use action plan. This would allow proper debate around the role of forestry and other measures related to land use change that would properly, and accountably, help reduce Scotland’s net emissions; and ensure that there was no risk that other welcome measures within the Climate Change Bill were sidelined while the forestry proposals are used as a political football.

Q12 The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?

FOES support the proposals to produce an energy efficiency action plan for Scotland. Frustratingly, a plan or strategy on this issue has been promised since 2004 and is yet to be delivered. Within the Bill there is little detail on what this plan may entail, although the policy memorandum contains more information. Given the massive potential for both carbon and monetary savings from energy efficiency, this action plan must be of the strongest and most comprehensive nature. In particular, the Bill must require Ministers to establish targets for energy conservation and energy efficiency in Scotland as a whole, and for those sectors with the highest gross energy consumption and greatest intensity of energy use. The targets and plans must include use of energy for transport and heat, and not just electricity. The plans must provide specific and separate measures for energy efficiency in both existing and new buildings. FoES believes that such plans should ideally be rooted in a statutory energy hierarchy which sets targets for demand management, energy efficiency, renewable and decentralized energy. Progress against such targets should be reported as part of the Bill’s annual reporting provisions.

The Bill should also require Ministers to establish measures to require local authorities and other public bodies to establish enforceable energy demand reduction targets, and to adopt plans for their delivery.

While recognizing that the Bill broadens the scope of an efficiency action plan beyond that required by section 179 of the Housing (Scotland) Act, we are concerned that the Government intends to repeal section 179 of the Housing (Scotland) Act. This requires a strategy for improving the energy efficiency of living accommodation. The Scottish Government’s proposals, in the present Bill, are weaker, given that section 48 of the Bill merely requires ministers to ‘prepare and publish a plan for the promotion of energy efficiency in Scotland’. From our point of view, this wording is neither as ambitious nor as prescriptive as that in the Housing Act. Our preferred solution is for a wording which meets the higher ambitions of ‘improve’ applied across the breadth of sectors foreseen in the present Bill.

We are also concerned that microgeneration is not included in the provisions of this section (apparently because of legal advice34) despite the Bill defining energy efficiency broadly to include ‘the use of technologies reliant on renewable sources of energy’ (Section 48 (8) (a)).

Microgeneration should be included, and specific provisions made to require that Ministers issue or revise planning guidance so as to facilitate the installation of microgeneration technologies, and in particular to require a minimum contribution to building energy demand from microgeneration in all new construction. This would help establish a firm market for Scottish manufacture and installation of microgeneration technologies.
This section of the Bill is also the appropriate place to resolve an outstanding shortcoming of Scottish law in respect of the promotion of energy efficiency and microgeneration. Where English and Welsh local authorities can offer a one-off discount or rebate from council tax to households installing efficiency or microgeneration, there are no similar enabling provisions in Scotland. Given the SNP has postponed any attempt to reform the local taxation system it is no longer appropriate to wait for such a reform bill to introduce such powers. **The Bill should therefore contain enabling provisions to provide rebates from council tax to households installing efficiency or microgeneration.** Similar provision is merited for business rates for small businesses.

Q13 The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government’s thinking in this area.

**What are your views on this approach?**

While FOES welcomes proposals to make regulations for the assessment of the energy performance of non-domestic buildings **we would like to see these enabling powers extended to domestic buildings; and powers provided to compel building owners to adopt all recommendations included in a performance certificate within a specified period, or at a minimum, before resale or leasing of the property.**

We advocate provision for an enhanced system of building labeling, linked to funding for upgrading to improve standards, which ensures that progressively it becomes impossible to sell or rent a substandard building, with the benchmark to be achieved progressively rising over time.35

Within the proposals discussed in the policy memorandum, there is a wide range of scenarios proposed. Extended across all buildings, Friends of the Earth Scotland would support measures that extend the scope of Energy Performance Certificates (EPCs) to take account of operational ratings. We would also support measures that require owners to formulate cost-effective action plans relating to their enhanced EPCs and ensure compulsory uptake of recommendations over time. Without both these measures, applied across domestic and non-domestic buildings, the proposals suggested fall short of delivering rapid and substantial contributions to climate targets.

Q14 The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

**What are your views on this proposal?**

We welcome the recognition that heat is a major issue in Scottish emissions. Around half of all primary energy use in Scotland is for heat. We support measures to reduce heat waste, such as combined heat and power and district heating, to improve the efficiency of heat use, and to produce heat from renewable and sustainable sources. We are concerned that – perhaps because of uncertainties in the UK regime for heat – the Bill only includes some very vague and general enabling powers. **We would support the inclusion of heat in the demand management, efficiency and microgeneration action plans, with explicit targets.**

However we are particularly concerned at the implications of the exclusion of all waste materials from the definition of fossil fuels (in Section 48), which deviates from previous practice in thereby designating non-renewable waste materials such as plastic as a ‘renewable source’ for energy (or heat) generation. **Friends of the Earth Scotland strongly opposes excluding all waste materials from the definition of fossil fuels**, as it would result in increased greenhouse gas emissions from the replacement of waste materials used for energy. In fact even biomass wastes such as paper, card and wood are typically better recycled – in climate terms - than used as energy sources. However we would accept the inclusion of uncontaminated, fully segregated biomass wastes as a renewable resource, and encourage their use for heat generation where recycling is impractical.
The use of waste as a “renewable” fuel directly conflicts with the attempts to reduce CO2 emissions. Incinerator technologies typically emit almost a third more CO2 than coal fired power stations per unit of electricity produced. However we support promotion of anaerobic digestion as the preferred approach to generate energy from biodegradeable wastes, as being the least harmful thermal technology to human health and climate change emissions.

Q15 The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas:

- Waste prevention and management plans;
- Waste data;
- Deposit of recyclable waste;
- Procurement of recyclate;
- Reduction of packaging;
- Deposit and return schemes;
- Charges for carrier bags.

What are your views on these proposals?

Waste prevention has a critical role in delivering a zero waste Scotland, yet to date has received very limited focus. We welcome many of the proposals within the Bill as they should help move action up the waste hierarchy. We have previously provided detailed views in our response to the zero-waste consultation paper, and merely summarise those views here.

Friends of the Earth Scotland therefore supports the development and implementation of requirements for site waste management plans and the establishment of mechanisms to support enforcement. Where plans are not implemented, within reason, SEPA or relevant local authorities should be permitted to undertake remedial action and charge for it at a penalty rate. The regulations should empower the setting of reporting provisions and standards. The establishment of such a plan should be a requirement at the planning stage for new developments. Specific requirements should perhaps be designed for those sectors that generate waste in the largest volumes (mineral and mining; agricultural and construction).

With regards to waste data, if business is to manage waste it must measure it. In addition, improved data on waste arisings can better inform policy and infrastructure decisions which will improve recycling and waste prevention in the business and commercial sectors. A statutory duty on businesses to report on their waste arisings would support SEPA and Government in developing and implementing waste and resource policy aimed at achieving a zero waste Scotland.

We would also support statutory targets on retailers for reducing packaging, improved powers to enable the public to more readily challenge excess packaging and legislation to require that packaging materials are taken back by retailers for reuse/recycling. The regulations must be readily enforceable by SEPA. Civil penalties may be preferable, as long as such a regime is used to ensure that penalties reflect the retailer’s ability to pay, rather than to enable fixed penalties of limited deterrent effect.

Furthermore legislation should also specify the requirement to use recycled materials, identify the extent of materials covered and enable a phased increase in the proportion of recycled material over time. In addition legislation should set out how these commitments are to be enforced. We are aware of voluntary approaches to stimulate specification of recycle in public procurement that WRAP have developed and support these being strengthened through legislation. Ensuring requirements for both public bodies and businesses to procure in this manner would help significantly increase the impact, and stimulate the supply chain. This would give considerable support for closing the zero waste “loop”, and ensuring demand for recycled material.

Regarding charges for carrier bags, countries that have implemented charges have delivered 70-90% reductions and voluntary measures no more than 25%. We remain convinced that the most effective way of cutting carrier bag usage would be through a plastic bag levy or ban, as has proved effective in Ireland. However, we would encourage powers to be drawn in broader terms to cover a full range of single-use, disposable products, of which plastic bags are perhaps the most obvious example.
There is also significant community support for reduction in use of single-use plastic bags. Friends of the Earth Scotland has seen this clearly demonstrated from our delivery of the CREW project, which included several plastic bag free community campaigns across the country.

Q16 What are your views on the adequacy of the Scottish Government’s consultation in advance of publishing the Bill?

Friends of the Earth Scotland are disappointed with the lack of effort the Scottish Government made to engage with communities and individuals around Scotland. This will probably hamper the Government in implementing the provisions of the Bill, and subsequent action plans which will require wider public engagement to deliver behaviour change, and to ensure support for the necessary major infrastructure developments in transport, and energy generation and transmission. In this respect we are gravely concerned that the similar lack of wide public engagement in the preparation of the National Planning Framework could hamper the delivery of projects important for climate protection in the future.

The delivery of the Bill’s climate targets will depend on effective outreach and engagement backed by effective social marketing to ensure that there is broad support for restrictions on climate damaging ‘anti-social’ behaviour, in the same way as broad support for challenging health improvement restrictions (such as the ban on smoking in public places) was achieved.

It is telling that despite the limited outreach, over 20,000 people responded to the consultation, a response rate second only to that of the consultation on the Smoking Bill over which the Government made considerable effort to engage with the public.

In light of this high response rate – achieved largely on the back of work by NGOs including Friends of the Earth to inform and engage the public with the process – it is disappointing that the Government apparently chose to place a lower value on responses received from individuals using or adapting text provided by NGOs.

We also feel that the consultation document could have been clearer and consulted more on general principles, and on matters of public concern. We note in particular that there was no consultation question on the inclusion of international aviation and shipping emissions.

Q17 Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government out on the consultation proposals?

As is typical of SEA practice, it delivered limited quantified analysis of the benefits and impacts of the programme. While in this case it is difficult to envisage the Bill programme having a net negative environmental effect, FoES believes that SEA procedures should be tightened in this respect. Indeed it would be appropriate, in our view, for the Bill to amend the SEA Act to require quantification of any significant climate effects identified in SEA practice.

Q18 Does the Bill raise any equalities issues you would wish to highlight?

Climate change impacts upon the poorest hardest. Poverty increases people’s exposure to the adverse effects of climate change, and poor communities are the most vulnerable, even though they have minimal responsibility for creating the problem. Between 2000-2004 262 million people were affected by climate disasters annually. 98% of these were in the developing world.37

Fundamentally the aims of the bill would reduce inequalities between Scotland and poorer developing countries, and benefits those disadvantaged groups already suffering from the impacts of climate change and sea-level rise. However the pursuit of climate targets could have unintended international consequences, such as those being seen at present with biofuels production increasing food scarcity and human rights abuses.
Within Scotland unintended consequences could foreseeably impact disproportionately on the elderly, or those with disabilities: if for example, measures to reduce domestic energy use led to increases in fuel costs faced by the fuel poor; or measures to reduce car use (such as road user or parking charges) failed to provide exemptions for those with disabilities. In addition, increases in flooding in Scotland could adversely affect our poorest communities, who are less able to pay for insurance and the costs associated with flood damage or displacement from their homes. The Bill may therefore need to make provision for appropriate compensation if such impacts arise, and should include a sustainability duty to ensure that the choice of measures to deliver the Bill's objectives minimises the risk of such consequences.

Q19 Do you have any comments on the impact of the Bill on sustainable development?

Global sustainable development must be an underpinning principle of the Bill. In light of this, FoES supports Stop Climate Chaos calls for sustainable development to be acknowledged in the long title of the Bill. It should be noted that this has a precedent given the Flood Risk (Scotland) Management Bill is set to be amended to include 'a more specific reference to sustainability in the Bill's long title'.

SCCS further believes that the Climate Change (Scotland) Bill should place a duty on the Scottish Government to ensure that any mitigation and adaptation efforts contribute to the furthering of sustainable development and ensure the avoidance of negative social and environmental impacts; either within Scotland or in the developing world. Such a duty would help ensure that the massive potential of the Bill to contribute to sustainable development could be realised.

Q20 Do you have any other comments on the Bill?

Friends of the Earth Scotland is keen to ensure that the provisions in the Bill are implemented effectively. We propose that, as in England and Wales, the courts be given a role. Ideally the courts should be given an effective preventative role – an opportunity to use their powers to quash Ministerial decisions on issues such as future targets or budgets, or projects or programmes that were likely to lead to breaches of the targets. In doing so, the courts would have to be able to consider the merits of the matter, and in particular the relevant advice of the relevant Advisory Body. It would also be critical that access to the court was timely and affordable. Unfortunately, these three criteria, despite being established by the Aarhus Convention, are not met in Scotland at present.

Even judicial review is less easily accessible than in England and Wales where the courts have accepted the principle of ‘protective costs orders’ where such actions are taken in the public interest by voluntary organisations. These provide a guarantee that the threat of a punitive costs award cannot deter a legitimate action to seek judicial review. In Scotland new provisions are needed to ensure that affordable and merits-based access to justice is available in cases relating to the Bill’s objectives. This would ensure that public interest groups could seek a court ruling if Ministers were failing to comply with their duties under the Bill. Such provisions may not require primary legislation, but we would expect Ministers to commit to ensuring that the necessary provisions are brought forward.

As noted above, in our answer to question eight, FoES also supports provisions for effective financial incentives and disincentives.

Further, we believe that the discipline of Strategic Environmental Assessment for plans and programmes should be used to ensure effective scrutiny of the extent to which new plans and programmes are compatible with the Climate Bill’s objectives. The Bill should require Ministers who are minded to approve a plan or programme for which the SEA has identified significant GHG emissions to seek advice from the relevant body on whether and how the plan or programme can be made compatible with relevant annual targets, and if such a plan or programme is then approved, the relevant Minister should be under a duty to explain to Parliament what measures will be taken to ensure compliance with annual targets.

Fossil fuel power stations and an emissions performance standard

The Turner Committee report recommended further consideration of an emissions performance standard (EPS) for fossil power generation, as a means to help stimulate carbon capture and storage. FoES acknowledges that direct legislative competence in this area is not devolved. However administrative devolved arrangements give Scottish Ministers the power to set guidance for consents on such power stations. We believe the Bill should include provisions mandating Ministers to use their powers to define guidance under section 36 of the Electricity Act 1989 to introduce an EPS by a certain deadline.
Ozone Depleting Substances
Recent research has revealed the significant amounts of potent greenhouse gases currently stored in insulation foam blown with hazardous ozone depleting substances - principally found in steel framed buildings. In the UK as a whole the stock is equivalent to some 3-4 million tons of CO2 (and outweighs the volume of similar gases in refrigerators by 20:1). However, unlike waste refrigerators which are strictly controlled and the gases recovered, demolition wastes from these sources are not properly controlled. Consideration should be given to bringing these gases within the ambit of the climate change bill, to provide a solid base and incentive for proper controls.

Therefore Friends of the Earth Scotland’s priorities for the Climate Change (Scotland) Bill and concluding comments on the Bill, are:

1. The SCCB is the most important piece of legislation to come before Holyrood so far, and is very welcome. As it sets a framework for four decades of action we believe it is essential to get it as good as possible now.
2. The objective of the Bill must be to play a fair role in preventing dangerous climate change (more than 2°C warming) by reducing Scotland’s emissions in a sustainable manner.
3. The 2050 target of at least 80% is in line with current scientific advice, but may well need to be further tightened or achieved earlier. The advisory body must be empowered to advise of when and whether long term targets should be tightened.
4. In setting annual targets Ministers should be subject to the ‘minimum floor’ of at least3% per annum from the beginning (including the 2010-2019 period), and also required to be compatible with a fair and safe cumulative budget to be identified by the advisory body.
5. The interim target of at least 50% reductions should be met by 2020, not by 2030, to ensure early and rapid action in line with scientific advice, and deliver a fair and safe cumulative budget.
6. For reasons of equity and sustainable economic development, a target should be imposed that at least 80% of the effort to reduce emissions on an annual basis must occur within Scotland, with international trading minimised. The net account must therefore be constrained to reflect this. It also needs parallel consumption accounting to ensure that Scottish emissions are not reduced by off-shoring economic activity.
7. International aviation and shipping emissions should be included in Scotland’s account from the outset using existing Kyoto reporting methodologies, with powers to amend the methodology in line with international practice.
8. The Bill should include the necessary enabling powers to provide effective financial incentives for delivery (such as a public sector climate fund) and provide clarity that access to the courts to ensure justiciability over targets and their delivery will follow the principles of the Arhus Convention.
9. A duty on public bodies, to reduce emissions in line with national targets, and report appropriately, should be imposed and resourced from the outset. The Bill must ensure it is enforceable; and establish powers to amend it, or specify more detailed duties to help deliver targets.
10. Energy efficiency measures should be placed within a statutory energy hierarchy which promotes sustainable energy management and supply, and the objectives of the action plan should be in line with those in the Housing (Scotland) Act – to ‘improve’ efficiency, not just ‘promote’ it. The powers to regulate building improvements should be extended to all buildings, and include powers to require all identified recommendations to improve operational ratings.
11. The Bill should include a requirement to take such steps as necessary to deliver sustainable supply of renewable heat. The definition of renewables should exclude mass-burn incineration technologies, and prioritise heat management, efficiency and biogas from anaerobic digestion, in line with an energy hierarchy.
12. The waste management measures included in the Bill are all welcome, but fall short of a comprehensive approach to zero waste which would prioritise waste reduction, and seek to phase out incineration, and minimise energy-from-waste in preference to reuse and recycling which save more energy.
13. The proposals for joint venturing by the forestry commission are welcome, but those on leasing the estate are of questionable value. Measures to maximise climate benefits from forestry and upland land-use should be addressed in an integrated manner in a land-use strategy for Scotland. The Bill could usefully require Ministers to bring forward such a strategy, compatible with the CCB targets.
1 Living within a carbon budget’ (2006), available for download at: http://www.tyndall.ac.uk/publications/briefing_notes/Livingwithinacarbonbudget.pdf
3 The Tyndall Centre has identified a safe carbon budget for the UK of 4.6 Gigatonnes of Carbon Equivalent (Gt-Ceq) – equal to 16.9 Gigatonnes Carbon Dioxide equivalent - between now and 2050 (Bows et al, ‘Living within a carbon budget’, 2006). Crudely extracting this to a Scottish context, suggests a Scottish budget of 0.4 Gt-Ceq – or 1.47 Gt-C02eq

34 Cook, G (15 January, 2009), SPiCe Briefing, ‘Climate Change (Scotland) Bill’

37 UNDP 2007 World Development Report

In 2008 the Scottish Government consulted on its proposals for a Scottish climate change bill. Glasgow City Council’s approved response was submitted at that time. On December 4th 2008, the Climate Change (Scotland) Bill was introduced in the Scottish Parliament.

Glasgow City Council’s response to the questions raised in the ‘call for views’:

Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

We welcome the proposal. It is essential that the Scottish Climate Change Bill establishes a statutory target for at least an 80% reduction of greenhouse gases in Scotland by 2050, following the Kyoto Protocol basket of six gases and the target suggested by Intergovernmental Panel on Climate Change for Developed Countries (80%).

Q2 The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

What are your views on the setting of targets in batches from 2010 to 2022?

The action taken in the next few years is crucial to the progress in tackling climate change. Therefore statutory annual targets would appear to be more efficient in achieving the 50% target in 2030 and 80% in 2050. With the multiyear target, there is a risk that early inaction may compromise further progress and achievement of interim and long term targets.

Q3 The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

To achieve both the 2030 and 2050 targets, the bill must establish year-on-year reduction targets of at least 3% from the start. This will also ensure that Scotland fulfills its aspiration of providing an example of good practice to other countries.

Q4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

It is suggested that the priority of the Bill is to establish domestic emissions in Scotland and that international emissions credits are kept to a capped minimum.

Q5 The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?
The definition appears to be fairly comprehensive and robust. The inclusion of emissions resulting from shipping and aviation is a valuable measure.

Q6 The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government's approach to obtaining independent, expert advice on climate change?

The use initially of the UK Committee on Climate Change is supported. If necessary in the longer term would appear that the existing bodies, e.g. SEPA, SNH, could advise, monitor and scrutinise the implementation of the Bill.

Q7 The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland's emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

The statutory reports are welcome; those will ensure clear and concise monitoring of the process and actions being taken.

Q8 The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

Those measures are welcomed to ensure the action of public bodies is in line with national measures; however this can only be done with adequate funding support as well as guidance and capacity building.

Q9 The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on this proposal?

This action is welcome. Adaptation is an essential complement to mitigation action against climate change, rooting it in the bill will ensure that it will not be undermined.

Q10 Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are your views on this proposal?

This proposal is welcome. The muirburn season has already been changed by the Welsh Assembly and DEFRA to adapt to climate change, prevent soil erosion and water pollution. There should be an introduction of even stricter regulations concerning heather muirburn, particularly on blanket bogs, to prevent significant release of carbon through peat erosion.
Q11 The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

The proposal is welcome. The forestry plays a key role in addressing climate change both by absorbing carbon dioxide from the atmosphere and storing it in growing vegetation and soil, and as a sustainable source of wood – an alternative and less polluting energy source to fossil fuels, and a low-energy construction material. The planting strategy should aim to achieve a sustainable balance between the planting of exotic conifers for fast carbon uptake and native hardwoods for longer term capture and biodiversity gain.

Q12 The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioral change.

What are your views on this proposal?

It is a very relevant proposal. As the Stern Review indicates, by 2050, energy efficiency has the potential to be the biggest single source of emissions savings in the energy sector. The most cost effective way of reducing emissions is to use energy more efficiently. It can also improve productivity and can contribute to the security of energy supplies by reducing reliance on imported energy and ensuring maximum usage of energy resources.

Education is the key to promote behavioral changes, since these occur when attitudes change and for this to happen, individuals and groups have to be educated about the consequences of their actions to them and others, as well as alternative actions and their advantages.

Q13 The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government’s thinking in this area.

What are your views on this approach?

It is a relevant and welcome approach. Non domestic buildings are significant users of energy and producers of greenhouse gases emissions. Action to reduce carbon emissions will be needed in every sector of the economy, but clearly we need to focus first on the areas where we can make the most impact for the least cost. Most measures relating to buildings, such as retro-fitted wall and roof insulation, and use of condensing boilers, will actually save money - as well as saving carbon.

Q14 The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

What are your views on this proposal?

A significant amount of the final energy consumed in the Scotland is in the form of heat, the generation of which accounts for a great part of the national CO2 emissions.

The investment in renewable sources of heat such as biomass, micro generation and heat from waste will certainly have a positive impact in mitigating against climate change, while preventing fuel poverty.
Q15 The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas:

- Waste prevention and management plans;
- Waste data;
- Deposit of recyclable waste;
- Procurement of recyclate;
- Reduction of packaging;
- Deposit and return schemes;
- Charges for carrier bags.

What are your views on these proposals?

These proposals are extremely relevant, given that waste is a growing problem, and its appropriate disposal is a central part of the work to reduce the effects of climate change because of the impact it has on the production of Greenhouse gases. Landfill sites are fast filling up, and combined with the resulting greenhouse gases they create, the amount of waste produced and the way it is treated waste needs to be re-evaluated.

However such proposals need to be considered in light of the Scottish Government’s Zero Waste Policy and in the context of the revision of the National Waste Plan, which is due out for consultation in 2009. The Policy and Plan will allow a more formal consideration of the benefits and necessity of these proposed actions.

Q16 What are your views on the adequacy of the Scottish Government’s consultation in advance of publishing the Bill?

Adequate.

Q17 Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government out on the consultation proposals?

No.

Q18 Does the Bill raise any equalities issues you would wish to highlight?

No.

Q19 Do you have any comments on the impact of the Bill on sustainable development?

No.

Q20 Do you have any other comments on the Bill?

No.
Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

We believe the 2050 reduction target should be 90% by 2050 from 1990 levels to meet reduction in CO2 necessary to reduce to possibility of runaway climate change (see Tyndall Centre for Climate Research).

The interim target is a good idea in principle, but we have suggested that the 2030 target would be better set at 2020 as this would tie in with dates set in other international agreements and the UK Act.

In relation to the level of the reduction target, WWF figures state that the original manifesto commitment of 3% annual reduction targets would result in a 45% reduction by 2020 and a 60% reduction by 2030. Therefore, the interim target as it is currently set, would not deliver the required trajectory.

Q2 The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

What are your views on the setting of targets in batches from 2010 to 2022?

Only statutory annual reduction targets set so as to achieve 90% reductions by 2050 are acceptable.

We suggest that carbon budgets should be of four years in length to run alongside a Parliamentary term to ensure accountability, and that these budgets should be set two to three years in advance.

Q3 The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

This approach is wholly inadequate. There must be a statutory requirement for equal annual reductions starting from 2010, that are set to achieve 90% reductions by 2050. Likely to be about 4% per annum.

Q.4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?
The objective of this Bill should be firmly fixed on directly reducing the emissions which arise in Scotland. Therefore, there should be a limit on the number of international carbon credits Scotland uses to meet its annual targets. Stop Climate Chaos Scotland suggests the absolute minimum of reductions should be met through the purchase of carbon credits, a figure of 20% has been suggested by the NGOs.

**Q5** The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

Emissions from international aviation and shipping must be included in the definition of ‘Scottish Emissions’. We welcome the shift in the Bill which moved towards their inclusion.

**Q6** The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government’s approach to obtaining independent, expert advice on climate change?

Independent, expert advice is essential. In the SGP consultation response we supported the proposal to make use of the UK Committee on Climate Change in the short term. If a Scottish body were to take on this role it should be a new body with a remit explicitly focused on climate change. One problem with the current proposals is that Ministers, not Parliament, would appoint the Members of this new committee, which reduced its independence and credibility. It should be noted that the NGO responses were overwhelmingly in favour of establishing a new Scottish Climate Change Committee.

**Q7** The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

Our main concern with this section lies in the lack of sanctions and accountability. The Bill currently contains no consequences for Ministers who miss their targets. Given that they are responsible for their success or failure, Ministers need to know what will happen if they fail.

**Q8** The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

We believe it is important duties are placed on public bodies in relation to reducing their emissions. Local authorities in particular are key to delivering reductions in emissions. Guidance, support and sufficient finance from central government are crucial if LAs are to play their part.
Q9 The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on this proposal?

It will be impossible to ‘adapt’ to many of the predicted global impacts of climate change such as global food shortages or impacts on the Scottish economy such as from a collapse in tourism. This is why efforts must be focused on reducing our emissions and demanding that other countries do the same.

Q10 Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are your views on this proposal?

No submission.

Q11 The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

No submission.

Q12 The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?

This requirement is welcome as energy efficiency can be a rapid and cost effective way of reducing emissions. The recent Scottish Government report on Low Carbon Buildings contained much to be welcomed. However significant levels of Government investment will also be required to achieve the potential for energy efficiency in older buildings.

Q13 The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government's thinking in this area.

What are your views on this approach?

These provisions are welcome. The non-domestic sector represents a significant proportion of the built environment and therefore will have to be included to achieve even the 80% reductions currently proposed by government.

Q14 The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

What are your views on this proposal?
As a major proportion of energy demand is for heat it is vital that heat be generated from non-fossil fuel, renewable sources and that a scheme, such as ROCs for renewable electricity, to encourage this switch by the energy providers is developed.

Q15 The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas:

- Waste prevention and management plans;
- Waste data;
- Deposit of recyclable waste;
- Procurement of recyclate;
- Reduction of packaging;
- Deposit and return schemes;
- Charges for carrier bags.

What are your views on these proposals?

The handling and treatment of waste generates significant emissions. There is an opportunity to reduce this impact through waste minimisation.

Energy from waste is not a sustainable way of generating electricity. As well as generating CO₂ emissions, incineration burns useful resources that could otherwise be conserved or recycled.

Q16 What are your views on the adequacy of the Scottish Government's consultation in advance of publishing the Bill?

No submission.

Q17 Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government out on the consultation proposals?

No submission.

Q18 Does the Bill raise any equalities issues you would wish to highlight?

No submission.

Q19 Do you have any comments on the impact of the Bill on sustainable development?

If the provisions of the Bill are successful in starting to achieve the required reductions in carbon emissions, this will start us on the road to sustainable development.

Without a shift to non-fossil fuel based sources of energy and a reduction in climate changing emissions, development cannot be regarded as sustainable development. The bill is therefore absolutely key to achieving this aim.

Q20 Do you have any other comments on the Bill?

Climate change threatens the lives of everyone but its impacts can be reduced if greenhouse gas emissions are reduced sufficiently quickly. At present plans to reduce emissions globally are not sufficient to prevent runaway climate change. The UN negotiations in Denmark later this year may be the last chance to secure global agreement on reductions and avert catastrophe. It is therefore imperative that Scotland joins other countries in showing global leadership if there is any possibility of getting the non-industrialised world to cut greenhouse gas emissions sufficiently to avoid runaway climate change. This bill is our flagship climate change policy and is a vital piece of legislation. The Scottish Government must ensure that it is not only the best climate legislation in the world but that it does what it says on the tin. Presently, the lack of early targets is undermines the Bill.
Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050. What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

The Highland Council is satisfied with the proposed end target of 80% reduction by 2050 and the interim target of 50% by 2030. This encourages greater reductions in the first 20 years of the Bill and is in line with the Council's response to the consultation on the Bill.

Q2 The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive. What are your views on the setting of targets in batches from 2010 to 2022?

Setting targets in batches will be helpful and enable authorities to plan emissions reductions projects in line with government targets. Highland Council would urge the Scottish government to produce the secondary legislation and associated targets as soon as possible in order that effective programmes of work can be planned.

Section 2, subsection (2) states only that targets for each year must be lower than the previous year. For example, in 2010 the target set would be for emission levels lower than 2009.

Highland Council welcomes Section 4 of the Bill, especially subsection 4(f) outlining the need to consider the impact of the target on remote and rural communities when setting budgets. Some consideration of preceding weather conditions should be included in this section also. In the north of Scotland, a particularly cold and long winter may result in increased energy demand and associated emissions. This could lead to a target being missed and result in difficulty reaching targets set the subsequent year. Targets set by the 1st of June 2010 outlining annual emissions reduction up until 2022 will need to be flexible to take account of such anomalies.

In the original consultation on the Climate Change Bill, many questions were about budget periods and the banking and borrowing between periods. No reference is made to this in the Bill. Is the period 2010-2022 considered to be one long budget period from which banking and borrowing could take place? If so, it is felt that this timescale is too long to ensure continued downward trends in emissions reductions. Clarification of the process is needed.

Are targets going to be uniform across sectors and within sectors? In terms of local authority areas it is clear that certain areas will be able to capitalise on renewables or the availability of land for carbon storage, making targets easily within reach while other authority areas may struggle. Rural and northern areas may see greater emissions due to transport, geography and prevailing climatic conditions.

From the perspective of a local authority interim budgets set far enough in advance could allow capital programmes containing details of carbon emissions reductions to be prepared. Local Authorities carry out this work through their Carbon Management Plans which tend to run from 3-5 years as opposed to being updated annually. The budget periods proposed in the original consultation are preferable to the current proposed year on year targets included in the Bill.

The Bill contains within it the ability for Ministers to re-set any of the dates set in section 4, subsection 2. In order that early emissions reductions are achieved it is imperative that dates do not slip back, delaying action.
Q3 The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

It is difficult to comment on the effectiveness of such an approach without first knowing:

A. The % emissions reduction anticipated through carbon removal
B. The % of carbon offsets or international credits to be allocated
C. The success in achieving emissions reduction at 2020

Due to changing society and technologies and the influencing factors outlined in section 4, subsection 2 of the Bill, it is felt that a similar approach to that leading up to 2020 should continue. Monitoring progress and seeking advice before setting targets would be best.

If targets leading up to 2020 are to be lower than 3% per annum then there is some confusion as to how the 80% reduction by 2050 can be achieved. In order to reduce cumulative emissions, early action is needed and higher targets should be set in the first half of the Bill. This seems to be reflected in the overall interim target of 50% by 2030 however a breakdown of annual targets does not make it clear how it should be achieved.

Q.4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

In the Highland Council response to the initial consultation on the Climate Change Bill it was stated that:

"Including international credits to help achieve the target by 2050 is not felt to convey the correct message; that the Scottish Government is a world leader in driving change. While it is accepted that developing countries need assistance to curb GHG emissions, as a wealthy nation, Scotland should be in a position to enable change within its society, rather than opt to reduce GHG levels by purchasing international credits (at a lower cost to the Scottish economy). There should, however, be scope to assist developing nations within the Bill, yet such assistance should not contribute towards our overall domestic target for 2050".

Highland Council are therefore disappointed to see that international credits will be included towards Scotland’s net emissions. While it is accepted that such credits could enable Scotland to contribute a greater share of global GHG emissions reductions, it is not felt that such an approach adheres to the Sustainable Development Principles outlined in Question 19.

However, as credits are included towards Scotland’s net emissions, Highland Council would urge that a limit is put on the number of such credits purchased and that tight regulation ensures that units purchased result in sustainable carbon emissions savings projects elsewhere with no adverse social, economic or environmental impacts.
Q5 The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

The Highland Council welcomes the inclusion of aviation and shipping in the Climate Change Bill. The Highland Council is also pleased to note that land-use and its effect on climate change have been scoped into the Bill. Although Scotland’s net emissions will give a baseline from which to measure change, it should be noted that levels of emissions and removals will not be uniform across the country and vary greatly between Local Authority areas. Care must be taken when reporting removals and emissions on a regional basis. Clarification is sought on the reporting requirements of public bodies in relation to the Bill. (See Question 8). As highlighted in the response to questions 2, care should be given in setting targets to ensure that each region in Scotland is contributing its “fair share” towards emissions reductions. This also adheres to the Sustainable Development Principles (Question 19).

Highland Council believes that in order to achieve a move towards a low-carbon society the greatest emphasis should be on emissions reductions and not removals. Utilising forestry and land-use as potential carbon storage will form a useful role in tackling climate change but is treating only the symptoms of the problem and not the cause. Although future technologies such as Carbon Capture and Storage are not mentioned in the definition of “removals”, section 15, sub-section 2 of the Bill allows Ministers to alter the definition of removals in the future. Highland Council would have concerns should CCS be included and request that any amendments to the definition be consulted upon.

The Highland Council also has concerns over the regulation of such land-use and the effects carbon storage will have on existing land-users.

There is no scope within the Bill to take account of the emissions from the products Scotland consumes or the effects transient populations and tourism may have on Scotland’s emissions. Areas with transient populations will have large fluctuations in GHG’s. This is touched upon further in Question 9.

Q6 The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government’s approach to obtaining independent, expert advice on climate change?

To allow comparisons and provide for consistency advice should come from the same body that is advising the UK Government on the UK Climate Change Bill – the UK Committee on Climate Change.

As the UK Government is the first to pass a Climate Change Bill and has a committee in place using world leaders in Climate Change Science from the Met Office and Hadley Centre, it is unclear what added value Scotland could gain from setting up an independent committee. There would inevitably be some cross over where Scotland has no devolved powers. However, the
Highland Council are content with the provision in Scotland’s Climate Change Bill that would allow a Scottish committee to be set up if deemed necessary.

Q7 The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

No submission.

Q8 The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

The Highland Council would welcome such duties as it would ensure that each area in Scotland was contributing its “fair share” towards tackling climate change. However these duties must carry with them the necessary budgets to perform the re-alignments that will be required to deliver GHG reductions. As well as duties, incentives should be provided to promote change.

There is a need for partnership working between local authorities and other public/private bodies, to maximise the overall emissions reductions.

The Highland Council welcomes the powers to issue guidance to public bodies. Clear guidance on measuring techniques, conversion factors and timescales is needed. The government could also produce “Best Practice” guidance on the methods and measures to be used to achieve GHG reductions. This is particularly relevant for those public bodies captured under the Carbon Reduction Commitment.

Methods for measuring footprint data can vary and public bodies currently have large differences in the scope and timescale of their Carbon Management Plans. A uniform methodology could enable public bodies to benchmark progress against one another and monitor collective success.

In terms of reporting, there are concerns at present over the responsibility of local authorities in reporting community emissions and in particular emissions from the basket of green-house gases. Currently data is gathered on CO₂ and Methane only. In terms of monitoring and reporting annually on targets, the preferred option would have been to use CO₂ emissions only, taking into consideration that CO₂ makes up 80% of Scotland’s equivalent emissions, and that the level of uncertainty around figures is lower for CO₂ than for the other greenhouse gases. It is suggested that the producer of the F-gases (Hydrofluorocarbons and perfluorocarbons) monitors emissions rather than the consumer.

Q9 The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on this proposal?
Firstly, the need to adapt will be greatly reduced (although never eliminated) if the Scottish Government opts for a cumulative measurement and promotes higher emissions budget targets in the early parts of the target period.

Certain aspects of mitigation interlink with climate change impacts and as such should be considered together in the Bill and not segregated in a separate strategy. In addition to adapting to the changing climate, Scotland will have to adapt to a changing society. The effects of changing weather systems may lead to increases in carbon emissions in some regions, both through natural release of carbon storage but also from transient populations as more people migrate away from areas worst affected by Climate Change and head North. This demonstrates why linkages must be made between mitigation and adaptation.

It is understood that work is underway to develop an adaptation framework for Scotland and this is welcomed. However proposals, policies and timescales should be implemented in line with the climate Change Bill and not after.

Q10 Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are your views on this proposal?

No comment.

Q11 The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

The Highland Council have submitted a response to Forestry Commission Scotland with regards to the proposal. This can be found appended.

Q12 The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?

No comment

Q13 The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government’s thinking in this area.

What are your views on this approach?

No Comment
Q14 The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

What are your views on this proposal?

No comment

Q15 The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas:

- Waste prevention and management plans;
- Waste data;
- Deposit of recyclable waste;
- Procurement of recyclate;
- Reduction of packaging;
- Deposit and return schemes;
- Charges for carrier bags.

What are your views on these proposals?

The Highland Council welcome the provisions for reduced packaging and the charging for carrier bags.

A full response to the consultation on the Scottish Governments zero waste policy has been produced by the Council and can be found in Appendix 2.

Q16 What are your views on the adequacy of the Scottish Government’s consultation in advance of publishing the Bill?

It is felt that local authorities were given adequate timescales to consult on the proposals for the Climate Change bill with opportunity to attend several workshops on the matter.

Q17 Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government out on the consultation proposals?

Only that at the time of the original consultation the Environmental Report was not ready for comment. Through the Environmental Assessment (Scotland) Act 2005 the environmental report should be released for consultation alongside the draft programme Plan and Strategy. Stakeholders should be made aware when the Environmental Report is available for review but Highland Council were not aware of the Environmental Report until this call for evidence. So the Scottish Government should adhere to the legislation it puts in place and expects others to follow and also could do more to publicise and be transparent about it’s procedures with all stakeholder.

Q18 Does the Bill raise any equalities issues you would wish to highlight?

None

Q19 Do you have any comments on the impact of the Bill on sustainable development?

In general, the Climate Change Bill aims, objectives and targets fulfil one of the key principles of Sustainable Development:

“development that meets the needs of the present without compromising the ability of future generations to meet their own needs.”
The Bill is trying to correct the detrimental impact we have had on our global environment and so aims to make society more sustainable as a result.

However, for sustainable development to be successful it is important that each individual, community, organisation and region takes responsibility for their greenhouse gas emissions and acts to reduce them. Through the use of “removals” and the purchase of international carbon units it is felt that the Bill fails to embed sustainable development principles across all sectors. As it stands it appears that the ability to buy your way out of action remains an option for the wealthy. The Bill also does not address the need for action throughout all regions of Scotland and it could be that some regions are working hard towards tackling climate change but “carrying” poorer performing areas. It will be important to address this in the secondary legislation.

The bill will require a massive shift in society and it should be accepted that, in order to achieve an 80% target by 2050 in a sustainable manner, the rate of economic growth and development will have to slow in the short term. If done correctly however, through careful investment in renewable energy projects, and a move towards sustainable transport, local food networks and more resilient communities, society could be in a better place in 2050 that it is today. Yet the transition to this point is going to be a difficult one.

Finally, climate change is a global issue and as we all share the one Earth, there still appears to be gaps in the Bill as to the role Scotland will play in encouraging and supporting other nations to mitigate and adapt to climate change (other than purchasing carbon units).

Q20 Do you have any other comments on the Bill?
None.

Appendices

Highland Council appendices on Forestry and Waste have been reproduced on the Rural Affairs and Environment part of the Scottish Parliament’s web site.
Dear Sir

Climate Change (Scotland) Bill — Call for Views

The Historic Houses Association for Scotland (HHAS) welcomes the opportunity to respond to this important consultation. The Association represents some 250 independently owned historic castles, houses and gardens in Scotland. We conservatively estimate that approximately two thirds of Scotland’s built architectural heritage is in private ownership overall. Collectively we believe we make a considerable contribution to the Scottish economy and Scottish society in general, and accordingly have considered these proposals carefully.

Having considered the Bill carefully, we believe that the clauses relating to energy efficiency are most relevant to our membership, and accordingly we have confined our detailed comment for matters covered by Questions 12 — 14 in the consultation questionnaire.

In general terms, we are supportive of the Bill’s requirement for the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change. We also note that the Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings.

In this context we would wish to make the point firmly that we believe that historic buildings justify sympathetic and, if necessary, different treatment, from more contemporary structures for the following reasons:

• There may be legal obligations which make certain energy saving measures (such as double glazing) impossible

• Certain measures may destroy the cultural and architectural value of historic buildings which enhance the well being of communities

• Historic buildings are valuable in energy terms, because their maintenance (and restoration) reduces the need for new build, which would be likely to be energy intensive (in terms of disposal of the old building, creation and transport of materials for construction, the construction process itself)

• Historic buildings can act as focuses for desirable regeneration, and that regeneration can be on as energy-efficient lines as possible.

• The materials which are used to reduce carbon emissions may damage and perhaps reduce the lifespan of an historic building.

• The materials used in historic buildings are often a key part of their authenticity.

• An holistic approach to assessment of the energy performance is essential. Embodied energy is an important consideration as is the lifecycle of building materials.

We are clear, therefore, that any such regulations must properly respect these extremely important characteristics of historic buildings and trust that you will support this view.

A further point may be relevant here. Article 4.3 of the EU Directive on the Energy Performance of Buildings (EU Directive 2002/91) provides for member states to decide not to set or apply energy efficient requirements for “buildings and monuments officially protected as part of a designated environment or because of their special architectural or historic merit, where compliance with the requirements would unacceptably alter their character or appearance”. However, we understand that the UK Government is NOT going to do that, but
instead will rely on a requirement that Building Regulations are sympathetic to the needs of historic buildings.

As you will be aware, existing buildings may not fall within the coverage of modern building regulations. It is all the more important, therefore, that the Scottish Government and those who implement its regulatory system will be sympathetic to the needs of historic buildings.

Finally, we note that the Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Association is happy to support this initiative and would only add that many of our member properties have already espoused the cause of renewable energy for heating purposes.

We trust you will find this helpful and relevant. Should you wish a more expansive discussion of any of the issues raised above we would, of course, be delighted to oblige. We should also mention that Historic Scotland has carried out considerable research into the energy efficiency of historic buildings and anticipate their response will support and add to the points we have made here.
WRITTEN SUBMISSION FROM HOLYROOD 350

Holyrood 350 Response to the Proposed Scottish Climate Change Bill

Holyrood 350 applauds the Scottish Government for the world leadership it has shown, not only in establishing this 80% reduction target for 2050, but in establishing other imaginative initiatives -such as the £27 million Climate Challenge Fund -to combat Climate Change.

Holyrood 350 (http://holyrood350.org/) brings together people who are actively working to reduce their communities’ carbon footprint through relocalisation. Many of these initiatives have received funding from the Scottish Government’s innovative Climate Challenge Fund.

This submission focuses only on the most fundamental question, Question 1, and the proposed target of 80% reduction of GHG emissions in Scotland by 2050 and 50% by 2030.

Q 1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

When the Bill was first proposed the target of 80% by 2050 was groundbreaking, however it is now clear that: Scotland needs to achieve a reduction of 100% by 2029 and 10% by 2011 to show the climate change leadership the world needs in order to start the race out of carbon, and to place us in pole position to take advantage of that race.

PART ONE: WHY?

Scotland must achieve a 100% reduction in emissions by 2029 and 10% by June 2011, primarily, but not only, because the Science says ever more emphatically that we must.

Why does the proposed bill ask Scotland to aim for 80% by 2050?

The Scottish Climate Change Bill’s proposed reduction targets reflect Lord Turner’s Climate Change Committee’s calculation that historically high emitting countries like Scotland must cut their emissions by 80% by 2050. This is in order to contribute to a Global reduction of 50% by 2050, in order to stabilise the climate and prevent runaway climate chaos.

Why does the IPCC 2007 Report mean we should aim for 95% [not 80%] by 2050?

The current Scottish Climate Change Bill, the EU, the UK and the IPCC have all accepted the scientific assessment that – in order to prevent runaway climate chaos -warming should not exceed 2°C above pre-industrial levels. The IPCC’s 2007 Fourth Assessment Report states that, in order to limit global temperature rise to 2°C, global emissions must fall by 85% [not 50%] by 2050, a fall which would lead to concentrations of CO2 in the atmosphere of approximately 450ppm. It is acknowledged by all the relevant reports that global emissions cuts can only be achieved through global equity (i.e. through apportioning the same rights to emit to all people in the world), so this Global target of 85% required to keep us below 2°C can clearly only be met by countries such as Scotland making cuts of 95% or more by 2050.

Why does the science now say we must aim for 100% [not 80%] by 2029 [not 2050]?

The 2007 IPCC report was, however, based on scientific findings and modelling from 2006 and earlier. Since then, the range of possible future scenarios on which the IPCC bases its targets, have been left behind by subsequent empirical evidence. What is now clear is that processes such as Arctic melting, methane being released from beneath the melting permafrost, and the weakening of the ability of the oceans, forests and soil to absorb carbon, are all happening far faster than the IPCC predicted. Furthermore, since these processes are both the result of global warming and themselves amplify that warming, it is dangerous to think – as Governments, scientists and campaigners have done up until now -
that a certain level of warming is ‘safe’ and to then aim to restrict the emissions increases and degrees of warming to that level.

Once the ‘positive’ feedback loops start to kick in, it will be extremely hard to stop them simply amplifying themselves in ever-accelerating feedback loops, however much we cut our greenhouse gas [GHG] emissions. For example, where the IPCC predicted an Arctic ocean ice-free in summer by the end of the century, it is now predicted this will happen by 2011-2015, eighty years ahead of IPCC predictions made in 2007 (Wasdell 2008, Climate Safety 2008).

Fig 1 “Summer Arctic sea ice thus appears to be disappearing more than 80 years ahead of the IPCC’s prediction, even though this was made as recently as 2007” Climate Safety (2008: 7) http://climatesafety.org/wp-content/uploads/climatesafety.pdf

Furthermore, the melting Arctic leads to less heat being reflected back into space, which leads to greater warming, which itself leads to more of the Arctic melting, and so on, a process that at some point becomes entirely independent of our level of GHG emissions, and a process that has a huge impact on the melting of the Greenland ice sheets, sea levels, the ocean currents, temperature increases, and so on. The key point is that we have to make a dramatic cut in the bulk of our GHG emissions now. If we are to slow and have a chance of stopping these runaway processes, we must create a zero-carbon, not low-carbon, economy.

In Edinburgh on 9th February 2009, Lord Adair Turner, Chair of the UK Government’s Climate Change Committee, gave one of Friends of the Earth Scotland’s ‘Building a low-carbon economy’ lectures, alongside Professor Jacqueline McGlade, head of the European Environment Agency. Turner argued that meeting the commitment to reduce our emissions by 80% by 2050 would only cost us 1-2% of GDP. In the light of the disturbing scientific findings presented in the lecture given by McGlade straight after Turner spoke, Turner was asked why it would not make more sense to accept a higher cost than 1-2% GDP in return for a better chance of avoiding catastrophic climate change. His answer was that if we followed his committees advice and sought to stabilise at an increase of 2.4°C, then we would avoid catastrophic climate change, and if the science was now saying something different then that would have to be reviewed, probably in a couple of years time.

The science clearly is saying something different. It is saying that current targets will guarantee catastrophe; and not just catastrophe for poor people in poor countries, but catastrophic climate change and possible extinction for us all (Wasdell 2008, PIRC 2008). For example, David Anderson of the Tyndall Centre for Climate Change Research argues that current negotiations for global agreements will guarantee levels of GHG in the atmosphere that will guarantee catastrophe. He concludes that “it is increasingly unlikely any global agreement will deliver the radical reversal in emission trends required for stabilization at 450 ppmv carbon dioxide equivalent (CO2e). Similarly, the current framing of climate change cannot be
reconciled with the rates of mitigation necessary to stabilize at 550 ppmv CO2e and even an optimistic interpretation suggests stabilization much below 650 ppmv CO2e is improbable.

(http://www.tyndall.ac.uk/publications/journal_papers/fulltext.pdf) [Link no longer operates]

At the ‘Building a low-carbon economy’ lectures in Edinburgh earlier this month, it was put to Lord Turner that, under the current recommendations of the Climate Change Committee, and according to their own calculations, he had calculated that our grandchildren will have a greater than evens chance of finding themselves in what Turner calls the "danger zone" of 2°C of warming and a 1 in 100 chance of finding themselves in what he calls the "extreme danger zone" of 4°C of warming. From the report's descriptions of the likely impacts of 4°C, it was pointed out that 4 degrees could quite properly be referred to as the "death zone", and Turner was asked: what percentage of our own, our children's and our grandchildren's income do we think most of us would be prepared to sacrifice to reduce those risks to say 1 in 10 and 1 in 1000 respectively? The questioners guess was that it would be more than 1-2%.

Is the Climate Crisis a greater emergency than a World War?

Where even the IPCC’s 2007 forecasts would require Scotland to aim for GHG reductions of above 95% by 2050, the emerging science calls for us to urgently stop and reverse the drive for forms of economic growth which require us to continually accelerate the extraction of carbon from the ground to pass through our economy and into the atmosphere.

Lord Stern’s and Lord Turner’s idea that one can effectively continue with business as usual, while "stabilising" greenhouse gas emissions and the temperature increase at 550ppm or 450ppm is clearly an approach made outdated by the accumulating scientific findings on the ground and the scientific understanding of the nature of accelerating feedback loops. The recent PIRC Climate Safety (2008) report, for example, demonstrates that 550ppm and 450ppm are points on an avalanche of positive feedbacks, an avalanche that would overwhelm the power of human intervention to stop runaway climate change.
It is for this reason that climate scientists like James Hansen say that a safe level of CO2 in the atmosphere is somewhere below 350ppm and we are already at 387 with global temperature change accelerating as the runaway process starts (Hansen 2008). Others, such as Professor Joachim Schellnhuber, head of the Potsdam Institute and climate adviser to the German Chancellor and the EU, told the Guardian (David Adam, 15 September 2008) that only a return to pre-industrial levels of CO2 would be enough to guarantee a safe future for the planet. He said even a small increase in temperature could trigger one of several climatic tipping points, such as methane released from melting permafrost, and bring much more severe global warming.

That means that to have any hope of averting a massive extinction event we have to take CO2 out of the atmosphere by rapidly reducing our emissions to zero, while protecting and enhancing the resilience of the soils, oceans and forests to act as carbon sinks to – over decades -draw down the CO2 already emitted. This is a far greater global emergency than even a World War, since the very survival of our species is at stake. As Brian Davey points out: entering into a world war (in this case a ‘war against climate change’) involves no guarantee that you will see victory, and it isn’t done on the basis of cost benefit calculations. You enter it because you have no choice, and -pulling together -you try everything possible to succeed (Davey ‘From the Green New Deal to a War on Climate Change’ 26 Feb 2009).

In World War Two Britain managed the huge switch in resource allocation that is required when people acknowledge there is an emergency and start working together. In World War Two military outlays (as per

---

Shaun Chamberlin points out that “the pre-industrial concentration of CO2 in our atmosphere was 278ppm and did not vary by more than 7ppm between the years 1000 and 1800 C.E.” (http://www.darkoptimism.org/2008/09/03/the-climate-science-translation-guide/).
cent of UK national income) rose from 15% in 1939 to 53% in 1941 (Davey 2008). This is the scale of resource redirection required, a redirection which would – as in previous world wars -also create full employment and social cohesion, and – if approached through policies such as those recommended below – also create an international level playing field for zero-carbon economies and so support the emergence of resilient communities interacting to build sustainability through equity, since survival for any one is only ensured through ensuring survival for all.

It is important to recognise the absolute centrality of equity to combating climate change. Turner, Stern, McGlade and all who have analysed the situation are clear that controlling climate change requires a globally equitable approach, if people in poorer countries are to participate in solving a problem that has historically been brought about by the actions and economies of the nations which have become wealthy through such action and economies.

Turner writes that “it is difficult to imagine a global deal which allows developed countries to have emissions per capita in 2050 which are significantly above a sustainable global average” (2008: 2), and therefore, “a fair global deal will require the UK to cut emissions by at least 80% below 1990 levels by 2050” (2008: 1). However, he adds that “The good news is that reductions of that size are possible without sacrificing the benefits of economic growth and rising prosperity” (2008: 1, emphasis added). It appears possible to deduce that his Committee calling for only an 80% cut by 2050 (despite the calculations of his own committee and those of the IPCC) may have been more to do with Turner’s perception of the politically possible, rather than a sober estimate of action commensurate with the science. As will be discussed below, the political and economic Global situation has been transformed over the last twelve months, and what may have appeared politically impossible – the regulation and redirection of the financial system – may have become politically inevitable as a result of the ongoing financial meltdown. The fact that what so recently appeared politically impossible may now be politically inevitable can provide us with some hope that we can make it politically possible to take the radical steps needed to combat climate change.

NASA’s James Hansen and his colleagues argue that "Continued growth of greenhouse gas emissions for just another decade practically eliminates the possibility of near term return of atmospheric composition beneath the tipping level for catastrophic effects. If humanity wishes to preserve a planet similar to that on which civilisation developed and to which life on Earth is adapted, paleoclimate evidence and ongoing climate change suggest that CO2 must be reduced from its current 385ppm to at most 350ppm. Remaining fossil reserves should not be exploited without a plan for retrieval and disposal of the resulting atmospheric CO2".

Therefore, as the November 2008 Climate Safety (http://www.climatesafety.org) assessment makes clear, we must aim for 100% reductions in our GHG emissions within 20 years – by 2029 – and we must kick start this process by taking the relatively easy steps which will enable us to reduce our emissions by at least 10% below 1990 levels by June 2011. Relatively easy steps, but accompanied by a complete reorientation from measuring GNP in terms that reflect the throughput of carbon through the economy to ensuring individual, family and community survival and well-being.

PART TWO: HOW?

How can Scotland achieve a 10% reduction by 2011 and 100% by 2029, and so show the leadership the world needs to start the race out of carbon (and can, as a result, prepare us for Peak Oil and revitalise the Economy at the same time)?

Man-made climate change is the consequence of industrial activity, and accelerating climate change emissions are driven by basing our economy on fossil fuel use, and on an approach which measures GNP in terms that reflect the throughput of carbon through the economy. Since even the International Energy Authority (which, up until it’s 2008 report, was denying that Peak Oil was anything other than a distant eventuality) now admits that Peak Oil is fast2 approaching, the action we have to take to stop accelerating climate change is action which can also prepare us for a world in which fossil fuels are no longer cheap

---

2 Peak Oil is the point at which we have used half the available oil, after which supply will never be able to meet demand.
and easily available.

We are therefore asking the Scottish Government to act with other governments (or, if other Governments are unwilling, then we are asking the Scottish Government to democratically secure the power) to demonstrate global and pre-emptive leadership, by immediately and rapidly transforming Scotland from an oil-dependent economy driven by growth, to a sustainable and resilient zero-carbon economy guided by the urgent need for sustainability, equity and long-term security.

While international negotiations are focussed on whether we should hit the wall of dangerous climate change at 60mph, 50mph or 40mph, we need instead to stop focusing on future targets and start braking fast so that we don’t hit the wall at all. To rephrase this in terms of David Wasdell’s representation [Fig 2 above]:

(i) If our current emissions are setting up future feedback loops which will take us over the ‘Critical Threshold’ hill, then the ball of consequences will roll downhill towards the Earth’s 6th extinction event with unstoppable acceleration.
(ii) If, however, we devote a war-effort of collective energy to setting up and intensifying current action designed to decarbonise the economy and society now, then we should still (just) have time to set up positive feedback loops whose impact on restraining future temperature rises should cut in just in time to halt our rolling over and down that hill, although the science is now pretty clear that current climate change related weather events will intensify, and we will inevitably be teetering at the top of the hill as a consequence of the cumulative effect of emissions which we have already pumped into the atmosphere.

The longer we leave reducing emissions the greater the cumulative impact, so the question is whether we are able to take action now to dramatically reduce total emissions. The question will not be: whether we have managed to reduce total emissions by 60, 80 or 100% by 2050. The question is: how fast can we create a zero-carbon economy and society now?

Where would this place us in relation to other economies?

The first key move is to recognise what the science is telling us, then to recognise that the steps which are technologically, economically and socially required of us will not only: (i) ensure our technology is at the cutting edge; (ii) place our economy in pole position to benefit from helping other countries to subsequently take the steps that — sooner rather than later — they are all going to have to follow us in taking; but will also (iii) enable us to make our communities resilient and vibrant places to live.

A recent report by experts from Hewlett Packard and Forum for the Future (Climate Futures: Responses to climate change in 2030 -October 2008) examines five sharply different scenarios for a 2030 world. Recognising the gravity of the situation -and that climate change will be the backdrop to all business, political and human decisions over the coming decades they make the business argument for greater climate change regulations now:

"Acting quickly is best for liberal markets. Some of the strongest objections to addressing climate change have been that we will constrain markets, and hence our freedom, at too high a cost. People have feared that climate change was a cover for rolling back the market reforms of the last decades. But in our scenarios, liberal market-based solutions seem much less attractive as time goes on than statist responses. This puts a different light on how to defend freedoms from market reforms. Advocates of liberal markets should act as soon as possible, pushing for a global agreement with teeth, national measures that use financial incentives, and the removal of market distortions that encourage unsustainable and wasteful resource use. The result may be a more constrained market system than today, but the long-term alternative could be a desperate turn to big government and protectionism" (2008: 69)

They go on to argue that “‘the historians of the future will call these the climate change Years”. If we have not acted soon enough “they may look back at us with a complete lack of comprehension or even disgust, rather as we look back on slave-owners. Or if climate change feels solved, or on the way to a solution, they may look back on us as heroes.” (2008: 70). In arguing for taking immediate steps now they add that: “steps taken now could open up previously impossible or unimagined paths of hope for combating climate
change” (2008: 68). The key distinction here is between (i) action which creates hope through not only directly reducing emissions but also inadvertently sets up a range of unanticipated positive knock on effects; and (ii) becoming paralysed either by despair or by hope that someone else will do something (or as Lord Turner remarked, paraphrasing St Augustine on goodness: Lord, make me carbon neutral, but not yet).

Perhaps the most useful – if unexpected – metaphor for the situation we have got ourselves into is that of the plane that took off from New York’s La Guardia airport last month, and lost both engines due to the engines sucking in geese and losing all power. The pilot could have just thrown up his hands in horror, or tried returning to La Guardia in the hope that he could make a more normal landing. Instead he calmly and with complete focus took the plane down where he could: on the Hudson River. The plane was wrecked; but everyone survived. If, metaphorically, the plane is an economy devoted to insatiable growth, and the geese are the intervention of nature, the pilot is each of us who are alive today. To return to metaphors closer to Turner’s paraphrasing of St Augustine, another way of conceptualising this is to consider that such miracles do not just happen; they are made through focused action.

HOW TO REDUCE EMISSIONS BY 100% BY JUNE 2029

1. PRICING CARBON OUT OF THE ECONOMY

The first and most crucial step we are calling on the Scottish Government to take is to price carbon into and out of the economy, in order to dramatically reduce and then stop carbon being extracted from the ground to pass through the economy into the atmosphere.

We call on the Scottish Government to introduce a scheme -by the time of the Copenhagen summit, December 2009 -to ensure that high-carbon products, modes of transport, energy sources and services, are fast replaced by zero-carbon ones. The necessary rapid rise in the cost of high-carbon options would be accompanied by the rapid development and shift to zero-carbon ones.

‘Contraction and Convergence’ is the most widely and globally accepted framework for capping and rapidly reducing carbon emissions to a level compatible with the continuation of human and other mammalian life on the planet. It aims to contract (cap and reduce) emissions in a way which does not penalise those least responsible for emissions (the poor in the Global South and North) but instead enables a convergence in which high emitters dramatically reduce their emissions in a way which supports low emitters to maintain or attain a reasonable quality of life. It is based on

(i) the survival principle: reducing emissions to an ecologically tolerable level; and
(ii) the equity principle: reducing them in a way which is socially tolerable, i.e. acceptable to the majority world, since our leadership will be fruitless unless they are willing to follow our lead in decarbonising society.

‘Cap and Dividend’ [or ‘Cap and Share’] is a politically attractive way for any country to unilaterally implement ‘Contraction and Convergence’: it is a straightforward way to radically reduce our emissions and create a far more energy healthy, socially stable and internationally secure society. It is fiscally neutral, in that all the money raised through oil, gas and coal corporations having to buy the right to bring carbon into the economy will be redistributed – on an equal basis -to the whole population.

‘Cap and Dividend’ is based on the fact that the atmosphere is a global commons which we all equally rely on. It gives each person the right to the same proportion of overall emissions which are reduced year on year, so reducing our collective emissions to zero and (if we ensure the resilience of carbon absorbing oceans, forests and soils) over time allowing emissions already in the atmosphere to be drawn down into the atmosphere.

3 Here we focus on the 4 strategic ways of reducing emissions, but there are a whole host of piecemeal moves which can have a massive cumulative effect. For examples of possible piecemeal changes (as well as strategic approaches) see George Monbiot’s ‘Here’s the plan’ (http://www.monbiot.com/archives/2006/10/31/heres-the-plan/) or Climate Safety’s ‘A few suggestions’ on page 23 of their Climate Safety Report (http://climatesafety.org/wpcontent/uploads/climatesafety.pdf). Ideas range from: electricity tariffs where energy becomes cheaper the less you use, ending domestic flights, a 55mph speed limit, using the £76 million earmarked for replacing Trident to build wind turbines and carry out a national insulation programme, get rid of private courier vans and return post to Royal Mail postmen walking.
these ‘sinks’.

Introducing ‘Cap and Dividend’ to Scotland:

In the ‘Cap and Dividend’ system the vast majority of the population are immediately better off and only those who can afford it (the heavy emitters) are penalised for disproportionately polluting the global commons. Introducing this system to Scotland, would mean that those bringing carbon into the economy (those very few companies importing or producing coal/ oil/ gas/ cement etc) would take part in an annual auction to buy the right to bring carbon into the economy.

The extra price they have then paid is

(i) passed on to manufacturers and other users of the fossil fuel they bring into the economy, which leads to higher prices for all those using those products, services, modes of transportation etc which have carbon embedded in them; but the cash generated from the auction of these carbon emission permits is

(ii) passed on to the population at large (directly into their bank or, preferably, in terms of stability, their post office accounts) so that people can deal with the increase in prices. This means that (a) those using more than their fair share of carbon are penalised because all such prices will have risen, while those using less (the great majority) will benefit with extra cash in their pocket, and (b) producers will be immediately encouraged to develop non-carbon based products/ services/ modes of transport, and avoid producing carbon ones.

After a 3 year settling in period, ‘Cap and Dividend’ (http://www.capanddividend.org/ or http://www.capandshare.org) could – if necessary -then be supplemented by people using Carbon Cards (similar to credit cards) to monitor their purchase of CO2 embedded goods and services (This is drawn from the ‘Tradable Energy Quota’ system -http://www.teqs.net/). Those purchasing more carbon than their fair share would now not only be paying for it through the price of the goods purchased, but would also receive proportionately less cash from the carbon auction dividend. Those purchasing vastly more carbon would start paying into that dividend fund themselves (at an exponentially increasing rate). Meanwhile the great majority (those who bring in less CO2 than their fair share) would receive this extra cash from those bringing in more. As the rapid rise in the cost of high-carbon options takes effect there would be a rapid development and shift to zero-carbon ones. As the amount allowed into the economy is reduced year on year, our collective emissions are reduced to zero.

ADVANTAGES: Political and Practical Advantages of ‘Cap and Dividend’:

1. A vote winner in that

   (i) it immediately puts money in peoples’ pockets and leaves them to choose the lower and zero-carbon options if they wish.

   (ii) it ensures that all the money from the auction (and subsequently from heavy emitters) is passed on directly to the vast majority of families and individuals; and, since none of he money will be kept by Government, there is no way this could be misconstrued as a way of raising Government revenue.4

2. Easy to use -It doesn’t require anyone to have to be involved in selling carbon shares. Its introduction would involve people receiving cash rather than a less attractive carbon ration (as proposed in the ‘Tradable Energy Quota’ scheme http://www.teqs.net/). However, once the system was embedded, it could move beyond the simple ‘Cap and Dividend’ equal allocation of cash, so that dividends reflect carbon use.

3. Market solution – it doesn’t seek a different political or economic game, it simply changes the rules of the game so that the market has to internalise the carbon cost.

4. Transferable potential -this system could easily, if people wished and at a late date, be expanded to include the real costs of non-Fairtrade or non-Organic products in a similar

---

4 In order to raise revenue for (i) urgent carbon reduction public schemes of work, and (ii) helping the poor here and in the Global South deal with climate change, the Government could make agreements reached in tax havens carry no weight in our courts. The unpaid tax recovered from tax havens could easily finance such massive projects (The Green New Deal).
way which gave people money.

5. **Technologically innovative** – the certainty of the cap (the permitted level of carbon in the economy) being reduced rapidly year on year, would immediately boost jobs and investment in the development of zero-carbon energy, goods and services.

6. **Creates a level playing field**: Together with the Government (i) reducing energy demand and ensuring 100% renewable energy, and (ii) re-regulating and re-directing finance (see 2 and 3 below), this policy will create a level playing field in which food and energy, goods and services, will be produced closer to home, helping build socially and ecologically healthy communities (see 4 below).

**CHALLENGES: Political and Practical Challenges of ‘Cap and Dividend’**

A. **UK context**: the Holyrood Scottish Government declared a target of 80% CO2 reductions by 2050 prior to London increasing its target from 60% to 80%. Scotland seeking to price carbon out of the economy would create tensions with the Westminster Government (unless they follow suit as rapidly as they did with the change from a 60% to 80% target). UK law would not allow Scotland to unilaterally implement such a system, but if people in Scotland powerfully push to do so, this would put huge pressure on the UK Government to again follow suit or to accept Scottish autonomy in this and related areas.

B. **EU and WTO context**: the EU and WTO could argue against us imposing stringent taxes on carbon embedded imports from countries which do not have a similar scheme. However, such a tax would be necessary to create a level playing field by levelling up international practice, and would put pressure on other EU countries to abandon the discredited ‘Cap and Trade’ scheme which gave away free Carbon Permits to the heavily emitting companies allowing them to increase profits, increase emissions and increase prices for citizens who themselves received no compensation.

C. **Impact of our re-localisation on the Global South**: Cheap products from the Global South would be priced out of our market through the requirement that they internalise their carbon costs at source or, if not, have taxes imposed on entry. However: (i) international trade tends to maintain undemocratic elites in power who impoverish people through taking their land and/or paying little for their labour. Removing this source of such elite’s wealth, diminishes their power, helping democracy; and (ii) since these cheap products externalise social (not just ecological) costs, Fairtrade schemes (point 4 above) could be introduced to address the social issues directly.

**Conclusion - Pricing Carbon into and out of the economy:**

‘Cap and Dividend’ [or ‘Cap and Share’] must be introduced – or in the process of being introduced - by the time of the Copenhagen summit in December 2009 in order to ensure that carbon is rapidly treated as a toxic and addictive substance which we as individuals and as a society need great help to stop being addicted to. This clear, equitable and practical way of rapidly doing this will ensure that all products and services that carry carbon into the economy and out into the atmosphere also carry a punitive financial cost. This would kick start modes of transport, energy and production which are zero-carbon. Any products entering the country (or set of countries) imposing such a tariff on their own carbon-based products and services would, necessarily, have to impose an equivalent tax on any services and products entering the country, in order to ensure a level playing field for all, and in order to begin the process of quickly levelling up international practice from carbon profligate to zero-carbon.

**2. SWITCHING FROM CARBON HUNGRY TO ENERGY HEALTHY INFRASTRUCTURE**

We call on the Scottish Government to, by December 2009, be in a position to implement a policy framework, legislative programme and support to enable a rapid switch from carbon hungry to energy healthy infrastructure.

This would involve an immediate end to the construction of infrastructure which is accelerating our carbon use and accelerating climate change, including the immediate end of motorway building, airport expansion, and out of town shopping centres. A rapid transformation in energy production, construction and in
transport infrastructure, including rolling out effective mass insulation and energy conservation schemes, public and community benefit renewable energy schemes, and exponentially expanding and electrifying (and reducing the fares to low or zero levels on) public transport.

To move to being an energy healthy society by 2028 we need to rapidly ‘Power Down’ and ‘Power Up’:

(i) ‘Powering Down’ from using carbon based and polluting energy sources and from being energy obese, thereby reducing energy use by 50% by 2029; and

(ii) ‘Powering Up’ by rapidly expanding renewables (including tidal, wind, CHP and hydro) to provide for all our remaining energy needs by 2029.

This transition will happen anyway as oil, gas and coal run out, but needs to be done now in order that the carbon from the the remaining fossil fuels are not released into the atmosphere.

However, it has to borne in mind, that global average (mean) temperature have already risen by between 0.75°C and 0.8°C since pre-industrial times, and a minimum additional 0.6°C of warming is still due from emissions to date -the delay in warming being a consequence of the time-lags in the system – so there is only another 0.6°C of warming possible before we hit 2°C. That 2°C increase may be reached as a result of accelerating feedback loops, but we have to consider whether there is still some play in the system, so that we can devote some further emissions, not to building motorways, runways, flying, producing plastic goods and so on, but to helping to build the renewable energy infrastructure we need.

How the energy transformation can technically be carried out by 2029 is outlined in the Centre for Alternative Technology’s widely acclaimed Zero Carbon Report. It is also clear from this, that it would be unnecessary and potentially entirely misguided to pour energy and resources into the expectation that we could develop bountiful, cheap and safe nuclear energy, and continue to use coal (through developing effective carbon capture and storage). The Zero Carbon Report makes clear that renewable solutions are available and can meet our real needs (rather than our manufactured wants) now if we choose to pour our energy into developing them (see: http://www.zerocarbonbritain.com/).

3. ESTABLISHING A RADICAL GREEN NEW DEAL

We call on the Scottish Government to recognise the underlying cause of the ‘triple crunch’ of the credit-fuelled financial crisis, accelerating climate change and the fluctuating but (over the long term) soaring energy prices which will accompany Peak Oil.

We call on the Scottish Government to -by December 2009 – have developed a policy framework and legislative programme to re-regulate the financial sector; and have begun the process of either:

(i) Persuading the Westminster Government to implement such legislation or, if the Westminster Government refuses, then

(ii) Creating this as ‘Shadow legislation’ and consulting the people of Scotland on whether they support the Scottish Government’s leadership in tackling these three connected crises.

Where even a year ago, it would have been seen as electoral suicide to advocate re-regulating the financial sector; there is now a huge popular appetite (amongst both expert analysts and the population at large) for such a move. The rules of the economic system have legally obliged companies to pursue the highest returns for shareholders without thought to how this can destroy the social, economic and environmental fabric. The quickest (even if least long-term) approach to increasing profit has been through externalising the social and ecological costs of producing goods and services (hence the outsourcing or production and service jobs to the Majority world).

As a first step, we call on the Scottish Government to:

(i) Push for transparency in transnational financiers and corporations dealings so that they become accountable for the impacts they are having, and so that we ensure they are accountable through paying tax rather than using tax havens to avoid contributing
their fair share to paying for the transformation we collectively and urgently need to undertake.

(ii) **Push internationally for tax havens and their secretive dealings to be stopped**, and in the meantime push for legislation to make any agreements reached in such jurisdictions lack any legal status here.

**Over the longer term, we call on the Scottish Government to:**

(iii) **Build a new alliance between politicians, environmentalists, industry, agriculture, and the unions.** One which puts the interests of the real economy ahead of those of footloose finance in order to make massive investment in renewable energy and wider environmental transformation, leading to the creation of an employment rich, secure and environmentally healthy society. The programmes and policies required to begin this process are detailed in The Green New Deal (new economics foundation, Larry Elliott, Caroline Lukas et al 21 July 2008. See: [http://www.neweconomics.org/gen/](http://www.neweconomics.org/gen/))

(iv) **Reorientate the money system** so that it exists (at national and local, and ultimately international, levels) in order to protect money as a shared commons which we all need to facilitate exchange, and as such exists to serve the wellbeing of society, rather than is used to increase the profits of the few at the expense of society and the environment (Davey 2008).

4. **SUPPORTING COMMUNITY RE-LOCALISATION:**

We call on the Scottish Government to dramatically increase its excellent support for communities seeking to make the transition from an oil dependent economy to a local one. This movement is evident in the wave of Transition Town, Going Carbon Neutral, etc., initiatives (see, for example, [http://www.transitionscotland.org/](http://www.transitionscotland.org/), [http://pedal-porty.org.uk/](http://pedal-porty.org.uk/), [http://fifiediet.wordpress.com/](http://fifiediet.wordpress.com/), etc).

The Land Reform (Scotland) Act should be expanded to extend support to urban communities to also have the first right (and support) to buy important community land and buildings when they come on the market. This expansion must not be at the expense of existing support for rural communities to do likewise, but can enable urban communities to rebuild themselves, partly through learning from the experience of rural community initiatives (see, for example, [http://www.isleofeigg.org](http://www.isleofeigg.org), [http://www.caledonia.org.uk/](http://www.caledonia.org.uk/)).

As the previous three actions are taken to stop the extraction of carbon, a level playing field will emerge in which food, energy and the things we need and want are produced far closer to home, with decisions increasingly being made at a local level; enabling us to re-establish healthy local economies and communities. In place of large corporations producing cheap and shoddy goods through exploiting cheap labour and engaging in practices (including long distance transportation) which damage the environment, in place of our fuelling those aspects of the economy in China and the rest of the Majority World which enable those with power in such countries to further exploit those pushed off their land and denied their rights, we will come to rely on establishing healthy local economies here, which will enable healthy economies there.

The three previous steps create the grounds for this fourth step which ultimately depends on people being willing to rebuild their communities as sustainable, healthy, resilient and desirable places to be through relocatising their economy. This fourth step involves the transition to viable vibrant interlining communities: where the commons is managed through negotiation and co-operation rather than through the imposition of developments by those who are absent from a locality and therefore never have to deal with the consequences of their decisions, decisions which are driven by how much they can extract from localities, rather than driven by the desire to make those localities sustainable.

The crucial point about this focus on relocalisation is that, according to the Stockholm Institute, without a completely new approach (such as this) even the most radical of their three alternative visions of the future led to well over **2°C** rises. When they ran the three alternative scenarios through the Met Office’s Hadley
Centre’s modelling system\(^5\), the rises were as follows:

(i) **AGREE & IGNORE** – the current approach in which international negotiations lead to weak target setting which countries then effectively ignore – led to rises of **4.85°C**;  
(ii) **KYOTO PLUS** -successful binding international negotiations with targets countries keep to – led to rises of **3.31°C**; and  
(iii) **A radical STEP CHANGE market approach** to severely restrict companies using fossil fuels in the first place – led to rises of **2.89°C**.

So, without a dramatically different pathway – such as this rapidly spreading relocalisation process supported and amplified by the policy framework to make zero-carbon a possibility we cannot stop the devastating extraction of carbon, nor demonstrate to the world how to get back below 350ppm and so stay below the danger threshold of **2°C**.

In summary: there is no way we are going to be able to pull back from the brink and – in the process - develop the localised economies needed for fulfilling zero-carbon lifestyles unless:

(i) There is clear legislation in place to ensure a level playing field for all, so that individuals, companies and public bodies are able to act to reduce emissions  
(ii) There is a clear programme to change energy use, infrastructure, and the materials we use, from carbon-based to carbon-neutral  
(iii) There is swift legislation to curb the ability of finance and the profit motive to exploit and damage, rather than serve society, and unless  
(iv) There is dramatically increased support for communities to make the transition.

**CONCLUSION:**

We call on the Scottish Government to respond to the World Crisis that the science is telling us we are now in, and to demonstrate world leadership by (i) making our target a reduction in emissions of 100% by 2029, and 10% by June 2011, and by (ii) taking the necessary steps to begin that dramatic reduction now.

We call on the Scottish Government to demonstrate clear outstanding leadership in the race out of carbon. This will put us in pole position to take advantage of that race, but, more importantly, it will kick start the race for human survival which so far has consisted of Governments discussing the rules of a race which should have long since begun.

Thank you for the opportunity to give our views on the Climate Change (Scotland) Bill. Living Streets is the national charity that stands up for pedestrians. With our supporters we work to create safe, attractive and enjoyable streets, where people want to walk.

We have been the national voice for pedestrians throughout our 80 year history. In the early years, our campaigning led to the introduction of the driving test, pedestrian crossings and 30mph speed limits. Since then our ambition has grown. Today we influence decision makers nationally and locally, run successful projects to encourage people to walk and provide specialist consultancy services to help reduce congestion and carbon emissions, improve public health and make sure every community can enjoy vibrant streets and public spaces.

Our response to the Climate Change Bill (Scotland) covers seven key points:

- We welcome and support this bill;
- Transport is the key priority area for action to cut emissions;
- To achieve the bill’s aims, the role of walking in cutting emissions must be recognised;
- We believe the bill doesn’t go far enough, in three areas in particular;
- The Bill must set annual emission reduction targets of at least 3% from 2010;
- The Bill must establish a duty on all public bodies to reduce emissions in line with the national targets;
- The Bill must include mechanisms for the enforcement of the emission reduction targets.

We welcome and support this bill

We strongly welcome the principle of Scottish climate change bill and the aspiration to lead the way on reducing climate change emissions.

Transport is key priority for action

In 2006, the Scottish transport sector was responsible for 24.4% of all greenhouse gas emissions. Transport is the main sector where emissions continue to rise: greenhouse gas emissions from the Scottish transport sector rose by 14.3% between 1990 and 2006, whereas all Scottish emissions fell by 12.3% over this same period. If this rise in transport sector emissions cannot be halted in the near future, then consideration should be given to setting specific targets for the sector.

Must recognise role of walking in cutting emissions

The VIBAT study[^1] by the Bartlett School of Planning at University College London set out to explore ways to reduce UK carbon dioxide emissions by 60% by 2030. It concluded that technological change on its own, even with a very strong push on efficient vehicles and alternative fuels, could not provide the necessary reductions in carbon emissions because of the additional car-based travel to be expected in the future.

Walking can contribute to the modal shift required provided specific policies are put in place. Since the end of the 1980s, the average amount of time spent travelling by car increased by 7% whilst the amount of time spent walking decreased by 20% to 67 hours in 2004. People are also less willing to consider walking for short distances compared to driving by car. In 2000 the proportion of people agreeing they could just as easily walk or cycle as take the car for short journeys was 41% compared with 37% in 2002.

To tackle this decline in walking, Living Streets believes we must create an environment in which walking is more pleasant, less obstructed by vehicle traffic and poor street design and where more jobs and services are in walking distance of people’s homes.

[^1]: Visioning and Backcasting for UK Transport Policy (Bartlett School of Planning, University College London and Halcrow Group Ltd. Department for Transport-Horizons Research Programme, 2004-05). Available at: [http://www.ucl.ac.uk/~uctf696/vibat.html](http://www.ucl.ac.uk/~uctf696/vibat.html)
The VIBAT study suggested that measures to enable and increase walking as a mode of transport could directly or indirectly contribute to significant reductions in CO2 emissions. The measures and potential impacts are listed below:

<table>
<thead>
<tr>
<th>Area of focus</th>
<th>Individual measures</th>
<th>Potential reduction in carbon emissions (million tonnes across UK)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Liveable Cities</td>
<td>— higher density urban areas with local centres — upgraded public transport — improved urban design — heavy investment in walking and cycling</td>
<td>2.4</td>
</tr>
<tr>
<td>Smarter measures</td>
<td>— workplace travel planning — school travel plans — personalised travel planning — travel awareness</td>
<td>2.4</td>
</tr>
<tr>
<td>Ecological driving</td>
<td>— slower speed limits, including implementing default 20 mph in residential streets</td>
<td>4.6</td>
</tr>
</tbody>
</table>

**The Bill must set annual emission reduction targets of at least 3% from 2010**

The Bill allows the Government the option of setting emission reduction targets for the crucial period up to 2020 that could barely reduce emissions during this period, despite the fact that all the scientific evidence shows that achieving early reductions in emissions is essential. The interim target (50% reduction by 2030) is not challenging enough; it compares unfavourably with the UK Committee on Climate Change’s Intended budget (42% reduction by 2020). We therefore support the Stop Climate Chaos Scotland recommendation of an interim target of 50% reduction by 2020.

It is imperative that the Bill establish annual emission reduction targets of at least 3% from 2010, not just from 2020, and that the interim target be amended accordingly. An early start in delivering emission reduction would also help focus minds in sectors - especially transport - where emissions are currently rising.

**The Bill must establish a duty on all public bodies to reduce emissions in line with the national targets**

The Bill fails to place upon public bodies a duty to reduce climate change emissions, providing only that Ministers “may” choose to do so at a later date. Local Authorities especially and the entire public sector generally have a key role to play in achieving the necessary emissions, especially under the new National Performance Framework. The Bill should be amended to establish a duty upon all public bodies to reduce emissions in line with the national targets.

**The Bill must include mechanisms for enforcement of the emission reduction targets**

The Bill contains no mechanisms for enforcement. As such, we question what will make Scottish Ministers (and public bodies) comply with the emission reduction targets that are set. Waste water and drinking water quality are regulated and enforced by specific bodies. This mechanism has proved a successful model in helping meeting targets for water quality, and the meeting of climate targets will require similar levels of scrutiny and sanctions. The Bill should therefore be amended to include measures for effective enforcement of the targets.
Introduction

The Steering Group came together to support the Members Bill on Energy Efficiency and Micro generation promoted by Sarah Boyack MSP.

The Members Bill was first consulted on in December 2006 and was resubmitted to the Scottish Parliament after the elections in 2007. It was agreed by the Economy, Energy and Tourism Committee that another consultation process was not required and the Members Bill proceeded to be drafted in 2008. In September 2008 the Cabinet Secretary John Swinney announced that he intended to legislate on Energy Efficiency and Micro generation in the Climate Change (Scotland) Bill.

During the Labour Business Debate on Energy Efficiency in the Scottish Parliament in November 2007 the objectives and broad proposals in the Members Bill were supported across the Chamber by members in all parties.

The purpose of the proposals in the Members Bill are to reduce greenhouse gas emissions and reduce fuel poverty by promoting the widespread adoption of energy efficiency measures by householders and businesses and the development of a mass market for micro-generation.

While there have been incremental changes in policy and government action in Scotland since the Members Bill was first proposed there remains no commitment to the principal proposals in the Members Bill namely to;

- Require Scottish Government to set targets for energy efficiency and micro-generation and for local authorities to consider such technology by setting targets and strategies to take this forward.
- Require Scottish Government to report annually on the progress of the implementation of the Members Bill.
- Implement one off discounts in domestic tax for householders who install energy efficiency and micro generation in their properties and similar one off discounts in business rates for small businesses
- Require all new buildings to include renewables or some form of low or zero carbon technology.

The fifth proposal in the initial Members Bill for permitted development rights for microgeneration was dropped from the Members Bill following the commitment given by Scottish Ministers after the 2007 elections that this would be taken forward by the new Scottish Government. The announcement of permitted development rights has taken until 6th February 2009 and while this makes some progress, it still means air source heat pumps and micro wind turbines have to go through the planning system to gain permission.

What organisations have supported development of these proposals?

The Members Bill Steering Group has brought together organisations with interests in the environment, fuel poverty and industry to work for warm, energy efficient homes and workplaces that are good for people and the planet. The Members of the Steering Group for the Energy Efficiency and Microgeneration (Scotland Bill) include:

- WWF
- Friends of the Earth Scotland
- Energy Action Scotland
- Age Concern Scotland
- Barnardo’s
Since the Members Bill was originally launched in December 2005, micro-generation and energy efficiency has shot to the top of the political and social agendas. A website (http://www.microgenscotland.org.uk) has been established by these environmental, fuel poverty and industry groups to push this agenda forward, and keep supporters informed.

**Why are the proposals contained within the Members Bill still needed?**

Since September 2007, the Cabinet Secretary for Finance and Sustainable Growth, John Swinney MSP has informed Sarah Boyack MSP that Scottish Government would not be supporting her Member’s Bill. He has however suggested that the Scottish Government may incorporate some of the provisions within the Energy Efficiency and Microgeneration (Scotland) Bill in the forthcoming Government Bill on Climate Change but to date there has not been any specific commitment made.1

Despite several Scottish Government announcements on energy efficiency and microgeneration, none of these fulfils the proposals set out in the Members Bill or will ensure that energy efficiency improvements and microgeneration measures are mainstreamed across society by requiring or incentivising such measures in homes or businesses. So, at the end of 2007, the Members Bill Steering Group agreed to support Sarah Boyack in moving the Members Bill to the next stage – to get it formally drafted and introduced into Parliament and supports her still in moving these proposals forward.

Since these proposals were set out, all the other political parties in the Scottish Parliament have continued to indicate support for this legislation. This was reaffirmed through cross party support for the Liberal Democrats’ amendment to the motion on Fuel Poverty which was passed by the Scottish Parliament in March 20082 and in the final amended motion following the Labour Business Debate on the 13th November 2008.

**How would these proposals help Scotland fight climate change?**

The Scottish Government has set a target of reducing greenhouse gas emissions by at least 80 per cent by 2050. The burning of fossil fuels to generate electricity or for heat are among the main sources of emissions Research suggests that the widespread installation of microgeneration could provide 30-40 per cent of our electricity needs by 20503, making a substantial contribution to reducing emissions. Microgeneration can also make a significant contribution to Scotland’s heat needs. Microgeneration technologies are now at a stage where they could begin to make a major contribution to the Scottish Governments climate change objectives. However, much of the hardware is expensive, being manufactured only in small quantities. A recent report estimated that there is the potential for 7-9 million installations of microgeneration by 2030, equivalent to 1 million in Scotland.4

Legislation to mainstream energy efficiency and microgeneration measures could kick start the market so volume of production can bring down prices, making the technology accessible to everyone, and encouraging Scottish manufacturers to expand. The sooner we start making progress in this area, the easier it will be to reduce emissions and tackle climate change. The Energy Efficiency and Microgeneration (Scotland) Bill proposals also aim to ensure that all new buildings include some form of micro-generation or low carbon technology as soon as possible to reduce their carbon footprint.

The proposals in the Members Bill would address the need to act swiftly to reduce Scotland’s emissions.

---

1 Official Report, Transport, Infrastructure and Climate Change Committee, 2 October 2007; c 178
2 Scottish Parliament: Official report 13th March 2008 c. 6913
How would these proposals help reduce fuel poverty across Scotland?

The most recent estimate from Energy Action Scotland states that there are 850,000 households living in fuel poverty in Scotland. Domestic gas and electricity bills have risen by 128 per cent and 76 per cent in the past five years. These increases equate to a combined average bill in excess of £1,000 meaning affordable energy is beyond the reach of many households. In 2008 alone the six dominant firms increased domestic prices by up to 26 per cent for electricity and 55 per cent for gas. Every 1 per cent rise in price pushes 8,000 more households into fuel poverty.

The proposals in the Members Bill will contribute to the Scottish Government’s target of eradicating fuel poverty, so far as is reasonably practicable, by 2016. Increasing the use of microgeneration – such as ground and air source heat pumps and solar panels - can particularly benefit the 30 per cent of the population who are off the gas network and often reliant on expensive and inefficient oil based systems. Increasing the energy efficiency of the building will help to reduce bills and make energy more affordable for the poorest households throughout Scotland.

Part 1: Emission Reduction Targets

Point in Time Targets

The Climate Change (Scotland) Bill proposes two ‘point in time’ targets relating to emissions. The first target is an 80% reduction in emissions by the year 2050 while the second is a target of 50% reduction by 2030.

The steering group members believe that the 2030 target is too late and inadequately ambitious to meet this rationale, and to fulfil the scientific imperative behind the Bill. We believe that energy efficiency measures and householder renewables have the potential to raise householder awareness and deliver early and significant carbon emission reductions. Home energy efficiency should be the place to start because relatively low cost measures can release substantial technical potential, and financial savings for householders.

Householder scale renewables are also now available but the price will not come down until there is a mass market. Research published by the Energy Savings Trust in May 2008 repeated the findings of previous research that one off discounts from the Council Tax would be an effective measure to promote uptake of energy efficiency measures.

The Steering Group is convinced that significant commitments are still required in the Bill that promote micro generation and energy efficiency as a vehicle to achieve early and significant reductions in greenhouse gas emissions.

Annual Targets

In addition to ‘point in time’ targets, The Climate Change (Scotland) Bill also provides for annual targets. Under the current proposals, the annual target will be rolled out in stages.

- Pre 2020 - Annual reductions need only be greater than the previous year
- Post 2020 - Annual reduction must be at least 3% year on year

The Steering Group believes that action to combat climate change needs to start immediately. The failure to stipulate specific targets starting immediately in the Climate Change Bill means as it now stands only marginal improvements in emission reductions between now and 2020 need to be delivered. This does not fulfil the SNP manifesto commitment or promises made that it would be radical. The proposals in the Members Bill would deliver significant greenhouse gas emission reductions in the short term.

---

Parts 3: Reporting Duties

The policy memorandum for The Climate Change (Scotland) Bill states that Ministers should be subject to strong and robust reporting requirements.

The Climate Change (Scotland) Bill imposes a duty to report annually and make a statement to Parliament relating to that report. Such a report would, if required, explain why emission targets are not met. In addition, there would be a duty on the Government to produce a report and statement on proposals and policies designed to meet future annual emission targets. It also requires reporting to include information on electricity generated and used in Scotland. It would be a simple matter to include a mandate to report on progress on efficiency and microgeneration in line with the Members Bill proposals.

The Members Bill proposals would also require the Scottish Government and Local Authorities to set targets to take forward the measures in the Bill and the Scottish Government to report annually to Parliament on progress made. This would be a practical way to deliver early progress on greenhouse gas emission reduction.

Part 4: Duties of Public Bodies

The current draft of the Climate Change (Scotland) Bill employs enabling powers to allow the Government to create secondary legislation to impose public sector duties, perhaps, at some time in the future. However, there is widespread agreement including amongst the Steering Group, that duties on public bodies need to be implemented right from the start and need to be established by the primary legislation, i.e. in the Climate Change (Scotland) Bill.

The public sector has a critical role to play, reducing emissions in line with national reduction targets and being seen to take a leadership role in society and the workplace. Many public bodies, responding to the consultation on the Climate Change Bill, responded positively about duties on public bodies. COSLA, in its response to the Climate Change (Scotland) Bill consultation, stated that it would have no objection to the proposal for enabling powers as long as local authorities were provided with adequate resources to act to enable those duties.

The Bill would be stronger if it required public bodies to be accountable for meeting targets, as those bodies would be more focused on delivering them. Voluntary measures are not enough to ensure delivery, or it would be happening already.

Such duties are common in other legislation such as the Land Reform (Scotland) Act 2003, Nature Conservation (Scotland) Act 2004 and the Water Environment and Water Services (Scotland) Act. Duties on public bodies and reporting requirements were outlined in the proposals for the Members Bill.

Part 5: Other Climate Change Provisions

Chapter 3 - Action Plan

Section 48 of the Climate Change Bill requires Scottish Ministers, within 12 months of the section coming into force, to “prepare and publish a plan for the promotion of energy efficiency in Scotland” and that “the plan must include provision about the promotion of the energy efficiency of living accommodation”. This is welcome, but there is no need to wait until the Bill is enacted to produce the first plan. The first Energy Efficiency Strategy was promised by Scottish Government in December 2003.

The Section will effectively repeal Section 179 of the Housing (Scotland) Act 2006 which stipulates that a strategy for improving the energy efficiency of living accommodation is required. The Scottish Government claim that the proposals in the Climate Change Bill will strengthen the existing statutory duty. However, while it would widen the duty, we would question whether it strengthens it.
While the Housing (Scotland) act required a strategy for ‘improving’ energy efficiency, the new Bill only requires a plan ‘promoting’ it. The connotations of ‘improve’ suggest greater pro-activity of response compared to the weaker ‘promote’. There is concern that as it currently stands, the Bill will be weaker than the existing provisions for the domestic sector.

One thing is clear, in order to be successful in improving energy efficiency, incentives are required to drive change. In England the existing provision of council tax discounts have been used in conjunction with power utilities to promote energy efficiency schemes which enable utilities to meet their CERT obligations. In Northern Ireland, Finance Minister Nigel Dodds announced his intention to introduce a ‘green’ rebates scheme for householders who bring their homes up to modern standards of insulation. Existing householders will qualify for a rebate by making energy efficiency improvements to their homes such as cavity wall and loft insulation. The scheme is being introduced to lower domestic consumption and reduce carbon emissions. This is why the proposals, for domestic incentives such as a reduction in Council tax, have been made in the Member’s bill.

Evidence shows this is the strongest incentive, and without any other proposals that would achieve the same ends, the Steering Group urge the Committee to consider it to bolster the provisions on energy efficiency in the Climate Change (Scotland) Bill.

Miscellaneous

New Build

The Scottish Planning Policy Guidance 6 (SPP6) document published in March ’07 sets out how the planning system should manage the process of encouraging, approving and implementing renewable energy proposals when preparing development plans and determining planning applications.

It includes an ‘expectation’ that all proposed developments over 500m$^2$ should incorporate on-site low or zero carbon equipment delivering an extra 15% reduction in CO$_2$ emissions. Some authorities in England and Wales already expect 20% reductions.

The SPP6 was intended to incentivise energy efficient development as the more energy efficient a building is, the less on-site renewables will be needed to make the 15% reduction. However, this intention is only expressed in Planning Advice Note No.84 (PAN84) that accompanies the SPP6, not the SPP6 directly, and the drafting of the SPP incorrectly defines the baseline as the building standard level, not the designed level of the particular building. The Steering Group understands that this disjuncture risks being overlooked in the Scottish Government’s proposed rationalisation of Scottish Planning Policies.

Surveys of the 32 Scottish local authorities suggest that SPP6 is not being given sufficient priority. A level playing field is required so that all developers are required to incorporate appropriate technologies in every development, thus stimulating the manufacture of renewables products and driving down costs. Without this requirement there is no evidence that these technologies will be routinely incorporated in developments.

The Steering Group therefore believes that the Climate Change (Scotland) Bill should improve upon SPP6 by including a requirement that all new developments should incorporate on-site zero and low carbon equipment contributing to a figure greater than the current 15% reduction in CO$_2$ emissions beyond the 2007 building regulations. This improvement should also have a clear statement regarding any impact an increase in energy efficiency installation would have on the requirement to install micro generation equipment for new developments.

---

7 Northern Ireland Executive 23rd December 2008  

Council Tax Incentives

The Scottish Government have remained steadfastly against this proposal. Initially, because they were committed to replacing the Council Tax with Local Income Tax (LIT) and as such the proposal was moot.

Note however, Liam McArthur MSP’s contribution to the debate of November 13th where he stated the need for accepting the principal of incentives, whether through council tax or LIT. In Northern Ireland, the incentive outlined above, relates to rates as the domestic taxation system. Now that LIT has been dropped by the Scottish Government there is now no argument for not enabling discounts from council tax.

As indicated above, research by the Energy Savings Trust suggests that a council tax rebate would be the more visible than other fiscal incentives. This in turn would maximise the potential for uptake. The Climate Change (Scotland) Bill should give local authorities the power to offer council tax rebates to incentivise householders.

Business Rates

Parallel proposals targeted at small businesses would ensure that a similar incentive for businesses would mean that where they operated in modest properties they would be encouraged to install energy efficiency and small scale renewables.

The Steering Group on the Energy Efficiency and Microgeneration Bill supports the Climate Change (Scotland) Bill and hopes that much of the learning around constructive proposals can be accommodated into the Climate Change Bill, as the Cabinet Secretary on Finance and Sustainable Growth has proposed previously.
WRITTEN SUBMISSION FROM NATIONAL LIBRARY OF SCOTLAND

Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

The National Library of Scotland (NLS) acknowledges the ambitious targets for reducing greenhouse gas emissions as set out in the Bill. The National Library of Scotland will set its own targets in accordance with our existing Sustainability Policy to help contribute to the Scottish Government’s annual targets.

Q8 The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

The NLS recognises its duties to reduce its carbon emissions and to report as required to the Scottish Ministers on this issue. The NLS will take cognisance of any guidance prepared by the Scottish Ministers.

Q20 Do you have any other comments on the Bill?

The NLS is one of a number of repositories of information in Scotland which can help to facilitate research into environmental management in general and climate change in particular. The Library believes it has an important role to play in providing research support for those working in this area.

Whilst welcoming the overall thrust of the Bill, the Library would like to see a commitment to investing in infrastructure (e.g. public utilities, public transport and digital infrastructure) to ensure that these ambitious targets are met. As an example, the NLS is very conscious of the further potential of new technology for widening access to information, without generating travel. NLS websites receive over 3 million ‘hits’ per year, against some 70,000 reader visits. Further investment in new technology will continue to have environmental benefits, such as increases in home-working, video-conferencing etc.
Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

Both targets will prove to be challenging for NHS bodies. Major Capital expenditure will be required for the achievement of the targets set out in the Bill; however it does present the opportunity to raise the profile of good energy management and carbon reduction strategies. A co-ordinated approach from all public sectors would prove to be the most cost effective and rewarding approach, as long as this was ‘driven’ by a central department with the power to actually influence change.

Q2 The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

What are your views on the setting of targets in batches from 2010 to 2022?

The setting of targets in batches may prove to be advantageous as this will aid organisations to plan long term strategies to achieve targets. The targets that are set must be achievable and realistic, and must be able to be reviewed within the ‘batch’ period.

Q3 The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

Annual targets should not penalise organisations for a good performance in the baseline year. Organisations that have already invested in carbon reduction and energy management will be penalised for being proactive, while an organisation that was managed badly will have easy reductions to make due to a poor performance in the baseline year.

Annual targets must also be weighted for weather conditions. Years which see an unusually hard winter may see organisations with mainly space heating energy use fail to achieve targets through no fault of their own.

Q.4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

Power generation in Scotland is already at over capacity for Scotland’s needs and a large proportion is sold in England. Will this mean that the UK government will supply carbon units to the Scottish government?
Q5 The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

Would flights passing through Scottish air space produce an ‘attributable emission’ to Scotland? This would be unfair as most transatlantic flights from mainland Europe pass over Scotland.

Q6 The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government's approach to obtaining independent, expert advice on climate change?

No view taken

Q7 The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland's emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

No view taken

Q8 The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

Reporting duties should not be onerous or overly bureaucratic. Consistent and clear guidance is required.

Q9 The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on this proposal?

No view taken
Introduction

We welcome the opportunity to contribute to this important proposed legislation and enclose the response from NHS Greater Glasgow and Clyde to the Climate Change (Scotland) Bill consultation.

Within NHSGGC there is recognition that the NHS has a duty to mitigate the impact of climate change by working to reduce our carbon footprint and to act as a truly sustainable organisation across energy use, transport, procurement, waste and building design areas. A recent paper published in the Public Health Journal (P. Cosford/Public Health 123 (2008)e1 – e5) provides a useful commentary on the potential role of the NHS in relation to sustainability and climate change and highlights the role played by the NHS Sustainable Development Unit in supporting change within the NHS in England.

NHS Greater Glasgow and Clyde’s Sustainability Planning and Implementation Group seeks to provide leadership for the organisation in matters relating to the environment and sustainability. Comments on the Climate Change Bill have primarily been drawn from this group that comprises representation from Acute Services, Public Health, Procurement, CH(C)Ps and Corporate Policy. It is our view that future legislation should reflect some recognition of the increasing demands of technology growth and legislative demands on services that in themselves can be contrary to the management of a downward trend in commodity usage and energy uptake. Examples of this can be seen in meeting demands for new scanners and the recent zero tolerance requirements for hand washing. There also needs to be some recognition of the age of the NHS estate and its ability, or not in some cases, to be adapted to accommodate alternative energy technology. There should be a clearer linkage of the sustainability agenda to the wider issues of addressing health inequalities. It would be helpful if related policy areas could provide further support for a sustainability strategy in general terms such as addressing poverty and supporting health improvement efforts so as to impact on the demand for NHS services.

The remainder of our response is structured around the identified issues, recognising that not all areas are relevant for us at present e.g. forestry.

We look forward to the publication of the response to this Bill and to the progression of this legislation as a means of supporting change.

Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

We welcome the Scottish Government’s proposals to aim for a significant reduction in greenhouse gas emissions in order to tackle the adverse effects associated with greenhouse gas emissions. The target of an 80% reduction by 2050 is ambitious – exceeding levels previously set, for example, by the Kyoto or the G8 targets – but achievable if there is support to implement and deliver on the necessary measures. We do recognise however that there is a view that more challenging targets in the future would reduce the risk of reaching the climate tipping points and clarity on whether the targets would include emissions arising from the manufacture of goods and services that are imported to Scotland would be helpful.

Q2 The Bill requires that the Scottish Government sets annual targets, in secondary legislation, from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?
Whilst we recognise that an early reduction in emissions is desirable, consideration should be given to the particular challenges relating to rebuild programmes that will affect the trajectory of the average annual reductions that can be achieved.

Q.4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

In order to achieve the ambitious 80% target it will be necessary to be focused on delivering a range of measures that reduce energy consumption, improve energy efficiency, shift energy production to more renewable sources and reduce waste. In addition, efforts to offset emissions will also be required. As a part of this the concept of a net emissions account may be helpful. However, any scheme for crediting or debiting carbon units and offsetting Scottish emissions has to be operated in a transparent manner that ensures that the Scottish emissions cannot simply be exported without being counted against the Scottish emissions reduction targets. There is a need to reduce the risk of creating a system of double counting and to avoid mitigating against a sense of purpose for Scotland to deal with its own emissions problem. We would therefore welcome a limit on the number of units Scotland can purchase. An uncapped purchasing of carbon units could undermine efforts to achieve the 80% net reduction in Scottish emissions and divert resources and attention towards merely exporting Scotland’s emissions elsewhere.

Q5 The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

We broadly support this definition but we would welcome further clarity on how the Scottish share of emissions from international shipping and aviation is to be determined. If this excludes emissions embodied in imports of goods and services to Scotland (e.g. of steel or fertiliser) there is a risk that it could provide an incentive for deindustrialisation and could prevent a holistic approach to the emissions that Scotland is responsible for.

Q6 The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government’s approach to obtaining independent, expert advice on climate change?

No comments.

Q7 The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?
Effective monitoring and reporting arrangements are crucial for achieving the reduction of greenhouse gases as proposed. We therefore welcome the arrangements set out in the Bill. Monitoring arrangements will have to utilise agreed international measurements to ensure they conform to existing standards and deliver comparable results. We would also like to note that any reporting arrangements will need to be operated in an efficient manner so as not to divert resources away from actual tasks of reducing greenhouse gas emissions and adapting to climate change.

Q8 The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

Public bodies are a significant part of the Scottish economy and contribute substantially to Scotland’s greenhouse gas emissions. We also acknowledge that public bodies are in a position to play a lead role in Scotland with regards to reducing emissions and combating climate change. As such we broadly support the provisions made in Part 4 of the proposed Bill, however, we would welcome further information on the nature of the “climate change duties” the Scottish Government is considering. Additionally, imposing any specific climate change duties on public bodies will in all likelihood bring with it cost implications for those organisations. It is unlikely that public bodies will be able to meet any substantial additional costs without further support from the Scottish Government. We therefore welcome the commitment expressed in 36 (6) for Scottish ministers to co-operate with relevant public bodies but we would like further clarity on how public bodies may be funded to deliver on any additional climate change duties.

Q9 The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on this proposal?

Adaptation to climate change is an important element in the overall approach to climate change, alongside efforts to reduce emissions and avoid increases in greenhouse gases in the atmosphere. We therefore welcome that the Bill makes specific provisions for the Scottish Government to take action on adaptation to climate change.

Q10 Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are your views on this proposal?

No comment.

Q11 The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

No comment.

Q12 The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?
Energy efficiency is a key aspect of reducing greenhouse gas emissions and we support the proposal to produce an action plan drawing together existing and proposed measures to improve energy efficiency.

Q13 The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government’s thinking in this area.

What are your views on this approach?

We support any efforts to make buildings more efficient and reduce the emissions associated with inefficient building design and maintenance. Whilst we therefore welcome the proposals set out in the Bill they raise some questions over the actions that would follow if buildings are found to fall short of accepted standards for energy efficiency. These questions will need to be addressed. We would also like to point out that any assessment process will have to be carried out in a way that is efficient and does not divert resources away from delivering on the wider climate change agenda.

Q14 The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

What are your views on this proposal?

As heating accounts for a significant proportion of energy consumption associated with domestic and non-domestic buildings, supporting the generation of heat from renewable sources is an important step. We therefore welcome the proposals to lend further legislative support to efforts that promote and incentivise heat generation from renewable sources.

Q15 The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas:

Waste prevention and management plans;
Waste data;
Deposit of recyclable waste;
Procurement of recyclate;
Reduction of packaging;
Deposit and return schemes;
Charges for carrier bags.

What are your views on these proposals?

We broadly support the proposal made in the Bill but offer some practical challenges in applying a sustainable approach to this area. The main issue is that whilst the Bill recognises the cost of achieving some of these aims it needs to be balanced against the cost of delivery. e.g. specifying a level of recyclates in products may be suitable for some industries and products but have a significant impact if we apply it broad brush. Within NHSGGC we have looked at changing basic products such as paper and pens. Paper: Switching to a 100% recycled paper product would create a cost pressure of £288k. (extract from recent paper: "If option 2 (recycled paper) is used the cost would increase to £2.28 per ream (total cost £763,800 option 2, a cost pressure of £288,100 = 60.5%).").

Pens: A standard 'Bic' pen is £2.50 per box of 50, 5 pence each. The cheapest pen made from recycled materials (76% recycled) is £7.10 per box of 10, 71p each. This is an increase of 1420%.

These practical examples demonstrate the need to understand the other pressures which may become barriers to achieving climate change if they are not considered and built into the strategy.

Q16 What are your views on the adequacy of the Scottish Government's consultation in advance of publishing the Bill?

No comment.
Q17 Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government out on the consultation proposals?

No comment.

Q18 Does the Bill raise any equalities issues you would wish to highlight?

The measures and actions required to achieve the targets set out in the Bill may be more difficult to implement for those living in poverty, potentially resulting in a widening inequalities gap. This would have implications for a range of other policy areas to take action to address these inequalities.

Q19 Do you have any comments on the impact of the Bill on sustainable development?

We welcome the Bill as a significant step towards greater support for new technologies and behavioural changes in Scotland in relation to sustainable development, for example by encouraging changes in the public and private sector regarding energy use, efficiency and waste.

Q20 Do you have any other comments on the Bill?

See introduction.
Q10  Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are your views on this proposal?

No view taken.

Q11  The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

No view taken.

Q12  The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?

Public building already have to achieve BREEAM excellent standards.

EU Directive 2002/91/EC and BRE guidelines have meant that public buildings require EPC’s (Energy Performance Certificates).

Q13  The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government's thinking in this area.

What are your views on this approach?

Considerable costs have already been incurred in producing EPC’s, costs which could have been targeted more beneficially at improving performance in what are generally known as 'poor performance.'

Consideration should be given ensure that any further costs incurred actually improve performance.

Q14  The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

What are your views on this proposal?

This is a good step forward in sustainable development.
Q15 The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas: Waste prevention and management plans;

Waste data;
Deposit of recyclable waste;
Procurement of recyclate;
Reduction of packaging;
Deposit and return schemes;
Charges for carrier bags.

What are your views on these proposals?

New regulations should not be overly bureaucratic and work with existing legislation and regulations. Charging for carrier bags has not been proven to work in the Republic of Ireland and may have led to the production of more plastic.

Q16 What are your views on the adequacy of the Scottish Government’s consultation in advance of publishing the Bill?

Consultation has been adequate.

Q17 Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government out on the consultation proposals?

No view taken.

Q18 Does the Bill raise any equalities issues you would wish to highlight?

None.

Q19 Do you have any comments on the impact of the Bill on sustainable development?

The bill may prove to be a stepping stone toward sustainable development.

Q20 Do you have any other comments on the Bill?

None.
Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

If the starting point for NHSScotland’s 80% reduction on direct building CO₂ emissions, i.e. energy usage, is the NHS actual usage in 1990, then the 50% and the 80% reduction are feasible. However, as much of the existing NHS buildings stock will still be in use in 2050 there will be a need for a substantial portion of the total NHSScotland energy requirement in 2050 to come from renewables, primarily grid electricity. Will there be sufficient green grid electricity to cover the demand from the NHS? Also, will the Scottish CO₂ figure for electricity generation, instead of the UK figure, be used to calculate an organisations emission, and to take advantage as more and more renewables come on line to accurately reflect the carbon emissions?

Q2 The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

What are your views on the setting of targets in batches from 2010 to 2022?

NHSScotland have had an annual target for nearly 25 years and the current 2% of base year target ends in 2010. NHSScotland will probably continue with an annual target designed to achieve 80% reduction on the 1990 base by 2050. NHSScotland would welcome some milestones however, there needs to be recognition of an organisations past performance. It is likely that different organisation will be starting from different points on their 80% reduction of their respective 1990 emissions. Setting targets should be designed to help all organisations converge on the required 80% reduction and not penalise those that have demonstrated substantial reductions since the 1990 base year. Also organisations should be allowed to follow there own published plans if it can be demonstrated to achieve the 2050 target.

Q3 The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

Over the last 22 years the NHS in Scotland has reduced energy usage in Hospitals by over 40% which is slightly more than a 2% year on year saving. However this is NHSScotland as a whole, within this some Boards were better or worse and we would propose that any new target would give this flexibility, i.e. the target would be of the overall organisation and not on its individual components. NHSScotland also recognise that there is a need to achieve an average of 2.6% year on year to achieve its 80% reduction by 2050. However, the level of funding provided for new Hospital/HC etc will be crucial to achieve this. Also the reductions of emissions year on year will depend on the phasing of this capital funding, resulting in some years having an above average reduction and vice versa a below average reduction in other years.
Q.4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

While the best outcome is for the target to be achieved from actual reductions of greenhouse gases there may be years when this is not possible, e.g. delay in commissioning renewables projects, installing new plant, etc; and being able to purchase carbon units from another country would keep Scotland on target for 2050. However this should only be a temporary measure, sooner or later there would still be a need to make the actual reductions rather than a continually purchasing carbon unit’s year on year.

Q5 The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

Direct emission made in Scotland is fine; however there is not a clear calculation for indirect emissions. International aviation and international shipping can be viewed as both direct and indirect, however Scotland’s share of aviation could be viewed as half of each flight that originals in Scotland i.e. aviation is two way traffic and each country could therefore be responsible for ½ the international aviation emission of all flights the land and take off from the airports. Alternatively a simpler method could be to count total aviation fuel supplied to airports within the country. Similarly for shipping it could be the amount of fuel supplied to ports within Scotland. If this is applied worldwide then the chance of double counting would be minimised.

Q6 The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government’s approach to obtaining independent, expert advice on climate change?

As it appears that the Scottish Government could be ahead of the rest of the UK in tackling climate change, this would be the natural progression to ensure Scotland can achieve its target. The recent change by the UK Government to set an 80% target following Scotland lead is just one area where Scotland is leading, therefore if there is a chance that Scotland could be held back, having the ability to form a separate group would provide the best of both worlds.

Q7 The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

The reporting arrangements are fine; however a fundamental must be to have a consistent method of collecting and reporting emissions. The Public sector could lead by example by using a common monitoring and reporting system to allow progress to the targets be tracked and reported to ensure consistency and accuracy.
Q8 The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

As mentioned in Q7 it is essential that the Public Bodies lead by example and achieve year on year reduction in emissions. Accurate and consistent reporting is essential to help identify early problems in achieving the target thereby identifying where guidance may be required.

Q9 The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on this proposal?

It is reasonable to expect SG to be looking at the various risks from increased risk of flooding and severe weather. Changes to building regulation to design to withstand severe weather etc. These need to be considered fairly urgently, amending where necessary planning regulations, building regulations to help manage these risks. Also to draw up a list of areas likely to regular flooding and produce plans and action to mitigate the risk to people and existing properties.

Q10 Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are your views on this proposal?

The Scottish Government should have this enabling power.

Q11 The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

NHSScotland would support decisions aimed at increasing carbon capture through increasing the size of Scotland’s forests thereby offsetting the amount of carbon dioxide emissions. NHSScotland would also support the increased production of wood chip to ensure economical supplies for Biomass plants for the carbon neutral process of providing local heating and electricity.

Q12 The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?

This is essential; however the starting point is to recognise that a substantial part of the current building stock will still be in use in 2050. New buildings will soon need to be carbon neutral, but the current biggest waste of energy is from poorly insulated buildings. Research is needed to identify methods of raising the insulation level to today’s regulations or even better. This needs to be done first before looking to change boilers or install renewables to avoid installing the wrong plant. However, the Public organisations would need financial support to ensure this is done.
Q13 The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government’s thinking in this area.

What are your views on this approach?

This is consistent with achieving a level playing field; it is required to ensure an organisation does not simply switch to use renewable energy without meeting a required minimum energy efficiency performance. NHSScotland has for almost 10 years monitored the Comparative Performance of Hospitals against a Best Practice base and this is now being rolled out to all the other small sites, i.e.; health centre, clinics etc. This provides a means to determine the best and worst performing sites enabling resources to be directed more effectively. Ultimately this could be done with EPCs if applied to all buildings and a central register was set up to monitor and report on the energy performance across all organisations.

Q14 The Bill places a duty on the Scottish Government to take such steps as it considers appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

What are your views on this proposal?

This would be acceptable to NHSScotland, however there must be conditions, all schemes should be vetted to ensure that the building/site that they are intended for meets a certain level of insulation performance, see Q12 comments, or will be brought up to at least today’s standard prior to the installation. This will ensure that the size of any equipment installed is minimised and energy performance optimised. Grants or funds provided for renewable heat projects should be sufficient to ensure this is part of the overall project.

Q15 The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas:
- Waste prevention and management plans;
- Waste data;
- Deposit of recyclable waste;
- Procurement of recyclate;
- Reduction of packaging;
- Deposit and return schemes;
- Charges for carrier bags.

What are your views on these proposals?

Help in all these areas would be welcomed by NHSScotland. NHSScotland collects details from all Boards on the quantities of waste being recycled. Slow progress is being made but help is needed to simulate the whole recycling business. It can still be difficult to get companies to collect all the different types of recycled waste. Setting targets on organisations to gradually recycle a greater proportion of their waste would bring in more competition and more importantly innovation on how to manage a collection system through a products life from purchase to disposal.

Q16 What are your views on the adequacy of the Scottish Government’s consultation in advance of publishing the Bill?

Fairly comprehensive Bill, although it would have been helpful if there was more details on the carbon emissions of different sectors, and what would be expected of them. For instance, what was is the 1990 level of emissions against each sector that the Bill will use as the baseline?
Q17 Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government out on the consultation proposals?

No comment.

Q18 Does the Bill raise any equalities issues you would wish to highlight?

There is much technical substance to the Bill and this may lead to discrimination with non-technically minded people. Also the provision of grants and subsidies need to be made available to those with limited financial means, or it might run the risk of supporting only those with the financial and technical know-how.

Q19 Do you have any comments on the impact of the Bill on sustainable development?

The Bill should be seen as another step on the route of continual improvement to achieve sustainable development.

Q20 Do you have any other comments on the Bill?

No.
Question 1: What are your views on the 2050 target and a 2939 interim target proposed in this Bill?

The targets seem ambitious. It needs to be supported by incentives as the public sector may not have the resources to achieve the targets by applying technologies such as renewables.

Question 2: What are your views on the setting of targets in batches from 2010 to 2022?

Consider this to be suitable.

Question 3: What are your views on this approach or any possible alternative approaches?

Consider this to be acceptable.

Question 4: What are your views on the proposals in the bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

No strong view.

Question 5: What are your views on this definition of Scottish emissions?

What is included or excluded in the net Scottish emissions account? What about electricity from hydro? If Scotland distributes goods/services elsewhere, is that emissions 100% Scottish or should the end user have proportion of responsibility for that emissions.

Question 6: What are your views on the Scottish Government's approach to obtaining independent expert advice on climate change?

Do not agree - why form another group when there is already one for UK.

Question 7: What are your views on these proposed reporting arrangements?

These are suitable.

Question 8: What are your views about this proposal?

There are already schemes run as CRC and EUETS as well as CCL that "tax" on emissions. Is this yet another of such schemes that will add further financial burden on Public Sector?

Question 9: What are your views on this proposal?

No strong views.

Question 10: What are your views on this proposal?

Consider this appropriate.

Question 11: What are your views on this proposal?

Consider this appropriate.

Question 12: What are your views on this proposal?

Consider this to be a necessary element of any bill.
Question 13: What are your views on this approach?

Happy with the proposal.

Question 14: What are your views on this proposal?

Consider this to be appropriate.

Question 15: What are your views on these proposals?

Business should no longer be allowed to produce packaging and carrier bags, unless they are made from recycled/biodegradable materials. Plastic bags should no longer be in use in City Centres.

Question 16: What are your views on the adequacy of the Scottish Government's consultation in advance of publishing the Bill?

Satisfactory.

Question 17: Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government on the consultation proposals?

No.

Question 18: Does the Bill raise any equalities issue you would wish to highlight?

No.

Question 19: Do you have any comments on the impact of the Bill on sustainable development?

The Bill can only assist the push for sustainable development.

Question 20: Do you have any other comments on the Bill?

None.
Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

The setting of an 80% reduction target is a challenging but necessary target. The setting of an interim target of 50% by 2030 is also welcome as this will help to ensure that actions are undertaken sooner rather than later (although, as the earlier carbon savings can be made the greater the overall savings perhaps a target of more than 50% by 2030 should be adopted). However, setting other additional interim targets for 2020 and 2040 would provide an additional incentive for action to be undertaken and progress to be maintained. There should be scope to raise the targets if scientific evidence required this to happen.

Q2 The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

What are your views on the setting of targets in batches from 2010 to 2022?

The setting of targets in batches should support on-going action and reduce the risk of a lack of urgency or complacency. However, the first batch of targets is for a 12 year period, while all other periods to 2050 are for 5 year periods. While appreciating there may be a desire to allow gearing up to meet targets, perhaps 12 years is too long a period for this.

Q3 The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

This approach may be an easier approach to implement but as there are significant benefits to be gained from lowering emissions as quickly as possible thereby significantly reducing total emissions from the implementation date to 2050 perhaps greater encouragement can be given to encouraging faster reductions. If progress is quicker than anticipated it may be unrealistic to expect an annual 3% reduction in the latter years leading up to 2050.

Q4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

If carbon units are to be used at all their use should be limited. The goal should be for Scotland and other countries to reduce their overall emissions from source. Further details are required with regards the provisions to be made for the use of carbon units.
Q5 The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

Whilst this approach seems fair in principle how will international aviation and international shipping actually be disaggregated in practice e.g. if a foreign airline carries a full load of Scottish passengers from a Scottish airport to a Spanish airport (and back) what proportion of carbon emissions would be placed against Scotland and what would be placed against Spain? (And, if the airline came from a third country what proportion of carbon emissions, if any, would be placed against the third country?) The issue of carbon emitted in the manufacture and transportation of goods made out with Scotland but consumed in Scotland (and vice-versa) also needs to be addressed. Again, when provisions are made for use of carbon units, it should be made explicit that those sold to outside Scotland will still be included as Scottish emissions and not double counted elsewhere.

Q6 The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government’s approach to obtaining independent, expert advice on climate change?

The key objective should be to obtain accurate, relevant and impartial advice on an on-going basis regardless of this advice coming from a UK or a Scottish body. The expertise of the UK Committee on Climate Change should not be ignored nor should the need for sufficient and suitable Scottish information. A UK level organisation may be seen to be more impartial with regards Scotland but the dependence on a body that is appointed by the UK Government may be an issue. It may be advantageous for a body to provide tailored advice for Scotland and serve as a dedicated resource. Options could be to provide additional resources to the UK committee to enable them to provide dedicated advice for Scotland or establish an additional Scottish committee which can work in tandem with the UK committee for UK-level issues.

Q7 The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

Regular reporting is necessary to measure progress, identify issues and help ensure accountability. The suggested reporting timescale (three years after the year ends) seems to be excessively long (and could result in targets being missed due to a lack of early warning). It may also be worthwhile identifying where carbon units have been sold and how/where it is proposed to direct revenue that is generated in the coming year to further reduce emissions.
Q8 The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

Whilst the need to place duties on public bodies is recognised there will also need to be recognition of the additional resources that will be required to address these duties effectively. The potential of placing reporting duties on medium and large scale private organisations should also be investigated.

Q9 The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on this proposal?

It is to be welcomed that the need for monitoring and reporting of adaptation to climate change is recognised, however, timescales need to be workable for those involved and relevant in terms of ensuring progress is being made.

Q10 Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are your views on this proposal?

The timing of Muirburn may well need to be altered due to changing climatic conditions and, as such, the enabling power is to be supported.

Q11 The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

The use of the National Forest Estate for renewable energy will help ensure a sustainable, climate friendly, secure energy source that also provides significant local and national economic benefits. Safeguards will, however, be required, with regards biodiversity, land use and water courses and with retaining the primary function of the Forestry Commission i.e. managing and promoting this land.

Q12 The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?
Increasing the energy efficiency of the building stock will make a significant reduction in greenhouse gas emissions as will efforts to change people’s behaviour. The requirements for energy efficiency of buildings should be justifiable in terms of the targets set out for emission reductions for each of the relevant periods identified. The Planning and Building Standards Systems would provide a good mechanism for energy efficiency measures in new buildings and subsequent ramping up of requirements in relevant legislation and guidance for these would be appropriate. For improvements in existing building stock and in terms of enforcement there will be an issue of resources for the enforcing authority and there is also an issue of what enforcement powers will be available. More information on exactly what is proposed is required before more detailed comment can be given.

Q13 The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government’s thinking in this area.

What are your views on this approach?

See response to Q12 (above).

Q14 The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

What are your views on this proposal?

A significant effort will be required to encourage space heating from renewables and the introduction of measures to bring this about is welcomed. Scotland has a large woodland resource with potential for an even larger resource to be created and managed sustainably. This could be used to provide large amounts of biomass fuel which, as previously stated above, could potentially provide climate friendly, secure energy in a manner that would have significant local and national economic benefits. Steps to encourage renewable heat could help “kick-start” the development of a large scale biomass industry in Scotland and help tackle any issues relating to local wood-fuel supplies. Any Government steps to encourage use of biomass require strong guidance and direction in support as many concerns exist as to legality of fuels within smoke control areas (which may require revisiting the relevant legislation), emissions of particulates, etc. This direction requires to be coupled with appropriate resources being made available to enable this. The requirement for a strong direction and provision of resources is applicable across the range of renewable sources as well as biomass.

Q15 The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas: Waste prevention and management plans;

- Waste data;
- Deposit of recyclable waste;
- Procurement of recyclate;
- Reduction of packaging;
- Deposit and return schemes;
- Charges for carrier bags.
- What are your views on these proposals?
The minimisation of waste production combined with mechanisms and incentives to recycle should help develop a “low waste” culture. There will, however, be a need to clearly define responsibilities between all concerned in the waste process including those concerned with monitoring and enforcement. The potential for enforcement authorities to recover reasonable costs through the levying of charges is welcome as this will ensure that regulation and enforcement is adequately funded. Measures to develop a market for recyclate are also welcomed as this will help overcome the lack of end users for recyclate. Support for “deposit and return” schemes and carrier bag recycling are also welcome as this will reduce waste but also encourage a recycling culture both with producers and consumers.

Q16 What are your views on the adequacy of the Scottish Government’s consultation in advance of publishing the Bill?

No comment.

Q17 Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government out on the consultation proposals?

No comment.

Q18 Does the Bill raise any equalities issues you would wish to highlight?

No comment.

Q19 Do you have any comments on the impact of the Bill on sustainable development?

The development of a low carbon economy that seeks to embrace both energy efficiency and renewable energy will significantly assist in enhancing sustainable development within Scotland. With Scotland’s vast but under-utilised renewable energy sources the Bill’s focus on renewables, including renewable heat, should help in the development of these resources and provide greater energy security and sustainable economic growth. The measures that are detailed in relation to waste minimisation and recycling should also assist sustainable development by developing a “low waste” culture and encouraging markets to develop for recyclate. The positive sustainable development benefits should, however, not be taken for granted as sufficient resourcing of various measures will be required to help ensure benefits are maximised.

Q20 Do you have any other comments on the Bill?

No comment.
Executive Summary

- Oxfam Scotland is a member of the Stop Climate Chaos Scotland (SCCS) coalition. This grouping of development, environmental and faith-based NGOs, trade unions and community organisations has the support of over 1.5m million Scottish citizens and is campaigning to try to avert dangerous climate change. Our response compliments that of SCCS, available at [www.stopclimatechaos.org/scotland](http://www.stopclimatechaos.org/scotland) and lists ten key priorities for the Climate Change (Scotland) Bill.

- These priorities include: an 80% reduction in Greenhouse gas emissions by 2050, statutory annual emission targets of at least 3% year-on-year reductions, the inclusion of aviation and shipping emissions in targets and the establishment of a Scottish Climate Change Commission in the primary legislation.

- Oxfam Scotland believes, along with SCCS, that strict limitations on the accounting of international trading of emissions credits must be imposed on Scottish Ministers to ensure a minimum of 80% of mitigation action takes place domestically.

- Internationally Oxfam is calling for a just, honest and urgent global deal to address the climate crisis that is already claiming thousands of lives annually, especially in the poorest areas of the world. If Scotland can produce a truly world leading bill it can be used as a global example - not just as a blueprint for other developed nations but as a signal to developing countries of the commitment of the global north to meet climate responsibilities. With the critical Copenhagen negotiations taking place in December 2009 this is the moment to set that example.

- The current international financial crisis and the global recession should not be used as an excuse to take no action or to push back in the medium to term the transition to a low carbon economy that is required in order to meet long term targets. Indeed, this moment of global change is an opportunity to re-model our economy to meet broader societal needs, combating both climate change and domestic poverty.

Introduction

Oxfam and Oxfam Scotland

Oxfam exists to combat poverty across the world. For nearly 70 years we have operated internationally, now in over 100 countries and with over 3000 partner organisations, to find lasting solutions to poverty and injustice. Oxfam has operated in Scotland for over 60 years. Through our shop network, our development education and youth development programmes, our campaigning and grassroots activism in communities across the country, through our UK Poverty Programme, tackling social exclusion in Scottish towns and cities.
Oxfam and Climate Change

For the most vulnerable in the world, climate change is not a coming crisis; it is already an existential threat. Excessive greenhouse emissions are – with scientific certainty – leading to floods, droughts, hurricanes, sea-level rise and seasonal unpredictability. These impacts are undermining millions of people’s rights to life, security, food, water, health, shelter and culture. The poorest in the world do not have the resources, human or financial, to meet this growing challenge. External shocks impact upon people in developing countries with a ferocity from which they can often never recover. The injustice of climate change is multiplied by the fact that those most affected are those least involved in causing the crisis. It is the rich, developed world that has for two centuries burned ever more fossil fuels bringing us to this critical juncture. Scotland has an undeniable historical role in the genesis of this crisis. As a cradle of the industrial revolution and the birthplace of the enlightenment thought that has spread a model of reckless consumption across the global North, Scotland has a duty to help create a climate for change.

Stop Climate Chaos Scotland

Stop Climate Chaos Scotland is a coalition of more than 30 organisations campaigning together to tackle climate change. The coalition members include environment and development NGOs, faith groups, trade unions, community councils, student societies, women’s organisations, a mental health charity, and many others. In Scotland, the members have a combined supporter base of over 1.5 million people.

The Stop Climate Chaos Coalition Scotland priorities for the Climate Change (Scotland) Bill are that it must:

1. Set out a framework that will achieve at least an 80% reduction in greenhouse gas emissions by 2050.
2. Establish in statute annual emission reductions of at least 3% year-on-year from the start, not just from 2020, compatible with a fair and safe cumulative budget identified by the advisory body (see 4).
3. Include emissions from all sectors in the framework and targets set out in the Bill, including those from international aviation and shipping, from the very start.
4. Establish a Scottish advisory body, a Scottish Climate Change Commission, in the primary legislation to support delivery of the Bill when it is enacted.
5. Ensure that at least 80% of the effort to cut emissions takes place in Scotland.
6. Establish duties on all public bodies to reduce greenhouse gas emissions in line with the national target.
7. Set in place robust, transparent reporting measures so the Scottish Parliament is well informed on progress in meeting targets and Government is held to account on mitigation and adaptation.
8. Ensure that strong enforcement measures are set in place in statute.
9. Ensure Scotland counts all its emissions and reports on those produced by products and services we consume as well as emissions produced domestically.
10. Be explicit that sustainable development is core to the purpose and delivery of the statute in relation to mitigation and adaptation.

Oxfam Scotland’s Response to the Call for Views Questions

Our responses to all questions are in line with the SCCS response. To save duplication, for answers to questions 1, 2, 5-10, 12-17 and 19 please refer to the SCCS document. The following answers are for emphasis and to provide the direct context of Oxfam’s experience.
Q3 The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

If dangerous climate change is to be avoided and long-term targets contained within the bill are to have any real meaning, action to reduce climate impact must take place urgently. The window that the bill currently leaves open until 2020 is unacceptable and unwise. It is not just the trajectory towards meeting 2050 commitments that must concern us. We must also look at the amount of greenhouse gases that are being produced on the way. Leaving meaningful change for another decade will result in significantly higher emissions overall. Given that the evolving science of climate analysis is pointing more and more towards the hazard of dangerous tipping points being reached over the coming decade it is grossly irresponsible to leave action until later.

The open window that the bill allows also ignores the human urgency of the situation. As we have stated, people in developing countries are losing their lives today. They do not have a decade to wait.

Scotland must also take account of the global political processes towards a new post-Kyoto deal that must be struck in December in Copenhagen. Scotland has promised world-leading legislation. If the Scottish Parliament succeeds in producing such a bill then it will be a signal to developing countries that the rich North are prepared to take the urgency of the situation seriously. Failure to take urgent action will be equally noted by the developing countries who showed resistance to a deal in Poznan last year in the face of weak commitments and a failure to recognise the urgent nature of the problem from the North. Building this trust is critical and Scotland needs to play a responsible part.

Q4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

The net Scottish emissions account serves as a useful model to account for Scotland’s impact on climate change. But accountancy is not the goal of this bill. The net Scottish emissions account should only be applied if it allows for the urgent incentives for change, in all sectors, required in order to meet urgent and ambitious government targets.

The interaction of devolved climate change legislation with reserved competences in trading systems and internationally agreed trading rules are deeply complex. Oxfam is not opposed to carbon trading either conceptually or, in some cases, in practice. Yet current systems of trading outwith the ETS are becoming increasingly discredited through the exposure of corrupt practices and perverse iniquities between rich beneficiaries and poor losers. It is essential that any trading that the Scottish Government takes account of in meeting targets is of the highest certified standard.
As the bill currently stands there is no limit set on the use of trading whatsoever. Ministers have stated publicly that they wish the bulk of mitigation to take place in Scotland, that Scottish money should be spent in Scotland to make the necessary changes to our economy and means of production domestically. Such assurances are welcome but are in no way binding, whether on this current administration or the next. The bill needs a statutory limit that will ensure a just distribution of responsibility. Oxfam strongly supports the SCCS position that a minimum of 80% of targets must be met domestically. An open door for ministers to meet targets through trading will do nothing to set the certainty of market conditions the private sector craves, will fail to provide the incentives for public sector action that Scotland needs or the honest appraisal of culpability that the developing world demands.

Q11 The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

Oxfam Scotland takes no direct position on the forestry proposals in the bill. We have however been greatly disappointed that such a controversial measure has distracted from the central and crucial thrust of the legislation in terms of political discussion and media attention and are unclear about the value these measures bring to the principle purpose of the bill.

Q18 Does the Bill raise any equalities issues you would wish to highlight?

Oxfam knows that those most likely to live in poverty globally are women and girls. Females in developing countries are most vulnerable to the external shocks of climate change that threaten safety, livelihoods and health. Climate change has a gendered impact in the same way that poverty does.

Q20 Do you have any other comments on the Bill?

The Scottish climate change legislation has emerged at a time of great international turmoil when the economic model so dominant in the global north and so damaging to the global south has begun to be questioned for the first time in many years. There will be those who contend that this is not the time to take action on ‘environmental concerns’, that the re-floating of the economy requires our full attention and the stimulus of all of our financial resources. It is precisely this kind of thinking, the fanciful and wilful divorce of finance and environmental consumption, which has led us to this perilous economic condition. Oxfam Scotland would caution all MSPs from the perversity of this negativity. This legislative agenda and the actions our Government and Parliament must take in implementing it are opportunities to help rebuild a productive economic model that is sensitive to consumption and that serves people first. We are keen to engage any and all politicians in how the now common change of phrases such as ‘green new deal and ‘green collar jobs’ can be made real to help address poverty both in Scotland and abroad.
Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

The 2050 target and 2030 interim targets being proposed for the reduction in greenhouse gas emissions are achievable, but challenging, and will require a strategic plan to achieve this aim.

Strategic changes would include progression with renewable power projects, transportation plans and strategies, low carbon and high energy efficient Buildings, shared use of resources, partnership working, and increasing public general awareness.

To fund the investment needed to achieve the target reductions it is recommended that the Scottish Parliament will need to consider the availability of investment and the resources required to achieve these targets and whilst much investment has been undertaken by the Council in this area already, a higher level of funding will be necessary.

Q2 The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

What are your views on the setting of targets in batches from 2010 to 2022?

The setting of achievable annual performance targets in batches between 2010 and 2022 is welcomed and good practice, as is the reporting of progress towards achievement of annual targets, for years 2030 and 2050, but this has resource implications across the Council which will need to be considered. The reporting periods are recommended as bi-annual between 2010 and 2022 to allow sufficient time for measurable progress to be recorded. A number of local Performance Indicators may be necessary to record progress across the Council and it is suggested this information be reported and monitored through the existing Sustainable Development Working Group which is a cross cutting group with individual work tasks assigned to Service Departments.

Q3 The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

The proposed annual emission target reductions of 3% is a positive but challenging target to set and whilst generally supportive of this, it must be progressed as part of a strategic plan. This plan should contain actions which will lead to measurable energy efficiency savings and whilst these actions will lead to improvements there will be additional costs associated with procurement and provision.

Annual targets will need to reflect the baseline year (1990) for each gas type and recognition for improvements already achieved or in progress.

Q.4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

The net amount of Scottish emissions is a useful starting point of reference with which the target for reducing greenhouse gases can be measured. The amount of units that emissions that can be credited or debited can vary, carbon units can be bought or sold however there should be a limit to the extent this can be done, if real progress is to be achieved. Containing demand for increasing energy consumption will be challenging, driven by change and increasing community aspirations in many areas.
Q5 The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

Scottish greenhouse gas emissions attributable to Scotland or those which represent the Scottish share of emissions from international aviation and international shipping require further definition by Scottish Ministers to enable an accurate picture for Scotland to be established at the outset, and to define how and whether these elements can be properly included, and the ability to influence external commercial entities in the medium to long term. Further information is being sought regarding how this process would be operated including items such as carbon offsetting measures and measurable targets apportioned to Renfrewshire. Renfrewshire as home to Glasgow International Airport should not be disadvantaged by the airport's location by having additional emissions attributable to Renfrewshire.

Q6 The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government's approach to obtaining independent, expert advice on climate change?

Whilst the use of independent expert advice for Scotland in addition to the advice provided by the UK committee on Climate Change is to be welcomed. Any additional actions from this advice would need to be aligned to UK advice. The impact and measures of this should be that it does not unduly put Scotland at a disadvantage compared to the UK as a whole and any advice should be tailored to Climate Change as it affects Scotland.

Q7 The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

Reporting requirements are fully supported and it is anticipated that all Scottish Local Authorities would follow existing corporate reporting mechanisms on performance. There will also need to be sufficient resources across the council to co-ordinate and undertake this task. It is further anticipated that individual Service Departments across the Council would be allocated tasks and undertake performance reporting, consistent for their area of responsibility.

Q8 The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

The requirement of local authorities to undertake regulatory functions regarding Climate Change duties is supported. It is anticipate these will follow existing corporate requirements. Further implications of this requirement include increased joint working with partners and public bodies.

Q9 The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on this proposal?

Whilst the general proposal for adaptations are welcomed, planning considerations for identified areas of risk due to Climate Change should be subject to regulatory controls and to address the effects of Climate Change.
Q10 Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are your views on this proposal?

The proposed controls through the bill are to be supported to enable control and improvement in Climate Change.

Q11 The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

The immediate intent of the legislation is to take forward proposals to allow the Forestry Commission to enter into joint ventures for:

- Renewable energy development and,
- To allow them to let timber cutting rights to fund Climate Change activity.

Both of these proposals could have significant planning and environmental implications. The Council would be supportive of these types of project and could work with the Forestry Commission to reduce the emissions of greenhouse gases.

Recognition should be given, however, to the significant environmental impacts that tree felling and planting can have on biodiversity, landscape, nature conservation and archaeology unless it is carefully managed.

Similarly, realising the untapped potential wind and hydro renewable energy schemes on the forest estate will have to be achieved in a sensitive manner that respects the environment. Public access may also be affected by these types of development.

Q12 The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?

The bills proposal for production of an action plan which should be strategic in nature to improve the energy efficiency of buildings is supported. Resource implications for continued progress need to be considered for buildings and the proposed implementation of an action plan should be supported by advice on cases of best practice, and benchmarking to encourage behavioural change.

Q13 The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government's thinking in this area.

What are your views on this approach?

The proposals for the Scottish Ministers to make regulations to the energy performance of buildings is to be welcomed and will be a driver for change.
Q14 The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

What are your views on this proposal?

Whilst the proposals for renewable sources are to be welcomed, a more direct approach is thought necessary to encourage greater use of bio-mass heat sources as it is an efficient method of reducing CO² emissions. There are issues which must be addressed centrally regarding the production of bio-mass crops used to create fuel. The use of locally produced bio-mass crops should be encouraged to reduce the transport CO² emissions.

The additional capital cost of installing a biomass heating plant must be offset against long term competitive biomass fuel prices and it will be important that the costs of biomass fuels are controlled centrally.

Q15 The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas:

- Waste prevention and management plans;
- Waste data;
- Deposit of recyclable waste;
- Procurement of recyclate;
- Reduction of packaging;
- Deposit and return schemes;
- Charges for carrier bags.

What are your views on these proposals?

The Council's views are to support these proposals and the undernoted identifies the Council's progress to date regarding these matters.

- **Waste prevention and management plans:**
  “Development of plans for the prevention, reduction, management, recycling and disposal of waste” Management, recycling and disposal of waste are already underway to comply with the Landfill (Scotland) regulations (in response to Landfill directive).
  Scotland’s new National Waste Plan is currently being prepared by the Scottish Government to replace original National Waste Plan and Area Waste Plans. Waste however Wastes Minimisation legislation is unlikely to be enacted in the short term. The European Waste Framework directive (17th June 2008) delays the introduction of this type of legislation until 2014.
  When enacting legislation clarity should be provided on the exact role of the enforcement agency; SEPA, Local Authorities and other agencies.
  Additional resources & training should be provided in relation to the duties imposed.
  If Local Authorities are required to implement local Waste Management Plans resources & training should be provided.

- **Waste data:**
  Information on municipal waste is already provided through SEPA waste data flow to comply with Landfill (Scotland) regulations. Resources and procedures are already in place to comply with European legislation. Comprehensive data is available at present. Any additional information could be provided (dependant on individual local authority management systems.)

- **Deposit of recyclable waste:**
  A comprehensive network of facilities is currently provided and there would be scope for additional facilities but practical considerations such as additional space at Civic Amenity sites or other places to accommodate containers for additional materials. Planning permission would be required at site facilities in high density areas and Town Centres. Ability to engage with other stakeholders (supermarkets, universities, shopping centres, schools, etc) to arrange the provision of containers.
  Facilities for deposits at events: Practical considerations and resource implications (weekends, etc) would require to be considered.
• **Procurement of recylcate:**
  This is relevant to Private Contractors within the waste industry. The Council is supportive to improve markets for materials and use recycled material where practically and economically feasible.

• **Reduction of packaging:**
  This is relevant to manufacturing and retailing sectors. Prioritise and encourage the use of packaging using a single material. Single material packaging has a positive effect on recycling rates. Less contamination (higher quality) and easier to manage through the recycling process.

• **Deposit & return schemes:**
  It is suggested that channelling this activity should be channelled through Retailers & Manufacturers as done in other countries (i.e. Sweden).

• **Charge for Supply of Carrier Bags:**
  Although no significant waste reduction would be expected, the benefits of this are that this initiative will raise the profile of recycling. (A simple positive action). This may ultimately have a positive effect on participation rates and may help to tackle the “through-away” culture. All Supermarkets should be required to provide take back schemes as it would discourage the public from requesting the Council to collect plastic bags for recycling. A very costly initiative with very little effect on tonnage/ targets.

Q16 What are your views on the adequacy of the Scottish Government’s consultation in advance of publishing the Bill?

It would have been useful to have a number of workshops to support the consultation process to further understand the requirements of the application of this consultation. Some example and models of best practice may also be useful to aid and support practical implementation of the bill.

Q17 Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government out on the consultation proposals?

As per Q16 it would have been useful to have a number of workshops to support the consultation process to further understand the requirements of the application of this consultation. Some example and models of best practice may also be useful to aid and support practical implementation of the bill.

Q18 Does the Bill raise any equalities issues you would wish to highlight?

The general issues are that Sustainable Development may have impacts on future new buildings developments and its planning requirements to meet Planning and building standards. Energy efficiency of buildings will be an ongoing requirement for asset management and greater demand for energy e.g. use of technology within schools need to be better understood regarding longer term implications.

Q19 Do you have any comments on the impact of the Bill on sustainable development?

No comment.

Q20 Do you have any other comments on the Bill?

No comment.

**Implications of this report**

1. **Financial Implications**
   No immediate or direct implications, but the adoption of courses of action arising from the Climate Change Bill may have implications with regards to investment and resources. Prudential borrowing in the nature of spending to save projects will need to be considered.

2. **Personnel Implications**
   Any implications will be in the medium to longer term. A change in working practices is seen more likely than seeking additional resources.
3. **Community Plan/Council Plan Implications**
   Healthier - Reductions in greenhouse gas emissions will bring beneficial health effect to the community.

   Safer and Stronger – Greenhouse gas reductions will support safer and stronger communities.

   Greener – Reductions in greenhouse gas emissions will bring beneficial health effects to the community.

   Developing our Organisation – Greenhouse gas reductions will enable improved ways of working and facilitate development of our organisation in areas of asset management and corporate working.

4. **Legal Implications**
   Legal requirement for the Council when the Bill is approved.

5. **Property Implications**
   Property requirements regarding energy efficiency will be an on going requirement and have an effect on working practises e.g. mobile/home working.

6. **Information Technology Implications**
   Current systems will be utilised to support new ways of working.

7. **Equal Opportunity Implications**
   None.

8. **Health and Safety Implications**
   Reduction on Greenhouse gas emissions will improve health of the community.

9. **Procurement Implications**
   None.

10. **Risk Implications**
    Risk of compliance with Climate Change Bill if resources are not aligned to areas for improvement.
The RSC welcomes the opportunity to submit formal written evidence to the consultation on the Climate Change (Scotland) Bill.

The RSC is the UK Professional Body for chemical scientists and an international Learned Society for advancing the chemical sciences. Supported by a network of over 46,000 members worldwide and an internationally acclaimed publishing business, our activities span education and training, conferences and science policy, and the promotion of the chemical sciences to the public.

The document has been written from the perspective of the Royal Society of Chemistry. The RSC’s Royal Charter obliges it to serve the public interest by acting in an independent advisory capacity, and we would therefore be very happy for this submission to be put into the public domain.

Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

The RSC believes that the Scottish Government is right to set a long-term legal target for reducing greenhouse gas (GHG) emissions through domestic and international action by at least 80% by 2050.

The RSC believes that the target to reduce GHG emissions by 80% below 1990 baseline levels by 2050 can be achieved but requires immediate action towards the following key goals:

- A strong and joined-up national and international leadership and policy that aims to massively reduce GHG emissions;
- A public consensus to save energy through both lifestyle changes and minimising heat loss from buildings;
- Energy efficient products and processes that minimise energy use in both manufacture and product use;
- Decarbonised transport achieved by developing highly efficient biofuels, lightweight construction materials, hybrid and electric vehicles, battery technology and further research into the potential of hydrogen as a fuel. Additionally there is a need to maximise the efficiency of conventional vehicles and fuels;
- Electricity produced from renewable energy sources such as wind, wave, solar and biomass resources;
- Development of carbon capture and storage technology so that the vast coal reserves of the Earth that will be exploited are done so with minimal GHG emissions; and
- Investment in skilled people and research and development so that future sustainable energy technologies will be developed.

However, it is important to recognise that reducing global emissions of GHGs by 80% by 2050 still commits the Earth to significant global warming for hundreds of years. This highlights the importance of an adaptation strategy alongside measures to reduce emissions.

The RSC believes that the Scottish Government should retain the ability to adjust the 2050 target in light of scientific advice, particularly that from the Committee on Climate Change. The science of climate change is evolving rapidly and it is vital that flexibility remains to account for the latest developments. For example, if an authoritative body, such as the Committee on Climate Change, concludes that there is a need for the GHG emission reduction target of 80% to be amended then this should be possible within this proposed system.

The RSC believes that setting of an interim target of 50% is sensible. The RSC also believes that an earlier interim target for the year 2020 would be appropriate so that Scotland’s reductions are inline with the UK, which has an interim 26% reduction target by 2020. However the RSC believes that the Committee on Climate Change should be free to advise Scottish Government on a pathway that will achieve the 2050 target without constraint; if the Committee on Climate Change were to believe that the optimal pathway would be one that delivered a reduction in GHG emissions greater than 50% by 2030 then this should not be hindered.

Scotland accounts for around 0.2% of global GHG emissions; therefore if Scotland’s emission
reductions are not matched by concerted global efforts then the Scottish economy will suffer and the world will continue to warm. To this end the RSC applauds the intention of Scotland to continue the argument for a global effort on climate change.

Q2 The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

What are your views on the setting of targets in batches from 2010 to 2022?

The RSC believes the rationale behind setting targets in batches is sensible; however the Scottish Government must be careful that setting the targets in batches does not hinder Scotland from reducing its emissions more quickly.

Q3 The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

The RSC believes this is sensible. However, it is important that the Scottish Government listens to advice from the Committee on Climate Change and that the annual targets, both before and after 2020, build towards delivering the 2050 80% reduction target. The RSC therefore recommends that the annual targets should be at least 3% lower than the preceding year from the point that the Bill is enacted. This would result in a steeper decrease in emissions and over the 40 year period result in lower total emissions; the Bill must not be a limiting factor in tackling climate change.

Q4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

The RSC believes that the concept a “net Scottish emissions account” is well conceived. However, the facility to purchase carbon units from outside Scotland to meet domestic targets, in terms of their overall quantity and sources should be used as a last resort. If carbon units are required to be purchased then the Scottish Government should be asked to explain why domestic measures failed to deliver the required GHG emission reduction. The RSC is also concerned about how the performance of international schemes will be monitored and policed to ensure they are delivering the expected GHG reductions. The RSC believes that it is critically important that monitoring and early warning systems are in place to ensure achievement of targets is on track. The Committee on Climate Change has a vital role to play here. It is important that during the Committee’s annual review of progress towards targets that where progress is unsatisfactory that the Scottish Government is obliged to put in place measures that will rectify the situation.

Q5 The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

The RSC believes that on the whole the definition of “Scottish emissions” is sensible; it is essential that a share of emissions from international aviation and shipping are included. However, the RSC believes that whether carbon intensive products which are imported into Scotland should be included into the definition of “Scottish emissions” is an issue that needs further debate.
Q6 The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government’s approach to obtaining independent, expert advice on climate change?

The RSC believes that any advice received by the Scottish Government needs to be truly independent and based on quality scientific fact; the need for an independent advisory Committee is essential if the objectives of the Climate Change (Scotland) Bill are to be met.

The UK Committee on Climate Change is an appropriate independent body to inform the Scottish Government on a pathway towards the 2050 target and to monitor progress en route. However, since some circumstances may differ between the UK and Scotland, the RSC believes it is sensible to allow provision for a Scottish Committee on Climate Change.

If the Scottish Government does decide to appoint a separate Scottish Climate Change Committee then it is important that careful consideration is given to the make up of the committee. RSC believes the committee should be made up of not only identified expert positions but also associated shadow advisory groups of: technology development, energy production, climate science and adaptation to climate change. It is necessary for the individual experts in each of these fields to be supported by advisory groups since individual experts cannot cover the vast range of developments that each of these fields represents. Of foremost concern is the possibility that the chosen expert may be biased towards a particular viewpoint or technology. This could have massive and detrimental knock on effects if biased and ill-advised decisions were taken. As an extreme example, on the advice of a Committee member the Scottish Government takes a decision to invest in a particular technology, at the detriment of other technologies, that ultimately proves not to deliver GHG emission reductions promised and Scotland fails to achieve its statutory GHG emission reduction target.

Q7 The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

The RSC agrees that the Committee on Climate Change should report to the Scottish Parliament annually on Scotland’s progress towards both its budgets and targets. It is vital that progress is subjected to scrutiny and that where necessary the Scottish Government must justify its performance and indicate remedial actions.

The RSC also agrees that the report should state whether or not the budget was met. In this statement the RSC recommends that the data be presented transparently so that it is obvious what progress has been made and through which mechanisms carbon emissions have been reduced and also where mechanisms have failed. The RSC also agrees that should the annual target not be met, Scottish Ministers should lay before Parliament a report setting out proposals and policies to compensate in future years for the excess emissions.
Q8 The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

No comment.

Q9 The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on this proposal?

The RSC is aware that the natural environment will change because of climate change and therefore it is essential that we have the correct tools to monitor this and base any intervention measures on sound scientific evidence.

Carbon dioxide persists in the atmosphere for around 100 years, so even if levels of CO2 emitted are dramatically reduced in the coming decades, atmospheric concentrations of CO2 will take a long time to respond. This means that the GHGs already emitted since preindustrialised times have committed us to global warming for at least the next century, and the possibility of stabilising temperatures will take decades longer and then only if action is taken now. Therefore the effects of climate change over the period from the present day to 2100 or longer should be considered, as any adaptation and mitigation of climate change will need to occur over at least this time frame.

Q10 Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are your views on this proposal?

Burning vegetation should be avoided wherever possible; if possible it should be collected and used as a feedstock for biomass-based products or fuels.

Most biomass for energy production is currently derived from industries such as forestry and from wood processing waste. Instead of burning vegetation it could be used to produce electricity, heat, biofuels or as a feedstock for the chemical industry in dedicated facilities. The potential for increased exploitation of biomass resources is very large.

Q11 The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

The RSC believes that although growing more trees will remove CO2 from the air, the benefits of this will be negated if the wood is exported and burnt elsewhere. It is Scotland’s responsibility to ensure that full life-cycle analysis applied to the new woodland.
The RSC believes that any proposals that support the use of new renewable energy should be supported. In spite of the apparent high land requirement for the production of significant quantities of biofuel using current technology, it is estimated that the total solid biomass potential is about 25% of total projected energy demand in 2050. Additionally local energy generation and use should help to reduce GHG emissions. However, if the intention of the Scottish Government is to use biomass, life-cycle analysis should be used to make sure it is truly carbon neutral.

Full life-cycle analysis should assess the implications of energy generation, including extraction, construction, transformation, transmission, usage and end-of-life. Only through a comprehensive and transparent process will the environmental impact be known and only then can energy options be compared on an equal basis. This will only be achieved with an intimate knowledge of the chemistry and thermodynamics of energy generation. This process will identify major opportunities for new chemistry such as methodology for highly efficient and low energy in situ extraction. The major challenge here is to develop life cycle assessment methodology that is globally accepted, robust and transparent.

Q12 The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?

The efficient use of energy in buildings is a fundamental sustainability issue; more than 40% of Scotland’s CO2 emissions, a major cause of climate change, come from the energy used to heat, light and run its buildings. It is essential that this is tackled through energy efficient measures and behavioural change.

The RSC is a partner in the European platform for sustainable chemistry (SusChem); one of the initiatives of this project is the smart energy home1 (see Figure 1), which is a good model of an energy efficient building. In this project ground-breaking technologies and smart materials will make this vision possible by reducing heat loss, improving energy efficiency and absorbing and transforming energy into electricity. This project aims to demonstrate a mixture of present and future energy technologies and has an interactive control system that provides real-time information on the status of the property. By a combination of smart windows and insulation materials, micro-energy generating technologies and intelligent control systems this project will demonstrate that a house can actually generate electricity for sale to the national grid.

It is also import to stress that this technology can be retrofitted to the existing housing stock and that energy efficiency measures should not just apply to new build. The RSC believes that the Scottish Government should set out its own action plan for ensuring energy efficiency in existing housing especially since much of Scotland’s housing stock is under council control.

1 www.suschem.org
Q13 The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government’s thinking in this area.

What are your views on this approach?

It is important that the energy performance of non-domestic buildings and the GHG emissions from these buildings is assessed. However, since it is estimated that the domestic sector in Scotland accounts for approximately 30% of CO2 emissions; the RSC believes that in addition the Bill should confer powers on the Scottish Ministers to make regulations providing for the assessment of the energy performance of domestic buildings, coupled to a grant scheme to encourage people to improve the energy efficiency of their homes. The domestic sector offers a huge opportunity and a challenge for reducing GHG emissions and domestic energy efficiency measures can play a significant part in meeting Scotland’s GHG reduction targets. 40% of domestic energy consumption is used to heat homes, and in turn, 30% of this energy is lost through windows. Smart coatings on glass and highly efficient insulation materials could dramatically reduce heat loss in all buildings saving money and reduce GHG emissions. With sufficient support, scientists and engineers will continue to develop products and services that are energy efficient.

Q14 The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

What are your views on this proposal?
The RSC believes the promotion of the use of heat from renewable sources is good and agrees it will help to meet the EU 2020 target of 20% final energy consumption from renewable sources. However, since this target is made up of individual targets for electricity, heat and transport, the RSC does not understand why the Bill limits the incentives to the production of heat. Scotland is well placed to generate both heat and electricity from renewable sources due to the excellent wind and coastal resources and hydro already generates approximately 10% of Scotland’s current total energy generation.

The RSC believes that the Scottish government should continue to support hydro projects to ensure that hydro will continue to play its part in Scotland's renewable energy generation of both heat and electricity.

The use of wind energy has grown rapidly over the past decade, with current capacity providing nearly 0.5% of the world’s electricity supply. Most forecasts show the capacity of wind energy continuing to grow. Scotland can and should be a part of this since its location means it has an excellent wind resource and Scotland possesses potential for offshore wind development. Developing and providing coatings for the protection of wind turbines is already a strongly competitive and growing business and the Scottish Government should encourage and support Scottish material scientists in this area. The RSC approves that the Scottish Government is already helping to fund the development of a demonstrator project of an offshore wind development in deep water in the Moray Firth.

Scotland possesses a huge wave and tidal energy resource; the potential exists to generate far more electricity than currently needed, from wave and tidal energy sources in the waters around the Scottish coast. There are several devices currently on test around the world ranging from tidal current turbines to large pistons that cause rising waves to force a column of air through a turbine. Scotland is surrounded by the North Sea and Atlantic Ocean; it is in a prime location to make use of these technologies to generate electricity. The RSC approves of the funding given to the construction of the European Marine Energy Centre from the Scottish Government.

In order to reduce GHG emissions from transport it will be necessary to use electric cars which run on electricity generated from renewable sources. In order for this to become a reality the RSC believes that the Scottish Government must also invest in scientific research into viable means of energy storage such as batteries, supercapacitors etc.

Q15 The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas:

- Waste prevention and management plans;
- Waste data;
- Deposit of recyclable waste;
- Procurement of recyclate;
- Reduction of packaging;
- Deposit and return schemes;
- Charges for carrier bags.

What are your views on these proposals?

The RSC supports any moves to become a more sustainable society. Recycling should take place wherever possible. The RSC believes the Scottish Government should make regulations in all these areas now.

The RSC is concerned that the policy memorandum indicates that the Scottish Government will initially rely on voluntary action to achieve the goal of improving waste and recycling and only intends to introduce legislative action, sanctioned by the Bill, if voluntary action does not achieve these goals.

The RSC suggests that timescales for the impact of global warming are perceived as too far in the future and that people cannot associate today’s individual actions with their impact on future climate change scenarios. This is a huge challenge to overcome as action is required now in order to reduce the impact of climate change.
To encourage individuals to “do their bit” towards minimising the impact of climate change will require a framework of incentives, regulation, education and demonstration and all of these must be at an appropriate level to inspire action.

The RSC recognises that regulation forcing the public towards a change in lifestyle is unlikely to be a vote winner. The RSC suggests that such legislation and regulation be brought in on the back of a cross-party agreement that demonstrates consensus of all major parties to the measures in the long-term. Equally such measures should be backed with an incentive, education and demonstration scheme at the appropriate level that clearly demonstrates the benefits and assistance of the measures.

In the public sector the Scottish Government must show leadership and demonstrate significant carbon emission reduction in both its buildings and its vehicle fleet. Such a scheme would increase stakeholder confidence in carbon emission measures and provide valuable data on high impact programmes and technologies.

Q16 What are your views on the adequacy of the Scottish Government’s consultation in advance of publishing the Bill?

No comment

Q17 Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government out on the consultation proposals?

No comment.

Q18 Does the Bill raise any equalities issues you would wish to highlight?

No comment.

Q19 Do you have any comments on the impact of the Bill on sustainable development?

It is important that there are sufficient trained and committed scientists and engineers to carry out the research, development, demonstration and deployment of renewable energy-generating technologies. It is also important that the Research Councils and DIUS ensure that there are collaborative funding mechanisms throughout the technology development pathway that allow scientists, engineers and technologists to work together to bring basic research through to developed products.

Q20 Do you have any other comments on the Bill?

No comment.
Summary
The Royal Society of Edinburgh welcomes the series of well-conceived and appropriate processes proposed in the Climate Change (Scotland) Bill. However, there are several approaches embedded in the Bill that the Society believes seriously undermine its potential to achieve its objectives and which the Scottish Parliament’s Transport, Infrastructure and Climate Change Committee is encouraged to consider for amendment.

- The endpoint target of an 80% reduction by 2050 is an irrelevance unless there are appropriate intervening milestones. The key target must be to minimise the aggregate emissions between now and 2050; to minimise the area under the emissions curve.

- The Bill implicitly assumes, as do many other approaches to this issue, that early emissions reductions will be small and later ones large. We believe that it would be more appropriate to reverse these relationships by targeting early, strong reductions that start as early as possible.

- We strongly advocate that an interim strategy target should be defined for 2020. It should be a challenging target that encourages early action, and one that, because of its imminence, perennially impinges on Government perspectives no matter which party is in power.

- Periods of recession tend to produce a reduction in emissions, which could create an unjustified sense of optimism about the ease with which targets could be achieved without the need for challenging emissions reduction strategies, only to find that emissions rise dramatically as we climb out of recession. It is important therefore that strategies are put in place now to ensure that re-establishment of growth does not create a strong increase in emissions.

- We are strongly of the view that short-term targets set by Government, should be based on the definition of a longer term trajectory. This should be done by an independent body that is advisory to Government that is able to draw upon the best available scientific and technical capabilities in climate science, energy technology, economics, business and social science. There is a place for a Scottish body since it may be the case that the appropriate policy in Scotland will need to vary from the more general policy across the UK.

- The effectiveness of an emissions reduction regime that depends on achieving frequent, clearly-defined targets will depend fundamentally on the rapid availability of accurate estimates of net emissions. In practise Scottish data typically arrives twenty months after the year in question. Unless this can be improved, annual setting of targets will be flawed and the assessment of the trajectory of change will be uncertain. We suggest that an independent monitoring and audit function should be set up that is robust and rigorous, and which will not only need to call on routine measurements but also on experimentally and computationally verified estimates.

- The purpose of the Bill is to establish the legal framework within which Scotland can take the path of reduction in its greenhouse gas emissions. This framework alone will not achieve that end. It must be clearly associated with powerful and credible strategies that stimulate change, and with the political leadership needed to persuade citizens of the need for action. We advocate the approach taken in the Nature Conservation (Scotland) Act 2004, in which a specific duty is placed on Scottish Ministers to designate a strategy for the conservation of biodiversity. We suggest that the Bill should place an analogous duty on Ministers to create a strategy designed to achieve the targets as set out in the Bill.
It is important that a suitable array of Action Plans is developed by the Scottish Government on a sector-by-sector basis for strategy implementation and that this is done in an integrated fashion to ensure convergence of purpose.

There are early gains to be made in reducing emissions and it would be sensible and natural to pick off the “low hanging fruit” first. There should be increased focus on those immediate and cost-effective ways of reducing emissions, such as energy efficiency. Major energy efficiency measures for buildings must be the major priority if we are to maximise our chances of reducing carbon emissions rapidly.

As the trends of climate change and its actual and imminent impacts become clearer, the imperative to move towards a low carbon economy is becoming stronger. It is recognised that those countries able to develop and implement low carbon technologies and limit the use of carbon-derived energy will be well positioned economically to exploit a developing global trend. The Scottish Government should consider developing an overarching low carbon strategy that also includes demand reduction.

1. The Royal Society of Edinburgh (RSE), Scotland’s National Academy, considers the Climate Change (Scotland) Bill to be of the utmost importance in creating the framework for efforts to reduce Scotland’s greenhouse gas emissions and achieve the targets agreed by the Scottish Parliament. Through the unrivalled technical expertise of its multi-disciplinary fellowship, the RSE has already provided input into the Scottish Government’s proposals for a Scottish Climate Change Bill, the precursor to the current Bill, and to the initial outline of Scotland’s climate change adaptation framework.

Global context

2. Human intervention in the natural systems of the Earth, including our impact on the climate system, has created massive problems for the sustainability of many aspects of human activity. Correcting such damaging impacts presents unprecedented political challenges because of the need for a global response. Although there is much uncertainty about the precise magnitude of future climate change, the direction of change is well established and the recent rate of change has been faster than scientifically anticipated. However, notwithstanding much debate and many good intentions, the rate of emissions of greenhouse gases from human sources has almost doubled since the year 2000, worse than the most pessimistic scenario of the Inter-Governmental Panel on Climate Change (IPCC). This makes it almost certain that the CO₂ equivalent greenhouse gas concentration in the atmosphere will rise above the 450ppm level regarded as a threshold for “dangerous climate change”.

Why should Scotland act?

3. The first reason is ethical. Although we recognise that greenhouse gas emissions directly produced in Scotland are a relatively small part of the total, our consumerist lifestyle means that we are responsible for a much greater share of global emissions. Because we import many of our manufactured goods rather than creating our own, we effectively export our emissions to others. Even without this however, we emit far larger quantities of carbon in comparison with the inhabitants of, say, Botswana, where the immediate impacts of climate change will be much greater. The fact that Scotland’s direct emissions are a small part of the global total is beside the point. The ethical imperative is for the burden of change to be borne according to the extent that we individually pollute the global atmospheric resource. It is the per capita consumption of that resource, measured by the impact of emissions on the atmosphere, that is the central ethical issue.

4. Secondly, self interest demands that we should want to see direct, local, damaging impacts minimised. To do this requires concerted global action and the prospects for this will be maximised when all states agree to act on the imperative. We make a contribution towards this trend by creating the legal and policy framework represented by this Bill, by associated policies and through leading by example.
5. Thirdly, as global trends move towards reducing environmental impacts of economic activity, and developing carbon-neutral systems of energy generation and use, there will be an economic, and possibly an international legal imperative for us to change. The relevant part of the science base in Scotland is very strong by international standards, renewable resources of wind and wave are plentiful and there still remains considerable investment potential in the financial services sector of the Scottish economy. If properly encouraged, there is great potential for Scotland to be a leader in developing and exploiting processes that will be the bedrock of a lower carbon, greener economy. At a time when there is a significant downturn in the economy there are both environmental and economic benefits to be gained from shifting patterns of consumption and changes in lifestyle.

Major issues for the current Bill

6. The RSE very much welcomes the seriousness with which the Scottish Government takes this issue and its commitment to ambitious and challenging targets for reducing greenhouse gas emissions by 80% by 2050 compared with emissions in 1990. Most of the processes proposed in the Bill seem to us to be highly appropriate and well-conceived. However, there are several approaches embedded in the Bill that the Society believes seriously undermine its potential to achieve its objectives and which the Scottish Parliament’s Transport, Infrastructure and Climate Change Committee is encouraged to consider for amendment. Rather therefore than responding to all the individual questions posed in the call for evidence, we have concentrated on the clauses in the Bill that we strongly advocate should be amended. We also comment on a number of omissions from the Bill that we regard as lost opportunities.

“The area under the curve”

7. The endpoint target of an 80% reduction by 2050 is an irrelevance unless there are appropriate intervening milestones. The key target must be to minimise the aggregate emissions between now and 2050; in other words, to minimise the area under the emissions curve. We therefore approve of the approach taken by the Bill, particularly for the period 2020-2050, which specifically requires emissions reduction of at least three percent per year compared to the target of the previous year. However, we suggest that the real political decision which the Committee would wish to consider is whether such targets could be introduced earlier e.g. from 2011, to put Scotland on the pathway to achieving its emissions reduction targets and reducing its aggregate emissions.

8. With this in mind the Committee may find it useful to examine the illustrative scenarios which we have compiled in an appendix. From this the Committee will note that neither scenario 1 nor scenario 2 delivers the 80% emissions reduction target in 2050 (which is 14.02 Mt CO\textsubscript{2}e based on the current 1990 baseline - 2006 Emissions Inventory). In other words, even if Scotland achieved 3% per year reduction in greenhouse gas emissions from 2010 the 80% reduction target would not be achieved by 2050. They also show the aggregate emissions for different reduction trajectory scenarios.

9. The Bill implicitly assumes, as do many other approaches to this issue, that early emissions reductions will be small and later ones large. We believe that it would be more appropriate to reverse these assumptions by targeting early, strong reductions that start as early as possible. Not only will the area under the curve be minimised if early reductions are substantial, but we believe that there is “low hanging fruit” to be taken provided that robust policies are introduced to encourage it (see also paragraph 21). We suspect that in practise, it will be most difficult to wring out the late stage reductions in emissions that bring us to the 80% target. We suspect that an S-shape curve of emissions reduction is most likely. The first part, of slow change, represents the time taken for policy instruments to come on-stream. The second part, of the fastest rate of emissions reduction, as one where we pick the “low hanging fruit”, with the final stage being one of relatively slow rate of reduction.
Major milestones

10. If Scotland is to develop the early trajectory of emissions reduction for which we argue, and even if it is to achieve its 2050 target, it is important that targets are set in such a way as to encourage early reductions. The Society is sceptical that the interim statutory milestone of 2030 is early enough. It does not convey the necessary urgency, nor give the issue sufficient prominence in a political environment that is not short of distracting issues. We strongly advocate that an interim strategy target should be defined for 2020. It should be a challenging target that encourages early action, and one that, because of its imminence, perennially impinges on Government perspectives no matter which party is in power.

11. The challenging target is not the interim target per se but the three percent or more per year emissions reduction from 2020 to 2050. A recent paper examined the impact of government emissions reduction programmes and it noted that no advanced economy has achieved more than a one percent year-on-year emissions reduction except as a consequence of economic recession. The current recession, of unpredictable length and depth, may well lead to such a reduction. It could create an unjustified sense of optimism about the ease with which targets could be achieved without the need for challenging emissions reduction strategies, only to find that emissions rise dramatically as we climb out of recession. It is important therefore that strategies are put in place now to ensure that re-establishment of growth does not create a strong increase in emissions. Further comments about linking recession to emissions reduction are found in paragraph 25.

Setting targets

12. The approach to target-setting in the Bill could prove to be flawed. The Bill proposes that Scottish Ministers can modify annual targets for Scottish emissions from 2010 to 2050. The risk is that this will focus debate on what short term targets should be, and not whether Scotland is achieving its long term objectives. The temptation for Government will be to set targets that can be met, and met without strong reactions from one special interest group or another that will perennially argue for a relaxation of targets. It could obscure the much more taxing imperative to meet long-term targets, and the concomitant pressures that will stimulate technological responses.

13. Although Government and Parliament are crucial parts of the process of achieving carbon targets through their design of legal and administrative frameworks and providing leadership, the license for Ministers to modify annual targets could become a highly party political matter rather than being determined by technical imperatives. It is crucial that policy is determined with reference to the technical nature of targets rather than to political considerations. As far as possible climate change issues should be considered apolitical given the seriousness of possible impacts. Ultimately, all of us, as citizens, rather than simply governments will be held accountable.

14. We are strongly of the view that short-term targets set by Government, should be based on the definition of a longer term trajectory. This should be done by an independent body that is advisory to Government, that is able to draw upon the best available scientific and technical capabilities with a range of expertise in climate science, energy technology, economics, business and social science. It would require carbon economics expertise as carbon markets develop and become increasingly important. There are number of models that would permit disinterested external advice to mesh with the ultimate responsibility of Government and Parliament. For example, such an advisory body could propose, and Parliament could debate adoption of, say, a 5-10 year trajectory so that progress could be monitored by Government, Parliament and citizens. Ideally, the failure in any one year to hit the desired trajectory should not be regarded as a failure by Government, but as an index of the efforts that would need to be made to get back on track, for ultimately, the challenge is not merely for Government, but for the whole of society.

---

1 Kerr, A.; Serendipity is not a strategy: the impact of national climate programmes on greenhouse-gas emissions, Area Vol.39 No.4 pp 418-430, Royal Geographical Society (with the Institute of British Geographers) 2007
15. There is a place for a Scottish body since it may well be that the appropriate policy in Scotland will need to vary in detail from the more general policy across the UK. It would be important however that such a body is formally linked to the UK Committee on Climate Change. There are arguments for and against the different models that have been put forward for Scotland – and in some cases Ministers will already receive advice from existing public bodies. For example, SNH already advises on the impact on wildlife, SEPA advises on flooding etc. However, there is a case for advice that genuinely emanates from an entirely independent source.

Monitoring progress: priorities and institutions
16. The effectiveness of an emissions reduction regime that depends on achieving frequent, clearly-defined targets will depend fundamentally on the rapid availability of accurate estimates of net emissions. International requirements are that emissions data is delivered fifteen months after the end of the year in question. Disaggregated data for Scotland is likely to follow after this international data since it draws on UK-wide data sets. In practise Scottish data typically arrives twenty months after the year in question. Unless this can be improved, annual setting of targets will be flawed and the assessment of the trajectory of change will be uncertain. We suggest that an independent monitoring and audit function should be set up that is robust and rigorous, and which will not only need to call on routine measurements but also on experimentally and computationally verified estimates, for example of the rate of forest sequestration of carbon, that will require input from basic research located in the universities and research institutes. The University of Edinburgh is a core partner in taking forward ICOS, a new European Research Infrastructure programme for quantifying and understanding the greenhouse balance of the European continent and adjacent regions.

17. In its response to the Scottish Parliament’s Economy, Energy and Tourism Committee Inquiry into Energy, the RSE strongly advocated the creation of an independent, authoritative audit body responsible for collecting and publishing reliable statistics. We also suggested that the two audit functions, of energy and emissions, should be well integrated, preferably by the same independent body. It is important that we agree about the facts and then debate what should be done, rather than arguing about the facts.

18. There is much to be said for smoothing the assessment of emissions trends by making running mean estimates of emissions rather than using the last year’s data as the gauge of progress. Our principal concern should be to see trends rather than be over-influenced by strong annual fluctuations likely to be produced by unusually cold or warm winters or by generation reduction from aging nuclear stations that are compensated for by increased generation from coal–fired stations that cause increases in carbon emissions in that year. A 3-year running mean might be most appropriate, which also argues for the timely release of emissions data.

Linking the Bill to emissions reduction strategies
19. The purpose of the Bill is to establish the legal framework within which Scotland can take the path of reduction in its greenhouse gas emissions. This framework alone will not achieve that end. It must be clearly associated with powerful and credible strategies that stimulate change, and with the political leadership needed to persuade citizens of the need for action. It is crucial therefore, in parallel with the legal framework, that a strategy, grounded in the practical realities and able to stimulate achievement of targets is forthcoming. A framework without an accompanying strategy would be futile. We advocate the approach taken in the Nature Conservation (Scotland) Act 2004, in which a specific duty is placed on Scottish Ministers to designate a strategy for the conservation of biodiversity. We suggest that the Bill should place an analogous duty on Ministers to create a strategy designed to achieve the targets as set out in the Bill. We suggest below, issues that could be the basis of such a strategy.
A duty on Ministers to create an emissions reduction strategy

20. It is important to consider as context for the Bill, some of the strategic issues and opportunities for emissions reduction, which are also relevant to the case we present above for sharper, earlier reductions and earlier, statutory milestones. Scottish emission targets cannot be viewed in isolation. A strategy for emissions targets must be intimately related at least to an energy strategy that is realistic about the market impacts of policy and its socio-economic consequence. Whilst we recognise the Scottish Government has been actively taking forward an adaptation framework in addition to the current Bill, mitigation and adaptation aspects need to be better integrated. The Bill is strong on appropriate mitigation measures, but weak on adaptation and societal engagement at the individual and community levels.

Energy strategy

21. There are early gains to be made in reducing emissions and it would be sensible and natural to pick off the “low hanging fruit” first. There should be increased focus on those immediate and cost-effective ways of reducing emissions, such as energy efficiency and demand reduction. Major energy efficiency measures for buildings must be the major priority if we are to maximise our chances of reducing carbon emissions rapidly. There are multiple government-led energy efficiency schemes and measures, with low take-up, being managed by a range of organisations, which are in need of better coordination. Behavioural change is inextricably tied up with energy efficiency, to ensure for example that ‘savings’ in one area do not lead to increased consumption in another. Promotional campaigns are however unlikely to achieve rapid, significant changes in habitual patterns of domestic consumption. (This is evident from long experience of public investment in health promotion, which has failed to tackle increasing obesity amongst other health problems.) In order to improve their effectiveness, promotional campaigns should be focussed on single issues, they should avoid trying to convey too many messages at once and should be linked to regulations that limit energy-wasteful designs, technologies and building practices. The success of the Scottish Parliament’s bold decision to ban smoking in public buildings shows that well-considered, decisive action coupled with political leadership on a major issue of public concern can be highly effective.

22. Given the current focus on the development of low carbon technologies across the energy spectrum, in Scotland and elsewhere, we reaffirm the recommendation from the RSE’s Report into Energy Issues for Scotland that due to the lack of robust procedures for assessing energy technologies and a lack of objectivity in assessments that are undertaken that a common methodology should be developed to assess the relative merits of energy technologies; this should include full lifetime costs and a full carbon audit.

Public engagement

23. There is every likelihood that strategies to achieve tight emissions targets such as that suggested above could arouse considerable popular antagonism, with the potential to split any political consensus on emissions or undermine Government policies. Success will only come about if there is a greater awareness of the threats posed by climate change and a willingness, both individually and collectively, to engage in appropriate measures to address those threats. Central and local government are crucial in providing leadership and setting the terms of that engagement, but non-governmental and voluntary bodies will need to energise civic society and promote individual and collective responsibility (for example, the Royal Society of Edinburgh is shortly to launch a major inquiry on adapting to climate change, which will contain a major public engagement element). The target of a low carbon economy by mid century will not be achieved without radical and costly changes in our use of energy and patterns of consumption. Strategies and policies to promote this paradigm shift are notably absent from the Bill.
A decisive initiative for the low carbon economy

24. As the trends of climate change and its actual and imminent impacts become clearer, the imperative to move towards a low carbon economy is becoming stronger. It is recognised that those countries able to develop and implement low carbon technologies and limit the use of carbon-derived energy will be well positioned economically to exploit a developing global trend. The new US administration has announced policies that reflect a decisive shift in this direction, with the intention to capture a powerful economic and technological position. The Scottish Government should consider a similar approach, by going beyond its encouragement of low carbon renewable energy technologies to develop an overarching low carbon strategy that also includes demand reduction.

25. Given the precarious nature of the current economic climate, new employment opportunities could also be created and maintained by the shift to a lower carbon economy. The public sector should position itself to take a clear and crucial leadership role and identify areas where investment could pay dividends particularly in terms of emissions reductions and energy savings in the near term as well as creating employment opportunities. We applaud the Scottish Government for its efforts in the renewable energy domain and this effort should be replicated in other areas where Scotland can command competitive advantage.

A cross-cutting strategy

26. Climate change represents a hugely complex cross-cutting issue over many areas of government and society. The practical immediate consequences are the intertwined issues of climate, energy, food, and the challenge of sustainable economic and social development. However, the administrative boundaries by which government manages its business can result in a lack of policy connectivity and policy contradiction. Moreover, many government decisions have emissions implications (e.g. abolishing bridge tolls) and as such, decision-makers need to be acutely aware that a decision in one area may have a contradictory and unintended consequence for mitigation and adaptation to climate change. It is important therefore that a suitable array of Action Plans is developed by the Scottish Government on a sector-by-sector basis for strategy implementation and that this is done in an integrated fashion to ensure convergence of purpose.

The importance of large scale policy integration

27. Whilst the Bill should focus on matters that the Scottish Government can control and lead on, it important that it ensures optimal linkages with policies and processes outwith Scotland. In terms of emissions, energy systems and cost, it is important to recognise that the linkages into the UK energy transmission system and the European market can be used to optimise efficiency. In principle, the most efficient low carbon system of energy transmission and supply for Scotland would be an integrated European system that was able to take generation from anywhere in Europe so as to optimise on low emissions, low cost and high security. An a priori concept of energy self-sufficiency with a failure to utilise efficiencies of scale could be damaging to the Scottish energy system, to its achievement of emissions targets and to its economy. It is vital therefore that UK and European level cooperation is exploited as part of the policy for emissions and energy security.
Maximising the impact of Scotland’s carbon sinks

28. The search for international agreement on greenhouse gas reduction will inevitably not only consider sources but also sinks, so that a national net budget is recognised and audited. Without it, there will be no incentive to preserve the planet’s great forest and peatland sinks for carbon. The woodland resource in Scotland will have a clear role in offsetting the country’s carbon emissions. The contribution that tree planting can make to removing CO₂ from the atmosphere is becoming increasingly clear. In 2005 the land use, land use change and forestry sector provided a net sink for greenhouse gases equivalent to 8% of Scotland’s total emissions. Within this overall figure, forest plantations, together with land converted to grassland, provided a sink equivalent to 20% of Scotland’s total emissions². There are also clear benefits for climate change moderation by increasing the use of wood and wood products as biofuels if they substitute for fossil fuels; and in the use of timber in construction as a substitute for more carbon intensive materials, such as steel and concrete.

29. Although there is considerable potential to increase the sequestration of carbon by forest planting, the rate of new planting has dropped to between 4,000 and 6,500 ha per year, at least partly as a result of rising land prices and uncertainty over CAP reform. The Scottish Government’s Forestry Strategy sets a target for increasing the woodland cover of Scotland from 17 per cent to 25 per cent by the second half of this century, justified by the contribution that forests can make to carbon management and the mitigation of climate change if sited on suitable soils. This reflects a shift in priority over the last 30 years from the creation of a strategic timber reserve through environmental and amenity priorities to one of combating climate change. In its Report on the Future of Scotland’s Hills and Islands the RSE Committee of Inquiry supported the increase in woodland cover but saw no possibility of achieving it unless measures were introduced to attract land out of other uses. It is not clear where this land will be found without impacting on either agricultural production or on biodiversity and landscape conservation. Without an effective framework for making decisions to resolve conflict, and identifying where there is potential synergy of use, important decisions will be delayed, or reached on an ad hoc basis.

30. The Bill proposes mechanisms to increase the rate of planting with the proposals for long-term leasing of cutting rights in forests currently managed by the Forestry Commission to private interests. This has provoked debate about the adequacy of the economic instruments to incentivise private interests to increase forestry planting without detriment to the sustained management of Scotland’s forests and the other benefits they provide.

In conclusion

31. The Framework proposed by the Bill presents Scotland with a real opportunity to make significant contributions to a vital global challenge and build upon the expertise it already has in a number of fields, such as in energy, particularly in relation to carbon capture and storage and renewables, whilst also reaping tangible benefits. There is also an opportunity to promote the excellence and technical expertise available in Scotland by establishing an independent group which can play a crucial role in setting the trajectory of targets for Scotland as we have suggested. To realise such opportunities it is critical that the Scottish Government adopts both a leadership role and an over-arching strategy, and that it acts as an enabler for more localised and individual actions. Timescale is a major factor and government will clearly need to stress the urgency of the situation with early statements of intent.

**Sources:** TECHNICAL NOTE: Climate Change (Scotland) Bill: Greenhouse Gas Emissions, Annual Reductions and Targets
Summary

RSPB Scotland is supported by over 79,000 members and employs around 200 staff to promote the conservation of birds and biodiversity. Our work covers a wide range of issues including planning, climate change, energy, marine issues, water, trade and agriculture. In combination with RSPB staff across the UK, and our international partners in Birdlife International, we have cross-cutting expertise and experience of land use and sustainability issues within Scotland, the UK and internationally.

Climate Change is the greatest long-term threat to our environment and humankind. RSPB Scotland believes that it is vitally important that Scotland sets an example to the world in helping tackle climate change by making deep and sustained cuts in greenhouse gas emissions. RSPB Scotland recognises the scale and urgency of the climate change problem, and are mobilising our own resources as an organisation, and the talents, energy and efforts of our membership, to help address it. We are taking steps to reduce emissions from our own use of energy in our properties and in our work travel as well as promoting energy saving and renewables to the wider public. We have long been a keen supporter of renewable energy and work closely with the Scottish Government and industry to encourage developments in the right places, which avoid environmental harm. (See Scotland’s Renewable Future).

With others in the Stop Climate Chaos Scotland coalition, we have developed a shared view on the key issues for a Scottish Climate Change Bill including the following top line asks:

1. Set out a framework that will achieve at least an 80% reduction in greenhouse gas emissions by 2050.
2. Establish in statute annual emission reductions of at least 3% year-on-year from the start, not just from 2020, compatible with a fair and safe cumulative budget identified by the advisory body (see 4).
3. Include emissions from all sectors in the framework and targets set out in the Bill, including those from international aviation and shipping, from the very start.
4. Establish a Scottish advisory body, a Scottish Climate Change Commission, in the primary legislation to support delivery of the Bill when it is enacted.
5. Ensure that at least 80% of the effort to cut emissions takes place in Scotland.
6. Establish duties on all public bodies to reduce greenhouse gas emissions in line with the national target.
7. Set in place robust, transparent reporting measures so the Scottish Parliament is well informed on progress in meeting targets and Government is held to account on mitigation and adaptation.
8. Ensure that strong enforcement measures are set in place in statute.
9. Ensure Scotland counts all its emissions and reports on those produced by products and services we consume as well as emissions produced domestically.
10. Be explicit that sustainable development is core to the purpose and delivery of the statute in relation to mitigation and adaptation.

RSPB Scotland’s evidence provides additional detail concerning environmental issues, to complement the general positions given in the SCCS and Scottish Environment LINK evidence, to which we are signatories.

The climate change threat to our natural environment

Climate change is having a staggering impact on our environment – a third or more land based plant and animal species could be driven to extinction by the 2050s if we take no action to limit global warming. To avoid these catastrophic impacts, we have to act in a sustainable manner to rapidly cut greenhouse gas emissions and plan adaptation to the inevitable changes that will occur. **We therefore urge the Scottish Government to provide a Scottish Climate Change bill with annual emissions reduction targets of at least 3% from the outset to deliver at least an 80% reduction in greenhouse gas emissions by 2050.**

Through RSPB Scotland’s research, land management on our reserves, and our network of volunteers we are well aware that the natural world is already being affected by climate change. This work provides warnings of the threats to species, habitats and ecosystems if we do not take urgent steps to address climate change. Wildlife in Scotland is responding to the unprecedented rate of temperature change with some bird species arriving earlier in migration, earlier blooming dates for plants, and earlier appearance of insects as spring creeps forward and autumn recedes. These changes are not occurring uniformly and discrepancies are leading to disruption of the food chain for some species.

Climate change may be having a dramatic damaging effect on Britain’s coastal wildlife, through undermining the food supply of seabirds on the North Sea coast. The spectacular seabird colonies on Shetland and Orkney have suffered catastrophic breeding failure, with poor management of the marine environment now being exacerbated by climate change. Due to rising sea temperatures, the plankton mix at the base of the food chain has altered radically, reducing the survival of sandeels – the staple diet of many seabirds, and commercial fish species.

Birds found in our uplands such as golden plover, are facing a serious reduction in breeding success as climate change affects their invertebrate food supply. These changes threaten an important part of our biodiversity as well as key tourist attractions with significant economic value.

A sustainable approach to tackling climate change

RSPB Scotland would like to see a strong commitment in the Bill to ensure climate change is tackled in a sustainable way that works within environmental limits. How we tackle climate change is important. There is no point saving the planet if we have destroyed our natural environment in the process. A healthy environment, where wildlife thrives can help in tackling some of the causes of climate change and provide natural solutions for dealing with impacts from changing weather and sea level rise. Much of Scotland’s economy and our international identity depend on the rich array of species and habitats that make up our biodiversity. There are many win-win solutions available where wildlife conservation can be delivered alongside action to address climate change. Examples are provided in an RSPB Scotland leaflet (Helping Nature to Help Us) and include:

- Peatbog restoration. Our peatland soils hold more than 40 times as much carbon as all the vegetation above ground. The living layer of mosses on a healthy bog contains as much carbon per hectare as a forest. Despite this importance, the majority of Scotland’s peatlands are left in a damaged state from past agriculture and forestry management, as well as peat extraction resulting in carbon losses with minimal funding available to address this and help restore them.
- Managing natural wetlands to provide flooding solutions as well as habitat for threatened species.
- Restoring and expanding native woodland habitat to conserve declining species and offer sustainable sources of fuel to meet local energy needs.

To achieve this sustainable approach, RSPB Scotland would like to see an over-arching sustainability included in the Climate Change (Scotland) Bill, and the long title amended to reflect this commitment to a sustainable approach.

---

Adapting to the impacts of Climate Change (s45)

We believe Scottish Ministers should be required to produce a Scottish impact assessment and to report regularly to the Scottish Parliament on programmes of sustainable adaptation action. Without cutting our greenhouse gas emissions, the climate change impacts will be so great that dealing with the consequences will be come impossible. We must therefore make emissions reduction a priority but also recognise that urgent and important work is required to adapt to the inevitable impacts of climate change from historic and present emissions, which remain in the atmosphere for many years.

Scotland has its own special environmental challenges when it comes to adaptation, including providing natural solutions to coastal and inland flooding and restoring large areas of peatland habitat and native woodlands as well as providing greater support for wildlife in our farmed landscapes. Much of our natural environment has been damaged by past activity and the resilience of many of our important species and habitats has been compromised. We believe that urgent action is required to take forward ambitious programmes of large, landscape-scale habitat enhancement to provide climate change adaptation benefits for wildlife and communities threatened by the impacts of climate change.

On our own nature reserves, we have undertaken habitat restoration which we believe can help demonstrate adaptation benefits. These include managed realignment at Skinflats near Grangemouth on the Forth Estuary and Nigg Bay on the Cromarty Firth where saltmarsh and mudflat habitat will be reinstated, providing vital feeding and nesting sites for internationally important bird populations as well as flood management benefits. To date there have been few examples elsewhere of such activity and we believe that strong leadership and coordination is required across public bodies to deliver such benefits at a large enough scale to provide resilience for wildlife and people, in the face of climate change.

Currently the Climate Change (Scotland) Bill relies on the UK risk assessment (section 56 of the Climate Change Act 2008) rather than requiring a specific report assessing the risks for Scotland. RSPB Scotland believes Scotland’s unique environment and population distribution demand an accurate assessment of the risks for Scotland. At the very least we would seek to ensure that SNH and SEPA play an active role in the UK risk assessment process.

The Climate Change (Scotland) Bill proposes that once Scottish Ministers have produced a programme of proposals and policies to meet the objectives of adapting to climate change, the only subsequent assessment of the progress made towards meeting the objectives is to be made by Ministers themselves. The Climate Change Act 2008 (s59) requires the Committee on Climate Change to assess the progress being made by the UK proposals and policies and we would expect a similar level of independent assessment of Scottish Ministers’ progress.

Land use

Land use in Scotland is responsible for 25% of our emissions, due largely to our organic carbon rich (peaty) soils and much of the responsibility for land use decisions is devolved to the Scottish Parliament. It makes sense therefore to ensure that the Scottish Climate Change bill addresses this sector. Farmers and other land managers need advice to better manage our soils to reduce carbon emissions and the research capacity of appropriate land use research institutes needs to be harnessed to this effect. Further support from the Scottish Rural Development Programme (SRDP) for appropriate management action will also be required to drive the necessary changes. RSPB Scotland believes that the Bill needs to address the contribution Scotland’s land uses make to climate change, and to facilitate environmentally sustainable mitigation and adaptation action. We would welcome an indication in the Bill that the Scottish Government’s forthcoming Land Use Review would set out a strategic approach for managing Scotland’s land use in relation to climate change mitigation and wildlife adaptation.

Forestry

We do not welcome the additional broad powers being proposed in Section 47 (1, 2 & 4) to over-ride the Forestry Commissioners’ duties under the Forestry Act 1967, and to delegate their functions. If enacted, these provisions could result in environmentally unsustainable forestry that would harm, not enhance biodiversity. The RSPB would expect full and proper consultation and public debate on any fundamental changes to the primary legislative framework of forestry in Scotland. This should be done separately from the Climate Change (Scotland) Bill.
We strongly support the idea of Forestry Commission Scotland being able to participate in environmentally appropriate joint ventures to address climate change under Section 47 (3).

Full written evidence on Section 47 of the Bill has been provided to the Rural Affairs and Environment Committee and is appended here. [CLICK LINK]

**Muirburn**

RSPB Scotland believes that introducing the flexibility to allow Scottish Ministers to make any required changes to muirburn dates in the future, based on sound and growing scientific evidence about management measures that can be taken to help climate change adaptation, as provided for by Section 46 of the draft Climate Change (Scotland) Bill is a sensible approach.

We would add that we also support the idea of making provision through a licensing system for out of season burning, to allow flexibility of approach. To provide the necessary safeguards for the natural heritage from out-of-season burning, we consider that a licensing system should be put in place and it seems to us most appropriate that such a system is administered by Scottish Natural Heritage as the Scottish Government's advisors on nature conservation.

Such a licensing system would, as mentioned, enable a flexible approach whilst a change in the unlicensed dates would reflect the needs of a changing climate and bring Scotland into line with England and Wales. We would welcome amendments to the draft Climate Change (Scotland) Bill to enable such a licensing system to be established at the same time as any changes in the permitted times for making muirburn.

Again, full written evidence on Section 46 of the Bill has been provided to the Rural Affairs and the Environment Committee and is appended here. [CLICK LINK]
WRITTEN SUBMISSION FROM SALVATION ARMY

Introduction

1. The Salvation Army welcomes the Climate Change (Scotland) Bill and endorses the proposal to cut emissions of greenhouse gases by 80% by 2050.

2. For The Salvation Army, climate change is a social justice issue. Our interest in the bill is in its overall impact and its implementation rather than in the technical detail. This submission is therefore confined to those questions that deal with broader issues. These are primarily questions 1-3, question 6, 7-9, 12, 13, and 20.

The Moral Imperative

3. The Salvation Army’s general approach is summarised by the following statement.

   The Salvation Army is concerned that climate change poses a serious and immediate threat to people everywhere, especially to the poor; and that climate change represents a failure in our stewardship of God’s creation. We accept the need to reduce the emissions of greenhouse gases urgently to avoid dangerous and irreversible climate change; and to promote a more equitable and sustainable use of energy and resources.

4. For these reasons we strongly support the Bill and the contribution it can make to reducing greenhouse gas emissions.

Public Involvement, Engagement and Commitment

5. Our main concern is that many people in Scotland do not feel involved, engaged and committed to the legislation.

6. We therefore believe that if it is to be effective the Bill should include provisions to require the Scottish Government to promote public awareness about the legislation and its targets; and to promote public involvement and engagement in meeting those targets. The broad Third Sector also has a vital role in raising concern about climate change and taking action to reduce negative impacts.

Overall targets (Questions 1-3)

7. The Salvation Army strongly supports the target of an 80% reduction in greenhouse gases by 2050. However this target may be too large and too remote for most people to understand. Faced with such a distant and such a demanding target people tend to set aside the challenge. To aid understanding and engagement short term targets are essential. We agree with the Church of Scotland’s proposal that an annual target of 5% a year is helpful and generally welcomed by congregations as a realistic target.

Scottish Committee on Climate Change (Question 6)

8. The Salvation Army supports the view of Stop Climate Chaos that a Scottish advisory body, a Scottish Climate Change Commission, should be established when the Bill is enacted.

Reporting duties (Question 7)

9. In our opinion, the clauses on reporting duties need to be stronger to require the Scottish Government to set out how it has provided advice and information to the public, how effective that advice and information has been; and how it has promoted engagement and involvement in the delivery of targets. If the Government is not effective in this regard the Bill is likely to fail in its purpose.
Duties of public bodies relating to climate change (Question 8)

10. Duties on public involvement and engagement could usefully be extended to all relevant public bodies (including subcontractors and the wider Third Sector). Local authorities and community planning partnerships in particular have a duty under best value to promote public engagement in their policy planning process and have now developed substantial experience in the field. Churches, congregations and other voluntary organisations could also play an important role and the legislation could helpfully embody a recommendation for public bodies to engage with voluntary organisations in the delivery of this duty.

Adaptation (Question 9)

11. As with mitigation, communities should be at the centre of strategies to promote adaptation. We suggest that the Bill could include more specific reference to the need to engage with communities in developing programmes for adaptation.

Energy efficiency (Questions 12-13)

12. The promotion of energy efficiency is a crucial response to climate change and the clauses are welcomed. However it may be appropriate to relate these duties to the need to tackle fuel poverty as the two issues are closely related. It might be appropriate for the bill to require the Government to take on a more specific duty to promote energy efficiency and tackle fuel poverty by including targets that will lead to a systematic improvement of the housing stock and to reduce the proportion of the population living in fuel poverty.

General issues

13. In conclusion, The Salvation Army reasserts the importance of the legislation and its impact on people across Scotland. The Bill must seek to involve and engage people and communities and set out clearly how the Government will be expected to do this.
Scotch Whisky Association evidence on Climate Change (Scotland) Bill

Scottish Parliament Transport, Infrastructure and Climate Change Committee

Introduction

The Scotch Whisky industry takes the threat of climate change seriously. Scotland’s distilleries are inextricably linked to the environment, relying on high quality water and cereals supplies, and available land to make and mature our products.

The Scotch Whisky Association\(^1\) therefore welcomes the opportunity to provide the Committee with its views on the Scottish Government’s Climate Change (Scotland) Bill. We welcome the overall direction of the Bill and applaud the Scottish Government for its Leadership.

Distillers have a long and proud history of taking active steps to protect the environment, improving energy efficiency and reducing emissions of greenhouse gases (GHG). Through participation in the Climate Change Agreement (CCA) of the Spirits Energy Efficiency Company\(^2\) (SEEC), Scotch Whisky distillers have improved their energy efficiency by 18% (based on provisional results from Milestone 4) on 1999 levels. In meeting their CCA targets, distillers have saved over 170,000 tonnes CO since 2001/02.

These improvements have been achieved through extensive capital investments in energy efficient/emission reduction technologies. That is not to say that the industry is resting on its laurels; member companies are now investigating alternative (low/zero carbon) energy forms to produce this iconic Scottish product, with published plans for three sites to switch to biomass as an energy source in the near future.

The Association is currently working with members to develop a wide-reaching environment strategy for the industry. Energy, greenhouse gas emissions, sustainable resource use and waste arisings are among the priority areas which have been identified. The industry is focusing on what further action can be taken to reduce impacts in these areas.

Scotch Whisky operates in a highly competitive and international market. Over 90% of Scotch Whisky sales are abroad - exports of Scotch Whisky in 2007 generated over £2.8bn, representing 19% of Scottish manufactured exports and 80% of Scottish food and drink exports. Care is required to ensure that regulation to tackle climate change does not place growing and successful industries, such as Scotch Whisky, at a competitive disadvantage.

We understand that the Bill is largely an enabling Bill and that, given the long timeframe over which the Bill’s aims intend to reach, it will be necessary to develop a framework for revisiting existing legislation to achieve the aims of the Bill, and potentially introducing new legislation where no existing powers exist. We would urge the Scottish Government wherever possible to ensure that existing powers are used before developing additional powers, schemes or requirements on already well regulated Scottish businesses.

The Bill presently hints at the potential for a new Scottish Emissions Trading Scheme and additional legislation aimed at reducing packaging. We would oppose the progression of such thinking at this point given the existing powers already available to the Scottish Government (via IPPC, EUETS, Climate Change Levy and Agreements, and the UK’s Carbon Reduction Commitment when it enters force in 2010).

---

\(^1\) The Scotch Whisky Association (SWA) is the trade association representing the scotch Whisky industry around the world. SWA members are distillers, blenders, bottlers and those engaged in the wholesale and export trade in Scotch Whisky.

\(^2\) SEEC is a joint venture between the SWA and Gin & Vodka Association. SEEC’s cc includes 55 of the 100 malt distilleries in Scotland and all 7 grain distilleries.
Distillers will be covered by all four overlapping schemes. Any further measures should focus on the, at present, non-traded/regulated sector, and even then careful consideration must be given to identify any potential knock-on effects such new measures might have on existing schemes.

Association Response to Specific Questions

1. The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

Scientific evidence suggests that it will be necessary to make significant cuts in greenhouse gas emissions if the consequences of global climate change are to be reduced. The greenhouse gas reduction targets proposed in the Bill clearly state Scotland’s determination to be part of a global solution to the threat of climate change, although setting targets does not guarantee success. It will be necessary for Government to put aside resources and introduce initiatives (including simplifying existing regulatory burdens) to help all sectors to play their part in meeting the ambitious targets.

Whilst industry will play its part in helping Scotland meet the targets, we would be concerned if the Bill were to introduce additional targets on sectors whose greenhouse gas emissions are already targeted under the UK’s comprehensive energy/climate change policy mix.

Scotch Whisky is already subject to the EU Emissions Trading Scheme, Climate Change Levy and Agreements, and some sites are likely to be included in the UK’s Carbon Reduction Commitment when it enters force in 2010. In addition, grain whisky distilleries are covered by the Integrated Pollution Prevention and Control regime; with one grain distillery also covered by the Large Combustion Plant Directive.

The SWA would have significant concern if an additional set of targets/emissions reduction scheme was proposed for Scotland for already highly regulated sectors. We would not wish to see the Bill introduce additional sector targets as this would only serve to add an extra layer of bureaucracy to an already complex policy area. Any further measures should focus on the non traded/regulated sector, and even then careful consideration must be given to identify any potential knock-on effects such new measures might have on existing schemes.

2. The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

What are your views on the setting of targets in batches from 2010 to 2022?

It is disappointing that the Bill contains provisions to set annual targets which we believe will be burdensome to monitor and enforce. Whilst it is proposed that annual targets are set in batches, we believe that “emissions budgeting”, whereby targets are set for, say, a five-year period, offers greater flexibility.

Annual targets within each budget period may be set, although emissions budgeting (as proposed in the Scottish Government’s consultation Proposals for a Scottish Climate Change Bill (January 2008)) would allow emissions from each year of the budget period to be balanced out ultimately, the target to meet would be that for the entire budget period and not for each year within the period. Emissions budgeting allows for any marked differences in emissions between each 12-month period to be balanced out. This is a much more realistic way of target setting, recognising that investments made may offer step-changes in emissions performance rather than a smooth performance curve.
We would also support the ability for the Scottish Government to bank and borrow between budget periods, allowing improvements to be staged within natural financial investment cycles rather than by arbitrary annual/budget period deadlines.

3. The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

As our response to question 2 advises, we are concerned about the introduction of annual targets. Instead we advocate the introduction of emissions budgeting.

4. The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

The concept of a “net Scottish account” appears to be appropriate. Action to meet the greenhouse gas reduction targets should take place within Scotland first and foremost. The Bill should not encourage industry to relocate outside of Scotland in order to reduce “Scottish” emissions.

The use of international carbon credits through, for example the Clean Development Mechanism (CDM) or Joint Implementation (JI), are a form of offsetting and whilst CDM/JI projects may lead to reductions in global greenhouse gas emissions, we believe that offsetting should be used but as a “last resort”. It might be appropriate to introduce limits on the quantity of carbon units which may be credited to the Scottish account annually.

5. The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

We support the Bill’s approach in defining Scottish emissions (“source” emissions). It is much more straight-forward to calculate Scottish source emissions than those based on, for example an end-user inventory.

Whilst in the case of Scotch Whisky, which is export-focused, the end-user inventory approach would have the effect of reducing Scotland’s emissions as the consumption takes place overseas, to a large extent, the geographical source of greenhouse gas emissions is not the issue as their combined impact is the same wherever they are emitted.

6. The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.
What are your views on the Scottish Government’s approach to obtaining independent, expert advice on climate change?

It would appear appropriate for the Scottish Government to utilise the expertise of the UK Committee on Climate Change, not least to avoid unnecessary duplication of work/cost. One would anticipate that the UK Committee would have sufficient knowledge and understanding of any Scotland-specific factors, although we agree that the Bill should make provision for this to be reviewed and if appropriate for a Scottish Committee to be set up. It might also be appropriate to use the knowledge and expertise of other established UK resources such as the Met Office.

7. The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

On the whole, the proposed reporting arrangements are appropriate, although it will be necessary to collate detailed information from a wide range of sources to establish if the target has been met. We would have concerns if that reporting created an additional burden on industry which already is required to report energy/climate change data for other policy areas.

8. The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

We believe that it will be necessary for the Scottish Government to task certain public bodies to perform additional duties under the Climate Change Bill. As a key customer of regulators (e.g. SEPA,) we would wish that the Scottish Government consult stakeholders if and when making decisions on additional duties and who will be responsible for their implementation. Where additional duties on regulators or other public bodies are imposed, we would be keen to ensure that those duties should not detract from their existing responsibilities and that the Scottish Government provides adequate resource where necessary.

Where additional responsibilities are related to climate change matters important to the whole of Scotland and not just specific sectors, Grant in Aid rather than cost recovery must be the mechanism used to fund those additional responsibilities. As our introductory comments suggest, we believe that climate change measures should be targeted at the public and domestic as well as private sectors.

9. The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on this proposal?

We welcome this proposal that will assist Scottish companies better understand their own objectives in relation to adaptation. We would be keen that the Scottish Government takes cognisance of the expected European White Paper on climate change adaptation and ensure that Scottish requirements are in line with European requirements in this area as far as possible.
10. & 11. MUIRBURN AND FORESTRY

We have no comments to make on these aspects of the Bill.

12. The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?

Whilst improving the energy-efficiency of buildings might help Scotland meet its climate change targets, we believe that commercial buildings already covered by climate change legislation (e.g. EU Emissions Trading Scheme, Climate Change Agreements, Integrated Pollution, Prevention E Control, or the forthcoming Carbon Reduction Commitment) should be exempt from further legislative measures to improve energy-efficiency to avoid duplication and administrative burden.

13. The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government's thinking in this area.

What are your views on this approach?

As our response to question 12 advises, we believe that non-domestic buildings should be exempt from further energy-efficiency policy measures if they are already covered by climate change legislation.

Furthermore, building use should be considered when assessing whether energy-efficiency/performance measures are necessary in non-domestic buildings not already covered by climate change mitigation legislation. For example, it would be inappropriate to require distillers to conduct a survey and then to implement energy-efficiency improvements (e.g. insulation) at their maturation warehouses, dry goods stores, or cask disgorging facilities as they do not require heating.

Often the only energy inputs in those buildings are related to lighting during operations. Indeed, for some spirit handling operations, natural ventilation is preferred to help reduce the build up of flammable atmospheres.

14. The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

What are your views on this proposal?

It is encouraging that the Bill focuses on renewable heat - over 90% of a typical distillery’s energy consumption is related to the generation of heat. To help further reduce greenhouse gas emissions, distillers are exploring innovative opportunities to utilise distilling co-products (cereal residues that remain alter distillation) as alternative fuels; this is in-line with the European Commission’s aim to maximize resource substitution.

Co-products are commonly converted into highly nutritious animal feeds and are valued by users, such as the Livestock sector, within the wider Scottish agricultural supply chain. It is a sustainable and Long-standing practice, with a number of animal feeds plants co-located with distilleries.
Distillers believe there is also an exciting opportunity to convert co-products into alternative fuels. A number of SWA member companies are, for example, investing significant resource in bio-energy technology; others are investigating its potential. Major projects include Diageo’s £65m bio-energy investment at the Cameronbridge Distillery Fife, and its new malt distillery at Roseisle Morayshire, a £24m bio-energy development by the Combination of Rothes Distillers and a new £7.2m anaerobic digestion biogas installation at Wm Grant & Sons’ Girvan Distillery.

Whilst projects such as these have the potential to deliver significant environmental benefits, we are concerned that industry ambitions are not thwarted by a bureaucratic definition of what constitutes a “waste”. It is vital that we achieve a pragmatic definition of how the feedstock material for such bio-energy plant is defined.

Scotland’s (and the UK’S) broad interpretation of what constitutes a “waste” would require distillers to comply with a raft of waste legislation, adding significantly to the regulatory burden faced. As a result, an opportunity will be missed, with companies compelled to use traditional and less sustainable fuel sources. Should distillery co-products used for energy purposes be classified as “wastes”, an opportunity to invest in innovation and alternative fuel will be lost.

The Association is in active discussion with SEPA to develop a technical solution to the issue in the shape of “product protocols” for our industry’s products. We are hopeful that this approach will allow a pragmatic decision to be taken on the definition of a range of distillery products in line with the non-waste status they have enjoyed to date.

15. The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas:

- Waste prevention and management plans;
- Waste data;
- Deposit of recyclable waste;
- Procurement of recyclate;
- Reduction of packaging;
- Deposit and return schemes;
- Charges for carrier bags.

What are your views on these proposals?

As a responsible industry, we are supportive of well thought out legislation which can deliver significant environmental improvements, proportionately and effectively. We welcome the overall direction on waste and support its aims of reducing the use of raw materials where possible, sustainable product design, waste prevention and recovering value from used materials.

We strongly believe that the existing legislative framework allows for a large number of the Bill’s proposed measures to be implemented through better implementation of current legislation and enforcement of existing laws. Equally, we are not convinced that the evidence base is currently available to understand if the powers proposed would deliver the desired outcomes. Before any firm plans for additional Legislation are developed, we would wish to see the Scottish Government better understand and articulate specific needs and concerns on which to justify new legislation.

Furthermore Scotland’s geography is extremely varied, the services and infrastructure supporting the local communities will be bespoke to their requirements and therefore the option of one approach fits all will not always be possible. Any future legislation agreed will need a degree of flexibility to ensure the individual and specific requirements throughout Scotland can be catered for.

We have the following comments to make with regards to the Bill’s specific proposals:

**Waste prevention and management plans**

We support this proposal in principle. A ‘strategy for waste’ makes good business sense and is a sensible approach for any responsible business. Any company which has an Environmental Management System or is operating under an IPPC Licence (the majority of SWA members will have one or both of these) will have a strategy in place to identify and control the waste streams. Indeed, contrary to the statement in the Bill’s policy memorandum, companies operating under an IPPC permit have a legal obligation to minimise waste arisings.

It is difficult to comment much further on this proposal as the proposals are yet to be developed. We would ask the Scottish Government to ensure that, as and when proposals are developed in this area, sectors/businesses which will be covered by such proposals are identified clearly from the outset in order to allow companies to plan adequately for potential changes in the way that they plan and manage waste activities. We would strongly recommend that a pilot of any new scheme is undertaken before plans are implemented or additional legislation is developed.

**Waste data**

We support this proposal in principle and agree that some of the data necessary to better understand waste management priorities is already collected by SEPA via Waste Transfer Notes. It should be relatively straightforward for the Scottish Government to obtain such data directly from its environmental regulator or from the waste management industry. We would not wish that waste producers be burdened with the additional bureaucracy of making additional data returns for CC Act purposes.

Currently SEPA obtain additional data at an individual operating site level via voluntary surveys to regulated businesses. Distillers’ experience with such surveys is that they are problematic for larger multi-site companies as the data which companies hold, provided by the Waste Companies, is amalgamated for the business and does not specify individual site volumes. If the waste data information is required for individual sites, rather than on a company basis, then our members will have to spend time and resources unbundling their data.

We believe the Explanatory Memorandum underestimates the cost of additional data collection (at £25k for all businesses). This is based on the point made above that companies across Scotland may well not be able to supply data at a site level. Should the information required for the purposes of the Bill were to be supplied by the Waste Management Industry directly, the figure of £25k may be closer to what we would anticipate.

**Deposit of recyclable waste**

We support this proposal in principle. The majority of our members’ production sites already have recycling infrastructure in place. We believe a Code of Practice for businesses would be sufficient to deliver the desired outcome rather than developing further legislation.

A significant number of our distilleries are sited in remote and island locations. These sites will produce minimum volumes of recyclable waste and we therefore believe a community approach should be taken rather than individual businesses being expected to develop facilities in isolation. In these remote locations demonstration of compliance will be an issue and a tailored approach will be required.

**Procurement of recyclate**

We are not convinced that additional legislation is required to deliver the desired outcome of ensuring that a minimum percentage of recyclate is used in products. We prefer a voluntary route to achieving the Government’s (laudable) aims.

An example of where a voluntary initiative is showing real potential for one of our key packaging materials is the WRAP (Waste a Resources Action Programme) recyclate protocol for glass.

The Association is actively participating in this WRAP supply chain initiative. Most glass manufacturers work in a global market. Requiring companies to negotiate levels of recyclate individually could create a business risk. Indeed, it may even risk the future security of supply, where supplies come from sources outside of Europe and our influence on our suppliers is limited. We believe that the most effective and efficient way to improve the level of glass recyclate in bottles would be through partnership working with glass manufacturers to set industry standards rather than leaving it to the customers to influence via their procurement policy.

**Targets for reduction of packaging**

The SWA is supportive of the principle of optimising packaging. Packaging allows products from the manufacturer, sold via the retailer, to reach the consumer in a condition which the consumer expects. It also extends shelf life, minimises breakages, safeguards public health, provides product information to consumers and for some luxury goods provides a gifting element.

We have concerns, however, over the suggestion that Scotland might adopt binding targets for overall reductions in packaging different to those set in Europe. Such an outcome creates an unlevel playing field and could provide a strong disincentive for manufacturers to supply to a Scottish market. We are also unconvinced that additional legislation is necessary. Instead we believe that better enforcement of the existing regulations together with voluntary measures such as some of those commented upon in the Policy Memorandum would be sufficient.

An example where voluntary initiatives have been successful in this area is in “light-weighting” of glass in the Scotch Whisky industry. The industry has invested significantly over a number of years in light-weight glass’ technology, requiring fewer raw materials and less energy to make and transport our product.

There are technical barriers to further lightweighting, however, and distillers would find it a real challenge to take the weight down further, if at all. Moreover, there is a need to remember consumer expectations in relation to the packaging of high quality, luxury brands. Such brands may well feature embossing and unique bottle shapes which generate physical limitations and dictate the wall thickness of the glass.

The most effective and efficient way to reduce packaging weights is through partnership working within the supply chain. For example, industry sectors working with the glass manufacturers to set industry standards rather than leaving it to customers to influence via their procurement policy.

The Bill’s Policy memorandum acknowledges that alternative means of meeting the policy objective of packaging reduction is possible. Voluntary measures such as the ones outlined above should be given every chance to succeed before new legislation is considered. We would wish to see the Scottish Government further supporting these types of initiative before it considers the introduction of blunt regulatory drivers and would be interested in participating in any government/stakeholder discussions on how such voluntary schemes might be further developed to achieve the Scottish Government’s policy aims.
Deposit and return schemes

The Scotch Whisky industry does not support a 'Deposit and Return' scheme for its containers. It would create significant additional business costs but more importantly it is highly likely (if bottles were required to be refitted) to have major impacts on the quality and branding of our products. The benefit to the environment of the proposal for Scotch Whisky is questionable. The business impacts can be summarised as follows:

- Glass weight: Spirits bottles are designed for single use and would require an increase in weight to make them sufficiently robust enough to withstand multiple-use. This would increase the use of raw materials;

- Presentation: Bottles would become scuffed and chipped during use. This is undesirable in a premium product and would fail to meet consumer expectations. It is likely to discourage purchase if the Government’s intention is to require refilling;

- Closures: Our industry uses tamper proof aluminium caps for a number of products which remain on the bottle once opened. There is currently no technology available to remove this article and a complete re-design of the spirit cap would be necessary to allow re-use;

- Bottle return logistics: Spirit bottles are in most cases branded items and would cause considerable difficulty in terms of sorting and returning to the correct bottler or company, if that is the intention;

- Investment: No spirit bottlers are equipped with bottle washing or electronic bottle inspection equipment of the type required to inspect re-use bottles. Both these pieces of equipment are substantial and would require investments of £0.5m - £0.75m on each line. Bottle washers are very large machines and would not physically fit into most bottling halls;

- Environmental consequences: To remove labels, residual spirit and foreign matter requires an aggressive cleaning in a caustic solution at 60 - 70°C, the environmental implication of this must be considered against any savings made not having to re-manufacture the bottle.

- Transportation: The UK market is less than 10% of total Scotch Whisky sales and the transportation of these glass bottles for refill over large distances is not environmentally desirable;

- Level of deposit: If this is set too high it could lead to an increase of counterfeits bottles and fraudulent collections of the deposit. If it is set too low then there will be no incentive for consumers to return the bottle.

We believe prior to any new legislation being scoped in this area, a pilot project should be undertaken to quantify the level of uptake by consumers and assess the costs against a more traditional education programme to change recycling behaviours. Any initiative or pilot should ensure it is clearly communicated that the bottles would be recycled rather than returned for re-fill

Charges for the supply of carrier bags

SWA has no specific comments on this proposal as only our visitor centres provide carrier bags for shop customers. Our industry would be happy to support and implement the final agreed approach for this proposal.

16. What are your views on the adequacy of the Scottish Government’s consultation in advance of publishing the Bill?
The Scottish Government’s consultation prior to the publication of the Bill was appropriate. In addition to submitting a formal response to the consultation, the Association attended a consultation discussion workshop and met with the Bill team to discuss proposals for the Bill prior to the launch of the consultation.

The Association has also contributed to various climate change related consultations including those looking at renewables and the energy performance of non-domestic buildings.

The Scotch Whisky Association
February 2009
Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

To take account of the recommendation in the First Report (Dec., 2008) of the UK Independent Committee on Climate Change for steeper cuts in greenhouse gas emissions by 2020, the Bill should be amended to include a target of 40% cuts on 1990 by 2020 (equivalent to 30% cuts on 2005) exclusive of international movement rising to an 80% target by 2050 inclusive of international movement.

Q2 The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

What are your views on the setting of targets in batches from 2010 to 2022?

The Association queries the concept of annual targets since general economic fluctuations produce year to year changes in emissions separable from policy actions. It suggests that secondary legislation should specify targets for the five years 2011-15 and 2016-20 compatible with the aim of 40% cuts by 2020.

Q3 The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

Bill should replace annual percentage cuts with a requirement for government to set percentage cuts for each following decade five years before the start of the decade. To meet the aim of an 80% cut by 2050 extended to include attributions related to movement to and from Scotland, there should be a further indicative cut of one-third between 2020 and 2030 with similar cuts in each of the two following decades.

Q4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

The Association, in common with the UK Committee on Climate Change, has strong reservations about procedures allowing Scotland to count as savings any significant amount of savings made outwith Scotland. There is a risk that political factors and low prices for carbon will dilute the incentives for the steeper cuts in greenhouse gas emissions required in all countries. Direct taxation of fossil fuels (less allowances for effective carbon capture and storage) is likely to be a more effective policy instrument as part of a package requiring the proceeds of such taxation to be used to reduce other taxation and provide investment incentives for shifts to greater energy efficiency, energy conservation and greater reliance on alternative fuels (The Association has already raised this issue in evidence to the Calman Commission).
Q5 The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

Emissions should include all emissions from Scottish sources plus, as proposed, amounts attributable to Scotland from international aviation and shipping. There should also be consideration of whether the following attributions should be added:-

a) emissions arising from manufactured imports consumed in Scotland (with corresponding cuts in the emissions of exporting countries);
b) emissions related to movement of passengers and goods between Scotland and other parts of the UK e.g. UK domestic aviation and other UK goods and passenger movement (with corresponding cuts in emissions otherwise entirely attributed to other parts of the UK) [in practice, UK domestic aviation may be the only area of internal UK movement to merit early attribution].

Q6 The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government’s approach to obtaining independent, expert advice on climate change?

The Bill should include powers for such a Committee but, in practice, this function could be handled by arrangements within the existing UK Committee at least for the next ten years.

Q7 The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland's emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

Expand to include means to enforce recommendations.

Q8 The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

No added comment.

Q9 The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on this proposal?
Should be altered to make clear that Mitigation is included - see also comment on Q20.

Q10 Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are your views on this proposal?

No added comment.

Q11 The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

No added comment.

Q12 The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?

As Q 14.

Q13 The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government’s thinking in this area.

What are your views on this approach?

As Q 14.

Q14 The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

What are your views on this proposal?

Welcome reference to Action Plan and to - Behavioural Change – see also comment on Q20.
Q15  The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas: Waste prevention and management plans;
Waste data;
Deposit of recyclable waste;
Procurement of recycylate;
Reduction of packaging;
Deposit and return schemes;
Charges for carrier bags.

What are your views on these proposals?

No added comment.

Q16  What are your views on the adequacy of the Scottish Government’s consultation in advance of publishing the Bill?

As Q17.

Q17  Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government out on the consultation proposals?

The effort to consult was commendable but the nature of the topic and the background information available early in 2008 made it difficult to provide meaningful comment and clear conclusions on the broad options considered as part of the SEA. It is worth noting that the broad brush SEA evaluation of options did consider that both the economy and the environment would gain from faster and sustained cuts in greenhouse gas emissions, a conclusion strengthened in the First Report of the UK Committee on Climate Change.

Q18  Does the Bill raise any equalities issues you would wish to highlight?

These arise both in relation to individuals and to different parts of Scotland but can be handled as part of Budgetary and Mitigation Strategies – see also comment on Q20.

Q19  Do you have any comments on the impact of the Bill on sustainable development?

This will depend on the Action Programmes and Monitoring adopted but Bill should reflect the UK Climate Change Committee view that progress on greenhouse gas reduction will make the economy stronger and more secure while also giving social gains and local as well as global environmental benefits.

Q20  Do you have any other comments on the Bill?

The main omission from the Bill is a requirement to indicate the proportion of greenhouse gas cuts likely to come from the action within the powers of the Scottish Government and action mainly dependent on UK, EU and international decisions. This should be made clear in the sections dealing with targets and percentage cuts.

Neither the Scottish nor UK Bills can set out detailed action programmes and related monitoring but the Scottish Bill should be modified to require the Scottish Government to produce rolling five-year action programmes and to indicate expectations of the outcome of UK, EU and international action. These programmes should include appropriate budgetary strategy and the treatment of adaptation, mitigation and equality issues. Review of such programmes should be the principal feature of the regular reports monitoring progress and recommending the further action required to meet, or modify, targets.
The Association sees significant opportunities for accelerating greenhouse gas cuts within the powers of the Scottish Government in relation to transport, planning and access. Scope for action in this area could be further enhanced through greater elements of fiscal, financial and energy devolution see our submissions to the Calman Commission, the Strategic Transport Projects Review and the summary comments on the First Report of the UK Climate Change Committee and the two reports on Energy and Carbon Dioxide made by AEA to the Scottish Government in October, 2008 (appendix).
APPENDIX

Extracts from SAPT Response to First Report of Calman Commission

Both the Scottish and UK Governments are now committed to 80% cuts in greenhouse gas emissions by 2050 together with intermediate targets but differing conditions and preferences within Scotland suggest that fuller devolution of energy powers could assist progress towards targets.

As part of the drive for greater energy efficiency and shifts in energy sources, the case for the Scottish Government having power to tax energy requires consideration provided that this is in a framework including the use of new income arising to reduce other taxes and to promote both energy efficiency and shifts to alternative fuels. With tax levied at the source of production (or import into Scotland), administrative costs would be low and it would be an important instrument aiding delivery of Scottish targets for emission cuts.

With respect to transport, more emphasis is required on an investment and pricing strategy which reduces the need for fossil-fuel intensive and environmentally disruptive movement. Stronger links are required between energy and transport strategies. To develop synergy in governance, two reforms are proposed:-

- Incorporation of the Transport Directorate in a Scottish Government Department also covering energy, climate change and planning issues
- A possible merger of Transport Scotland and Network Rail (Scotland) but with close links with both a Rail Agency in England and with a DfT merger with the Energy and Climate Change Department established by the Prime Minister in 2008

Transport Finance Unlike present arrangements, charging for both road and rail infrastructure use should be a devolved power. Such charging would provide an income stream, along with some of the proceeds of fossil fuel taxation, to underwrite future borrowing for major transport projects compatible with energy and climate change strategies. The final Calman Report should recommend a new agreement between the UK and Scottish Governments on the proportion and nature of motorised road taxation to be regarded as road charging payable direct to Scotland with a related cut in the present level of block grant from UK taxes and borrowing.

There should be power to the Scottish Government to vary the level of road and rail charging in line with better delivery of policy aims for the economy, energy, climate change and transport. This should embrace power to borrow against selective increases in charges related to reduced congestion and major projects OR to use such increases to finance PPP/PFI agreements.

Extracts from SAPT Response to Strategic Transport Projects Review (STPR)

Strategic Environmental Assessments (SEA) and Scottish Transport Appraisal Guidance (STAG) procedures should be revised to reflect the integrated economic and environmental benefits arising from the steepened cuts in greenhouse gases by 2020 and beyond as recommended in the First Report of the UK Independent Committee on Climate Change (December, 2008). The aim should be meaningful integration of environmental, economic and social objectives in a series of Five Year Action Programmes, including both fiscal and regulatory measures.
Movement Forecasts  The STPR, and ongoing revisions, need to reflect the impact of changes in policy and in fossil fuel prices on future levels of movement and modal share both within Scotland and on external links. It is important to take account of a downward revision of aviation growth forecasts in the context of the view of the UK Climate Change Committee that recent rates of growth (now much affected by cyclical downturn) are not sustainable over the years to 2050. In particular, both the UK and Scottish Governments have recognised that there are increasing prospects for rail, not only to handle more freight (with much lower emissions and less disturbance for local environments than movement by HGV), but also to attract a substantial share of short-haul (250 to 500 mile) passenger trips presently made by air.

STPR and emission predictions require adjustment to give explicit recognition to the economic benefits of continuation of the near stabilisation of road vehicle miles (already evident for car use as shown in Scottish Transport Statistics, December 2008) and a substantial slowing of aviation growth. Conversely, the new policy and forecasting context is likely to maintain recent high levels of rail growth and add momentum to increases in active travel (walking & cycling) and in tram, bus and demand responsive transport for many of the shorter trips which, if made by car, contribute to emissions, traffic delays and other adverse impacts on local environments. Similar changes need to be reflected in the finalised National Planning Framework (NPF).

Transport Technology, Regulation and Investment

The UK Climate Change Committee takes the view that changing technology and related regulatory/fiscal measures to encourage more energy efficient vehicles and alternative fuels will have a substantial role in reducing emissions but the absolute impact will be lessened if high growth in movement continues. The need for more investigation of this area is admitted and the Climate Change Committee is now urging faster moves towards the use of electric power in transport if targets for steepened cuts in emissions by 2020 are to be met. The Committee also desires a review of aviation growth in an international context.

What also requires examination as part of Action Programmes and an evolving STPR are the increasing prospects for net economic and emission gains from a stabilisation of overall vehicle miles (reductions in some areas) in Britain by 2022 with air travel in Britain (and to the nearer continent) also being cut.
