The bioenergy industry is central to the delivery of the UK’s international obligations on climate change and the Scottish Government’s intentions in the Climate Change (Scotland) Bill. The use of biomass material to displace energy production from fossil fuels will have a beneficial impact on carbon emissions and the encouragement of energy schemes using local timber will result in lower transport emissions.

As reported by the FREDS Biomass Energy Group (BEG)¹,

Biomass, particularly wood fuel, is accepted as carbon neutral. It can have a positive effect on the environment. It is also a predictable and firm source of energy supply and therefore an important contributor to a diverse energy mix, which is vital to security and continuity of supply.

¹ Year of reference 1985.
Scottish biomass is uniquely placed within the UK to contribute to both Scottish and UK renewable targets by 2010. This is because, as FREDS reports, Scotland has a substantial existing and expanding resource from managed woodlands and sawmill products which can be accessed for wood fuel almost immediately. The GB wide forestry resource is predicted to grow well in excess of demand over the next three decades, and around 60% of that resource is located in Scotland. According to FREDS, the future harvest level is likely to be around 5.5 million cubic metres above current use, and the minimum size of the biomass electricity market in Scotland could be as much as 450 MW of installed capacity. Other factors, such as the growing of energy crops may greatly increase these figures.²

Furthermore, this capacity figure would be significantly greater if the use of biomass materials for heat is increased.

From the work that FREDS has undertaken, alongside the findings from reports by the Biomass Task Force³, Sustainable Development Commission⁴ and the DTI/Future Energy Solutions⁵, it is clear that there is considerable impetus to develop biomass as a renewable fuel. Scotland is well placed to derive benefit by developing a new business arena for the forestry sector and by improving the Scottish economy through reducing dependence on external fossil fuel supplies and related uncontrolled energy prices.

2. Do you consider that either of the Government's consultation proposals (on entering into joint ventures and on leasing cutting rights) would enhance the Forestry Commission's role in dealing with greenhouse gas emissions and climate change?

The Commission owns and manages a very large estate which is likely to include a significant number of sites suitable for generation of electricity from hydropower and wind. Whilst the Commission has in-house project development expertise it may prove commercially sensible to work in partnership with other players in the renewables industry to realise any potential, especially where it is desirable to promote rapid deployment.

However we believe that the energy generation by any such joint venture should be limited ‘to generate power from wind, hydro and micro power’ and that there is no suggestion that the Forestry Commission would form joint ventures to develop bioenergy projects of any scale. If bioenergy Joint Ventures were proposed, these allow a situation to arise where Forestry Enterprise Services is effectively selling timber to itself. Real or perceived, serious market distortion in the wood fuel market may arise.
3. Do you envisage any implications for nature conservation, biodiversity or recreational interests from the two proposals and, if so, what are they?

As long as the cutting/felling and any re-planting activity by third party operators takes place in accordance with the same good environmental practice that the Forestry Commission would themselves follow, then it is likely that good standards can be maintained by the private sector.

To get the full potential benefit from new wind and hydro renewable energy schemes may require local changes in forestry practice. For example, low density native forests can have beneficial effects on hydrology and run off compared to closed canopy evergreen plantations and so be more compatible with new hydro schemes. Equally, dense tree cover in close proximity to wind turbines can cause air turbulence which reduces the amount of power that can be generated. If the Government want to maximise the benefits of new wind and hydro schemes then they need to ensure the Commission has the necessary duties and powers to change existing species mix and planting density accordingly.

4. Do you believe there are any implications for rural employment from the two proposals and, if so, what are they?

The opportunity to develop renewable energy schemes within the national forestry estate is likely to bring complementary economic activity in terms of construction and maintenance of schemes as seen in non-forestry estate around Scotland.

Scottish Renewables welcomed the publication of a Scottish Government study into Scotland’s future hydro power potential. The future potential lies primarily in small and medium-sized developments at a community and/or local level. The national forestry estate could considerably contribute to releasing the estimated 650MW potential in Scottish hydro power with the consequent positive jobs and economic impact that would bring.

5. Do you have any other views on these two proposals from the Government?

No comment at this time.

Scottish Renewables
29 January 2009
The SRPBA welcomes the opportunity to provide comments to the Rural Affairs and Environment (RAE) Committee on the provisions relating to forestry in the Climate Change (Scotland) Bill. Under section 47 of the Bill, the Scottish Ministers would be given the power to modify the functions of Forestry Commission Scotland (FCS) if they consider it necessary or expedient to meet greenhouse gas emissions reduction targets under the Bill or for other climate change reasons.

The SRPBA responded to FCS’s Climate Change and the National Forest Estate: Consultation on Forestry Provisions in the Scottish Climate Change Bill on the 27 February. This consultation paper indicated that the Scottish Ministers are considering using the section 47 power to enable FCS to (i) enter into joint ventures with developers on FCS land with the intention of participating in renewable energy programmes, and/or (ii) offer leases and cutting rights over parts of the national forest estate. It is suggested that FCS could use the money generated by these proposals on climate change related projects, such as forest creation.

1. Do you envisage that the Forestry Commission could play a greater role than it does at present in reducing greenhouse gas emissions or in alleviating or responding to the effects of climate change? If so, what suggestions would you make?

The SRPBA believes that FCS could play a greater role in reducing greenhouse gas emissions than it does at present. We consider that the proposal to allow Forestry Commissioners to enter into joint ventures with developers with the intention of participating in renewable energy programmes on the national forest estate seems to be a sensible suggestion. FCS can currently lease non-forested land for any purpose (but not forested land) and has done so for several projects including windfarms. The SRBPA believes that FCS could get better value for Scotland by entering into joint ventures with developers and receiving a share of the profits, thus generating more funds for investment in woodland expansion. Therefore, FCS would be contributing to reducing greenhouse gas emissions by (i) entering into renewable energy projects on the national forest estate and (ii) investing the money raised in planting more trees which lock up carbon, can be used as a renewable fuel resource, are easily recycled and can substitute for more energy intensive materials, thereby reducing carbon emissions.

2. Do you consider that either of the Government’s consultation proposals (on entering into joint ventures and on leasing cutting rights) would enhance the Forestry Commission’s role in dealing with greenhouse gas emissions and climate change?
As stated in our response to question 1, we believe that granting FCS the powers to enter into joint ventures with the intention of participating in renewable energy programmes on the national forest estate will enhance their contribution to reducing Scotland’s greenhouse gas emissions. However, based on the limited amount of information available to date, the SRPBA does not think that the leasing proposal would enhance FCS’s role in dealing with greenhouse gas emissions and climate change. It is proposed that the money raised from leasing would be put back into future planting which would have benefits for climate change. However, we are apprehensive that the money raised will not necessarily be put back into the forestry sector. The proposed leases will last for 75 years, during which time governments will change and agendas will change. In practice, the government cannot guarantee that money raised will be reinvested into the forestry sector. Any lease arrangement that attempts to ensure that the public’s interest in the national forest estate is retained is likely to be very complex, possibly not 100% effective in the long run and very expensive overall. Furthermore, a 75 year lease does not relate to rotation length and this may lead to the demand for a lease roll over or sale of land.

3. Do you envisage any implications for nature conservation, biodiversity or recreational interests from the two proposals and if so, what are they?

The SRPBA envisages that the money raised from joint ventures will be reinvested back into the forestry sector for future woodland creation. With this additional income stream FCS will be able to fund biodiversity projects and ameliorate recreational opportunities on the national forest estate. However, if the leasing proposal goes ahead, FCS may stand to lose 25% of their land area but because this would include some of their most productive forests they may lose approximately 33% of their income, thus increasing their unit costs. Therefore, less money would be available for nature conservation, biodiversity and recreation. If FCS loses its income stream due to the introduction of a 75 year lease to a private company, there must be a guarantee that any shortfall in finances will be met by the Government in order to continue providing the public benefits noted above.

4. Do you believe there are any implications for rural employment from the two proposals and, if so, what are they?

The SRPBA believes that allowing FCS to enter into joint ventures could potentially create jobs in rural areas of Scotland. On the other hand, if 25% of the national forest estate is leased, including some of the most productive areas of forestry, then it is inevitable that FCS will not be able to fund as many positions as at present. The Minister has argued that there could be an increase in jobs available if the leasing proposals go ahead because the money raised from leasing could be reinvested back into the forestry sector and more positions could be created. However, there is no guarantee that the money will be put back into the forestry sector and the lessee will be under no obligation to employ existing FCS staff because they may already have their own staff.
5. Do you have any other views on these two proposals from the Government?

General comments
• The consultation period was unusually short from 4 November 2008 to 27 January 2009, including the Christmas and New Year breaks. A consultation period of three months is considered more usual and any shorter period makes it difficult for stakeholders to gather opinion and respond fully. We appreciate that the closing date is set early due to the fact that the Climate Change (Scotland) Bill has already been introduced in the Scottish Parliament. However, this suggests that there is some urgency to the government’s proposals and it appears that they are all a bit ‘last minute’. It has been rumoured that a single investor has already approached the Scottish Government to lease land and this would require the government to rush through enabling powers. The SRPBA is aware that the Minister has dismissed these claims but we would still like to raise them as concerns held by some of our members. In general, the whole consultation process seems rushed and this is evident from the consultation paper itself which lacks any detail about the joint ventures or leasing proposals. This lack of clarity makes it more difficult to formulate a definitive view.
• Before even contemplating whether the joint ventures and leasing powers are a good thing we need to address the main question in the consultation - should the government have enabling powers built into the Climate Change (Scotland) Bill to allow joint ventures and leasing? If it is granted enabling powers then sufficient checks and balances need to be contained within the primary Act to give the forestry industry some comfort that the detailed secondary legislation will be properly consulted upon and scrutinised. We would require confirmation that the secondary legislation will be passed using the affirmative procedure in parliament so that the relevant committee has the opportunity to scrutinise and ask questions of the government. This would give stakeholders an opportunity to engage with MSPs if any changes are required. We do not feel that negative resolution is appropriate in these circumstances.
• The SRPBA would like to know timing for the secondary legislation. We would like to know when we could expect to see draft regulations and need some assurance that the industry will be given sufficient time to scrutinise them. The primary Act must contain an obligation upon Scottish Ministers to consult.

Joint Ventures
• Some have questioned whether or not FCS has the appropriate skills to enter into joint ventures since their expertise is in managing state owned woodland, not renewable energy projects. However, Forestry Commissioners do have experience in management and commerce, consequently they are suitably equipped to enter into joint ventures. FCS can provide the land and management expertise while the other partner(s) can contribute their experience in overseeing renewable energy projects. Therefore, successful joint ventures are achievable.
• However, we would like to add one point of caution regarding joint ventures: FCS would have to participate in any losses if projects failed and therefore risks would be taken with taxpayers’ money.
Leases and cutting rights

- How many leases will there be – one lease of the whole 25% of the national forest estate to a single (possibly foreign) investor or a number of leases to private sector interests in Scotland? The former option would be very unpopular with the public as well as some of our members but based on discussions to date it seems more likely.
- Will lease(s) be renewed or extended after the initial period of 75 years? If so, is this not just a sell-off in another name?
- FCS is generally regarded as a good neighbour. How can this benefit to landowners be preserved with the new tenants?
- How will the future of the processing sector be guaranteed beyond honouring existing contracts?
- The SRPBA does recognise that potential lessees will need to make their woods work hard to generate a return and they will have an interest in a competitive and vibrant market for their products. However, unlike FCS they could mothball their timber at times of low prices thus creating supply problems. Private growers have not generally been willing to enter into long term contracts with sawmills since they prefer to sell at times of better prices only and cannot therefore be relied on to maintain continuity of supply.
- Instead of offering leases to new investors, the SRPBA believes that more planting would take place if the rules of the Single Farm Payment, which facilitate ‘armchair farming’, were changed. There are costs and risks involved with planting trees on bare land whereas one can let that land remain bare and receive money for doing so in the form of a Single Farm Payment. Reform of these rules would remove one barrier to increasing planting. It would seem illogical to simply increase grant rates for forestry without firstly addressing this Single Farm Payment barrier. By planting on bare land, land managers could be contributing to a mosaic of land uses in Scotland which would provide both themselves and the wider Scottish population with multiple benefits such as biodiversity benefits, diversification of sources of income and helping to tackle climate change. The SRPBA strongly encourages the development of a rural land use framework for Scotland and we welcomed initial discussions on this topic in September 2008. Scotland needs a framework in order to identify the most appropriate land uses for each area in order to ensure our limited land resource is carefully used.
- The SRPBA believes that if funding was made more readily available to the private sector, they would be willing to increase planting to meet government targets. The SRDP needs to be simplified and streamlined to encourage private foresters to plant, grant rates for new planting schemes need to be increased and restocking grants (including for Sitka spruce) need to be reintroduced because this would ensure that there is no delay between felling and replanting. Private owners and investors have not lost their appetite for planting, as demonstrated by the large oversubscription to the Ayrshire locational premia under the old SFGS. In short, if the incentive is present, the private sector will provide the forests.

SRPBA
January 2009
Scottish Climate Change Bill (incl. National Forestry Estate)

The Scottish Tourism Forum is delighted to respond to the consultation on the Scottish Climate Change Bill on behalf of its members.

The Forum is the Scottish independent industry body representing tourism and hospitality businesses across many sectors, trade associations, local marketing groups, trade suppliers and businesses that earn their living from tourism or have an active interest in tourism and its importance to Scotland. The Scottish Tourism Forum is positioned as the national strategic voice of the industry and partners need look no further.

STF has a membership base of trade associations, area business groups and individual businesses. Within our membership we have forty five trade associations representing sectors right across the industry and we reach an estimated 6,000 businesses through this network.

STF is funded through its membership with a purpose to unite tourism interests and add value to members’ businesses. We bring public and private players together, to encourage the voicing of opinion about problems, priorities and solutions.

The value of tourism to Scotland is £4.2b annually and the industry has set itself the ambition to grow the economic value to over £6.1b by 2015, by adopting the strategies in the Tourism Framework for Change reviewed strategy. We feel our comments are reflective of this ambition recognising the enablers and barriers to drive growth even during these challenging economic times. The Scottish tourism industry by definition must be here and as such any investment in to tourism is an investment in to Scotland’s future and directly to its communities.

We recognise the important role, both at present and into the future the Forestry Commission plays in its stewardship of around 10% of the countryside of Scotland. This asset is one that is enjoyed by both tourists and local communities alike, it is also seen as having a key potentially role in the further development of the tourism offer in Scotland.

The consultation looks specifically to address four main questions and our response to this is as follows:

1. What are your views on allowing the Forestry Commission to enter joint ventures, with the intention of participating in renewable energy programs on forest estates?

The STF see this area as an opportunity for effective local partnerships to be involved at an early stage of planning, to vision and deliver a range of sympathetic
initiatives that would be used to engage with visitors and local communities, assisting in the promotion of good practise and driving increased use of the forestry estate.

2. **What are your views on allowing Scottish Ministers and Forestry Commission to offer leases and cutting rights over parts of the national estate?**

Concerns have been raised over the potential conflicts between areas that have been leased out and their use for recreation. One of the strengths of the Forestry Commission’s activities is their understanding of the needs and potential opportunities within their estate leading to sympathetic development of tourism projects. The role of the Rangers is vital, a much valued resource at the local level, working in partnership to unlock untapped potential (eg Dark Sky’s) and working with communities to deliver benefit to both tourism and local communities. If long term leases are applied this could potentially stifle the further development of these opportunities.

The Commission operates in a fashion that is sympathetic in meeting the potential opposing needs of recreation against timber production and reassurance would be needed to avoid local issues arising.

The current arrangements operated by the Forestry Commission provide opportunities for local operators to be used. It is likely the beneficiaries of the leasing would be able to use national level contracts and this could have a real impact to employment in the local area. If national contracts are applied this would potentially see higher carbon emissions and lower profits from the timber operations.

We understand the criteria for the selection of properties for inclusion in surplus property list, these should be looked at carefully and the development potential should also be identified in partnership before decisions are made.

3. **What are your views on (1) transferring proceeds from leases and cutting rights to not-for-profit trust, for investment in woodland creation; (2) transferring the landlord’s interest in this land to not-for-profit trust; (3) ministers stipulating in the constitution of such a not-for–profit trust.**

The Forum does not have particular opinions on this question

4. **Are there other actions which need to be taken, or are there other changes in legislation which need to be made, in order to allow the public and private forestry sector to contribute to Scotland’s target of reducing emissions by 80% by 2015? If so, please outline what these are.**

We would full support Government in its goal to reduce carbon emissions and are not aware of any unforeseen issues relating to legislation.

The Scottish Tourism Forum would be delighted to provide further evidence or information around the points raised if required.

**Scottish Tourism Forum, January 2009**
1. *Do you envisage that the Forestry Commission could play a greater role than it does at present in reducing greenhouse gas emissions or in alleviating or responding to the effects of climate change? If so, what suggestions would you make?*

Yes. I believe that more could be done to capture carbon by restoring the thousands of hectares of lowland raised bog owned by FCS. Peat stores a lot of carbon and an active peat bog acts as a store of this carbon, locking it up for a very long time. In the 1970s FCS bought and planted a lot of lowland raised bogs as was the policy at the time. Now these lowland raised bogs are being assessed for their condition and most are found to be capable of full restoration or partial restoration to active peat bogs. This is despite 30 odd years of conifers growing on them. FCS is in a great position to achieve this work whereas bogs owned by private individuals have not seen the sort of restoration works that Scottish Natural Heritage had hoped, even with grant incentives. There are thousands of hectares of publicly-owned peat bogs that could be restored and FCS has the know-how to do this work effectively and efficiently. There are many reasons why restoring the FCS lowland raised bogs would be great for Scotland, but the carbon store argument is one of the strongest at the moment.

The other response that FCS could make would be to shift the new planting species away from commercial conifers and more towards native woodlands. Native woodlands out perform the non-native conifers when you look at carbon lock-up over the long term. However, the commercial conifers lock up more carbon in the short term. Again, there are many reasons why it would be beneficial to have more native woodlands planted but the long-term carbon lock up is a strong argument.

By having Forest Research the FCS are in a strong position to lead on forestry and climate change issues, for example researching tree species choices to allow our landscapes to adapt successfully to climate change. A strong FCS is important, I believe, to allow us to face the challenges presented by climate change.

2. *Do you consider that either of the Government's consultation proposals (on entering into joint ventures and on leasing cutting rights) would enhance the Forestry Commission's role in dealing with greenhouse gas emissions and climate change?*

I believe the proposal to enter into joint ventures will enhance FCS's role in dealing with greenhouse gas emissions and climate change. I do not believe that the proposal to lease cutting rights would do this. The main reason I do not believe this is because of the lack of a plan to demonstrate what the
released money would be used for. How can you believe in something that you don’t know the details of? This is the most frustrating part of this whole proposal - the lack of any information about what the government would do with the expected £200 million from the FCS estate. FCS staff have been informed by the Director of FCS that Michael Russell has not given any assurance that the money would come back to the forestry sector, however in the press the Minister is quoted several times stating that this money "might" and "could" be used for more tree planting. It is my understanding that there is no plan of how to use this money, that involves forestry for climate change measures or otherwise, and therefore the consultation on the leasing of the FCS estate has come before proper evaluation and planning by the government of their proposal - cart before horse.

3. Do you envisage any implications for nature conservation, biodiversity or recreational interests from the two proposals and, if so, what are they?

I consider that the more FCS are involved in energy developments on their estate the better for conservation and recreation. I would see there being a positive effect and some cracking extras coming from such developments that would not come otherwise. FCS have demonstrated such benefits when working on numerous smaller-scale projects / developments on their estate and they would make sure that the benefit to the public was maximised.

I consider that if the leasing proposal is to go ahead there will absolutely be a detrimental effect on conservation and recreation. FCS is funded partly by the income from timber sales. To lose at least 25% of the most productive forest areas is to lose a huge chunk of funding for FCS work such as working with local communities, building recreational facilities and managing land for conservation. To argue that there will be no effect is ridiculous, and anyone who knows how FCS works knows that work on delivering the social and biodiversity elements of the Scottish Forestry Strategy would suffer. In addition to these significant funding issues there would undoubtedly be impacts in the forests leased out to the private sector. Again, anyone who works in the industry knows that the public forests are managed with a different set of objectives, by people with different motivations and in a different manner than the private forests. Yes the private sector would have to manage to the UKWAS standards but if this was all FCS did too then we would not see the wide range of benefits that we do today in the public forests. FCS do extras that the private sector will not because it does not make them money. FCS does things not because it makes money but because it makes local people feel involved or it provides habitat for wildlife or it improves a community's health etc. The staff in FCS are proud of the care and attention that the forests and their visitors, the wildlife and the heritage receives. In my experience, the private sector are hardly ever in their woods and there is usually no local staff available to talk to people or turn up to community meetings. However, they do grow excellent timber - and that is because they don't put resources into anything else. If this is all we want our forests to deliver then we need to re-write the Scottish Forestry Strategy.
4. Do you believe there are any implications for rural employment from the two proposals and, if so, what are they?

I am nervous about the implications for employment but I am not in a position to have much information about this issue.

5. Do you have any other views on these two proposals from the Government?

I object to the way the consultation has been carried out. It has been very quiet, the proposals have, in my view, been hidden in the Climate Change (Scotland) Bill and the consultation period has been too short. And with no proposal of how to spend the £200 million from leasing it has been a useless exercise. I am suspicious that the leasing proposal has not been thought through properly and that the Minister has been advised by people who have been wanting to privatise FCS for years. To dress it up under Climate Change - an incredibly important issue - is insulting and offensive. I am very worried about Climate Change and am involved in the carbon-neutral movement, if I thought the leasing proposal was any use I would support it. It is not, it is a bad idea that will only release short term cash at a long term cost and this is stupid. It would be the open door to privatise the rest of FCS and this would be a bad move for Scotland.

Thank you for the opportunity to respond to this consultation.

Emma Stewart
27 January 2009
1. Do you envisage that the Forestry Commission could play a greater role than it does at present in reducing greenhouse gas emissions or in alleviating or responding to the effects of climate change? If so, what suggestions would you make?

Yes. I would suggest that the FC is in an exceptional position to play a greater role and that being such a large landowner is one of its greatest assets in being a more useful tool in the fight against climate change but the leasing out of any large forest blocks would in fact reduce this ability. The possibilities of entering into joint ventures to create renewable energy schemes would not only increase the area of land available to such schemes but would generate a source of income which the FC could then use directly in an increased tree planting scheme, especially in the creation of new native woodlands which would offer a much better carbon sequestration effect than a private, profit making conifer planting scheme. Joint ventures would also put the FC in an outstanding position in terms of taking forward wood-chip biomass power plants on a local scale, close to the sources of timber and working with the local councils and businesses to provide as near to carbon neutral energy as possible.

2. Do you consider that either of the Government’s consultation proposals (on entering into joint ventures and on leasing cutting rights) would enhance the Forestry Commission’s role in dealing with greenhouse gas emissions and climate change?

Joint Ventures: I believe that this proposal would hugely increase the role of both the FC and SG in dealing with these problems by enabling renewable energy projects to be undertaken on the NFE thereby reducing emissions and, at the same time, generating income which could be used directly by the FC to fund an increased level of tree planting to aid carbon sequestration. If such a proposal were accepted it would increase the FC’s ability to contribute to the actions on combating climate change whilst effectively reducing the burden on the SG budget by allowing the FC to partly fund itself through the income generated by such joint ventures.

Leasing Cutting Rights: I do not see any way in which this proposal could enhance the role of FC or the SG in dealing with emissions or climate change. A privately managed, leased forest would certainly offer no greater benefits to the actions on climate change than would a publicly owned, FC managed forest. On the other hand the proposal is to take the money generated from the lease and place it at the disposal of the government for such projects as tree planting and renewable energy projects, however, it has been stated that this money cannot be “ring-fenced” for such uses and, as such there is no guarantee that the money will ever make any contribution to the fight on
climate change. It has also been stated that the money would be distributed for tree planting projects via the grants system such as SRDP but there has in fact been very little take up of the grants for tree planting in the recent past so the money may well sit there unused - why generate more money for a grant system which is struggling to give out grants when a state funded organisation such as the FC already exists and has the land, infrastructure and expertise for successful woodland creation projects - an established organisation will almost invariably offer better value for money than having to create and/or expand another department to try and give away an increased level of grant funding to landowners who seem not to want it anyway.

3. Do you envisage any implications for nature conservation, biodiversity or recreational interests from the two proposals and, if so, what are they?

I do not see any implications for the above areas through the Joint Ventures proposal as any such projects would be fully vetted by the relevant bodies (planning departments, SNH, SEPA etc) as they are for any works. I do however, see major implications for all 3 areas if the leasing proposal were to be passed: Nature Conservation and BiodiversityThe FC has, as part of it's remit, an obligation to conserve, manage and improve the biodiversity and nature conservation value of the NFE which it manages on behalf of the people of Scotland. To this end it has established a well known and respected wildlife management and conservation role which routinely works with other conservation organisations on projects which go well beyond any requirement of the statutory requirements of a forest management organisation. Off the top of my head the FC has participated in: Providing release sites and key habitat for re-introductions of Sea Eagles and Red Kites, provided important man-made nest sites for Ospreys, provided a habitat for the up-coming trial re-introduction of Beavers, working to save the endangered Black Grouse by sympathetic management of open areas and forest edge, created a nationally and internationally renowned deer management team and generally successfully managed commercial conifer plantations in a manner which is sympathetic to the needs of our native wildlife. How could a private investment company leasing the NFE hope to provide such benefits whilst returning a profit on their investment even with the grant funding which would have to be offered by the government as an incentive to do any of these things and what is the point of generating an income by leasing off the NFE if this income then has to be given back to the leasee to get them to provide conservation benefits already provided by the FC?

Recreational Interests
Obviously any right of access to the forest would be unaltered thanks to Scotland's world leading laws on this matter. However, what leasing organisation would create such diverse recreational opportunities as currently offered by the FC - walking, horse-riding, nature watching, tourism and of course the very well known mountain biking facilities across the country which has led to Scotland being ranked as one of the best mountain biking destinations in the world. The vast majority of these facilities are free to use and open to all thus offering an excellent help in the current battle against
obesity and ill health. Many of these facilities would be lost under private forest management as they cost money and expertise to maintain.

4. Do you believe there are any implications for rural employment from the two proposals and, if so, what are they?

Yes.

Joint Ventures: These may help to create short term employment directly on site during the construction phases as well as maintaining existing local businesses such as shops, accommodation facilities and contracting firms in the long term and create new permanent jobs in the management and maintenance of schemes such as wind farms, hydro-electric and small scale biomass power plants.

Leasing: This would probably lead to a down-turn in rural employment as a leasing company would endeavour to do as little as possible to manage the forest successfully as the more people it employs and the more works it carries out the less profit it will make. The FC manages its forests under best practice guidelines and as such undertakes much work that a private company would deem unnecessary however these works improve the forest greatly in terms of nature conservation, biodiversity and recreation as well as providing vital rural employment at the same time. The FC also agrees to have a constant timber output throughout the year - this means that local contractors and, further afield, timber mills have a steady flow of work enabling them to maintain a full time work force, a private company would want to maximise the income from its timber sales and as such would only fell crops when the timber market was buoyant thus leading to peaks and troughs in the market and an unstable rural economy. One of the reasons for the FC being created was to bring stability to a volatile market and thus establish steady rural employment.

5. Do you have any other views on these two proposals from the Government?

Joint Ventures: As is obvious from my above comments I feel that this proposal offers excellent opportunities for the FC, the Scottish Government and on the behalf of Scotland as a whole in taking the negatives of climate change and changing them for positives in terms of lower emissions thanks to renewable energy schemes and increased carbon sequestration by increased tree planting on the NFE funded directly by the joint venture projects. There is also the opportunity to offer carbon trading by private companies paying for woodlands to be established to offset their own emissions, the FC, using the NFE, is in a prime position to become a source of long term income for this and future governments. At the same time, the FC could continue to provide its established, well known and recognised services for nature conservation, biodiversity and recreation but place a lesser burden on government funds and therefore the tax payer by the increased level of self funding.
Leasing: This seems to me to provide, at best, a source of funding to try and persuade private landowners to plant trees by handing out government grants which, in the past, they haven't taken up and to provide more incentives and research funding to renewable energy which is already big business in its own right and is increasingly being funded by the multinational energy companies as they move themselves away from fossil fuel reliance. Why should the Scottish people give up one of the country's greatest assets in return for a short term (and short sighted?) quick and easy source of cash. Finally, the Minister has made a great point of saying that none of Scotland's publicly held land will be sold off, however, it seems that at the end of a leasing deal the leasee would not simply hand the land back but would want the government of the time to remunerate them for works carried out and improvements made, potentially an uneconomically viable amount - what is the difference between this and selling off land outright?

John Taylor
26 January 2009
Response to Consultation on Forestry provisions in the Scottish Climate Change Bill (issued 4th November 2008).

Please find following my comments on the above consultation. By way of background a short summary of my cv might be helpful.

For 15 years until 2000 I managed a 6000 acre upland estate in Perthshire. This involved the integration of hill sheep, hill cattle, forestry, deer and grouse enterprises.

From 2000 I have been a self employed forestry consultant, with forestry plans being a speciality.

I have a degree in Agriculture from London University and a MSC in Forestry and its relation to Land Management from Oxford. I have a Diploma in surveying.

I am a member of the Institute of Chartered Foresters and a Chartered Environmentalist. I am a member of the Perth and Argyll Area Forestry Forum, but the opinions expressed here are my own personal views, and do not represent the views of the forum.

Qu1. Joint Ventures.

This suggestion is an essential step that must be taken in the current economic environment, and if the objective is revenue generation then this offers a clear alternative to the lease proposal. While there are a whole range of opportunities open to the FCS if this policy is adopted, power generation primarily from wind offers the most lucrative opportunity in the short to medium term. One option for raising capital in advance of actual revenue flows from FCS projects would be to launch a bond or share against the future energy/revenue creation.

Qu2. Leasing the Forestry Estate.

The scale of this proposal, which seems to be driven by what the Timberland funds want rather than from the perspective of public good, is the major problem. Small leases of lesser terms are probably much less alarming. A lease to a single entity greatly increases risk, and the fact that the leasing entity will share most of the features of a hedge fund can’t be conducive to risk reduction.
A single leaseholder of a 75-year lease on the core parts of the FE landholding is risky enough. But when you add to the equation the present economic climate, the opaque nature of timberland funds which are based in Jersey etc, and the diverse nature of a funds holdings then these are all massive risk multipliers. An effective risk assessment on any of the timberland funds is actually impossible. The state of the insurance market is also an added consideration.

Picture the situation as the holder of the lease runs into problems in their portfolio of properties across the World. Wildfires and drought in Australia rip the heart out of their investment; political instability and the economic situation leads to their Asian leases being withdrawn without compensation; massive storm flattens Scottish Forests all along the West Coast in 2012. Insurance companies, already in a dire state, can't cope with scale of impacts and don't pay. The company sinks, but the legal wrangling and untying the investment packages goes on for 10 years. Twenty five percent of the heart of Scottish Forestry in limbo for this time, and requiring a massive bail out by the tax payer. This is such a predictable scenario.

**Security of supply** and a distortion of competition are also concerns. A commercial company would have no incentive to work for the national good or look after the interests of competitors. On the security of supply issue the point was made by the Minister that existing contracts would be honoured, this is helpful, but the key point is the development of new/existing businesses to take advantage of all the positive factors at play in the forestry sector here and now. The proposal will distort and stifle new capacity, and this probably has impacts on competition laws and best practice.

The target leaseholder seems to be Timberland funds along the US model. Timberland Funds, are based in offshore tax havens, often Jersey. Any revenue generation will not feed back into the Scottish economy. They are also highly skilled at exploiting any loophole that comes there way in order to maximise returns for their investors. For example future revenues from windfarm developments (which is the real meat of the proposal) can be dissipated by a range of artifices to minimise leakage of funds from the private fund, and so minimise public benefit. The vigorous avoidance of tax liability is of course totally legal at present.

On the employment issue, I know from experience of working in the Forestry management business that investment companies employ very few people directly; you could probably run the Scottish branch of the successful leaseholder with less than ten people. All the management and contracting work is subcontracted out. This does create insecure employment, but there is nothing there for FCS staff to actually transfer into. I know from experience that TUPE offers no protection for staff in a business transfer where organisational restructuring is taking place. In addition no civil servant in their right mind would transfer from the secure civil service to the howling wasteland of the private sector at present. I believe that the Ministers triple promise on employment/redundancies arising from the proposal is rash and
unrealistic under the present world environment. Even the civil service has a limit to the deadweight that it can carry.

By ripping the heart out of the FCS and feeding it to an investment fund (who are the very people who delivered us to this point) the ability of the FCS to fund its non economic research, recreation, amenity, social and environmental functions will be destroyed. The FCS will not survive if this goes ahead. Ministers seem to have no perception of the importance of morale in running a business, and it’s impact on productivity and long term effectiveness. Civil servants are not robots, although there are exceptions to this! From a man management perspective the FCS has been handled very badly by the current administration. The SEARS fiasco has precipitated a deep malaise in both SNH and FCS, and the lease proposal is another example of insensitive and counterproductive management.

The fact that the leaseholder would be able to drain off RDC funds is a factor that should be considered in working out the full costs/benefits of this proposal.

I am not in favour of the lease proposal.

Qu3. Creation of a not for profit trust to manage funds for woodland expansion.

The primary reason for this proposal seems to be to create a mechanism for the retention of funds that would otherwise flow back to Westminster due to time limits on spending.

If this were in fact the primary reason then the most effective method of delivering the benefit (of retaining funds) would be to have a grown up conversation with Westminster. The objective of this would be to enable the funds to be retained both within Scotland, and within the forestry sector specifically for woodland expansion. This would of course provide carbon sequestration/substitution and economic benefits for the UK as a whole.

The proposed not for profit trust would use up a lot of scarce resources both during the set up and operational stages, and this would tend to duplicate the FCS functions. In addition if the Trust were set up to act as the landlord for the lease, then this would have further adverse impacts on FCS influence, morale, and employment opportunities.

One of the main problems would be that the potential for conflict between the trust and the FCS is huge, and this would inevitably lead to a lack of a cohesive forestry body. The current tensions between the SEARS partners in the ministerial forced departmental marriage are apparent to everyone working in the rural landuse sector, and this should serve as a warning.
Qu4. Other measures to reduce carbon emissions.

Planning to avoid over centralisation of both forestry management functions (amalgamation of FCS conservancies), and operational/end use functions has scope to deliver a reduction in carbon emissions. The concept of keeping it local seems to be lost on administrative planners.

The major role of forestry in reducing emissions is in product substitution (low energy intensive wood for energy intensive steel etc). This is potentially more significant than carbon sequestration within temperate forests, and this aspect has been severely neglected/underplayed in the current discussion.

The potential for woodfuel to substitute for non-renewable carbon sources as a source of heating and electricity is appreciated, but it is still a poor cousin compared with renewables such as wind power. The potential for woodfuel heating to play a major role in meeting targets is probably greater than wind energy.

Woodland creation can provide product substitution benefits (if the tree species are productive) and carbon sequestration benefits. Woodland expansion is limited by the following factors:

1. Competition with other landuses and an uneven playing field (eg SAF payments on farmland lost if land is planted with trees). Agro-forestry may have a role to ameliorate this impact if it was actively promoted instead of ignored.

2. Administrative complexities and bureaucratic overheads create huge on costs and uncertainty. The EIA process and the RDC are very discouraging to new planting.

3. Insufficient funding to overcome the two hurdles above.

There is scope to increase planting by dealing positively with any, or all of these issues. In terms of public expenditure an adjustment of forestry's relative competitive ability coupled with a reduction in the administrative deadweight would be the most cost effective way to expand the forest area.

Having said this, the funds required to reach a tipping point are not large, and an additional directed £10M to £20M per annum would have a huge positive impact on planting rates. The success of the Locational Premium Scheme and the old Native Pinewood scheme under WGS show the effect of funding in redressing forestry's competitive shortcomings cf Agriculture (that is subsidised to the hilt). This additional funding could readily be sourced by an adjustment of rates and priorities within the existing RDC. New funding is not required.

Ian Thomas
The Bill includes a number of suggestions for how forestry and in particular Forestry Commission Scotland can contribute more to the fight against climate change. I am supportive of all but one of them. The point that I am very concerned about is the proposal to lease out a very large section of the National Forest Estate to a private company.

I think this suggestion poses a serious risk to the Scottish forest industry, important conservation work, recreational opportunities and the existence of the Forestry Commission.

The Forestry Commission is a vital player in maintaining a healthy forest industry in Scotland. The dire economical situation at this very moment highlights the differences between the FC and the private sector. The forest and wood processing industry is very hard affected by the crash in house building with resulting sharp declines in the value of timber. During times like these the private sector naturally limits the amount of timber that they put to the market – why sell now when you might as well wait a couple of years and make 30% more money for the same wood. The FC, however, is committed to put certain volumes to the market regardless of the price. By doing this the FC plays a vital role in ensuring that forest contractors, timber hauliers and sawmills can keep working through very difficult times.

Many forest professions are specialist work and are not easy to recruit again if the people are forced to leave the sector during a recession. Forest workers are often people living in rural areas with limited alternative job opportunities locally. They could well be forced to move if there is no work to be found.

In short, I see the FC as a vital player in limiting the impacts of bad times on the forest industry as a whole and to hundreds of jobs in some of the most fragile communities across rural Scotland.

In addition to the above I believe that the proposals carry a real risk for damaging the good conservation and recreation work that the FC carries out all over its estate. Under a lease different condition will, no doubt, be imposed on the private sector company. But there is only so much that can be expected of a purely commercial private partner. For example, it is one thing to preserve things like access rights – which are guaranteed in Scotland anyway - but it is something completely different to actively encourage people into the forest as the FC is doing. Another example is that it is one thing to adhere to the legal minimum requirements for protection of certain plants and animals but something completely different to actively work to improve the conditions for threatened species as the FC is doing.
Another risk I see is that this could be the thin end of the wedge for a wholesale dismantling of the FC. The initial proposal suggests leasing out something around 25% of the National Forest Estate. This is obviously bad enough but the legislation will probably not carry any limit so once introduced it will be very tempting for future Scottish Governments to take another slice of the cake when they are desperate to raise more money.

I believe that the additional money that could be raised by this proposal is overestimated and absolutely insignificant when compared to the benefits of the current system.

Finally, a short comment regarding other options for how Scottish forestry could contribute more to the fight against climate change. Changing the current unworkable and unattractive grant scheme for private forest planting could give a very significant boost to the afforestation around the country. Alternatively, changes could be made to the tax breaks available for planting new forests. I am aware that taxation is a Westminster issue – but if carried through the impact across the UK would only be all the greater because of this. I think there is a significant interest in Scotland to plant more forest but the economical incentives for private landowners are currently not attractive enough.

Simon Thorfinn

Response to Proposal for Forestry (Scotland) Climate Change Bill

I have been asked to give a response on behalf of the Tweed Valley Tourist Consortium with regard to the proposals for leasing forestry commission land contained in the Climate Change Bill.

The Tweed Valley Tourist Consortium represents 58 businesses within the Tweed Valley area many of who are either directly or indirectly involved with mountain biking and related activity and outdoor pursuits in the Tweed Valley Forest Parks.

The extraordinary growth of mountain biking in the Tweed Valley forest park area over the past ten years has been facilitated and encouraged by the Forestry Commission to the great benefit of the local tourism industry spawning many new businesses and developing excellent partnerships within the private sector which have had a considerable impact on the local economy.

We believe the proposals to lease parts of the forest could have a hugely detrimental effect on the Commission's ability to continue to encourage and foster the growth of its mountain bike parks and contribution to tourism in general.

Firstly, if the forestry commission land in the Tweed Valley area was leased it would be highly unlikely that any private operator would be remotely interested in developing the mountain bike activities any more than on a very limited basis as there would be little commercial gain. However, even if the Tweed Valley remained unaffected directly we would question the impact of taking a large portion of land out of direct FCS control on its overall budget how this would in turn impact on their budget for tourist related activities in general and on local jobs which are an important link for local businesses and the community to have with the Commission.

It seems ironic that this potential threat has arisen as part of the Climate Change Bill as tourism in the forest areas represents one of the most environmentally sustainable forms of tourism with enormous potential for rural Scotland to build and grow for the future.

Catherine Maxwell Stuart
Chair
Tweed Valley Tourist Consortium
19 January 2009
As the trade association which represents the technical and commercial interests of the UK wood processing sector and which has a very significant number of Member Companies based in Scotland, we welcome the opportunity to participate in this consultation.

May we first state that we have found it very difficult to provide detailed responses to each of the four questions posed, because of the lack of detail. We firmly believe that the level of new tree planting and especially commercial conifer planting in Scotland must be increased. It is a serious concern that current planting levels are not reaching Scottish Government targets and appropriate action is required to address this important issue. However, no detail is yet apparent as to how this might be done. We would welcome the opportunity of providing input to such discussions.

The consultation seeks respondents’ views on four questions; our responses are presented below;

Question 1. What are your views on allowing the Forestry Commissioners to enter into joint ventures, with the intention of participating in renewable energy programmes on the national forest estate? We are unable to give our unqualified support for the Forestry Commissioners to enter into joint ventures, with the intention of participating in renewable energy programmes on the national forest estate, as insufficient detail has been provided in respect of the type, scale, potential risk and location of such ventures. If such information can be provided then we would be pleased to offer comments. In the absence of such detail, we would say that if developments, including wind farms or hydro-electric schemes, were to be made on the national forest estate which resulted in the removal of any tree cover, especially if it is commercial conifer crops, then it is essential that there is compensatory planting of crops where tree cover is lost. It is questioned if it is necessary to pursue large scale leasing of commercial forests in order to facilitate the ability to enter into joint ventures. Also, if such joint ventures were to be developed, it is also essential that revenue from such projects must be wholly retained for use in forestry, including support for new commercial planting and restocking of commercial timber crops. Although Forestry Commission Scotland has significant expertise in forestry matters, renewable energy is clearly not their specialist area of expertise and as a consequence, there could be significant risks associated with direct involvement in this area.
Question 2. What are your views on allowing Scottish Ministers and
Forestry Commissioners to offer leases and cutting rights over parts of
the national forest estate? There has been considerable discussion
amongst UKFPA Member Companies in relation to this subject and it is
readily apparent that is the most controversial aspect of the consultation.
Industry views can be summarised by saying that again, there is insufficient
detail to comment comprehensively. However, it is felt that leasing up to one-
quarter of the national forest estate, possibly to a single entity for up to 75
years has the potential to cause irreparable damage to the well established
Scottish forest products sector. It is not known if the lessee would be an
existing forest industry businesses or group of businesses, a renewable
energy company or other investors, whose objectives are unknown. What is
certain is that if prime commercial conifer forest areas are to be leased, then
very significant volumes of high quality timber will be removed from the open
market.

It is likely that strategic supply arrangements between the lessee and selected
consumers would be developed, which would deny many businesses the
opportunity to purchase wood on the open market, as they currently do from
FC Scotland, in an open and fair manner. Such a dramatic change to the
wood supply chain is likely to adversely impact on the viability of many wood
using businesses in the sector.

There are also very serious concerns that if the lessee is a renewable energy
company, or is otherwise active in this sector, that the timber crops will solely
be used for renewable energy purposes. Whilst it is recognised that wood
and wood products have a role to play in the renewable energy mix, it must be
recognised that burning wood should not be the first option for crops which
are suitable for the manufacture of solid wood products, wood based sheet
materials or paper products.

The prime focus must be on using these crops for the manufacture of
products which will continue to store the carbon absorbed by the growing tree
and that at the end of its service life, the products should be recycled for
further use and that ultimately, at the end of the natural service life of the
product, burning for heat and/or power generation would be appropriate, but
not before. Above all, it is essential that the development of the renewable
energy sector is not supported to the detriment of the Scottish forestry and
forest products sector.

Since its establishment, the Forestry Commission has in general terms been a
force for the good; sustainable forest management and the consistent
marketing of wood on the open market has supported significant investment in
Scotland’s wood processing industry.

The Forestry Commission has consistently produced production forecasts,
has brought wood to the open market in good times and bad and has
provided businesses with regular purchasing opportunities and long term
supply contracts, all of which has underpinned the development of the sector
and ensured the continued delivery of valuable economic, social and
environmental benefits, especially in rural areas. All of which has provided businesses with confidence, which is an essential requirement for continued investment and development, which in turn ensures continued competitiveness and profitability. Without this confidence, the future for businesses in the sector would be very uncertain. There is currently no indication of what requirements would be placed on the lessee in relation to production forecasting, open market sales etc. Furthermore, restricting the supply of such large volumes of wood from the open market also raises questions about competition/monopoly issues.

There are grave concerns about the likelihood of monies raised from the proposed leasing arrangements being reserved or otherwise ‘ring-fenced’ for forestry use, to support new planting etc. It has already been stated by the Minister for Environment and senior Forestry Commission Scotland staff that there are no guarantees of this. It has been stated that monies could be used for climate change related projects; this would not guarantee expenditure on forestry, as climate change encompasses such a wide range of subjects and there is a risk that some, or possibly all of the money raised may not be invested in forestry. There is also a fear that monies may be spent on other Scottish Government initiatives which may be deemed to be politically more deserving than forestry. This is simply not acceptable. It is increasingly recognised that trees, woods, forests and wood products play a vital role in climate change mitigation and every effort must be made by the Scottish Government and Forestry Commission Scotland to maximise these benefits, by increasing new planting of commercial conifer species, which will increase carbon storage, provide unique renewable wood products for several markets and continue to provide a revenue stream for Forestry Commission Scotland.

A figure of approximately £200 million has been suggested as the sum which might be achieved via a leasing arrangement. In relation to what is being offered and the timescale involved, it is suggested that this seriously undervalues this unique national asset, perhaps by as much as 20%.

The motives for the leasing proposals are also questioned by many; although climate change mitigation is stated, some suggest that the proposals may have more to do with bolstering Government finances.

Mention is also made of cutting rights; here too, further information is required to enable detailed comment, however, lessons may be learned from overseas experience and a study could be of value in determining whether this approach, involving much smaller areas for timber production purposes than that currently being proposed for leasing, would be appropriate in Scotland.

Question 3. What are your views on (i) transferring the proceeds from leases and cutting rights to a not-for-profit trust, for investment in woodland creation; (ii) transferring the landlord’s interest in this land to a not-for-profit trust; and (iii) Ministers stipulating the constitution of such a not-for-profit trust. The lack of detail about the constitution, composition, objectives and operation of a not-for-profit trust presents further difficulties in responding. It is recognised that in theory, such a trust could
have greater financial freedom than the Forestry Commission and this could be have some advantages. Additional information is required to enable us to comment further. From an industry perspective, commercial relations with the Forestry Commission are relatively straightforward and any new arrangements with a not-for-profit trust or similar body must not in any way result in increased complexity, bureaucracy etc. At this stage, we are unable to identify any meaningful benefits of establishing a not-for-profit trust for the purposes broadly described in the consultation.

**Question 4. Are there any other actions which need to be taken, or are there other changes in legislation which need to be made, in order to allow the public and private forestry sector to contribute to Scotland’s target of reducing emissions by 80% by 2050? If so, please outline what these are.**

We believe that there is an opportunity to achieve the objective of increased rates of new planting and woodland expansion in Scotland. The current target of 10,000 hectares per year should, in our opinion, be increased to at least 15,000 hectares per year, which would provide an appropriate mix of commercial and amenity woodland and forests. It is worth noting that there was recently a period when grant aid was not available in Scotland to support new planting/restocking, which will certainly have impacted on planting levels. Furthermore, the introduction of SRDP as the grant aid mechanism has not been universally welcomed by those with an interest in commercial forestry. Further attention is required to ensure that grant aid mechanisms are fit for purpose, are suitably ‘user friendly’ and ensure that the desired objectives are achieved. It is also suggested that the subject of the tax treatment of forestry be reconsidered. It is noteworthy that planting levels and related activity in Scotland were at their highest during the period when forestry received preferential tax treatment. It is acknowledged that some of that planting attracted criticism, a proportion of which was justified, but it is important to appreciate that lessons have been learned from these times. The practice of forestry today is very different from that in the past and in view of this, it would be possible to incorporate safeguards to ensure that new planting is appropriate, in terms of location, scale, crop type, management objectives etc.

We recognise that fiscal matters are reserved to Westminster, but would suggest that the time is right for the Scottish Government to raise this issue with HM Treasury and to promote a supportive tax regime for forestry.

It has been demonstrated in the past that the private sector can play a valuable role in woodland creation/expansion, provided that appropriate incentives are provided. There is every to think that given an appropriately conducive environment, that a major contribution can be made towards achievement of Scottish Government objectives relating to forestry and also climate change mitigation.

In summary, we regret that we have not been able to comment more fully on this issue because of the lack of detail in the consultation, but nevertheless, it must be noted that there is already very serious concern about the potential implications of the proposals, especially those relating to leasing and cutting rights, which could irreparably damage the existing forest products sector in
Scotland and seriously jeopardise the role that the sector has in helping to mitigate the effects of climate change. The preference amongst the majority of businesses in the forest products sector in Scotland is for the status quo to be maintained and to reject the leasing proposals. Furthermore, there should be no expansion of the forest disposal programme.

UKFPA and its Member Companies in Scotland wish to continue their engagement with Forestry Commission Scotland and the Scottish Government and to explore how increased tree planting and forest expansion can be achieved in Scotland and how the benefits provided by our trees, woods, forests and forest products can be maximised.

**D.J. Sulman**  
**Executive Director**  
**UK Forest Products Association**  
**19 January 2009**
The Woodland Trust Scotland welcomes the opportunity to respond to this consultation. The Trust is the UK’s leading woodland conservation charity. We have four main aims: no further loss of ancient woodland, restoring and improving woodland biodiversity, increasing new native woodland and increasing people’s understanding and enjoyment of woodland. We own over 1,000 sites across the UK, covering around 20,000 hectares (50,000 acres) and we have 300,000 members and supporters. In Scotland we own and manage 80 sites across 8,500 hectares.

Key Points

- **All** income raised from Joint Ventures with energy companies must be reinvested in the delivery of multiple public benefits through forestry.
- **All** income raised through leasing of FCS land and cutting rights must be reinvested in forestry. In particular, the delivery of new woods and forests providing multiple public benefits. Carbon sequestration should not be the only driver for woodland creation.
- At least 6000 ha per annum of new woodland native is required to achieve the vision as laid out in the Scottish Forestry Strategy 2006.
- Selection criteria for land leased must ensure minimal inclusion of social and environmental benefits.
- Measures to address climate change should include delivery of both mitigation, adaptation and reduction of energy demand.
- Any loss of income from timber sales should not lead to any reduction in funding levels for remaining land managed by FCS.
- If a lease is undertaken, it must ensure that all public benefits are protected, all duties and requirements of FCS are transferred to the leasing party.
- UKWAS certification for the leasing party must be retained throughout its duration and any major corrective actions carry financial penalties.

Introduction

- In principle we welcome the fresh look the Forestry Commission Scotland (FCS) is casting over how it can deliver for climate change.
- We welcome the concept of exploring dynamic approaches to achieving some challenging woodland creation targets.
- We are glad that FCS recognises the ethos of the not-for profit (NFP) and voluntary sector and the power it has to promote positive public action.
- The proposals contained within the consultation paper represent a radical shift (potentially the most radical since 1919) and have appeared with very little warning. It is a complex area and detailed information (particularly financial) on the implications of such a shift is scarce.
The enabling powers proposed for forestry in the draft Climate Change (Scotland) Bill have been presented in draft form to Parliament before the consultation on their inclusion has been concluded. This does not engender confidence in the public consultation process.

Specific Questions

1. What are your views on allowing the Forestry Commissioners to enter into joint ventures, with the intention of participating in renewable energy programmes on the national forest estate?

Woodland Trust Scotland (WTS) in principle has no objection to the legislation being amended to allow FCS to undertake joint ventures with renewable energy companies subject to appropriate safeguards because we support the principle of injection of new resources into forestry and in particular woodland creation. Safeguards include: a requirement to undertake EIAs, protection of public benefits (e.g. PAWS, access and recreation provision, woods of high conservation value, biodiversity, semi-natural habitats), that the proposals follow full planning process, and that there will be no development leading to the loss of woods of high conservation value. All income raised must be reinvested into delivery of multiple public benefits through forestry. Without these safeguards Woodland Trust Scotland (WTS) would not support the proposal.

2. What are your views on allowing Scottish Ministers and Forestry Commissioners to offer leases and cutting rights over parts of the national forest estate?

Leasing the commercially productive parts of a National Forest Estate to private companies with linked cutting rights is not a new concept. If this concept was adopted in Scotland, WTS would require firm guarantees to enable us to support the idea, including:

- All funds raised (estimated at £200m) would be directly re-invested in forestry related activities and delivery of further public benefits, in particular in relation to climate change and woodland creation. Mitigation, adaptation, product substitution, reduction of energy demand, renewable heat, woodfuel, district heating and diversification of energy supply are important factors in delivery of climate change priorities. WTS would not find it acceptable for income raised from FCS land to be invested in other areas of combating climate change or indeed other areas of public expenditure. We would see that as ‘Robbing Peter to pay Paul.’
- Ancient and semi-natural woods and woods of high conservation value included in the leased land must be retained and managed as such.
- There is a significant difference between a right to access and accessibility; accessibility must be retained in leased land.
- Any company or body leasing FCS land must be UKWAS certified. The lease must ensure UKWAS certification is retained and any major
corrective actions carry financial penalties. Future land managers must deliver current (including in the future) public policy including the duty on biodiversity (as per the Nature Conservation (Scotland) Act 2004), as would be the requirement for FCS.

- Selection criteria for land to be leased must ensure that woods included provide the least environmental and social public benefits (more rigorous than National Forest Land Scheme disposal criteria). We see native, ancient and semi-natural woodland as having the broadest public benefit.

- FCS income streams from timber production will be adversely affected by the leasing of up to 100,000 ha of productive forest to private companies. It is important the Scottish Government ensures that funding levels for the remaining land holding are at least equivalent to the existing estate on a £/ha basis.

- The effect on SRDP funding availability may be negative if an additional 100,000 ha are eligible.

3. What are your views on (i) transferring the proceeds from leases and cutting rights to a not-for profit trust, for investment in woodland creation; (ii) transferring the landlord’s interest in this land to a not-for profit trust; and (iii) Ministers stipulating the constitution of such a not-for profit trust.

Currently it is very difficult to form a clear view on this due to the lack of detailed information. The suggestion of creating a not for profit trust strongly implies a social or environmental purpose for such a body i.e. public rather than commercial benefit, and some stakeholder representation in its governance arrangements but this is not explicit in the proposals.

Guarantees WTS would seek in order to support the proposal:

- All income from the lease of land and cutting rights to be invested through the NFP Trust into multiple public benefits through forestry, particularly climate change related. This means investment in climate change adaptation as well as mitigation.

- NFP Trust is constituted to deliver forestry related public benefits and priorities as laid out in the current Scottish Forestry Strategy and in particular in relation to climate change mitigation and adaptation.

- NFP Trust could enable creation of significant areas of new native woodland. There is a broad level of support for woodland expansion as clarified by the Woodland Expansion in Scotland Consultation 2008.

- All woodland creation funded through the new structure should be UKWAS certified.

- We would not support the idea of the NFP Trust using lease and cutting rights income to solely create new production forests. All new woodland created should be multipurpose and provide significant public benefit. In order to achieve the current Scottish Forestry Strategy vision, more than 6,000 hectares of native woodland is required per annum for the next 50 years (35% of the enlarged forest cover of 25% land area).
• We can not see the logic of the NFP Trust creating more commercial production forest to sell or lease off and then create more in a cyclical fashion.

• There has been a clear change in policy drivers for forestry in the last 18 months or so, in favour of forestry and woodland creation for climate change mitigation. WTS supports woodland carbon sequestration projects for residual emission only where carbon storage can be assured in perpetuity and where additional benefits to society such as new and enhanced public access, greater biodiversity, and landscape maintenance and enhancement are included within the project outputs from the start.

• If the carbon sequestration figures in the consultation paper are based on the Centre for Ecology and Hydrology’s C-FLOW model, it is extremely difficult to see how the proposed scale of aforestation brings about the stated level of carbon sequestration. For example, by creating 10,000 hectares of new woodland per year between now and 2020, under typical management practices it would generate a net carbon source.

• We cannot see the need for the NFP Trust to hold the landlord’s interest in the leased land to ensure public interests are safeguarded. In particular because we do not know how the Trust will be constituted or what its purposes would be. Also, if the NFP Trust was given a role as the ultimate arbiter of public interest of leased land it would be playing the same role that FCS would play for the unleased land. This appears to be duplication of resources (the Trust requiring expertise and resource to deliver this responsibility) and implies that land owned by FCS is a less safe option.

4. Are there other actions which need to be taken, or are there other changes in legislation which need to be made, in order to allow the public and private forestry sector to contribute to Scotland’s target of reducing emissions by 80% by 2050? If so, please outline what these are.

- The Scottish Climate Change Bill should contain a duty on all public bodies to deliver climate change reductions in a sustainable manner in line with the national target.
- Public body’s procurement policies to include FSC certified timber products as standard.
- Reduction in the forest industry’s emissions through best practice and Low Impact Silvicultural Systems.
- Introduce minimum standards and certification of greenhouse gas savings and environmental impacts for all forms of bio-energy.
- Open ended clauses to enable Scottish Ministers to change the role and functions of Forestry Commissioners in the Climate Change Bill cause concern. Land use accounts for approximately 25% of all climate change emissions. It would appear to be more logical to include for development of a strategy and action plan on how to tackle emissions related to
sustainable land use in the bill rather than to include enabling powers for forestry before the planning work is undertaken.

- If appropriate legislative changes are enacted, WTS would welcome the opportunity to be involved in the development of the redistribution of funds and the terms and conditions of any leases.
I am responding to this call for evidence in my capacity as Director General of the Wood Panel Industries Federation. The WPIF represents all UK manufacturers of wood-based panels, who have been consulted in the formulation of this response.

The Federation’s members employ approximately 6,000 people in the UK, directly and indirectly, and have an annual turnover in excess of £650m. The industry occupies eight UK manufacturing sites (three in Scotland) and is the second largest processor of UK-sourced wood, annually consuming some 4.5m tonnes. Approximately 65% of the UK industry’s wood requirements are sourced from Scotland.

General
The wood panel industry is deeply concerned by some of the forestry provisions included in the Scottish Climate Change Bill. We do appreciate the Scottish Government’s over-arching aim of raising capital for extending forest cover in Scotland. Whilst we support the objective to expand Scotland’s forest cover in support of climate change objectives, the lack of detail in the Government’s consultation document leads us to question, a), whether the objectives will be met and, b), whether actions taken will actually threaten the continued operation of our members, who are reliant upon resource coming from the productive forest areas being discussed.

We believe that unless serious and prompt attention is given to increasing the level of new commercial planting then the imbalance between supply and demand highlighted by the Clegg study will be realized and the consequence of this would be to threaten the continued existence of our members.

We cannot support proposals that threaten coniferous wood supply. Whilst not agreeing with all Forestry Commission policies, we recognise that over the long term they have introduced a degree of stability into the market, and by maintaining supply throughout the economic cycle have enabled processing industries to have the confidence to invest and grow.

Under the proposals, the only commitment voiced is to honour existing supply contracts, which means that there is no certainty beyond these and evidence to date would point to a private investment group being less than willing to enter into long-term supply arrangements.

Some of the proposals contained in the Scottish Government’s consultation are to be tentatively welcomed, such as the joint ventures on Forestry Commission land with renewable energy providers, through technologies such as wind and hydro electric. Using sparsely populated land, with low
recreational usage, for wind turbines seems a sensible approach. However, more detail is needed before we can fully support such measures.

The areas that the WPIF has most concerns about are the long-term leases and cutting rights. We are particularly concerned by the prospect of a single entity lessee being in control of up to 25% of FC Scotland land – and a higher proportion of its productive forests. This could have disastrous ramifications for the wood supply and market throughout the UK, bearing in mind how important FC Scotland is as a consistent and large-scale supplier. We cannot support these proposals without details on the “safeguards” alluded to in the consultation that might protect wood supply as well as recreational access and the other important services currently provided by the Forestry Commission.

We are aware that the more safeguards and conditions applied to this leasing arrangement, the less profitable it is likely to be for the Scottish Government. However, the costs that might result from market failure in rural industries must be taken into consideration, especially in the present economic climate.

In a period of great uncertainty for businesses, we question the wisdom of engaging in far-reaching proposals at this time, for if these proposals proceed, they will merely add to the growing uncertainty about the future and further undermine confidence for investors.

**Question 1: Do you envisage that the Forestry Commission could play a greater role than it does at present in reducing greenhouse gas emissions or in alleviating or responding to the effects of climate change? If so, what suggestions would you make?**

Yes, the Forestry Commission could play a greater role by: a) planting more trees; b) allowing wind farms and hydro schemes on their land; c) utilising as much of the brash as is possible as fuel without impacting on drainage and soil quality; d) improving access to less economic areas; f) promoting the development of manufactured wood products as they extend the carbon life, whereas burning is only carbon neutral.

**Question 2: Do you consider that either of the Government's consultation proposals (on entering into joint ventures and on leasing cutting rights) would enhance the Forestry Commission's role in dealing with greenhouse gas emissions and climate change?**

On balance, the WPIF supports the use of joint ventures for clean renewable energy programmes or micro-generation on the estate, subject to certain safeguards and standards being implemented; i.e. timber extraction and replanting being maintained in productive areas, revenues raised being circulated back into increasing commercial planting and maintaining access for recreational and community use.

Before we fully endorse joint ventures, we would like to see some detail on how these joint ventures would work in practice and what kind of “renewable energy programmes” would be accepted. We would also need to know
whether felling would be affected by such programmes or the terms of the joint venture.

It is impossible to support the proposals for leasing and cutting rights as they stand. In the absence of detail, they appear to jeopardise the future supply of wood to the wood processing industries. Although FC Scotland has confirmed that existing contracts would be honoured under any new leases, this does not give the necessary confidence for the long term and the Scottish Government must ensure that safeguards are put in place for maintaining a sufficient supply of wood – i.e. that contracts with existing users will be entered into in the future, based on a fair market price that is not driven by the purchasing power of a subsidised energy sector.

The consultation proposes certain safeguards for protecting the interests of “existing stakeholders”. Although it is not an exhaustive list, industry is not explicitly included. Whilst we do not deny the importance of protecting services for recreational users and community groups, as well the jobs of FC staff, the relationship between the Forestry Commission and the wood processing industries is extremely important. Not only does it provide a considerable proportion of the wood panel industry’s raw material, it has supported this industry and other wood industries through periods of depressed prices by maintaining supply when it was cut by the private sector. Stability of supply throughout the economic cycle is essential for our industry and to this end the Forestry Commission has helped our industry by giving supply confidence, which has facilitated considerable investment. In our view, a private lessee would not wish to commit to maintaining such stability.

The wood industries have estimated that the 25% of FC Scotland land proposed for leasing would equate to around 40% of its productive forests, if land is selected according to the Repositioning Programme’s scoring. This is extremely worrying for the wood processing industries, especially if the lease were to be granted to an investment company with interests in wood energy which might wish to deny purchasing opportunities to competitors. We would welcome explicit proposals for safeguards for wood supply, though we are sceptical that a commercially attractive model can be developed that maintained the public interest responsibilities currently provided by the Forestry Commission.

Qu. 4: Do you believe there are any implications for rural employment from the two proposals and, if so, what are they?
We reject the assertion that leasing would create more jobs in the forest industries sector. Biomass-fuelled electricity and non-combustion forms of generation require considerably fewer workers than traditional wood processing industries. If too much of the UK’s wood supply is diverted to the biomass sector, there will inevitably be job losses in industries such as the wood panel industry that rely on domestic wood production. These job losses are likely to be greater than the jobs created in the energy sector.
Qu. 5: Do you have any other views on these two proposals from the Government?

On the subject of a not-for-profit trust, the wood panel industry recognises that it could provide a degree of flexibility that the Forestry Commission does not currently enjoy. However, there is a risk that, for all the upheaval, it could be a case of substituting one bureaucracy for another and that as a consequence any potential benefit would be lost. There is insufficient detail to be supportive or otherwise of the proposal. The representation and constitution of the trust is all-important, particularly if wood processing interests are to be fully represented. We would also welcome some explanation of the “open membership” of the trust proposed, as well as what kind of constitution is envisaged.

We would prefer that the Forestry Commission maintained a controlling interest.

Capital raised from any of the schemes proposed here should be recycled back into forestry for planting purposes. Not only would this be a clear and efficient way to mitigate climate change but it would contribute to the Scottish Forestry Strategy’s ambitious goal of increasing Scotland’s woodland cover to 25%.

Although it is recognised that raising a large amount of capital could significantly aid new planting, it must be asked why current planting targets (10,000 ha of new planting per annum) are not being met. The Government should consider whether the existing grant system is the most effective mechanism for incentivising this process. We would urge a private sector solution to planting, which could achieve greater levels of planting with greater efficiency. In view of the long-term demands for timber from all sectors, we would support a planting rate of 15,000ha per annum, with an allocation of 9,000 ha to commercial forestry.

Conclusion

There is broad industry consensus that the proposals for cutting rights and long-term leases could be highly detrimental to the health of these industries, not to mention rural employment and the Forestry Commission’s public service remit. There is a widely held belief that the current proposals are under-selling the forest estate. Beyond the simple land value, there are highly valuable benefits, in terms of potential production, recreation and alternative use. Therefore, in response to the details provided so far, the WPIF cannot support granting powers to the Minister over leasing Forestry Commission land and granting cutting rights. The following key concerns must be addressed:

- Security of supply, including and beyond existing contracts;
- Reinvestment: monies raised must be earmarked for planting (particularly commercial planting);
- Jobs: replacement of existing wood processing industries by the renewable energy sector will cause greater unemployment;
Market competitiveness needs to be maintained across all wood-using sectors.

The WPIF hopes that the Scottish Parliament will pay serious attention to the concerns raised in this response and that the Scottish Government will conduct a meaningful dialogue with the wood panel industry and other affected industries. We look forward to discussing these issues in depth with the Minister at our scheduled meeting on 12th February.

Alastair Kerr
Director General, Wood Panel Industries Federation
28 January 2009
Some contemporary evidence leads a number of land managers to have doubts over the need to change muirburn dates in Scotland in response to climate change. A review of best scientific information is required. In addition, the recent consultation on the question “Do you agree that in order to adapt to the possible effect of climate change on moorland, it is necessary for the Scottish Ministers to be given powers to vary the permissible dates for muirburn in the future?” gave a split in responses, with 28 respondees being supportive and 24 not supportive. This paper reflects the subsequent discussions over this issue by key organisations.

It is recognised that muirburn that takes place on most managed grouse moors is generally undertaken in accordance with the Muirburn Code and with industry recognised best practice. However, there are concerns over the suitability and appropriateness of muirburn elsewhere in time and space on Scotland’s heather and grass moorlands.

After a series of meetings between the organisations listed below, and Scottish Government, agreement has been reached on the following points relating to amending the provisions of the Hill Farming Act 1946, which will apply to Scotland only. These provisions may be effected through the Scottish Climate Change Bill.

We feel that Scottish Ministers must:

- Have powers to issue specific licences to land managers for burning outside the legal muirburn dates, based upon adaptive requirements for climate change considerations

We also feel that were Scottish Ministers given powers to vary the permissible dates for muirburn any such variation:

- should be driven by climate change adaptation only
- must be evidence led, based upon good science and supported by SNH as advisors to Government
- must be preceded by consultation with those directly affected
- must include the month of September within the legal burning season
- should consider regionalisation of any change to muirburn season, based upon adaptive requirements for climate change considerations
- should be undertaken via an affirmative procedure with reference to the muirburn provisions of the Hill Farming Act 1946.

Muirburn Dates in Relation to Climate Change Adaptation

Despite a significant split in opinion seen in the recent consultation, we understand there remain suggestions that Scottish Ministers should receive the power to vary the permissible dates for muirburn as part of the provisions of the Scottish Climate Change Bill. It has been suggested that the principle areas this may help in are:

- By protecting carbon rich peat from damage if the climate becomes drier.
- By protecting ground nesting birds in the event their breeding become earlier.

However, we are seriously concerned that there is little evidence for a positive adaptive effect for these powers, while there is good evidence that restricting the season may be positively damaging. This is because our research suggests that:

- Shortening the muirburn season could increase the risk of inappropriate burning and decrease wildfire control options, thus promoting carbon loss.
- Shortening the muirburn season could lead to many moorland birds breeding less well as risks to breeding birds are naturally limited by the industry’s self-interest.

Limiting muirburn dates could thus negatively affect climate adaptation in the future if the powers were not used wisely or without a solid evidence base. We recommend that the need for the powers to amend the season are considered as part of possible future legislation only after essential research has been conducted; such research should aim to create models which can accurately predict climatic, habitat and soil conditions which would pre-dispose towards damaging wildfire. We could then support an amendment to the Act which would allow temporary local suspension of burning rights for environmental protection.

There are also a number of other positive actions relating to muirburn that we would support that could help Scotland adapt to climate change. Ministers should be given powers to extend the muirburn season into September or powers to allow for license applications for muirburn season extensions. Consideration could be also given to a range of practical tools such as amending the Muirburn Code, supporting capital and fuel costs associated with the muirburn equipment which brings wildfire protection capability and the funding of work to establish reliable water supplies for firefighting activities on moorland and woodland areas.
We hope that these suggestions are useful to you in your deliberations.

Muirburn and the Climate Change (Scotland) Bill
Evidence from RSPB Scotland to the Rural Affairs and Environment Committee

RSPB Scotland believes that introducing the flexibility to allow Scottish Ministers to make any required changes to muirburn dates in the future, based on sound and growing scientific evidence about management measures that can be taken to help climate change adaptation, as provided for by Section 46 of the draft Climate Change (Scotland) Bill is a sensible approach.

We would highlight that the proposed clause is an enabling clause giving Ministers the power to make changes should they consider it “necessary or expedient to do so in relation to climate change”.

The evidence submitted below seeks to establish that the impacts of climate change are already evident in the habitats associated with muirburn and that Scottish Ministers should have powers similar to those in England and Wales to take account of these changes and vary permitted time for making muirburn as appropriate.

We would add that we also support the idea of making provision through a licensing system for out of season burning, to allow flexibility of approach. To provide the necessary safeguards for the natural heritage from out-of-season burning, we consider that a licensing system should be put in place and it seems to us most appropriate that such a system is administered by Scottish Natural Heritage as the Scottish Government’s advisors on nature conservation.

Such a licensing system would, as mentioned, enable a flexible approach whilst a change in the unlicensed dates would reflect the needs of a changing climate and bring Scotland into line with England and Wales. We would welcome amendments to the draft Climate Change (Scotland) Bill to enable such a licensing system to be established at the same time as any changes in the permitted times for making muirburn.

Compliance with the Muirburn Code is presently a condition for the receipt of Single Farm Payment and should continue to be so.

Climate change impacts on moorland
A recent study commissioned by Scotland’s Moorland Forum from the British Trust for Ornithology (BTO Research Report No.362, March 2005), based on substantial bird nest record data, has shown that a number of key moorland breeding bird species are breeding earlier. It is suggested in the report that this may be a response to climate change. In addition, a number of these
“moorland specialist” species, including hen harrier, merlin, golden plover and dotterel are listed on Annex 1 of the EU “Birds” Directive, requiring special conservation measures to be taken to protect their populations. Most of these species nest on the ground in either heather or grass and their nests and dependent young are therefore at risk from burning events. The BTO report cites lack of evidence of the current spatial effects of muirburn on the populations of Annex 1 (and other) bird species.

In the north and west Highlands of Scotland in particular, it has become customary for serious wildfires to break out usually in April and May. There have been many such serious incidents in recent years, which have caused serious damage to moorland, forestry, and nature conservation interests, as well as tying up fire service resources. With dryer springs, brought about by climate change, and therefore an increased risk of such wildfire events, we believe that it is essential that the Scottish Government provides some greater clarity on muirburn dates at the end of the season.

In recent years, there has been an increased prevalence of heather beetle outbreak caused by climate change. Heather beetle infestation has caused heather die off and loss. This has occurred on sites such as our Abernethy Nature Reserve, which is a Natura 2000 site. The infestations of heather beetle are exacerbated by warm summers, which “stress” the heather and make it more susceptible to heather beetle attack, as well as warmer winters, which improve survival of heather beetle larvae. Both wet summers and warm winters are becoming more prevalent due to climate change. The recommended treatment for heather beetle infestation is burning of the affected areas as soon as an outbreak is detected to reduce spread of beetle attack. We can therefore see that a strong case might be made in such circumstances for a licence for out of season burning to take place in order to protect the wider heather resource, and possibly also to protect the biological interest of Natura 2000 sites.

Provisions in England and Wales
In England and Wales there is provision under the Hill Farming Act 1946 (as amended) to allow Defra and the Welsh Assembly Government to amend the permitted dates for making muirburn, and for issuing licences for out of season burning. Indeed, Defra have now amended the upland burning end of season date in England to “sun down” on 15 April. In Wales, the Welsh Assembly Government has introduced end of season date of 31 March. These measures have been taken by the authorities to prevent soil erosion and pollution of water courses, as well protection of biodiversity and adaptation to climate change. We support the idea of similar arrangements in Scotland.

Scotland and Climate Change - Getting it Right

Friday 27 March 2009

[THE PRESIDING OFFICER opened the meeting at 10:00]

Opening Remarks

The Presiding Officer (Alex Fergusson):
Good morning. The noise that you can hear over the sound system has never been heard before. However, today is a day of firsts in many ways.

I warmly welcome you to your Parliament and your debating chamber in Holyrood. It is a great pleasure for me, as Presiding Officer of the Parliament, to be able to welcome you this morning.

As you know, this event has been organised by the Transport, Infrastructure and Climate Change Committee of the Parliament to coincide with Parliament's scrutiny of the Climate Change (Scotland) Bill. I am very much looking forward to this morning’s contributions on a subject that, over the past decade, has leapt to the very top of the world’s agenda.

As many of you may be aware, the Scottish Parliament is this year marking its 10th anniversary. When the Parliament was established in 1999, it was founded on four key principles: openness, accountability, the sharing of power, and equal opportunities. The Scottish Parliament has taken its commitment to those key principles seriously and has sought to give effect to them through our policies and the actions that flow from those policies. That is why our committees meet in public, as, indeed, does the whole Parliament, and it is why we hold public events such as this one in our debating chamber. Events such as today’s allow people from outside the worlds of Parliament and Government to come here and speak directly to MSPs and ministers, and to affect directly the work that gets done here. To put it simply, we feel that politics is just too important to be left to the politicians. We politicians are much the richer when the widest possible participation is enabled, as it is by today’s event.

A transcript, of today’s proceedings will be produced, which it is intended will form part of the Transport, Infrastructure and Climate Change Committee’s final report on the Climate Change (Scotland) Bill. Today’s event is also being webcast live on the holyrood.tv website, and archive footage will be available on the site, which you can access from the Parliament’s website, after today’s event.

In addition to hearing from several keynote speakers during the course of today, there will be opportunities for everybody to contribute to debates on the issues that are before us. This is your Parliament, and today’s event is an excellent opportunity for each of you to have your say on an issue that affects us all. I encourage you to continue to engage with your Parliament long after today’s event and well into the future, whether it be through participating in committee events like today’s, attending one of the many events in our festival of politics in August, submitting petitions or engaging directly with your elected representatives. I hope that you have an interesting, informative and stimulating day.

I invite Patrick Harvie MSP, who is the convener of the Transport, Infrastructure and Climate Change Committee, to the floor of the chamber.

Patrick Harvie MSP (Scottish Parliament Transport, Infrastructure and Climate Change Committee): I echo the Presiding Officer’s welcome. It is a pleasure to be able to spend the day with you, discussing the Climate Change (Scotland) Bill and the global context that it sits in.

Members of the Scottish Parliament do not always have an opportunity to engage with global issues, due to the devolved workload that we focus on, but it is absolutely necessary that we engage with certain issues. The issue of climate change cannot be viewed parochially. We cannot see it as just Scotland’s issue—it is the global issue.

The last time that the G8 met in Scotland, in Gleneagles, we had a conference in the chamber, the then Presiding Officer having given us permission to do so. We invited MPs, academics, representatives of non-governmental organisations and others to debate the issues that the G8 would be debating and to send a message about population and development. It was an opportunity for MSPs to hear some of the voices from around the world not at second or third hand but at first hand, here in the chamber, and to arrive at a shared perspective. That event was hugely valuable, both for MSPs and our guests, so as part of our scrutiny of the Climate Change (Scotland) Bill, my colleagues and I thought that it would be worth while arranging a similar event to enable us to try to join the dots between what is happening in Scotland, what is happening in the United Kingdom and what is happening globally. It will be valuable to hear the voices of people who have a perspective on climate change that is different from the ones that we normally hear, as it is based on where they come from in the world and what is happening there, and is equally important. I hope that you will take the opportunity to scrutinise the
Climate Change (Scotland) Bill and what the Scottish Government is doing and put it in the context of those global issues, given that today is only a few months before the Governments will once again meet to find out whether a global deal can be agreed.

The committee has had a chance to get our teeth into the bill during our stage 1 inquiry. We have not yet submitted our stage 1 report, and we have not yet begun the more detailed scrutiny job of stage 2, when we will debate amendments. The engagement that you have with us today has a good chance of influencing the work that we do and of shaping our thinking as we approach that work.

We are in a period of minority Government. In the first eight years of devolution, ministers sat before committees to introduce amendments to bills knowing that, nine times out of 10, the votes were in the bag. That is not the case now. All MSPs in the Parliament have the opportunity to shape the bill and strengthen it if necessary. Many of you might agree that it is necessary to strengthen it, and we would like to hear the detail of your views on that.

I thank you for coming to the Parliament today and I hope that you will participate in a lively and constructive manner throughout the whole day.

The Presiding Officer: I draw the attention of all delegates to the day’s programme, a copy of which should be on your desk. I would like to take a few moments to go through the programme with you.

We have divided the day into two sessions, each of which will be preceded by a series of short presentations.

The first session will be on the impact of climate change across the world and action that is required or is being taken to adapt to or mitigate its effects. The presentations will be from the University of Edinburgh carbon management masters programme; Forhadul Islam, who is a political officer with the Bangladesh high commission in London; Paul McAlavey, from the European Environment Agency; Ahmed Moosa, from the Maldives; and Dr Ian Burton, from Canada. The morning’s debating and discussion session will be facilitated by Louise Batchelor. We will have a short break around 11.35 and lunch will be around 12.45.

The second session, which will be chaired by Alasdair Morgan, one of my deputies, is on the proposals that are contained in the Climate Change (Scotland) Bill and how they will fit with the international efforts that are discussed during the morning session. There will be presentations from Stewart Stevenson MSP; from the Scottish Government; Simon Pepper, an independent consultant on climate change; and Professor Donald Brown, from the United States of America. The session will also be facilitated by Louise Batchelor. There will be an opportunity for delegates to ask questions at the end of all the presentations when we move to the debate.
Opening Address

The Presiding Officer: Without any further ado, I invite Dr David Guggenheim to give the opening address. Dr Guggenheim is president of 1planet1ocean, as well as being a consultant in conservation policy and science. Based in Washington DC, he provides services to clients in the non-profit sector, governmental agencies and private industry.

The floor is yours, Dr Guggenheim.

David Guggenheim (1planet1ocean): It is a great honour to be here. I want to take this opportunity to commend the Scottish Parliament and the people of Scotland for their leadership, because it is precisely the sort of leadership that it is going to take to address the global issue that we face. I hope that, in a small way, my presentation can help you better understand what you are doing here and how it helps the rest of the planet, including the special part of the planet that I work for, which is that blue part of the planet—most of the planet; the 74 per cent of the planet that is covered in water, depending on which perspective you look at the earth from.

I want to tell you a few stories through that blue lens. As my colleague Dr Sylvia Earle stated so beautifully and with such a graceful economy of words, “no blue, no green”. If we do not get it right in the oceans, all of our green efforts are for nought.

I thought that I would start by telling you about one of the more bizarre jobs that I have had. You might remember something called biosphere 2 and seven individuals who volunteered, back in the early 1990s, to be locked inside a glass structure, wearing silly-looking uniforms, for two years and to try to survive in that sealed environment from what they could produce and grow. They had a 1 million gallon ocean with a coral reef and they also had a rainforest, a savannah and an area to grow crops.

I was brought in as a consultant, because things started to go wrong. All of a sudden, oxygen levels dropped to what they would be on the top of a 15,000ft mountain peak. It was difficult for people to breathe. Carbon dioxide levels increased to near-toxic levels. Food was scarce. On the screen, you can see a photograph of a younger version of me, one of the so-called biospherians. You can see that she is rather thin.

The lesson is clear: even in an environment that we supposedly controlled all aspects of, things went awry in unexpected ways, and did so extremely quickly. We need to apply that lesson to biosphere 1—the planet earth—and consider some of our actions as being part of an uncontrolled experiment that we really have to take responsibility for.

On Saturday, I was fortunate enough to be at the Explorers Club’s annual dinner in New York, at which the speaker was Edward O Wilson. He told us that half of all species could be extinct by the turn of the century, that a large number of species are disappearing even before we can discover them, and that by far the main cause of that is habitat destruction. He referred to climate change as being a form of habitat destruction.

In no place is the discovery of new species more relevant than in the oceans. Believe it or not, we have explored only around 3 to 5 per cent of our oceans. Every time that I put my head under water—whether it be when I am scuba diving or in a submarine—we find something new, like those black smokers in the Pacific that turned upside down the belief of nearly everyone of my age that photosynthesis was the only way to support life on earth and that nothing could survive without the sun. That is what we thought, but here was a colony doing just fine without the sun, thousands of feet under the water.

In 2007, we took a pair of submarines to Alaska, in an unusual partnership between Greenpeace and the National Oceanic and Atmospheric Administration, to explore the two largest underwater canyons in the Bering Sea, including one that is twice the size of the USA’s Grand Canyon. On what we considered to be just a typical day at the office, we conducted some transects along the bottom and, if we saw anything unusual, we headed off, took some close-up video and maybe collected small samples. On the screen, you can see a little patch of sponges and the manipulator arm dropping a sponge into a basket. That is no big deal, except that human eyes had never seen that sponge before. That is just the first of many more species that we expect to find from that expedition.

10:15

I have been involved in expeditions off south-west Florida to document the deepest coral reef in the continental United States. We pulled up what is shown on the screen, which is about the size of a dinner plate. It looks like a purple blob, until we see the two antennae on the right side. That is a giant and previously undescribed nudibranch. It is
kind of cute. Essentially, a nudibranch is a sea slug. I could go on and on all day with such examples. The point is that we are in a period of discovery in our oceans.

We are also discovering how the oceans work. The screen shows one of my favourite faces—that of a grouper in the Caribbean. We were off the west coast of Tampa, Florida. Each of the craters on the bottom—this is approximately 350ft deep—is about the size of a back yard swimming pool, is filled with fish and has a lot of exposed substrate. We were very curious. What in the world were we seeing and why was it there? Coming into the picture in the background is the explanation—a red grouper. Red groupers dig those holes. They are ecosystem engineers that modify the environment. All the little fish seek the shelter offered by that substrate, then the groupers eat those fish. The groupers are farmers—they are clever. There are other such examples. The screen is showing a tilefish burrow, which is further south. These are large mounds that use the same idea of attracting lots of other animals to the habitat.

The point is that fish are more than just fish—they are an essential part of the environment. I am showing a video in which we return to Alaska. What we see down in the deep parts of the ocean is not at all what we expected, at least when I was growing up, when we thought that the deep ocean was devoid of life. Up in the Bering Sea, our dives went down to about 2,000ft. That area is rich with life that we are just beginning to understand, including corals, which are the oldest living animals on the planet—some are up to 4,000 years old.

If you want to live at the bottom of the Bering Sea, you must deal with a lot of pressure, the dark and the cold, and you must have something to hang on to, because the undersea current is powerful. Even in our submarines, we found negotiating that current challenging. When I filmed the coral that is coming into the frame, my foot was floored on the gas to stay in position against the current. What does an animal do down there? One thing that a fish can do is swim against the current, but that takes a lot of energy. However, a fish that was born flat has got it made, because it can lie on the bottom and let the current wash over it, like the halibut on the video—that is a great strategy. That is what these guys do. In such a high-current environment, the bottom is full of depressions where fish such as the halibut dig themselves in, so all we see is their little eyes peeking above the sediment. That is another example of how ecosystems work. The beauty of such ecosystems is in the detail.

Each little fish-shaped depression that we can see is full of other animals—in this case, shrimp. For a shrimp, such a situation is ideal—it just gets down into the little hole, out of the current, and food particles start to fall on top of it. It just sits there and eats. That is a great survival strategy.

I wish that I had the time to show you the rest of this video. You can see one of the other things that we found—these unusual rocks. I thought that they were meteorites—they did not look as though they belonged there—but they were covered with life, as they provided something to hang on to. There were corals, sponges and octopuses. So where did those rocks come from? They came from glaciers. They were caught up in icebergs that floated down to the middle of the Bering Sea, melted and dropped the rocks.

Again, something seemingly insignificant such as where a rock falls or where a fish lies constitutes the fabric of ecosystems and shows us how they work. Sometimes, it is those little things that matter the most, and the big things that human beings are doing to affect those little things cause unexpected changes through the reactions of our ecosystems. That happens when we take too many fish from the sea or when global climate change affects where fish can live and how far south the stones that are caught in icebergs drop.

Earlier this month, I spent some time in Barrow, Alaska, which is the northernmost settlement in North America. I heard a lot of stories from locals there about the change in ice that has taken place in that community, which is another dramatic change that I am sure many of you have seen the statistics about. For that community, which survives on whaling, it has been devastating. I heard from an emergency response person who said that half the town ended up floating out to sea on a piece of the ice sheet that broke off. That turned into an interesting rescue operation. On the screen, you can see the record lows there. Ice also provides a substrate for algae to grow on, which is part of the primary production in the food chain in our oceans, so it is very important.

I spend a lot of time studying coral reefs. We hear a lot about them, but why do we care so much about them? There are not that many coral species—maybe 1,000—but it is estimated that a quarter of all marine life forms depend on coral structures for their habitat. We have already lost 20 to 25 per cent of our coral reefs and, the way that things are going, another 25 per cent will be lost in the next 20 years. One of the problems is temperature. It has been stated that corals are already living near their thermal tolerance. They have a thermal tolerance range of only about 1°C—the red line that you can see on the graph is the threshold beyond which they just cannot survive. We are close to reaching that threshold on a global average basis.
Other things are going on besides temperature change, including the fact that so many human beings live in close proximity to those coral reefs. In this video of our expedition to Veracruz, Mexico, about five years ago, everything that you see is dead. The skeletons of the corals are still there, but the corals have died. In a 15-year period, 95 per cent of those corals died. That is another example of how fast things can happen due to temperature change, overfishing and water quality issues.

Those factors are of great concern, but we can now add something new to the list—ocean acidification, which is perhaps the most underpublicised consequence of fossil fuel emissions. The dissolving of carbon dioxide in ocean water creates a more acid environment. Those beautiful cliffs of Dover are made of coccoliths or coccolithophores, which are part of the plankton food chain that secrete calcium carbonate, like so many other marine species, including corals. However, in an acid ocean, it is unlikely that many of those species can survive.

The graph shows a time series that begins in the upper left, where red is good. In the lower right, you can see that there is not much red left. The purple and dark blues are bad. Those very acid areas happen to occur in some of the most productive oceans in the world, including the Southern Ocean, which means that the foundation of the marine food chain is imperilled, and that is critical.

What a great pleasure it was to wake up in the morning and read in the Washington Post about the largest marine reserve in the world. That is one of the short-term activities, whether on land or sea, that are relatively easy to do and which buy us time for the future, because they maintain the integrity of all those little relationships that I spoke about earlier.

In January, one of the last Bush Administration acts was, ironically, to announce the largest marine protected area in the world—the size of Spain—in the United States south Pacific territories. Had we had the foresight to protect more areas, the everglades would not now be undergoing the largest environmental restoration in human history, costing about $11 billion, to put the ecosystem back together. We are all finding that preserving intact such ecosystems buys us time on climate change and is also economical in the long term, because we do not have to pay to restore them. We are finding ourselves engaged in an exercise in triage—sadly, we cannot save everything. In looking at conservation in the oceans today, many folk are trying to figure out what we can save that will endure and eventually repopulate areas downstream. Protected area networks are the latest idea in the science.

I will talk about the United States of America for a moment since that is where I am from. Tragically, in the Reagan years, the environment became a polarising issue in our politics at the highest level. I have not seen that duplicated in any other country. Unfortunately, the spin doctors, including Rush Limbaugh, whom many of you might have heard of, have done nothing but perpetuate many myths, including that climate change is not happening or is not real.

We were really hamstrung to make progress until recently. A few things changed, one of which was that four of the five warmest years since the 1890s all occurred in the early part of this century. We also had some of the most devastating hurricanes, including hurricane Katrina. We had 21 named storms in 2005 that killed thousands—hurricanes Katrina, Wilma and Charlie were among the five most costly hurricanes. We also saw the price of gas go up. Those things, and the uncanny timing of a movie by a former Vice-President of the United States, captured the American imagination and spirit, and made people understand that climate change was real and that we needed to deal with it, but we still had a little way to go.

Our President at the time was clearly impeding progress and not engaging. You can imagine my glee, therefore, when I stood in the Mall on inauguration day and heard Barack Obama say the word “science” during his inauguration speech:

“We will restore science to its rightful place”.

That was the campaign platform of the Obama Administration, which is focused on reducing oil dependence, creating new green jobs and reducing greenhouse emissions by 80 per cent by 2050. That might sound familiar to you. I am pleased to say that I do not see any signs that the Administration is wavering at all. It is only March, but it is a case of so far, so good.

10:30

The budget stimulus package includes projected revenues from cap and trade emissions. There was a stark difference between the Obama platform and the McCain platform, which refused to put any mandatory limits on greenhouse gas emissions. We still do not have a comprehensive greenhouse gas bill in the United States, as a lot of the details have still to be worked out, but the placeholders have made their way into that huge, unprecedented budget.

There has been a reversal of the Bush Administration’s policies that prevented states such as California from asserting their leadership. The state of California wanted to exceed federal standards for automobile emissions, and 12 other states have now joined in—Obama has given
clearance for that to happen by establishing a waiver from the Environmental Protection Agency.

I will wrap up by focusing on where we need to go from here. At the Explorers Club last week, I heard that the commander of the manned mission to Mars is currently in elementary school. We could say the same thing about successful climate change policy. If we do not engage the next generation successfully as we move ahead, our plan—in whatever form—will not succeed.

Some of you know that I have been travelling to all 50 US states—it was my nutty idea, when I turned 50 years old in October—to share with children stories about the oceans and exploration and to try to get them excited about science and the frontiers that await them under water. I have been to places such as Kansas, which is a community in the geographic centre of the country in which half the kids have never seen an ocean. Most recently, as I mentioned, I was up in Barrow in Alaska, where I was one of two people in the classroom—the other being the teacher—who had never eaten whale meat. I got very different perspectives from those kids.

I have noticed that we are losing our perspective on the way that the planet used to be. I do a lot of work in Cuba, and—trust me—the sea turtles that were described in Christopher Columbus’s log book as being three to four feet long and in such vast numbers that they covered the sea are not found there any more. In fact, the number of sea turtles in the world today is only 1 per cent of what it was in Christopher Columbus’s time—we have pretty much eaten the rest and destroyed their habitat.

The next photograph is of the kids of a fisherman I work with in the Virgin Islands, holding up a picture of the biggest fish that their dad caught that day. I do not know whether those look like big fish to you, but to me they look like something that I would put in an aquarium. The situation in the Virgin Islands is serious: that is what is found at the fish market, and those kids are growing up thinking that those are big fish. That is a phenomenon known as shifting baselines, and it undermines our ability to make policy, because we are losing our reference points. None of us was alive so we cannot remember what the planet used to be like.

There is another problem. The book “Last Child in the Woods” is focused on saving American children from nature deficit disorder. The average American kid—believe it or not—spends less than four minutes outside in nature in unstructured activity, which is dramatically different from when I was a kid. The kids in Juneau, Alaska, spend a lot of time outside, but a teacher in Morrow in Georgia told me that she took some students in high school to the trees at the back of the school to do a science experiment, and they thanked her—they said that it was the first time that they had ever been to the wilderness. That is the sort of perspective change that we are dealing with.

I am afraid to say that with that lack of visitation comes fear. People are deathly afraid of nature. They are especially afraid of the oceans, and in particular of sharks. I loved what a fourth-grade teacher in Florida told me fear was—she said that it was simply an acronym for “false evidence appearing real”, but it is a significant obstacle. I have noted excessive hand washing among kids. Once they come into contact with nature, they feel unsanitary and immediately wash their hands or use wipes. We are in an age in which we are losing our perspective.

I have come to realise that the picture on the screen is many kids’ view of what a scientist is. My job has been to show them that, unlike the man in the picture, being a scientist can be very cool, and to give them an idea of some of the technology that they can look forward to, for example cities under the sea. I show them pictures of the inauguration on the Mall, which I watched with 2 million of my closest friends. I was moved by the fact that kids were involved. People who were too young to vote were paying attention. The fact that young people were involved in the election is really inspirational to me. I ask young people to put notes in bottles that I will take back to the Obama Administration so that it can hear their words. The fourth grader from Alaska who is on the screen wrote, “Dear Obama, we have crabs and whales. Can we keep them?” There is something in the way that a kid writes.

I am deeply grateful and honoured to be here. Despite the difficulties ahead, there is great hope. When it comes to engaging the next generation, the good news is that even the kids who have never seen the ocean love it and really care about the environment. It is up to us to ensure that we continue that work with them. [Applause.]

The Presiding Officer: Dr Guggenheim, it is we who should thank you, because I am quite sure that if you inspire those children across America in the same way that you have inspired us, we can expect great things from the next generation. Thank you very much indeed.
The International Impact of Climate Change

The Presiding Officer: We will now move into the first debating session which, as I mentioned earlier, is on the impact of climate change and the action that is required or is being taken to mitigate its effects. Shortly, representatives of the University of Edinburgh’s carbon management masters programme will make the first presentation. The carbon management masters programme is a landmark collaboration between the school of geosciences and the school of business and economics at the University of Edinburgh. We have with us today lecturer and programme director Dr Dave Reay, who has drawn together six students from the programme: Lilian Rushaigo from Tanzania, Somanath Narayan from India, Kushal Gurung from Nepal, Rahul Barua from the United States of America, Mike Passway from the United Kingdom, and Ibnu Najib from Indonesia. Lady and gentlemen, you are most welcome to join us.

Ibnu Najib (University of Edinburgh Carbon Management Masters Programme): Good morning, representatives of the Scottish Parliament, ladies and gentlemen. I would like to take you around the world with stories from our home countries that will illustrate two main messages. The first message is that climate change is having an impact now; its impact is not decades or centuries away. The second is that global co-operation and justice are imperatives in answering the challenges of climate change.

I will begin by saying a little about myself. My name is Ibnu Najib. I come from an archipelago of more than 17,000 islands—Indonesia. We have not been able to count successfully the exact number of our islands, but our small islands are disappearing. Although our islands make up only 1 per cent of the world’s land surface, one tenth of the world’s plant species are in Indonesia and, after Brazil and Congo, our rainforest is the third largest in the world.

Unfortunately, despite the important role that our forest plays as the world’s lung, it is endangered. Natural causes and market demand—national and international—have halved our forest in less than 60 years. The rush to seemingly quick and miraculous fixes such as biofuel has further degraded our forest. I am happy that the world, including developed nations, has started a discussion to reverse the flawed logic of the market that allows trees to be worth more economically dead than alive. However, I am worried by the fact that most schemes stand firm on carbon trading and utilise most of the financial engineering that has led to the current disastrous financial crisis. As there is discussion here, too, about inviting business schemes into forest management, I would like to call more attention to the social justice aspect of the issue.

Lilian Rushaigo (University of Edinburgh Carbon Management Masters Programme): I am Lilian Rushaigo from Tanzania, east Africa, where many climate change impacts are already apparent. Local communities have noticed changes in rainfall patterns and unexpected and serious droughts, sometimes in regions that are heavily dependent on rain-fed agriculture. Diseases such as malaria that are common at lower altitudes and in warmer areas are affecting populations in regions that were previously uninhabitable by mosquitoes. Rises in sea level in coastal areas of Kenya and Tanzania such as Kunduchi and Diani Beach are eroding most of the coasts. Some family homes, fish markets and beachfront hotels have literally been swept away.

One of the most obvious impacts of climate change in the region is the receding glaciers of mountains such as Kilimanjaro in Tanzania and Rwenzori in Uganda. That development has had adverse effects on the surrounding ecosystems, with reduced run-off leaving local communities and wildlife to fight for the remaining resources.

All the impacts that I have described are affecting people who are heavily dependent on the environment for their livelihoods and are reducing people’s chances of survival. Capacity building and investment in adaptation efforts are crucial in the region and in Africa in general.

Kushal Gurung (University of Edinburgh Carbon Management Masters Programme): Namaste. I am Kushal Gurung from Nepal, the land of mighty mountains that, sadly, may not remain snow capped for ever. Our glaciers are melting rapidly because of climate change. That has led to the formation of unstable glacier lakes, 20 of which may contribute to significant flooding. So far, only one lake has been contained to a safe level, but the risk has still not been completely eliminated, due to a lack of funding—and there are 19 still to go.

The Himalayas also contain the headwaters of many rivers that run to countries such as China and India. Glacial retreat may dry up those rivers, endangering the source of drinking water for almost one fifth of the world’s total population. Furthermore, Nepal relies largely on rainwater for agriculture, and lately the monsoon has become less predictable. That has made poor farmers even more vulnerable. Our resources are not adequate to enable us to monitor and predict climate change impacts; that makes it difficult for us to gear up for adaptation efforts.

It is an irony that Nepal, whose carbon footprint is 10 times smaller than that of the UK, should
suffer in the way that I have described. For us, the Climate Change (Scotland) Bill represents action to correct that inequity. However, the bill could be strengthened by the inclusion of measures to support developing countries in adapting to climate change.

Somanath Narayan (University of Edinburgh Carbon Management Masters Programme): I am Somanath Narayan from Bengaluru, India. As an Indian citizen, I feel privileged to witness what is arguably the making of history. If strengthened, the Climate Change (Scotland) Bill could lead the world in moving towards a low-carbon economy. How the Scottish Parliament decides to pave that new road is of particular interest to India. My country and its people are acutely aware of the risks of climate change. India has a 7,500km coastline that is densely populated and vulnerable to flooding and rising sea levels. Predicted future climate change impacts include a fall in agricultural productivity and melting glaciers, affecting vital water resources.

My country understands that climate change is a global challenge that can be met only when each country takes appropriate and equitable steps in the right direction. India is a developing nation that aspires to bring electricity to 600 million people who are currently living without it, to eradicate poverty and to provide social and economic security by creating a sustainable growth trend. As such, our path to tackling climate change is bound to be different and more strenuous than yours here in Scotland. However, I am sure that Scotland, as a developed country, will lead the process by endorsing a strong, successful climate action plan from which others can learn. Thank you for listening.

10:45

Rahul Barua (University of Edinburgh Carbon Management Masters Programme): I am Rahul Barua and I am from the United States. As each of us here today works toward climate solutions, I tend to agree with my country’s new Secretary of Energy, Dr Stephen Chu, that the American public has not yet “gripped in its gut what could happen.”

A few citizens may have heard of Kivalina, Alaska, a village that has recently filed suit against ExxonMobil in the face of rising sea levels, and Californians have been warned of the potential loss of all agriculture, but the link to America’s unchecked emissions and overconsumptive lifestyle has rarely been propagated.

I am proud that we now have an Administration that understands the severity of the challenge and the urgent need for action, but we are new to this. The scope of the Climate Change (Scotland) Bill exceeds its national boundaries and is a powerful opportunity to help to determine the pace, sincerity and level of commitment on climate change from all developed nations.

Mike Passway (University of Edinburgh Carbon Management Masters Programme): Good morning. My name is Mike Passway and, as you can probably guess, I am Scottish. As Scotland is a country with warm-hearted people but a cool climate, many Scots welcome the prospect of global warming—after all, a rise of a couple of degrees centigrade is welcome, particularly on a nippy morning like today.

However, the bigger picture is far from benign and we have already seen very damaging effects of climate change in Scotland and elsewhere in the United Kingdom. For example, several severe landslides have occurred in the Highlands and it has been worked out that it would be too expensive to try to mitigate the effect of those landslides as the cost would run into billions of pounds. Coastal erosion is another major problem. For example, the rising North Sea could completely inundate the Old course at St Andrews, the home of golf, giving a whole new spin to the expression “water hazard.”

Landslides, floods and other horrific aspects of climate change have occurred regularly around the UK in recent years. My colleagues have highlighted the international significance of the Climate Change (Scotland) Bill, but it clearly has great meaning for all of us in the UK. In the pivotal year of 2050, I hope to be a sprightly 89-year-old, but I also hope that my nine lovely nieces and nephews, who will then be about the age that I am now, will be even more involved in the fight against climate change.

Ladies and gentlemen, we face a global and complex challenge but, with brave hearts, focused minds and strong international co-operation, we can overcome it.

Ibnu Najib: Members of the Scottish Parliament, ladies and gentlemen, the story that we have told describes the urgent need for strong action and commitment now because the impact of climate change is happening right now all around the world, including in Scotland, as Mike Passway told us. Our story also calls for action that can protect the silent voice of future generations. After all, how old will you be in 2050? We might not all be here, but my children and your grandchildren will be.

Our story also calls for more global co-operation. My country and Somanath Narayan’s country, for example, will benefit massively from Scotland’s expertise in renewables. As Lilian Rushaigo and Kushal Gurung illustrated previously, many developing nations such as ours need more support if we are to improve our adaptation
capability before time runs out. Our story also calls for us to revisit the current flawed logic that has allowed the market too often to commodify conscience and escape responsibility while marginalizing parts of our global community.

Strong, just, and immediate global action is our message. As Rahul Barua said previously, the Climate Change (Scotland) Bill can exceed its national boundaries because it will invite a higher level of commitment from America and other developed nations. We are grateful for the opportunity to be here and we sincerely hope that our messages will be incorporated into what can truly be the strongest climate change bill in the world.

The Presiding Officer: I thank you all very much indeed on behalf of everyone here for showing such a wonderful commitment to this subject and for a stark reminder of why we are all here today.

Our next speaker is Forhadul Islam, who is currently political counsellor at the Bangladesh High Commission in London, where he works to maintain and strengthen Bangladesh’s bilateral relations with the United Kingdom and Ireland. He is also assigned to work with the Commonwealth and with the International Maritime Organization. Mr Islam, the floor is yours.

Forhadul Islam (Bangladesh High Commission): Honourable Presiding Officer, learned speakers, distinguished ladies and gentlemen—a very good morning to you all. I am honoured to be here among people who are so expert in climate science, whereas I am no expert at all. As requested by the Scottish Parliament, I will read out a brief paper on the impacts of global climate change and the response of Bangladesh from the political point of view.

The changing cycle of nature—longer droughts, anomalous rain patterns, the melting of glaciers—tells us that all nations, rich or poor, will be affected to a greater or lesser extent in the coming years. None can escape the effects of climate change.

In Bangladesh, the climatic situation is evolving fast. Due to this, climate change is viewed as a national security issue in Bangladesh. With carbon emissions of only 145kg per capita—as against the 21 tonnes of carbon released by the average American citizen—Bangladesh is a victim of climate change. Bangladesh seeks strong political commitment and the support of the international community to assist in implementing and achieving a long-term strategy to combat the challenges of climate change. We hope to see climate justice prevail through future global legal instruments.

The longer it takes us to start building a climate-resilient society and economy, the greater our country’s vulnerability will be and the more expensive it will be to remediate the impacts. We need to act now. Unabated growth in carbon emissions and the resultant temperature rise will mean coastal inundation, recurrent floods and cyclones and millions of environmental refugees. Building up the necessary resilience is urgently required, as delayed action will increase risk and cause phenomenal damage and loss. The international community—in particular, our development partners—have obligations to support and finance our right to climate-resilient development. Urgent action to reduce global greenhouse gas emissions is the only chance to slow global warming to prevent Bangladesh and many other vulnerable coastal and littoral countries from facing a catastrophic future.

Bangladesh is ranked as one of the most vulnerable countries in the Intergovernmental Panel on Climate Change’s recently published fourth assessment report. In the section on “Observed climate trends, variability and extreme events”, the report notes that average temperature in Bangladesh has registered “An increasing trend of about 1°C in May and 0.5°C in November during the 14 year period from 1985 to 1998”.

The report says that “Annual mean rainfall exhibits increasing trends” and there have been “Decadal rain anomalies above long term averages since 1960s” and “Serious and recurrent floods … during 2002, 2003 and 2004”.

It also says that “Salt water from the Bay of Bengal is reported to have penetrated 100 km or more inland along tributary channels during the dry season” and “The precipitation decline and droughts … have resulted in the drying up of wetlands and severe degradation of ecosystems.”

In facing climate change impacts, there is political will in Bangladesh. The Government of Bangladesh recognises the vulnerability of the country, its people and overall development efforts due to the adverse affects of global warming and climate change. As one of the leaders of the less developed countries, Bangladesh has been actively engaged in the international response to climate change, with a view to ensuring that its concerns are addressed in any global framework to respond to climate change. As a demonstration of our spirit and will to commit to the collective force in combating global warming, Bangladesh
ratified the climate convention in 1994 and the Kyoto protocol in 2001.

I will now talk about some of the recent significant interventions. On 2 February 2009, the newly elected Government of Prime Minister Sheikh Hasina set up two committees—the climate change strategy and action plan committee and the climate change fund management committee—to ensure that people get the maximum benefits of the sum of around 3 billion taka that is allocated in the budget for implementing mitigation and adaptation plans in the current fiscal year.

Previously, the Government set up a secretariat on climate change under the Ministry of Environment and Forests to monitor activities to combat climate change and to deal with the climate change fund. The Government of Bangladesh has initiated a number of agricultural programmes to help to manage climate-related impacts. For example, crop diversification has helped to develop drought and salinity-resistant rice varieties. Other programmes, such as the agri-forestry programmes, the programmes on the production and use of biogas and the organic fertiliser programmes are most related to climate change mitigation.

In April 2007, at the United Nations Security Council, Bangladesh supported the United Kingdom position that climate change is an emerging concern for security. At the high-level UN event in September 2007, the former chief adviser of the caretaker Government of Bangladesh made a statement urging the global community to ensure the rights of vulnerable people. At the Bali conference in 2007, during the climate change negotiations, Bangladesh was instrumental in creating the necessary pressure to build momentum among countries that were reluctant.

At the regional level, Bangladesh devoted considerable energy to reflect its climate change concerns with regard to development. That has led to the South Asian Association for Regional Cooperation declaration on climate change. Bangladesh has legal instruments, policies, plans and programmes and is implementing strategies, approaches and principles to start its journey towards a climate-resilient Bangladesh. The overall goal is to increase the country’s resilience to climate change in order to reduce the adverse effects of climate change on various economic sectors and to minimise human suffering.

Bangladesh is a small land with a huge population, where human activities are huge. Therefore, addressing climate change involves huge resources, in terms of capacity and funding.

The Bangladeshi Government is vigilant in tracking the challenges of climate change and is taking due preparation to build the resilience of the country. Bangladesh has already considerably invested in infrastructure development to reduce risks and increase the capacity for adaptation over time. The success of Bangladesh’s relief and rehabilitation work in combating calamities such as floods and cyclones is acclaimed by the international community. The mechanism that we follow inspired the imagination of others who are in similar situations. A compliancy approach to climate risk management and adaptation has recently been taken.

However, it is not possible to address everything at one time. As such, it is necessary to adopt an overarching strategy that will address the immediate concerns. That approach involves targeting specific locations, communities, sectors and areas of special importance that can lead the way in addressing similar concerns in other parts, sectors, communities, ecosystems and so on. Bangladesh has designed a climate-resilient development framework and has accordingly prepared tools, mechanisms, partners and processes. This is the time to develop appropriate strategies, select priorities, targets, pilots and assessments for further replication in the future.

11:00

The Presiding Officer: Thank you for that interesting talk, Mr Islam. I thank all of our speakers for setting such a vivid backdrop to the debate that will now take place.

Our first discussion session will give you an opportunity to discuss any of the points that have been raised or, indeed, any points that you wish to raise. Before we begin, I will quickly cover some housekeeping rules.

I encourage everyone to participate as fully as possible. If you wish to speak please raise your hand. Once you have been invited to speak, you should stand up and wait for the red light on the microphone to go on—it will be switched on for you; you do not have to do anything to it. It would be helpful if you could give your name and that of the organisation that you represent. In order to allow as much participation as possible, I ask you to restrict your contributions to about two minutes.

I have great pleasure in handing over to Louise Batchelor, who will manage the debate for us. Louise is a journalist and well-known broadcaster who has long specialised in energy and environment issues. She has worked as a presenter and reporter on many television programmes, including “Reporting Scotland” and “Newsnight” in London, and we welcome her to the Scottish Parliament today.
Louise Batchelor (Facilitator): Thank you, Presiding Officer.

I too welcome everyone who has come together for this quite extraordinary gathering. Present today are members of Holyrood’s Transport, Infrastructure and Climate Change Committee, some of whom represent areas that are heavily dependent on the oil industry but find themselves working on potentially world-leading legislation. We also have with us people from countries with some of the heaviest carbon footprints and with some of the lightest. Also present are people from various walks of life in Scotland: people from communities and NGOs who are working hard to find ways of reversing or mitigating the effects of climate change and of being less dependent on fossil fuels.

Throughout today’s debates, I will try to keep our eyes on the bigger picture. There will be a lot of nitty-gritty to consider, but we must remind ourselves constantly that climate change is already happening and that we are already seeing the effects of it, here and—more so—abroad. We must remind ourselves of the urgency of today’s proceedings.

We have heard about the impact on the oceans, the interconnectedness of all life and the fact that something that happens in Alaska can affect something that happens on the ocean floor. We have heard about the vulnerability of Bangladesh and from the University of Edinburgh carbon management programme about the various threats and impacts of climate change.

I do not know how many people here have seen the new film on climate change, “The Age of Stupid”, which has been showing in Edinburgh this week. I saw it on Wednesday, but it does not matter whether you have seen it because the title says it all. It asks a simple question: why are we all so cheerfully participating in our own destruction? What is wrong with us? Why do we not get it, even though we keep on talking about it? I would say that I am one of the guilty parties in that regard. We still keep flying, for example, and one of the messages of the film is that we should not. However, if we did not fly, we would not have gatherings such this one, which might mean that we were unable to make the progress that we need to make.

That is all that I am going to say, because I want to hear your reactions to the speakers that we have heard from so far. Lots of themes have arisen. Why is there not more of a sense of urgency? What more could we in Scotland and the developed world do to help the developing world? What support, advice and resources can we make available? We heard a call from Nepal for more support, and we should bear it in mind that we have 10 times its carbon footprint. What is the role of carbon trading, and what will be the impact of the global recession? It is over to you. Who is going to start?

John Riley (Scottish Action on Climate Change): I am from Scottish Action on Climate Change and Carbon Neutral Biggar.

First, I would be interested to hear Mr Guggenheim’s view of Jim Hansen’s suggestion that we need a target of 350 parts per million of CO2 in the atmosphere. We are at 387ppm at present, and the figure is going off the scale. Does Mr Guggenheim believe that we should aim for a target of 350ppm if we are to avoid a 2°C increase in temperature? If so, it has been suggested than an 80 per cent reduction by 2050 is simply not enough. We would need a position of zero carbon by 2030, which is quite different from the scenario that is suggested in the Climate Change (Scotland) Bill.

Secondly, how are we going to achieve the reduction? By persuasion or economic growth? I do not think so. We have to introduce international carbon rationing in the form of contraction and convergence in order to help the developing countries to work towards equal per capita carbon entitlements. If they do not use their entitlements, they can sell them to the western world and generate an income, which will help them to develop. We will not achieve zero carbon by 2028 unless we move towards international carbon rationing—and unless we do so extremely quickly.

If people do not understand contraction and convergence, I have brought a copy of a CD for everybody at the event. It was produced by Scottish musicians who believe passionately that we have to introduce international carbon rationing and who have written a song about it. There is also a voiceover which explains what contraction and convergence is. Please take a CD away with you.

Louise Batchelor: There were a lot of detailed points there, but basically they come down to whether we are being ambitious enough. Are we going to achieve enough?

David Guggenheim: John Riley asked enough questions to keep us busy for the rest of the day, but the central question was whether our target is the right one. On that point, there is good news and bad news. Through my lens of blue, the good news with regard to marine life is that our targets are adequate to address some of the most critical issues but, when it comes to ocean acidification, the problem is not temperature but the dissolution of carbon dioxide in sea water to create a more acidic environment. I heard Dr Nancy Knowlton of the Scripps Institution of Oceanography speak last weekend, and she said that we will require additional sequestration tactics and
technologies—and perhaps some techniques that have not even been invented yet—to begin the active removal of carbon dioxide from the atmosphere, the point being that carbon dioxide has a residence time of at least a century in our atmosphere. The level might already be beyond the breaking point for some species of marine life in the oceans.

That is the short answer to what I expect will be a longer discussion.

Louise Batchelor: Yes—that is a big topic. Does anyone else want to comment?

Ibnu Najib: I would like to comment on contraction and convergence in relation to carbon rationing. Coming from a developing country, I agree with contraction and convergence, but I have some reservations in that carbon rationing should address the supply side more than the demand side. As people from developing countries, we have seen in the various international negotiations that, when it comes to limitations on countries, the stronger countries always have an excuse and find ways to navigate away from the limitations.

I agree with carbon rationing, but it should be aimed more at the supply side of corporations in the public domain. We know about them, but I am afraid that, when we target the demand side, the market mechanism and the rationing will go in the same direction as the injustice that has been happening and we, in the developing countries, will be the ones who suffer more again.

Louise Batchelor: So what can be done to cut down on the supply side? Does anyone want to speak specifically on that?

Justin Kenrick (Pedal Portobello Transition Town and Holyrood 350): The issue on the supply side is not about trying to cap people’s carbon emissions through their flying or whatever they do at ground level—that is not going to happen. It is about putting in the price at the top so that, for example, Exxon has to pay a huge amount to be allowed to put oil into the economy.

Basically, climate change is happening because carbon is being taken out of the ground, put through the economy and released into the atmosphere. The process is that simple. To stop that, we must prevent carbon from coming out of the ground, and I think that, on the supply side, we have to consider placing a huge price on putting carbon into the economy. We need Government legislation on that. The bill is absolutely fantastic, but even more fantastic has been the climate challenge fund, which has supported communities throughout Scotland as they have started to find ways of making a living and making life work without having to release so much carbon.

It has been superb to focus on what is happening in other countries, but we also need to consider how we can solve the issues on the ground here and make our lives better at the same time. The Fife diet is a great example of that. I do not know whether everyone has heard of it, but the idea is for people in Fife to eat only local produce, to avoid the carbon emissions from getting stuff from South Africa or wherever. In the beginning, it was seen as just Mike Small and a bunch of crazy mavericks doing something on the one hand, but a couple of weeks ago Roseanna Cunningham was at the launch as it was scaled up to a regional level across the whole of Fife, with everybody involved.

Such initiatives are about tackling climate change in a way that makes our lives better. Part of that is about addressing the supply side, ensuring that the financial cost of destroying the planet is too high for us here.

Louise Batchelor: Can I just throw something back at you? If we make fuel prohibitively expensive, what will we do about fuel poverty?

Justin Kenrick: That is very simple. In a cap and dividend system—you can Google the phrase—such as Peter Barnes has created in the States, Exxon and the other oil and coal companies would pay money into a trust fund, which would be divided equally between the population of the UK or of Scotland. Someone who was poor would get a wodge of £300 every month to help them to meet their fuel bills. Someone who was rich would get the same amount, but they would be paying a vast amount more because they would still be flying off to the Seychelles, running their two cars or whatever else. That would address fuel poverty immediately by redistributing the money that the companies pay, and the cap would be brought down slowly over time. If you Google it, you will find the scheme.

Louise Batchelor: Okay. Thank you very much.

Donald Brown will speak later, but he wants to say something in this part of the debate. He is from Penn State University, in the United States, and has previously been on a US delegation to United Nations climate negotiations. Donald, can you make fossil fuel prohibitively expensive? Can you tackle the supply side? How would that go down domestically in the States? As a rider to that, will America bring something meaningful to the table at the end of the year?

Donald Brown (Penn State University): There are competing theories about how we can address the supply and demand sides in relation to carbon emissions, but I am an agnostic about whether that can be done through caps alone or through taxation mechanisms.
The world is experimenting greatly with various methods of reducing carbon emissions, and I am happy to report that some US states have been extraordinary leaders in that over the past eight or nine years. Most people know about the Bush Administration, but they do not know that California and the western states have committed to significant reductions in greenhouse gas emissions or that the north-eastern states have capped carbon emissions in their electricity sector.

A great deal is being done at state and municipal level in the US, on climate change, that is not widely known about. Obama has indicated that he will bring a meaningful position to Copenhagen. The details are being worked out as we speak, so it is a little premature to say exactly what that position will consist of.

Louise Batchelor: I have heard that commentators in the States are saying that Obama will not be able to find anything that is acceptable to Americans by the time the UN talks start in December. Are you more optimistic?

11:15

Donald Brown: The real question is whether we will have domestic legislation in place before he comes to Copenhagen. It will be a fairly close call whether he can pull it off, and people are worried about whether he can come to Copenhagen with legislation in hand. Some forces are starting to organise against his doing that so we shall see.

Louise Batchelor: That is very interesting. We look forward to hearing from Donald Brown later.

To take us in a slightly different direction is Christine Wood from Tullis Russell.

Christine Wood (Tullis Russell Papermakers): I work for a paper-making company in Fife. We will announce very soon that we will build a biomass plant on our site and, although we are proud of the efforts that we are making, we can always do more. One idea that I heard about recently was to pay developing countries to keep the rainforests as they are and not fell them for palm-oil production or paper making by irresponsible companies. What do people on the panel think? It seems like an elegant solution to me, but there seem to be a lot of adverse comments about it.

Dave Reay (University of Edinburgh): Land use more generally—but including forestry—has been one of the big misses in international policy so far. Fossil fuel emissions get the headlines because they are major ones, but about 20 per cent of our greenhouse gas emissions from human activity comes from land use change, most of which is through deforestation. We need something much better than what we have to protect forests and soils from degradation. That will be one of the key tests of whether Copenhagen succeeds in mitigating climate change.

Louise Batchelor: I am not sure that you immediately addressed Christine Wood’s question, but it was interesting. I would to hear from Indonesia again.

Ibnu Najib: The mechanism referred to in Christine Wood’s question is called the reduced emission from deforestation and forest degradation programme in the United Nations. There are two important points to consider here. The first is the power of market solutions, and the second is lack of attention to the justice problem, which is actually the same point.

I was at the Poznań negotiations last year. The discussion about the effort to make trees economically worth more alive than dead is dominated by business interests. The International Emissions Trading Association is the biggest non-governmental organisation in the discussion. Indigenous people have been shouting outside the conference room and asking for more attention. Everyone has been saying ahead of Copenhagen that we are running out of time and we have to do something about the forests, but the something that is being discussed is mostly about financial engineering. If you want give people the money to maintain forests for 100 years, where will the money come from and how do we give them it continuously?

The discussion has been about how to provide money for 100 years, but there are alternatives, such as the proposal from Brazil that developed countries have a specific fund that would be located in the developing countries. The solution exists and the market is not the only answer, which is good for our country.

Attention should also be given to where the money will go. Will it go to the Government or the people? If the money is given to the Government, the countries who donate from the fund should ask the Government how it will give the money to the people. That important question needs to be addressed.

Louise Batchelor: At that point, the negotiators start to file the problem under “Too difficult” and things break down. We will hear from the European Union shortly, but there is a suggestion that some EU countries, such as Poland, are saying that it will be too expensive for them to contribute to such funds.

Duncan McLaren (Friends of the Earth Scotland): I will add to what our friend from Indonesia was saying.
There are, of course, good reasons to avoid deforestation, and developing countries almost certainly need financial aid to help them to do that, but there are two big downsides. First, as Ibn Najib set out clearly, many processes are being undertaken in ways that exclude indigenous peoples and forest dwellers from the lands that they have treated, or that should be treated, as theirs. Excluding people and turning their forest into a carbon sink is not a sustainable way of proceeding.

Secondly, far too often, avoiding deforestation is proposed as a way of allowing developing countries to choose not to cut their emissions but to pay for reductions in emissions elsewhere. I refer to the process of carbon trading and carbon indulgences that allows rich countries to buy reductions in emissions in poor countries, with social problems attached, instead of making them domestically.

The point that I am making is part of a bigger case that states that we in the rich and developed world need to make available to poor countries substantial funding, technology and new social models—different ways of doing things that do not rely on continued economic growth—so that they can build climate-resilient economies and societies. We need to do all of that in addition to making urgent and severe cuts in our domestic emissions.

Louise Batchelor: How would you make such funding available other than through carbon credits? How would you ensure that the money got to the indigenous people who are dependent on the forests?

Duncan McLaren: I am not an expert on the latter question, and probably not even on the first. However, it is possible to establish funds that are not tied to the creation of carbon credits. There is no logical reason for Indonesia to have to give us carbon credits if we pay it to protect forests.

Louise Batchelor: So we should simply tax people and hand over the money.

Duncan McLaren: The world has committed itself to increasing development aid, but so far we have failed to do so. We have committed ourselves to meeting the millennium development goals. It is clear that funding is needed in addition to what has been pledged. We must take it from other sources and not use it simply for reductions in carbon emissions. That is the red herring in the debate.

David Guggenheim: Some of points that I wanted to make were made far more eloquently than I could have made them. For a marine biologist, I have spent an uncanny amount of time on the forestry issue. Back in the early 1990s, when US electric utilities were examining ways of offsetting carbon emissions, I authored a report on behalf of the Electric Power Research Institute on the suitability of Siberian forests for that purpose.

One issue that keeps coming back in relation to forestry projects is monitoring, measurement and the threshold of proof that a project has resulted in net sequestration or a net carbon benefit—in other words, establishing that something would not have happened without the project. That is tricky when dealing with something that is as difficult to measure as a forest. I could point folks to a body of knowledge in the area, including a report by the Keystone Center in Colorado from the early 1990s, which involved broad participation but focused on measurement issues.

I agree that it is important that projects should benefit local people. We have seen some poor models of ecotourism—the promise of dollars and pounds coming into a region to support it, only for that money to go to a resort that imports its labour force and so on. We must ensure that projects are not an empty promise of support.

Louise Batchelor: The debate is starting to engender in me a feeling that there are all sorts of possible solutions to the problems, but every single one has many problems attached to it. I hoped that that would not happen quite so early in the day.

We are talking about forests, so who better to hear from than a representative of the Royal Botanic Gardens in Edinburgh?

Stephen Blackmore: The millennium for Scotland project, in which I had no hand, was truly inspired. The project was partly at community level, and similar forestry projects around the world happen at several levels. There is a big debate about carbon trading, but simple and practical projects are taking place in many countries, including Scotland. That action needs greater support and a greater urgency behind it.

It is fundamentally important that we do not forget the role of nature in reducing carbon dioxide emissions—David Guggenheim mentioned that in relation to the oceans, and forests have a role on land—but there is also a technological component. In Scotland, we have special opportunities to be way ahead on alternative energy production and, in particular, carbon sequestration or capture. We have perhaps lost some of the opportunity to exploit the North Sea oil fields for that, or some of
the energy to do so. I sincerely hope that one result of the Climate Change (Scotland) Bill will be a commitment to our being pioneers in carbon capture. We should look to nature and natural solutions, but also to engineering and technological solutions.

**Robin Harper MSP:** Mention was made earlier of Dr Nancy Knowlton of the Scripps Institution of Oceanography, who has said that we need active removal of carbon from the atmosphere. Sequestration is not active removal, although it is a step on the way. It is pumping underground stuff that otherwise would go into the atmosphere.

Many of the answers that we have heard have been to do with prevention. The only active removal that occurs to me is the use of wood in building. There are huge opportunities to replace carbon-intensive building materials, such as brick, concrete and steel, with wood. At Acharacle in the north of Scotland, a school is being built entirely of massive wood—it will become iconic when it is opened in a couple of weeks. We need to develop the technology, but the opportunity exists now to start using wood.

That is happening in Switzerland and Austria—Brettstapel is the name that has been given to the process there—and we should move to that system throughout the world. The wood in the Parliament building will still be here in 100 years, so it has locked up carbon for the next 100 years. A small school can lock in up to a million kilos of carbon dioxide equivalent permanently, or until the school has to be replaced. We must do the figures on that.

We have a huge opportunity to be much more imaginative about how we use our wood in Scotland. I am not completely against biomass, but using wood for building is a much better answer than burning it, putting the carbon back into the atmosphere and then capturing that carbon again in wood.

**Louise Batchelor:** I would love to believe that that is the solution, but I am not convinced.

**Robin Harper:** It is part of the solution.

**Louise Batchelor:** Okay—it is part of the solution. I will go back to Stephen Blackmore on that. Is it not the case that we consume far more than we can grow and that we can never grow enough to keep up in terms of building materials, biomass and carbon absorption in our forests?

**Stephen Blackmore:** The simple answer is that we could do so. To pick up from where Robin Harper left off, there are no single or simple solutions but a multiplicity of solutions. That is why I suggested that there are strong natural components involving the use of biology and nature to capture carbon in the soils. Fundamentally, the question whether we can continue to feed and improve the quality of life of people around the world comes down to the need to tackle human population levels as well as to produce more food. We can certainly do the latter if we improve our agricultural and land management techniques. We can achieve most of the biological solutions for our planet, but it will depend on willpower and investment in resources. Again, as I said earlier, much can be done at the local and community domestic scale. Changes are not always made through huge international efforts: they can be done locally, too.

**Louise Batchelor:** Thank you for that optimistic note.

**Stephen Benn (Royal Society of Chemistry):** We greatly welcome today's event and are glad to take part in it. I echo the view that a range of solutions is what will make a difference. We first need international leadership, which we hope the Copenhagen meeting will provide, but lifestyle changes will also be required. There is enormous potential in the reduction of energy demand through greater energy conservation, especially for heat loss through buildings, which is considerable.

We will clearly have to decarbonise transport in a variety of ways, such as through highly efficient biofuels, lightweight materials, hybrid and electric vehicles and battery technology. There will have to be further work on the potential use of hydrogen as a fuel, and we must make as much effort as possible to get electricity generation from a variety of renewable sources.

The CCS technology will be crucial. As was said earlier, there is tremendous potential in Scotland, and some of us in the Royal Society of Chemistry regret that it has not been exploited as quickly as it could have. We would not want it to be developed elsewhere when there is clearly good potential here.

Finally, but by no means least, the development of investment in people and skills is necessary to deliver all that progress here in Scotland as well as in the rest of the UK.

**Louise Batchelor:** May I come back to you on a couple of points? We already hear that biofuels, which are believed to be one way forward, are laying waste to the rainforests of Indonesia—that seems to be a major problem. Further, how would you produce the hydrogen? Which would be the most viable energy resource for doing that?

**Stephen Benn:** Briefly, there are good biofuels and bad ones. It is important in a debate such as this that people understand that distinction.
Louise Batchelor: And which are the good biofuels?

Stephen Benn: That is a good point. My colleague Hannah Taylor knows more detail—and she has just whispered to me that the good ones are second generation biofuels. However, the main point is that there are differences between biofuels and there is no reason why we should lay waste to rainforests to develop a more efficient biofuel.

Louise Batchelor: Okay. We will maybe hear about hydrogen later on. We probably have time for one or two more questions.

Adrian Loening (Carbon Trade Ltd): I am from Scottish Action on Climate Change and, professionally, from Carbon Trade Ltd here in Scotland. I have some complex comments to make, but I will try to keep them short.

Louise Batchelor: I will keep you short.

Adrian Loening: The first one is that, in Copenhagen in December, we must find a better way of carbon trading. I spend most of my professional life on methane capture projects with specific climate benefits that are potentially unlike biofuels and forestry projects, but it is immensely complex and difficult to organise those markets. I am a bit at odds with people here who are in favour of carbon capture and storage. I think that we should rename that enhanced oil recovery, and I agree with Justin Kenrick that carbon needs to stay in the ground.

Finally, it has been a reasonably nice, sunny day here in Scotland, but I am sat in my seat being blinded by electric lights.

Louise Batchelor: Shall we try to switch them off and see what happens? Thank you very much for being succinct. We will have another quick point of view.

Matthew Crighton (Unison Scotland): I will try to be quick, but I am sorry if we cannot discuss my point. We are looking at a couple of crises across the world, one of which is the climate, but the obvious one is the economy. The G20 meeting will shortly take place, and Governments are putting millions and trillions of dollars and pounds into banks, which fund company developments. Why cannot we put those two areas together by putting a condition on all that Government money that any investment that is touched by public money must lead to a reduction in carbon emissions from developments and that any growth must be green? We need to make that point loud and clear now because discussions are going on about the re-regulation of the world economy—rather disconnectedly, it seems to me—at the same time as the Copenhagen discussion about climate change.

Louise Batchelor: That is an extremely good point on which to end this first discussion session, and it perhaps tees us up for one of the next debates. Thank you all very much for the fantastic contributions so far. I hand back now to the Presiding Officer.

The Presiding Officer: Thank you, Louise. I am learning lessons in how to conduct debates, so thank you for providing such a good example of how to do so—it has been very interesting.

As Louise Batchelor indicated, that brings us to the end of our first session. Perhaps I can just answer the question about the lights. As I indicated at the beginning, the event is being webcast and will be available to others who want to access it through archive footage. If we do not have the lights on, we will all be sitting in complete darkness as far as that footage is concerned. That is the main reason for the lights being on.

We will now have a short comfort break, and I urge people to use it for the purpose suggested rather than to explore the building. It will be a short break of 10 minutes, and we will restart promptly.

11:37

Meeting suspended.

11:50

On resuming—

The Presiding Officer: If you would like to take your seats, we will get under way again. It was brought to my attention during the interval that one or two people at the back of the chamber are having a little difficulty hearing. I advise you all that if you lift up the lid of the black console on your desk, it acts as a loudspeaker. That might help people who could not pick up what was said through the sound system.

Welcome back. I trust that everyone is feeling more comfortable after the comfort break. I am pleased to invite Paul McAleavey, who is a European Union civil servant who has been seconded to the European Environment Agency in Copenhagen, to give us our next presentation. He is responsible for the political communications department. Like all our speakers, we are delighted to have him here. [Interruption.]

Paul McAleavey (European Environment Agency): That little pause was good—it allowed me to enjoy the moment even more. As a Scot who campaigned for this Parliament many years ago, it is with huge pride that I stand here. I am grateful that the sound problem gave me a little extra time to absorb the moment.

As the Presiding Officer said, I speak as a civil servant of the European Union. I have been asked
to provide this morning’s session with a European policy perspective. The organisation that I work for, the European Environment Agency, is based in Copenhagen. It is an information agency rather than a regulatory agency, which was set up by the European Community in 1994 to ensure that the EU and its citizens have the information and the analysis that are required to make the changes that our environment needs or, in the words of this event, to provide the information that will help the EU and its member states to “get it right”.

Our geographical scope is broad. We have 32 member countries—the 27 members of the EU, plus Iceland, Norway, Switzerland, Turkey and Liechtenstein. Our remit is similarly broad. We are required to support sustainable development and help achieve significant and measurable improvement in Europe’s environment through the provision of—these are four important adjectives—timely, targeted, relevant and reliable information. If people have a chance to look at some of the publications that I have left on the agency’s stand outside the chamber, they will see that we do not just write documents for decision makers; we have a mission to popularise information for the broader public. I will use some metaphors to explain the scale of what we are talking about.

In the short time that is available, I will highlight just some of the work that the agency does in Copenhagen and how it might be relevant to the work that is being done in Scotland.

On climate change, the agency plays a specific role as part of the European effort. Basically, our experts co-ordinate a massive accountancy job by collecting, verifying and analysing data on greenhouse gas emissions from all over Europe. The data are then used to produce two key annual reports that feed into the Kyoto process. This year, the numbers and the analysis are particularly significant in the context of the 15th conference of the parties—COP15—negotiations that will take place in Copenhagen in December. With the first commitment period under the Kyoto protocol in effect running out in 2012, COP15 will be expected to produce an ambitious successor. Some 15,000 or so delegates will descend on the city in December so, as someone who spends his working days in Copenhagen, I warn anyone who plans to come over to do their Christmas shopping this year that hotel space is very limited.

The first report that we produce each year is the inventory of greenhouse gas emissions, which is published in early summer. Basically, that report counts gases to give an overall picture of emissions across Europe. We send the report to our European Commission colleagues, who officially submit it to the United Nations Framework Convention on Climate Change. Because the data are first verified at national level, the data in the report are always subject to a delay of one and a half years. Our latest report, which was released in June 2008 but is based on data from 2006, shows that emissions from the EU 15—meaning the 15 member states that were members of the European Union before the 2004 enlargement—were basically 3 per cent below the base year. In 2006, EU 15 emissions were 3 per cent below the base year, whereas the target is for them to be 8 per cent below.

What does that mean for people—like me—who are not climate scientists? Given that the concept of counting gas is quite abstract, we have made efforts to simplify and popularise the report by explaining the cuts in terms of the number of days of the year. Basically, the EU 15 Kyoto target of achieving an 8 per cent reduction in emissions from their 1990 levels means that we need to cut 29 days-worth of emissions every year for each of the five years between 2008 and 2012. The latest data from the agency show that we have cut 10 days-worth of emissions between 1990 and 2006. In simple terms, we still need to cut a further 19 days of emissions just to reach the Kyoto target of an 8 per cent cut. By analogy, the Climate Change (Scotland) Bill’s target of achieving an 80 per cent reduction in emissions by 2050 means, as I understand it, that Scotland will need to cut 290 days-worth of emissions by 2050.

The other main report on mitigation that we produce each year is the greenhouse gas trends and projections report, which is published in the autumn. Whereas our spring report looks back at what has happened, our autumn report looks at the likelihood that member states and the community will achieve the Kyoto commitments. Basically, our greenhouse gas trends and projections report allowed the European Commission to produce this month the graph—labelled “1. Climate change - Greenhouse gas emissions”—that can be seen on the screen. The graph shows that the EU 15’s performance remains mixed, but the EU 15 as a whole should meet the Kyoto commitments if the member states speed up implementation of planned measures.

If we consider the issue at national level, we see that France, Greece, Sweden and the United Kingdom reached their Kyoto target in 2006. We then have a middle batch of countries—Austria, Belgium, Finland, Germany, Ireland, Luxembourg, the Netherlands and Portugal—that project that they will achieve their Kyoto targets. However, our projections for Italy, Spain and Denmark—yes, including Denmark—indicate that those states will not reach their Kyoto emission reduction goals. As one can imagine, that takes us into some interesting discussions every autumn with our host Government in Denmark.
The graph looks ahead beyond Kyoto to 2020 because, in December last year in advance of COP15, the European Union agreed a climate and energy package called 20/20/20 by 2020. That package commits the EU to reduce greenhouse gas emissions by 20 per cent by 2020; to increase the share of energy from renewable sources by 20 per cent by 2020; and to improve energy efficiency by 20 per cent by 2020. The slide shows graphically—I refer to the red dot labelled “EU-27 target”—what a 20 per cent reduction would look like by 2020.

However, what do such targets mean to non-experts? How do we communicate the 2020 target to people who are not climate scientists? We have explained that reaching the 2020 target is the equivalent to removing the emissions from all transport in Europe. Imagine the emissions from every truck, bus, car, train, boat and aeroplane disappearing—that is the equivalent of a 20 per cent cut by 2020. The target is ambitious but, as we have heard this morning, it needs to be—the challenge is serious.

12:00

I was aware that you would not be able to pick up the detail of the next slide—that is not a problem, because copies of the report from which it is drawn are available outside. Even if all emissions stopped today, climate change would continue for a long time, due to the historical build-up of greenhouse gases in the atmosphere. The third report that I want to highlight is our climate impacts report, which is based on 40 indicators and shows climate impacts that are already evident in Europe. My intention in showing you the slide was to highlight the diversity of climate impacts in Europe. This morning we heard people speak eloquently about the impacts that are evident outside Europe, but there are already impacts in Europe.

The Mediterranean region—the yellow area on the map—will experience less precipitation, lower river flow, more forest fires, increased water demand, a high risk of desertification and a risk of more biodiversity loss. In the central and eastern European region—marked in green on the slide—there will be more temperature extremes, less summer precipitation, more floods and more forest fires. Here, in the north-western part of Europe, with our maritime climate, we can expect more winter precipitation, higher river flows, a higher risk of coastal flooding and the northern movement of freshwater species. We do a lot of work on Natura 2000 designated areas. Now that we have an almost complete designation of Natura 2000 sites in Europe, the climate has changed the ballpark. It has taken 20 years to achieve the designation of most sites, but we will need to revise the map because of the impact of climate change.

I wanted to use my time to give you a glimpse of some of the European perspectives that provide part of the context for your deliberations on the Climate Change (Scotland) Bill. You can find the reports that I have mentioned on our website, and I have left some copies outside the chamber to be picked up today.

To finish, I would like to draw your attention to work that the agency is doing in relation to energy and on the subject of co-benefits. We are about to launch a new report that maps out the potential of wind energy in Europe. Early indications suggest that the potential of wind energy corresponds to about 2.5 times the gross electricity generation of the EU 27 by 2020, even taking into account social, environmental and economic constraints such as Natura 2000. A key message for the agency is that renewable energy comes in small, even micro, packages. Because energy from the sun, winds, waves and tides is diffuse in nature, it is far better suited to a decentralised generating system.

Tackling climate change has huge co-benefits. I will explain what we mean by that. The effort that is required for us to meet the 2020 targets will also cut air pollution in Europe. For example, improving energy efficiency and increasing renewable energy will reduce fossil fuel consumption, which is a key source of air pollution. Such positive side effects are referred to as co-benefits. We have estimated that achieving the 20/20/20 by 2020 package would cut by £8.5 billion every year the cost of meeting the EU legal air pollution requirements. The savings to European health services could be as much as six times that figure—in other words, a €50 billion benefit to our health services, as a co-benefit from climate change action. There is a lot at stake. Thank you for your attention. [Applause.]

The Presiding Officer: Thank you very much for that very stark presentation.

I welcome Ahmed Moosa, who is a Maldives special envoy for science and technology and is currently looking into President Mohamed Nasheed’s recently announced initiative for the islands to go carbon neutral in the next 10 years.

Mr Moosa, the floor is yours.

Ahmed Moosa (Maldives Government): Thank you very much, Presiding Officer.

Honourable members, ladies and gentlemen, it is a great honour for me to be able to participate in this very big event and in an important and timely debate. I thank the organisers and the Scottish Parliament for giving us this tremendous opportunity to contribute.
Climate change is the biggest challenge facing mankind today. The Maldives is a group of small—or, as you say in Scotland, wee—coral islands in the middle of the Indian Ocean. Journalists often use terms such as blue skies, crystal clear warm water, white coral sand, paradise and a sparkling image of perfection to describe the islands, which are one of the world’s most exotic holiday destinations. However, according to other reports, the Maldives is a paradise that is soon to be lost. Climate change is threatening to wipe away this natural wonder.

Global warming has never been a myth. We can witness its effects across the globe. For example, in the early 1990s, when I studied at the University of Glasgow, we had snow throughout the winter months. Now, as most people know, it hardly ever snows in Glasgow. The summers are warmer than ever here in Scotland and throughout Europe.

In the Maldives, several islands have been severely affected. Coastal and beach erosion, frequent flooding and fresh water shortages have all been attributed to climate change; the El Niño of 1997 caused severe coral bleaching not only in our reefs but in several other similar habitats around the world; and there have been a number of extreme weather events, including the recent floods in the United Kingdom and an increased incidence of severe hurricanes.

Honourable members, ladies and gentlemen, the Maldives might be a very small country but we have our own language, culture and traditions. We have been living in a relatively pristine environment for well over 3,000 years. If sea levels rise as predicted, then we lose everything. Climate change is a real threat to our existence.

The world must come together to save not only the Maldives but our whole planet from peril. There is absolutely no doubt that the leaders of the industrial nations have the biggest role to play in this greatest of human endeavours. In that respect, we in the Maldives are most encouraged by the Scottish Parliament’s initiatives to pass new measures to challenge this important issue. This is a historic opportunity for Scotland to lead the world and lay down strong measures to combat climate change. Scotland is my second home and I am very proud of what it is doing.

The new democratic government of the Maldives is committed to tackling the threats of climate change. Earlier this month, President Mohamed Nasheed announced the aim for the Maldives to be the first carbon neutral country through investing in renewable energy and decarbonising our economy. In addition, we are inviting researchers and scientists to come to the Maldives and set up research hubs and outposts. Indeed, we have already started to sign agreements with European universities.

A UN study published in January offered evidence that global warming undermines a number of basic rights such as food, water, shelter, health, life and self-determination. The Maldives has since successfully lobbied the UN Human Rights Council to adopt a resolution to hold a panel discussion on the relationship between human rights and climate change. The Maldives-led resolution secured the support of 88 co-sponsors, including 15 members of the Alliance of Small Island States and key allies such as India, Sri Lanka and, this week, the UK, for a panel debate to be held in Geneva this July and before December’s conference in Copenhagen.

We call on the world to come together in a spirit of solidarity to tackle climate change in Copenhagen later this year.

I will present some facts and figures about the impact of climate change in the Maldives. According to estimates, the country has a population of fewer than 400,000 people. We have around 1,200 islands, of which roughly 200 are inhabited. The Maldives cover 298km², and more than 99 per cent of the country is sea.

The main industries are tourism and fisheries, and our gross domestic product per capita is approximately $3,000. The capital island, Malé, is the smallest capital in the world: it is about 2km² and has a population of around 120,000—the majority of the Maldivian islands have fewer than 2,000 inhabitants. Malé is the industrial and financial hub of the country; it is protected by a sea wall that was donated by the people of Japan and which was one of the key reasons why Malé was spared in the recent Tsunami.

The critical issue for the Maldives is that it is a very flat country. The average elevation is less than 1.5m above sea level—floodling is now reported in many of the islands, coastal and beach erosion is commonplace and shortage of fresh water is a major issue. The Maldives contributes less than 0.001 per cent to greenhouse gas emissions worldwide, but the country will be the biggest victim of global warming if IPCC projections prove to be correct.

The next slide shows coral bleaching as a result of rising temperatures following the events of El Niño in 1997—we saw bleaching in many areas throughout the country. In the next photograph you can see houses on the islands that have been destroyed by flooding. The next picture shows the erosion of the beach—normally the beach flows nicely into the sea, but in this case all the sand is gone.

Our strategy is to lobby for a debate to take place before Copenhagen. We need help from the international community to develop the capacity of our people and transfer the technology to the
Maldives. As a relatively poor country, we need funding and financial assistance from the developed world.

The President of the Maldives announced this week that we will try to go carbon neutral within the next 10 years, and some of our resorts are already attempting that. There is an on-going focus on driving forward the international commitments. We have a national adaptation programme of action to try to protect the islands as much as we can, and we will introduce renewable energy to the Maldives, which will be one of my biggest tasks. We are seeking to cooperate with international research organisations and, as I mentioned earlier, we want the Maldives to be a research hub for scientists.

Climate change is a real threat to the very existence of our country. The Maldives needs international support to combat it, and we will continue to campaign to get a strong commitment from the international community in Copenhagen. We want to lead by example as much as we can by going carbon neutral within the next 10 years.

Thank you very much—we believe that, together, we can save this world.

The Presiding Officer: Thank you, Mr Moosa. I have spent many a long hour—as I am sure many others have—looking at pictures of those beautiful islands in holiday brochures, and I imagine that researchers will be queuing up to accept Mr Moosa’s invitation to create a research hub there.

Our final speaker, Dr Ian Burton, has unfortunately been delayed by a travel hitch. We will not lose his expertise, because we will hear from him this afternoon. We will go straight to the debate that would have followed his presentation—it will take the same form as the earlier debate, and will be expertly convened by Louise Batchelor.

12:15

Louise Batchelor: Thank you, Presiding Officer. We have two fantastic presentations to kick off our next debate, which will last approximately half an hour. I have loads of questions to ask, but I should not indulge myself; it is really back to you.

I am conscious that there are quite a few young people here this afternoon. We are joined by people from the Scottish Youth Parliament, the Children’s Parliament and Inverkeithing High School. I hope that you feel that you can participate—we would very much like to hear from you, especially as there was so much focus earlier on getting the message across to the younger generation. I suspect that, in many cases, it is the younger generation that needs to get the message across to us, but that is another matter.

I will throw out a few themes to explore. The first is the urgency with which action must be taken. We have just seen from the situation in the Maldives that climate change is already happening and that the situation is critical already. Are things happening fast enough to address it? The second issue is the new democracy in the Maldives. Is democracy the right model for tackling climate change? In this morning’s edition of The Scotsman, Dr Richard Dixon asks whether democracy is too weak a mechanism. It is difficult to persuade people in democracies to vote against their short-term gains—those are my words, not Dr Dixon’s. The third issue is carbon trading, which we talked about earlier. There is a whole issue about how the developed world can help the developing world.

Right—enough of me. We will hear first from Dr Dixon, as I have name-checked him.

Richard Dixon (WWF Scotland): Thanks for the mention.

Urgency is a key issue. That is brought home to us when we think about the first achievement of the Climate Change (Scotland) Bill, which is the setting of a target to reduce carbon emissions by at least 80 per cent by 2050. We can argue about whether the figure should be higher, but the target that is set in the bill is for a reduction of at least 80 per cent, so it could be more than that. Nevertheless, 2050 is so far away that we need a much clearer indication—which I hope that we will get from the minister this afternoon—that the Government is serious and that something is going to happen soon.

We have heard from all the international speakers so far that the Climate Change (Scotland) Bill is important in the process leading up to Copenhagen. What we need is early action. If we were back in the 1960s thinking of what would happen 42 years ahead, we might think that England would often win the world cup and—yes—that big cities would have trams. We would also think that computers would be huge things that took up whole floors of buildings but had nothing to do with us in our daily lives. Similarly, 2050 is so far away that, whatever we think about, we will get it absolutely wrong. The next 10 to 20 years is the timeframe in which we can put the right measures in place.

Alternatively, we can do the wrong things. If we build new coal-fired power stations that are around for 50 years, we will set ourselves on the road to disaster. If we make the decisions about investment in research now, and if we set the right early targets, we will set an example that the world needs. We are not just saying that we aspire to
meet a target in 2050; we are saying that we are serious about the task and that we will set ourselves on the right course not just from 2020—
which is what the bill does, sort of—but from next year, when the bill comes into force, with tough action being taken in each year. Most of us in the NGOs are calling for a reduction target of 3 per cent a year, which is also what the SNP manifesto called for. Such a target would send the message that, straight away—right from the first year—we are going to do something pretty tough to move things along.

Louise Batchelor: Thank you very much. As we have hinted, there will be more forensic examination of the bill this afternoon.

On the issue of urgent action, I ask Paul McAleavey whether there is a sense of urgency in Europe. You have come up with some fantastic ways of describing what must be done, such as the number of days’ worth of emissions that we have to cut per year. Are you getting a sense of urgency in Copenhagen?

Paul McAleavey: There is, indeed, a sense of urgency in the European Union—is my microphone switched on?

Louise Batchelor: It is switched on, but it is that one over there. Sorry—they are conspiring against you today.

Paul McAleavey: I am not used to sitting in the First Minister’s chair.

There is a sense of urgency in the European Union. The discussions are on-going—we all follow them in the newspapers. Difficulties have been experienced over the past couple of weeks in getting some countries—Poland has been mentioned in particular—to sign up to financing for adaptation measures. However, those problems have been the exception rather than the rule.

The European Union has had a high level of engagement. I spoke about the 20, 20, 20 by 2020 target. The European Union has said that, if other developed countries sign up, we will move the target to 30 per cent by 2020. There is a sense of urgency, although the precise final negotiating position for Copenhagen has been put back a little bit, until June. As delegates will probably know, the Prime Ministers will meet again in June to consider issues such as financing. I am sure that there will be lots of opinions in the chamber on whether the level of urgency is high enough.

Rob Gibson MSP (Scottish Parliament Transport, Infrastructure and Climate Change Committee): I am a Scottish National Party MSP for the Highlands and Islands and a member of the committee that is considering the Climate Change (Scotland) Bill. Louise Batchelor asked whether democracy can deliver. In Scotland, we are grappling with the idea that if we can engage people through the development of renewable energy systems—particularly in marine energy—that can take the lead in Europe, we can create jobs and people will understand the imperative of being involved in the climate change revolution. The paradox is that, although we want to do those things locally, we have so much that we can export. Therefore, we would buy into the European model of a supergrid.

I have a question for the panel. We are talking about building targets on the basis of statistics that take 18 months to appear. Can we find any way in which to achieve speedier analysis of the data and, if so, will that be shared around the world? Do people agree that accountants will have to learn to have a carbon balance sheet, as well as a monetary one?

Louise Batchelor: That is one for Paul McAleavey. Can the EU do the analysis and science any faster?

Paul McAleavey: The reason why it takes 18 months in the European Union is simply because some of the emissions data are based on formulas. For example, some of the data need to be calculated using estimates from agriculture. The member states have to verify those estimates before they pass them to the European level, otherwise they might not believe what we said back to them. A faster mechanism is available through the market. The emission trading scheme that has been established sends much quicker signals on emissions and the carbon price. We report on official data 18 months behind, but the market and some of the market institutions that deal with carbon trading make estimates that are, I would say, slightly less reliable but based on more recent market data. There might be scope for considering the way in which those two processes operate together.

Louise Batchelor: We keep being told that there are 100 months to save the world or before the tipping point happens. It would be good if we could all see on our computers or wherever a big screen showing us our emissions increasing, for example. I do not know whether that will ever happen, but it is not beyond the wit of humankind to come up with such a system. That is a rhetorical point.

Ahmed Moosa: I want to say something about how democracy can play a part. After I was appointed to my job on 11 March, I quickly asked the ministries to give me some of the reports that had been done on renewable energy and the adaptation that we need for the Maldives. I have a big pile of those reports, which, combined, cost a couple of million dollars. They were funded by the United Nations Development Programme, NGOs and even Governments and were produced over
the past 15 or 20 years, but no action had been taken on them. Maldivians have just removed a dictatorship after 30 years, during which there was no education on recycling or renewable energy. We are having to introduce that in the Maldives. The regime that was in place was not concerned about that. It was making noises—the Maldives hosted the first small island conference on sea level rises back in 1987, for example—but it was not doing enough.

Louise Batchelor: So a green benign dictatorship is not necessarily the answer.

Ahmed Moosa: Indeed.

Sagan Turner (Inverkeithing High School Energy Group): I would like to go back to the point about our being the next generation. My school, which is an eco-school, is doing particularly well. At the same time, however, many people in our school do not understand climate change. I have a friend who tells me that climate change does not exist. That makes me think that the children of parents who do not believe in climate change will not find out about it.

Admittedly, I watch a bit too much TV. I see the adverts about 2020, and the one with the recycled paper bag, which is pretty cool. However, not enough information is going out to the next generation to make them aware of the situation. Even in my school, which does very well and which has a large eco-school committee, there are still not enough people who are aware of what is happening. Thinking about the rest of the country, how are we going to get the next generation more aware of the situation and how they can contribute?

Louise Batchelor: Thank you—that was a superb contribution. At the same time that people hear about the campaigns and see the information about climate change, they also see adverts for cars and every electrical good under the sun. It is a real problem.

Liam Beattie (Scottish Youth Parliament): I would like to touch on the point that has just been made. Consulting young people is hugely important. By 2050, young people who are in primary schools today will be in this chamber, and I hope that they will be debating the positives that came out of the Climate Change (Scotland) Bill, if it gets passed. I dread to think that, in 2050, they will be picking up the pieces left by the previous generation, if we do not take action now and if the bill does not get passed.

I consulted my eco-schools group yesterday. For those who do not know, such groups are environmental committees. The eco-schools initiative is a Scottish initiative—I am not sure whether it is UK-wide. Of the very few people who were on the group, none knew about the Climate Change (Scotland) Bill. This world-leading bill is not well known among young people—or older people.

We need to raise awareness of global warming, whether through education or adverts, and we need to change people’s perceptions about climate change, including the idea that it is not happening or that it is not our responsibility but the Government’s responsibility. Everything possible that can be done needs to be done now.

Louise Batchelor: How many of your friends or contemporaries believe that climate change is happening and believe in the need for urgent action?

Liam Beattie: Young people especially are a bit more sceptical about climate change. They see it as something that is not our responsibility. Changing attitudes will take a while, but once they have changed, we will reap the benefits because of what can get done.

Alex Hill (Met Office): I will pick up on the points that have just been made. Those two kids are absolutely spot on. I talk to lots of groups and individuals, and our difficulty is not necessarily that the Climate Change (Scotland) Bill might not be successful—I think that it will be; it is an incredible piece of legislation. The biggest problem is persuading people, and the vast majority of people do not do enough and do not care enough. Our biggest problem is educating young people and adults—everyone who is involved in either generating or using energy. The problem includes our general lifestyle.

We need to start with a huge education programme and, frankly, we have failed to do that. As scientists, we have failed to do that—instead, we bicker about whether the level of CO₂ is going to be 550ppm or 525ppm, for example. We do not get across the fundamental science and the fundamental differences that climate change will make to the way in which we live our lives on this planet over the next century. We must start with that point.

As scientists, we must stop bickering about numbers and about whether doing this or that will help. We need to get across the basic message to as many people as is humanly possible. We need to become organised. To be frank, people of my generation need to apologise to people of later generations, because we started the mess. It is unfortunate that future generations will feel the impact, which they will have to do something about.

12:30

Louise Batchelor: I could not agree more—except for the point about education in schools. In
the schools that I have visited, the subject is on the curriculum and is being taught. However, people of our generation still drive our kids to school and back—my kids are a bit older than that now. Children are being told about climate change, but they see no adaptation as a result of it.

Stephen Blackmore: I agree with everything that has been said, especially by the school representatives, about the need for education. I will add an emphasis to that. Some people are in denial about climate change, but those who are aware of it include many people who think that we can do nothing. It is fundamentally important to convey the fact that our intelligent species knows many of the answers. We know what to do and what steps to take about climate change—it can be tackled—but I am afraid that I do not hear that being said often enough.

The danger is that the communications that we put out tend simply to frighten and alienate people. We need to make them aware of the problems and, alongside that, we need to provide the many solutions, some of which we have heard about today. The message of problem plus solution can motivate action.

Debbie Walker (Scottish Transport Studies Group): I am an atmospheric chemist—I am in the scientists’ camp. We talk a lot about the barriers to taking action and perhaps about democracy being one of those barriers. As a scientist, I am filled with horror that we are still debating the numbers and how readily and quickly we will be able to quantify the carbon saving of an action and see its impact on the inventory. To be frank, as a scientist, I do not really care. We know that introducing technologies that reduce our dependence on intensive and finite fossil fuel use is good not just from a carbon perspective, but for the economy and sustainability. Why are we focusing on the numbers game and debating whether the target should be 350ppm or 450ppm? We heard Paul McAleavey talk about cross-benefits. Such actions have multiple benefits—they are not just about carbon. Surely they make sense, so what are the barriers to taking action? We have talked about urgency. Yes—the need to set policy and targets is urgent, but the need to take action is far more urgent.

Louise Batchelor: I said at the beginning that I wanted to keep the debate on the big picture; Debbie Walker has done that beautifully for me.

John Riley: The big problem is that we see economic growth as more important than longer-term survival. That is crazy.

Alex Hill talked about education. We rely on TV for a substantial part of what we learn. I will put Louise Batchelor on the spot: how can we liaise with the media and particularly with TV companies on how they can assist us? Can we bring the media to forums such as today’s conference and ask how they can help us?

Louise Batchelor: The answer is that you must shout more loudly. People are shouting very loudly about the current financial recession, about what is or is not in their bank accounts and about what capitalism has done to them. Many people in the chamber believe in everything that we are saying but, believe it or not, the messages are not getting out loudly beyond this room. As I said, people are far more concerned about short-term interests. They are far more worried about what is happening to their money. I blame no one for that; I, too, am concerned. However, that is the message that is being heard loudly in newsrooms.

The only way that you will change that is by constantly logging on to the stories on the websites, not just of the BBC, which I have now left, but of all the other media organisations. Every time stories appear, put in your comments, write to those organisations and phone them, otherwise they ain’t going to get it because they hear a much louder noise coming from all sorts of other self-interest groups.

John Riley indicated disagreement.

Louise Batchelor: You are shaking your head—okay.

Daniel Leary (Natural Environment Research Council): I appreciate that I am running slightly counter to the more optimistic turn that the debate has taken. We have heard a lot about the challenges that are faced in meeting carbon budgets. We have also heard that tackling the situation that we are in will involve multiple methods and multiple approaches. On the back of that, I thought that it might be appropriate to mention geoengineering, which is probably best defined as environmental interventions that are designed to treat the symptoms of climate change rather than its causes, which is what carbon budgeting is all about. An example of geoengineering is iron fertilisation of the oceans to sequester carbon. Some geoengineering ideas are somewhat whacky, such as the one that involves sending mirrors into outer space to reflect the sun’s rays away from earth. If at all possible, I would be interested to get the panel’s views on whether we are at the stage at which use of such methods is necessary. Even if we are not, might it be a good idea at least to research such approaches?

Louise Batchelor: Are those not quite dangerous red herrings? I throw that point back to the panel. David Guggenheim takes a highly global view. What do you think about iron fertilisation of the oceans?
David Guggenheim: I am a few steps behind—I just wanted to talk to the students.

Louise Batchelor: Perhaps you could do that as well as responding to Daniel Leary's question.

David Guggenheim: Last Saturday, I was on a panel at the Explorers Club when a fourth grader—I think that he was the only kid in an audience of stuffy older explorers and famous people—stood up and asked me what he could do to help people in his school understand the problems of the oceans. I looked at him and I said, “You’re doing it.” People have a greater fear of public speaking than they do of death, but he had the courage to stand up and ask a question. To the students here I say, “You, too, are doing it.” That is extremely inspiring. You should never underestimate what your voice is capable of accomplishing. In many, if not all, cases, your peers and your schools will follow. A fifth grader whom I met in Georgia started a petition against the finning of sharks—the practice of cutting off their fins for shark fin soup—which made it all the way to Washington DC. We should never underestimate the power of a young voice in a democracy.

What was the other question?

Louise Batchelor: You have travelled so much that you are meeting yourself coming back the way—you cannot remember the question because of jetlag. The question was about what technical fixes we can use in the oceans. We have already discussed carbon sequestration and whether that is burial for good or a bit of a temporary fix.

David Guggenheim: I have read a lot about the storage of clathrates—those interesting structures that are able to hold their mass under high pressure—at the bottom of the ocean. I am convinced that, technologically, such a step is possible. On one level, it is disturbing that we always think of the oceans as the place where we dispose of stuff when we cannot figure out where else to dispose of it.

The big challenge with some of those technologies is the sheer amount of energy that would be involved in making them happen. Some of the Pacific canyons off the west coast of the United States would be ideal storage sites, but thousands of miles of pipelines would have to be built to transport the carbon dioxide there. Although such techniques can work in a laboratory, I have yet to see evidence that they can be scaled up to work in reality.

I have a problem with some of the other proposals. The fertilisation of the oceans through, for example, the use of iron in the nutrient-limited environments in the southern ocean would interfere with the natural cycle of primary production in the oceans. Although, again, the process might make a lot of sense in a test tube in a laboratory, it is another uncontrolled experiment on top of multiple uncontrolled experiments.

Louise Batchelor: I cannot believe that I said that those ideas might be red herrings. Forgive me.

To what extent is the European Union or the European Environment Agency looking at technical fixes to get us out of this mess?

Paul McAlavey: The EEA is not looking at technical fixes, for sure. On whether the EU is, I simply repeat the excellent point that was made earlier about the coincidence of the financial crisis happening with the climate crisis. We have an opportunity to ensure that a proportion of the stimulus packages is spent on some of the new technology that is being developed, and we have done some work to find out how much of those packages is being directed towards such investment.

Eddie Phillips (Go Greener): I represent Go Greener—we were called that before the Scottish Government came up with its go greener campaign, so I thank it for adopting our slogan. I want to talk about people’s attitudes, because I think that we are missing something.

I am holding a WWF document called, “Simple & painless? The limitations of spillover in environmental campaigning”. It contains a quote from the Cambridge physicist David McKay:

“Don’t be distracted by the myth that ‘every little helps’. If everyone does a little, we’ll achieve only a little.”

I will give a graphic example of that. When talking about the recent economic downturn, a relative of mine said, “Well, we’re just going to have to put our climate change stuff on hold until we get over this economic situation.” How wrong can you be? I believe that the Chinese character for “crisis” is two lines, one that means “danger” and another that means “opportunity”. That is what we are facing.

We know that the recycling market is jittery. However, I believe that that situation also contains opportunities. I would be interested to know people’s views on that. I do not believe that we should postpone our campaign; I believe that we should instead use the present economic situation to move the campaign up a gear.

Louise Batchelor: I agree. I heard an interviewer on “Newsnight”, of all programmes, asking, “Now that we have the financial crisis, aren’t environmental concerns a bit of a luxury?”

Mike Passway: On the point about iron fertilisation, you mentioned red herrings. According to the news this week, the problem is to do with red crustaceans. Iron salts were fed into
the ocean and the algae bloomed, as predicted, but it was then eaten by crustaceans. That is another geoengineering plan up the spout.

Louise Batchelor: Unintended consequences.

Somanath Narayan: On the urgency factor, I come from India and, when I get back home, I certainly want to speak to Government officials to persuade them to stop burning new coal and doing other things that contribute to emissions and to communicate to them the urgency of the situation. However, I need examples if I am to do that. The Climate Change (Scotland) Bill sets targets for 2020, which means that I will probably not get an appointment to sit down and talk to the ministers until 2025. Scotland needs to cut emissions now, so that I can persuade my ministers to start their efforts by 2015 or 2020 at the latest.

12:45

Louise Batchelor: Thank you for reminding us of that.

I want to throw the question back to someone from an NGO, so I am glad to see Richard Dixon’s hand up. I want to know why NGOs are failing to get the message across. Why are there still so many people who choose not to believe that climate change is happening or who believe that there is no point trying to do anything about it? I am sure that you will mention that you have quite a big action planned.

Richard Dixon: Indeed. I will start where we started off this session, with the question of democracy and whether it is too weak a tool to achieve anything. We all know that politicians will only go as far as they think that they public want them to go. If a small but vocal minority makes a fuss about something, politicians may well think that a majority of people hold that view. It is difficult for politicians to judge the mood of the public and work out how much they can do on any given issue and still get voted in at the next election—to use the simplest representation of a politician’s considerations.

Tomorrow night, we are holding our earth hour event. From 8.30 to 9.30 tomorrow night, people around the world will be switching off their lights. The lights of this building will go out, as will those of the Forth bridge and other buildings around Scotland. More than 100 million people will take part around the world, in 80 countries. The chief aim of the event is to show politicians that lots of people are concerned. They are only doing something simple—just switching off their lights—but they are sending a message to politicians, and politicians should understand that that gives them a mandate to go to Copenhagen, as leaders, and do something tough.

Louise Batchelor: You neatly ducked the hardest part of my three-part question. Why are NGOs such as WWF failing to get the message across to—I think—the majority of people?

Richard Dixon: Climate change is a challenge for people because, in their hearts, they know that it is a challenge to the way that they live. If you talk to people about recycling, it is easy to convince them to do a little bit of extra work, sort their refuse and put various things out on the right day—they can do that and feel that they have done their bit. Most people, however, know that if you talk to them about climate change, you are partly talking to them about not driving so much, driving a different sort of vehicle, insulating their home and doing stuff that they kind of know is right but do not really want to do themselves. If it is someone else’s car that is going to go away, that is fine—more space for their car. However, the self-denial aspect is a challenge to many people.

Why do we not get the message across in a big way? The car industry spends hundreds of millions of pounds advertising cars and we spend a tiny pittance sending out press releases that sometimes get in the papers and on television. We are quite up against it.

Louise Batchelor: As you say, doing something about it is a pain, basically.

I thank everyone for their contributions; I am looking forward to more debate this afternoon.

The Presiding Officer: I thank Louise Batchelor for so ably managing this lively and important debate. I am delighted to say that Dr Ian Burton has arrived. We welcome him to the chamber and look forward to hearing from him this afternoon.

I am genuinely sorry to be leaving the conference at this point, but I have to get back to my constituency. As I intimated earlier, one of my deputies will take over this afternoon.

I do not know whether “enjoyed” is the right word, but I have found today to be incredibly stimulating and—yes, it is the right word—enjoyable. I applaud everyone who has contributed so well to the morning sessions, and I am sure that the rest of the day will be a great success.

12:49

Meeting suspended.
Climate Change and Scotland

The Deputy Presiding Officer (Alasdair Morgan): Good afternoon, ladies and gentlemen. Welcome back. I hope that you enjoyed your lunch. I thank those who provided displays in the reception area—WWF, the Met Office, the European Environment Agency and the Tyndall centre for climate change research. I am Alasdair Morgan, the Deputy Presiding Officer and your chair for this afternoon. I hope that you are looking forward enthusiastically to the afternoon’s session.

We will move on to presentations with a different focus—the Climate Change (Scotland) Bill and how it will fit in with the international efforts that you discussed this morning. I invite Stewart Stevenson MSP to come to the well of the chamber. He has represented the Banff and Buchan constituency in the Parliament since he won a by-election in 2001. He was re-elected in 2003 and again in 2007, when he was appointed as the Minister for Transport, Infrastructure and Climate Change.

The Minister for Transport, Infrastructure and Climate Change (Stewart Stevenson): I thank Patrick Harvie and the other members of the Transport, Infrastructure and Climate Change Committee for inviting me to speak at this event. In my role as the Minister for Transport, Infrastructure and Climate Change, I have regular contact with the committee on a wide range of issues. The challenge of climate change remains a key priority in our discussions, particularly as the Climate Change (Scotland) Bill is passing through Parliament. I hope that this morning was useful and informative. We have an impressive range of participants, especially those who have travelled far to be with us from Canada, Bangladesh, Tanzania, India, Nepal, Indonesia and the United States.

As you know, the global impact of climate change is an enormously wide subject with many uncertainties and unknowns. In recent years, the science behind the subject has made it fairly clear that periods of dramatic change are likely. At a climate change summit that was held in Copenhagen earlier this month, scientists suggested that sea levels could increase by more than 1m by the end of the century. The latest projections are much more dramatic than previous estimates and mean that around 10 per cent of the world’s population—some 600 million people—would be in danger of being flooded. As well as sea level rises, many areas of the world face more extreme storms, floods and droughts. They also face worse shortages of food, water and energy, with the associated health risks.

Climate change impacts are not just events to worry about in the future; they are with us now. Already, some of the poorest people in the world, who are least responsible for the changes, are paying the price. The key message from the Copenhagen summit was that there is no excuse for inaction. One of the Government’s key aims is to ensure that that mantra is adopted throughout Scotland by all of us who can make a difference—and that means every single one of us. It is an issue not just for the Government, for public bodies or for business; all of us, as individuals, have an important contribution to make.

In Scotland, as in the rest of the world, a twin-track approach is needed. We need to limit, by whatever means possible, the emissions that we produce. Our climate is already changing, and emissions have a delayed impact. Even if we stopped all our emissions immediately, global warming would continue for decades to come. This is not about preventing climate change—it is already too late for that; it is about trying to limit its worst effects. As well as reducing emissions, we must adapt to the changes that we experience. Summers in Scotland will be warmer and drier; winters will probably be wetter and stormier. Sea levels will rise and we will probably have more flooding and more landslides.

As organisations make their plans for the future, they need to plan for life in this different world. Some existing infrastructure—roads, harbours, water treatment plants, housing—might not be right in a changed climate. Of course, adaptation plans have to work in a low-carbon economy too. Good planning now can save pain later.

This year is a crucial one in global climate change. The global economic downturn should not and must not deflect us or the rest of the world from the pressing need to reduce emissions. We need to take stock of the situation and demonstrate that green economic revival is possible. Achieving sustainable economic growth remains our key purpose in the Scottish Government. The move towards a low-carbon economy is a significant economic opportunity for Scotland and one that we have to embed firmly in our policy processes.

At the end of this year, a crucial UN climate change conference will take place in Copenhagen. It marks the end point of a two-year negotiating process under the Bali road map and will, the world hopes, produce a successor to the Kyoto protocol. I was pleased to attend the Poznań UN conference in December, which was a key milestone in the process. Speaking to other states and regions from around the world, I took the opportunity to showcase developments in
Scotland as a model of international excellence and, of course, to learn from others.

Many of you here today might have seen already the latest climate change film, “The Age of Stupid”, which is set in 2055. The film challenges many aspects of our consumer lifestyles, but the overriding message is: why did we not stop climate change when we could? This year is a critical turning point in the bid to avoid that question being asked in years to come.

Although Scotland is a small country with just 5 million people, we currently emit around one seven hundredth—0.15 per cent—of the world’s global CO2. If everyone in the world lived like the Scots, we would need three planets to support us. In other words, it can take just a few days for the average Scot to produce as much CO2 as someone living in a developing country would produce in an entire year.

Scottish ministers are committed to a Scotland at the forefront of global efforts to reduce greenhouse gas emissions. From the outset, the Scottish Government has taken its responsibilities on climate change very seriously indeed. We realise the long-term significance of decisions that are made now and the moral obligation that we have to take action. We are working with the UK Government to help it to influence the European Union and the United Nations to make firm and ambitious commitments to protect the world’s climate and safeguard future generations, particularly those in developing countries, who will be most impacted. We are also working in partnership with the UK Government and other devolved Administrations to deliver the targets in the UK Climate Change Act 2008, which became law at the end of last year. We welcomed the first report of the Committee on Climate Change in December 2008 and have submitted our views on the appropriate level of carbon budgets and associated issues to the Secretary of State for Energy and Climate Change in advance of his announcement alongside the Chancellor of the Exchequer’s budget on 22 April. It is a seminal report that emphasises the challenge ahead but, importantly, makes it clear that it is a challenge that can and must be met.

One of the Government’s goals is to address together the health of the economy and the environment. “The Government Economic Strategy” sets out our core purpose of sustainable economic growth. Central to that purpose are the sustainability targets to reduce emissions by 2011, based on 2005 levels, and by 80 per cent by 2050.

Scottish people are already quite well informed about climate change. A survey of more than 3,000 people living in Scotland was carried out on our behalf last year. I am pleased to say that only 1 per cent of respondents had never heard of climate change, while 43 per cent said that they knew a fair amount about it. The majority of respondents—57 per cent—said that climate change is an immediate and urgent problem, although about a fifth—22 per cent—seemed to think that it is more of a problem for the future. Respondents were also asked whether they agreed with this statement:

“It’s not worth Scotland trying to combat climate change because other countries will just cancel out what we do”.

I am pleased to say that two thirds of those who were surveyed disagreed with that statement. Although we have to improve our environmental behaviours in Scotland, I am confident that the people of Scotland are primed for action to tackle climate change.

The passage of the Climate Change (Scotland) Bill will result in Scotland having a world-leading statutory framework to underpin action on climate change. The measures in the bill will put Scotland at the forefront of international action to tackle climate change. In our target of an 80 per cent reduction in emissions by 2050, we will include all the Kyoto greenhouse gases as well as emissions from international aviation and shipping. We will be the first country to do so. To ensure that there is progress and accountability, we have built into the bill a credible framework of annual targets and strong reporting requirements.

I am pleased to say that the first stage of evidence taking on the bill was completed earlier this month. My ministerial colleagues and I are grateful to all those who have taken time to present their views on our bill. All being well, we aim to achieve royal assent later in 2009. For my part, I recently gave evidence to the Transport, Infrastructure and Climate Change Committee on a number of issues that were raised during stage 1 of the bill. In response to strong opinion that was voiced at that stage, and in light of the developing scientific understanding, we have decided to have an interim target for 2020 rather than, as the bill proposes, for 2030. The level of the target will be informed by a number of considerations including the first report of the UK Committee on Climate Change, which I mentioned earlier, and the carbon emissions budgets that the UK Government adopts under the UK act. I hope that that demonstrates both our commitment to the need for early action and our recognition of the desire for greater certainty about the early years of Scotland’s emissions reduction trajectory.

We are only too aware that setting the targets is the easy bit. Achieving them will require enormous effort, co-operation and perseverance. Every sector will have to play a part, and each individual will find individual challenges. An initial overview of measures that could contribute to an 80 per cent reduction was carried out on our behalf and was
published in November. We are now working to produce a discussion document for publication later this year, which will set out the key areas for carbon savings and the work that needs to be done to deliver those in the short, medium and long term to meet our interim and 2050 targets.

The ministerial team fully accepts the Stern report’s conclusion that the cost of inaction on climate change far outweighs the cost of action. I may be the only minister with “climate change” in my job title, but every minister has to be a climate change minister. Projects to tackle climate change are underway in many sectors, including energy, transport, business, the public sector and housing. We are not waiting for the legislation to be in place before we take action to reduce emissions. We have already announced the £10 million saltire prize to encourage innovation in marine renewables in Scotland and around the world. We are pleased to have the National Geographic Society as our worldwide partner in that prize. Since the Government came into power, we have approved 20 large-scale renewable energy schemes, including the largest consented wind farm in Europe and one of the world’s largest wave energy developments. We have surpassed the landmark of 3GW of renewables capacity. That is enough to power 1.5 million homes with clean, green energy.

We have also made significant investment in public transport infrastructure to tackle congestion and reduce emissions. We have launched a new sustainable travel programme called smarter choices, smarter places, and £15 million has been made available for seven demonstrator projects in communities throughout Scotland, from Dumfries to Kirkwall.

14:15

We have encouraged a number of key Scottish businesses to share knowledge and good practice by supporting the May day network. We have planned for the introduction of the carbon reduction commitment for commercial and public sector organisations, to extend trading of carbon emissions, and have announced proposals for the first stage of an ambitious area-based home insulation scheme, supported by £15 million of new Government funding, plus £15 million of match funding from other sources. The scheme is currently being developed, and we hope to launch it in the autumn.

To inform future decision making, we have made a commitment to assess the carbon impact of Government expenditure. We believe that there are few parallels to our approach. Although it presents considerable challenges, we will continue to work towards the development of methods that will help us to achieve our goal of reducing emissions that are associated with the Government’s expenditure each year of more than £30 billion.

In addition, we recognise the enormous value of community involvement in seeking solutions to climate change. To support activity on a community level, we have allocated £27.4 million to the climate challenge fund. I am extremely encouraged by the scope and innovation of the applications that we have received. Work is underway in the area.

In conclusion, Scottish ministers are committed to Scotland being at the forefront of efforts to reduce emissions. We can take a measure of reassurance from our knowledge that collective international action works. We must be clear that the task that we have set ourselves is achievable. We can and, no doubt, will continue to debate the difficulties that we face in seeking to achieve our goal. However, despite the scale of the challenge, our underpinning mindset must be that international co-operation can deliver the global action that is required to limit the effects of climate change for the sake of future generations, be they in the developing world or here at home in Scotland.

The Deputy Presiding Officer: The next presentation is by Simon Pepper. In 2000, Mr Pepper was awarded the OBE for services to sustainable development. He was the director of WWF Scotland for 20 years—until 2005—and served as an external appointee on the Cabinet sub-committee on sustainable Scotland. He is now freelance, but he has a special interest in promoting change in climate behaviour. He is chair of the Scottish Government’s climate challenge fund panel.

Simon Pepper (Independent Climate Change Consultant): I start by thanking the Transport, Infrastructure and Climate Change Committee for its efforts in organising today’s debate. I also thank this morning’s contributors, especially those from other countries, who have given us a colourful insight into the dilemma that developing countries face.

As we all know by now, there is no question but that climate change threatens us here in Scotland, directly and indirectly, through its economic and other impacts. I hope that the case has been made that we should act in our own interests. However, I want to take a wider perspective, as the moral case globally should underpin our attitude to the issue. Poorer countries, especially in southern climes, are hit by a double injustice. They are least responsible for climate change—as we have heard—and they are hardest hit by its effects.
The facts are well known and well rehearsed. Let us not beat about the bush. It is confidently predicted that a temperature rise of more than 2°C would cause death and destruction on a massive scale, especially in poorer countries, not to mention indirect impacts on the whole world from the resulting disruption of economies and huge populations moving about. That would be a human catastrophe. In fact, “atrocity” might be a better word to use, given what we know about the scale of climate change and its human cause. We are in danger of witnessing a largely avoidable crisis, catastrophe or atrocity that has been caused by the greed and negligence of a large—but not very large—sector of the world’s population.

We know that the tipping point of a 2°C temperature rise, which will probably trigger that sequence of events, is expected to be reached in the next few decades, unless the whole world acts quickly and sufficiently to turn round emissions by about 2015. We know that we in the rich world are the most responsible for that state of affairs. In the past, we could claim to be the unwitting cause of the problem, but not now. In relatively recent years and months, the situation has changed critically. Climate change and its causes are now acknowledged facts that are beyond sensible dispute. It is interesting that one could not have said that even a year or two ago.

In 2009, we are poised at a significant moment in the world’s history. From now on, we all know where we stand and how the future will judge us. We have our responsibilities to fulfil. We know that if we kid ourselves that that would be too difficult, fail to take appropriate remedial action and continue to make matters worse, we must accept that we are taking an informed and active part in this outrage against the great mass of humanity, whose lives will be disrupted and destroyed.

Sure, other countries are implicated too, but we in Scotland have a triple duty to act, apart from our well-rehearsed economic interest in doing so and the various benefits for our health and wellbeing that were mentioned this morning. First, our part of this global problem is our responsibility. China’s part is China’s responsibility—let us not be distracted by that. The example that we heard this morning from the Maldives, whose population is one 10th that of Scotland, was dramatic. The Maldives is not waiting for others to commit to a zero-carbon future—it is getting on with that and committing itself to that target now. Secondly, ours is a disproportionately large part of the problem, because our per capita emissions are among the highest in the world. Thirdly, we aspire—rightly—to global leadership.

We have a clear choice that we can take. Do we take the necessary action to remove ourselves unambiguously from any complicity in the catastrophe, or do we dither, delay, devise excuses and do less than is necessary? I stress that I see a compelling and overriding moral imperative that we must acknowledge and cannot dodge.

I congratulate the Minister for Transport, Infrastructure and Climate Change and the Scottish Government on the Climate Change (Scotland) Bill’s content, which has been recognised as potentially world leading, as the minister said. The setting of a target for 2050 and an interim target is the most important feature of the bill’s approach, because it allows Parliament to elevate decisions about the target above the inevitable policy debate that will continue for ever about how we reach the target from year to year. It is also commendable—I endorse what the minister said—that the bill covers all the greenhouse gases and international aviation and shipping. The bill is the first legislative proposal so to do.

I also congratulate the minister on his emphasis on the scientific basis of targets. He has been correct repeatedly to stress in submissions to the Transport, Infrastructure and Climate Change Committee that targets will be determined objectively in response to scientific advice and not to short-term political considerations. We should all round on any political party that seeks to secure reduced targets for electoral advantage.

That said, I hope that the debate will explore some key points about the bill, to put a bit more flesh on those broad commitments. I will touch on five topics that others might want to pick up on. The first is whether the bill commits us to enough. The world needs leadership, so to aspire to be the best in the world is a good start, but if being the best in the world does not guarantee that the job gets done, it is not enough. The test is whether, if everyone followed us—which is what people do to leaders—the climate crisis would be resolved. Currently, the answer, sadly, is no. Recently, Lord Stern summed up the serious concerns that the climate is changing much more quickly than expected and that the world is responding much more slowly than expected, so the need for remedial action is multiplying. The commitments in the bill, especially in the period up to 2020, for which we have no targets as yet, are not sufficient. My first question is whether the bill is ambitious enough.

My second point is on whether the targets will really be driven by the science, as we understand the commitment is. Despite the minister’s assurances that that is the case, the argument tends to creep in from Government that certain challenging targets would not be achievable. We must be very careful about that, because it is a sign that expediency, not science, is starting to influence our choice of targets. Does that
argument mean that we cannot meet the targets without discomfort or economic disadvantage? If so, it is difficult to see how we square that with the known implications of failure to tackle climate change for hundreds of millions of people in the world. Is that what we mean by leadership? I do not think so. We cannot ignore the plight of two thirds of the world’s population because of relatively minor discomfort that we might have to suffer. Any pain that we feel would be very small compared with the misery that climate change is sure to inflict on hundreds of millions or perhaps billions of others. Therefore, my second question is whether we have a cast-iron guarantee that the targets will be set on a scientific basis, leaving aside political considerations.

My third question is whether the bill requires change soon enough, which is another dimension of the story. Will the bill deliver our share of the necessary net emissions cuts to avoid a 2°C rise and the tipping point? At present, the bill commits the current Administration to little if anything beyond what it is doing already—the current score is a mere 1.3 per cent reduction per annum. An interim target in 2020 is welcome news; a world-leading number on that target would be even better news, if it were science driven. That target should drive demanding annual targets up to 2020, starting now.

The Tyndall centre for climate change research recommends 6 to 9 per cent per annum cuts from now, which makes the current figure of 1.3 per cent look, frankly, pathetic, although it complies with the bill as it stands. I wonder why the minister is waiting to request advice on which to base the 2020 target and annual reductions up to that date. The Government does not need legislation to set its targets now, which we understood from its manifesto it planned to do. Time is of the essence. Clear signals are needed sooner rather than later and delays in setting the targets or getting on with achieving them merely add to the burden for future Administrations and generations. My third question is whether the bill demands, and commits us to, action soon enough.

My fourth point is on whether we are measuring the right thing. We could cut the emissions that we produce here in Scotland and still make no difference at all to climate change if we simply import our needs from other countries. Whatever half-measures the international community is signed up to, surely, if we aspire to leadership in Scotland, we must measure and report at least the level of emissions for which our consumption is responsible, wherever in the world the emissions take place. We must also limit access to carbon credits as a way of avoiding more direct responsibility for our emissions. Thirdly, we need to set and measure cumulative budgets for our emissions so that we can see the whole picture of what our contribution will be between now and 2050. That is the fourth question, about measuring the right thing.

14:30

Lastly, I want to ask what is to fear. My feeling is that the Government is seriously underestimating the galvanising effect of leadership in setting targets early, even if those targets turn out to have been too ambitious. Once those targets are set, we will know where we are heading. The current situation—which a lot of people in the chamber would describe as a sort of paralysis, in which there is a great sense of urgency and a clamour for change but that change is not happening—arises from the fact that we have not yet set the targets. Once we have set them, we will be off and will know where we are going. That will get people moving.

The Scottish Government’s projections for the possibilities of early change are very timid. Okay, macro projects—the big investments—often take up to a decade to mobilise. However, the people can be mobilised surprisingly quickly with the right leadership and all the people together—all 5 million of us—can make a big difference both as individuals and as communities. For much of the population, a 10 per cent reduction is not difficult at all. Those of us who have tried it can testify to that.

The climate challenge fund applications that I see give a very encouraging insight into the remarkably ambitious, creative and enthusiastic willingness of communities throughout the country to respond with effective action. However, they need leadership and key milestone targets to sustain their belief in the possibilities of a better world—a happier, healthier, safer, greener world in which enlightened Scotland is a beacon to the international community.

The part that NGOs have to play in that was mentioned this morning. NGOs are straining themselves to mobilise the public mandate, but because of the sense of paralysis without targets, it is difficult for them to do so. No imperative is appearing from the top to drive people on. Tomorrow’s earth hour, which has been organised by WWF, will be one more sign of the growing public clamour for a strong lead and a strong bill.

Those are the five questions that I want to ask. Are we talking about doing enough? Is it science driven? Are we doing it soon enough? Are we measuring the right thing? What is to fear about ambitious, early, strong targets? I am sure that those and other points will be raised by others during the debate. My main point is that we should not distract ourselves with the failings of other countries; we should do what is morally necessary
to fulfil our responsibilities to the future. Our claim of leadership demands no less than that.

First, we should set ourselves targets that are based not on what is easy or on what is influenced by what is easy, nor on what others are doing although we hope that they will follow, but only on what the science says is necessary to prevent the worst effects of climate change. That is the overriding moral imperative, and leadership of that kind would resonate powerfully around the world. How we will meet those targets and how we will minimise the effect of the targets on our own people are important but secondary considerations. We can move much more decisively into a discussion about the how as soon as we know more clearly what we are aiming to do.

We must grasp the nettle soon and set appropriate targets that are as challenging as necessary. Let it never be said that we failed to act in a timely and sufficient way when we knew what was needed; let us not be guilty of negligent inaction in the face of such a dire crisis for the world.

Scotland’s international reputation has a lot to gain and a lot to lose. The genie is out of the bottle; we claim leadership. I hesitate to refer to our track record as a footballing nation, especially in advance of tomorrow’s game but, as far as such claims are concerned, there is an ominous precedent in the world cup of 1978. Those who can remember the disastrous vainglory of Ally McLeod and his ill-fated approach to leadership in that challenge will understand what I mean when I say that Scotland does not need claims of world leadership full of sound and fury but, in the end, signifying nothing. At this time and in this field of play, the stakes are much too high.

The Deputy Presiding Officer: Thank you, Mr Pepper.

As you know, Dr Ian Burton was not able to deliver his presentation this morning. I am glad to say that he has joined us and I invite him into the well of the chamber.

Dr Burton is a scientist emeritus with the adaptation and impacts research division of the Meteorological Service of Canada; professor emeritus at the University of Toronto; co-chair of the Ontario expert advisory panel on climate change adaptation; co-chair of the World Bank expert group on the pilot programme for climate resilience; and a visiting fellow at the International Institute for Environment and Development in London. I am not sure whether there is something about the environment that generates jobs with very long titles, but Dr Burton is nevertheless very much welcome.

Ian Burton (Meteorological Service of Canada): Thank you very much. It is a great pleasure to be here and I apologise for not being present for this morning’s presentations and discussions. I was on my way from an IPCC meeting in Oslo, but got diverted by airline problems. The IPCC—the Intergovernmental Panel on Climate Change, that is, not the independent police complaints commission—is preparing a new report for the international community on the effect of climate extremes in the creation of natural disasters.

I have been asked to give a view from Canada on climate change impacts and adaptation. I should point out that a view from Canada is exactly that: it is not the view from Canada and I am not speaking on behalf of anyone else. The question that I want to examine is whether we are doing enough about adaptation and whether what we are doing is being done in the right way. I apologise that, because of my late arrival, my presentation is something of a throwback to this morning’s discussion.

Most of my remarks are based on a study completed in Canada in 2007 called “From Impacts to Adaptation: Canada in a Changing Climate 2007”, which makes a thorough national assessment of the kinds of impacts that are now being experienced; contains some detail on the impacts that we might experience in the future; and takes a gentle tiptoe into the area of adaptation, movement towards which, although happening, is not as aggressive as it might be.

The report proposes a balanced response to climate change. There should be an appropriate amount of mitigation; in other words, we should try to reduce emissions to halt or prevent climate change. Such an approach ranges from using more energy efficient light bulbs to the long-awaited cap and trade programme, which is on its way. Adaptation, on the other hand, relates to the impact on climate change of small activities such as water conservation and whole-sector approaches such as integrated water strategies.

The goals of what was the first large-scale national assessment since the completion in 1997 of the “Canada Country Study: Climate Impacts and Adaptation” were to highlight advances made in our understanding of vulnerability and to provide a knowledge platform for what we hope will be the next stages in the process.

With regard to the nature and distribution of climate change in Canada, the globe on the slide that is being displayed illustrates changes in annual mean temperature in degrees centigrade between 1995 and 2005. As you can see, northern Canada is experiencing a dramatic amount of change, particularly in the McKenzie basin in the north west, where the change in temperature is
already having a significant impact on the environment and Inuit native people’s lifestyles.

The next slide shows a number of little illustrations of the kinds of impacts that are being observed and measured. These represent only a small sample; there are many more. One might wonder, for example, why the pine beetle infestation in the boreal forest of northern British Columbia does not appear on this pictomap. The explosion of the pine beetle population and its subsequent killing off of the boreal forest, which is likely to affect the whole boreal belt from western to eastern Canada, is at least partly attributable to climate change, because the milder winters that the boreal forests have been experiencing—which are part of the general warming trend—have contributed in large part to the over-season survival of the beetles and the growth in their population.

In addition to these various observed trends and impacts, there has been a series of extreme disasters and catastrophic events. The next slide outlines four in particular: an ice storm; a set of wildfires; the tail-end of a Caribbean hurricane in the maritime provinces; and floods in the Saguenay region of Québec.

I have summed up why we must take a more serious approach to adaptation nationally and globally than we have done thus far in what I call the adaptation imperative. The lines plotted on the graph on the left-hand side of the slide set out the resident IPCC emission scenarios. They are a little bit out of date, and it is widely recognised that they are conservative—or, if you like, optimistic—in the amount of emissions that they expect to be produced. According to the most optimistic scenario, which is represented by the green line, global emissions will peak between 2040 and 2050. As the graph on the other side shows, if the peak were to be delayed for so long, global surface warming would continue well beyond the end of this century. As I say, those scenarios are now widely considered to be too optimistic.

As well as the adaptation imperative, there is what I like to call the adaptation deficit. I do not have the latest figures but in the period from 1950 to 2006 there has been a rapid rise of global total figures for insured and uninsured disaster losses. A lot of those losses have occurred in the developed world, with perhaps proportionally higher losses in the developing world. That shows that, despite the fact that, to date, we have not experienced as much climate change as we are about to, we have not been doing a very good job of managing our control and adaptation of and our response to weather disasters. Losses are already going up and, given where we ought to be, we are already facing a deficit in adaptation.

Adaptation has so far been relatively neglected during the climate change negotiations—although that is changing—due to three myths. First, it has been said that it is a local and regional, and environmental, problem, and that we do not need to be concerned with it as a matter for international co-operation and development. That is not correct—adaptation is global and strategic and multisectoral. The types of disturbances that will occur in many parts of the world as a result of climate change will create problems and raise issues that go well beyond national boundaries.

Secondly, there is an idea that adaptation is antithetical to mitigation: that if one talks about adaptation, one is not serious about reducing greenhouse gas emissions. That is a myth, as the better we understand adaptation requirements, the stronger the case will be for mitigation. The third myth is that adaptation is defeatist. It is not, and if we do it properly, we will help to build social resilience.

I will comment briefly on Ontario. Canada is a federal state and a lot of the provinces are taking their own initiatives in adaptation. In Ontario, for example, a climate change secretariat that is mostly concerned with mitigation has been established in the premier’s office. We have also established an Ontario expert panel on climate change, which is discussing the issues with ministries and leading them to take climate change adaptation into account in their practices and policies in areas across the board, including water, natural resources and ecosystems, infrastructure, energy, agriculture, health, emergency management, education and others.

The panel is helping Ontario to develop a long-term strategy for adaptation; enhancing the capacity of ministries to take adaptation into account in their programmes and policies; working with communities and stakeholders to bring them into the adaptation movement; and developing tools, incentives and regulations.

It has recently produced a guidebook on adaptation to climate change for Canadian communities, which is intended primarily for use at a municipal level. It is interesting because it does not simply address adaptation—although that is its main burden—but says that communities ought to be thinking, planning and developing their future to contribute to the mitigation effort and to contribute to adaptation in the context of a sustainable future.

The final slide shows the websites that give further information on the subject. I thank you for your attention—it is a pleasure to be here.

The Deputy Presiding Officer: Thank you, Dr Burton.
I welcome our final speaker: Professor Don Brown, from the United States. He is associate professor in environmental ethics, science and law at Penn State University, where he is currently teaching an interdisciplinary course on climate change and sustainable development and acting as programme director of the collaborative programme on the ethical dimensions of climate change.

**Donald Brown (Penn State University):** I am delighted to be here, and I thank the Scottish Parliament. I have been working on climate change for about 25 years, and I learn something new at every meeting I go to, which I find valuable—I have met many colleagues here today.

I congratulate the Scottish Parliament on its work. Listening to Stewart Stevenson, I know that I do not have to tell him some of the things that are in my presentation. Listening to Mr Pepper, too, I know that he is not the identified office for my comments, as he already gets what I am about to say.

I will reflect on the ethical and moral dimensions of climate change, on which I want to encourage us all to turn up the volume. Some people get the significance of Al Gore’s claim—which he made three times in his movie—that climate change is a moral issue, but many do not. I will argue that climate change is not only a moral issue, but that it raises multiple civilisation-challenging moral and ethical issues.

There are things about the global scale of these problems that call out for an understanding that climate change is a moral and ethical issue. First, what people do in one part of the world can dramatically hurt people in other parts of the world—the slide shows the first human example of that in a very dramatic way. Secondly, the harm that people can cause to others in that way is potentially catastrophic. Thirdly, climate change is already happening. The chart that you can see on the slide was produced as part of work at the centre for health and the global environment at Harvard Medical School—it identifies the deaths that are already being caused by climate change. We heard a number of examples of such deaths earlier today. Fourthly, although Governments understand their mission as to protect national interests and those in one part of the world have no jurisdiction in or responsibility for other parts of the world, climate change affects other people. No national strategy—not even the Scottish national strategy—makes sense unless it is part of a global solution to a global problem. Countries cannot consider only their national interests.

We have to turn up the volume on climate change as a moral issue, at least in my country. As the economy slows down, people are saying, “It’s not in our national interest to take on climate change at this particular moment.” If climate change is an ethical issue, we have obligations, duties and responsibilities, and excuses for not taking action are not justifiable. The idea that it is not in a country’s national interest to do something does not wash if climate change is viewed as a moral obligation. The notion that climate change is a moral and ethical issue connotes that we do things not because of self-interest, but because of responsibility.

Framing the issue as moral does not necessarily mean that we will get consensus on what morality requires. As you know, some people look to religion for their truth in terms of their moral responsibilities, whereas in secular societies we look to a variety of ethical systems, utilitarianism and rights theories. Environmental ethics is about a misplaced focus—in my view—on differences between meta-ethical theories, because when it comes to policy, nothing turns on those distinctions. I will have to explain that claim to you at another time.

The point about climate change is that, even though we may have different ethical starting points, our analysis indicates that on many of the major policy issues on which climate change requires us to focus there is an overlapping consensus. In other words, it makes no difference that, in relation to some of the major moral and ethical issues that climate change raises, we may have individually different moral and ethical positions that dictate our responsibilities to us on a day-to-day basis. No ethical system would condone the status quo behaviour on climate change.

I wrote a book on the United States’ behaviour on climate change. The US used three excuses for 20 years: scientific uncertainty; the cost to the United States alone, interestingly enough; and the idea that we did not have to do anything because the rest of the world was not doing anything. Mr Pepper hit eloquently on the reason why that final excuse does not wash as a moral or ethical excuse.

The fact that we have different ethical starting points does not mean that we may not agree on what ethics and morality require. More important, ethics knocks all the outliers out, even if there is a difference of opinion on the allocation question, to which I will refer in a moment. Some of the positions that have been taken on international allocation would, in our view, satisfy no ethical or moral theory.

Framing something as an ethical issue works in the real world for many public policy issues. That is critically important because most of the debate in the United States is framed by scientific and economic discourses that pretend to be ethically
and value neutral, but which obscure ethical and moral questions.

The next slide has a list of religious institutions in the United States that now take the position that climate change raises ethical and moral issues. I run a programme at Penn State University in which we work with applied ethics institutes around the world. We are always looking for collaborators because our mission is to turn up the volume on the ethical and moral dimensions of climate change. We have been in existence for about three or four years and have been trying to identify the major ethical issues that climate change raises. I will end by talking about two of them in a bit of detail.

The more we look at climate change, the more we see issues crying out to be understood as moral and ethical. In our "White paper on the Ethical Dimensions of Climate Change", we identified civilisation-challenging moral and ethical issues. The first refers to what is called the stabilisation question: at what level do we try to stabilise carbon dioxide in the atmosphere? No national strategy, including the Scottish national strategy, makes sense unless it takes a position on the stabilisation question. As you will undoubtedly know, carbon dioxide in the atmosphere is already at 380 parts per million and it looks like it may be too late to stabilise it at 450ppm. The IPCC has talked about having 900 to 1,000ppm under the most pessimistic climate change scenarios.

It would be a civilisation-challenging problem by itself to try to figure out how to meet energy demands, given different possible stabilisation levels. The next slide has a graph that shows different curves. The bottom curve is for 350ppm, the next is for 450ppm and the next for 550ppm. People do not get the scale of the problem, because it would take a civilisation u-turn to stabilise at 450ppm. To make matters worse, the atmosphere is like a bathtub into which different people put different amounts. However, slowing down the tap water will not solve the problem. We must cut emissions way back. Every country would probably have to cut carbon emissions to under 2 gigatonnes per year to stabilise carbon dioxide levels.

We talked about the 2°C rise in temperature, but we did not talk about how incredibly difficult it will be to prevent that. Because of what is called climate sensitivity there is significant uncertainty about how much warming we will get with different levels of greenhouse gases in the atmosphere—we hear of figures from 2°C to 4.5°C. Time does not allow me to explain all the information on the next graph, but the middle curve shows the probability of exceeding a 2°C rise in temperature if we try to stabilise carbon dioxide in the atmosphere at 450ppm. Even at that level, there is a 45 to 66 per cent chance that we will overshoot the 2°C rise. At 550ppm, and assuming that the IPCC’s distribution for climate sensitivity is correct, it is virtually certain that we will exceed 2°C. The point is that all this is a moral issue. Scotland, Pennsylvania and the United States, for example, must take a position on not only targets but how they relate to the concentration levels of carbon dioxide in the atmosphere. Mr Pepper said that there is no need to be conservative about initial targets. I would argue that any target must be considered in the context of the position that is taken on the stabilisation question. We know that many parts of the world, such as Africa, are particularly vulnerable to a 2°C rise in temperature. For example, a 2°C rise will mean that Uganda can no longer grow coffee. We are probably at the tipping point of melting the Greenland and west Antarctic ice sheets, and Africa is particularly vulnerable to rises in sea levels.

15:00

The models disagree about the effects in different parts of the world, but they all agree that some parts of the world will get a lot drier. Many of those places are already getting drier. There is great human suffering—it would tear your heart out—in parts of Africa that are already getting drier where the models predict that they will.

So the first issue is: what is our position on the stabilisation question? That is a deeply moral question. The significance of its being a moral question is that we cannot simply look to our own interests to solve it. We need to understand that we have duties and responsibilities.

The last issue that I want to talk about is the allocation question. Now that we know that the world can accept only 2 to 3 billion tons of carbon per year if we want to stabilise greenhouse gas levels, how do we divide up those 2 to 3 billion tons? That is a huge, civilisation-challenging, moral issue. The next slide, which shows what parts of the world are emitting greenhouse gases and what parts are vulnerable, reveals an amazing disaggregation between harms and benefits.

There could be no more obvious moral and ethical question than what each country’s fair share of the global target should be. The map in the following slide, which is labelled "United States of Climate Change", shows that, unfortunately, the entire emissions from India are equivalent to those of only two states—Texas and Louisiana—in the southern part of the United States. The US is way beyond its fair share of safe global emissions. I can say that without any fear of contradiction. No matter how the allocation question is posed or
what formula for distributing carbon emissions is used, there is no credible argument that, without radically reducing emission levels, the US is emitting its fair share.

The next slide deals with carbon dioxide contraction, which is the issue of how we allocate those 2 to 3 billion tons. That is a civilisation-challenging moral issue because, if we give each person an equal right to the atmosphere, the consequences for the rich countries are quite dire. Instead of having to reduce emissions by 80 per cent, the United States will probably need to reduce emissions by 96 or 97 per cent.

I will end by mentioning other civilisation-challenging issues that need to be understood as moral questions. Who will pay for the damages? The representative from Canada sort of started to touch on that. The question is also a moral issue concerning retributive justice. The world—certainly my country—has not even begun to wake up to the Stern report’s conclusion that it will cost more to do nothing. The logical implication of that is that damages are already being experienced and someone will need to pay for them.

I could mention many other ethical and moral questions, such as who the duty holders are, but that would take a further 10 minutes. The answer is that we are all duty holders—individually, locally, regionally, nationally and internationally.

Thank you for your attention.

The Deputy Presiding Officer: I thank the speakers for their excellent presentations. It is Friday afternoon, we have had a good lunch and thoughts are turning to the weekend, but the big theme or message that has emerged from today’s event is the urgent need to take action, the lack of time that we have left, and how quickly we need to find things that we can do. Those are themes to explore.

I am very glad that the Minister for Transport, Infrastructure and Climate Change, Stewart Stevenson, will be here for about 15 to 20 minutes. I am not going to waste his time by talking a lot, but I want to bring the discussion back to the pragmatic level and ask: how much difference will the Climate Change (Scotland) Bill proposals make to our everyday lives? As Simon Pepper asked, do they go far enough? Will they make us drive less, consume less and insulate our houses better? Will they speed up the rate at which wind farms are given permission or at which marine energy is developed? Will we end up having to rely on carbon credits to meet the targets? You know what the questions are, so who is going to start?

Richard Dixon: I am the director of WWF Scotland. We have had two interesting presentations about the moral issue that is climate change, but one dimension that was missing was Scotland’s moral role. We have had James Watt commercialising the steam engine, Mr Dunlop and his tyre, and Mr Macadam and his lovely road surface; Patrick Macmillan and his bicycle do not really outweigh the fact that Scotland created climate change and it is all our fault. There is a moral duty on Scotland to help lead us out of the problem, and we heard from international speakers this morning the interest in the Climate Change (Scotland) Bill as a measure that could help to lead discussion towards a good result in Copenhagen.

Three aspects seem to me to be the most important: two are to do with content and one with process. On content, the most important thing that the Scottish bill will do is include aviation. We are nearly there on agreeing how to do that correctly, and it is terribly important because no one else is doing it and it sends a clear message to Copenhagen.

On process, we talked this morning about timescale. We talked about urgency, but another aspect is not just all of us acting urgently to put urgent targets in place but how long it takes the bill to get through Parliament. If the bill heads towards becoming an act before the summer, it will be a very important piece of paper to wave about in the run-up to Copenhagen. If, however, it finishes off some time in November, no one will take any notice of it internationally. Part of the urgency is about turning the bill into an act and getting it out there to make a difference in time.

The other key content issue is one that Simon Pepper raised—early action. The minister talked about early action, and it is welcome that the 2030 target in the bill will become a 2020 target, but the key issue is what level it is set at and what combination of percentages will operate in that first decade. At the moment, we do not know any of that; we know only that there will be a 2020 target, but we do not know how hard politicians will be driven. As I said this morning, our prescription
is to set a 3 per cent target every year right from the start so that we know where we are going.

The UK Committee on Climate Change has come up with two sets of numbers: 34 per cent and 42 per cent, the difference between which being how hard we try and, partly, whether a global deal is put in place. If there is such a global deal, that committee says that we should go for 42 per cent.

Louise Batchelor: That is for 2020.

Richard Dixon: That is for 2020. The UK committee is clear that the 42 per cent target is what the UK should go for and that it is only in limited circumstances that we should be unambitious and go for the 34 per cent target. The 42 per cent target is the benchmark, but Scotland has some natural advantages, such as our great renewable energy assets, so we could go for even more. I wonder whether the minister will comment on his thinking so far, particularly on the relevance of that 42 per cent target that the UK committee says that the UK can achieve. Why can Scotland not say straightaway, “Yes, of course, we can do that”?

Louise Batchelor: Minister, that is a pretty clear question on the 42 per cent target. Ministers might include aviation in the bill, but will it turn into a must?

Stewart Stevenson: Aviation is a must; the issue is simply a legal drafting one and, if people are uncomfortable with it, we will look at the drafting.

We are a Government of 47 members facing an Opposition of 81 so we are not totally in control of the timetable, but we are hoping to have the final stage of the bill in the last week before the summer recess—in other words, at the end of June. However, if material issues arise, I have made the commitment to the Transport, Infrastructure and Climate Change Committee, which organised today’s event, that it will have the time to deal with them. In a sense, we should not be unduly precious about timescale if we need to give parliamentary time to material issues. Patrick Harvie, the committee convener, and I will work together on that because he shares the ambition to get moving as quickly as possible.

The 42 per cent stretch target is precisely that. We want to get scientific advice on the matter, so that we know what direction to take. Simon Pepper said that it would be better for us to set ambitious targets and not meet them than to set targets that we can definitely achieve. We will probably take a different view on that, because the credibility of targets will be damaged if we set targets that we consistently fail to meet. We must engage with the scientists to get the balance right. A number of assumptions in UK terms are associated with the 42 per cent target. I refer to the half of our carbon that can be traded under European rules.

Simon Pepper asked why we are not asking the UK Committee on Climate Change for advice right now, instead of waiting until the bill has been passed. First, if the bill goes through Parliament on schedule, we will have time to get advice on the schedule that is included in the bill. Secondly, we do not know what the legislation will look like until the parliamentary process has been completed, so we do not have the necessary context. However, we are working closely with the UK committee on the matter and are discussing the provisions that we want to include. We will not ask the committee for advice formally until the bill has been passed and we know what the legislation looks like, but we are interacting on the provisions that it is our ambition to include. I hope that my comments give some reassurance not only to Simon Pepper and Richard Dixon but to others who are listening. Our ambition is to make the kind of progress that is needed.

Louise Batchelor: Thank you, minister—we are certainly not done with you. I suspect that we are also not done with targets.

Duncan McLaren: The minister is well aware of all of the things that we ask for, so I will not go through a long list of them—I will make just two points now.

First, given what we have just heard about ethics and urgency, the issues of a stabilisation level and an allocation between countries come together in the setting of a cumulative budget for the total emissions that a given country may emit over the period from now until about the middle of the century—let us take 2050, which is the date in the bill. The biggest provision missing from the bill is a commitment to ask the UK Committee on Climate Change to provide scientific advice on the total budget for which Scotland would aim. That would allow ministers a bit of flexibility in determining how far above 3 per cent per year they must go, and when, to deliver a safe outcome. Will the minister ask the committee for advice on what would be a fair and safe cumulative budget?

Louise Batchelor: That is a pretty big question.

Duncan McLaren: I have a second, smaller question—although it is not really so small. We have talked a great deal about the urgency of action. I want to stress the urgency of some non-action—not doing things that would lock in massive emissions in the future. The minister is responsible for deciding whether, as part of the national planning framework, Scotland will go ahead with large coal-fired power stations, which, without carbon capture and storage technology from day 1, would risk large emissions that would
blow apart any safe budget. I urge that, when necessary, we urgently take decisions not to do things, as well as decisions to do things. [Applause.]

Louise Batchelor: Duncan McLaren raised two issues: cumulative totals and the need for major reversals or changes of heart on some planning issues.

15:15

Stewart Stevenson: Setting a cumulative budget is an interesting issue. In effect, if we set annual targets, we need only add up the numbers to arrive at a cumulative budget. I have already told the Transport, Infrastructure and Climate Change Committee that we are happy to do the arithmetic that will translate the annual budgets into a cumulative budget.

The closer together the targets that any country chooses to set—be they five-year, three-month or one-day targets—the closer we get to understanding what the cumulative budget is. We must remember that the targets are, in any event, only the surrogate for what we are trying to achieve, which is to keep the temperature down. That has been covered in a number of the presentations today.

We need to keep our eye on 2050. As I have said to many people, 2050 is a great challenge, not least because I will be 104 years old. It is some distance ahead, and we might have to do later other things that we cannot conceive of today. I am entirely relaxed about cumulative budgets. In essence, we are doing the arithmetic on that.

Duncan McLaren spoke about the provision in the national planning framework, which is our horizon to 2030 for spatial planning, and he referred to the provision for carbon-capture-ready coal-fired power stations. The technology is not ready today, so we cannot make that commitment.

On the other side of the balance sheet, the other very important thing in the national planning framework is the commitment to develop marine renewable energy. We have one quarter of Europe’s potential off our shores—60GW of potential renewable energy. What does that big number mean? It is more than 10 times what we produce as electricity as a nation now, and we are already a nation that exports electricity. The potential for marine energy exists, and the £10 million saltire prize is designed to promote the technical, scientific and engineering work that will improve marine tidal energy generation. We have two types of marine energy that will take us in that direction: wave energy and, down at the bottom, tidal energy.

We would like there to be action on carbon sequestration, which will help us to re-engineer existing plants of a variety of kinds, not just in the power sector. As yet, however, the technology is not there; it is at a relatively early stage, particularly as regards turbines.

Louise Batchelor: Let me bring you back to the subject of Hunterston, minister. This morning, we were talking about capturing hearts and minds, and some people were saying how difficult that is. Some people get it about climate change; others do not. Is part of the problem not that our Government is sending out mixed messages? You are speaking about marine energy and other good things, but you then say that you will have a coal-fired power plant as well. Is there not a real presentational problem in even mentioning that?

Stewart Stevenson: We have to be able to replace the capacity that will come out of our system when our two nuclear power stations close down in the middle of the next decade and the decade after that. Coal is one part of what might be the answer on that timescale, but the longer-term answer will undoubtedly be tidal energy. We are already getting a significant amount of energy from wind power, but wind power is not as reliable as tidal power. Geothermal power is also part of the issue.

Louise Batchelor: So you are saying that you do not have a choice.

Stewart Stevenson: We do not have a choice in the short term, but that is why carbon capture is so important.

Judith Robertson (Oxfam Scotland): I am head of Oxfam Scotland. I would like to bring this morning’s international discussion into this afternoon. I am here with my colleagues from many of the countries where Oxfam works—we work in more than 100 countries around the world, for which the immediate issue of climate change is devastating. Hundreds of millions of people’s lives are being affected now: for example, subsistence farmers all over the world cannot rely on basic grain supply to get their crops to grow. The situation is not just being caused by poverty; it is causing poverty.

We have an opportunity, through the Climate Change (Scotland) Bill, to show the way. It is still just an opportunity, however—that is the point that I wish to make. I am glad to hear that the questions around annual targets and the 2020 target are still open, but the question needs to close—and do so quickly in such a way as to deliver what the science says. We need to deliver by 2020 in order to deliver what we need by 2050.

We have heard repeatedly that there is no option. We have heard moral arguments, arguments about practicality and efficiency, and
economic arguments. I do not know how many more arguments our politicians need to hear to be convinced that the issue is a live one.

Louise Batchelor: Can we make that into a narrow question about targets?

Judith Robertson: No. It is not a narrow question.

Louise Batchelor: Could you make it into one?

Judith Robertson: No. I want to come back to Simon Pepper’s point about confidence and the Scottish football team. The Scottish football team believed that it could win that world cup, but it could not score the goals. Scotland believes that it can lead on climate change legislation—and it can do that—but it has to put the ball in the back of the net. That is basically what I am trying to say, and I would like the minister to say how we will do that.

Louise Batchelor: Thank you for that point. I will turn that into a narrow question for the minister. Are we off with Ally’s army? What is the problem with setting annual targets immediately? Everyone tells us that, unless we act within a decade, it will be too late.

Stewart Stevenson: The simple answer is that we do not yet have the science to set the annual targets in the Scottish context.

Louise Batchelor: But have we not seen the science? We know what is happening.

Stewart Stevenson: No. We need a consistent source of scientific advice. At present, we are committed to using the UK Committee on Climate Change, which is currently the best available source. It is important that we use that committee, which has only just been established formally under the UK Climate Change Act 2008, although it existed in shadow form for several months before that.

Scotland’s situation is different from that of other countries, so we need specific advice. As I said, we are responsible for one seventh of the world’s emissions. Nonetheless, we have to do at least one seventh, if not rather more, in our response, because of our unique opportunities. If we start by making political decisions rather than being driven by the science, we will continue to make political decisions. Future decisions will be adverse rather than beneficial if we allow them to be made at the minister’s desk—even with a minister as enlightened as I am.

Louise Batchelor: I thought that we had the science, so I am confused now. Do we have any points on the science?

Justin Kenrick: The science is absolutely crucial. Lord Turner admitted that the UKCCC’s findings are based on the IPCC 2007 modelling, which was based on pre-2006 data. We are getting data now about the Arctic and the permafrost, and we have Kevin Anderson’s work at the Tyndall centre and Jim Hansen’s work at NASA. All that work shows that the situation is much more drastic than that modelled in the UKCCC’s findings. So to follow the science, we should not follow those processes; we should follow what the scientists say now and what they said in Copenhagen last month. The Government is right to follow the science. I am looking at the man sitting next to me, as he is from the Tyndall centre. If I understand it correctly, the Tyndall centre says that we need annual cuts of 6 to 9 per cent now.

At the end of the morning session, Louise Batchelor said that dealing with climate change is a real pain, but I want to say that it is not. I am from the Portobello transition town organisation. I have found that dealing with climate change is a fantastic opportunity to change the way in which communities live and to make them sustainable and vibrant places. Debbie Walker said this morning that, when we take the required steps in response to climate change, we immediately make an economic benefit and improve people’s lives. A 6 to 9 per cent reduction in the next year and the year after will enable us to make the changes that we need in our lives. It is a pain not dealing with climate change. That is not a moral pain as a result of the effects on others but a pain because it leads to extinction for us.

Louise Batchelor: Good point.

Rachel Nunn (Going Carbon Neutral Stirling): I will make a pun that is worse than Louise Batchelor’s one this morning about a red herring. My team of eight people are at the coalface in dealing with the disinterested public—unlike those in transition towns—and trying to get them to take action on their carbon footprint. Tonight, I am going to a tae kwon do group that has kids and, later on, adults. The guy told me, “You can’t talk to the kids, because you can’t brainwash them about climate change—I’m not having that.” It is an interesting observation that the majority of people in Scotland still seem to think that talking about climate change is slightly taboo, slightly greeny and possibly slightly religious. It worries me that that attitude is still out there. I am allowed to talk to the adults in the group, although I am not sure who is more scared. I wonder whether I am more scared of the rejection, if they do not want to start reducing carbon, or they are more scared that I will ask them to do something. Communication and leadership are essential, and Simon Pepper is right that we need targets and that we need them to be communicated.

I think that there are three businesses on the list of delegates for today’s event. Two of them were due to sit between me and Doug McLaren, so they
are either really titchy people or they are not here. If today's event is an informed debate about how we can get a collective and collaborative solution, why are businesses not at the table?

Louise Batchelor: I must admit that I asked where the businesses are and whether they are comfortable with what is proposed in the Climate Change (Scotland) Bill. The encouraging answer was that, by and large, they are comfortable with what is proposed, so we should not be too depressed about the lack of business representation.

Kat Jones (Scottish Natural Heritage): Professor Brown said that climate change is a moral issue and that Governments and states therefore have no excuse for failing to act. The same is true of individuals. My point is about the personal action that each of us needs to take.

There is lots of discussion about reducing our greenhouse emissions through decarbonisation of the economy, and we need to find alternative, low-carbon technologies to take the place of polluting technologies. However, although low or zero-carbon alternatives exist in some cases, we must wake up to the fact that there are by no means zero-carbon alternatives for all our goods and services. Almost everything that we do emits carbon to a greater or lesser extent, and as such it will be a huge challenge to make the cuts that we need to make. Measures to increase efficiency and reduce waste therefore play a huge part in the reduction of emissions, including the use of waste heat, the insulation of homes and more efficient transport.

We need to use our resources as efficiently as possible and we need alternative technologies but, if we want to avoid dangerous climate change, we need to reduce our consumption. We need to use our cars less or not at all, to fly less or not at all, to buy less stuff, to heat less, to mend things and to use less electricity.

Louise Batchelor: I think that most people here would agree with you, but do you have a question?

Kat Jones: The question, I suppose, if the minister is still here—

Louise Batchelor: He is still here—just.

Kat Jones: The positive message is that avoiding climate change means that we need more active transport. We need to walk or cycle and become fitter people. We need to live closer to where we work and to spend more time in our communities. I would like to see an emphasis on that side of the action that we can take on climate change.

Louise Batchelor: Minister, at the last count, only 1 per cent of the transport budget was spent on walking and cycling. Why is that?

Stewart Stevenson: Well, of course, walking is very cheap. I walked here today, and I can tell you that, in the 680 days for which I have been in office, I have made 351 walking journeys of 10 minutes or more. That equates to some 300 miles that I have walked on ministerial business, and that includes only the journeys of 10 minutes or more. Not only that, but let me share with you—I think you are adult enough for this—that I have lost so much weight that I can no longer keep my trousers up without braces. I say that not in a vainglorious way but to illustrate the fact that climate change is about individual action. I think that that is what Kat Jones was saying.

In the past two years, I have almost halved the number of car miles that I travel. It was 40,000 miles. It is still quite high and is substantially above the average, so there is clearly more that I can do, but 59 per cent of my personal journeys are accounted for by rail, walking, bus, ferry, cycle and subway.

Louise Batchelor: I am going to be rude and interject. That is impressive, but your Government still has a massive road-building programme.

Stewart Stevenson: Actually, the Government has a massive railway programme, which has seen a 30 per cent increase in patronage of our railways. We are also putting more money into buses and changing the way in which we support the fuel subsidy of our buses to make it more ecologically focused. Under that work, there will be more rewards when behaviours are more ecologically focused.

We heard earlier about the Tyndall centre. I am not familiar with the figures of 7 to 9 per cent. I will go back and look at that, but I think that the numbers are rather different.

We also heard about Lord Turner, who is one of the great communicators in politics. He is not of my political persuasion, so you should believe it when I say that. He told a Westminster committee that, if the economy grows by 3 per cent per annum—when he said that a year ago, that was reasonable—and the cost of 2 per cent of GDP that Sir Nicholas Stern identified applies, the growth that would have been delivered in January 2050 will be delivered later in the same year. That provides a context for the fact that the pain—the cost—of heading in the right direction is entirely affordable.

15:30

Rachel Nunn talked about not being allowed to brainwash kids. I think—and I suspect that others
think so, too—that the kids are doing the brainwashing, because they have got it much more than we wrinklies have. The kids are proselytising, educating and intervening in their parents’ activities, so do keep up your work.

Businesses in Scotland—and elsewhere, I think—are heavily engaged. One hundred and forty businesses have signed up to the May day network, and the climate change business delivery group, which is independent of Government, is working with the Government. Back when I was appointed as a minister nearly two years ago, my second engagement was to talk to the Confederation of British Industry Scotland in Edinburgh. I was surprised to find myself in a room of people who were engaged and enthusiastic. Of course, they were enthusiastic not because of the ethics or the morality, to which I sign up, but because they could see a profit in reducing their energy use. If that is what will take business on the road, let us work with it and have the morals and ethics a wee bit later. If businesses at least do the right thing now, that will be a modest help.

I say none of that to underrate the challenge, which is undoubtedly substantial. Please forgive me for leaving now, as I must undertake other duties.

Louise Batchelor: Thank you very much, minister. As you leave, questions will still be ringing in your ears.

I will try to bring in people who have not had a chance to speak. Two people are trying to speak; I call Adrian Shaw first, but I promise to take you both.

Adrian Shaw (Church of Scotland): I was delighted to hear about the ethical issues that Donald Brown raised, because for the Church of Scotland climate change is primarily an ethical issue, as it will cause much damage to many people around the world. For that reason, we strongly support the Climate Change (Scotland) Bill.

However, we are concerned that the Government will get nowhere near an 80 per cent target by 2050 or any other interim target—no matter how stringent—unless people in Scotland believe in and are committed to action. For the necessary changes to be effective, people must be aware of their scale. We have heard some of the changes being discussed. People will have to believe that those changes must be made in their lives and those of their communities and they will have to know how to make those changes. We are quite a long way from that in Scotland, despite the many exciting projects that we have heard about.

I will draw a parallel with the hugely successful act that the Scottish Parliament passed to implement the smoking ban. Literally overnight, that changed behaviour in Scotland for the better. Was that legislation so successful because of its fine detail, or because it was argued about, debated and well known and because people said, “I will do it,” when it had to be implemented? We must be in such a position with climate change, but I do not think that the bill will deliver that.

Louise Batchelor: Is the Church of Scotland leading by example?

Adrian Shaw: Scotland has 200 eco-congregations of different denominations. They are people who want to make the change and who want to help cut emissions. That is part of the process and of the solution.

Louise Batchelor: I apologise to Mike Robinson, who stood up at the same time as Adrian Shaw. It is his turn now.

Mike Robinson (Stop Climate Chaos Scotland): I must wear a different coloured shirt next time.

I will start with a semantic point. The annualised targets about which people are nervous are not targets, but minimum targets. It is critical that we use the right terminology. Nobody will applaud us for getting near those levels; we are meant to try to exceed them. I reiterate what my colleague Justin Kenrick said: most of the science refers to cuts of 8 to 9 per cent. The longer we leave it, the higher the targets will probably become. That might be an incentive to rush the bill through before the summer.

I will pick up on carbon capture and storage and on coal-fired power. Of course that remains an issue. It is counterintuitive to proceed with CCS when we are pushing through legislation on climate change. The Massachusetts Institute of Technology said that it did not think that CCS would be practical until 2030, so that technology can hardly address the urgency of the situation.

Louise Batchelor: Thank you very much for making that point.

Bill Slee (Macaulay Land Use Research Institute): I return to the role of the rural land use sector in addressing climate change. It is a pity that the minister has gone—

Louise Batchelor: There are plenty of other people listening and the event is still being webcast, so do not worry.

Bill Slee: We need to get our ducks in a row. There are areas of rural policy in which the targets are not being achieved. We are way below the target of achieving 25 per cent forest cover by 2050. Forestry is invaluable because of the scope that exists for it to be used as a renewable fuel and, as we heard earlier, as a renewable building material.
Another area of rural policy is the Scottish rural development programme, under which grants for renewables are potentially available, but enormous bureaucratic obstacles are put in the way. In parts of Government that could be driving forward the climate change agenda and pushing renewables, there are many obstacles that are not being removed. If we are to reach the targets, it is incumbent on us to get all the ducks in a row—we must ensure that all the directorates of Government are working together effectively. I do not believe that they are at the moment.

Louise Batchelor: We saw what happened when the former Minister for Environment tried to push through an idea to lease off parts of the forests—he failed utterly. What is your opinion of that proposition?

Bill Slee: It was exactly the wrong type of activity. If we want to get communities involved, surely the way to do that and to make possible the provision of relocalized renewable energy would be through the community forest land scheme, which allows communities to lease or purchase forest land, rather than by leasing it to a multinational company.

Louise Batchelor: Everyone who has their hand up has spoken before. I think that Eddie Phillips has had his hand up the longest.

Eddie Phillips: Although I am here representing Go Greener, I am convener for environment on East Renfrewshire Council as well—I sometimes forget which organisation I am representing.

I am really sorry that the minister has gone because I wanted to put him on the spot. The bill is largely okay, but it is long on what and short on how. Its problem is that it says that tackling climate change is partly down to individuals and partly down to the Government and councils, but there is a missing link, which is core-funded community-leading organisations—in other words, organisations such as Carbon Neutral Stirling, Carbon Neutral Biggar and Go Greener. Such organisations are extremely important. We need them to be supported by the Government and councils if we are to take the message on to the doorstep. There needs to be a step change, and for that we need leadership. Go Greener, the organisation that I represent in East Renfrewshire, is showing such a lead, but we need core financial support for community organisations. We need a commitment on that, and I had hoped that the minister would be asked to respond to that, but that will obviously not happen today.

I finish by saying to the Government, “Well done for what you have achieved, but it is not enough.” We need support for local groups such as Go Greener. We know what we need to do; what we want are the resources to do it. Please can we get them?

Louise Batchelor: You have highlighted another of today’s running themes, which is about how we get any Government to take good, pioneering, radical action. Does the impetus come from the grass roots up or from the top down? What are the mechanisms? Do we all have to take to the streets? It is clear that communities are starting to take action. I guess that we just need more communities to do that.

We will have another point from the Youth Parliament.

Liam Beattie: Good afternoon. I represent the Scottish Youth Parliament, which debated the bill a few weeks ago at our general meeting in Dunfermline. Although it received overall support, I have two concerns about it. It is a shame that the minister has gone. The first point is about public transport and the second is about aviation.

The brilliant idea of simply not using the car is impossible for people who live in rural areas. This morning I had to spend two and a half hours travelling the 50 miles from Hawick in the Borders to Edinburgh. The car is a much better alternative. Unless better public transport infrastructure is put in place in Scotland, people will not use public transport. They will say, “Why should I have to go on public transport when it is a lot simpler to use my car?”

On aviation, why should a low-income family be prevented from flying to Spain once a year, for example, when a person who works in Canary Wharf can easily fly down to London every day without thinking about the rise in the tax?

Louise Batchelor: There is a huge issue around who should fly and who should not, but I am not sure that today is the day for that discussion. Does it depend on how much money you have, how important your job is or your reasons for flying? It is a massive debate.

No one should worry about the fact that the minister is not here, because members of the committee are still here, and so are the civil servants. You can decide for yourselves whether you think that they are less important than the minister, but his eyes and ears are still here.

Adrian Loening: I am rather concerned that all of the discussion has been rather long on encouraging people to address climate change issues. I am grateful to our friend from the Church of Scotland, who mentioned the smoking ban, because I believe that we need to force measures on the population. For example, I would not be allowed to build a house that had doors that were 2in too low or which did not have a bathroom. However, we are allowed to build houses with
poor insulation and no solar panels and to create streets around them with infinite street lighting and parking places. We need to build into the system a way of ensuring that those matters are dealt with.

I will steal a sentence from a friend of mine who said, “If the world was a bank, we would have saved it since Christmas.” Well, the world is a bank, actually.

Louise Batchelor: And a much more important one. Are you saying that, given the nature and urgency of the challenge, we should be almost on a war footing now, and that things should be happening tomorrow?

Adrian Loening: There is technology in existence and straightforward things that we can do. As soon as the bill is passed by Parliament, we can legislate to ensure that no house will be built in Scotland without a solar water heater. The technology is simple; last year, I bought one on eBay for £500, and it works beautifully.

Juliet Swann (RSPB Scotland): I want to pick up on the point that the gentleman from the Macaulay Land Use Research Institute made about land use, especially given that many of the presentations today have been about the impacts that we are already seeing on the land around us and how we are adapting to that. As Dr Burton said, we should not apologise about talking about adaptation as it is part and parcel of the fight to tackle climate change. As the gentleman from the Macaulay Land Use Research Institute said, there are already mechanisms that we can use—we could leave this chamber today and go out and start improving how we adapt to climate change. We can do things now around natural flood management and restoring our peat bogs, for example, that will benefit communities, people’s health and the economy as well as fighting climate change.

Dr Burton talked about how the Canadian Government is moving forward on adaptation. I would like to know how it is driving that and what it is doing to achieve the adaptation changes that are necessary.

Louise Batchelor: That is a good question. Dr Burton?

Dr Burton: Very briefly, it is not doing as much as it ought to be doing. It is getting started.

Louise Batchelor: Give us a glimpse of what it is doing.

Dr Burton: We are proposing that the five-yearly land use plan updates that are done at a municipality level should now take climate change into consideration, in relation to adaptation and mitigation. That would involve precisely the kinds of things that the questioner referred to.

Louise Batchelor: That is good.

Fran Loots (Comrie Development Trust): I am from the Comrie Development Trust, and I also work part-time for the John Muir Trust.

We have heard quite a lot about renewable energy, and there is a need to consider that. However, there is an important step before that, which involves the amount of energy that we use in the first place. If the Scottish Government is saying that it does not necessarily need legislation in order to act in this area, the biggest thing that it could do at this time is to make a massive commitment to energy efficiency measures. That would hit two targets at once: it would reduce the amount of emissions, because we would need less energy; and it would have a significant impact on the economy. Those are fairly simple and straightforward measures that are within the Government’s gift.

15:45

The other issue is about how we look at how energy is delivered in the long term. One of the communities with which I have had contact with my John Muir Trust hat on is on the island of Eigg. It is interesting to look at what has happened there, where people have gone from a system of relying very much on diesel for their generators, for example, to a system of 95 per cent electrification that relies on renewable energy. The technology is there, and the situation is interesting, but what is really significant is the steps that the community have taken to have responsibility for their lives. They have put a cap on how much electricity they can use. If they trip the system by using too much in their homes, it gets cut off and they have to pay to get it restored. That seems a simple and neat way to deal with the matter—behaviour has consequences and actions issue from them. I would love a system like that in my house; I have teenagers who know all about the world and the changes in it, but they feel that they cannot do much.

Louise Batchelor: They still want to use the tumble dryer.

Fran Loots: Exactly. They do not connect their actions with what happens.

Louise Batchelor: Those are two very good points on which to end the session, particularly the point about energy efficiency, which most people know is a subject very close to Patrick Harvie’s heart. I have been asked to hand back to Patrick Harvie, who is convener of the Transport, Infrastructure and Climate Change Committee. Thank you all very much.
Concluding Remarks

Patrick Harvie: I thank Louise Batchelor for her contributions and facilitation throughout the day. I also thank the committee clerks, the events team, the broadcasting unit, the official report and the security staff, who have all helped to make today possible. I thank our speakers, the MSPs and all participants, the Presiding Officer and the Deputy Presiding Officer.

I also extend my thanks to the minister in his absence. I was particularly interested in his comment that all we had to do was to add up those short-term targets to know what the total budget will be. That seems a clear indication that those minimum, anything-above-zero, targets are going to be replaced with some specific targets—numbers that we can add up. I very much look forward to amendments along those lines from the Government—if the Government forgets to lodge them, perhaps somebody else will.

In the morning session, I was really struck by some of the generational issues that were expressed. I grew up with a bit of an environmental activist mother, as Louise Batchelor knows. I used to hear phrases such as, “If we don’t get this right, future generations will never forgive us.” That kind of statement is outdated now and we should stop saying it. It is not about future generations any more; it is about this generation. It is about people living on this ball of rock who are suffering right now; it is about our generation not only having to take responsibility for its actions but living with the harm that has already been caused all around the world. Still we hear of people, particularly in the rich world, seeking indulgences, as Duncan McLaren called them in our morning session—the things that we can do that make us feel a little better, but which do not deal with the fundamental problem.

I lay that charge not just at individuals, because there is a tension between individual and Government effort. Governments more than anyone else are guilty of seeking indulgences at the moment: they seek a policy on this or that, but they do not stop doing the harm at the same time. Our approach will work only if we stop causing harm by building unnecessary roads, expanding airports that we do not need to expand and building new coal-fired generating capacity. If we stop doing those things and do the good stuff, we will get somewhere, but if we take a more-of-everything approach, we will fail.

There is a really crucial moment for all of us. Everyone in the room is aware of how important this year is—not just for Scotland, with its domestic bill, but for the world, with the negotiations that will take place at Copenhagen. There is a fear that we could move from denial and inaction to defeatism and inaction. Rather than moving from one irrational state to another, we should occupy the rational space between the two, which is to take action.

I was delighted to hear about some of the inspirational action that is planned and is already being taken in the Maldives, to which I pay tribute. We saw a photograph of the country’s capital city, surrounded by a little defensive sea wall. If any country could be forgiven for thinking, “This is not our problem—we must just deal with survival,” or for making a flippant comment about the proportion of the world’s greenhouse gas emissions that it produces, it is the Maldives. However, the Government of the Maldives has not done that but has sought to give genuine leadership. It may have set long-term targets, but it is not waiting to meet those targets or for the rest of the world to act. Instead, it has decided to take action now, within an understandable timescale of 10 years, to show the world that that can be done.

I thank Ahmed Moosa very much for his contribution.

Can Scotland show such leadership? Simon Pepper provided us with some useful suggestions. He and others in the chamber talked about having science-driven targets and about starting policy initiatives now, rather than waiting for targets to get through Parliament. The Government of the Maldives has just come to power; the Scottish Government set its 3 per cent policy target nearly two years ago, but the Parliament is still working through the legislation. There is no reason for us to wait for the bill to be passed—we should crack on with the policy target of reducing emissions by a minimum of 3 per cent per year.

We should amend the legislation by, for example, setting limits on the use of international credits. If we accept that we must achieve transformational change in our levels of greenhouse gas emissions and in our contribution to the harm that is being done around the world, it is bizarre to imagine that we can use unlimited international credits as another form of indulgence to meet our targets. We need to make clear that the huge bulk of the effort must be domestic.

I want to say something about the wider issues—the underlying philosophical issues that sometimes get lost when we talk about targets. The concept of a green new deal was behind some of the comments that were made and some of the questions that were asked. When previous generations spoke about a new deal, they were facing a recession and the prospect of war. Behind that threat was a philosophy—the ideology of fascism. People had to deal with the problems caused by the recession in a way that was consistent with combating that ideology. In creating a green new deal—the phrase has been
picked up by Governments around the world—we must take an approach that allows us to deal with the recession and climate change and to move away from using fossil fuels, which are running out, but we must also address the underlying ideology that drives a lot of the harm that has been caused.

I call that ideology consumerism. In the rich western world, we adopted a consumerist economic model. That did not happen through a law of nature—consumerism is not innate to humanity. Instead, there was a deliberate, conscious decision to adopt a political and economic model in the rich world that has allowed the rich to get richer and the poor to get poorer, half the world to be too fat and half the world to be too thin, and precious resources to be plundered and squandered. The consumerist model has allowed the rich world to squander its wealth and to overconsume, while elsewhere some of the most basic human needs are left unmet.

If the climate change challenge requires from us what was described today as a civilisational U-turn, is that not about time? Should we not welcome the opportunity to create such a U-turn? If we see a green new deal only as a stimulus and as a way of reviving life in the economic model that caused the harm in the first place, we are certainly being unambitious.

Overturning a consumer economy—to create what we might call a conserver economy—would mean living within our ecological and financial limits. Yes, that means living with limits on our emissions of greenhouse gases such as CO₂, but that is just one expression of the required change. The limits within which we must live include those for land, water and marine harvest. We have been living beyond those limits.

The green new deal must also have something to say about—this is a dangerous word—population. I do not know what that is yet, because anyone who ever even raises the question is told to get back to China. However, the population question will need to be resolved in some way—I do not know exactly how.

The green new deal will also need to redefine what progress means. We will need to come to an accommodation with the idea that economy shares its roots with ecology. The economy is not just about money—I do not know where such an idea came from—but about all of life. If “sustainable economic growth” is to mean anything—if I am ever to stop laughing at the phrase as an inherent contradiction—both Governments and individuals will need a change of mindset as well as a set of targets.

Over the next few weeks and months as the Climate Change (Scotland) Bill moves through the committee process, let us focus on getting the targets and framework right but let us not imagine that setting the targets will mean that the job is done. Once the bill has been passed, we will have only the beginning of a transformational change in our economy, society and politics. I hope that everyone here will continue to contribute to that transformational change.

I thank everyone for their contributions today.

The Deputy Presiding Officer: I thank Patrick Harvie in his capacity as convener of the Transport, Infrastructure and Climate Change Committee—another one of those long titles—for bringing together such a diverse range of delegates from all over the world, and from across the climate change world.

I also thank Louise Batchelor, who facilitated our discussions. It is always helpful to have a professional doing the job instead of us amateurs.

Finally, my greatest thanks go to the delegates who have taken part. I apologise to those whose contributions could not be taken this afternoon or, indeed, this morning. I thank all the speakers and delegates for their enthusiasm and for the content of their contributions. In particular, I thank those participants who have travelled here from afar and who have given us valuable insight into what climate change means for their countries. They have helped us to understand the impact that our actions have not just in our own small country but globally.

As delegates leave the chamber, they will be guided to the exit via the garden lobby, where there is a global change exhibition that demonstrates how communities in four continents have responded to climate change. The exhibition brings together the work of various leading nature photographers from Africa Geographic, Australian Geographic, Canadian Geographic, New Zealand Geographic and the UK magazine Geographical. I hope that everyone enjoys the exhibition.

Thank you all for coming to the Scottish Parliament, and safe home.

Meeting closed at 15:59.
ALPHABETICAL LIST OF PARTICIPANTS

A
Jillian Anable (Scottish Transport Studies Group)
Ian Angus (Royal Town Planning Institute)
Richard Aspinall (Macaulay Land Use Research Institute)
Simon Aumonier (Scottish Transport Studies Group)

B
Clifton Bain (RSPB Scotland)
Ben Barclay (Children’s Parliament)
Una Bartley (Christian Aid)
Rahul Barua (University of Edinburgh Carbon Management Masters Programme)
Louise Batchelor (Facilitator)
Helen Bath (British Red Cross)
George Baxter (Scottish and Southern Energy)
Liam Beattie (Scottish Youth Parliament)
Stephen Benn (Royal Society of Chemistry)
Stephen Blackmore (Royal Botanic Gardens Edinburgh)
Donald Brown (Penn State University, United States)

C
Foysol Choudhury (Bangladesh Samity Edinburgh)
Chloe Clemmons (Church of Scotland)
Robert Colburn (British Red Cross)
James Cooper (Transport Research Institute)
Matthew Crighton (Unison Scotland)
Kevin Cullinane (Transport Research Institute)

D
Dario dalla Costa (Scottish Government)
Richard Dixon (WWF Scotland)
Gary Dunion (WWF Scotland)

ADDITIONAL INFORMATION FROM STOP CLIMATE CHAOS SCOTLAND

Including comment and analysis on supplementary evidence submitted by the Minister for Transport, Infrastructure and Climate Change.

Introduction
Stop Climate Chaos Scotland (SCCS) provides this supplementary evidence to help inform members of the Transport Infrastructure and Climate Change Committee in their consideration of the Stage 1 Report. The following submission sets out the clear scientific evidence for immediate and significant emissions reduction and provides a description of some of the policy options available to support delivery of the necessary reduction of at least 3% per annum.

If the Scottish Climate Change Bill is to provide global leadership in its attempts to tackle climate change it must reflect the scientific imperative for early and significant reductions. While the ambition of the 2050 target is right and to be welcomed, the lack of clarity in the cuts proposed in the next ten years means the Bill provides a poor template for others just when the world is looking for leadership on climate action.

Summary
1. The scientific evidence clearly shows that developed nations must reduce their emissions by at least 3% immediately.
2. The EU Emissions Trading Scheme does not constrain our ability to achieve at least 3% a year reductions.
3. Reductions of 3% per annum are achievable: the additional effort required in the non-traded sector is less than the Government estimates, and the potential for reduction is greater.
4. The economic downturn is likely to have the effect of reducing Scotland's emissions by over 3%. We have to take action now to ensure this rate of reduction is maintained by targeted policies that put us on a path to a green, low carbon economy.
5. Significant additional emissions savings to those identified in the Minister's supplementary evidence are available to support meeting the shortfall identified by the Scottish Government.

2020 reduction baseline
The Scottish Government figures for the reduction needed in the non-traded sector by 2020 to meet national 3% per annum figures are over estimated in several respects. These include the use of inconsistent forecasts and baselines and overly conservative assumptions on the likely reductions within the traded sector. We calculate that the reduction likely to be required by 2020 is between 9 – 11 MtCO2 (see Appendix 1).

The scientific case for early action
"...we expect the targets in our bill to be driven by the science"¹ Stewart Stevenson, Minister for Transport, Infrastructure and Climate Change.

The recent scientific literature on climate change places significant emphasis on the importance of immediate and significant cuts in emissions from the developed world to ensure an early peak in global emissions. For example, the conclusion that we need ‘stringent emissions cuts’² is reached by Parry et al (2008), Schellnhuber (2008)³, Anderson et al. (2008)⁴ and most urgently by Hansen et al (2008)⁵. The credibility of any emissions reduction target is therefore dependent on them being set on the basis of the latest science. Attempts to ‘balance’ the scientific imperative for action with political decisions regarding ‘achievability’ will only serve to undermine the Bill. Recent history has shown that for any moment in time a target set on terms of achievability is likely to fall short of ambition and may be exceeded. The original renewable electricity target of 18% by 2010 is such an example as this was met as early 2006/07 and current targets for 2013 have also been exceeded. But in the case of climate change targets, we cannot afford to set a low benchmark and exceed it later, when other countries are looking for our leadership now. Political will and leadership can redefine the measure of achievability and yet as the Bill currently stands it appears to give space for the ‘potentially short-term political considerations’ the Minister has said must be avoided.

Recent climate modelling work carried out by the UK Met Office provides further evidence of the need for immediate reductions in emissions. The work concluded that “overall, a delayed and slow decline in emissions would probably lead to nearly 2°C more warming than an early and rapid decline in global emissions - a total temperature rise of 4°C above pre-industrial levels”. The Met Office’s analysis of different emissions reductions scenarios shows that even a minimum [global] annual reduction of 3% would result in significant global warming, stating that “even if [global] emissions start to decrease in the next two years and reach a rapid and sustained a rate of decline of 3% per year, temperatures are likely to rise to 1.7°C above pre-industrial levels by 2050 and to around 2°C by 210067”. This means that the science tells us Scotland’s contribution must be at least 3% per year if this scenario is to be achieved and must start immediately.

Alongside the urgent conclusions of the emissions modelling work the empirical evidence of climate change continues to provide a stark reminder of the need to act now. Scientific research shows us that:

- The Arctic Ocean is losing sea ice 30 or more years ahead of the projections presented in the Fourth Assessment Report (Stroeve et al, 2007).
- Floating tide-water glaciers in the Antarctic Peninsula are losing ice faster and are making a greater contribution to global sea level rise than reported in the Fourth Assessment Report (Pritchard and Vaughan 2007).
- The actual emissions growth rate since 2000 has been greater than any of the scenarios used by the IPCC in either the Third or Fourth Assessment Reports8.

### Policy options for emissions reductions from the non-traded sector.

The table below provides examples of further emission reduction options and potential that could be achieved by 2020 that were not detailed in the supplementary evidence provided recently by the Minister. The table clearly demonstrates that even focusing on a couple of policy areas there are significant emissions reductions options available to contribute towards delivering a target of a 14MtCO₂e reduction (identified in the Government’s supplementary evidence as being required to deliver a cut equivalent to 3% each year to 2020, although as noted elsewhere SCCS believes this target to be lower). We have cross referenced the identified additional policy options with those in the Minister’s evidence and UK Climate Change Committee report to remove any double counting of emissions saved. Further details and references for the emission reduction options are set out in Appendix 2.

6 See [http://www.guardian.co.uk/environment/2008/oct/01/climatechange.carbonemissions](http://www.guardian.co.uk/environment/2008/oct/01/climatechange.carbonemissions) for the full article.

7 Recent work by the Tyndall Centre shows that global emissions are very unlikely to peak before 2020 and therefore even greater emissions reductions are required to so ensure the global emissions budget does not trigger dangerous climate change – i.e. even the projections from the Met Office could be interpreted as conservative.

It is clear from the above table that even without fully accounting for the likely additional reductions that will actually occur in the traded sector there are significant emissions reduction potential from the non-traded sector to suggest that a target of at least a 3% per year cut to 2020 is achievable.

This simple analysis of policy options and their emissions reductions potential does not include:

- The substantial emissions savings that we believe could be delivered by amending the Strategic Transport Projects Review (STPR). The Minister’s supplementary evidence states that emissions are expected to rise in the non-traded sector by some 2 MtCO_2e. The STPR would suggest that some 0.9 Mt of any rise will arise in the road transport sector. Given that nearly all other sources of emissions in the non-traded sector are making reductions it is clear that far from being in line with its ambitions on climate change the Scottish Government’s transport policy places a disproportionate burden on other sectors.
- Greater potential for emissions savings from forestry land use and land use change.
- Greater scope for emissions savings from non-domestic buildings.

In this document we have focused on savings from domestic effort and not accounted for any potential for international credits.

**Emissions from the traded sector**

The supplementary written evidence submitted by the Minister for Transport, Infrastructure, and Climate Change argues against immediate emissions reductions of at least 3% on the basis that the predefined reductions from the European Emissions Trading Scheme (ETS) place too great a burden on non-traded sector. SCCS acknowledges that integration with the ETS is a complicated area but does not recognise the ETS as placing a constraint on the emissions reduction ambition of Scotland. The Scottish Government is committed to a 50% renewable electricity target by 2020 and aiming for a 20% renewable energy target by 2020. Both these targets and many other policy commitments reflect the renewable energy potential of Scotland and place us on a path to a decarbonised power sector at a far faster rate than the predetermined path described by the ETS. For instance, the combined impact of delivering the renewable electricity target and installing CCS to cover some of Longannet's output would produce a reduction of nearly 6MtCO_2 between 2010 and 2020. However, under the Scottish Government’s proposal the emissions savings are effectively not credited to the Scottish account except where permits are auctioned. This accounting system effectively acts to dis-incentivise energy efficiency and renewable energy policy as the savings are not counted.

Even if this accounting approach is to be followed, the traded sector will make a vastly more significant contribution to emission reductions following a global deal, whether in Copenhagen at the end of 2009 or later. The predetermined emissions trajectory will increase from over 1.5% to over 4% per annum, meaning the burden on the non-traded sector is significantly reduced. The Government does not quantify for the fact that the traded sector will be subject to increased ambition as a result of a global agreement and consequently improved EU targets any time before 2020. The CCC analysis of enhanced ambition in the energy sector suggests the emissions cut in this sector would rise to 56%, reducing the contribution required from the non-traded sector from 9MtCO_2e to just 3.4MtCO_2 (or roughly 1.25% per year).

After 2012, the ETS will enter its third period and will move to substantial auctioning of emission permits particularly across the power sector. This will have the effect of completely removing the current perverse incentive to not accelerate emissions reductions from our domestic power sector and establish an accounting system that acknowledges the real savings made from decarbonising our power sector.

In summary, although the ETS introduces a complicated market mechanism into Scotland’s emissions inventory it does not prevent us from setting and meeting targets of at least 3% a year. In addition to this, further emissions reductions options for the non-traded sector are available to the Scottish Government than those highlighted in the Minister’s supplementary evidence, the combined effect of which is to make reductions of at least 3% per year highly achievable.

---

9 This is almost double the CCC forecast for this sector (CCC, figure 14.5b)
Economic downturn and emissions reductions
The Scottish Government’s reluctance to follow the scientific evidence and deliver on their manifesto commitment to reductions of 3% ignores the fact that the economic downturn will result in an accelerated decline in emissions in the immediate future. Historical economic data shows that at times of recession, emissions have tended to decline by more than the slowdown in GDP. Although the volatility in emissions has reduced with time and the Scottish economy has become less carbon intense we can still expect a total decline in emissions of over 3% in parallel with the economic forecast of a 3.7% drop in UK GDP for 2009 made by the OECD. The response to the economic decline must recognise the opportunity to realise a new green economy and ensure we emerge on a low emissions trajectory, to do otherwise risk a false start under the Climate Change Act that could threaten our ability to help prevent dangerous climate change. Moreover, to stimulate domestic innovation rather than increased imports of technology and techniques, and thus gain maximum economic benefit from climate mitigation, Scotland will need stretching targets.

Conclusions
1. The science already exists that tells us Scotland must reduce its emissions by at least 3% per year, there is no scientific reason for this minimum not being established in the Bill from the outset.
2. The table of emissions saving measures presented in the Minister’s supplementary evidence omits considerable emissions reduction potential available to the non traded sector.
3. The Minister’s evidence underestimates the contributions to Scotland’s targets which will be made by the traded sector both in the current circumstances, and following a global deal at Copenhagen; and in this and other respects, over-estimates the contribution which would be required from the non-traded sector.
4. Annual reductions of at least 3% are therefore both necessary and achievable.
5. The current drafting of the Bill elevates political expediency above scientific necessity.

11 See http://www.oecd.org/dataoecd/52/29/42466854.pdf [Link no longer operates]
The Scottish Government figures for the reduction needed in the non-traded sector by 2020 to meet national 3% per annum figures are over estimated in several respects. The figure of 14MtCO₂ should be reduced in the following ways.

First, the baseline assumption of a 2 MtCO₂e rise in emissions in that sector is debateable. The CCC report would suggest a level baseline is more realistic. The CCC analysis suggests that excluding energy generation (the majority of the traded sector), air transport and land-use (ie sinks, not emissions), the reference projection is for no change between 2009 and 2020. Slight growth in road transport and agriculture emissions are offset by small declines in waste and residential emissions (CCC, figure 14.5b). Cambridge Econometrics modelling (also reported by the CCC, pp440-441) of the industry, services, road transport and residential emissions from Scotland suggests a reference scenario in which emissions decline by 3Mt-CO₂ in the period 2006-2020. On that basis the target reduction would fall to 12 MtCO₂.

Second the figures assume that the traded sector reduction is only directly equivalent to the target overall reduction (of 34% in the interim budget). This is false. The CCC assume that to deliver an overall reduction of 34%, the power sector (the majority of the traded sector) will deliver 40% reductions over 1990 levels (figure 5.22). Using this assumption in the Scottish figures cuts the target reduction by a further 2 Mt-CO₂e to 10 MtCO₂e.

Thirdly, the baseline figures being used by the Scottish Government appear to be those for 2006, not 2009, in which Scotland’s total emissions could well be 3Mt lower that in 2006, due to the continuation of current trends, accelerated by economic downturn. This would translate into a further reduction in the non-traded target of at least 1MtCO₂e, to just 9 MtCO₂e. This level equates to annual reductions in the non traded sector in the order of 3.5% per year. However there are still more factors which the Government has not considered which will reduce this further.

Fourth, the Government assumes that the traded sector in Scotland will not make any contribution to Scottish emissions reductions beyond that set by the ETS bubble. This is not a valid assumption. At the UK level a greater contribution could be accounted by auctioning less ETS credits, while in Scotland, the effect of better performance in the traded sector – eg through further exceeding our renewable energy targets - is that Scottish businesses will buy less auctioned credits, thus leading to a greater cut in emissions attributed to Scotland. This effect cannot be quantified, although it should be noted that the renewables industry suggests that by 2020 a 70% contribution from renewables to electricity demand is practical.

Fifth and finally, the Government does not quantify any increased ambition in the traded sector as a result of a global agreement and consequently improved EU targets any time before 2020. The CCC analysis of enhanced ambition in the energy sector suggests the emissions cut in this sector would rise to 56%, reducing the contribution required from the non traded sector to just 3.4 MtCO₂e (or roughly 1.25% per year).

ADDITIONAL INFORMATION FROM SCOTTISH COUNCIL FOR VOLUNTARY ORGANISATIONS

The Scottish Council for Voluntary Organisations (SCVO) is the national body representing the voluntary sector. SCVO seeks to advance the values and shared interests of the voluntary sector. SCVO has a membership of over 1200 but also speaks on behalf of a much wider constituency of third sector organisations across Scotland.

SCVO welcomes the introduction of the Climate Change (Scotland) Bill. SCVO is especially concerned that inequalities at the global, national and local levels exacerbate the damaging effects of climate change on those least able to cope with and adapt to them. This has direct implications for the provision of services by many SCVO members.

As a prospective member of the Stop Climate Chaos Campaign (SCCS), SCVO supports the SCCS response (Annex I) to the call for views on the Bill by the Committee on Transport, Infrastructure and Climate Change with respect to the specific questions raised. Further to this, however, SCVO would particularly like to echo the points made below in responses by the Church of Scotland (Annex II) and the Royal Society of Edinburgh (Annex III) and to draw the attention of the Committee to the significant role which the voluntary sector and community groups have in offering solutions to both the mitigation of and adaptation to climate change.

“…it would be helpful for the legislation to embody a requirement for public bodies to engage with voluntary organisations in the delivery of this [public engagement] duty.”

Written submission from Church of Scotland to the Transport, Infrastructure and Climate Change Committee, para 11.

“Central and local government are crucial in providing leadership and setting the terms of that engagement, but non-governmental and voluntary bodies will need to energise civic society and promote individual and collective responsibility.”

Written submission from Royal Society of Edinburgh to the Transport, Infrastructure and Climate Change Committee, para 23.

The Climate Change (Scotland) Bill has set ambitious targets on emissions reductions, which are to be applauded. For behavioural change to occur on the scale required to meet these targets and, more importantly, for there to be a genuine reduction in overall CO2 emissions, individuals and communities must be thoroughly engaged in the process and an integral part of the solution: they will need to understand fully the reasons behind what will inevitably be the harsh realities of change and difficult policy decisions.

The current iteration of the Bill fails to recognise properly the fundamental need for public involvement.

The voluntary sector has the potential to play a central leadership role in facilitating behaviour change amongst communities across Scotland.

SCVO believes that provision for the need for engagement to be incorporated in the Bill can be accommodated, as follows:
Part 1 – Emissions Reduction Targets
4 Setting annual targets

Recognition of the opportunities which community groups and the public present as activists in addressing climate change and contributing to reduction targets is necessary. When setting annual targets, in addition to those issues listed under 4 (a)-(h), it is proposed that Scottish Ministers should also have regard to the capacity and potential of a mobilised public to help achieve these.

Part 2 – Advisory functions
20 Scottish Committee on Climate Change + Schedule 1
22 Advice on annual targets etc

With reference to the establishment of a Scottish Climate Change Committee, it is important that representation of the third sector be included on the Committee to ensure that the role of the sector as a contributor to solutions is recognised in advice to Ministers. Such representation would be relevant, for example, with respect to 22 (3) (c), i.e. the sectors of the Scottish economy in which there are particular opportunities for contributions to be made towards meeting the targets through reductions in emissions of greenhouse gases; and would acknowledge that such opportunities extend beyond the confines of ‘the economy’.

Part 4 – Duties of public bodies relating to climate change
36 Duties of public bodies relating to climate change

There is specific need within the Bill for commitment by the Scottish Government actively to engage with communities in the promotion of understanding climate change and the implications of the Climate Change (Scotland) Bill, i.e. to explain the scale of the problem and the necessity for targets, what these targets are and how they are to be achieved. It is proposed that included in the duties of public bodies is a binding commitment to engage with communities and the general public on promotion of the objectives of the Bill.

Part 4 – Duties of public bodies relating to climate change
38 Reporting on climate change duties

Following on from the previous point, Ministers’ duties on reporting under the Bill should therefore incorporate reporting on the extent and effectiveness of engagement with the public, as proposed above.

Background to the role of the voluntary sector

It will only be with concerted and collective effort that the issue of climate change can be addressed and we believe that this is dependent on action at ground level by an informed and engaged public. With appropriate support, the voluntary sector is well placed to complement this effort and to help mobilise communities and individuals in responding to the challenge of climate change. A number of voluntary organisations have developed experience and are already dealing with the consequences of climate change.
SCVO recognises that the effects of climate change in Scotland will affect the poorest most acutely. The impact of rising fuel prices and concomitant increases in fuel poverty already bear this out. It will be Scottish communities which experience the impacts of climate change most directly and it must therefore be those same communities which need to be empowered to be a focus for mitigation and, especially, adaptation efforts. Through its wide membership, SCVO is positioned to support communities to respond to climate-induced events and anticipate future needs.

There is a range of examples across Scotland in which the voluntary sector has embarked on initiatives which, whether or not it is their primary objective, contribute to mitigation efforts and progress towards a low carbon society. These include community renewable energy projects, re-use and recycling initiatives, and cooperative transport schemes. They are inspired by a diversity of individuals, voluntary organisations, community and faith groups, and social enterprises. They are not isolated cases and reflect a growing willingness amongst the public to act. Despite this, the level of understanding amongst the public overall of the relevance of climate change and of the Climate Change (Scotland) Bill in particular, appears to be low. Further, there is an assumption that, for example, when an extreme weather event occurs, it is the public authorities who will come to the rescue. If predictions about climate change are to be believed, the frequency and extent of such events in future mean that it will be vital for communities themselves to understand the risks involved and to build up resilience to the associated dangers. Again, the voluntary sector can make a positive contribution to working with communities to strengthen their ability to adjust to changing conditions.

SCVO strongly believes that recognition of the role of the public and the capacity of the voluntary sector working with communities should be included in this extremely important piece of legislation to ensure that efforts to address climate change are maximised across society.

Annex III – Written submission from Royal Society of Edinburgh to the Transport, Infrastructure and Climate Change Committee
CLIMATE CHANGE (SCOTLAND) BILL
LETTER 18 MARCH 2009 – ANNEX A – 3% PER YEAR EMISSION REDUCTIONS

I wrote to you on 18 March on the Climate Change (Scotland) Bill and at Annex A provided information on officials’ analysis of the proposal for three percent, year on year, annual reductions to 2019.

Since that letter, work has been ongoing to further refine the data we used as the basis of our analysis and to update estimates of abatement potential. This has led us to revise some of the figures which were set out in my earlier letter.

To allow the Committee to make its recommendations in the light of the most up to date information, I have set out the changes in the figures from my previous letter in Annex 1 below.

I would stress that the revised figures set out below are current “best estimates” of potential savings. As you are aware there is a considerable amount of analytical work being commissioned in the field of climate change and no doubt this will provide further refinements to the data. I would intend to keep the Committee advised of any further revisions.
The updating of the figures was completed just as my officials received a copy last week of the supplementary evidence paper from Stop Climate Chaos Scotland (SCCS). Unfortunately, there were significant errors in the figures used in this paper, particularly those seeking to reflect Scottish Government analysis. Officials have had discussions with SCCS and I understand SCCS has now issued a revised paper to Committee members.

Nonetheless, a number of concerns remain regarding the issues raised in the SCCS paper and I address some of these briefly in Annex 2 below.

However, this does highlight the complicated nature of some of the key principles in the proposed legislation and delivery of it. Given this, I would be happy for officials to work with Committee clerks in setting up additional informal meetings with the Committee in the coming weeks to discuss further any of these key issues.

STEWART STEVENSON
3% PER YEAR EMISSIONS REDUCTIONS

1. Annex A from the letter “CLIMATE CHANGE (SCOTLAND) BILL”, sent by The Minister for Transport, Infrastructure and Climate Change to the Convener of the TICC Committee on 18 March 2009 sought to demonstrate that adopting even the most radical measures proposed by the Committee on Climate Change (CCC) would be far from sufficient to meet 3% per year emission reductions. It was stated that the measures proposed by the CCC to meet its “Intended Target” of a 42% reduction by 2020 (against 1990) would leave a gap of over 7 MtCO$_2$e compared with the reductions needed to 2020.

2. This is a complex area and analysis of potential carbon savings is ongoing and, since the letter was sent, officials have refined their estimates. It is now estimated that the more radical (42%) measures proposed by the CCC, alongside current Scottish Government policies, would leave a smaller gap, of some 5 MtCO$_2$e, in the reductions needed to 2020.

3. The reasons for this change are as follows.

   a. Slight adjustments have been made to the assumed path of the Scottish traded sector from 2006 to 2020. The CCC also recently revised its “business as usual” projections to 2020 for transport and for non-CO$_2$ greenhouse gases. These two changes mean that, to meet the target in 2020 associated with a 3% annual reduction trajectory, abatement of around 13 MtCO$_2$e against “business as usual” is needed between 2006 and 2020 (rather than the 14 MtCO$_2$e stated in the previous letter).

   b. Estimates of the potential abatement from each sector have also been revised, to take into account where Scotland differs from the rest of the UK.

   c. The greatest change in estimated abatement potential is from forestry. The previous paper took a pro-rata share of the CCC’s estimated UK savings from forestry. More robust estimates from Forestry Commission Scotland of the savings that would be achieved by a 15 000 hectares per year planting rate in 2020 are now being used instead. This adds almost 1 MtCO$_2$e to the savings estimated previously.

   d. Other slight increases in estimated abatement potential come from domestic buildings, transport, waste and agriculture and these have now been factored in.

   e. In total, these changes increase the possible abatement to some 8 MtCO$_2$e in 2020, leaving the aforementioned 5 MtCO$_2$e shortfall. As was stated in the earlier letter, not all of these savings would necessarily be available because some of them are from UK and EU measures which are not currently being implemented.
Stop Climate Chaos supplementary paper

The following are headlines covering some of our concerns over the issues raised in the SCCS supplementary paper.

Table at page 3 of the supplementary paper

As set out above the table uses incorrect figures and double counts many of the savings identified as additional. SCCS have agreed to provide the Committee with a revised paper.

Projections

The CCC’s revised “business as usual” projections, discussed in Annex 1, show a rise of around 1 MtCO$_2$e in non-traded sector emissions between 2006 and 2020. The projections used by SCCS in their paper exclude the absorption of CO$_2$ from forests and other land, which is included as standard in Scottish emissions figures. This has a material effect on projections and we are unclear why SCCS has adopted this approach.

Additional savings identified by SCCS

The savings listed in the table in Appendix 1 of the SCCS paper have been drawn from various documents, and it is not clear how much of these savings are already accounted for in either the CCC’s “business as usual” projections or the measures to deliver their Extended or Stretch Ambition. Additionally, the costs per tonne of CO$_2$e abated may not have been fully taken into account, whereas the CCC, in recommending measures, does consider cost effectiveness.

Future contribution to carbon savings by the Traded Sector

The 18 March letter to the Committee set out the Scottish Government analysis of the 3% proposal on the basis of current circumstances i.e. without there being a global deal. The Bill will become law before such a global deal and therefore we need to consider targets on the basis of the current ability to deliver.

We are aware of the additional expectation that will come upon the Traded Sector in the event of any global deal, and of the CCC’s recommendations for delivery of a 42% target. It was made clear at the end of the 18 March letter to the Committee that the Scottish Government would review the 2020 target in the light of changed international circumstances.

The SCCS supplementary paper makes a number of points around the Traded Sector of which we have concerns. Officials will have continuing dialogue with SCCS and would be happy to discuss further with the Committee at any future informal session.
CLIMATE CHANGE (SCOTLAND) BILL

Transport, Infrastructure and Climate Change Committee

Stage 1 Report

SCOTTISH GOVERNMENT RESPONSE

5 May 2009
# Climate Change (Scotland) Bill

## Transport, Infrastructure and Climate Change Committee

**Summary of Recommendations on Parts 1-4**

### High-level Summary

<table>
<thead>
<tr>
<th>The Committee welcomes the Bill and endorses its general principles.</th>
<th>Scottish Ministers welcome the Committee’s support for the Scottish Government’s world leading legislation to tackle climate change.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>The Committee affirms its support for the inclusion of the six key greenhouse gases within the Bill and agrees with the general balance of opinion that the 80% emissions reduction target for 2050 is the minimum which is necessary.</th>
<th>Scottish Ministers welcome this recognition and support for these key elements of the Bill.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>The Committee believes that the framework for emissions reductions targets set down for the period between 2010 and 2019 needs to be more robust. The Committee wishes to see the interim target brought forward from 2030 to 2020, in line with changes proposed by the UK Government in advance of international discussions due to take place in Copenhagen later in 2009.</th>
<th>The Scottish Government has committed to introducing a new 2020 interim target in the Bill to replace the existing 2030 target. This new target will be pivotal in incentivising early action to reduce greenhouse gas emissions during the next decade, steered by the statutory annual targets to be set in line with the 2020 target.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>The Committee calls on the Scottish Government to put before the Parliament at the earliest possible date a comprehensive strategy document outlining how it intends to achieve the targets set out in the Bill.</th>
<th>The Strategic Overview Project looks at the high level measures required in each sector to meet our 2020 targets and the transformational measures that we will need to achieve our 2050 target and deliver a low carbon economy. One of the key outputs of the Strategic Overview Project will be an Indicative Delivery Plan which will be published in summer 2009. This will involve engagement with key stakeholders and act as a bridge to the more detailed statutory Report on Policies and Proposals which will set out the measures to deliver our annual targets to 2022, to be published summer 2010.</th>
</tr>
</thead>
</table>
**Targets - methodology**

<table>
<thead>
<tr>
<th>Recommendation 1</th>
<th>A review of the process of producing the annual disaggregated greenhouse gas inventories has been commissioned jointly by the UK Government and Devolved Administrations. The review will consider the practicability of whether data can be published earlier, as well as the potential to produce provisional Scottish emissions estimates in advance of the final Scottish inventory. The Committee will be advised of the progress of this work. SEPA is among the key data providers to the UK’s emissions inventories. The Scottish Government will continue to work with SEPA to explore how it can support the delivery of climate change objectives.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Recommendation 2</strong></td>
<td>When producing the final annual assessment of Scottish greenhouse gas emissions, a significant amount of time is devoted to data quality assurance processes. As stated in response to Recommendation 2, the Scottish Government is reviewing whether data can be published earlier, and importantly without compromising accuracy. The outcome of this work will also inform decisions around the use of provisional emission estimates in the future.</td>
</tr>
</tbody>
</table>

The Committee recommends that the Scottish Government increases its efforts to identify the means by which the 18 to 20 month reporting time [for reporting emissions] can be reduced and keeps this Committee up to date with its progress in meeting this objective. The Committee notes the potential expertise offered by SEPA in the field of emissions monitoring and recommends that the Scottish Government considers how this could best be employed to support the Bill framework. The Scottish Government will continue to work with SEPA to explore how it can support the delivery of climate change objectives. When producing the final annual assessment of Scottish greenhouse gas emissions, a significant amount of time is devoted to data quality assurance processes. As stated in response to Recommendation 2, the Scottish Government is reviewing whether data can be published earlier, and importantly without compromising accuracy. The outcome of this work will also inform decisions around the use of provisional emission estimates in the future. SEPA is among the key data providers to the UK’s emissions inventories. The Scottish Government will continue to work with SEPA to explore how it can support the delivery of climate change objectives. SEPA is among the key data providers to the UK’s emissions inventories. The Scottish Government will continue to work with SEPA to explore how it can support the delivery of climate change objectives. When producing the final annual assessment of Scottish greenhouse gas emissions, a significant amount of time is devoted to data quality assurance processes. As stated in response to Recommendation 2, the Scottish Government is reviewing whether data can be published earlier, and importantly without compromising accuracy. The outcome of this work will also inform decisions around the use of provisional emission estimates in the future. SEPA is among the key data providers to the UK’s emissions inventories. When producing the final annual assessment of Scottish greenhouse gas emissions, a significant amount of time is devoted to data quality assurance processes. As stated in response to Recommendation 2, the Scottish Government is reviewing whether data can be published earlier, and importantly without compromising accuracy. The outcome of this work will also inform decisions around the use of provisional emission estimates in the future.
### Recommendation 3

The Committee recommends that the Scottish Government clarifies what emissions data it intends to place in the public domain in order to allow the Parliament and other interested parties to scrutinise its performance in meeting its targets.

The annual *Greenhouse Gas Inventories for England, Scotland, Wales and Northern Ireland* is the main source of information on greenhouse gas emissions in Scotland. This document is published annually and its reporting is consistent, as far as possible, with international reporting guidelines.

As confirmed to the Committee in March 2009, Scottish Ministers are committed to publishing the formal advice they receive from the UK Committee on Climate Change on annual targets.

### Recommendation 4

The Committee recommends that a mechanism for reporting on consumption should be established which is in addition to, but separate from, the framework of targets set out in the Bill.

The Scottish Government recognises the growing importance of the need to consider the greenhouse gases associated with Scotland’s consumption and has noted the Committee’s recommendation.

The Scottish Government has established a National Indicator to reduce the overall ecological footprint of Scotland’s consumption and production.

The ecological footprint gives an overall measure of the global impact of our everyday choices and offers an estimate of the land and sea area needed to provide all the energy, water, transport, food and materials that we consume.

Research is underway to update Scotland’s ecological, and carbon, footprint. Outputs of the current work are expected in 2010.

The complex nature of the calculation of this indicator means there is a substantial lag in providing estimates. Data lag can exceed three years.
<table>
<thead>
<tr>
<th>Recommendation 5</th>
</tr>
</thead>
<tbody>
<tr>
<td>The Committee recommends that the arrangements for reporting on consumption should be flexible enough to take account of developing international understanding of the methodology for consumption reporting.</td>

<th>Recommendation 8</th>
</tr>
</thead>
<tbody>
<tr>
<td>The Committee therefore recommends that the Scottish Government should be required, in setting out its approach to the meeting of the targets, to define and quantify how each of the four key sectors; land-use, energy generation, energy efficiency and transport are expected to contribute to overall emissions reductions.</td>
</tr>
<tr>
<td>The Government’s draft Indicative Delivery Plan, to be published in summer 2009, will set out the key sectors for emissions reductions - heat supply and demand, electricity supply and demand, transport, rural land use and waste - and identify where action will have to be taken to meet Scottish targets.</td>
</tr>
</tbody>
</table>
## Aviation and shipping

### Recommendation 9

The Committee recommends, as a first step, that the Scottish Government considers how the multiplier effect for radiative forcing can be incorporated into the data on aviation emissions, so that additional damage to the atmosphere that occurs when emissions take place at high altitude is taken into account.

The Committee suggests that the Scottish Government requests advice from the UK Committee on Climate Change on how best to measure and incorporate these effects.

Section 14(3) of the Bill requires Scottish Ministers to request expert advice before bringing forward an order to commit to a methodology to calculate Scotland’s share of international aviation and international shipping emissions.

Scottish Ministers intend to seek this advice from the UK Committee on Climate Change and anticipate the Committee will offer a view on radiative forcing. This advice will be sought in advance of bringing forward secondary legislation under this section — required by June 2010.

### Recommendation 10

The Committee requests clarification on the approach which the Scottish Government intends to take in relation to shipping emissions in advance of bringing forward an order under section 14 of the Bill.

The Scottish Government is content to commit to consulting with the Committee on future orders under section 14.

### Recommendation 11

The Committee recommends that there should be separate provisions covering aviation and shipping emissions in the Bill.

Section 14 of the Bill currently offers a flexible approach, permitting separate orders on international aviation emissions and international shipping emissions to be brought forward.
### The interim target and targets to 2019

<table>
<thead>
<tr>
<th>Recommendation 12</th>
<th>The Scottish Government intends to introduce an amendment to the Bill to introduce a new 2020 target to replace the existing 2030 target.</th>
</tr>
</thead>
<tbody>
<tr>
<td>If the government is now willing to set a challenging interim target for 2020, it must buttress that approach either by specifying percentage annual targets between 2010 and 2020 or by bringing significantly forward the date by which it expects Scotland to be on track with a 3% annual reduction in emissions.</td>
<td>In line with the UK Committee on Climate Change's first report to the UK Government (December 2008), Scottish Ministers will propose that this target will be set at “at least 34%”.</td>
</tr>
<tr>
<td>The Committee recommends that the Scottish Government should introduce more challenging provisions into the Bill for the period 2010 to 2019 in order to promote early action to reduce emissions.</td>
<td>Scottish Ministers also intend to introduce an amendment requiring that the interim target must be “at least 42%” once the EU adopts at least 30% as its target for greenhouse gas emission reduction over the period 1990 to 2020.</td>
</tr>
<tr>
<td>The Scottish Government should accompany a challenging interim target for 2020 with either specifying percentage annual targets between 2010 and 2020 or by bringing forward the date by which it expects Scotland to be on track with a 3% annual reduction in emissions.</td>
<td>A new enabling power will accompany the amendments for the new 2020 target to allow the Scottish Ministers to increase the 2020 target.</td>
</tr>
<tr>
<td>As already indicated the Scottish Government will formally seek the advice of its independent advisers, the UK Committee on Climate Change, for recommendations on the annual targets to 2022. These annual targets will be brought forward for agreement by the Scottish Parliament by 1 June 2010.</td>
<td>As Scottish Ministers are determined that this new 2020 target will provide a meaningful incentive to take early action to reduce emissions in the short term to 2020.</td>
</tr>
<tr>
<td>In setting the 2020 target the Scottish Government has considered the best evidence available, principally the first report of the UK Committee on Climate Change, in addition to internal analysis by experts within the Scottish Government and information on UK carbon budgets to 2022 announced as part of the Chancellor's Budget Statement.</td>
<td></td>
</tr>
</tbody>
</table>
Recommendation 13

The Committee identified it wished further information on the scientific and policy advice on which the Scottish Government is basing these decisions on, the extent to which it has calculated the financial implications of the decisions and a robust appraisal of any impact on jobs.

The Stern Report and the UK Committee on Climate Change's first Report both clearly set out that the cost of inaction outweighs the costs of tackling climate change. This is explained in the Financial Memorandum for the Bill.

As the Scottish Government takes forward its work on delivery and the development of the Scottish Report on Policies and Proposals, we will be refining our understanding on the costs of delivery and the consequential opportunities for jobs and sustainable economic growth by moving to a low carbon economy.
## Achieving the targets

<table>
<thead>
<tr>
<th>Recommendation 14</th>
<th>The Committee recommends that Ministers bring forward proposals for an engagement strategy as part of their implementation plan for the Bill.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The Scottish Government will publish a first version of the Indicative Delivery Plan in summer 2009. Officials will be engaging on this with key stakeholders over the summer and these discussions will help take forward the work to develop the Scottish Report on Policies and Proposals. The Scottish Ministers see such engagement as a key aspect of implementing the Bill over the short, medium and long term.</td>
</tr>
</tbody>

<td>This is the purpose of the Scottish Report on Policies and Proposals - to set out the measures the Scottish Ministers believe are necessary to deliver the annual targets from 2010 - 2022.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Recommendation 16</th>
<th>The Committee requests that the Scottish Government provides a clear timescale for the production of the strategy overview discussion document, and an indication as to its contents, before Stage 2.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The first version of the Indicative Delivery Plan will be published in summer 2009. It will set out, at a strategic level, the measures required in the key sectors to meet the 2020 target and the transformational measures necessary to meet Scotland's long term emissions reduction targets. This work will draw on the best available evidence including the first report of the UK Committee on Climate Change.</td>
</tr>
</tbody>
</table>
## Advisory Functions

**Recommendation 17**

The Committee recommends that the Scottish Government enters into discussions with the UK Committee on Climate Change with a view to conducting a realistic analysis of the nature, level and frequency of the advice it is able to provide and the additional dedicated financial and human resources which might be required.

This Committee therefore further recommends that this information should be made available to the Parliament prior to the beginning of Stage 2. If the UK Committee on Climate Change is not able to provide the necessary commitments in respect of its resources and engagement with Scottish interests, then the Scottish Government should consider what other models might be appropriate.

Scottish Ministers are pleased that the Committee supports its use of the UK Committee on Climate Change in the first instance for expert advice.

The Minister for Transport, Infrastructure and Climate Change confirmed to the Committee by letter on 18 March that Scottish Ministers will take expert advice from the UK Committee on Climate Change prior to bringing forward an order to establish annual targets. Scottish Ministers have confirmed that they will publish this advice.

Scottish Ministers believe it would be premature to seek that advice formally when the Parliament is still in the process of scrutinising the Bill. Meantime officials continue to work closely with the UK Committee to ensure that the necessary work is in place to enable the Committee to give appropriate advice on annual targets when required.

Following Royal Assent, there will be a need to discuss with the UK Committee the advice and support it can provide to the Scottish Government more generally. Section 38 of the Climate Change Act 2008 provides a statutory context for this - placing a duty on the UK Committee to provide advice to the national authorities on request, either in relation to the UK Act, climate change more generally, or to Devolved Administration targets. The UK Committee also has a well-established business planning process, involving a Sponsor Group comprising representatives of UK Government and Devolved Administration representatives. The annual business planning process provides an opportunity for the UK Government and Devolved Administrations to request advice under section 38 of the 2008 Act and is a mechanism for ensuring that the UK Committee can plan and manage its work and resources effectively.

As noted in the Financial Memorandum, Scottish Ministers believe that requesting advice from the CCC is more cost-effective than any other option. Should this position change for any reason, Ministers would of course investigate alternative options for receiving expert advice - for which the Bill makes provision.

The UK Committee's corporate plan will be published shortly and will reflect Scottish Government requirements. Scottish Ministers are content to provide further information on this before Stage 2.
**Reporting Duties**

**Recommendation 18**

The Committee notes the requirement in the Bill for Ministers to provide a statement to the Parliament in particular circumstances, such as if an annual emissions target has not been met.

The Committee considers that this provision is welcome, however, it notes that a requirement only to give a statement to the Parliament would not allow full and robust questioning of Ministers.

The Committee considers that a more appropriate option would be that a replacement provision be placed in the Bill requiring Scottish Ministers to make themselves available to attend a public meeting of the parliamentary committee (or committees) with climate change issues within its remit, to give evidence on their reports on meeting annual targets.

Scottish Ministers are committed to open and transparent scrutiny of their actions to deliver the new Scottish climate change targets.

The requirement for Ministers to provide an annual statement for Parliament reflects this and offers the Parliament an opportunity to question Ministers.

It is at the discretion of the Parliament whether it chooses to accept such an offer and the length it assigns to questioning the Minister. Such a statement can also be accompanied by one or more invitations to the relevant lead Minister to give evidence to Parliamentary Committees.

Section 34 of the Bill provides a wide selection of mechanisms by which Parliament can hold Scottish Ministers to account. It includes an offer to meet with all the Conveners of Parliamentary Committees.

These provisions far exceed what has ever been offered to the Scottish Parliament in primary legislation and demonstrate the willingness of Scottish Ministers to extend the boundaries of Parliamentary scrutiny in recognition of the significance and crosscutting nature of climate change.

The Government regrets that the Committee do not appear to have accepted these provisions in the spirit in which they were intended.

The character of the engagement between Government and Parliament should reflect the need for all policy areas to act on Climate Change.

The Committee has an opportunity to amend these provisions at Stage 2 if it wishes.
### Duty on public bodies

**Recommendation 19**

The Committee recommends that the Scottish Government should create a general duty on public bodies to take account of climate change in their activities, although the Committee is of the view that concerted action will be required in order to translate this general duty into meaningful action.

Scottish Ministers believe it is not appropriate to apply rigid and inflexible duties in primary legislation. The Bill contains enabling powers to permit such duties to be applied in the future if the voluntary approach fails.

Scottish Ministers are very supportive of the current initiatives being undertaken to reduce greenhouse gas emissions in the public sector. One noteworthy example is the commendable support that CoSLA and Scottish Local Authorities have shown in taking forward Scotland’s Climate Change Declaration. Forcing inflexible and unchangeable duties on such bodies in this Bill threatens to undermine the excellent work already underway in this area.

If in time additional efforts or focus are required, either widely across the public sector or more specifically in targeted areas, the enabling powers in the Bill allow this to be taken forward in a consultative manner, with the support of Parliament.

Scottish Ministers maintain that this voluntary response is the better approach rather than applying a duty on public sector bodies now – with the powers available in the Bill able to be called into play if considered necessary at some future date.
Recommendation 20

The Scottish Government has considered this recommendation. It considers that providing a list of public bodies in the way suggested by the Subordinate Legislation Committee would not be in line with the approach adopted in the Freedom of Information (Scotland) Act 2002. The 2002 Act includes a list of this kind because the Act itself places direct duties on the bodies listed. The provisions in the Climate Change (Scotland) Bill do not apply a climate change duty on public bodies but instead create an enabling power under which such duties can be created in secondary legislation.

Including in the Bill a list of public bodies to which a climate change duty might be applied in the future could cause significant confusion for those bodies. It would be highly likely that bodies would need to be included in the list for the sake of completeness but upon which climate change duties may never need to be applied. If multiple duties with differing purposes are created, some bodies may also be subject to different combinations of duties.

The Scottish Government’s preference is to include details of public bodies to which climate change duties apply in the secondary legislation used to create those duties. This approach will be clearer for the bodies involved and will avoid the need to amend the Bill every time a new duty is created under the enabling power in section 36(1).

The Subordinate Legislation Committee recommended that the wide scope of the enabling power in section 36 of the Bill could be mitigated to some extent by the provision of a list of public bodies to whom the power is to apply along with a power to add to the list subject to affirmative procedure.

This Committee endorses this recommendation and seeks a response from the Scottish Government on this point ahead of Stage 2. The Committee recommends that full consultation should be carried out in advance of any affirmative subordinate legislation being brought to the Parliament under this section.
### Adaptation

**Recommendation 21**

The Committee supports the adaptation provisions in the Bill and looks forward to considering the first report in this subject published by the Scottish Government on this subject.

The Scottish Government welcomes the Committee's support for the adaptation provisions.

### Muirburn

**Recommendation 22**

On the basis of the comments made by the Rural Affairs and Environment Committee and following the Minister for Environment's stated intention to bring forward an amendment to the muirburn provisions at Stage 2, the Committee is content with these proposals.

The Scottish Government welcomes the Committee's support for the muirburn provisions and for the Government's intended amendment at Stage 2.

Annex A contains a response to the specific comments made by the RAE Committee.
Recommendation 23
This Committee endorses the recommendations in the report of the Rural Affairs and Environment Committee and notes that the Scottish Government has recently changed its position on one of these recommendations - the leasing proposals. This Committee notes that further clarification may be needed on the implications of the Scottish Government's policy change, particularly the status of the funding for the mitigation of climate change which was mentioned in the Policy Memorandum as resulting from this proposal.

Now that the leasing proposal is no longer being taken forward, the Scottish Government needs to explore other options to achieve the annual 10,000 hectare woodland creation target. The ability to form companies for renewable energy development will provide funding in the medium to long term. FCS is also exploring options for help in the short term, including improving woodland creation measures in the SRDP and further use of the existing 'repositioning' programme (whereby woodland of low public benefit is sold to provide income to buy land which can be planted for greater public benefit).

Annex A details responses to the RAE Committee recommendations.

Recommendation 24
The Committee recommends that in future, where there is a strong possibility that legislative proposals will be substantially altered by the outcome of a consultation, they are only brought to the Parliament once that consultation has been completed and the results properly assessed.

The Committee's recommendation is noted. Scottish Ministers agree that Bill provisions should be fully assessed before they are brought to Parliament. However in this case the leasing proposal arose after the Bill process had begun. The proposal had the potential to realise £200m, so it was certainly worthy of serious and immediate consideration. Gauging public opinion was, of course, essential, and the consultation exercise, analysis of responses, and determination of recommendations were carried out as quickly as possible (in light of the ongoing Bill) but also with due diligence.

The Committee will wish to note that the Economy, Energy & Tourism Committee recommendations are detailed in Annex B.
## Recommendation 25

This Committee endorses the conclusions of the RAE Committee’s report on the Bill and calls on the Scottish Government to respond in full to its recommendations. The RAE Committee notes that there exists opposition to the inclusion of this enabling power within the Bill. This Committee notes that the carrier bag proposal in 2006 was subject to a separate and full bill scrutiny process, rather than being included as a piece of enabling legislation within a wide-ranging bill.

Annex A details responses to the RAE Committee recommendations.

The conclusions of the RAE report on the Bill called for the Scottish Government to have regard to a range of factors. The point at which these factors will come into play is that at which any of the powers proposed in the Bill are used to make legislation. At that point the Scottish Government will have regard to these factors to the extent that they are relevant to legislation being put forward.

In the interim many of the issues the Committee identified will be addressed in a consultation on a revised National Waste Management Plan for Scotland, which will be issued later in 2009. This national plan is the proper context to address many of these themes, which are considerably wider in their application than in the Climate Change (Scotland) Bill.

As regards carrier bags in particular, the scrutiny afforded to this issue in 2006 has informed the development of proposals now. Notably, the current proposals are not restricted to only plastic bags.

## Recommendation 26

This Committee notes the evidence that action is already being taken by some retailers in respect of charging for carrier bags, and that public attitudes in relation to recycling and reusing carrier bags appear also to have shifted within the last few years. The Committee recognises that either the current provisions or a separate Bill could provide the means to implement a carrier bag charging regime.

The Scottish Government welcomes the action being taken by retailers not only in respect of charging, but also on other ways of reducing bag use. This action is being taken in the context of changed public attitudes. As the Cabinet Secretary for Rural Affairs & the Environment informed the RAE Committee on 4 February 2009, we "would not expect to use the provisions if we achieved the same objective outwith legislative routes. However, we are not yet at that point and it is important that Parliament and the Government have the wherewithal to achieve our objectives for Scotland."
### Recommendation 27

The Committee recommends that the Scottish Government reflects seriously as to whether its approach in relation to this provision is the correct one. The Committee is not convinced as to the value of this approach, and notes that the timing of the proposal may owe more to the availability of this Bill as a suitable legislative vehicle for introducing enabling powers rather than the powers being urgently required.

The Scottish Government notes that a similar provision is now in force in all other parts of the UK. Indeed, the Environment Minister of the Welsh Assembly Government has instructed her officials to prepare regulations. Such legislation could provide useful lessons. At the very least, it is appropriate that Scotland should have a similar weapon in its armoury at a time when this issue is under active consideration elsewhere in the UK.
### Financial Memorandum

#### Finance Committee Report

<table>
<thead>
<tr>
<th>Conclusion 28</th>
<th>The Scottish Government welcomes the acknowledgement by the Finance Committee that there is uncertainty over some of the costs associated with bringing forward long term targets for reducing carbon emissions and is pleased to note that the Committee accepts that the margins of uncertainty are adequately reflected in the Financial Memorandum.</th>
</tr>
</thead>
<tbody>
<tr>
<td>The Committee acknowledges the uncertainty over some of the costs associated with the Bill, particularly in relation to the performance of unproven technologies and methods for reducing carbon emissions. The Committee accepts that the Financial Memorandum adequately reflects these margins of uncertainty.</td>
<td>The Committee notes the enabling nature of the Bill, particularly Part 5 and considers that the Financial Memorandum would have been stronger if modelling work had been carried out on the potential financial impact of the measures on businesses and public bodies. The Committee also considers that in a number of areas insufficient policy direction has been provided, which has made it difficult for local authorities and businesses to be able to assess the financial impact of the proposals.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Conclusion 29</th>
<th>The Scottish Government notes the Committee's views on the enabling powers in the Bill and the associated financial information provided in the Financial Memorandum. The Committee will wish to note that the Financial Memorandum will be revised at Stage 2 to take account of changes to the Bill, including the Part 5 forestry and non-domestic building provisions. Officials are also looking to include any new costing information which has become available since the introduction of the Bill. In particular, the UK Committee on Climate Change's first report in December 2008 and the UK Carbon budgets, announced by the Chancellor in April, are being scrutinised for additional information to help aid the financial information presented on the Bill.</th>
</tr>
</thead>
</table>
The Committee notes that the Scottish Government is currently undertaking significant pieces of work to finalise some aspects of its policy, namely the Strategic Overview project, an options review on forestry proposals and the consideration of energy efficiency scenarios and considers that this work will provide vital indications of future costs. Given the significant implications of this work, the Committee would have preferred that it had been completed in time for its consideration of the Financial Memorandum to the Bill. As a result, the Committee expects to take an interest in scrutinising the financial impact of the outcomes of this work. The Committee, nonetheless, welcomes the Government’s commitment that all substantive regulations will be accompanied by a fully costed regulatory impact assessment.

These points are noted.

Scottish Ministers welcome the Finance Committee’s continuing scrutiny of the different policy objectives contained in the Bill and are happy to work with the Committee to provide further information as it becomes available in the future.

As confirmed to the Finance Committee, as the range of enabling powers in the Bill are brought forward for implementation, all secondary legislation instruments presented to Parliament for consideration will be accompanied by costed regulatory impact assessments.

As the Committee will be aware, the Financial Memorandum sets out the current understanding and knowledge on costs. Further detail on the costs of delivering measures to meet the 80% target can be found in the AEA Report "Mitigation against climate Change in Scotland: Identification and Initial Assessment of Policy Options" commissioned by the Scottish Government and published in November 2008. This can be found at:

http://www.scotland.gov.uk/Publications/2008/11/19142102/0

Work is ongoing through the Strategic Overview Project to refine the Scottish Government’s understanding of the costs involved in delivering measures to meet the climate change targets. This work will continue as the statutory ‘Report on Policies and Proposals’ is developed for publication in 2010.
<table>
<thead>
<tr>
<th>Conclusion 31</th>
<th>Scottish Ministers welcome the Finance Committee's continuing engagement with the Bill and its associated future statutory instruments. Scottish Ministers are happy to work with the Committee to provide additional information as it becomes available.</th>
</tr>
</thead>
</table>
| The Committee has given notice that it may seek to track subsequent statutory instruments made under the provisions in the Bill and seek to scrutinise their financial implications. | **Recommendation 32**  
Given the long-term perspective of the Bill, and the wide range of policy streams that may contribute to its implementation, the Committee recommends that the Scottish Government should consider how it will monitor and control the cumulative costs of implementation.  
1. | Scottish Ministers acknowledge the Finance Committee's recommendation and will consider this carefully as delivery plans crystallise and carbon accounting mechanisms develop and mature. |
**Transport, Infrastructure and Climate Change Committee**

**Recommendations on the Financial Memorandum**

<table>
<thead>
<tr>
<th>Recommendation 33</th>
<th>Scottish Ministers welcome the Committee's endorsement of the Finance Committee's recommendations.</th>
</tr>
</thead>
<tbody>
<tr>
<td>This Committee endorses the conclusions contained in the report of the Finance Committee and in particular its strong comments regarding the uncertainty of the figures contained in the Financial Memorandum.</td>
<td>As indicated to the Finance Committee, the Scottish Government is considering ways in which the financial information in the Financial Memorandum can be updated and improved.</td>
</tr>
<tr>
<td>The Committee welcomes the intention of the Finance Committee to take an interest in the financial impact of the outcomes of the Scottish Government's ongoing work on climate change, and the indication that it may scrutinise the financial impact of any subordinate legislation brought forward under the Bill. However, the Committee believes that the financial information provided is totally inadequate given the scope and importance of this piece of legislation and a revised financial memorandum is required before the Bill can be approved.</td>
<td>The Committees will wish to note that Scottish Government officials are considering new costing information which has become available since the introduction of the Bill. In particular the UK Committee on Climate Change's first report in December 2008 and the UK Carbon budgets, announced by the Chancellor in April, are being scrutinised for additional information to help aid the financial information presented on the Bill.</td>
</tr>
<tr>
<td>This Committee recommends that the Scottish Government prepare a revised financial memorandum in advance of Stage 3 consideration of the Bill.</td>
<td>Where updated and improved information is available, with Parliament approval, Scottish Ministers will seek to revise the Financial Memorandum to include this new and additional information.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Recommendation 34</th>
<th>The Scottish Government has noted this recommendation.</th>
</tr>
</thead>
<tbody>
<tr>
<td>The Committee recommends that the Scottish Government provides, as a matter of urgency, details on how it intends to assess and present the job implications of plans it brings forward under this Bill. The Committee recommends that these plans must be developed in partnership with employers and trade unions to ensure that potential job losses can be avoided and job opportunities in sustainable industries are maximised.</td>
<td>The Energy Efficiency Action Plan will include consideration of skills and training issues associated with the development of energy efficiency, and an assessment of the potential for jobs which will of course contribute to the nation's economic recovery.</td>
</tr>
</tbody>
</table>
This work is being led by the Energy Efficiency Programme Board, recently established by the Scottish Government.

The Renewable Heat Action Plan “will include consideration of skills and training issues associated with development of the renewable heat market. The wider Renewables Action Plan, which will be published later in 2009, is being structured in the context of the Scottish Government’s commitment to economic recovery, and will include an assessment of the potential for jobs within the renewable energy sector overall, including renewable heat.

This will cover opportunities from the short-term need to up-skill plumbers to install microgeneration, to the likely growth of maintenance jobs on onshore windfarms, to the longer-term potential transfer of skills from the oil and gas sectors across to the emerging marine energy sector. This work is being led by the Renewable Energy Skills Group, chaired by the Scottish Funding Council.”

Scottish Ministers are committed to working in partnership with employers and unions.

In particular under the terms set out in the Memorandum of Understanding, signed in December 2007, the Government will continue to work with the STUC to ensure that all job opportunities are fully maximised and to ensure that any job losses are kept to a minimum.
<table>
<thead>
<tr>
<th>Recommendation 35</th>
<th>Scottish Ministers are happy to respond to the recommendations made by the Subordinate Legislation Committee. Both Committees will wish to note that these recommendations are responded to in Annex C of this document.</th>
</tr>
</thead>
<tbody>
<tr>
<td>The Committee notes the Subordinate Legislation Committee’s recommendations and recommends that the Scottish Government provides a written response to this Committee and the Subordinate Legislation Committee ahead of the start of Stage 2 which addresses the points raised in the Subordinate Legislation Committee’s report.</td>

<tr>
<td>Scottish Ministers can confirm that the leasing proposals are not proceeding.</td>
</tr>
</tbody>
</table>
and Forestry Commission will take steps to ensure longer term security for affected staff, improving on the short term security provided by TUPE regulations.

Recommendation RAE 8

The Committee appreciates assurances from the Minister on the importance the Scottish Government would place on contract conditions for any private company leasing land. However, placing restrictions on the private investor would reduce the attractiveness of the lease and the likely income available from it. If the proposal goes ahead, the Committee believes that Parliament must have the opportunity to view and comment on the draft contract or a summary of its requirements before it is finalised.

Noted.

Scottish Ministers can confirm that the leasing proposals are not proceeding.

Recommendation RAE 9

Should legislating for this policy in this Bill remain the Government's position, the Committee recommends that the Bill be amended to cap the scope of the powers provided to reflect the specific policy proposal behind these powers. In doing so, the Committee recommends that the Bill be amended to make the distinction between provisions enabling joint ventures and provisions enabling the leasing proposal, as at present the same provision enables both proposals.

Noted.

Scottish Ministers can confirm that the leasing proposals are not proceeding.

Recommendation RAE 10

The Committee specifically recommends that an upper threshold on the length of the land lease should appear on the face of the Bill as should a maximum threshold for the proportion of land to be leased at any one time.

Noted.

Scottish Ministers can confirm that the leasing proposals are not proceeding.
<table>
<thead>
<tr>
<th>Recommendation RAE 11</th>
<th>Scottish Ministers agree it would be useful for FCS to have the powers to do this. However the Climate Change (Scotland) Bill is not a suitable legislative vehicle for this, as the purpose of a community lease may extend beyond climate change.</th>

| The Cabinet Secretary for Rural Affairs & the Environment wrote to Maureen Watt MSP, the Convener, on 10 March with this information. His letter is published on the Committee's website in the papers for its meeting of 18 March 2009. |

| The Scottish Government will take this into account in taking these provisions forward. |
| In the case of the point on social and economic factors, it also notes that this is not a matter primarily to be addressed through legislation on waste. |
The need to take into account any potential negative impact on social and economic factors including in remote and rural areas, of aiming towards ambitious targets to reduce carbon emissions.

The Scottish Government will take these into account in taking these provisions forward.

Recommendation RAE 15
The Committee recommends that the Scottish Government should provide specific costed proposals for such an organisation (i.e. “clearing-house” establishment) to Parliament well in advance of the relevant instrument of subordinate legislation being laid to afford the relevant committee the opportunity to fully scrutinise the proposals.

Should the Scottish Government proceed with proposals for a “clearing house” arrangement we will seek to ensure that costed proposals are available at the stage of formal consultation, which would precede the laying of any Regulations.

Muirburn

Recommendation RAE 16
The Committee appreciates the Minister’s reassurances that the Government will actively consult with all key stakeholders at an early stage in its deliberations on how to use this power.

Scottish Ministers will seek to amend section 46 of the Bill, to make the order-making power subject to affirmative parliamentary procedure. By making this change, this will support active consultation with key stakeholders at an early stage, prior to Parliamentary scrutiny. The Scottish Government has initiated separate discussions with stakeholders covering the other issues raised in the consultation around the Climate Change (Scotland) Bill.
**Conclusions**

<table>

<tr>
<th>Recommendation RAE 17</th>
<th>Waste</th>
</tr>
</thead>
<tbody>
<tr>
<td>Concerns with the level of detail available in the Bill and accompanying documents for certain proposals; the inclusion of important proposals within subordinate legislation only (which impacts on the potential for full parliamentary scrutiny); and concerns with the timing of some of the consultations for the Bill's provisions;</td>
<td>It is customary for environmental legislation to delegate powers to the Scottish Ministers to make secondary legislation to introduce important aspects of the programme: an example is the Water Environment &amp; Waters Services (Scotland) Act 2003. Inclusion of detailed legislation on the waste provisions would seriously distort the Bill.</td>
</tr>
<tr>
<td></td>
<td>In any event we do not intend to regulate in the current economic situation. This gives sectors producing waste a chance to develop voluntary measures. If these are insufficient, regulation will need to be based on the situation prevailing at the time. They are also likely to need regular updating in the light of market developments etc.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Forestry</td>
<td></td>
</tr>
<tr>
<td>As noted by the Committee in paragraph 63, the Order making power at section 47 is subject to affirmative resolution procedure. A section 47 Order could only modify a function for a climate change related purpose, and it could not remove forestry functions without a clear climate change justification. Nor could the power be used to remove over arching duties imposed by other legislation, such as the biodiversity duty in the Nature Conservation (Scotland) Act 2004.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Wherever possible, the Government prefers to complete consultations before introducing legislation. However, it is important that the Government responds to new information and evidence, as it did by introducing the forestry provisions in the light of advice from the AEA Technology Report on options for mitigating climate change in Scotland. Consultation on the forestry provisions closed on 27 January, and a preliminary analysis of responses was provided to</td>

</tr>
</tbody>
</table>
Recommendation EET 5

The Scottish Government should makes all efforts to ensure that the education and training sector in Scotland is well-prepared and can respond to the growth in employment opportunities by providing the right number of people with the right skills at the right time, and reports back to the Committee on this as soon as possible.

The Scottish Funding Council has set-up a Renewable Core Skills Group, to look at the skills needs for the renewables sector in Scotland. Represented on the Group are: sector skills councils, Skills Development Scotland, higher and Further Education sector, along with Scottish & Southern Energy, Scottish Power and Scottish Renewables.

In addition the Sector Skills Council is doing some research for Scottish Government on...
the longer term sectoral needs – from microgeneration installation to wind farm maintenance to marine energy engineers.

The provisions under section 50 allow for an evolution of the existing energy performance certificate arrangements for buildings. The skills base has already been established and is growing rapidly. In terms of the basic cost-effective improvements that would form the backbone of Action Plans emerging from ACEPs, they would in the first instance be the tried and tested methods such as, insulating hot water tanks and roof spaces. Again the skills for this type of work already exist within the construction industry.

<table>
<thead>
<tr>
<th>Recommendation EET 6</th>
</tr>
</thead>
<tbody>
<tr>
<td>The Scottish Government should ensure that energy efficiency projects are in a position to play a full and meaningful part in meeting the statutory targets for 2010 and thereafter.</td>
</tr>
</tbody>
</table>

Current Scottish Government programmes and policies on energy efficiency will contribute to its 2010 statutory target.

The forthcoming Energy Efficiency Action Plan will detail the range of Scottish Government policies and programmes that will continue to deliver significant improvements in the energy efficiency of all sectors. The plan will include details on:

- recent announcements on funding for a major area-based home insulation scheme;
- recent announcements to bring forward proposals for a significant loan scheme; and
- an outline of current financial incentives (such as the Energy Assistance Package, household and community grants for microgeneration; the new area based home insulation scheme; the Central Energy Efficiency Fund for the public Sector; and the Energy Saving Scotland – small business loans).

The plan will also outline how the Scottish Government is working to maximise the impact of UK Government policies and programmes in Scotland, for example the Carbon Emission Reduction Target and the
| Recommendation EET 7 | The Scottish Government should ensure that a revised financial memorandum be produced and we would expect the costs identified above to be covered within this. | The development of the Energy Efficiency Action Plan itself will have no new costs associated with it, but will be met from existing resources. The measures contained within the action plan will all have costs attached to them, but as these are measures which are already in place, or have been planned within the current spending review period, these already have funding attributed to them. Any new measure or programme which is not currently funded or has funding agreed will be subject to the usual financial scrutiny as part of the annual budget process or spending review. The development of the Renewable Heat Action plan itself will have no new costs associated with it, but will be met from existing resources. The measures contained within the action plan will either be costed from existing budgets or new activity will be subject to the relevant financial assessment. |

---

The Climate Change Bill includes a mandatory provision to introduce an energy efficiency action plan for Scotland. We believe that having a legislative requirement to develop, revise and report on an action plan will give action on energy efficiency a level of scrutiny which the issue requires.

Ministers could publish an action plan before the Climate Change Bill becomes an Act but this would not fulfil our requirements under the Act - Scottish Ministers would still have to produce and publish another action plan within 12 months.

On the assumption that the Bill will be passed in summer 2009, the action plan will be published shortly thereafter.
Officials are currently finalising draft regulations, 'The Carbon and Energy Performance of Non-domestic Buildings (Scotland) Regulations 2009'. These mock regulations will be shared with both the EET and TICC Committees.

It must be borne in mind that these are 'mock' regulations which have not been subject to detailed research nor to the scrutiny of a working party nor public consultation. They will however give Committee Members and others involved in Parliamentary debate a 'flavour' for how the enabling powers are to be used.

The costs identified within the current Financial Memorandum are still relevant, having regard to the enabling provisions within Section 50 of the Bill, but we intend to reduce the number of scenarios in an amended version. However to provide further assistance, Scottish Government officials will arrange for illustrative costs to be provided for the 'mock' regulations.

Recommendation EET 8

The Scottish Government should introduce within a reasonable timeframe, an action plan to improve the take-up of renewable heat technologies in Scotland and to work with all the necessary parties to achieve progress in this area, and provides a clear timetable from the Minister for the introduction of the heat plan before Stage 2 of the Bill.

The Scottish Government consulted on a Renewable Energy Framework late last year, October 08 to December 08, which, included a draft Renewable Heat Action Plan. The consultation responses were published on Scottish Government's website on 30 January 2009. The responses will help inform the Renewable Energy Action plan, which will be published over the summer 2009 and will include a Renewable Heat Action Plan.

In summary the timetable for producing a Renewable Heat Action Plan will be summer 2009.

Annex C
Subordinate Legislation Committee Report
Summary of Recommendations

Independence of the Advisory Body

Recommendation SLC 1

The Explanatory Notes with the Bill (paragraph 33) and the Policy Memorandum (paragraph 31) indicate that Ministers will require to seek expert, independent advice from the advisory body, but that "independent" is capable of having different meanings and does not necessarily refer to a body which is wholly independent of the Scottish Ministers.

In particular, the SLC draws attention to the fact that the Scottish Ministers will be responsible for appointing the members of a Scottish CCC and will be able to issue directions and guidance to the Committee.

The Scottish Government recognises the point that is being made here. The Explanatory Notes and Policy Memorandum seek to capture the spirit of the advice which will be provided by the advisory body.

The UK Committee on Climate Change has already demonstrated that it will advise Government to set very challenging targets. Its advice is transparent. The foundation of its independence is that its advice is based on evidence and analysis.

Should a Scottish Committee on Climate Change be established in the future, or equivalent advisory powers conferred on an existing body, it is intended that the expert advice be provided in a similarly transparent way, based on evidence and analysis rather than political imperative.
Public bodies upon which a climate change duty may be placed

Recommendation SLC 2

The SLC believes that the power under section 36(1) to impose climate change duties on public bodies is extremely wide in its scope, in particular as neither the public bodies which may be subject to climate change duties nor climate change duties themselves are adequately and clearly defined.

The Committee recommends that this could be mitigated to some extent by provision of a list of public bodies to which the power is to apply along with a power to add to the list subject to affirmative procedure.

Recommendation SLC 3

The Committee recommended that guidance issued to public bodies under section 37 should be laid before Parliament for a period prior to implementation, and any resolutions of the Parliament made in respect of the draft guidance during that period taken into account.

The Scottish Government response is at recommendation 20 in the main body of this document.

This would be a highly unusual course of action.

It is intended that this guidance assist in developing consistency of approach across those public bodies to which specific climate change duties apply. It could also include examples of best practice.

Laying such guidance before the Scottish Parliament would seem disproportionate in this context. However, Scottish Ministers would be happy to discuss with the relevant Parliamentary Committees enhanced consultation arrangements for the development of section 37 guidance.
### Forestry

**Recommendation SLC 4**

The SLC believes that powers in section 47 [Forestry] are very wide in scope as there is no restriction in the Bill on what may be done in exercise of the power beyond that it must deliver a climate change purpose.

Before exercising the power in section 47, the Scottish Ministers must satisfy the test that the exercise of the power will assist in reducing emissions or otherwise contribute towards mitigating climate change.

This could, for example, require the national forest estate to be managed in ways that assist with carbon sequestration.

But it could not, for example, remove forestry functions without a clear climate change justification - and it is hard to conceive of circumstances where there would be this justification, given the positive role of forestry in relation to climate change mitigation.

### Waste

**Recommendation SLC 5**

The SLC has reported that most of the waste powers (sections 52, 53, 54, 56 and 57) are expressed in very broad terms and that there is nothing on the face of the Bill to restrict their application to purely commercial activity.

It is appropriate that the waste provisions be expressed broadly. The sectors which can contribute most to improved resource use through waste prevention and recycling, and thus help mitigate climate change, will not necessarily remain static over the period between now and 2050.

Recent movement on the markets for recyclate demonstrates this. Any regulations made will need to be able to respond to market conditions, which cannot necessarily be foreseen at this point. It is therefore appropriate that the powers should enable whatever action becomes necessary over time to be taken.
The fact that the regulatory powers are not necessarily restricted to commercial activity is also appropriate. For example, it is at least as worthwhile for a private individual constructing a new ten-bedroomed house to develop a waste prevention and management plan as it would be for a commercial enterprise. Evidence from England is that these plans actually start to save money at a level of project between £250,000 - £300,000. This is a level which will include a great deal of non-commercial activity.

Nevertheless, it is the Scottish Government's intention to avoid creating unnecessary burdens in developing regulations under these powers.
Climate Change (Scotland) Bill: The Cabinet Secretary for Finance and Sustainable Growth moved S3M-3963—That the Parliament agrees to the general principles of the Climate Change (Scotland) Bill.

Sarah Boyack moved amendment S3M-3963.2 to motion S3M-3963—
insert at end—

“and, in so doing, further agrees that unambiguous quantified targets for the reduction of greenhouse gas emissions for the period between 2010 and 2019 are needed so that the current government and governments elected in 2011 and 2015 can be held to account for delivering early action on tackling climate change”.

Alison McInnes moved amendment S3M-3963.1 to motion S3M-3963—
insert at end—

“and, in so doing, calls on the Scottish Government to publish an energy efficiency action plan within six months and to bring forward amendments at Stage 2 that set out substantive transparent measures to put Scotland on a steady path to achieving the Bill’s emissions reduction ambitions, including early action to meet a scientifically credible 2020 interim target, the measurement and reporting of cumulative emissions, broad sectoral targets, a duty on public bodies to take account of climate change in their activities, the inclusion of Scotland’s share of international aviation and shipping emissions in its emission targets, a limit on the use of international carbon credits and a robust reporting mechanism that allows for detailed parliamentary scrutiny of progress”.

The Presiding Officer used his discretion under Rule 11.3.3 to put the question on the motion and amendments at Decision Time on Thursday 7 May 2009.
Climate Change (Scotland) Bill: Stage 1

The Presiding Officer (Alex Fergusson): The next item of business is a debate on motion S3M-3963, in the name of Stewart Stevenson, on the Climate Change (Scotland) Bill. I am using my discretion under rule 11.3.3 of standing orders to allow the question on the motion, together with the questions on the two amendments, to be put at decision time tomorrow night. Accordingly, members are reminded that debate will be concluded tomorrow afternoon.

15:04

The Cabinet Secretary for Finance and Sustainable Growth (John Swinney): It seems entirely fitting that, 10 years to the day since the first elections to this Parliament, we are meeting to consider ground-breaking legislation and to set out our approach to tackling climate change. Surely coincidence highlights the necessity of this Parliament fulfilling its role in realising the potential of our country and addressing the challenges that face it in the 21st century.

The bill could not be of greater importance. Climate change is the greatest environmental threat facing humankind. If global action is not taken to reduce emissions significantly, the world faces an uncertain future. Even during the short time that we have been considering the Climate Change (Scotland) Bill, the outlook on climate change has worsened.

About 2,000 international scientists met in Copenhagen in March and confirmed the overwhelming evidence that humans are causing global warming and that climate change is happening faster than was previously predicted. The Climate Change (Scotland) Bill is a call to action—a motivation for all of us to make a difference. That aspiration lies at the heart of the energy and commitment behind the establishment of this Parliament and enabling it to make a contribution not only to the lives of people in this country, but to the lives of those who live in other countries. Many people in developing countries are likely to be the worst affected by the impact of climate change. Those of us who live in the developed world will also see changes in our weather patterns, with Scotland predicted to experience wetter winters and warmer temperatures throughout the year, which has implications for all of us. That puts the onus and responsibility on us all to act.

Patricia Ferguson (Glasgow Maryhill) (Lab): Given that poor communities and poor countries will, as the cabinet secretary rightly identifies, suffer most from climate change, and given that the average carbon footprint in the west is about 9.4 tonnes of emissions, compared with less than 0.1 tonnes in Malawi, does the cabinet secretary agree that we should be assisting the developing world with mitigation and adaptation measures, and that we should not need to dip into the international development budget, for example, in order to do so?

John Swinney: Patricia Ferguson makes an entirely valid point about the impact of climate change on people who live in developing countries. She also highlights an aspiration, with which I entirely agree, that there is an obligation on all of us in the developed world to make a contribution to assisting with and encouraging the steps that can be taken in those countries to adapt to the new climatic conditions. There is also a responsibility on us to act to ensure that we in no way extend or exacerbate the difficulties that those countries face. The matter of international aid budgets is reserved to the United Kingdom Government, but we would certainly encourage a focus in policy making on making progress on the questions that she raises.

Through the leadership that is being displayed by the Scottish Government, with Parliament's support, Scotland can make a difference on this vital issue, and 2009 is a particularly appropriate year in which action should commence. Against a background of worldwide economic problems, the countries of the world will meet in Copenhagen in December, under the auspices of the United Nations Framework Convention on Climate Change, to negotiate a post-Kyoto protocol climate change agreement. The discussions will be significant for setting the pace of action to tackle climate change through a new global agreement to accelerate emissions reductions. Such an agreement will trigger the European Union's commitment to review its present target for 2020 of a 20 per cent reduction in emissions to a much more ambitious 30 per cent reduction, and we will play an active part in working to secure a more ambitious agreement.

In the face of such a huge and complicated challenge, we might ask ourselves how Scotland can hope to play any meaningful role in global action. We are a country with just 5 million people, emitting just 0.15 per cent of global greenhouse gas emissions. However, as Patricia Ferguson said, the important point is that our emissions per head of population are far above our fair share, and they need to be reduced.

The Government has a clear and consistent vision of Scotland as a country that is leading the way among nations, and we are delivering our ambitions for Scotland. The Climate Change (Scotland) Bill is an opportunity for Scotland to act...
as a model of international best practice by setting a world-leading level of ambition.

**Brian Adam (Aberdeen North) (SNP):** Will the cabinet secretary give way?

**Patrick Harvie (Glasgow) (Green):** Will the cabinet secretary give way?

**John Swinney:** I give way first to Mr Harvie; then I will come to Mr Adam.

**Patrick Harvie:** I am grateful to the cabinet secretary, and to Brian Adam for his patience.

The cabinet secretary talks about Scotland giving leadership to the world, and the existence of the Climate Change (Scotland) Bill is one marker of that. However, the adoption of the UK’s approach to targets, with exactly the same interim and long-term targets as have already been adopted by the UK, does not mark the bill out as distinctive in any way. What is the rationale for an interim target that is based on an assumption that there will not be international agreement? Should we not assume that there will be such international agreement and step up to the plate with ambitious long-term and short-term targets?

**John Swinney:** Mr Harvie is in danger of talking down the level of ambition in the bill. To be fair to the Government—which I always want to be, of course—we have set out a range of radical and ambitious measures to set the pace of the agenda. I will talk in more detail about targets later, but in no way can the Government be described as lacking ambition on this fundamental issue for our society to address.

**Brian Adam:** It is of course important that Governments take action but, as the cabinet secretary said, it is also important for all of us to take action. I am sure that he is aware of representations on community engagement from eco-congregations such as those at Bucksburn Stoneywood church, Dyce church and Sheddocksley Baptist church in my constituency. What is the Government’s view on community engagement? Would it welcome an amendment to ensure that that is part and parcel of the bill?

**John Swinney:** The Government would certainly consider sympathetically any amendments on community engagement. Mr Adam kindly provides me with the opportunity to pay tribute to eco-congregations, which have contributed significantly. Some months ago, Mr McNulty led a debate in Parliament on eco-congregations. In my constituency, the Auchtergaven and Moneymie parish church was rebuilt in an immensely eco-friendly fashion. That is a tremendous example of a development in the religious community to deliver an environmentally friendly and enhancing facility in the community. At stage 2, the Government would look sympathetically on the point that Mr Adam makes.

Before I address the bill in detail, I will highlight several activities that are fundamental to the Government’s approach to tackling climate change. We have committed ourselves to introducing a new system of carbon assessment for the whole Scottish Government budget, which will begin to operate with our 2010-11 budget. We have an ambitious low-carbon energy plan that is based on 10 energy pledges. We are on track to exceed our target of generating 31 per cent of Scotland’s electricity from renewable sources by 2011. We are investing £2.6 billion over three years in greener transport to give people alternatives to cars. Once the carbon reduction commitment commences next spring, about 50 per cent of Scotland’s emissions will be covered by carbon trading schemes.

To complete the picture of existing initiatives, the £27 million climate challenge fund—a product of discussion between the Government and Mr Harvie and the Scottish Green Party in 2008-09—is proving to be a great success and is funding community carbon reduction projects throughout the country, which might relate to some of the aspirations that Mr Adam just mentioned.

A crucial point is that the Government is also preparing Scotland for the impacts of climate change. Our climate change adaptation framework will help decision makers to plan and prepare for change now. That will enable Scotland to be better placed to take advantage of opportunities and to build resilience.

I am proud that the bill will put Scotland at the forefront of international action to tackle climate change. It sets a target to reduce Scotland’s greenhouse gas emissions by 80 per cent by 2050. That target is challenging, but it is the minimum for which we should aim if Scotland is to contribute to the global efforts to tackle climate change.

However, 2050 is a long way into the future, and we need to be certain that we are taking effective action now. That is why Scottish ministers have put in place a system of annual targets, which is essential to provide the challenge and the imperative for action for ministers and our successors. That is the right thing to do, as it will require the Scottish Government and future Administrations to take action.

**Mike Rumbles (West Aberdeenshire and Kincardine) (LD):** Is not the whole point of producing legislation on an issue such as climate change to set not only targets, but penalties for people who do not achieve the targets? Has the cabinet secretary considered including penalties so that the bill means something?
John Swinney: A legitimate argument for adding penalties to the bill can be made, but the Government has not chosen to take that route. We would rather approach the bill from the perspective of motivating and encouraging action to tackle climate change than have a relatively false debate about how the Government would pay a penalty to itself for failures that might occur. I would prefer to ensure that ministers are subjected to rigorous scrutiny by the Parliament to make delivering the aspirations in the bill obligatory for ministers.

The Government proposes to make the bill tougher and stronger. Having listened to the stage 1 evidence, ministers agree that an earlier interim target than the 2030 target is appropriate to ensure early action. At stage 2, the Minister for Transport, Infrastructure and Climate Change will therefore lodge an amendment on introducing a new 2020 interim target. That will set the pace for emissions reductions during the next decade and ensure that ministers need to match the Scottish Government’s aspirations with action. I am pleased to confirm that Scottish ministers will introduce an interim target for 2020 that requires emissions reductions of at least 34 per cent.

The Government is committed to going further. That is why we are insisting that an obligation is put on ministers to increase the 2020 34 per cent target to at least 42 per cent, once the EU adopts at least 30 per cent as its target for reductions in greenhouse gas emissions over the period 1990 to 2020. I am absolutely committed to increasing the interim target as soon as possible, which is why I intend to add that commitment to the bill at stage 2.

We know that the expert advice of the UK Committee on Climate Change is that the UK should deliver emissions reductions of 34 per cent by 2020, given the current circumstances, with the target increasing to 42 per cent if a new international agreement is reached in Copenhagen. Scottish ministers agree that that is the minimum that we should aim to deliver.

Patrick Harvie: If the new interim target represents a steeper trajectory and earlier achievement of the cuts than was the case under the previous interim target, does it not follow by mathematical necessity that the annual targets in the period between now and 2020 must themselves be tougher? How can we take seriously a tougher interim target if the same annual targets are set to 2020?

John Swinney: Ministers will be required by regulation to bring forward annual targets. By clear necessity, those targets must create the capacity to deliver the 2020 target that we will set in the bill. The arrangements to lock in the requirement for action appear to me to be absolute.

We considered the 2020 target carefully. Scotland does not operate in a vacuum—many of the levers for reducing our emissions are controlled by the European Union and the United Kingdom Government. A prime example is energy generation, which is covered by reservations in the Scotland Act 1998, and emissions from energy generation fall within the EU emission trading scheme.

At this stage, going further than 34 per cent is just not an option. I will explain to Parliament why I believe that that is the case. Even if we deliver all the abatement measures that are set out in the UK Committee on Climate Change’s 500-page report, we could not deliver a 42 per cent reduction in emissions by 2020 without proportionate action being taken at the UK and EU levels. Our ambition is clear and our approach is realistic.

Long-term targets are important. As I said to Patrick Harvie, at the heart of the bill is a duty on Scottish ministers to set annual targets to define each step of Scotland’s emissions reduction journey. Those targets will be set in batches from 2010, thereby providing certainty about our emissions reduction trajectory.

Scotland’s share of international aviation and shipping emissions will be included in all the targets in the bill. I am proud that that is a world-leading step. I confirm our intention to amend the bill to remove any unintended ambiguity in that respect. That will ensure that Scotland’s share of those emissions will be covered from the setting of the first annual target onwards.

The bill requires that Scottish ministers obtain expert advice before they set annual targets. The Scottish Government will use the expert and independent UK Committee on Climate Change for advice in the first instance. On the basis of the ambition that the committee showed in its first report, “Building a low-carbon economy—the UK’s contribution to tackling climate change”, I am confident that it will recommend challenging targets for Scotland.

In the longer term, the bill provides flexibility for ministers to establish a Scottish committee on climate change or to apply new powers to an existing Scottish public body. I am also determined that the Scottish Government will focus on delivering emissions reductions in Scotland through domestic effort. That is why ministers propose the introduction of a provision to require Scottish ministers to limit the use of international credits to offset Scottish emissions.

Des McNulty (Clydebank and Milngavie) (Lab): I welcome what the cabinet secretary has just said on international credits. Does he have a percentage figure that he will share with the chamber for what the limit would be?
John Swinney: The Transport, Infrastructure and Climate Change Committee recommended to the Government that we should take a broadly comparable position to that which has been taken by the United Kingdom Government, and that is the position that the Government is currently considering.

Much has been said during the stage 1 evidence sessions on the application of duties on public bodies. The bill contains enabling powers to allow Scottish ministers to place specific climate change duties on the Scottish public sector in the future. For the record, I reiterate my support for working in partnership with the public sector and recognise that there are many good examples of initiatives that are being taken to reduce greenhouse gas emissions. I see no need to move away from that partnership approach and I am not willing to do anything that undermines it. I am encouraged by the fact that the Convention of Scottish Local Authorities shares the Government's view and I am disappointed that the Transport, Infrastructure and Climate Change Committee does not share the Government's confidence in proceeding in a partnership way.

On the issue of reporting and scrutiny, I make it clear that the Government will design, in partnership with the Parliament, the strongest and most obvious level of scrutiny of ministers and their performance in relation to the implementation of the bill. We have made a suggestion in the bill that ministers should be publicly scrutinised by a committee of conveners. We would be happy to have that scrutiny in public, and the proposal recognises that climate change affects all policy areas—it is not just the preserve of the Transport, Infrastructure and Climate Change Committee but affects justice, health, local government and the whole gamut of policy areas. That is why the Government has offered that particularly high level of scrutiny. I hope that the Parliament will consider that with the same generosity with which the Government made that suggestion to the Parliament.

The Government's desire is to create legislation that is world leading and enduring and which commands the support of every corner of the parliamentary chamber. We must recognise that, if we are to succeed in our aspiration of delivering on the climate change agenda, we must act with the support of every political party. That is the style that the Government will adopt in taking the bill through the Parliament.

I move,

That the Parliament agrees to the general principles of the Climate Change (Scotland) Bill.

Sarah Boyack (Edinburgh Central) (Lab): I concur with John Swinney that what we are debating today is a significant bill, and it is highly appropriate that we do so as we hit 10 years of the Scottish Parliament's operation. It will be the most important bill that we pass. We can debate that among ourselves afterwards, but in terms of its long-term ambitions and the challenge that it attempts to address, I think that that is a fair argument.

Nevertheless, the bill will be successful only if we all buy into it. That does not mean that we all have to agree with one another at this stage. There is time for more detailed consideration of the bill at stage 2. We believe that the bill is not strong enough at the moment and that there are significant gaps that need to be addressed. In particular, we think that climate change needs to inform all Government decisions from now on and that our agenda must involve all of us as citizens, consumers and people who are involved in businesses, trade unions and church groups.

I will address three things: the need to act now and to set ourselves the right targets and benchmarks; the need to get our governance structures right; and the need to put in place a series of policy programmes that tackle at the same time both the recession that we are currently experiencing and climate change.

Our top line is that the bill does not go far enough. We welcome the announcement and the comments that have been made by the cabinet secretary today, but we still feel that the bill does not go far enough. It does not address the early years, and it would represent a massive missed opportunity if the bill were to be passed as it is currently drafted. The policy in the Scottish National Party's manifesto for annual statutory targets of 3 per cent reductions was not one that we considered took the right approach during the election campaign, and we argued our corner. Given that that policy was dumped as soon as it had done its job of harvesting green votes for the SNP, we believe that it was more a cynical election strategy than a genuine commitment to radical action. The alternative approach that is laid out in the bill is simply not good enough. It is a betrayal of the trust of the many thousands of people who voted for the SNP on the basis of that policy.

The Minister for Transport, Infrastructure and Climate Change (Stewart Stevenson): Will the member take an intervention?

Sarah Boyack: No. I want to get started.

The critical time to act is now, and the action that we take must be meaningful and real. The driver for success must be tougher, quantified
interim targets. We have lodged our amendment to concentrate minds on that. We need to send businesses, Government departments and agencies and people in Scotland a clear message that the Parliament intends to act now. We believe that political accountability needs to be built into the system. We need to incentivise the sort of thinking that starts to turn things around now, not in 2018, on the eve of our having to meet a 2020 target. We believe that that 2020 target is too far off. Not only is it too far off to drive short-term action with a sense of urgency, but it is too far off to incentivise the medium-term policies that Governments will need to deliver on by 2020. It is three elections away. We need to bring the day of action closer to home—to the SNP today and to the next two Governments, which we hope will be Labour ones.

Stewart Stevenson: It might be helpful if the member understood that we are quite happy to support her amendment. Does she recognise that, by putting a 42 per cent figure on the face of the bill, as we intend to do in the context of European agreement on a 30 per cent figure, we are challenging our partners to step up to the plate so that, together, we can deliver—with annual targets every year to 2020—precisely what she is proposing?

Sarah Boyack: As we understand the position, the targets are not quantified. The targets in the bill will kick in from 2020 but, before then, the targets will be in regulations. We absolutely support a 34 per cent target. I understand that that is what John Swinney said will be in the bill, and that the 42 per cent target will be adopted if we get collective action at Copenhagen. I am not critical of the target that has been set for 2020. We understand why the Government has gone for that target. The challenge is to supplement it. We did not believe in annual targets, but we think that we need mid-points. We accept the point made by environmental campaigners that each Government should be accountable for what it does. We welcome the SNP’s support for our amendment today.

John Swinney: I think that I answered the point that Sarah Boyack is making when I responded to Patrick Harvie’s intervention. The setting of targets in regulations obliges ministers to act in a fashion that sets us on a trajectory that delivers the 2020 interim target, which we all now agree is exactly the right position.

Sarah Boyack: We think that we need quantifiable targets on the way, and our amendment is designed to ensure that the progress of each Government can be assessed.

Every time that respected scientists review the position on climate change, they tell us that, although they cannot be certain of how climate change will work in the future—particularly in relation to feedback mechanisms—the situation is more urgent than it was the previous time that they reported. That is what the Intergovernmental Panel on Climate Change and the UK Committee on Climate Change report, and that is why we want tougher earlier action. We do not agree with the setting of arbitrary annual targets, because different things can happen each year. We need to judge each Government on its track record.

We know that we need to go beyond paying lip service to the challenges and actually change how we do things. We believe that it is the next 10 years that are crucial, not the debate about 2050. It is easy to get sucked into discussions about long-term targets and ignore the short-term challenges. That is why we want to go for unambiguous, quantified targets.

We need to start doing something now, and we need to set ourselves on a path of radical reductions in carbon emissions. We need to focus not only on how we are doing, with annual reporting to the Parliament, but on the consideration of cumulative targets. Everything that we do in the early years has an extra dividend. We are not just meeting a target; we are ensuring that those carbon emissions are not created in the atmosphere for generations to come. Surely we can all agree about that. However, we do not believe that that will happen without more serious pressure, and that is the purpose behind our amendment, which is designed not only to affect the current Government but to signal to the system as a whole that we are all serious.

We believe that the Transport, Infrastructure and Climate Change Committee’s report on the Climate Change (Scotland) Bill is excellent. It is the latest stage in a lengthy process of debate. Similarly excellent is the report from the Rural Affairs and Environment Committee, particularly its recommendations on waste and the position that it took against dumping 25 per cent of the Forestry Commission’s estate. Further, the Economy, Energy and Tourism Committee has given us an invaluable set of recommendations, all of which the Government should implement.

We argued for a whole week’s debate on the bill not just because three committees have been involved in its consideration, but because of the range and depth of issues that the bill needs to address if we are to get it right. If we had only debated the issue this afternoon, we would not have covered the range of issues that need to be picked up before stage 3. Last month’s lobbying was a graphic illustration of the support that there is in our communities for radical climate change legislation.
Our support for the bill’s principles will be clear, but we want to flag up that many amendments will be needed to make the bill more radical and effective.

Mike Rumbles: Will the member give way?

Sarah Boyack: No. I need to get on.

Today we will focus on the overarching principles of the bill and amendments that are needed in that context; tomorrow we will focus on practical progress, provision for which needs to be slotted into the bill, to support economic activity and build a bridge from today's technology and expertise to future priorities. The recession makes such an approach all the more important.

There is a need to incentivise local authorities and businesses to rethink their day-to-day approaches. The briefings that we received from Scottish and Southern Energy and Scottish Renewables, and the business community’s contributions to our stage 1 consideration, made it clear that companies are beginning to focus on serious action. Businesses need amendments to the bill at stage 2 that introduce practical measures on energy efficiency and small-scale renewables. Such amendments would strengthen the bill and the ability of the Government and future Governments to deliver on carbon reductions, which are needed in all sectors.

If we are to make the bill work, the business community, trade unions and communities must buy into it. That is why we are committed to developing green jobs, not just in the renewables industry, which is hugely important, but in other industries. There are opportunities to invest in public transport and support for electric cars and other vehicles. There are opportunities in energy efficiency in the building industry, in relation not just to new developments but to the need to build mass markets for the retrofitting of our existing, inefficient infrastructure. We must not just talk a good game but put legislation on the statute book and implement it.

Public duties need to be more effective. We need climate change action at every level of government. What will the concordat deliver on climate change? The issue needs to be addressed. What carbon emissions reductions will be achieved? There will be different challenges and opportunities for each local authority, but there are huge common areas in which a common approach and clear leadership will deliver results. We need concrete results, not vague aspirational language. More work is needed.

Stewart Stevenson: Will the member take an intervention?

Sarah Boyack: I have taken a couple of interventions and I want to move on.

Particular issues need to be explored. After the debate, I will consider John Swinney’s comments about the nature of the advice that is given to ministers. The work of the UK Committee on Climate Change has been crucial in setting the UK Government framework, which the Scottish Government is adopting, and in translating IPCC findings into action. However, we need to consider particular challenges for Scotland that arise from the nature of our geography, land and communities. We also need a land use strategy, so that we can plan for the future and ensure that we do not ignore challenges until it is too late but address them head-on.

We particularly need to tackle our housing. A raft of practical actions are not in the bill. We welcome Government responses to the stage 1 report on minor issues, but we want more action. In particular, tax incentives are crucial, to ensure that people act. That view is shared by Scottish and Southern Energy and Scottish Gas. Such an approach could be linked with the energy efficiency action that was provided for in this year’s budget, which members supported. We need to ensure that there is area-based action from which every citizen in Scotland can benefit. In England and Wales, 67 local authorities are doing such work, and Northern Ireland is putting a system in place. We do not need to be told that the Scottish Government has no legal power to act, as the Government said in the paper that we received last night; we can use the bill to give the Government that power. The bill presents us with an opportunity to plug a gap, which we will try to take by lodging amendments at stage 2. We need practical policies now if we are to deliver on energy efficiency. We cannot let political prejudice stand in the way of action that is being adopted throughout the UK. Council tax incentives would be a good fit with other work that the SNP Government is undertaking.

We support the early production of an energy efficiency action plan. The plan has been delayed for years—the SNP Government is not the first Government to delay it—and is needed soon. I am not making an excessively party-political point when I say that we need to ensure that energy efficiency reaches the top of the agenda not just in a single debate but for the future. We need to do that within six months.

I think that all members agree that one of the toughest issues that we must address is emissions from aviation and shipping. We cannot turn back the clock on social aspiration and economic progress but we must find ways to take account of aviation and shipping. That is a challenge. It is vital that we do not ignore other forms of transport. Day to day, people make fundamental choices, but they are not being given the necessary, high-
quality public transport choices, particularly in areas where those could be delivered.

We need to introduce tougher, cumulative emissions targets to drive early action on the issues on which it will be relatively straightforward for the Government to act. In the first eight years of the Parliament, there was major investment—championed by Labour—in public transport, but that needs to continue at the same level.

It is inevitable that we will focus on hitting targets, but we must involve people, businesses, communities, churches, trade unions and schools. We all should feel part of the process, because there is an appetite for change. The bill will be a framework for action. It cannot be a question of passing the bill, putting it on the statute book and the Government, or even the Parliament, patting itself on the back for being radical. We need an implementation plan, which must be discussed during the stage 2 consideration of the bill. We must do that both to concentrate minds and to deliver policies that will create a track to a low-carbon society.

I agree with the cabinet secretary that the next Scottish budget must be more ambitious. We will need not only dedicated energy efficiency schemes and individual community schemes—welcome though those measures are—but mainstream Government expenditure if we are engaged with the climate change challenge and determine how to reduce carbon emissions. We are still waiting for some assessments to take place at a Scottish level to enable a public debate on that.

The power of the state, whether national or local, is crucial. The state has the potential to play a huge role in enabling us to make the transition to a low-carbon economy. Through public procurement of food, buildings, infrastructure or services, the Government can make practical greenhouse gas reductions in the early years, not just the later years. The Government should use the hiatus caused by the lack of investment, while we wait for the Scottish Futures Trust or public-private partnerships, to reconfigure contracts so that the next generation of investment in public transport and buildings is greener and more energy efficient and reduces carbon emissions from day one, not from some future point.

The challenge is in front of us all. It is time for the SNP to implement some of its forgotten manifesto pledges that would help to reduce carbon emissions. When new schools are built, they must all be heated and powered by on-site renewable energy. The same should go for hospitals and other public sector buildings.

We need a bill, targets to drive action, governance structures and the accountability mechanisms of the Parliament and wider public life. We also need to ensure that the bill is matched by the development of policy measures that will deliver carbon reductions. There has already been a robust debate on the bill in our communities. It is a landmark bill, but it needs significant amendment at stage 2.

I move amendment S3M-3963.2, to insert at end:

“and, in so doing, further agrees that unambiguous quantified targets for the reduction of greenhouse gas emissions for the period between 2010 and 2019 are needed so that the current government and governments elected in 2011 and 2015 can be held to account for delivering early action on tackling climate change.”

15:38
Alison McInnes (North East Scotland) (LD): I look forward to the bill progressing to stage 2 following this week’s debate but, through my amendment, I want to highlight some of the key changes that are needed to make it fit for purpose. It needs tougher targets, a greater depth and a robust reporting mechanism so that successive Governments can be held accountable for the rate of progress in this most pressing matter.

Over the past year, the Government has regularly made claims about its bill being an example for the world to follow—it could never be accused of modesty. Is the bill world leading? Not yet. At the moment, it is so lacking on early action that there is no certainty that the end target can be achieved, but I welcome the cabinet secretary’s comments on that and will reflect on what he said.

For two years, the Government has promised effective legislation on climate change. I do not want it to shirk its responsibility now because the task is difficult. In contrast to the SNP, the Liberal Democrats are determined that the bill should fulfill its potential and set a global example to other developed nations.

Scotland must not waste the chance to show the world the right way in legislating on climate change. The bill does not do that, but it could and should. I hope that there is cross-party support for further strengthening of the bill and for my amendment. Change can happen if enough people will it, and we have seen an enormous upsurge of interest in tackling climate change. That support from across the country should galvanise us and strengthen our resolve. People are asking us to be bold and will not forgive us if we are timid about it.

This is not about political point scoring; it is about doing what is necessary. As a Parliament, we can unite to make the Climate Change (Scotland) Bill a strong and effective bill that will ensure early and sustained action. We can signal that we want to grasp the opportunity, kick-start
change and give Scotland a positive edge and renewed confidence in moving forward.

Yesterday, the Government published its response to the committee’s recommendations. In some instances, what is proposed still falls short of expectations. I will address that issue alongside some of the main issues of the report and the bill.

The most disappointing aspect of the bill may be the lack of early action that is proposed. Yes, targets would be set from the outset, but there is no mention of the SNP’s promised 3 per cent annual cuts until 2020 and no interim target until 2030, although the minister has admitted that he will move the interim target to 2020, in line with the UK bill. I am eternally hopeful that he will introduce measures for real, early action.

Simply requiring a reduction each year until 2019 shows a lack of ambition and, more worrying, a reluctance to take responsibility. It is all very well for the minister to say that that approach will “balance science and achievability”, but he cannot duck the facts. The science is simple and it indicates that urgent action is needed now. The committee report recommends early and sustained action, which I believe should mean cuts of 3 per cent per annum from the outset. The Met Office puts it simply:

“Even if emissions start to decrease in the next two years and reach a rapid and sustained rate of decline of 3% per year, temperatures are likely to rise to 1.7 °C above pre-industrial levels by 2050 ... the risks of dangerous climate change will not increase slowly as greenhouse gases increase. Rather, the risks will multiply if we do not reduce emissions fast enough.”

Turning to cumulative emissions, I think that science is probably driving the composition of this bill more than it has that of any other. Percentage reductions are a necessary measure of progress, but the science of climate change speaks not in percentages but in absolutes. The key to success lies in the total amount of greenhouse gases that we release into the atmosphere. We know that the current concentration of carbon dioxide in the atmosphere is about 387 parts per million. Climate change prediction models are constantly updated, but we know that to have even half a chance of limiting climate change to a global temperature rise of 2°, we would need to stabilise the concentration at no more than 450 parts per million of CO₂. If we reached 550 parts per million before stabilising, we would be more likely to have a 3° or 4° temperature rise, with all the damaging effects that would go with that.

What that means is that we have a real, scientifically measurable limit on how much CO₂ equivalent we, as a world, can emit over the next 10, 20, or 50 years. From that, we can work out what Scotland’s fair share of those emissions will be. With that in hand, it would almost be irresponsible not to measure our cumulative emissions, report on them and track whether we are staying within bounds.

**Stewart Stevenson:** Does the member accept that, by having annual targets, we in effect set a cumulative limit on the amount of CO₂ that it is possible for our country to emit? Has she noted the Government’s commitment to do the arithmetic to support that and show the cumulative emissions?

**Alison McInnes:** I know that, when the Government consulted on the bill, it acknowledged that cumulative emissions measurements would be important but more difficult to do. I urge the Government to carry on with measuring both cumulative and annual emissions.

The Government needs to heed the science in setting the interim target for 2020 and the annual targets for the next 10 years. A 34 per cent target for 2020 is not challenging enough. Simply hitting 3 per cent each year, which is what the Government committed to do, would lead to a 43 per cent reduction by 2020. Indeed, more recent projections have suggested that our ambition for the bill should be a 50 per cent reduction. We must have an interim target that encourages early action and annual targets that do the same. It is not just me who says so: the committee heard time and again that early action is needed. Not only the environmental lobby but businesses and public bodies said that.

An ambitious target for 2050 is not enough. There must be a road map for getting there. Without proper interim targets and with no steep trajectory, we are left with the impression that the Government is happy to wait for technical fixes to be developed that will solve all our problems. We will need technology to help us, but we can do things now in the short term, such as pushing building insulation measures and promoting better fuel efficiency and greater energy efficiency. We can do things that will set us well on our way to the reductions that we need to make and which will give us time to work on the bigger fixes. Moreover, far from costing billions, they could save us all money.

Turning to sectoral targets, I believe that everyone will need to take action if the bill is to succeed. I do not believe that the bill should set out detailed targets for every sector, but it should be clear from the outset that action is required from all quarters to make a difference. The bill should require the minister to set broad sectoral targets on energy efficiency, energy production, transport and land use—the major sources of emissions—and to identify what is expected from the different sectors.
Stewart Stevenson: Will the member take a brief intervention?

Alison McInnes: Sadly, no, I have a lot to say before closing.

I also believe that a general duty to take account of climate change should be imposed on public bodies, which can play a pivotal role in setting an example. Voluntary action from local authorities and the likes of Scottish Natural Heritage is to be commended, but other public agencies, such as health boards, are not so far forward. By enshrining a general duty in the bill, we would signal from the outset that every body must play its part.

Another key issue, which should rightly be separated from transport in general, relates to shipping and aviation. I am glad that the minister will amend the bill to ensure that emissions from those sectors are included from the outset.

My colleague Liam McArthur will address in detail the energy efficiency issue that is highlighted in my amendment.

On international credits, Scotland must meet its targets mainly through domestic means if we are to ensure the greatest impact from our efforts. That will require us to set a limit on the amount of carbon emission reductions that can be accounted for through international credits. I welcome the minister’s comments on that today, as I believe that we should seek to maximise domestic effort. I suggest that the cap should be set at 20 per cent up to 2020 and that we should consider introducing a sliding scale thereafter.

On reporting mechanisms, the bill as introduced requires the minister to do nothing more than lay a progress report before Parliament. A 10-minute statement with 20 minutes of questions is worthless as a means of scrutinising an issue of such importance. If we are to hold successive Governments to account, the bill must provide a clear and robust reporting mechanism. A good example might be the national planning framework, on which Parliament is given a 90-day period for sustained analysis of results along with an iterative process that ensures that parliamentarians build up expertise in the matter. That allows scrutiny to become more robust as the years roll by.

I was slightly disappointed with the almost petulant comments in the ministerial response to the committee’s recommendation on reporting mechanisms. The response simply notes:

“the Committee do not appear to have accepted these provisions in the spirit in which they were intended.”

This is too serious and important an issue for that.

John Swinney: On that point, I agree that it is important that Parliament can exercise its own mind. That is why the Government has singled out a different mechanism for holding ministers to account on the targets: ministers would be required to appear in public before a group of committee conveners who represent all policy areas. That makes the point that climate change affects every aspect of legislative and policy activity within the Parliament—

The Deputy Presiding Officer (Alasdair Morgan): Quickly, please.

John Swinney: That is the point that I would like Parliament to consider in its deliberations.

Alison McInnes: I accept the spirit in which that offer is made, but I believe that the issue is of such importance that we must think hard about what the best mechanism is to tie in future ministers, who might not be so willing to come forward and talk voluntarily.

John Swinney: They will be obliged to do so.

Alison McInnes: We will need to come back to the issue. At the moment, I think that how we deal with the national planning framework provides one possibility. As I said, this is too serious an issue to rely on the spirit of the legislation. The reporting mechanism must be robust in providing proper scrutiny. Most important, the mechanism ought to be laid out in black and white to ensure that Parliament can effectively hold the Government of the day to account.

From the moment that it was published, the bill has received an unprecedented level of public response. Just a couple of weeks ago, 500 people gathered outside the Parliament building to demand that we deliver a strong climate change bill. We must show that Parliament is listening. Things can change, so we should stop saying that change is too difficult and start finding ways to make it happen. The current financial crisis has caused us many problems, but it also gives us an opportunity. Let us not rush blindly into getting back to business as usual. Let us grasp this opportunity and look to rebuild with a green agenda. We can refocus—

The Deputy Presiding Officer: The member really must conclude.

Alison McInnes: Presiding Officer, this is the first great bill of any substance that has come through my committee in the two years since I was elected. I feel truly privileged to have had the opportunity to work on the bill and to be part of the Parliament that will pass it—

The Deputy Presiding Officer: The member must conclude. I am sorry.
Alison McInnes:—but I want it to be something that I can be proud of.

I move amendment S3M-3963.1, to insert at end:

"and, in so doing, calls on the Scottish Government to publish an energy efficiency action plan within six months and to bring forward amendments at Stage 2 that set out substantive transparent measures to put Scotland on a steady path to achieving the Bill’s emissions reduction ambitions, including early action to meet a scientifically credible 2020 interim target, the measurement and reporting of cumulative emissions, broad sectoral targets, a duty on public bodies to take account of climate change in their activities, the inclusion of Scotland’s share of international aviation and shipping emissions in its emission targets, a limit on the use of international carbon credits and a robust reporting mechanism that allows for detailed parliamentary scrutiny of progress.”

15:49

Patrick Harvie (Glasgow) (Green): I thank the many witnesses who gave oral and written evidence to the Transport, Infrastructure and Climate Change Committee. I also thank my fellow committee members, the committee’s clerking team and the other committees that have contributed to the parliamentary scrutiny process for the bill. On this occasion, I will also thank my mum. When she dragged me at the age of six to sit at the back of Green party meetings, she might not have guessed that I would be here today but, without her, I am sure that I would not.

The story goes back somewhat further than that. It is more than half a century since the first scientific papers appeared that said that we had put rather a lot of CO₂ into the atmosphere since the industrial revolution and that maybe that was an area for future research. It is more than 30 years since scientific consensus began to emerge on the issue and more than 20 years since the emergence of political consensus that something must be done. We have spent all the intervening time determining what action must be taken.

It is 10 years since the Scottish Parliament first sat and members such as Robin Harper and, notably, Sarah Boyack, as well as members of all the parties, began to think about what we could do to tackle climate change. Halfway through this Government’s term in office, we are having a debate that we have waited for with anticipation. It is more than half a century since the first scientific papers appeared that said that we had put rather a lot of CO₂ into the atmosphere since the industrial revolution and that maybe that was an area for future research. It is more than 30 years since scientific consensus began to emerge on the issue and more than 20 years since the emergence of political consensus that something must be done. We have spent all the intervening time determining what action must be taken.

It is 10 years since the Scottish Parliament first sat and members such as Robin Harper and, notably, Sarah Boyack, as well as members of all the parties, began to think about what we could do to tackle climate change. Halfway through this Government’s term in office, we are having a debate that we have waited for with anticipation. We have yet to achieve political consensus that something must be done.

I will have time to address only some of the committee’s recommendations, but I am sure that those that we do not discuss during the debate will receive full scrutiny at stage 2. As I am opening the debate on behalf of my committee colleagues, it is important that I reflect the balance of views, including any differing opinions, rather than just having my own wee rant—that is for later. Thankfully, on this occasion, that is an easy task, because the committee has agreed on some important changes that should be made to the bill. Although each of us might have written a slightly different list of recommendations, I am delighted that we managed to produce a report that was signed up to fully by the whole committee—there was no split on any of our strong recommendations.

The Government’s response to our report—which, incidentally, arrived with us after 4 pm yesterday; the minister might want to avoid that in the future—dealt positively with some of the recommendations. In particular, I welcome the fact that there will be a limit on the use of international credits. The world cannot pay someone else to solve the problem. Those of us who live in countries that have a high per capita CO₂ impact must take responsibility for our actions.

There was recognition that some aspects of the parliamentary reporting mechanism should be re-examined at stage 2—not because we spurned the cabinet secretary’s generosity in producing proposals. I hope that when members of the committee are generous with the additional suggestions that they make at stage 2, the cabinet secretary will welcome that process and engage constructively in it.

Mike Rumbles: Does the committee’s convener agree that the bill lacks teeth? If we are serious about reaching the annual targets, would he be sympathetic to amendments at stage 2 that required, let us say, the appropriate minister to resign automatically? [Interruption.] Mr Stevenson is laughing.

Patrick Harvie: The appropriate parliamentary mechanism would be a motion of no confidence. If the member wishes to discuss one, he has my number.

Time and again, the committee heard compelling evidence that early cuts in emissions—specifically, those that are made in the first 10 years—are of the greatest importance. Before it published its report, the committee already knew that the 2030 target would be moved forward to 2020. However, we went further than that, arguing that the targets for the period leading up to 2020 must be made more robust, either by bringing forward the point at which annual reductions of 3 per cent must begin to be achieved or by building towards the achievement of such reductions.

The Government’s response has been simply to restate the intention to produce a 2020 target. Indeed, leaving its announcement of what that target would be until less than 24 hours before the debate ensured that the committee had no opportunity to take evidence or seek views on the
Government’s figure. Given that the Government has fallen in behind the UK Government’s approach of adopting a target of reducing emissions by 34 per cent by 2020, which could rise to a target of 42 per cent, it has now become a follower, even though it still claims a leadership role on climate change.

Stewart Stevenson: Can the member tell us of any other jurisdiction in the world that has made a commitment to meeting a target of reducing emissions by 42 per cent, if European Union agreement is reached? Has any other Administration made such a commitment?

Patrick Harvie: From a global leadership point of view, the jurisdiction that I would cite is the tiny and vulnerable Maldives, which is not waiting for 2050 or 2030, or for global action. Its ambition is to be carbon neutral in 10 years. If any country in the world could be forgiven for saying that climate change is someone else’s fault and someone else’s responsibility to deal with, it would be the Maldives, the capital city of which is hunched behind a tiny, vulnerable sea wall. Plans are already being made for evacuation, because the people know that they are going to lose their islands. That is leadership. What is the point of waiting until the world or Europe catches up? What is the point of assuming that the world will fail to catch up? The call for early action that was made by so many witnesses, endorsed by the science and recommended by the committee appears so far not to be heard.

As the bill stands, the first annual target will not be specified until the final year of the current Government’s term of office and not at the 3 per cent trajectory that is needed. The committee has argued for earlier specified annual targets. I think that that is the basis of the slight misunderstanding between the Government and Labour Party front benchers on the amendment. The issue of contention is whether the earlier targets are to be specified in the bill as opposed to specified by ministers after the bill has passed.

Future Governments will inherit the targets, but we should not give the Administrations that will be elected in 2011, 2015 and 2019 cause to resent a late start made in this session. The committee recommended two additional aspects to the reporting framework: to examine consumption-based emissions—the emissions in other countries for which Scotland is responsible—and the means of publishing data on cumulative emissions. Notwithstanding the minister’s response to Alison McInnes a few moments ago, the Government’s written response to the committee report has little to say on those and we will explore them further at stage 2.

The committee also recommended that the Government produce far more detail on key sectors of the economy: land use, transport, energy generation and energy saving. How much weight can those sectors pull? The Government responded by pointing to its intention to produce a draft indicative delivery plan some time in summer, presumably after the bill is passed. Fifty months after coming to office, the Government will have its first draft indicative ideas about where the cuts will come from—that is early action.

The transport issues that the committee addressed were mostly to do with aviation and shipping. We heard from the Sustainable Development Commission more recently; in its view, transport remains in general the area with the greatest mismatch between rhetoric and reality. The inclusion of aviation and shipping emissions is welcome, but there remain significant unanswered questions, not least on radiative forcing—as the committee noted—and on the Government’s intentions for aviation growth.

I must also note that since the publication of the committee’s report there have been suggestions that some in the industry are lobbying for a return of the air route development fund. It would be instructive to know whether the cabinet secretary considers such a proposal compatible with the climate change objectives.

At paragraph 202 of our report, we make a very clear call for public engagement to be put at the heart of the agenda, not just on policy development or strategy documents but in relation to public acceptance, positive attitudes, a can-do spirit, a willingness to think about shared and personal responsibilities, community efforts and lifestyle changes. The Government response on that recommendation is also disappointing. References to stakeholder discussions over the summer suggest that it has the wrong end of the stick.

On the need for scientifically informed debate, the Government claims to have considered the best evidence available. However, repeatedly, the committee heard concerns that, for the most part, the primary source is the IPCC’s fourth report. Even those who worked on that report now acknowledge that it is already out of date. The cabinet secretary referred to Copenhagen and the most recent scientific announcements.

We were surprised that the Government has not yet formally consulted the UK Committee on Climate Change. It states in its response that it believes that it would be premature to do so, yet we as members will be expected to address scientific evidence in support of amendments at stage 2. I hope that the Government will recognise that evidence needs to come from a broader base than simply the IPCC’s fourth report.
The final thought that I will share is my pleasure that the bill has been introduced during a period of minority government. Any Government will want to take seriously political advice on a measure that might be brave. I am very pleased that the bill that we finally pass will be the Parliament’s bill and not the bill as it was introduced.

15:59

Alex Johnstone (North East Scotland) (Con):
In the words of Kermit the Frog, “It’s not easy being green”. That comes with some sincerity from someone like me, who is from a background where green politics were not as important as they were in other areas. I have paid tribute before to members in the Parliament and those who have taken part in the broader political debate: they have done much to take green politics from the margins of political influence to the heart of policy making. The fact that we are in the chamber to debate the Climate Change (Scotland) Bill at stage 1 is evidence of their success.

We must now consider the nature of and the need for the legislation. Some members would not have been at all surprised if the Conservatives had in the past taken the position that there was no need to pursue such legislation. In truth, however, the mainstreaming of green policy and the understanding that the climate is changing has driven Conservative thinking as well as that of other political parties. It should therefore come as no surprise that the Conservatives wholeheartedly support the spirit of the bill.

Similarly, it might not have been a surprise to some if the Conservatives had decided that the right thing to do was to pursue the UK bill rather than separate Scottish legislation. Although we considered that possibility at the outset, two things became clear. First, Scotland is starting from a very different place in relation to climate change and how we deal with it and, secondly, it has a very different level of potential. Consequently, it is only right that Scotland should move ahead with its own legislation.

The proposal was first introduced in the form of an SNP manifesto commitment during the election campaign, which contained at its heart a target of an 80 per cent reduction in emissions by 2050. One of the first things that I had to do was to assess whether that was an appropriate commitment. At that time, the UK Government was moving towards a 60 per cent reduction by 2050. It was perhaps suspicion on my part that made me think that the Scottish National Party was simply trying to outbid the UK Government with a higher, more ambitious figure, but the fact that the UK Government quickly changed its position to pursue an 80 per cent target indicates that that figure was perhaps more appropriate.

One broad issue that arose during the Transport, Infrastructure and Climate Change Committee’s inquiry was the question of whether the target is ambitious. The Government is keen to say that 80 per cent is an ambitious target, but some organisations that appeared before the committee suggested that it is not. I suggest that it is an appropriate and ambitious target but only if we take into account genuine short-term measures with regard to how we will achieve it.

The second most important and significant issue is the decision to go for a 2020 rather than a 2030 target. That 2030 target was, I believe, simply too far in the future and, however ambitious we set it, would not have set the agenda for early progress. Consequently, the Government’s decision to pursue a 2020 target is a significant departure.

It is nonetheless extremely important that we know how that target will be set. The details—which have been explained by the Minister for Transport, Infrastructure and Climate Change in committee and by the Cabinet Secretary for Finance and Sustainable Growth today—suggest a 34 per cent target with the option of rising to a 42 per cent target, which is an acceptable path.

If we are to achieve that, we need short-term targets, and I will continue to seek further clarification from ministers on how those short-term targets will be set and—more important—what they are likely to be. If we do not make early progress on annual targets, we will not make the progress that is necessary in the first 10 years.

Stewart Stevenson: Does the member agree that it is vital that we have expert advice to help us set the annual and interim targets and that the UK Climate Change Committee that was established under the UK legislation is a good starting point for such advice?

Alex Johnstone: I accept that. Indeed, on the question whether there should be a separate Scottish committee or whether we should rely on the UK Committee on Climate Change, I believe that the UK committee provides an appropriate starting point. The establishment of a separate Scottish committee might be appropriate at some point, but I believe that that time is still some way off. Moreover, given that our targets are broadly similar to UK targets and, more important, feed directly into the achievement of UK targets, I think that we have a great deal to gain by having a common source of advice.

I am still concerned about one or two key areas. First, given that the bill is two years behind the UK legislation, one might question its relevance. However, that very fact gives us the opportunity to pass more advanced legislation that takes into account figures that were not available when the UK legislation was introduced—the Government...
Patrick Harvie is convener of the lead committee for the bill and will make some points on behalf of the Rural Affairs and Environment Committee, which considered parts of the bill. He stresses that he joined the Rural Affairs and Environment Committee just as it was finishing its report, so I will highlight the committee's work on certain sections of the bill. I am sure that other members of the committee and the Minister for Environment will go into much more detail than I will.

The Rural Affairs and Environment Committee specifically requested that it be appointed as a secondary committee to scrutinise the provisions that fall within its remit—the forestry, waste reduction and recycling, and muirburn provisions. On behalf of the committee, I thank all those who provided oral and written evidence and the clerks for their hard work.

I will start with muirburn, which was the least contentious issue. Muirburn is important in regenerating hill and moorland habitats, but the issue did not evoke a great number of responses, except on the dates and lengths of periods allowed for burning. I welcome the cabinet secretary's undertaking to consult stakeholders fully on the issue, and we will keep a close eye on the amendments that the Government lodges on the matter at stage 2.

On waste, the committee is aware that the bill's provisions on waste reduction and recycling are enabling in nature because the Government does not propose to introduce secondary legislation to enforce them if the same ends can be achieved through voluntary measures. The committee appreciated the logic of that approach but, given the importance of the provisions, we think that any such secondary legislation should be subject to the super-affirmative procedure, which would allow additional time for scrutiny of its contents, including in draft form.

Other issues stemmed from the evidence that the committee heard and need to be addressed to progress the central aim of reducing, reusing and recycling waste. They include the urgent need to focus on reducing commercial and industrial waste that is sent to landfill; the need to address the lack of infrastructure that is currently available to implement the policy intentions in the bill; and the need to consider matters that the Environment and Rural Development Committee raised in session 2 to do with the impact, including the environmental impact, of sellers of goods charging for the supply of carrier bags.

The Rural Affairs and Environment Committee also considered the opportunities that the current international market conditions could present for Scotland to develop waste recycling industries; the need to ensure that measures are undertaken in accordance with both the Government's definition of recycling and the waste hierarchy that is set out.
in the waste framework directive; and, in order to inform public decision making, the need for the Government to endorse one method of measuring carbon footprints and to establish criteria that are based on it that reflect which waste reuse and recycling practice is the most sustainable.

On the more contentious issue of forestry, we all know—the Minister for Environment in particular—that the submissions that were received on the proposal to lease a percentage of Forestry Commission land either opposed that proposal or raised substantial issues with it. On the basis of the weight of the opposition to the proposal and issues with the adequacy of the consultation process, the committee recommended that the Government should not progress the proposal. As members might appreciate, the committee therefore welcomes the Government’s announcement that it will not progress the proposal. Assuming that this is still the Government’s intention, the bill will be amended at stage 2 so that the provisions in section 47 are restricted to purely enabling joint ventures.

All the written submissions supported the idea of the Forestry Commission entering into joint ventures with private companies for the development of sustainable energy projects, such as wind farms and hydroelectric infrastructure projects. Evidence to the committee suggested that such joint ventures have the potential to generate considerable income, although members are aware that there are practical barriers to generating income quickly because of the time taken to receive planning permission and clearance from environmental regulators for proposals such as wind farm projects. Given the notable support for the joint venture proposal from stakeholders, the committee recommended that the Government should explore the full potential of joint ventures, including whether support should be provided for their establishment.

The committee’s report notes that, in the response to the Government’s consultation on the proposals, there was widespread support for the idea of community leasing. Although provisions on that would not sit easily in the bill, as community leasing would have social benefits that are unrelated to mitigating climate change, the committee recommended

“that the Scottish Government incorporates provisions to allow for community leasing in future legislation.”

That would meet the call from members that we must encourage members of the public to buy into the climate change debate.

The Deputy Presiding Officer (Trish Godman): You should finish now, Ms Watt.

Maureen Watt: Finally, as usual, many organisations have sent in briefings on the issue, which have highlighted Scotland’s position at the forefront of tackling climate change. However, caution should be—

The Deputy Presiding Officer: You must finish now, Ms Watt.

16:16

Cathy Peattie (Falkirk East) (Lab): Climate change is everyone’s responsibility, and people who accept the responsibility will want strong climate change legislation. Building on the UK Climate Change Act 2008, the Climate Change (Scotland) Bill will be world leading and we must get it right. Those who want to make a contribution to the future of our planet have nothing to fear from the bill, as it sets targets that we must meet to avert disaster, facilitates and encourages public participation and engagement in climate change policy and action, and ensures that all public authorities are on board and do what they can to work with central Government and the public to achieve the targets. What we are asking will not always be easy to achieve, but we would not ask it if we did not think that it was essential. If we act slowly, it will be harder to meet the challenges.

Those who constantly seek to innovate and reduce their impact on the climate should not find complying with the legislation any harder than complying with targets that they would set for themselves. Indeed, quite the reverse is true, as the bill should make that easier. On the other hand, those who are in denial—those who think that the bill does not affect them and that climate change is simply not a problem and nothing to do with them—might have a bit more difficulty. For those who want to be part of the solution, the bill is not part of a problem.

All of us have something to contribute—not only those who work on renewable energy, the more efficient use of resources, insulation programmes and carbon capture or in other jobs that immediately spring to mind as green jobs—and we must do all that we can to green our jobs. Central and local government and other public authorities have an important role in taking measures to limit climate change and adapt to the changing climate.

The issue is not only about flood defences and greener energy, reducing congestion and improving public transport, and reducing the number of flights that we take and being more thoughtful about using local produce, important though those actions are; it is about becoming more conscious of the impact of everything that we do. We need to take a joined-up approach and must always consider whether there is a better way in which to do things so that we reduce our carbon footprint. We must combine renewable energy and heat schemes with power schemes,
and we should combine climate change adaptations with improvements to schools and hospitals. We can get jobs done more effectively while allowing people more flexibility in order to reduce commuting. The issue is about developments in a sustainable and low-carbon economy.

A general duty on public bodies to ask about such issues must be written into the bill. We have to see that action is making a difference. I am talking about not just local authorities but all public authorities—organisations such as Scottish Enterprise, the health service, further and higher education bodies, Scottish Water, the Scottish Environment Protection Agency, Scottish Natural Heritage and sportscotland. All public authorities have a role to play.

Stewart Stevenson: I wonder whether the member makes a distinction between the bodies that are part of the Scottish Government—on which duties placed on the Government will also apply—and local authorities, in which there should be independent decision making. The duties imposed on local authorities should be imposed in a different way and should be of a different character.

Cathy Peattie: Each public authority will consider what it needs to do, and I will come on to that very issue in a few moments.

Each public authority has a role to play through training, procurement, planning, environmental management, land use, public engagement, employment policies and the use of new technology and research—to name but a few issues. We need to know that bodies are doing everything that they can with regard to both their own activities and the impact of their planning and procurement policies. This is not about being prescriptive. Each organisation or public authority will have to define what it must do in order to meet the public duty. I believe that the duty must be embodied in this legislation.

The public duty relating to equal opportunities is a good example to consider. For years, it was expected that public bodies would have policies on equal opportunities, but many public authorities adhered to such policies only in relation to recruitment. Local authorities were much better but, even then, the reality was that only one person or a small team of people was responsible for equalities throughout the local authority.

The existence of a public duty on equalities now means that equal opportunities are mainstreamed throughout organisations—and that can now be audited. It took more than 20 years for that to happen, but we cannot allow that length of time for a duty on climate change. We do not have the time.

We need transparency and effective monitoring and reporting. Target setting should clearly be the role of the UK Committee on Climate Change, but I believe that complementary activity is also required at Scottish level. Scotland has devolved government, Scottish law, and Scottish bodies. There are distinctly Scottish dimensions, and we therefore need to address the issues at Scottish level—through either existing Scottish bodies such as SEPA or a newly set-up organisation.

I ask the minister to look again at the issues that I have raised this afternoon. We in the Scottish Parliament have a duty to ensure that this legislation is strong. I urge all members to consider their duty to future generations.

16:23

Shirley-Anne Somerville (Lothians) (SNP): There is now no doubt that climate change is the biggest challenge that humanity has faced. Ironically, it is of our own making. Efforts so far to tackle climate change have not been encouraging.

The first international climate change regime has been put in place, but it has had barely any effect on the global greenhouse gas trajectory. The bill is our opportunity, in our country, to change that.

The cabinet secretary has rightly detailed the positive work that the Government has undertaken to date. I believe that the bill is a world-leading piece of legislation, but we must always strive to better the original proposals. I shall concentrate on two issues—the measurement of consumption emissions, and the limits on international carbon credit.

New research by the Stockholm Environment Institute has found that, although production emissions from Scotland fell by 13 per cent between 1995 and 2004, Scotland’s consumption emissions rose by 11 per cent. Further on in the briefing that members received, the example of Ravenscraig was used. Scotland did not stop using steel when Ravenscraig closed; we simply started importing it, and the resultant emissions, from elsewhere. Consumption-based reporting will allow us to see whether we are driving down our emissions, or whether we are responsible for exporting them to outside our own borders.

We have a global responsibility. I cannot be the only member who has spoken to people who are not quite convinced by the arguments on climate change—people who say, “Well, China’s building a new power station every week, and they’re exporting all these goods, so it’s really their fault.” A report from the Tyndall centre for climate change research has shown that, in 2004, net exports from China accounted for 23 per cent of its total CO2 emissions. The responsibility is not China’s; it is that of everyone who is importing and
using its products. There is a bigger picture that we need to take account of.

Passing the bill will be good for Scotland, on two levels. It is good for our policy makers, who will have a better understanding of the drivers behind the changes to Scotland’s emissions. It is also good for Scotland’s jobs, because it incentivises us towards maintaining green work at home, rather than outsourcing it abroad. The bill also has an important role in individual empowerment. It can be a powerful communication tool, engendering a big appreciation of the impact of individuals, organisations and Government on the global environment.

It has been found that, the more we earn, the more we pollute. Consumption reporting will focus the minds of those of us who consume more than the people who are directly affected by our emissions.

Carbon credits is an area in which the bill can be strengthened, and I welcome the minister’s announcements on that so far. There can be no doubt that emissions reductions must be domestic if we are to play our part in reducing climate change. A tough limit on credits is necessary. We should ensure that we are reducing our emissions, not exporting them. We can buy our way out of trouble one year by buying some carbon credits, but that does nothing to achieve the long-term targets that we all claim to hold dear.

I believe that the bill will incentivise investment. We can invest in the technologies that will reduce our domestic emissions, while creating green jobs. Mitigating climate change might have its challenges, but it also has its opportunities. Scotland has the opportunity to become a green powerhouse of Europe. I do not want projects just to be in place here; I want them to be researched, designed and piloted here—and then taken round the world to build a low-carbon economy. Domestic effort is the best way to achieve that.

Alex Johnstone: Does the member agree that that is doubly critical given that many low-carbon technologies, particularly in renewable power generation, are very efficient in the production phase in terms of manning, and that, consequently, we must have the design and production jobs here? Otherwise, the green jobs revolution might simply not happen for us.

Shirley-Anne Somerville: I very much agree with the member’s comments. Scotland has already lost out with onshore wind power; notwithstanding the recent good-news announcements concerning Campbeltown, we do not want the same problems to arise for wave or tidal energy.

Many members have discussed the significance of the 10-year anniversary of the first Scottish parliamentary elections, and of the bill. I was listening to comments about that on the radio this morning. There have been some lows in the Parliament, but there have also been many highs. The Climate Change (Scotland) Bill has the potential to be this session’s defining moment. I agree with Sarah Boyack: arguably, the legislation will be the most important that the Parliament has passed to date.

I am proud that the SNP Government has produced and introduced the bill. More important, by the end of the process, the Parliament must feel ownership of it. We will disagree on some points on the way. We all want improvements to be made so that the bill becomes the best that it can be. By the end of stage 3, the bill might not include everything that we want it to include; however, it must have become the Parliament’s bill. We all have a responsibility to turn the framework into reality. We will fail unless we practise the new politics that people wanted from the Parliament. It is imperative that we take what is a framework document and use it to enthuse and energise the public. The framework will mean nothing if it does not lead to real change, not just for politicians but for the public sector, businesses and individuals.

We have an opportunity for world leadership in energising and enthusing not just the Scottish public, but those who will gather in Copenhagen. I ask everyone in the chamber to get behind the bill and to make it the best that it can be. We will see what we can do to show that world leadership.

Malcolm Chisholm (Edinburgh North and Leith) (Lab): The Climate Change (Scotland) Bill is the most important bill of the parliamentary session and climate change is the most urgent issue of the age. Climate change not only threatens the future of our children and grandchildren, but is already affecting millions of people throughout the world. For example, the UN tells us that in the first five years of this century, 262 million people—of whom 98 per cent were in the developing world—were adversely affected by climate change.

So urgent, challenging and potentially unpopular is the issue that we must come together across the political divide to lead together in a new-politics approach, as advocated by Shirley-Anne Somerville. She and I are the co-conveners of the cross-party group on climate change, which is showing how we can act together on the issue across the political divide.

Equally crucial is community involvement and action. I am sure that all members have many groups in their constituencies that are acting on
climate change. When we debated eco-congregations on 17 December 2008, I mentioned churches in my constituency, so I will not repeat their names. However, perhaps I can be forgiven for mentioning groups that have won awards from the climate challenge fund—Greener Leith, the North Edinburgh Trust, the Out of the Blue Arts and Education Trust and the Pilmney Development Project. Those groups illustrate the importance of local people coming together to take action at the grass roots. In due course, the bill should be amended to promote public awareness and engagement in meeting the climate change targets.

Of course, the 80 per cent headline target is an excellent start. It is one of the main reasons why the bill was widely welcomed when it was published. However, I was given pause for thought when I read the Royal Society of Edinburgh’s submission on the bill, which begins by saying:

“The endpoint target of an 80% reduction by 2050 is an irrelevance unless there are appropriate intervening milestones.”

That encapsulates a main point that has been made by several members, including Sarah Boyack. The key issue for climate change is cumulative emissions. That is why emissions reductions must as far as possible be front-loaded rather than end-loaded, as the bill proposes.

In all the submissions that I read, two of the most interesting pages were the last two in the Royal Society of Edinburgh’s submission, which incorporate a table—I know that the minister, as a mathematician, will have studied it—that indicates that even with 3 per cent annual reductions starting next year, we would not reach the 80 per cent reduction by 2050. When I read that, I concluded that we certainly need 3 per cent annual reductions without delay. The only good effect of a recession is that it allows an easy start, to recognise the greater climate change damage that emissions at altitude cause.

Stewart Stevenson: Like me, does the member wish to have appropriate expert advice that reflects the different aviation sectors, so that we encourage moves to the more sustainable forms of aviation that will increasingly be available?

Malcolm Chisholm: We certainly need expert advice, but we also need radical action on aviation and other forms of transport. Transport is a big concern. Those who read the editorial in The Herald this morning will have seen the quotation from Maf Smith of the Sustainable Development Commission, who said:

“Travel is the policy area where there is least alignment between current action and long-term sustainability”.

At the beginning of my speech, I referred to unpopular action, which we need. Aviation issues will not be solved just by using the planes to which the minister referred. We also need action on car travel, as well as the promotion of public transport. We must quantify emissions reductions in the transport sector, as in other major sectors, such as energy generation and energy efficiency.

I welcome the limits on international credits. It is right that at least 80 per cent of emissions reductions should be achieved by domestic effort. I hope that that will be put in the bill.

Finally and crucially, part of the acting together that I emphasised at the outset must be action by other public bodies. An enforceable duty must be placed on such bodies to reduce emissions in line with national targets.

I hope that the minister will look seriously at Oxfam Scotland and Friends of the Earth Scotland’s proposals for a public sector budgetary regime that involves incentives and disincentives.

16:35

Nanette Milne (North East Scotland) (Con): I am pleased to have been given the opportunity to speak in this stage 1 debate in support of the general principles of the Climate Change (Scotland) Bill.

If we believe that climate change is real—which we do—and that it poses a long-term threat to political stability and economic growth, we must all work together as nations, Governments, businesses and individuals to do our bit to combat climate change by doing our utmost to reduce our carbon footprint. If we are to achieve that, tough but meaningful targets need to be set and attained. That is why my party has given support to a climate change bill for Scotland that sets out the targets and policies by which such change will
be achieved and by which progress towards our goal will be carefully monitored.

I did not have the opportunity that was afforded to the members of the three parliamentary committees that scrutinised the bill of hearing evidence from the many groups of people with an interest in the issue. However, although the bill focuses on long-term targets, it contains little practical detail on how those targets will be achieved. The detail has been left to subsequent policy and regulation. That is particularly the case in section 5, in which many enabling provisions—for example, in the area of waste management and recycling—are set out. Our concern is that the provisions could result in a raft of future subordinate legislation that could have significant financial implications for local authorities, businesses and consumers. That provoked much disquiet during the scrutiny of the bill at stage 1. I will elaborate on the issues later in my speech.

I will confine most of my brief remarks to section 5. Before I do so, I too align myself with the Church of Scotland eco-congregations, the Energy Saving Trust, the Confederation of British Industry and many other organisations on the need for public co-operation and involvement in fighting climate change. If people around Scotland are not aware of the bill or how it might affect them—indeed, it would appear that few of them are—they will press on with their lives regardless of climate change and what they can do to fight it.

If the bill is to achieve its intended results, individuals and communities must become involved in trying to meet its set targets. To that end, I am pleased to note the recommendation in the lead committee’s stage 1 report that ministers should produce proposals for an engagement strategy as part of their implementation plan for the bill. I was pleased to hear the cabinet secretary’s positive response to that recommendation in his opening speech.

Section 5 addresses a number of important issues, not least of which is the requirement for a programme of action on how Scotland will adapt to the impacts of climate change to be placed before Parliament. Given that agriculture produces a significant proportion of our greenhouse gas emissions, land management techniques have a key role to play in mitigating climate change. Habitat conservation and agricultural and forestry activities can help by way of reducing losses from soils and sequestering carbon in vegetation.

There is increasing competition for land use in rural areas. Much land has been—and continues to be—developed for housing and industry. In addition, biofuels are increasingly displacing food production and conflict can arise where woodland replaces heather moorland. Of course, there can also be complementarities, one example of which can be seen when the restoration of peatlands improves water quality in addition to reducing greenhouse gas emissions and improving habitats. If we are to get the greatest benefit from the use of our rural land, we need to develop a sustainable land use strategy. The Parliament gave cross-party support to that in the forestry debate on 19 March.

RSPB Scotland pressed the Government to include a commitment in the Climate Change (Scotland) Bill to introduce a sustainable land use strategy. I have a deal of sympathy for that approach. We are pleased that the Government decided to drop its forestry leasing proposals following widespread opposition during the consultation process. That said, we are supportive of other roles that the forestry sector can play in reducing carbon emissions; joint ventures such as renewable energy projects are one example of that.

We welcome the Government’s intention to review muirburn provisions. The minister’s stated intention is to lodge an amendment to ensure that the power to vary muirburn dates will maintain the current number of days when burning is allowed, thus protecting carbon storage and reducing the risk of wildfire, as well as protecting our natural heritage.

We are supportive of measures to encourage energy efficiency, as explained by my colleague, Alex Johnstone. Nevertheless, as I said earlier, we remain to be convinced by many of the provisions that are included in section 5 and the level of subordinate legislation that it provides for regarding waste management, recycling and packaging, deposit-and-return schemes and charges for plastic carrier bags. The British Soft Drinks Association, for example, is concerned that the sections on waste, recycling and deposits contain some potentially far-reaching provisions that have not yet been fully analysed. It fears that those sections might impose additional cost burdens on both industry and consumers that will run into many millions of pounds and might weaken existing measures to ensure the recycling of packaging waste.

Patrick Harvie: Will the member give way?

Nanette Milne: I do not have time. I am just finishing.

We should listen carefully to such concerns and give consideration to the BSDA’s suggestion that the proposals should be introduced as primary legislation, if and when necessary, to ensure full legislative scrutiny, rather than being bundled into the present bill.

We are dealing with a significant and complex piece of legislation, and I have no doubt that the bill will be amended significantly during the next
stages of its progress through Parliament. However, like my colleagues, I am content at this stage with the general principles of the bill and will be happy to support it when the vote is taken tomorrow afternoon.

16:41

Liam McArthur (Orkney) (LD): Limbering up for this afternoon’s debate, I sat through last night’s champions league semi-final between Arsenal and Manchester United. Admittedly, as a piece of research into climate change it proved next to useless. However, given all the pre-match hype, it was a bit of an anticlimax, in which sense I spotted certain similarities between ITV’s coverage of the big match and some of the SNP’s more outlandish claims about the Climate Change (Scotland) Bill. That is not to say that the bill’s central objective of reducing greenhouse gas emissions in Scotland by 80 per cent by 2050 is not bold or ambitious, because it is, and it commands broad support throughout the Parliament and beyond—all the more so given the cabinet secretary’s welcome commitment today to ensuring that the bulk of the reduction is achieved in Scotland.

Rob Gibson (Highlands and Islands) (SNP): Can the member tell us what climate change targets the Liberals proposed in their manifesto for the most recent election?

Liam McArthur: I am happy to accept that the bill is bold, but, as I will discuss, it is rather lacking in detail, as many members have suggested.

Setting targets—particularly long-term targets—does not, of itself, achieve anything, as I am sure Rob Gibson accepts. It can provide a valuable steer to business, the public sector and individuals as to the direction of travel, and inform decisions about where to invest and how to act, but the targets will be met only if they are backed by a credible action plan—a road map to achieving the goals that have been set. Sadly, despite its many laudable features, the bill is still wanting in that respect. Fortunately, there is time for Parliament to rectify that, and perhaps this afternoon we are seeing evidence that ministers are waking up to our concerns.

Rightly, the bill covers a wide range of issues. I will concentrate on the contribution that energy can and must make in addressing the challenges that we face. In his excellent book “Sustainable Energy—without the hot air”, David MacKay, professor of natural philosophy at the physics department of the University of Cambridge, points out that the energy debate is “inundated with a flood of crazy innumerate codswallop.”

It could be that, when Professor MacKay wrote that, he had just attended a mind-mapping session with our very own Minister for Enterprise, Energy and Tourism. However, to be fair to Mr Mather, I am fairly sure that that opinion was formed some time ago.

Like the climate change debate as a whole, Professor MacKay bemoans the fact that discussions about future energy policy involve the use of language and numbers that are intended to impress rather than inform. He concludes that, however we stack up the numbers, there is no getting around the fact that the “climate problem is mostly an energy problem.”

It is, therefore, entirely appropriate that both the Economy, Energy and Tourism Committee and the Transport, Infrastructure and Climate Change Committee have drawn attention to the fact that renewable energy and energy efficiency have a key role to play in delivering carbon emissions cuts.

In its briefing for the debate, the microgeneration and energy efficiency bill steering group makes it clear that “significant commitments are still required in the Bill that promote micro generation and energy efficiency as a vehicle to achieve early and significant reductions in greenhouse gas emissions.”

I acknowledge and welcome Mr Swinney’s clarification that he intends to introduce a new interim target for 2020. However, as Patrick Harvie and others have mentioned, that still does not address the point that has been made by the steering group, the Royal Society of Edinburgh, Friends of the Earth Scotland, Scottish Renewables, the Association for the Conservation of Energy and others that ministers’ failure to commit to making immediate, meaningful and quantifiable cuts in emissions effectively risks chucking in the towel on achieving the interim and 2050 targets.

Stewart Stevenson: Will the member give way?

Liam McArthur: I am sorry, I do not have time.

On quick wins, the obvious place to start is energy efficiency. Inexplicably, the Government continues to treat energy efficiency as the Cinderella of the energy debate. After the consultation that was carried out by the previous Executive, Jim Mather felt confident enough in May 2007 to promise that he would make publication of an energy efficiency action plan an “early priority”. A year later, he had another stab at guessing the date of the publication, saying this time that it would be published by the end of 2008. Now we are told that the action plan cannot be published until 12 months after the provisions in the Climate Change (Scotland) Bill come into force. Two years after the SNP came into office, this continued delay is simply not acceptable. That
is why the Liberal Democrat amendment calls for an energy efficiency action plan to be published within six months. Unless the Government takes the issue more seriously, its credibility on climate change and, indeed, on fuel poverty will be compromised. On microgeneration, too, ministers must use the opportunity that the bill presents to make progress with the proposals that are set out in Sarah Boyack’s proposed energy efficiency and microgeneration bill, which commands widespread support.

Having dumped local income tax, ministers now have no excuse for opposing local tax incentives to boost the uptake of microrenewables and energy efficiency measures. The Energy Saving Trust argues that council tax rebates are more visible than any other fiscal incentives, and I understand that Ian Marchant of Scottish and Southern Energy has told Mr Swinney that the bill is the obvious vehicle for delivering such an incentive. I hope that ministers will respond positively to that.

On permitted development rights, the Government must show more ambition, not least in extending those rights to the non-domestic sector. The steps that have been taken by ministers today, while helpful in relation to solar panels and ground-source heat pumps, still do not go far enough. As ACE points out, with regard to micro wind and air-source heat pumps, guidelines threaten to “stunt development”. Action on that point could be part of a concerted attempt to enhance the contribution that is made by renewable heat. Scottish Renewables proposes a target of generating at least 14 per cent of heat from renewables by 2020. It would be useful to hear the minister’s views on how that might be achieved.

It would also be useful to hear what specific steps are being taken to further empower local communities to address the climate challenge. As the debates in this chamber on Community Energy Scotland and eco-congregations have demonstrated, the necessary desire, capacity and innovation are present in many of our communities and congregations, but a more decentralised, bottom-up approach is required to allow them to flourish.

The Government is right to remind us of the potential of the bill to be world leading and a fitting tribute to this Parliament as it enters its second decade. However, that potential will be realised only if ministers are more specific about how they intend to achieve their objectives between now and 2020.

Like others, I look forward to Parliament helping to deliver legislation of which we can all rightly be proud, and I have pleasure in supporting the general principles of the bill and the amendments in the names of Alison McInnes and Sarah Boyack.

16:48

Charlie Gordon (Glasgow Cathcart) (Lab):
This is a major bill by any standard, and it has been scrutinised to varying degrees by five parliamentary committees, including the Transport, Infrastructure and Climate Change Committee, of which I am a member. I do not know about the other committees, but I know that the evidence-taking sessions that my committee held were numerous, comprehensive and very, very long. It is fair to say that there is a significant level of support for the general principles of the Climate Change (Scotland) Bill in the chamber and among those who submitted evidence to the committees, despite—or perhaps because of—the fact that the bill is lacking in detail.

It is because of that lack of detail that the Transport, Infrastructure and Climate Change Committee calls on the Scottish Government to put before the Parliament at the earliest possible date a comprehensive strategy document outlining how it intends to achieve the targets that are set out in the bill. It is all very well having targets but, having launched a few in my time, I know that there is always a wee wumman who comes up and says, “Aye, son, but what are you actually gonnae dae?”

The Government has said that it has a strategic overview project, which will spawn an indicative delivery plan this summer, and that a report on policies and proposals, which will set out measures to deliver annual targets, will be published next summer. All of that is fine—that is what the Scottish Government is saying it is actually gonnae dae.

The Transport, Infrastructure and Climate Change Committee said that particular sectors must be prioritised. It identified four key sectors: land use, energy generation, energy efficiency and transport. The Government indicated that its indicative delivery plan—the one that is intended for the summer—will touch on heat supply and demand, electricity supply and demand, transport, rural land use and waste. Although the Government’s language is slightly different from the language in the committee’s report, it appears that the Government intends to respond to our concerns.

The Finance Committee, which considered the bill’s financial implications, opined:

“the Financial Memorandum would have been stronger if modelling work had been carried out on the potential financial impact of the measures on businesses and public bodies.”
In its response to the Finance Committee’s report, the Scottish Government said that it would publish a revised financial memorandum to the bill at stage 2.

The Finance Committee gave formal notice that it might "track the subsequent statutory instruments and seek to scrutinise the financial implications."

That is an important point, not just for the committee but for the Parliament. The bill is quite general. It is not vague, but it lacks detail, and in the years to come many of its consequences will be manifested through secondary legislation. We must therefore continue our scrutiny role for a long time.

Stewart Stevenson: We agree that work will not be finished when the bill passes into law. Scrutiny must continue all the way to 2050.

Charlie Gordon: The minister makes a fair point, but that aspect of the bill makes it rather unusual.

The Transport, Infrastructure and Climate Change Committee recommended that "the Scottish Government provides, as a matter of urgency, details on how it intends fully to assess and present the job implications of plans it brings forward under this Bill."

The committee meant not just new job opportunities but threats to existing jobs and how such threats might be avoided. It is fair to say that the Scottish Government responded in suitably emollient terms.

Those and many other concerns, in particular the concern about targets that members have expressed, will merit more scrutiny, not just during the next stages of the bill but in the context of future secondary legislation. We will consider the issues in future parliamentary debates.

Outside the Parliament, individuals and businesses are helping to address the climate change agenda through innovation, as Cathy Peattie said. Two innovations have caught my eye. The new class 380 trains from Siemens for the Scottish rail network are efficient in their own right and will help towards modal shift from car to public transport. In my final 10 seconds I will mention the new website that has been launched to enable everyone to track the ambitious and exciting carbon capture and storage project that is proposed for Longannet power station.

That is my six minutes.

The Deputy Presiding Officer: It is indeed.
role in action on climate change, which is why we consulted on leasing to help fund forest-related mitigation measures. However, we have listened to what the public consultation told us, have withdrawn the proposals and will now consider the wider suggestions that various consultees made.

I am glad that everybody is glad that we did that, but the fundamental requirement remains the same and has to be addressed. Forestry Commission Scotland will continue to develop arrangements for renewable energy projects using joint ventures, but the five-year gap before realistic income streams can come from joint ventures means that we have to take shorter-term measures. As indicated previously, that means an acceleration of the pre-existing sales programme in the interim. The income from renewables is expected to rise from its current level of £6 million per year to about £10 million per year by 2012 and £30 million per year by 2020.

I hope that that answers some of Maureen Watt's comments. I listened to her speech with a certain degree of poignancy. We have shared committee scrutiny of the bill, even though I was surprised mid-scrutiny to turn into the object of scrutiny instead of the person doing the scrutinising.

A couple of members mentioned waste management, which is a notable success. Emissions have been cut since the early 1990s as less waste has been sent to landfill, but we need to keep making progress. The bill's various enabling provisions on waste management provide back-up powers should the voluntary measures not succeed. I assume that the lack of major comment on them suggests that they have a degree of general support. I remind the Parliament that they would be introduced—if at all—by affirmative procedure, so there would be plenty opportunity for debate.

Maureen Watt and Nanette Milne mentioned muirburn. They should be aware that, although it is included in the bill, other aspects of muirburn are likely to be addressed in separate legislation later in the Government's term in office.

Adapting to climate change is a new and important area of work. Last week, Stewart Stevenson launched a consultation on a climate change adaptation framework, which addresses some of the points that Patricia Ferguson raised in her intervention. We want to share anything that we learn with others.

The bill strikes the right balance. There has been a lot of discussion about the detail that members say should be in it. However, if it was all in the bill, the bill would be unfeasibly large and, more to the point, the bill's passage through the Parliament would be delayed.

It is acknowledged that adaptation matters and that Parliament should see regular and rigorous progress reports on how the Government is dealing with it. The Government is up for that. There are also powers to allow ministers to impose adaptation duties on organisations at a later date, if that is required.

I commend the bill to members. There will be a full closing speech on it in tomorrow's debate. Points raised in this debate but not answered by me will be answered then. The bill is our chance, as legislators in 2009, to leave a huge legacy for not only the immediate but the long-term future of Scotland. I hope that we do not allow that legacy to be sunk by petty squabbling, which will not help anybody in the long run.

The Presiding Officer (Alex Fergusson): That concludes this afternoon's debate on the general principles of the Climate Change (Scotland) Bill. The debate will conclude tomorrow afternoon. I remind members who were not here earlier that I am using my discretion under rule 11.3.3 of the standing orders to allow the questions on motion S3M-3963, in the name of Stewart Stevenson, and on the two amendments to be put at decision time tomorrow night.
Climate Change (Scotland) Bill: The Parliament continued debating the general principles of the Climate Change (Scotland) Bill.

After debate, amendment 3963.2 in the name of Sarah Boyack was agreed to (DT).

After debate, amendment 3963.1 in the name of Alison McInnes was disagreed to (DT) by division: For 57, Against 62, Abstentions 0).

After debate, the motion as amended was agreed to (DT).

Accordingly the Parliament resolved—That the Parliament agrees to the general principles of the Climate Change (Scotland) Bill and, in so doing, further agrees that unambiguous quantified targets for the reduction of greenhouse gas emissions for the period between 2010 and 2019 are needed so that the current government and governments elected in 2011 and 2015 can be held to account for delivering early action on tackling climate change.

Climate Change (Scotland) Bill: Financial Resolution: The Minister for Transport, Infrastructure and Climate Change (Stewart Stevenson) moved S3M-3923—That the Parliament, for the purposes of any Act of the Scottish Parliament resulting from the Climate Change (Scotland) Bill, agrees to any expenditure or increase in expenditure of a kind referred to in Rule 9.12.3(b)(ii) or (iii) of the Parliament's Standing Orders arising in consequence of the Act.

The motion was agreed to (DT).
Climate Change (Scotland) Bill: Stage 1

Resumed debate.

The Presiding Officer (Alex Fergusson): For the sake of people in the public gallery, I should explain that the next item of business is a continuation of yesterday’s debate on motion S3M-3963, in the name of Stewart Stevenson, on the general principles of the Climate Change (Scotland) Bill. Speeches should be no longer than six minutes. I will allow a couple of seconds for the ministers to change places.

If he is ready, I call Jim Mather. You have six minutes.

14:57

The Minister for Enterprise, Energy and Tourism (Jim Mather): Thank you very much, Presiding Officer. I have just passed the manual dexterity test.

I am delighted to have the opportunity to speak on day 2 of the stage 1 debate on the Climate Change (Scotland) Bill. Clearly, the bill is a flagship piece of legislation for the Scottish Government, the Scottish Parliament and Scotland itself. Therefore, I welcome Labour’s absolute support for our strengthening of the interim 2020 target. I am also encouraged by the evident consensus in Parliament that our emissions reduction target of 80 per cent is right. Liam McArthur acknowledged that the bill’s central objective is “bold” and “ambitious” and Alex Johnstone recognised that the target is “appropriate and ambitious”.

Our aim is to deliver world-leading legislation on climate change—which is of global importance—at a crucial time as we all work towards what we hope will be an ambitious new international agreement on climate change in Copenhagen in December this year. All along, our intention has been that Scotland should act as a model of international good practice in order to influence decisive world action. We are committed to acting in cooperation with the United Kingdom Government, with which we are already working on the delivery of European Union commitments.

With Scotland’s wide and material array of natural resources, we are well placed to respond to climate change. As a result, we can deliver a solid and persuasive plan of action to follow on from the self-evident political commitment. In so doing, the foundation of our response to climate change and to the challenge that it presents is our energy policy. As I have said, Scotland has vast potential in renewable energy. Onshore wind power is an established green energy technology, and offshore wind is rapidly opening up huge new opportunities. The emerging wave and tidal marine power technologies are also attracting great new interest. That is being augmented by the saltire prize, which we are working on with the National Geographic Society.

Marine energy obviously presents many technical engineering challenges, but Scotland’s history of North Sea exploration puts us in a good position to develop the required expertise to meet those challenges. We have comprehensively done that in North Sea exploration, which is proven by our exporting of those skills around the globe. Our blend of track record, natural resources, expertise and commitment reinforces the belief that Scotland can be the green energy capital of Europe. Given that we have a quarter of Europe’s renewable energy potential, there is no doubt that Scotland will always be on the global energy map. We already enjoy that status, as we are well on the way to achieving our target of meeting 50 per cent of our electricity demand from renewable sources by 2020.

Patrick Harvie (Glasgow) (Green): Given what the minister has said about renewable energy, does he agree with the Transport, Infrastructure and Climate Change Committees recommendation that the Government should provide us with more detail on the emissions cuts that are expected in electricity generation and three other key sectors? What can he say in response to that recommendation?

Jim Mather: The delivery plan will provide that additional detail. I expect it to evolve along the lines that Patrick Harvie suggests.

Our status and standing will be further established and enhanced as we do more, for example by encouraging the development of renewable heat. As the First Minister announced last week, Scotland is uniquely positioned in terms of geography, technology and ambition to become Europe’s leader in carbon capture and storage, which is the key technology for decarbonisation of emissions from fossil-fuel power generation and heavy industry. It is obvious that Scotland can be a world leader in the generation of clean, green energy.

Gavin Brown (Lothians) (Con): The minister mentioned renewable heat. Does he think that section 51 of the bill, which deals with renewable heat, goes far enough to make Scotland lead the world in that area, or could the Government go a bit further?

Jim Mather: There is always scope to improve, but I think that section 51 contributes to our being allowed to make the claim that we are world leading.
In addition to our work on carbon capture and storage, I am well aware that we must carry out work at the other end of the spectrum if we want to have the maximum impact and to continue to be a net exporter of low-carbon power. We need to tackle our domestic energy use, which we are doing through a range of actions on energy efficiency, including use of building standards and energy performance certificates, our support for the work of the Carbon Trust and the Energy Saving Trust, and our funding for a new area-based approach to energy efficiency.

All that emphasises that the climate change agenda is not just an issue of moral responsibility or just an environmental issue. The actions that we in Scotland take on climate change are inextricably linked to our economic aim of effectively managing the move to a low-carbon economy. We must ensure that that generates the economic impetus that we expect from a low-carbon future, and that it creates the green jobs that it is evident will be part of Scotland’s national economic recovery. I look forward to further progress on that and other fronts as the bill progresses into law.

15:02

Lewis Macdonald (Aberdeen Central) (Lab): Yesterday, Sarah Boyack said that the Climate Change (Scotland) Bill is potentially the most important legislation that we will pass in the current session. The challenge is in how we will ensure that the bills outcomes are as significant in practice as its words will be on paper. That was the spirit in which I and other members of the Economy, Energy and Tourism Committee approached our consideration of the sections of the bill that deal with energy efficiency and renewable heat. I am glad that we did so but, in my view, the bill falls short of expectations in a number of areas.

The first surprise comes in the opening provision on energy efficiency, which states:

“The Scottish Ministers must prepare and publish a plan for the promotion of energy efficiency in Scotland”,

and stipulates that that plan

“must include provision about the promotion of the energy efficiency of living accommodation.”

The surprise was that that form of words highlighted the promotion of energy efficiency, when ministers proposed to repeal section 179 of the Housing (Scotland) Act 2006, which committed them to preparing

“a strategy for improving the energy efficiency of living accommodation.”

On 4 March, we asked the minister why he proposed such a dilution of the existing provision. We did so in vain, although I am pleased to say that ministers have since then accepted the point and have indicated that they will support amendments at stage 2 to restore and, perhaps, to extend the existing provision, whereby they will have to produce an energy efficiency plan that is focused on outcomes as well as aspirations.

I hope that the minister will be able to tell us that the discussions between his officials and their Westminster counterparts, which he mentioned to the committee on 4 March, have not thrown up any fresh anxieties about what the Scottish ministers can and cannot do in respect of energy efficiency.

The Minister for Transport, Infrastructure and Climate Change (Stewart Stevenson): I welcome that statement of intent, although it is not quite a response to my question about the discussions that the ministers officials have had; perhaps we will hear that in the winding-up speech.

The Economy, Energy and Tourism Committee also recommended that ministers should include in the bill the setting of targets for energy efficiency. Unfortunately, that recommendation has not yet received a positive response. Of course, setting targets on its own does not deliver outcomes, but it stimulates activity, shows seriousness of intent and allows progress to be measured. The committee heard yesterday from Jeremy Sainsbury of Natural Power, who has been a member of the forum for renewable energy development in Scotland since its inception some five years ago. His evidence was very clear, and I suspect that it would be echoed throughout the renewable energy sector. Scotland’s devolved Government, by setting ambitious targets from the beginning, sent a clear message that we wanted to see the renewable energy sector grow. The raft of proposed developments that are now coming through the system is a direct consequence of that proactive approach.

I hope that ministers will think again about taking the same approach to energy efficiency. A positive signal now, which other parties could support and industry could rely on, would stimulate confidence in the sector and help to maximise the contribution of energy efficiency to cutting carbon emissions.

The committee called on ministers to publish a full draft of their proposed energy efficiency action plan before stage 2 of the bill. Thus far, they have chosen not to do so, but have offered one of those circular arguments that are well suited to not doing
Ministers could publish an action plan before the Climate Change Bill becomes an Act but this would not fulfil our requirements under the Act—Scottish Ministers would still have to produce and publish another action plan within 12 months.”

That would be true, unless ministers were so bold as to amend the bill to allow themselves to introduce their energy efficiency action plan early. It seems that that is what committee members from all parties were calling on ministers to do.

The committee would like ministers to be ambitious in the promotion of renewable heat. Again, the first sight of section 51 was disappointing. It will require ministers to “take such steps as they consider appropriate”, which is not a clear or demanding statutory obligation. It does not give great confidence that detailed plans are already in place.

However, ministers have now said that they will publish a renewable heat action plan this summer, following action at Westminster. That is welcome. They have set a target of 11 per cent of demand for heat in Scotland to come from renewable sources by 2020, which is less than the 14 per cent target elsewhere, but it is a start. I hope that there will be amendments to put more substance and more detailed targets in the bill.

The committee called for combined heat and power schemes to be part of the Governments plans on both energy efficiency and renewable heat. I am pleased to say that that has been agreed to and I look forward to seeing the substance of it. It is important that lessons that have been learned to date from the experience of CHP and district heating lead to action. The Climate Change (Scotland) Bill provides that opportunity.

When the committee visited Aberdeen Heat and Power Company in March, we heard about an important difference between Scotland and England in the assessment for rates liability of CHP schemes. In Scotland, the mains distribution pipes, the risers and the CHP building itself are charged business rates, but in England, they are not. The difference for a scheme such as the one at Stockethill in my constituency is some £18,000 a year, which is added to the cost of heat and power to the consumer. As, I am sure, we will hear this afternoon, local tax discounts to stimulate energy efficiency measures have huge potential but so, too, do business rates exemptions for stimulating CHP. I hope that ministers will consider that.

Overall, the recommendations of the range of committees, with cross-party support, provide a solid base for further improvements to the bill. I hope that more of those proposed changes are accepted at stage 2 and taken forward by ministers.

15:09

Jim Hume (South of Scotland) (LD): It is easy for us to ask what difference a small country like ours can make, but there is no doubt that we can make a difference. Climate change is complex, and there are natural cycles at work, too, but no one can doubt that we are polluting. That point was illustrated by the recent Stop Climate Chaos Coalition rally.

Green issues have always been at the heart of Liberal Democrat policy. In coalition, we made great strides on renewable energy. We invested about £100 million in renewables and support for energy efficiency—ahead of any other part of Britain or Ireland—and we have provided support for more than 600 small renewables and microrenewables projects. Lib Dems have delivered record recycling rates, which have trebled under our governance, and we have a proven track record in delivering green policies. We know what is achievable.

As a continuation of the good work, we support the bills headline target of an 80 per cent reduction in emissions by 2050. However, two important points arise. First, the Government has so far offered no precise details on how it will achieve that reduction. Work to tackle climate change must begin now. Many members have spoken about the Stern report, which emphasises the importance of speedy action. That important point is also made in the report of the Transport, Infrastructure and Climate Change Committee. It is a point that my party has been making for many months.

Stewart Stevenson: I absolutely accept that the previous Administration worked on tackling climate change. It will be important that we build on that work, rather than start anew, and that we keep going until 2050.

Jim Hume: Yes. As I said, this is “a continuation of the good work”.

The second point to arise is that, as my colleagues have said repeatedly, what we need to see from the Scottish Government now are clearly defined and detailed plans on how it will tackle climate change—plans that will take forward the targets that are set in the bill. We believe that the interim target could be brought forward from 2030 to 2020.

I welcome todays debate—and, of course, yesterdays—and the committee report, which echoes much of what my party has been saying for some time. However, I could not take part in
the debate without talking a little bit about forestry and land use. First, the leasing proposal threatened the Climate Change (Scotland) Bill. Those are not my words—they were the words of RSPB Scotland and the like. The proposal has been dropped after there was overpowering opposition to it, but the powers that will enable ministers to change the functions of forestry commissioners remain in section 47. I will lodge an amendment at a later stage if the Government does not address that issue.

Secondly, according to the then minister, we are now left with the prospect of a huge funding gap for climate change measures such as tree planting. The lease option was supposed to raise a one-off £200 million. We were told by the minister that “by dropping the leasing proposal, we face a short-term funding problem for woodland creation for up to five years.”

However, the Scotland rural development programme figures that were released last week—and with which Mr Lochhead agreed, just about 20 minutes ago—directly contradict that statement. We can now see that there is “ample headroom” for forestry under rural priorities funding. I hope that it was a miscalculation on the ministers part, rather than a misrepresentation. Clarification would be welcome.

We know that tree planting has a role to play in acting as a carbon sink, although there is still debate about how significant a role it can play. Tree planting has to be done in a balanced way, taking other land uses into consideration and not displacing existing and commercially viable activities. Tree planting can be only a part of the solution. There is no point in planting up hundreds of acres of land if nothing is done to address renewable energies or our energy consumption; and there is no point in planting without considering other land use and without considering soil types. Planting in peat-based soils releases a large amount of carbon, and it can take 30 years of tree growth to negate that release.

We need an integrated land use strategy that will take into account all types of land use—from commercial and agricultural, through to leisure and environmental. The recent forestry debates have highlighted the fact that forestry is a lot more than just wood production or a carbon sink.

My concern with the bill as it stands is the lack of detail on management of Scotlands land. The forestry sector has been acknowledged in the bill, but ministers have so far failed to provide direction for Scotlands major land user, which is agriculture—of course, I declare an interest in that respect. If the Scottish Government is determined to tackle climate change, it can ill afford to mismanage one of our most important resources.

We all await the results of the rural land use study towards the end of this year, but what will come of the study, and will the Government be in a position to formulate a proper strategy on its conclusion?

This bill is welcome. I hope that ministers will heed the committees recommendations, and I also hope that a sensible land use strategy will be produced sooner rather than later. It would, of course, go hand in hand with the Climate Change (Scotland) Bill.

15:14

Bill Wilson (West of Scotland) (SNP): The Scottish Governments proposed actions to tackle climate change are both bold and essential—and rather more clear-throated than I am. The urgency of the situation hardly needs to be stressed. We were presented with a graphic example of that urgency last month, when the ice bridge that pinned the Wilkins ice shelf to the land shattered, threatening the shelf itself. That shelf, which is almost half the size of Wales, is the 10th to break away or shrink to a fraction of its original size in the past 50 years.

Climate change has already wreaked havoc in Africa. A 2007 report states:

“The climate change threat is greater in Africa than many parts of the world. The changing weather patterns are already creating new complex emergencies where areas are simultaneously hit by droughts and floods, often accompanied by outbreaks of infectious diseases. Many communities are living through almost permanent disaster conditions.”

It is a relief, therefore, that the new United States Administration is taking climate change seriously. Unfortunately, the previous US Administration, and far too many people in general, swallowed the myths of professional climate change deniers—people who were funded by the likes of ExxonMobil to lie and obfuscate. Only a year ago, according to The Guardian, ExxonMobil admitted that its support for lobby groups that question the science of climate change may have hindered action to tackle global warming. In its “2007 Corporate Citizenship Report”, ExxonMobil said that it intended to cut funds to several groups that “divert attention” from the need to find new sources of clean energy. So, ExxonMobil has publicly recanted; however, many of the myths that it has paid for live on, such as the one that volcanoes are a major cause of climate change. All such myths are easily debunked. I refer members to a handy website—www.grist.org/article/series/skeptics/—in which they may be interested.

Far from being in thrall to the short-term vested interests of climate change deniers, the Scottish Government is, with its ambitious proposals, leading the world in tackling climate change.
Scotland was ahead of the field in pushing for an 80 per cent reduction in greenhouse gas emissions by 2050 and has dragged the UK behind it. I welcome the commitment to a minimum annual reduction in emissions of 3 per cent from 2020, and I am pleased by the move from a 34 per cent reduction to a 42 per cent reduction by 2020 if the EU agrees to a 30 per cent reduction by that year.

Aviation is responsible for at least 3 per cent of the total man-made contribution to climate change, and shipping is responsible for 3.5 to 4 per cent. Both threaten to be increasingly important. Therefore, I am particularly pleased that the Scottish Government is including Scotlands share of emissions from international aviation and shipping in its greenhouse gas targets.

I will make a slight digression: shipping also contributes 18 to 30 per cent of the worlds nitrogen oxide pollution, 9 per cent of global sulphur oxide pollution and a significant amount of particulate matter, which are major contributors to asthma, heart disease and cancer. It is estimated that pollution from shipping causes 60,000 deaths a year in the US and 1,000 deaths a year in Denmark. The UK figure lies somewhere between the two.

There is talk of setting up low-emissions shipping zones. I encourage the Scottish Government to take an active interest in that and in the use of novel ship-propulsion methods such as solar power, fuel cells and high-tech kites, which could significantly reduce the consumption of fossil fuels. I am confident that the country that instituted the £10 million saltire prize could also innovate in shipping propulsion.

As far as aviation goes, I congratulate the Transport, Infrastructure and Climate Change Committee on its suggestion that the Scottish Government should examine how to account for additional damage to the atmosphere that occurs when emissions take place at high altitude. I note the proposed measurement of fuel intake at our airports as an initial step in monitoring the impact of aviation. That has the advantage of being relatively straightforward but the disadvantage that flights with stopovers will count only the fuel that is used to fly to the stopover points and not the total fuel that is used in the flight from Scotland.

With regard not just to aviation but to other causes of climate change, I am of the opinion that there is great merit in individual carbon budgets—or, as discussed in the March/April issue of Resurgence magazine, “Tradable Energy Quotas”. Time does not permit me to discuss TEQs in detail, but one of their many advantages is that they are redistributive: people who could afford air travel would have to buy TEQs from those who could not. Not only would such a scheme tackle climate change, with a reduced quota of TEQs being issued every year; it would also tackle local, regional and global inequality, which in themselves are major threats to health and wellbeing.

The Climate Change (Scotland) Bill is leading the way. I applaud those who have contributed to it: environmental groups, the Transport, Infrastructure and Climate Change Committee and the Scottish Government, which is a responsible and responsive Government that has sought, listened to and acted on the best available advice. Let this be the start of Scotlands resurgence as a global leader. Let the words of Voltaire ring true once more:

“We look to Scotland for all our ideas of civilisation.”

Climate change could be an opportunity for Scotland rather than a malign threat; it could be a driver for truly sustainable development. We will be a greener country, of course, but we should also use climate change to become a fairer, healthier and wealthier, smarter, safer and stronger country. We could, and should, show other countries how to do that. Margaret Mead said:

“Never doubt that a small group of thoughtful, committed citizens can change the world. Indeed, it is the only thing that ever has.”

Why not the citizens of Scotland?

15:20

Marilyn Livingstone (Kirkcaldy) (Lab): Like my colleagues on the Economy, Energy and Tourism Committee, I welcome the Scottish Governments interim targets towards reducing greenhouse gas emissions by 2020. Achievement of the targets that are outlined in the Climate Change (Scotland) Bill for investing in energy efficiency and renewable heat initiatives will depend on the Scottish Government being able to maintain a sustainable and highly skilled workforce in the environmental sector.

In February 2009, the Cabinet Secretary for Finance and Sustainable Growth outlined his plans to create up to 16,000 green jobs over the next decade and claimed to be engaging with industry, skills providers and potential employers to deliver those opportunities. However, the Economy, Energy and Tourism Committee has heard evidence from Northern Energy Developments and the Carbon Trust that there remain considerable skills shortages in renewable energy and in the basic energy efficiency sector. That has implications for potential employees, from those with level 2 Scottish vocational qualifications to those with degrees and postgraduate qualifications.
In my constituency of Kirkcaldy, the Adam Smith College has reported an anticipated shortfall in its ability to meet bursary commitments to its existing body of full-time students, which currently exceed £500,000. If the situation is not tackled, the Adam Smith College will have to make up for the shortfall from within its already strained budget, which will result in inevitable cuts.

I have used the example of my local college, but across Scotland the shortfall in bursary funding in the college sector is £4.1 million, which will impact on bridging the skills shortages in the renewable energy field. We have also heard that college applications have risen by between 30 and 40 per cent, and that some of those courses are already filled, which leaves no provision for school leavers who are awaiting their exam results. Addressing those skills gaps is a key part of realising renewable heat and energy efficiency targets. The Scottish Government must assess the employment implications of the plans that are outlined in the bill and work with employers and trade unions to maximise job opportunities and take a joined-up approach to the Governments skills agenda.

Further to the failings on skills, the target of reducing emissions from new buildings by 30 per cent is inconsistent with the ambitious target that was set by the Scottish Government to reduce greenhouse gas emissions by at least 80 per cent by 2050. Section 179 of the Housing (Scotland) Act 2006 requires a strategy to improve energy efficiency, while the bill only outlines a plan to promote it, which makes the bill weaker than existing provisions for the domestic sector.

My constituency starts at Burntisland and finishes at Buckhaven. It is bounded along its length by the Firth of Forth, so I know only too well the impact that climate change is having on seawall structures. At the well-reported Adam Smith lecture in Kirkcaldy the other week, Kofi Annan made strong points about the impact of climate change on the poorest people in Africa, which other members have spoken about.

Buildings make up the single largest component of our carbon footprint, so if emissions from new buildings are not reduced effectively, the Government will not tackle climate change. The Government must explain the inconsistencies in the bill and say why it does not include requirements that would improve on Scottish planning policy 6. Evidence that was given to the Economy, Energy and Tourism Committee indicates that low-carbon and zero-carbon technologies will be essential to meet the revised energy targets.

Although the bill includes provisions on assessing the energy performance of existing non-domestic buildings in order to raise awareness of their contribution to greenhouse gases, the Scottish Government has failed to outline its intentions on the energy performance certification of domestic buildings.

The provisions in the bill will enable the Scottish ministers to create regulations to oblige building owners, responsible authorities and other bodies to improve the energy performance of non-domestic buildings. However, through the Economy, Energy and Tourism Committee, the Energy Saving Trust has called for the bill to include such provisions for the domestic building sector. That was also recommended by the committee but the Government has failed to take it into account.

Stewart Stevenson: It might be useful if I say that, through building regulations, we have a three-yearly programme of upgrading standards. To use that method is more appropriate than relying on a provision in a bill, which applies at a single point in time.

Marilyn Livingstone: I take that point on board but, as a committee member, I am presenting to Parliament evidence that we heard from experts.

A programme is urgently needed to improve energy efficiency in the domestic sector by providing households with advice on, and financial support for, energy-saving measures and introducing a stricter standard for new housing. The Scottish Government must outline how it intends to proceed with energy performance certification of domestic buildings, in order to make a serious attempt to tackle climate change.

I support all the committees recommendations, which would, among other things, ensure a commitment to drive forward improvements in insulation and provide the opportunity to install small-scale renewables in houses and businesses throughout Scotland. That would be achieved if the Government were to accept the committees recommendations and the measures that are outlined in Sarah Boyack’s members bill. I present those recommendations seriously and on the basis of the evidence that the committee took.

15:26

John Scott (Ayr) (Con): As ever, I begin by declaring an interest as a farmer in this important debate on climate change. I will quote Robert Burns, rather than Voltaire, who said:

“Facts are chielis that winna ding”.

Today—and not before time—we must face the facts of climate change. Temperatures are rising, sea levels are rising, Arctic summer ice is disappearing and summer heat waves are increasing, as is the intensity of localised tropical storms. Essentially, that is being brought about by
the greenhouse effect and the emission of greenhouse gases. We will all—individually and collectively—have to start to address the problem. That is why Conservatives welcome the bill.

However, the Royal Society of Edinburgh and the Transport, Infrastructure and Climate Change Committee have expressed concern that the bill creates only a framework when we should be producing a strategy with details of solutions and costings. The challenge is to produce such a budgeted strategy as soon as possible, to pull together into a coherent policy the diverse and competing demands of energy production, food production and economic and social development in the face of fast-moving climate change.

The Rural Affairs and Environment Committee dealt with part 5 of the bill, on which my colleague Nanette Milne spoke yesterday. It is fair to say that Conservatives believe that that part could be stronger and that its introduction could have been better managed. When she was the committees convener, the Minister for Environment condemned the fact that the consultation on forestry was not undertaken timeously. Perhaps that contributed to the Governments eventual withdrawal of its poorly thought-through leasing proposal. However, that is in the past, and lessons will be learned, but we must find out soon what further forestry proposals—if any—the Government will produce.

It is unquestionable that increased afforestation—perhaps funded by joint ventures—will reduce our carbon footprint, but only if trees are planted on land that is capable of food production. That is a key point. Planting on peat soils appears no longer to be good practice for carbon reduction, so planting on mineral soils is the alternative. In the face of climate change, a growing world population and crop substitution, a strategic decision needs to be taken about our food-producing capability here in the UK and in Scotland. From a UK perspective, it is unwise to reduce still further our strategic ability to feed ourselves and to increase daily—as we are doing—our dependence on importing food from elsewhere in the world, so I say to the minister that we need an integrated land use policy soon, as that will have a huge impact on climate change.

Waste reduction and recycling have been mentioned. Scottish Conservatives fully understand and support the Governments intention and measures to drive towards a zero-waste position and reduce our dependence on landfill. However, the Federation of Small Businesses and other respected witnesses expressed serious concern to the Rural Affairs and Environment Committee about the lack of infrastructure to achieve a zero-waste position or anything approaching it, or even to comply with existing European obligations. Dirk Hazell of the Scottish Environmental Services Association noted that

> “we need to accelerate our transition from a disposal to a recycling society, but to do so requires more infrastructure.”—[Official Report, Rural Affairs and Environment Committee, 28 January 2009; c 1361.]

and John Ferguson of the Scottish Environment Protection Agency said that the required infrastructure development would be

> “a challenge to the planning system.”—[Official Report, Rural Affairs and Environment Committee, 4 February 2009; c 1389.]

None of those statements takes account of the costs to already cash-strapped local authorities.

Stewart Stevenson: Is the member aware that, in my parliamentary constituency, there is an excellent facility that is recycling food waste? In fact, the private sector is in many ways stepping up to the mark and providing considerable useful infrastructure to complement and supplement what comes from elsewhere.

John Scott: The minister should forgive me for not being aware of what is going on in his constituency, but I am sure that the facility to which he refers is of enormous value.

We need to know how these laudable objectives will be met. In addition, we need to know how food waste will contribute to recycling and composting targets—indeed, the excellent example that the minister highlighted from his own constituency might provide a model for us all—and whether energy from food waste will be counted as contributing towards the cap on energy from waste.

We support the Governments position on carrier bags. As long as the voluntary approach is working, there is no need for legislation.

I welcome the Governments view that the length of the muirburning season should at least stay the same. In fact, given the predicted increase in rainfall, I go further and suggest that the start of the season be brought forward to earlier in the autumn. After all, it is often difficult—and, due to increasing rainfall, becoming more so with every year—to get the right weather conditions to carry out this skilled and essential work in the spring.

Notwithstanding the bills lack of detail and its dependence on secondary legislation being laid at a later date, we welcome its general principles. We also welcome the fact that the Government has revised the 2020 targets—with a 34 per cent reduction in CO2 rising to 42 per cent if Europe plays ball—and acknowledge that they are ambitious.

We need to learn from what has happened in other countries that are further down the legislative
route and use their experiences and ideas in developing the bill—putting flesh on its bones, one might say—with constructive amendments at stages 2 and 3. We desperately need to focus on reducing commercial and industrial waste—in fact, we need to make a start on that soon.

We will work constructively with the Government to develop and improve the bill at stages 2 and 3, and we look forward to meeting our commitment—indeed, our duty—to the next generation to leave things better than we found them.

15:32

Angela Constance (Livingston) (SNP): I am grateful for the opportunity to speak in this debate, as I truly believe that the Climate Change (Scotland) Bill will be part of this Governments and, indeed, the Parliaments—lasting legacy. Like many members, I have received a sizeable number of representations in support of the bill. Eco-congregations, eco-schools, fair trade groups and the many community councils in my constituency are actively engaged in combating climate change by changing behaviour at every level of society.

I have lost count of the number of times that I have visited a primary school, only to be blown away by finding that very young children know exactly what we need to do to save our planet. That is very uplifting and it gives me great hope for the future. However, the responsibility of parliamentarians is to bequeath to our children the right building blocks. As John Swinney said in the debate yesterday, the challenge is to create “enduring” legislation. With that in mind, we must bore down into the detail of this substantial bill. I have no hesitation in proffering my support for this world-leading and ambitious bill, and although I take exception to small parts of some of the detail, I do not want that to detract from my overall support for it.

That said, I seriously question the inclusion of section 59, which enables the current or any future Government to introduce, if it so wishes, charges for supplying carrier bags. I am grateful to my constituent Mr Bill MacDonald for bringing to my attention the problems in principle with that proposal.

The merits of charging for carrier bags were fully debated and tested by the Environment and Rural Development Committee in the previous parliamentary session during consideration of Mike Pringles Environmental Levy on Plastic Bags (Scotland) Bill. The committee did not recommend Mr Pringles bill to Parliament and it was withdrawn—for good reasons. More recently, when scrutinising the Climate Change (Scotland) Bill, the Rural Affairs and Environment Committee clearly pointed the Government back to the work of the Environment and Rural Development Committee and the issues that it highlighted. On pages 67 and 68 of its stage 1 report, the Transport, Infrastructure and Climate Change Committee states:

“In relation to the specific issue of charging for the supply of carrier bags, the RAE Committee noted that it had received numerous written submissions opposing the policy behind this section of the Bill. This opposition was based on evidence which suggested that proceeding with this policy is unlikely to deliver the intended environmental benefits and instead lead to increased emissions.”

Alex Johnstone (North East Scotland) (Con): Does the member agree that on this issue—uniquely to date—the largest retail businesses and their customers are doing great work to reduce the number of carrier bags, by using renewable bags and, in some cases, not using bags at all?

Angela Constance: I accept that the voluntary agreement is resulting in reduced use of plastic carrier bags, but I am concerned that that may be counterproductive and that we will merely replace the lightweight carrier bags with which we are all familiar with heavier plastic, paper, cotton or jute bags, which are often coated in plastic. Such products have a carbon footprint, are often bulkier and can lead to increased transportation costs. Evidence was presented to the Rural Affairs and Environment Committee that waste could increase by 13,700 tonnes per annum. The Irish experience has demonstrated clearly the unintended consequences of replacing plastic bags with so-called environmentally friendly bags for life, which has resulted in an increase in food packaging for loose items for health and hygiene reasons. That is an example of a counterproductive policy.

It is regrettable that the focus has been on lightweight plastic carrier bags, because—as I know—they are reusable as nappy bags, sandwich bags, freezer bags, pedal-bin liners and dog-poo bags; they can also be recycled. Surely the issue should be to improve plastics recycling. With that in mind, I welcome the cabinet secretaries announcement earlier this year that £5 million from the zero waste fund will be used to develop a home market for reprocessing plastics.

I am well aware that the Governments stated intention is not to introduce charging at this point but to retain the option to do so. Matthew Farrow of the Confederation of British Industry hit the nail on the head when he said in evidence to the Transport, Infrastructure and Climate Change Committee:

“The carrier bag issue is endlessly rehearsed and is a symbolic issue, and to be honest I would say that the proposal for carrier bag charges is probably not the best way to increase diversion from landfill. The effort that would be put into that policy could be better expended
If we are to create what Mr Swinney calls “enduring” legislation, we should not make symbolic proposals; instead, our proposals should be robust, rigorous and evidence based. In my view, section 59 is ill conceived. The merits of the case have already been rejected twice. Plastic bags account for 0.2 per cent of our waste, so our energy should be focused elsewhere. I urge ministers to put the issue to bed once and for all and delete section 59 from this otherwise ambitious and world-leading bill.

15:39

Peter Peacock (Highlands and Islands) (Lab): As members know, I have been pottering about as an elected politician for more than a quarter of a century. I have seldom seen an issue rise up the political agenda as fast as climate change has. The Parliament is reflecting that development in its consideration of the bill. It is right that we should do so, because, without question, climate change is one of the biggest challenges facing the entire population of the world.

We all know about changes in the environment from personal experience and going out and about: there is much more intense rainfall; winters are much milder; there is more flooding in winter, because of the increased rainfall; we get less snow and frost than we used to; we get more squally wind; and the wind is much stronger during certain periods. The seasons are starting to change, too. Birds are nesting earlier, to mention just one illustration of that. Farmers and people involved in forestry, fishing, ornithology and climbing can reflect their personal experiences of the climate changing around them.

I pay tribute to Al Gore’s part in the process of raising worldwide awareness of climate change with his film, his lecture work and his book “An Inconvenient Truth”. I went to hear him speak in Glasgow a couple of years ago. His was an impressive exposition of the challenges that we face. Unquestionably, Al Gore has been partly responsible for the shift in American public opinion that allows the Obama Government to do the things that it will now do. That is an important point in a world context.

Controversial though Al Gore’s thesis is in many quarters—people take issue with some of the detail of what he says—he has unquestionably focused the minds of people around the globe on the issues. Even for those who do not accept the fine detail of some of his points and arguments, it surely cannot be right to keep pumping out into the environment the amount of carbon dioxide that we do, needlessly and wastefully.

Stewart Stevenson: I very much agree with that. When Barack Obama said, “We will harness the sun and the wind and the soil”, he left the tides to Scotland. Is that not a key opportunity?

Peter Peacock: I am glad to see that the SNP has bought into the claims that the Pentland Firth will be the Saudi Arabia of renewables. I support what will be going on there, and I hope that more renewable energy generation will take place there, and more widely.

Along with changes in public opinion, public awareness of climate change issues has become much more acute, sensitive and alert. Individual citizens want to do the right thing by the environment, although they are often not clear what the right thing is. That brings me to the theme of considering the issue from the individual citizens perspective and thinking about what we can do individually to contribute to the aggregate change that we want to take place. Central to that is empowering citizens. Information, in turn, is central to empowering individuals to make changes in their lives. That can be information on, for example, insulating their homes, public transport choices or buying a certain type of car. It might also be information on the type of housing that they construct, or on recycling, composting or a whole range of other things that they can individually take part in or do.

In my experience, it is not easy for people to access good, comprehensive, independent, impartial advice about what they should do. What is the optimal depth of insulation for lofts? How should people treat their windows to make them more energy efficient? Is triple glazing definitely better than double glazing? In my circumstances, I might ask whether an air-source heat pump or a ground-source heat pump would be better. What about solar panels and photovoltaic cells? What is the right thing for my household to do to help combat the changes in the climate? What about converting cars to run on liquefied petroleum gas? What about the question of an electric car versus a modern diesel engine? Individuals have 101 questions—even 1,001 questions—that they want to ask, but getting ready access to the answers is not straightforward. In moving the debate forward, it is important that more information is made available. Might we wish to place a duty on local authorities to help ensure that information is supplied throughout the country?

I will move on to my own experience of building a house, and I will develop the argument about information, advice and consultancy. I built my own house about five to six years ago. The design stage started about eight years ago. I can tell members that it was not a thing to do when I was...
a busy minister, as it took up a lot of time. My house was built to the proper standards, but it contains no renewable devices. That is a matter of great regret. I accept a large part of the blame for that, but not once during the process was I ever advised by my architect, by the planners or by the building warrant people about what was the right thing to do or about the range of options that were open to me.

Retrofitting my house would be expensive. I can find all sorts of commercial products in the marketplace, and all sorts of people advancing why I should buy one product over another, but it is virtually impossible to find a single point of contact for advice on what I can do to make a difference in my home. That brings me back to the role of advice and consultancy. During our consideration of the bill, we might consider whether there is a way of placing a duty on architects, planners and people who are involved in building control to give such advice, to help individuals contribute to change.

Robin Harper (Lothians) (Green): The new Acharacle primary school will need hardly any extra heat put into it. Does the member agree that it is best to build houses that will need no energy in the first place?

Peter Peacock: I completely agree. That intervention brings me neatly to my next point, which is about regulation—

The Deputy Presiding Officer (Alasdair Morgan): It is your last point, Mr Peacock.

Peter Peacock: It is my last point and I will make it quickly. If the individual citizen cannot act, we must act collectively, for example through regulation. The need to improve building standards to encourage projects like the one that Robin Harper mentioned is central. I could go on for ever, Presiding Officer, but you are scowling at me, so I will sit down.

15:45

Iain Smith (North East Fife) (LD): I did not believe that we would ever see the Deputy Presiding Officer scowl.

I welcome the opportunity to speak in a debate on perhaps the most important bill ever to come before the Parliament. I am convener of the Economy, Energy and Tourism Committee, so I will speak mainly about the recommendations in our report on the sections of the bill that cover energy efficiency and renewable heat. I stress that I am not speaking on behalf of the committee. Although the committee was not formally designated a secondary committee—I guess that that makes us a tertiary committee—it was agreed with the lead committee that we would deal with chapter 3 of part 5, which falls within our energy remit.

It is fair to say that the committee was surprised and disappointed by the lack of substance behind the very general provisions in chapter 3. Moreover, I am very disappointed by the Governments poor response to our report. Indeed, it would be wrong to say that the Government has responded to our report, because the response that was published on Tuesday appears to address only the recommendations from our committees report that were referred to in the lead committees report. Of the 17 recommendations that were unanimously agreed by the Economy, Energy and Tourism Committee, the Government has ignored six completely, failed to address three, rejected three outright and rejected one in part. However, it has generously accepted the points that we made in the remaining four. That inadequate response leaves unanswered the fundamental question about exactly what the bill will achieve.

The Governments excuse that the bill is a framework bill does not wash. It is simply not good enough to ask the Parliament and the Scottish people to take so much on trust. When the Economy, Energy and Tourism Committee tried to probe Government officials on the policy intent behind the framework, I was shocked by the paucity of substance in the responses. Indeed, the committee was so shocked that we had to ask the Minister for Transport, Infrastructure and Climate Change, Stewart Stevenson, to come before the committee to try to put policy flesh on the bones—it was that bad.

Stewart Stevenson: Thank you.

Iain Smith: It is unfortunate that even after hearing from the minister and receiving the Governments response to the report, many of the committees questions remain unanswered.

I turn to issues of substance. I think that members of all parties would agree that it is crucial that we address Scotlands appalling record on energy inefficiency if we are to meet our climate change objectives. Half our energy use is on heating, and much of that is wasted, due to poor insulation standards in many of our domestic and non-domestic buildings—let alone the wasted heat from power generation. We need not just a plan to promote energy efficiency but positive action to improve energy efficiency. We need such a plan today, not within 12 months of the bill being enacted. We have waited too long for the publication of an energy efficiency action plan, and it appears that the Government is using the bill as an excuse to delay the plan further.
Lewis Macdonald mentioned the Government's response to our comments on the energy action plan. The Government said:

"Ministers could publish an action plan before the Climate Change Bill becomes an Act but ... Ministers would still have to produce and publish another action plan within 12 months."

What utter nonsense. Sir Humphrey would be proud. It is surely not beyond the collective wit and wisdom of the entire Scottish Government to come up with wording that would allow the action plan to be published now. It is equally important that the Parliament knows what the Government intends to put into the action plan. What energy efficiencies are to be achieved through the plan? How will the approach be monitored? The Parliament needs to be certain that the provisions in the bill are sufficient to deliver what is needed.

On setting targets, the Government's response was:

"For energy efficiency we are keen to focus on outcomes rather than targets".

Ministers may call it what they like, but we need to know the target outcomes for energy efficiency. However, members should not worry; we have been promised another discussion document in the summer, which will cover that work. I say to the minister that that is not good enough. We do not want more discussion; let us have action.

It is also difficult to judge whether the bills provisions on energy performance certificates are adequate, because the policy intent is not clear. During the Economy, Energy and Tourism Committees inquiry, I sought clarity on what the proposed new regulations would seek to achieve, and specifically on how the Government would determine whether the approach that it opted for—out of the seven proposed options that it put before us—was delivering. One presumes that the intention is to drive up the energy efficiency of non-domestic buildings, but what level of improvement is being sought, over what period, and when will a judgment be made on whether the regulations are delivering? We look forward to seeing the mock regulations that have been promised. I hope that they will be published ahead of stage 2.

It is probably in the area of renewable heat that the bill needs most strengthening. I urge the Government to look beyond renewable heat to address the whole issue of heat, and wasted heat in particular. We must address issues such as the wasted heat from power generation, the promotion of waste to energy and the development of district heating schemes, as well as renewable heat sources such as biomass, air-source and ground-source heat pumps and solar. I therefore hope that the Government will strengthen section 51 at stage 2. It is important that we do so.

We asked the minister to set out the Government's intentions regarding Sarah Boyack's energy efficiency and microgeneration bill in the stage 1 debate. I do not think that any of the three ministers who have spoken so far have done so; I hope that the minister will do so in winding up.

Finally, in response to the committees recommendation that the Government should report on whether some form of rebate through local taxation systems to incentivise energy efficiency, renewable heat or microgeneration should be introduced, the Government said:

"councils in Scotland do not have the same level of discretionary powers to offer council tax discounts as councils in England. To give Scottish councils similar powers would require primary legislation."

The bill will be primary legislation. Surely it must be possible to put in this framework bill a provision to enable the introduction of a council tax discount scheme if the Government at some future date decides that such a scheme would be beneficial?

This is an important bill, but it needs to be substantially amended and strengthened at stage 2 if it is to meet the challenges of climate change.

15:51

Rob Gibson (Highlands and Islands) (SNP): The radical Scots academic Dr Malcolm Slesser died at the age of 80 only two months after the Scottish National Party Government was elected in 2007. He was twice an SNP candidate, a renowned mountaineer and a valued fellow of the Centre for Human Ecology. Before that, he lectured at the University of Strathclyde in the 1970s, where he wrote about his concerns for the planet.

In his groundbreaking book "The Politics of Environment: Including a Guide to Scottish Thought and Action", which was published in 1972, he examined how modern technology was being exploited by an irrational economy of "unlimited industrial expansion in limited space", which, as the blurb in his book states, "must inevitably destroy itself, the land, the community and very probably, hazard the future of mankind".

He was an inspiration to many of us in the SNP, an eco-hero who will not be forgotten. His message appeals across party lines, so it is most fitting that in addressing the challenges of climate change, the bill puts practical steps in place to reduce radically greenhouse gases, a science that was in its infancy and of which Malcolm Slesser was only beginning to be aware in the 1970s.
We need action plans to ensure that Scotland shows a lead to other nations by taking our full share of the fight against climate chaos in time for the Copenhagen conference in December. I want to focus on a couple of issues that can make a real difference via the bill. Scotland has many advantages in playing its carbon-busting part. We now know how blessed Scotland is with the largest proportion of high winds, big waves and strong tides in Europe. That gives us a huge economic opportunity to contribute to the UK contribution to the EU’s 2020 targets. Tidal and wave power in the Pentland Firth will follow on from the huge arrays of offshore wind turbines to provide secure and safe green power to ourselves and our neighbours to the south and across the North Sea.

Heat represents more than 50 per cent of our energy needs in Scotland, yet heat generated from renewable sources represents less than 1 per cent of demand. A massive increase in the delivery of renewable heat will be required in the domestic and commercial sectors in the years ahead if overall targets for greenhouse gas emission reduction are to be met alongside the targets for renewable energy. The further behind we get on delivering renewable heat, the steeper the targets will need to be in the electricity and transport sectors to meet overall energy targets, and the steeper the targets will need to be across the whole of society in order to meet climate change targets.

I therefore welcome the response from the Minister for Transport, Infrastructure and Climate Change to the Economy, Energy and Tourism Committees report, in which he pledged that the renewable heat action plan will contain a target to supply 11 per cent of heat demand from renewable heat by 2020 as part of the overall EU targets.

With regard to job opportunities from climate change mitigation, the Transport, Infrastructure and Climate Change Committees conclusion on the financial memorandum in its stage 1 report discusses the Governments estimate that 16,000 jobs will be created in the field of renewable energy. Members were “extremely concerned” about the veracity of that estimate, but I am glad to say that at the Economy, Energy and Tourism Committee yesterday we heard evidence that verifies that figure—indeed, we heard evidence from some who believe it to be a conservative estimate.

As a member who represents the Highlands and Islands and has a long-standing interest in land use and tenure, I agree with RSPB Scotland on the need for an holistic approach to rural land use. Scottish land plays a big part in our greenhouse gas emissions. Emissions are falling slightly, but they must fall faster. Scottish risk impacts reports must be prepared for our Government, to complement the advice from the UK Committee on Climate Change. Particular features, such as the huge blanket peat bogs in the flow country in my region and our precious native pine woods, would then be subject to technical scrutiny from dedicated Scotland-based scientists. Such reports would provide that scrutiny and an annual reporting mechanism. Annual reporting is already provided for in the UK Climate Change Act 2008, and it should appear in our bill. I hope to hear from the minister on that.

I was privileged to visit Eigg last weekend to see its self-sufficiency drive for renewable energy for all houses on the island. From four windmills, a solar voltaic array and a run-of-river hydro plant, each home gets 5kW of electricity. Few in the cities could cope with such low amounts of electricity, but Eigg folk are leading the fight in limiting demand and securing clean energy supplies.

Malcolm Slessor would be proud that we, as members of the Scottish Parliament, are finding our way to the best means to stop climate chaos. Some 37 years ago, in “The Politics of Environment”, he wrote:

“Modern technology need no longer be the servant of economics. It is now able to halt expansion-for-expansions sake without entailing unemployment and recession. There is now no excuse whatever for trying to impose this servant economics willy-nilly over the more biological, nourishing, attributes of human communities”.

The principles of the bill are world class, and the amendments at stage 2 must make it easier for Scots to adapt to climate change. I believe that members of the Parliament can empower the citizens by our scrutiny of the bill now and after it is passed, and I fully support it.

15:57

Elaine Murray (Dumfries) (Lab): I, too, am pleased to take part in the stage 1 debate on the bill, which is widely considered to be very important.

I will concentrate on waste strategy. Although the Minister for Environment stated yesterday that she assumed that the lack of major comment on the bills proposals suggests that they have a degree of general support, there are a number of points to be considered, as Angela Constance ably demonstrated in her contribution a few minutes ago.

Waste policy is important in tackling climate change. First, waste is, as a derivative of production and consumption, a strong indicator of inefficiencies at one or more points of a commoditys useful life. Secondly, waste itself may contain greenhouse gases or, more often, it may
contribute by producing greenhouse gases—frequently methane—as a product of anaerobic degradation, as happens in landfill sites.

Methane is 21 times more powerful as a greenhouse gas by weight than carbon dioxide. However, with an atmospheric lifetime of around 12 years, it is reasonably short lived, and controlling its production now can therefore make a real contribution to shorter-term targets.

Despite the Governments 25 per cent cap on energy from waste, waste processes such as the anaerobic digestion of agricultural or food waste, which produces methane that is used to produce power, should be encouraged, although wasting food should be discouraged as far as possible.

I commend Dumfries and Galloway Council—I do not always do so, but in this instance I will—for its capping of the Locharmoss landfill site, and the use of the methane that is produced there for the generation of electricity, which contributes to the national grid.

The bill does not transpose the European revised waste framework directive into Scots law, as is required by 12 December next year. In referring to recycling, the bill does not distinguish between reuse, recycling and recovery, as the directive requires. The directive also requires 50 per cent of household waste and 70 per cent of construction and demolition waste to be recycled or reused by 2020. Those may appear to be challenging targets but, back in 2005, Flanders, whose population of 6 million is only slightly higher than Scotlands, achieved 70 per cent recycling, reuse or composting of household waste.

The Rural Affairs and Environment Committee heard evidence on the need to subject commercial and industrial waste to the same requirements as domestic waste. The bill requires business and public bodies to provide information to SEPA on the waste that they produce, thereby identifying opportunities for a reduction in waste management costs and a means of comparison with businesses of a similar size and sector. The committee recognised the need for internationally agreed measures of carbon accounting across the life-cycle of a commodity. At times, it seems as if the evidence is counterintuitive: what one thinks of as low carbon can turn out to be high carbon, and vice versa.

Many small businesses want to recycle their waste, but find it hard to do so because of a lack of infrastructure. In evidence to the Rural Affairs and Environment Committee, Susan Love, of the Federation of Small Businesses, stated that

"It will not be remotely possible to implement many of the bills measures unless we make progress with facilities", and Dirk Hazell, of the Scottish Environment Services Association, advised that

“There is nowhere near enough waste infrastructure ... to comply with existing European obligations.”—[Official Report, Rural Affairs and Environment Committee, 28 January 2009; c 1362, 1361.]

However, it is highly unlikely that local authorities can fund the development of such infrastructure. They are already struggling, as their current funding regime allows them to address only their existing obligations. The duty must rest on producer responsibilities, coupled with increases in landfill cost and—in certain cases—a ban on certain materials going to landfill. A duty on producers would encourage them to decrease waste and its toxicity and promote recycling and reuse.

Both SEPA and WRAP suggested that some forms of industrial and commercial waste should be banned from being sent to landfill. Stop Climate Chaos Scotland is looking into the possibility of strengthening the waste provisions along the lines of the Flanders policy on selected landfill and incineration bans.

Friends of the Earth has suggested that penalties for sending waste to landfill could be differentiated between small and larger businesses, perhaps by way of a link to turnover. In its response to the consultation on the bill, SEPA expressed disappointment that the suggestion that it had made in 2006 that direct variable charging should be made the subject of further consultation appears to have been withdrawn.

The bill addresses the six greenhouse gases that are mentioned in the Kyoto treaty, which includes action on hydrofluorocarbons but not chlorofluorocarbons and hydrochlorofluorocarbons, both of which are often referred to as ozone-depleting substances—ODS—because of the damage that they can do to the ozone layer. They are used in refrigerators and require careful end-of-life-cycle disposal. Prior to 2004, those compounds were also widely used in plastic foam insulation as the blowing agents that formed the core of insulating sandwich panels in industrial steel-clad buildings.

As the law stands, when such buildings are demolished, those materials have to be disposed of as hazardous waste and only in hazardous waste landfill. However, those gases are also significant greenhouse gases. As such, their carbon footprint is some 300 million to 400 million times that of carbon dioxide. It is unfortunate that similar care is not required with ODS-containing materials in the construction industry. Albeit that they are put to hazardous landfill, those gases can leach into the atmosphere, wreaking damage on the ozone layer, adding to atmospheric
greenhouse gases and contributing to Scotland's carbon footprint. A strong case can be made for those compounds to be included in the list of greenhouse gases in section 9. On this subject, Scotland has the opportunity to lead the rest of the world.

The waste provisions in the bill are enabling provisions, but that does not mean that they are not controversial. I therefore support the Rural Affairs and Environment Committees suggestion of the use of the super-affirmative procedure.

16:04

Robin Harper (Lothians) (Green): I recommend that everyone should pay close attention to nearly every speech that I have heard over the past two days.

In her closing remarks yesterday, Roseanna Cunningham reminded us all that the bill is our chance to leave a legacy for the long-term future of Scotland. I agree with those remarks. The bill is perhaps the most important piece of legislation that the Scottish Parliament will ever pass. However, the minister went on to say that she hoped that “petty squabbling” would not sink the bill. Is she really happy for the bill to proceed, more or less in its current form, straight to stage 3?

Thankfully, as the Government would do well to remember, it is a Government without a majority. As so many members said yesterday, in the end, the bill will be Parliament's bill. We will not be harassed or made to feel that our attempts to strengthen and improve its provisions are simply “petty squabbling”. I am afraid that, as far as my party and I are concerned, the bill does not yet strike the right balance.

Over the course of stage 1, campaigners and experts—including, of course, the environmental movement but also social justice and international development groups—worked hard to build a case for a strong bill. I thank and commend them for their work, but I also urge them not to rest when the bill is passed. Their energy will be needed urgently if we are to see the radical policy shift that will turn targets into realities.

In large part because of the work of those experts and campaigners, many key arguments have already been won. One such is the argument for a cap on international credits. The Government has agreed to introduce such a limit at stage 2. That is thoroughly welcome, as transformation must begin at home. The whole world cannot pay someone else to solve the problem. Countries such as Scotland, with high current emissions, high historical emissions and huge renewable energy potential, must take the lead.

Stewart Stevenson: I echo what Robin Harper said and congratulate the environmental lobbyists on the work that they have done. I agree absolutely that they should remain engaged all the way to 2050 because we will probably be engaged but the wider community will always need encouragement to continue to move forward.

Robin Harper: I thank the minister for his intervention.

The argument to include aviation and shipping emissions has also been won. It is essential to include the emissions from those sources. We want to count them so that we can see them fall, not so that we can watch them rise inexorably as they have done for a decade. Even the Governments own adviser, the Sustainable Development Commission, says that we cannot commit to aviation expansion.

The argument for setting strong early cuts to put us on the right trajectory has been won too. It is good news that the Government will bring the 2030 target forward to 2020, but it follows logically and automatically that the annual targets should and must be strengthened to make it achievable.

We need to follow those arguments through and reflect those changes in the bill. Roseanna Cunningham should not be too nervous. We have in mind many straightforward and constructive amendments that will help the bill to deliver real, effective change without making it “unfeasibly large” and will give it some ambition, which is important.

Despite claims to the contrary, the bill lacks ambition. To be frank, it is disappointing in many respects and little better than a simple copy-and-paste job from the UK legislation. The most obvious example of that lack of ambition has been cited many times in the Parliament, but it is a fundamental part of the bill, so I feel no shame in going over it again. It relates to targets. We must have long-term and annual targets—the long-term targets to lock future ministers into the long-term task and the short-term targets to ensure that each serving minister is held accountable during their term in office.

The annual targets must be set in the bill at 3 per cent at the very least. The Green view, which is backed by the evidence of the Tyndall centre for climate change research and many others, is that we need a 4.5 per cent annual reduction, leading to a 30 per cent reduction by 2010, a 70 per cent reduction by 2030 and a 90 per cent reduction by 2050. Those figures are realistically closer to the cuts that are necessary according to more recent science.

The world is reaching a tipping point. Marine and terrestrial environments are under attack from levels of chemical pollution and overexploitation.
that are already causing one of the swiftest species extinctions in geological history. To overheat our fragile earth at this point would be catastrophic.

Ten years ago today—not yesterday—my election on an environmental ticket was announced. Over that time, it has caused me considerable content that many good Green policies have moved from being the preserve of our party into the mainstream. Some of those policies are embodied in the Climate Change (Scotland) Bill and I am sure that others will be written into it during the amendment stages. It may take more time for others still to be accepted, but the direction of travel is clear: a sustainable future in which Scotland lives within its ecological means. That is the only survival strategy open to us and I, for one, remain hopeful that people in and outside the Parliament will, ultimately, vote for our survival.

I have time to refer to some of the speeches that I heard during the debate. I commend Iain Smiths speech for its content, for being focused and for its reference to energy efficiency action plans. I commend, too, Rob Gibson for its references to what should be done and what should be offered to our communities. I commend other members speeches for referring to what we still need with regard to science and accurate figures and information on which to base the policies that we should follow in the future.

16:10

Stuart McMillan (West of Scotland) (SNP): I am pleased to take part in this important debate. I acknowledge the hard work and determination of the Scottish Government in introducing the Climate Change (Scotland) Bill and of members who have taken part in the debate.

Many aspects of the bill have been discussed, so I will not attempt to cover too much old ground. I will focus my contribution on how a recent visit to Berlin by a delegation from the Economy, Energy and Tourism Committee relates to the bill. The purpose of the visit was to learn more about energy policy and usage in Berlin and in Germany as a whole.

The Economy, Energy and Tourism Committee has been undertaking an energy inquiry for some months. It started formally last September, before I became a member of the committee. We are now at the inquirys tail-end, and a report is due to be completed by the summer. As a new member of the committee, I have found the debate extremely informative. It has got me thinking even more about my own energy usage and my contribution to CO2 emissions as well as those of the country as a whole. I was particularly interested to hear the contribution of Peter Peacock, who is unfortunately not here at the moment.

The trip to Berlin ties in well with the bill. I will highlight two meetings and their relevance to the bill, particularly to section 48, which is on the duty of ministers to promote energy efficiency. Our programme of events included a meeting with two members of the German Bundestag: Dr Axel Berg, the SPD spokesman on energy; and Herr Laurenz Meyer, the CDU/CSU spokesman on the economy. While discussing the effects of energy consumption and energy loss in domestic properties, both Bundestag members acknowledged that there are major problems with German buildings and that it is up to the state to provide solutions.

We were informed that approximately 60 per cent of the current housing stock in Germany is rented, which will facilitate a domestic property improvement programme. In Scotland, however, 76 per cent of the housing stock is privately owned and 24 per cent is rented. It will therefore be a bit more challenging to have such a programme in Scotland. I said to Dr Berg that it was refreshing that there was an acknowledgment of the housing problem and that it was being examined. However, Germany appears to have acknowledged the problem some years ago. It was obvious to me that Scotland and the UK are some years behind Germany. I stated to Dr Berg that very little had been done in Scotland or, indeed, the UK to tackle this domestic problem. Dr Berg replied with a most startling response, “Sir, you must be a very poor country.”

As everyone in the chamber knows, however, Scotland and the UK are not very poor countries—far from it. However, there appears to have been little drive to promote energy efficiency in the past. Many buildings throughout Scotland that are energy inefficient can and must be improved. Providing resources to deal with that is obviously vital, as is promoting energy efficiency plans, for which section 48 provides.

We had a meeting with the German energy agency and were informed that Germany plans to retrofit 50 per cent of buildings within the next 20 years. Given that 75 per cent of buildings in Germany were built before 1978, it is easy to understand that the retrofit will be a massive undertaking. Even if the 50 per cent retrofit is achieved, the target of a 2.5 per cent reduction in emissions will not be met, because it is currently calculated at 1.7 per cent. Even with retrofitting, there will therefore still be challenges for Germany, but at least it will be moving in the right direction.

Robin Harper: Is the member indicating that the SNP would like to look again at the Scottish Green
Ms Wendy Alexander (Paisley North) (Lab): Like others, I welcome the fact that the United Kingdom and, with the passage of the bill, Scotland are providing leadership in the strategic framework for tackling climate change.

As others have said, the bill is a vital start, but it still leaves us with a choice: either we can stop at setting ambitious targets for tomorrow’s policy makers or we can challenge ourselves now to start setting targets for the current generation and to put in place policies to deliver those cuts in emissions. As Angela Constance said, people all over Scotland and at every level will be disappointed if the height of our ambition is not to set any short-term statutory duties for the current parliamentary session, for the next parliamentary session, between 2011 and 2015, or for the subsequent session, from 2015 to 2019. That is not what the people of Scotland want from us. The important thing is that we work with the bill to ensure that we act now rather than later. As the Stern review concluded—and as others have alluded to—it is clear that

"the benefits of ... early action far outweigh the ... costs of not acting."

However, the bill as it stands manifestly lacks strong early action.

Our second challenge with the bill is that we need not simply to set the right targets but to put in place the hard policy measures to make things happen. As we have learned to our cost over the past decade—Robin Harper alluded to this in a very powerful speech—simply defining the problem does not necessarily lead to the solution. To make that happen, the bill must tackle the system failures that are slowing the rate of green transformation. That means that the bill must go further in addressing market failures, providing the right financial incentives and ensuring that we take brave decisions on regulation.

The need for us to do that can be demonstrated by looking no further than our near European neighbours. We might now have the most ambitious strategic framework for the next 40 or 50 years, but the size of the green economy in each of our European neighbours—including Denmark, Germany, the Netherlands and Spain—is significantly larger than that in Scotland. That is not because people in Scotland have a lesser wish to be green; it is about our responsibility to create the right policy framework. I hope that the Government will try to meet the environmental ambitions of the people of Scotland by giving serious consideration to the advice of the three parliamentary committees and by making some of the brave decisions required for actual delivery.

Stewart Stevenson: Does the member regret, as I do, the loss of the pre-combustion CO₂ sequestration opportunity at the Peterhead plant that is now being developed in the middle east?

Ms Alexander: I certainly welcome the fact that there are to be four CCS plants across the UK and a much larger number in Europe. CCS is an example of an area in which we need to work together and not try to score points if we want to secure the scale of investment that is required. I refrained from saying that we had been leapfrogged by the UK on targets, but I predict that we will be leapfrogged again unless we deal with the issue of short-term targets.

I return to the areas in which we need policy action. As has been mentioned, energy efficiency has been the Cinderella of the energy and climate change debate for decades, and it would be a shame if we allowed it to be a Cinderella in the bill, but that is the position as things stand. The provisions on energy efficiency, the energy performance of buildings and renewable heat lack...
the necessary policy bite. In the case of energy efficiency and renewable heat, there are no targets at all. The bill should include new financial incentives on energy efficiency and renewable heat. When that has been done, those new commitments must be reflected in a revised financial memorandum.

As the Economy, Energy and Tourism Committee suggested, we would like local tax rebates to be provided to incentivise the take-up of energy efficiency, renewable heat and microgeneration. In the case of microgeneration, one need look no further than the evidence of Ian Marchant, who chairs the Governments business advisory group, on the wisdom of the provision of financial incentives in that area. That has been requested by the coalition that supports Sarah Boyacks proposed members bill on energy efficiency and microgeneration, and it would be respectful to the member, the coalition and Parliament if the Government could set out its intentions with regard to that bill—and, in particular, the proposal that general permitted development rights should be extended in the ways that the committee described—as soon as possible.

I am aware that time is pressing. The state of our domestic housing stock should shame us all. We cannot achieve the climate change targets unless we make it fit for purpose. That is an area that the bill leaves behind, and it is one that should dominate our thinking at stage 2.

Scots do not want to be less green. We are less green because of an inadequate policy framework, for which we should all take responsibility. The bill represents the only opportunity that we have to pass primary legislation that will address that inadequate policy framework. The next generation will judge the bill not on the ambition of our targets but on whether it fixed the policy framework so that we could deliver. I hope that we will put in place the necessary policy framework by amending the bill as it goes through its parliamentary stages. If we fail, we will have failed the many Scots who look to us not simply for targets but for delivery.

The Deputy Presiding Officer: We move to the winding-up speeches.

16:23

Ross Finnie (West of Scotland) (LD): Since its introduction, ministers have described the bill as “world leading”. However, as Alison McInnes, who opened for the Liberal Democrats, and many others have said, both yesterday and today, that is not yet the case. Liberal Democrats will be extremely happy if the bill is world leading when it emerges from stage 2, but there is a lot of work to do before then.

Liberal Democrats totally support the overarching target of reducing emissions by 80 per cent by 2050. We support the adoption of a scientifically credible target for 2020 and the setting of more ambitious early years targets and broad sectoral targets. However, the setting of targets and the giving of undertakings to Parliament to report on those targets are not in themselves sufficient to qualify for the title “bill”.

I welcome the ministers acknowledgement that much of the content of the bill builds on “Changing Our Ways”, Scotas first climate change programme, which was published by the coalition Government and was a subset of the sustainable development programme. I believe that climate change must be set in the context of sustainable development.

I recall that, after the strategy was published and when the UK Government introduced proposals for a climate change bill, there were discussions on the difference between a strategy, which is a series of objectives and undertakings that a Government gives and for the delivery of which its ministers are accountable to Parliament, and an act of Parliament, whereby a public policy is brought within the mischief of the law by being given a statutory framework and is ultimately judiciable in the courts.

Yesterday, in response to a question from my colleague Mike Rumbles, the Cabinet Secretary for Finance and Sustainable Growth eschewed the notion of a Government imposing fines on itself. That is a fair point, but if the targets and undertakings are not enforceable in law, do the measures merit the status of an act of Parliament? Therefore, apart from the policy issues that still wait to be addressed, which Robin Harper and Wendy Alexander narrated, more work is necessary before the targets and undertakings better fit the test of qualifying as a bill.

The Cabinet Secretary for Finance and Sustainable Growth (John Swinney): I am sure that Ross Finnie will accept that not every requirement of policy intervention is stated in legislation that Parliament passes. With a bill that has to give effect to the creation of a framework and a responsibility for a 40 to 50-year period, stating every requirement is a particularly difficult challenge. Will he reflect on that?

Ross Finnie: I do not doubt that we cannot specify everything. However, my fundamental point is that I do not believe that Parliament will accede to a doctrine that undertakings that are given by a minister in the Parliament have force and effect only if they are enshrined in an act of Parliament. That is the distinction that we have to
draw. At present, there is very little to suggest that anything in the bill will be enforceable in law. That matter must be addressed at stage 2.

Liberal Democrats accept that the world and the science have moved on since we produced the climate change programme when we were in government. However, the case for more ambitious targets in the early years has not changed fundamentally. The Government will advance its 2020 target from 34 per cent to 42 per cent only if the EU agrees to such a target. I have two points on that. First, is there an inference to be drawn that, if the Copenhagen summit failed to adopt the target of 80 per cent by 2050, the Government would retreat from that figure? Surely not.

Secondly, and more important, what is the domestic arithmetic that shows that a more ambitious target cannot be set in the early years? The previous Governments strategy document showed that Scotlands share of meeting the then much lower short-term target of 20 per cent by 2010 was a reduction of 1.7 million tonnes of carbon, but the then Scottish Government set the target at 2.7 million tonnes of carbon. I put it to the ministers that the increase in renewable energy production alone suggests that a more ambitious early target is appropriate.

The need for broad sectoral targets is also essential to give credibility to the overarching target. The work of the previous Government showed the difficulties to which the cabinet secretary has referred—the variability of contribution between the elements and the different achievements by sectors. Unless we produce broad targets for the sectors and take account of the fact that some sectors can and should be pressed to perform above the average, there is a risk that we will fail to meet the overall target.

Public sector bodies must be brought within the ambit of the bill. Liberal Democrats are not, as the cabinet secretary said yesterday, suggesting that the Government should take a unilateral approach, but agreement must surely be reached with the health service and local government, for example, on targets that are consonant with the Governments overall targets. That must form part of the bill because, otherwise, vast tracts of public expenditure will not be subject to the necessary scrutiny of climate change policy.

My colleagues Liam McArthur, Iain Smith and Jim Hume set out the reasons why the introduction of an energy efficiency strategy is urgent, why we need to pay more attention to renewable heat and why a land use strategy is important. We are pleased that the Government has accepted the need to include aviation and shipping emissions in its targets and to limit the use of international carbon credits.

Liberal Democrats will therefore have pleasure in supporting the general principles of the bill, but our amendment is designed to ensure that the bill emerges from stage 2 fit to be passed as an act of Parliament and is not simply a strategy by another name. I commend to Parliament the amendment in the name of Alison McInnes.

16:30

Gavin Brown (Lothians) (Con): This bill is vital for Scotland and for the world, and it is vital in the short, medium and long term. For those reasons, Scottish Conservatives are happy to support the key principles of the bill. Of course, the bill is not perfect, and the Government has been gracious enough to accept that. There is work to be done today, tomorrow and thereafter.

I want to focus on some specific areas where I think that the bill ought to be strengthened. I will consider the rhetoric of Government ministers. Yesterday, we heard from Mr Swinney that the bill was groundbreaking, and we have heard today from Jim Mather that the bill is world leading. Groundbreaking and world leading are therefore the yardsticks by which each section of the bill ought to be measured.

The first issue that I want to consider is the green council tax rebate. Scottish Conservatives have been in favour of such a rebate for some time. South of the border, 40 of the 60 councils that have adopted such a policy are Conservative councils. My colleague Alex Johnstone said yesterday that he intends to lodge amendments on the issue.

The policy works: it is proven south of the border, and it is about to be put in place in Northern Ireland as well. It works because people get a rebate of somewhere between £50 and £125 per house for taking forward measures on energy efficiency, heat or microgeneration. There is no real reason why that cannot happen in Scotland, too. The Economy, Energy and Tourism Committee considered the policy, and made a clear recommendation—without division—that it ought to be taken further.

Sarah Boyack (Edinburgh Central) (Lab): I am very gratified to hear support for that strong policy. Will the member also comment on the proposal to incentivise businesses through business rates? Is there scope to pick up on the point that Stewart Milne made about new developments all being required to have an appropriate level of renewables development?

Gavin Brown: The short answer is yes—all such areas ought to be considered. If a measure...
works in relation to domestic households, there is no reason why it cannot be made to work in the commercial sector as well.

We should consider the evidence that was given by the Energy Saving Trust, which stated clearly in its submission that a rebate is a tax incentive that is most likely to work. We also had positive evidence from Scottish and Southern Energy and Northern Energy Developments, and in the Halcrow report. The British Gas research into the local authorities where measures had been implemented shows that 35 per cent of those interviewed said that they would not have taken energy efficiency measures without the council tax rebate, and that 60 per cent of those interviewed said that they would prefer a council tax rebate to other grants or incentives to take up measures.

The policy is strong. One of the reasons given by the Scottish Government for rejecting a rebate was that it was about to introduce a local income tax. That, of course, is not going to happen in the foreseeable future. Another reason given by the Government related to primary legislation, but that reason has been dealt with during the debate. There is no strong, tangible reason why the measure cannot be adopted. As I said, the committee agreed its recommendation without division. A rebate is popular with consumers, councils and energy companies, and it could provide a real step-change in the take-up of energy efficiency measures. Energy efficiency measures are critical because, in the hierarchy of measures to reduce carbon emissions, they are the simplest and most important.

I turn now to sections 48 and 49 of the bill. At the moment, the language that is used on energy efficiency is neither groundbreaking nor world leading. Section 48(1) says:

"The Scottish Ministers must take such steps as they consider appropriate to promote the use of energy efficiency in Scotland."

Ministers then have up to 12 months from the point at which the section comes into force to produce the plan.

Consultations on energy efficiency have taken place over a number of years. Some of the evidence that we heard suggested that the plan is ready to go now. It is extremely important that the Government shows leadership in this area. The timing is also critical. If the Government has 12 months from the date on which the section comes into force, we could be at the end of 2010 before a plan is in place. We have carbon emissions targets from the beginning of 2010, but if we do not get any benefit from the target that is at the top of the hierarchy in year one, that will not be a very good start to the process.

The same applies to renewable heat, which is dealt with in section 51. I asked Jim Mather whether he thought that the response in sections 48 and 49 is strong enough, but the response in section 51 is even weaker:

“Scottish Ministers must take such steps as they consider appropriate to promote the use of heat produced from renewable sources.”

It does not ask even for a plan, and there is no timeframe whatever. Such provisions are absolutely vital, as heat makes an enormous contribution to carbon dioxide emissions—more so than electricity and transport. We need to see stronger action from the Government on renewable heat.

We will support the general principles of the bill. It is a good bill, but there is much work still to be done on it. We hope that the Government can take that work forward, as we will get only one shot at it.

16:36

Des McNulty (Clydebank and Milngavie) (Lab): I agreed with John Swinney yesterday when he said that it is highly appropriate that, on the 10th anniversary of the first elections to the Scottish Parliament, we are debating arguably the most important and far-reaching legislation to have come before us. The decision of the parliamentary authorities to set aside two afternoons for the debate has proven to be correct, and we have had some very worthwhile contributions from all sides of the chamber. I highlight particularly Angela Constances speech, with which I agreed completely. I will return to the issues that she discussed later.

It is worth pointing out that the work that has been undertaken by the various committees that have examined the bill reflects the best practice that has evolved in the Parliament—comprehensive and inclusive evidence taking and rigorous scrutiny not just of the bill, but of the mass of evidence put forward in connection with it, culminating in clearly argued and constructive reports to the Parliament, which I hope will inform members consideration. This is legislating as it should be done.

However, we cannot afford to indulge in too much back slapping. People who are anxious to claim that the bill is groundbreaking or world leading should recognise that making the most ringing declarations of intent with regard to tackling climate change or, indeed, setting, but not meeting, higher targets than those set by any other jurisdiction will not slow down the melting of the polar ice cap, halt the inexorable rise in average temperatures that is being experienced in many parts of the world or stop the increasing pollution of the atmosphere. Only action will do, and I believe that only early action will succeed.
Declaratory legislation must be accompanied by a strategy and an implementation plan that people will sign up to—if not with the same enthusiasm with which they sign up to the principles of the bill, then with the same determination to carry those principles forward in actions, many of which will turn out to be difficult and unpopular with some constituents.

If the committees recommendations are accepted and if the current Scottish Government comes up with a programme of quantified targets for the reduction of emissions, the delivery of which it and future Governments that are elected in 2011 and 2015 will be held to account for, we can have an excellent bill. However, the test of the bill is not in the setting of targets but in the delivery of action that is linked to the targets. I am pleased that the cabinet secretary accepts the Labour amendment in the spirit in which it was lodged. Our priority is, and has been throughout the scrutiny process, early action. We welcome the Scottish Governments acceptance of the case for bringing forward the interim target date from 2030 to 2020. Like the Scottish Government, we believe that the percentage reduction target that is set for 2020 should be based on the best available scientific advice.

Our objective should be in line with the maximum achievable targets that have been identified by the UK Committee on Climate Change, within the band between the extended ambition target of 34 per cent and the stretch target of a 42 per cent reduction in emissions by 2020.

Our preference is to look towards the more ambitious 42 per cent target, recognising that changes initiated by Europe will be required to enable some of the measures to be brought in. If that does not happen, the 42 per cent target will be much more difficult to achieve. However, I still believe that we should frame our aspirations around the 42 per cent target, partly to make a statement of intent, but also to make it clear to those involved in the summit at Copenhagen that we have support in our Parliament for a truly radical approach to dealing with global climate change.

Having spoken to the minister, I do not think that we are at odds, in principle, and I believe that a way forward can be found that will bring together all our ambitions.

However, it is not enough to set a challenging target for 2020. As the Royal Society of Edinburgh and many other witnesses who appeared before the Transport, Infrastructure and Climate Change Committee told us, we need to have in place quantified targets that cover the period between now and 2020 and plot out the area under the curve of projected emissions reductions that we believe can be achieved through concerted short-term and medium-term action. I hope that the minister will be able to confirm that he shares our belief that quantified targets are needed for his Government and the next two Governments. We need targets that enable us to focus on short-term trends—a running mean over two or three years, or three or four years—so that we can ensure that the trajectory of change is in line with what is required to meet the challenging 2020 target that I hope we will agree on in the next few weeks.

Stewart Stevenson: I confirm that we have had helpful discussions and that we are very much travelling in the same direction. We believe that, if we can find an appropriate way of incorporating a target of 42 per cent, that will challenge others, which is important because joint action will lead to successful action.

Des McNulty: That is a positive statement, and I hope that we can proceed on that basis.

To make the required progress, we need quickly to implement the necessary steps to reduce emissions in the areas of land use, energy generation, energy efficiency and transport. Labour supports measures that will substantially increase low-carbon electricity generation capacity in Scotland and, in particular, the development of renewables. I hope that we can agree that renewables development should be accompanied by reducing emissions from existing coal-fired generation and that we can do more to develop local generation and distribution capacity through, for example, combined heat and power stations.

As members have pointed out, we need an urgent programme to improve energy efficiency in the residential sector, providing householders with advice on and financial support for energy saving measures and introducing tougher building standards for new houses. As Sarah Boyack has repeatedly argued, energy saving technologies such as ground-source heat pumps and microgeneration offer a way forward. Peter Peacock gave a much longer list of such technologies, and I am sure that a complete list would be extremely long. The introduction of incentives such as council tax rebates, a policy that now has the support of Alex Johnstone and Liam McArthur, would supply an additional impetus to the adoption of some of those measures by domestic consumers.

Money that is put into energy efficiency does not deal only with climate change issues; it can help to create local jobs in local authorities and the voluntary sector, which will take forward the green jobs agenda.

In transport, radical measures are needed to deliver significant modal shift. We need to make public transport more price competitive and
quicker from door to door than private transport so that people will shift from the car to the bus, the train or the tram for commuting and leisure travel.

We accept that statutory sectoral targets are not appropriate at this point, but we want the contribution that each of the sectors is expected to make to overall reductions to be quantified, so that there will be a benchmark and so that we can ensure transparency. Such information needs to be part of a detailed strategy and implementation plan that covers the period between now and 2020, spelling out how agreed targets are to be met. In line with what we have suggested about targets, the aim should be to hold whichever politicians are in charge in each electoral or budgetary cycle to account for their share of the responsibility for meeting Scotland’s climate change commitments. Scotland has to realise its full potential in reducing its carbon footprint. However, it is also necessary to ensure that we get the right balance between our climate change aspirations and our other aspirations, such as those around sustainable growth, developing better health and education services and so on. Doing that will not be easy and we will have a tough task. When we start to see the detail, we will deal with the toughness.

I highlight the importance of jobs when tackling climate change. We have argued that employers and trade unions need to be involved early in discussions about job impacts. We need a full risk assessment of the job implications of the climate change strategy and any implementation plan.

Our emissions levels have been driven by the transfer of manufacturing overseas—especially to China and other parts of the far east. We are now in a somewhat different situation as a result of the economic downturn, and the situation will move on again. Our strategy must be robust enough to take account of whatever circumstances we experience. We need to reduce the prospect of inaction or slow progress in the early years; to quantify the expected contribution to meeting our emissions targets from the key sectors; to increase transparency; to reduce the scope for evading political accountability, so that every Administration must shoulder its continuing responsibilities; to send a positive message from Scotland to the rest of the world; and to engage the people of Scotland in the process.

I will highlight one or two issues from the Transport, Infrastructure and Climate Change Committees stage 1 report. A substantial body of evidence shows that section 59 is ill conceived and inconsistent with the bills overall aims, and I ask the minister again to review the provision and to consider whether it is appropriate.

I do not want reporting arrangements to be overelaborate. We need to streamline arrangements so that the Parliament has a sensible route to scrutinise what this Government and successive Governments are doing. The danger is that we will become overelaborate at stage 2. We all have an interest in guarding against that.

I listened to the Cabinet Secretary for Finance and Sustainable Growth’s response to Brian Adam on the engagement strategy, which is a theme that I have pursued. I am happy to work with Brian Adam and any other member on an engagement strategy.

As for international credits, I think that we should seek domestic delivery of 80 per cent reductions. We should examine the argument in the committees report for establishing a Scottish panel to work alongside the UK Committee on Climate Change and add the Scottish dimension on what is required. A role exists for Audit Scotland and perhaps the Accounts Commission in technical monitoring of progress through government.

One of the most difficult issues will be duties on public bodies. The SNP has expressed its view on that, and I know that many people have a different view. However, I hope that we can reach a sensible resolution that suits all sides and is not seen to place a disproportionate burden on local government.

The debate has been positive. I expect us to go on from here to produce a very good bill. I return to the point that the difference that we make will be through action, and I hope that we are girded up for that.

16:48

The Minister for Transport, Infrastructure and Climate Change (Stewart Stevenson): I am fully girded for the occasion.

I welcome the scope of the debate over the past two days, which has been of good quality. At least part of every members speech has taken us forward and usefully informed the debate. I was particularly taken by Des McNulty’s concluding remark that one of his key aims is to ensure that we keep it simple at stage 2. As the minister who has the pleasant duty of taking the bill through stage 2 on the Governments behalf, I heartily subscribe to his view and hope that we can deliver on it.

The debate has been unusual as, at least in this parliamentary session, it is unique in that four ministers have contributed to it. That does not just indicate the day-to-day engagement of those four ministers, but generally reflects the fact that every minister—like every member and everyone in the wider community—must be their own climate change champion in their own circumstances. I
want to work with other members of the Parliament to put flesh on those bones and identify common ground and ways of taking things forward that sustain the very positive tone of today’s debate.

Although we find ourselves able to support the Labour amendment, we cannot support the Liberal Democrat amendment because of its reference to the public duties. We are prepared to continue to discuss the subject, but we must recognize the very real sensitivities of the Convention of Scottish Local Authorities and local councils on this matter. Although we might be able to find some convergence and strike the right balance, the Liberal Democrat amendment does not do so and, as I say, we cannot support it.

The support for the bills general principles that, unless I am very much mistaken, we will see at 5 o’clock this afternoon is but the first step in the process. Discussions will continue through stages 2 and 3, and we will have to do a great deal more work to justify what we all want: legislation and actions that will act as a beacon for others. I certainly think that challenging the EU to step up its ambition is one that we are looking seriously at that approach—-it is not yet a commitment, but we are doing the work to see whether it is possible.

As I turn to the points that have been raised during the two days of debate, I have to say that I expect that I will not deal with them all, but we will look very carefully at the Official Report and get back to members directly on any significant matters.

A discussion that I had with Mr McNulty and Ms Boyack after yesterday’s debate suggests that we might have a greater common understanding on the annual targets that we will put in place in secondary legislation next year and the need for those to form the core of what ministers will be accountable for over the coming period. Within a couple of years, we will have set targets that take us half way to 2050. That will certainly be a substantial set of commitments.

Ms Boyack described the provisions on public duties as vague commitments. We are looking at them again but, as I said earlier, we want to be very careful about how we progress in that respect.

Alison McInnes urged us to take early action. Earlier, I pointed out that we are building on action that has already been taken. This is a continuum of activity that transcends the transition from the previous Administration to this Administration and, indeed, will continue after many of us are no longer on this earth to see it in operation.

I sensed a suggestion that we might be able to disregard expert advice, but something that each and every one of us has to cling to is the need to use expert advice to determine the figures. The very moment politicians start to pluck figures out of the air, however well they might justify doing so by selecting what might have been stated elsewhere, they give future generations of politicians a hook for reneging on, moving back from or being less ambitious with commitments.

Alison McInnes (North East Scotland) (LD): Will the minister advise the Parliament on whose expert advice he has set the interim 2020 target?

Stewart Stevenson: The 34 per cent and 42 per cent figures came from the UK Committee on Climate Change. If things go to plan and we are able to set targets in June 2010, advice from that committee might give us a different answer. We will of course respect that. The fact is that, in this situation, information is evolving and understanding increasing.

With regard to the debate on how Parliament will scrutinise the Government’s efforts, Alison McInnes made the interesting suggestion that we consider the model that was adopted for the national planning framework in the Planning etc (Scotland) Act 2006. We are looking at the text of the 2006 act to find out whether we can lift it and put it into the bill. Should we conclude that we can simply incorporate the wording of the 2006 act in the bill, it is more likely that we will do so at stage 3, given the tight targets for stage 2. We are looking seriously at that approach—it is not yet a commitment, but we are doing the work to see whether it is possible.

Patrick Harvie and I had a wee exchange on the subject of the Maldives, which is seeking to go carbon neutral. That is extremely admirable but, having looked into the subject, I make the point that aviation is not included in the Maldives ambition. Given that tourism is the country’s main industry, its situation is not quite the same as Scotland’s; that illustrates the point that every country must find its own salvation. Patrick Harvie also referred to aviation and shipping; it is important that we continue to look at those issues.

Alex Johnstone commended the 34 to 42 per cent approach as one that would find favour with Conservative members.

Patrick Harvie: The minister will be aware that not everyone commended the 34 to 42 per cent approach that the Government has decided to take. Regardless of whether annual targets are included in the bill or in secondary legislation, how is a minister to set them after the bill has been passed if the Government has not yet decided—and will not decide for several years—whether it is aiming for a 34 per cent target or a 42 per cent target?

Stewart Stevenson: That is to misunderstand. Both the 34 per cent and the 42 per cent figure, together with the up-to-date advice that the
Committee on Climate Change will provide next year, will inform the annual targets that will be set—there is an absolute linkage.

I must make some fairly rapid progress. Charlie Gordon came up with the best question of the debate, as he often does, when he asked:

“what are you actually gonnae dae?”—[Official Report, 6 May 2009; c 17120.]

That is absolutely focused and on the money. Once we get the bill out of the way, we must focus on delivery and on ensuring that we get the outcomes that we want.

Liam McArthur advocated a bottom-up approach to developing initiatives, which is commendable. However, I suggest gently that that is a little at odds with the idea that we should direct centrally, through public duties, what happens.

The Presiding Officer (Alex Fergusson): Order. I am sorry to interrupt, minister. Members who have just come into the chamber should do others the common courtesy of allowing them to hear what is being said by members who have taken part in this two-day debate.

Stewart Stevenson: Thank you, Presiding Officer.

Lewis Macdonald spoke about the target of 11 per cent that has been set for heat from renewable energy. That is part of an overall 20 per cent that includes a range of other things—we are aiming to do a little better than the UK as a whole. That is reasonable.

I can tell John Scott that we are conducting a rural land use study, information on which we will provide shortly.

I am pleased to hear that Peter Peacock has the carpentry skills to build his own house. When I am building my next house, he can help me.

The community on Eigg that Rob Gibson mentioned was supported by the Scottish Government, under the excellent Scottish community and householder renewables initiative. We look with continuing interest at what is happening on Eigg.

This has been an interesting and engaging debate. It is the beginning of what will be a continuing engagement for years to come. Some years ago, John F Kennedy said that man can solve any problem that man creates. [Interuption.]

The Presiding Officer: Order. I have already asked members to be quiet. Would they please do that?

Stewart Stevenson: We must hope that John F Kennedy was correct, but there is no absolute certainty in that regard.

Yesterday, when we were discussing the electrification of the whole of Scotlands rail network, one of the senior Government directors said to me, “Surely we will have to have battery-powered trains to go to Kyle of Lochalsh and places like that.” The good news is that some battery-powered trains are already operating in England. We will copy a good idea, wherever it comes from.

I support the motion in my name.
Decision Time

17:01

The Presiding Officer (Alex Fergusson): There are 12 questions to be put as a result of todays business. Members should note that the question on motion S3M-3963, in the name of Stewart Stevenson, on the Climate Change (Scotland) Bill, and those on the two amendments to that motion, will be put before the questions on this mornings business.

Members should also be aware that, if motion S3M-4065.3, in the name of Fergus Ewing, on community courts, is agreed to, amendments S3M-4065.1 and S3M-4065.2, in the names of Richard Baker and Robert Brown respectively, will fall.

The first question is, that amendment S3M-3963.2, in the name of Sarah Boyack, which seeks to amend motion S3M-3963, in the name of Stewart Stevenson, on the Climate Change (Scotland) Bill, be agreed to.

Amendment agreed to.

The Presiding Officer: The second question is, that amendment S3M-3963.1, in the name of Alison McInnes, which seeks to amend motion S3M-3963, in the name of Stewart Stevenson, on the Climate Change (Scotland) Bill, be agreed to.

Are we all agreed?

Members: No.

The Presiding Officer: There will be a division.

The Presiding Officer: The result of the division is: For 57, Against 62, Abstentions 0.

Amendment disagreed to.

The Presiding Officer: The third question is, that motion S3M-3963, in the name of Stewart Stevenson, on the Climate Change (Scotland) Bill, as amended, be agreed to.

Motion, as amended, agreed to,

That the Parliament agrees to the general principles of the Climate Change (Scotland) Bill and, in so doing, further agrees that unambiguous quantified targets for the reduction of greenhouse gas emissions for the period between 2010 and 2019 are needed so that the current government and governments elected in 2011 and 2015 can be held to account for delivering early action on tackling climate change.
The Bill will be considered in the following order—

Sections 1 to 20  Schedule 1
Sections 21 to 66  Schedule 2
Section 67  Long Title

Amendments marked * are new (including manuscript amendments) or have been altered.

Amendment 77 was admitted in error (as it was identical to amendment 39) and so does not appear in this Marshalled List. Instead, Robin Harper now appears as a supporter of amendment 39.

Before section 1

Patrick Harvie

75 Before section 1, insert—

<PART
FOUNDING PRINCIPLE

Founding principle
The founding principle of this Act is to ensure that Scotland makes at least an equitable contribution, in accordance with its international responsibilities and capabilities, to the international goal of stabilising greenhouse gas concentrations in the atmosphere at a level that would prevent dangerous anthropogenic interference in the climate system.>

Section 1

Robin Harper

Section 2

Alison McInnes

1 In section 2, page 1, line 17, leave out <2030> and insert <2020>

Stewart Stevenson

2 In section 2, page 1, line 17, leave out <50%> and insert <34%>

Alison McInnes

3 In section 2, page 1, line 17, leave out <50%> and insert <42%>
After section 2

Stewart Stevenson

4 After section 2, insert—

<Modifying the interim target>

(1) The Scottish Ministers may, by order, modify the percentage figure mentioned in section 2(1) so as to substitute a higher figure for the one for the time being mentioned there.

(2) If an appropriate Community instrument comes into force, the Scottish Ministers must, before the expiry of the appropriate period, lay a draft of a statutory instrument containing an appropriate order before the Scottish Parliament.

(3) An “appropriate order” means an order under subsection (1) modifying the percentage figure mentioned in section 2(1) so as to substitute a figure of at least 42%.

(4) An “appropriate Community instrument” means a Community instrument—

(a) which contains a commitment to reduce greenhouse gas emissions by at least 30% compared to 1990 levels by 2020; and

(b) which amends the Decision of 26 March 2009 of the European Parliament and of the Council on the effort of Member States to reduce their greenhouse gas emissions to meet the Community’s greenhouse gas emission reduction commitments up to 2020 in the manner envisaged in Article 8(2) of the Decision.

(5) The “appropriate period” means the period of 3 months beginning with the day on which the appropriate Community instrument comes into force.

(6) If a draft of an appropriate order is not laid before the expiry of the appropriate period, the Scottish Ministers must lay the draft as soon as reasonably practicable afterwards.>

Stewart Stevenson

7 In section 4, page 3, line 7, at end insert—

  <(  ) If annual targets for a period are not set by the corresponding date mentioned in paragraphs (a) to (g) of subsection (2), the Scottish Ministers must set the annual targets as soon as reasonably practicable afterwards.>

Patrick Harvie

Supported by: Alison McInnes

89 In section 4, page 3, line 7, at end insert—

  <(  ) In this Act, the “fair and safe Scottish emissions budget” is the aggregate amount of net Scottish emissions for the period 2010-2050 recommended by the relevant body as being consistent with Scotland contributing appropriately to stabilisation of greenhouse gas concentrations in the atmosphere at a level that would prevent dangerous anthropogenic interference with the climate system.>

Section 5

Patrick Harvie

90 In section 5, page 3, line 10, after <request> insert <and publish>

Patrick Harvie

91 In section 5, page 3, line 11, at end insert <in relation to the target-setting criteria>
Alison McInnes

92 In section 5, page 3, line 11, at end insert—

<( ) When providing advice under this section, the relevant body must—

(a) express a view as to whether the annual targets are appropriate; and

(b) explain that view by reference to the target-setting criteria.>

Patrick Harvie

Supported by: Alison McInnes

93 In section 5, page 3, line 11, at end insert—

<(1A) When providing advice under subsection (1), the relevant body must also express a view as to—

(a) the extent to which the annual targets should be met by—

(i) taking action to reduce net Scottish emissions;

(ii) the use of carbon units that in accordance with regulations under section 12(2) may be credited to the net Scottish emissions account;

(b) the respective contributions towards meeting the annual targets that should be made—

(i) by the traded sector of the Scottish economy;

(ii) by the other sectors of the Scottish economy;

(c) the sectors of the Scottish economy in which there are particular opportunities for contributions to be made towards meeting the targets through reductions in emissions of greenhouse gases.

(1B) In subsection (1A)(b)(i), “traded sector” means the sectors of the Scottish economy which are covered by trading schemes within the meaning of section 44 of the 2008 Act.>

(b) deliver a reduction in greenhouse gas emissions (or a removal of greenhouse gas
from the atmosphere) that would not otherwise have occurred; and

(c) relate to projects which benefit, and promote sustainable development in, the
country in which the reduction in emissions referred to in paragraph (b) is taking
place (or in which the activities giving rise to the removal of greenhouse gases
referred to in that paragraph are taking place)>

After section 12

After section 12, insert—

<Restriction on use in 2010-2012 of carbon units purchased by Scottish Ministers>

(1) The Scottish Ministers may not, where subsection (2) applies, credit to the net Scottish
emissions account for a year in the period 2010-2012 any carbon units purchased by
them.

(2) This subsection applies provided the percentage figure mentioned in section 2(1) is
34%.

Section 14

In section 14, page 6, line 36, leave out <may> and insert <must>

In section 14, page 7, line 6, at end insert—

(2A) A draft of a statutory instrument containing the first order under subsection (1) must be
laid before the Scottish Parliament no later than 1 June 2010.

(2B) If a draft of the first order is not laid by the date mentioned in subsection (2A), the
Scottish Ministers must lay the draft as soon as reasonably practicable afterwards.

As an amendment to amendment 11, leave out lines 4 and 5

In making an order under subsection (1) the Scottish Ministers must have regard to the
extent to which the impact of emissions on climate change may vary according to the
altitude at which such emissions are made.
Section 18

Patrick Harvie
104 In section 18, page 8, line 22, at end insert—
<(  ) Regulations under subsection (1) may not include provision for any scheme whereby carbon units may be traded or offset to mitigate greenhouse gas emissions made in Scotland.>

Robin Harper
130 In section 18, page 8, line 23, after second <unit> insert <, purchased by the Scottish Ministers,>

After section 18

Stewart Stevenson
12 After section 18, insert—
<Limits on use of carbon units

(1) The Scottish Ministers must, by order, set a limit on the net amount of carbon units that may be credited to net Scottish emissions accounts during the periods mentioned in paragraphs (a) to (i) of subsection (2).

(2) The Scottish Ministers must set the limit—
(a) for the period 2010-2012, no later than 1 June 2010;
(b) for the period 2013-2017, no later than 31 December 2011;
(c) for the period 2018-2022, no later than 31 December 2016;
(d) for the period 2023-2027, no later than 31 December 2021;
(e) for the period 2028-2032, no later than 31 December 2026;
(f) for the period 2033-2037, no later than 31 December 2031;
(g) for the period 2038-2042, no later than 31 December 2036;
(h) for the period 2043-2047, no later than 31 December 2041;
(i) for the period 2048-2050, no later than 31 December 2046.

(3) The “net amount of carbon units” means C minus D, where—
“C” is the amount of carbon units credited to net Scottish emissions accounts during the period in accordance with regulations under section 12(2);
“D” is the amount of carbon units debited from net Scottish emissions accounts during the period in accordance with such regulations.

(4) An order under subsection (1) may provide that carbon units of a description specified in the order do not count towards the limit.

(5) If the limit for a period is not set by the corresponding date mentioned in paragraphs (a) to (i) of subsection (2), the Scottish Ministers must set the limit as soon as reasonably practicable afterwards.>
Des McNulty

12A As an amendment to amendment 12, line 2, at end insert—
<( ) The Scottish Ministers may only credit to the net Scottish emissions account for a year in the period 2013-2017 carbon units purchased by them up to a limit of 20% of the reduction in the amount of the net Scottish emissions account planned for that year.>

Alison McInnes

Alison McInnes

12F As an amendment to amendment 12, line 25, at end insert—
<(6) The Scottish Ministers must, before laying a draft of a statutory instrument containing an order under subsection (1) before the Scottish Parliament, request advice from the relevant body.
(7) If the order under subsection (1) makes provision different from that recommended by the relevant body, the Scottish Ministers must lay before the Scottish Parliament a report explaining why.
(8) The Scottish Ministers must, as soon as reasonably practicable after laying a report before the Scottish Parliament under subsection (7), and in so far as reasonably practicable, make a statement to the Parliament relating to the report.>

Stewart Stevenson

13 After section 18, insert—
Modifying limits on use of carbon units etc.

1. The Scottish Ministers may, by order, modify—
   a) a limit on the use of carbon units set by virtue of section (Limits on use of carbon units)(1);  
   b) any date mentioned in paragraphs (a) to (i) of section (Limits on use of carbon units)(2).

2. The Scottish Ministers may make an order under subsection (1)(a) only if they consider that it is appropriate to do so as a result of—
   a) a modification of the interim target; or  
   b) another significant change to the basis on which the limit on the use of carbon units was set.

3. The Scottish Ministers may make an order under subsection (1)(b) only if they consider it appropriate to do so.

4. An order under subsection (1)(a) may provide that carbon units of a description specified in the order do not count towards the limit.

Stewart Stevenson

After section 18, insert—

Advice before setting or modifying limits on use of carbon units etc.

1. The Scottish Ministers must, before laying a draft of a statutory instrument containing an order under section (Limits on use of carbon units)(1) or (Modifying limits on use of carbon units etc.)(1) before the Scottish Parliament, request advice from the relevant body.

2. If the order under section (Limits on use of carbon units)(1) or (Modifying limits on use of carbon units etc.)(1) makes provision different from that recommended by the relevant body, the Scottish Ministers must publish a statement setting out the reasons why.

3. A statement under subsection (2) may be published in such manner as the Scottish Ministers consider appropriate.

Brian Adam

Supported by: Des McNulty

After section 18, insert—

Public engagement strategy

1. As soon as reasonably practicable after making an order under section 4(1) setting annual targets, the Scottish Ministers must prepare and publish a strategy (a “public engagement strategy”) setting out the proposals and policies which they intend to adopt in order to—
   a) inform individuals and communities about the targets specified in or by virtue of this Part;   
   b) encourage individuals and communities to make contributions towards the meeting of those targets.
(2) In particular, the strategy under subsection (1) must identify actions which may be taken by individuals and communities in order to contribute towards the meeting of the targets specified in or by virtue of this Part.

(3) The second and each subsequent strategy published under this section—

(a) must contain an assessment of the progress towards implementing proposals and policies set out in earlier strategies;

(b) may make such adjustments to those proposals and policies as the Scottish Ministers consider appropriate.

(4) A public engagement strategy may be published in such manner as the Scottish Ministers consider appropriate.

(5) As soon as reasonably practicably after publishing a public engagement strategy, the Scottish Ministers must lay the strategy before the Scottish Parliament.

Climate Change (Scotland) Bill

1st Groupings of Amendments for Stage 2

This document provides procedural information which will assist in preparing for and following proceedings on the above Bill. The information provided is as follows:

- the list of groupings (that is, the order in which amendments will be debated). Any procedural points relevant to each group are noted;
- the text of amendments to be debated on the first day of Stage 2 consideration, set out in the order in which they will be debated. THIS LIST DOES NOT REPLACE THE MARSHALLED LIST, WHICH SETS OUT THE AMENDMENTS IN THE ORDER IN WHICH THEY WILL BE DISPOSED OF.

Groupings of amendments

**Founding principle**
75

**2050 target**
76

**Interim target: modification**
1, 2, 3, 4, 5, 6, 8, 24, 25, 26, 27, 28, 29, 30, 31, 35

*Notes on amendments in this group*
Amendments 2 and 3 are direct alternatives
Amendments 5 and 6 are pre-empted by amendment 79 in the group “Setting annual targets: criteria”
Amendment 8 is pre-empted by amendment 46 in the group “Power to modify annual targets etc.”

**Setting annual targets: amounts**
36, 37, 38, 39, 78

*Notes on amendments in this group*
Amendment 37 pre-empts amendment 38

**Setting annual targets: criteria**
79, 80, 81, 83, 84, 85, 86, 40, 41, 87, 42, 88, 89, 109

*Notes on amendments in this group*
Amendment 79 pre-empts amendments 5 and 6 in the group “Interim target: notification” and amendment 80 in this group
Role of relevant body in relation to annual targets
82, 90, 91, 92, 93, 97, 49, 106, 107, 108, 110

Notes on amendments in this group
Amendment 97 is pre-empted by amendment 96 in the group “Cases where advice not followed etc.: giving of reasons”
Amendment 49 is pre-empted by amendment 100, also in that group

Deadline for setting annual targets
7

Cases where advice not followed etc.: giving of reasons
94, 95, 96, 98, 99, 100

Notes on amendments in this group
Amendment 96 pre-empts amendment 97 in the group “Role of relevant body in relation to annual targets”
Amendment 100 pre-empts amendment 49, also in that group

Power to modify annual targets etc.
43, 44, 45, 46, 47, 48

Notes on amendments in this group
Amendment 46 pre-empts amendment 8 in the group “Interim target: modification”

Achievement of annual targets: respective contributions of domestic reductions and crediting of carbon units
50, 125, 51, 52, 10, 57, 12, 12A, 12AA, 12AB, 12C, 12D, 12B, 12E, 12F, 13, 14, 60, 19, 61, 62, 63, 65, 68, 69

Notes on amendments in this group
Amendment 60 pre-empts amendment 19

Annual targets: progress towards achievement
9, 101, 111, 20, 112, 21, 64, 22, 115

Notes on amendments in this group
Amendment 9 pre-empts amendment 101
Amendment 111 pre-empts amendment 20
Amendment 112 pre-empts amendment 21
Amendment 64 pre-empts amendment 22

Greenhouse gases
53, 102, 54

Net Scottish emissions account: restriction on use of carbon units
126, 127, 128, 129, 130
Carbon units: source
55, 56

Scottish share of emissions from international aviation and international shipping
58, 11, 11A, 103

Carbon units: carbon offsetting and trading
104

Public engagement strategy
59

Functions of advisory body
105

Relationship between advisory body and Scottish Parliament
131, 132, 134, 135, 136

Minor amendments
15, 16, 17, 18, 32, 33, 34

Electricity generation: advice and reports
133, 137, 138

Power to give directions to advisory body
113, 114

Reports on targets etc.: content
116, 67, 117, 118, 23, 119, 120, 121

Reports on certain kinds of emissions
70, 124

Reports: provision of information to the Scottish Parliament
71, 122, 122A, 72, 73, 123

Charges for supply of carrier bags
74
Transport, Infrastructure and Climate Change Committee

Extract from the Minutes of Proceedings

14th Meeting, 2009 (Session 3)

Tuesday 26 May 2009

Present:

Rob Gibson
Patrick Harvie (Convener)
Alison McInnes
Cathy Peattie (Deputy Convener)

Charlie Gordon
Alex Johnstone
Des McNulty
Shirley-Anne Somerville

Also present: Brian Adam, Robin Harper and Elaine Murray.

Climate Change (Scotland) Bill: The Committee considered the Bill at Stage 2 (Day 1).

The following amendments were agreed to (without division): 1, 4, 38, 5, 6, 40, 41, 42, 88, 90, 97, 8, 10, 57, 11, 12, 13 and 14.

The following amendments were agreed to (by division)—

2 (For 6, Against 2, Abstentions 0)
7 (For 7, Against 1, Abstentions 0)
92 (For 5, Against 3, Abstentions 0)
98 (For 5, Against 3, Abstentions 0)
99 (For 5, Against 3, Abstentions 0)
100 (For 5, Against 3, Abstentions 0)
50 (For 5, Against 3, Abstentions 0)
9 (For 7, Against 1, Abstentions 0)
51 (For 5, Against 3, Abstentions 0)
52 (For 5, Against 3, Abstentions 0)
12A (For 5, Against 3, Abstentions 0)
12B (For 5, Against 3, Abstentions 0)

The following amendments were disagreed to (by division)—

75 (For 2, Against 6, Abstentions 0)
76 (For 1, Against 7, Abstentions 0)
3 (For 2, Against 6, Abstentions 0)
36 (For 2, Against 6, Abstentions 0)
37 (For 2, Against 6, Abstentions 0)
39 (For 2, Against 6, Abstentions 0)
80 (For 2, Against 6, Abstentions 0)
78 (For 1, Against 7, Abstentions 0)
79 (For 2, Against 6, Abstentions 0)
82 (For 2, Against 6, Abstentions 0)
84 (For 2, Against 6, Abstentions 0)
85 (For 1, Against 7, Abstentions 0)
86 (For 1, Against 7, Abstentions 0)
87 (For 1, Against 7, Abstentions 0)
89 (For 2, Against 6, Abstentions 0)
91 (For 2, Against 6, Abstentions 0)
43 (For 2, Against 6, Abstentions 0)
11A (For 2, Against 6, Abstentions 0)
12AB (For 2, Against 6, Abstentions 0)
12C (For 2, Against 6, Abstentions 0)
12D (For 2, Against 6, Abstentions 0)
12E (For 2, Against 6, Abstentions 0)
12F (For 2, Against 6, Abstentions 0)

Amendments 94, 53, 126, 55, 58 and 59 were moved and, with the agreement of the Committee, withdrawn.

Amendments 49 and 101, were pre-empted.

The following amendments were not moved: 81, 83, 93, 95, 96, 44, 45, 46, 47, 48, 125, 102, 54, 127, 128, 129, 56, 103, 104, 130 and 12AA.

Sections 1, 9, 10, 11, 13, 15, 16, 17 and 18 were agreed to without amendment.

Sections 2, 3, 4, 5, 6, 7, 8, 12 and 14 were agreed to as amended.

The Committee ended consideration of the Bill for the day amendment 59 having been disposed of.
Scottish Parliament

Transport, Infrastructure and Climate Change Committee

Tuesday 26 May 2009

[THE CONVENOR opened the meeting at 14:02]

Climate Change (Scotland) Bill: Stage 2

The Convener (Patrick Harvie): Good afternoon, everybody, and welcome to the 14th meeting this year of the Transport, Infrastructure and Climate Change Committee. I remind members, witnesses and everyone else present that all mobile phones and other devices should be switched off.

We have no apologies to record. I welcome to the meeting two MSPs—Sarah Boyack and Robin Harper—who are not members of the committee.

The only item on the agenda is the beginning of our stage 2 consideration of the Climate Change (Scotland) Bill, which is a substantial item and is perhaps enough to be going on with. I welcome the Minister for Transport, Infrastructure and Climate Change, Stewart Stevenson, and his colleagues: Philip Wright is deputy director of climate change in the Scottish Government, Fiona Page is the bill team leader, Frances Beck is a solicitor, and Max McGill is an assistant Scottish parliamentary counsel.

Before we begin our consideration of amendments, I put on record my appreciation of the great deal of hard work that the clerks have put into processing the amendments in difficult circumstances. Their late work is much appreciated.

I will say something about the process. In order to speed things along, if any member who is responsible for an amendment does not wish to move it, they should simply say, “Not moved.” At that point, I will not specifically call for another member to move the amendment, but any other member may move it simply by saying, “Moved.” However, I will not pause for long, so the member should get that in quickly. If no other member moves the amendment, we will simply proceed immediately to the next amendment on the marshalled list.

If a member wishes to withdraw an amendment after it has been moved, I will ask whether anyone objects to its being withdrawn. There is no scope for having a division on whether an amendment should be withdrawn. If any member objects to the amendment being withdrawn, we will immediately proceed to the question on it.

Although it will be possible to intervene when other members are speaking, all members will have the opportunity to contribute to the debate on each group of amendments, if that is possible within the time that is available. I do not expect a great number of interventions, except perhaps when the closing speaker is speaking.

Finally, on the use of the casting vote, which is a possibility, the normal process would be to vote for the status quo. Having looked at the amendments, I do not anticipate their being any reason for me to depart from the normal process. I expect to vote for the bill as it stands, if I am required to use a casting vote.

We might not cover all the amendments that are in front of us today, but we will make as much progress as we can. At the end of the meeting I will announce the deadline for amendments for the next stage 2 meeting.

Before section 1

The Convener: Amendment 75, which is in my name, is in a group on its own. We are considering amendment 75 first, but it relates to the final paragraph of our stage 1 report—paragraph 370—on the bill’s overall purpose. The purpose is perhaps self-evident to committee members who have studied the bill for so long, but I argue that there is a clear opportunity to bind legally future ministers not only to the targets and the framework but to the bill’s objective.

Amendment 75 was inspired by the Stop Climate Chaos Coalition, which argued that the aim and logic of the bill should be explicit in its text. The amendment takes its form of words from the United Nations Framework Convention on Climate Change, which states in article 2 that its objective is

“to achieve, in accordance with the relevant provisions of the Convention, stabilization of greenhouse gas concentrations in the atmosphere at a level that would prevent dangerous anthropogenic interference with the climate system.”

I have used a similar form of words for amendment 75, arguing in it that we should “ensure that Scotland makes … an equitable contribution” to the UNFCCC’s purpose.

I move amendment 75.

I now ask whether any members wish to—I beg your pardon, I have also—forgive me, but this is my first stage 2 as a convener. I hope that you will bear with me for the many mistakes that I am sure I will make.
Do any other members wish to contribute to the debate on amendment 75? Does the minister want to comment?

The Minister for Transport, Infrastructure and Climate Change (Stewart Stevenson): Amendment 75 clearly aims to insert a founding principle into the bill, and we recognise the spirit in which the amendment was lodged. The proposing member referred to the UN convention from which the amendment’s words come. As a general point, of course, such statements do not necessarily have any particular legal effect. If a bill becomes law, it should determine the rights and responsibilities of individuals, companies, Government and public bodies such as local authorities. Laws should impose duties or convey powers. Every word in an act should have legal effect and actually do something.

I want to address a particular point in amendment 75—although the wording properly comes from the UN convention—which could unintentionally, I am certain, have a restricting effect on the bill in some circumstances. I refer to the use of the word “anthropogenic”, which could allow a challenge to actions that are taken in exercise of powers under the bill to address climate change effects that are not anthropogenic in their origins. Examples of that are the substantial emissions of CO₂ that can result from geological sources, such as volcanic activity, but the clear evidence from around the globe is that anthropogenic emissions—that is, human-induced emissions—are driving the problem. I am content with the term “anthropogenic” and will press the amendment.

The use of the word “anthropogenic” might appear to restrict the bill to addressing only climate change effects that are derived from human activity. That could restrict the application of the powers in the bill in other circumstances that, although not frequent, are far from improbable. On that basis, I ask Patrick Harvie to withdraw amendment 75.

The Convener: The term “anthropogenic climate change” is widely—in fact, globally—recognised and understood. I do not accept the argument that it would introduce ambiguity in relation to livestock or ruminants, which can be related to human land use policies and practices. The minister mentioned larger geological sources of emissions, such as volcanic activity, but the clear evidence from around the globe is that anthropogenic emissions—that is, human-induced emissions—are driving the problem. I am content with the term “anthropogenic” and will press the amendment.

The question is, that amendment 75 be agreed to. Are we agreed?

Members: No.

The Convener: There will be a division.

For
Harvie, Patrick (Glasgow) (Green)
McInnes, Alison (North East Scotland) (LD)

Against
Gordon, Charlie (Glasgow Cathcart) (Lab)
Johnstone, Alex (North East Scotland) (Con)
McNulty, Des (Clydebank and Milngavie) (Lab)
Peatlee, Cathy (Falkirk East) (Lab)

Amendment 75 disagreed to.

Section 1—The 2050 target

The Convener: Amendment 76, in the name of Robin Harper, is in a group on its own.

Robin Harper (Lothians) (Green): For the Climate Change (Scotland) Bill to be a success, it will need to do two things: first, it will need to set targets for reductions in emissions at the right levels, and secondly, it will have to set out how to achieve those targets. My first two amendments focus on the targets themselves and I will address them collectively.

The targets in the final bill must be at the levels that are demanded by science. They must also be at levels that allow Scotland to play the responsible role that we want it to play internationally—the bill has frequently been flagged up in that respect. Finally, they must be practical and achievable. Some people would like our economy to be decarbonised completely by 2020, but that is an impractical target and would be doomed to fail.

The best research to date on the issue is by the Tyndall Centre for Climate Change Research, whose staff are Britain’s leading experts on climate change. They calculate that a 90 per cent reduction in our emissions is needed by 2050 to give us even a 30 per cent chance of keeping temperature rises below 2°C. The fact is that the science is shifting, and the news gets worse and worse; it does not get better. Scientists who met in Copenhagen earlier this year ahead of the crunch talks that will take place in December confirmed that the 2007 Intergovernmental Panel on Climate Change data were conservative, that sea level rises will be worse than previously thought and that emissions reductions will need to be quicker than previously proposed. Much of our thinking has been based on the Stern report, which it is universally recognised is already largely out of
date. My amendment 76 therefore seeks to bring the existing long-term target of 80 per cent up to the 90 per cent that has been recommended by Tyndall, Al Gore and others. It is a target that even Epson, the printer company, is prepared to set for itself. Are we going to be less ambitious than Epson?

14:15

We have before us an interim target of a 50 per cent reduction by 2030. That would leave too much of the work to the later phases of the legislation’s life, and would therefore make the final target harder to reach. We can do the mathematics. Every tonne of carbon that we put into the atmosphere at the moment will stay there for 100 years, so it is important to begin reducing carbon now. I therefore urge the committee to back Alison McInnes’s amendment 1, which seeks to retain the 50 per cent interim target but to bring it forward to 2020. I was going to lodge a similar amendment myself, but Alison McInnes got there first.

We need annual targets from the start—targets that allow us to hold ministers accountable. The bill sets no minimum levels for reductions in emissions before 2020, which must be fixed. My second amendment in this area would therefore introduce an annual minimum target—

The Convener: I remind the member that we are debating amendment 76, which is the only amendment in this group. There will be opportunities to debate other amendments as we proceed.

Robin Harper: I see. I am sorry, convener. When I was preparing what I wanted to say, I presumed that the amendments that I have been discussing would be taken together.

I move amendment 76.

The Convener: As no other members want to contribute to the debate on amendment 76, I invite the minister to respond.

Stewart Stevenson: Members will know that I have emphasised the need to be driven by expert advice; we should not proceed before taking expert advice. The United Kingdom Government has sought advice and the figure at the moment is 80 per cent.

Mr Harper said that targets have to be practical and achievable. At this stage, we do not have the information that would help us to understand how 90 per cent could be achievable. However, Mr Harper quite properly made the point that the science is shifting. We will discover whether the 80 per cent target remained the target of successive Governments up until 2050 when we get to 2050. During that time, expert advice will advance.

At this stage, we feel that it would be premature to revise the target in the bill of “at least 80%”. I therefore ask the committee not to support amendment 76.

The Convener: I invite Robin Harper to wind up the discussion on amendment 76.

Robin Harper: I suppose that it all depends on our attitude. The minister would like us to prove that it is necessary to revise the target to 90 per cent and that we can achieve it, but I would like somebody to prove to me that we cannot achieve 90 per cent. If we consider the rapid progress of recent years—both in renewables and, more important, in the possibilities for energy conservation—we can see that 90 per cent is not an impossible target. One way of looking at it is that it is only 10 percentage points more than 80 per cent. It depends on which way you look through the telescope.

The trend of the news does not change, and things are already worse than was suggested in the Stern report. When we compare the presentation made by Jacqueline McGlade with the one made by Lord Adair Turner in the McEwan hall in Edinburgh recently, we see a remarkable contrast. On the one hand, there was a relatively content Government position from Lord Adair Turner, who said that we can do what is required; on the other hand, there was a remarkable series of figures that had been produced by the European Environment Agency. It was not put very strongly, but it was suggested that the situation was already much more severe than we had thought even a year ago.

I argue strongly that if we want the bill to mean something, even in the next five or 10 years, we should go for a target of 90 per cent.

The Convener: The question is, that amendment 76 be agreed to. Are we agreed?

Members: No.

The Convener: There will be a division.

FOR
Harvie, Patrick (Glasgow) (Green)

AGAINST
Gibson, Rob (Highlands and Islands) (SNP)
Gordon, Charlie (Glasgow Cathcart) (Lab)
Johnstone, Alex (North East Scotland) (Con)
McInnes, Alison (North East Scotland) (LD)
McNulty, Des (Clydebank and Milngavie) (Lab)
Peattie, Cathy (Falkirk East) (Lab)
Somerville, Shirley-Anne (Lothians) (SNP)

The Convener: The result of the division is: For 1, Against 7, Abstentions 0.

Amendment 76 disagreed to.

Section 1 agreed to.
Section 2—The interim target

The Convener: Amendment 1, in the name of Alison McInnes, is grouped with amendments 2 to 6, 8, 24 to 31 and 35. I refer members to the notes on pre-emptions in this group, which are provided on the list of groupings. Members should also note that amendments 2 and 3 are direct alternatives.

Alison McInnes (North East Scotland) (LD): Amendment would 1 bring the interim target date forward to 2020, putting the Scottish bill in line with UK and other international reporting and legislation. It reflects the recommendation in our stage 1 report, with which the minister has already said he agrees.

Amendment 3 would set the new 2020 interim target at 42 per cent. As you said, convener, amendment 3 is a direct alternative to the minister’s amendment 2, which proposes that the interim target be the less scientifically credible 34 per cent. In my view, 34 per cent would mean more or less business as usual. For Scotland to show real leadership on climate change, the interim target must be ambitious. That means setting it above the 34 per cent level that has already been established for the UK as a whole.

Science now indicates that a 42 per cent cut by 2020 is the minimum that must be achieved if our efforts are to have any real impact in limiting the damaging effects of climate change. The target is achievable in Scotland, and simply hitting the 3 per cent annual reduction, which was one of the Scottish National Party’s promises for the bill, would allow it to be reached. Long-term targets are all very well, but they are no substitute for short-term action. My amendment 3 would ensure the delivery of early, sustained action. There is overwhelming evidence, as we heard from witnesses at stage 1, that early, sustained action is necessary. Our stage 1 report stresses the need for a “more robust” target. In its evidence, the Royal Society of Edinburgh stated:

“It should be a challenging target that encourages early action, and one that, because of its imminence, perennially impinges on Government perspectives no matter which party is in power.”

Our natural resources give us the ability to deliver more than the UK Climate Change Act 2008 asks of us. As Robin Harper has already mentioned, new research by the Tyndall Centre for Climate Change Research shows that a target of at least 42 per cent is needed to give us the best chance of avoiding dangerous climate change.

The minister has said that the science should determine the targets. It would seem, however, that expedience is currently uppermost in his mind. A weak target means larger cumulative emissions, and it increases the risk of not meeting the overall target. The Government has claimed that it has “the most ambitious climate change legislation anywhere in the world”, but I do not believe that yet. I urge the committee to support the target of 42 per cent, which is driven by the necessity for urgent action. In so doing, the committee can set the tone for the rest of the bill.

I move amendment 1.

Stewart Stevenson: I will explain our position on Ms McInnes’s amendments. I am happy to support amendment 1—indeed, we submitted an identical amendment, albeit after Ms McInnes, so we are entirely happy to support it.

A challenging target will set the pace for the first decade of statutory annual targets, thereby helping to drive early emissions reductions. I am pleased that we share that ambition—I am sure that that is true of everyone here. However, I cannot support amendment 3. We need a suitably challenging interim target for 2020 that will ensure real, tangible action by the Scottish ministers, but I cannot support a target that cannot be delivered in the absence of appropriate action by the UK Government and the European Union.

Let me talk through some of the difficulties with that. We have a clear understanding of the level of challenge that is required to deliver emissions reductions of 34 per cent and 42 per cent in 2020, and we have considered carefully and in depth the information and recommendations in the UK Committee on Climate Change’s first report, which was issued in December 2008. We have also undertaken additional analysis to explore and clarify the details behind those recommendations as part of work to identify how to meet new Scottish climate change targets.

Reducing emissions is a complex business that involves different tiers of activity throughout Scotland, the UK and the European Union. Collectively, those tiers of activity influence the overall amount of Scottish emissions each year. Scotland’s emissions are split between the traded sector and the non-traded sector. That key distinction has significant implications for achieving the target. The traded sector is made up of power stations and other energy-intensive industrial installations, which are covered by the EU emission trading scheme. That scheme is one of our strongest policy levers to reduce emissions from large emitters, but it will deliver to our numbers emissions reductions to 2020 at levels that are predetermined by the European Union. Those emissions account for approximately 40 per cent of Scottish emissions. We do not directly have the power to influence the level of those reductions. The only factor that will increase the reductions that are planned through the ETS is the...
level of emissions reductions that the European Union commits to. That is why we are eagerly looking to a future decision by the EU to reduce greenhouse gas emissions by 30 per cent by 2020, which is not expected until we are successful in agreeing a new international agreement to replace the current Kyoto protocol.

It is also important to remember the UK Government’s influence on Scottish emissions. We cannot seek to reduce emissions at a higher rate than the UK rate in reserved areas such as energy generation. We can plan emissions reductions of 42 per cent in 2020 only if the UK Government is equally ambitious and the EU reduces its emissions by 30 per cent. I will give members some quantitative numbers. A 42 per cent target would mean that we had to deliver reductions of 30 per cent in 2020 only if the UK Government is equally ambitious and the EU reduces its emissions by 30 per cent. I will give members some quantitative numbers. A 42 per cent target would mean that we had to deliver reductions of around 17 million tonnes of CO₂ equivalent between 2006 and 2020. Even if the Scottish ministers delivered everything that is detailed in the UK Committee on Climate Change’s 500-page report, we would still have a 4 million tonne shortfall on the 42 per cent target. It is thus impossible for us to deliver by ourselves. We need matched action and commitment by the UK Government and the EU.

However, I share the committee’s ambition to reduce emissions as quickly as possible, which is why I have lodged amendments on behalf of the Scottish Government. Our amendment 2 requires a 2020 interim target to reduce emissions by at least 34 per cent. More significant, amendment 4 will require the Scottish ministers to lay an order before Parliament that seeks to increase the 2020 interim target to at least 42 per cent if the EU agrees to reduce its greenhouse gas emissions by at least 30 per cent by 2020.

In order to change the interim target year to 2020, a number of consequential amendments are required throughout the bill. My remaining amendments in the group seek to achieve that aim.

We are absolutely committed to increasing the interim target to 42 per cent at the earliest opportunity, which is why I propose to put that requirement on the Scottish ministers in the bill. There are no ifs and no buts. We will have to increase the target if the EU commits to emissions reductions of at least 30 per cent. Doing things in that way is our firm challenge to the EU to rise to the ambitions that we are setting. It will ensure that we increase the 2020 target at the earliest opportunity, and it signals our commitment to delivering the target to the international community.

14:30

**Des McNulty (Clydebank and Milngavie) (Lab):** We are talking about a complex and difficult area of the bill. People say that science is to the forefront and that we must make decisions on the most appropriate scientific basis, but I am not sure whether we have all the information that we require about the achievability of targets in Scotland to allow us to say with certainty that figure A or figure B is the maximum that is achievable. I seriously considered proposing an alternative percentage, as Alison McInnes did. My problem was that, with the evidence base that I have, it was difficult to say with certainty whether 42, 40 or 39 per cent is right.

An interim target of 34 per cent would be unambitious. A problem is that Governments in general—not just the Scottish Government—are almost taking an approach of saying, “We will if you will.” Everybody is waiting for somebody else to be the first person to move and I am not sure whether that is the best way to proceed.

I have difficulty with both the amendments that would change the interim target. I incline more towards the ball park in which Alison McInnes is operating, but I am not sure whether 42 per cent is the correct figure.

I would like the Scottish ministers to seek advice from the relevant body, which is defined in section 5, about the maximum contribution that is achievable through early action to reduce the net Scottish emissions account between 2010 and 2020.

**Stewart Stevenson:** It may be useful if I say that we plan to take precisely that approach. I hope that the member recognises that we, too, want to be ambitious and that we wish to obtain that advice at the earliest opportunity.

**Des McNulty:** If that advice were obtained, I would expect that body to stipulate a higher target than the minister proposes and I would want the Scottish Government to put that higher target in the legislation. I would like amendments to be lodged at stage 3 to facilitate that process.

The right place for us to be is at 38 to 40 per cent, but I want us to say absolutely robustly that the specified figure is the maximum that is achievable and is supported by a robust analysis of what is to be delivered.

My attitude to the Government’s amendments and those in Alison McInnes’s name is to ask whether they will take us to the right place, which is not that the committee should pick a percentage for Scotland but that we should pose to the relevant advisory body the right question—what is the most that we can do to make the bill as strong as it can be? We should make the figure that that
body provides our target. That is the approach that I would like us to take. I am interested in taking that approach on a cross-party basis and in hearing colleagues’ opinions about how we would best achieve it. The target is not a subject for political point scoring; our objective in the bill should be the highest level that is consistent with what is achievable. I hope that everybody will work together constructively to achieve that end.

We need to focus on what Scotland can do. I do not think that there has been a systematic analysis of what Scotland can achieve, given its unique opportunities and potential in the development of renewables. The target that emerges from the debate should be the one that corresponds to what Scotland can achieve; we should not pinch someone else’s target.

The Convener: Des McNulty was right to say that we should not pinch a target from other sources. We should be clear: the 34 per cent and 42 per cent targets are existing, not new, targets; the question is whether we should adopt one of them in Scotland’s bill. It has always struck me that there seems to be a lack of rationale for the lower interim target. To adopt the lower target on the assumption that we will try to reach wider agreement to work towards the higher target would still leave us with a question: whatever target we set, what will we do to get ourselves onto an ambitious emissions reduction trajectory? If our trajectory aims at the lower interim target, even just for the first year or two, it will be vastly more difficult to achieve the higher interim target if and when we adopt it.

The only basis for taking action on climate change is the assumption that the world will come to its senses and work together to achieve ambitious reductions. It seems bizarre to set a target on an assumption that the world will not do that. I am puzzled by the suggestion that although we know what is required we should set a target of 34 per cent in the meantime. I simply do not understand that position.

Sarah Boyack (Edinburgh Central) (Lab): I agree with bits of what members have said. I think that Labour would want to go further than 34 per cent. Our difficulty with setting another target is partly to do with what the minister said about the traded sector.

It is difficult for us to say that our bill will be more radical than everyone else’s and will push everyone at Copenhagen in the autumn if it is not more radical. I cut to the chase. Our problem with amendment 4 is that it assumes a target of 34 per cent but suggests that should Europe sign up to a tougher target we will increase our target to 42 per cent. Such an approach will cut across our attempts to produce a radical bill that will persuade everyone else to sign up to a tougher target.

We are not convinced that work is being done that can take us to 42 per cent, and there is a moot point about when we will be able to make the shift. We want the bill to set a tougher target and we do not think that the Scottish target should be predicated on what the rest of Europe is signing up to. That is the wrong approach.

The difficulty is that we are at stage 2, debating two targets. We want to come back to the issue. As Des McNulty said, the Labour Party wants to talk to colleagues about how much further we can go. We must ensure that we get the target right. This is a process. During consideration of previous bills in the Parliament we continued to discuss issues after stage 1 committee reports had been published. Our report on the Climate Change (Scotland) Bill at stage 1 was excellent, but the work does not stop at stage 2; stage 3 will be as important as the other stages have been. At stage 3 we will want the approach in the bill to go further than is proposed in amendment 4.

We welcome the minister’s willingness to bring forward from 2030 to 2020 the year by which the interim target must be achieved, which will help to push the pace, but we are not there yet. In the early days of the Parliament, civil servants told me in a “Yes Minister” way that the renewables targets that we were setting were very ambitious. We now have a target of 50 per cent of electricity generation to come from renewables by 2020, but it took us a while to get there.

We must ensure that the target in the bill is ambitious and credible. I hope that we can come back to the issue, because we should be discussing the matter in the committee and beyond it. What currently seems too difficult to achieve will, in time, have to be delivered. The issue is to do with what we put in the bill, and that—along with the evidence that we have heard from the minister on the traded sector—is why we are reluctant to vote today for the 42 per cent target that Alison McInnes has proposed.

We can go further than the 34 per cent target, so we want to push beyond it. Des McNulty is right to say that the issue is complex. We are not happy with setting a target that says to the rest of Europe, “We will do this only if you will.” We should consider what Scotland can do—we all know that it has greater renewables potential.

No one has yet mentioned the business community. We do not want to saddle businesses with a figure that is generally viewed as very difficult to achieve and that they would view as not credible, but it is clear from all the evidence that the committee has received that we should go further together. We should find some space to set a different target by the end of the bill process. I hope that committee members will not stick with
amendment 4 as it stands; it is not ambitious enough—we need to do better.

The Convener: Are there any brief additional remarks?

Stewart Stevenson: Yes—I will try not to push the boat too far on the length of time.

A key point is that the figures—34 per cent and 42 per cent—have come from expert advice. The 42 per cent target that appears in the amendment in my name would mean that our bill would be the only one in the world—as I understand it, subject to anyone telling me otherwise—with an ambition at that level, so we are setting the pace.

We can in no way control, through whatever we do in Scotland, the trajectory in relation to the 40 per cent of our carbon emissions that are within the European Union trading scheme’s purview. To set a figure that takes no account of what we know will come from that traded sector, knowing that we cannot close the 4 million tonne CO₂ equivalent gap, would simply be to sign up to failure.

We must go to Europe and say, “If you sign up for 30 per cent, we will sign up for the more ambitious 42 per cent target.” We will seek to be part of the team that is persuading Europe by saying we are up for that challenge and ready to accept it. Of course, it is likely, upon receiving the advice that we will seek after the bill has completed its passage, that the 34 per cent figure will be revisited. Ministers have the power to raise those percentages—although they have no power to lower them—and, based on expert advice, we will end up with the highest possible figure for the 2020 target. We would ask the committee to give us advice on a possible figure for that, based on what can be delivered. I urge members to support the amendments in my name, and I hope that we can continue our constructive dialogue on what is generally acknowledged to be a very complex area.

Alison McInnes: I stress that amendment 1 is not about point scoring, but is driven by what I believe is necessary rather than what might be comfortable for us. There are only two options on the table this afternoon.

The minister has not sought guidance directly from the UKCCC, but has relied instead on that committee’s report for the UK, thereby ignoring the specific issues in relation to Scotland that could help us to deliver on a higher target. We must send the right signal to Scottish business and investors, who have told us that they want certainty in relation to what is required of them.

There is no point in waiting for others to catch up because, as the convener has said, the longer we put off the 42 per cent target, the less achievable it will be. We should not be misled by the minister’s suggestion that it is conditional on others’ actions; Des McNulty’s point about the “We will if you will” approach was spot on. Someone needs to take the lead; it needs to be Scotland. I have real doubts that a tougher target will be proposed at stage 3 if we concede the 34 per cent target today.

Amendment 1 agreed to.

14:45

Amendment 2 moved—[Stewart Stevenson].

Des McNulty: Convener, may I seek clarification from the minister on an issue?

The Convener: I will allow one brief question.

Des McNulty: When I spoke earlier, I asked the minister whether he would be agreeable to publishing, before the end of 2009, advice from the relevant body on the maximum achievable contribution towards reducing the net Scottish emissions account through early action in the period 2010 to 2020. I also asked whether he would be agreeable to putting that higher target to the Parliament in short order. Is the minister prepared to commit to that today?

Stewart Stevenson: That is an approach that commends itself to the Government.

The Convener: The question is, that amendment 2 be agreed to. Are we agreed?

Members: No.

The Convener: There will be a division.

FOR

Gibson, Rob (Highlands and Islands) (SNP)
Gordon, Charlie (Glasgow Cathcart) (Lab)
Johnstone, Alex (North East Scotland) (Con)
McNulty, Des (Clydebank and Milngavie) (Lab)
Peattie, Cathy (Falkirk East) (Lab)
Somerville, Shirley-Anne (Lothians) (SNP)

AGAINST

Harvie, Patrick (Glasgow) (Green)
McInnes, Alison (North East Scotland) (LD)

The Convener: The result of the division is: For 6, Against 2, Abstentions 0.

Amendment 2 agreed to.

The Convener: I ask members to ensure, if at all possible, that the debate is concluded before we begin voting on amendments.

Amendment 3 moved—[Alison McInnes].

The Convener: The question is, that amendment 3 be agreed to. Are we agreed?

Members: No.

The Convener: There will be a division.
The Convener: The result of the division is: For 2, Against 6, Abstentions 0.

Amendment 3 disagreed to.

Section 2, as amended, agreed to.

After section 2

Amendment 4 moved—[Stewart Stevenson]—and agreed to.

Section 3—Annual targets

Amendment 36, in the name of Alison McInnes, is grouped with amendments 37 to 39 and 78. I refer members to the notes on pre-emption in the group, which are in the groupings list.

Amendments 36, 37 and 39 relate to the setting of annual targets. For the bill to have any real effect in fighting climate change, it is vital that the requirement for early action is built on. Delaying the introduction of 3 per cent annual targets until 2020 will mean that the required action will not be taken in the crucial first years. Every year ambitious targets are delayed, extra greenhouse gases are released into the atmosphere and preventing dangerous climate change becomes much harder.

The First Minister has said that his legislation will be more ambitious than the Labour Government’s legislation in every respect, but the bill backtracks on that. It also denies Scotland the economic advantage that it could have, as we run the risk of missing out on the green jobs revolution that would come from a speedy transition to a low-carbon economy. Amendments 36, 37 and 39, which are one of the Stop Climate Chaos Coalition’s big asks, reflect the wishes of a great many people throughout the country. All committee members were at the climate change rally last month, so I do not need to remind them of the strength of feeling on the issue.

I move amendment 36.

Des McNulty: Amendment 38 is an attempt to ensure that progress works out steadily, year by year, rather than starts slowly and ends with a rapid incline. There must be criteria in the bill that require ministers to ensure that they have a planned reduction of emissions over the full period, to allow the interim target to be reached. One of the concerns has been about a lack of early action; the amendment is intended to deliver that process.

Although we have not supported the introduction of an immediate 3 per cent year-by-year reduction and will not support amendment 36, we have consistently felt that the Government needs to bring forward from 2021 the date at which the 3 per cent annual reduction will be achieved. That is part of the thinking behind amendment 38.

Robin Harper: As the afternoon has progressed, it has become increasingly clear that amendment 78 might be even more necessary than we thought.

Amendment 78 proposes that the 3 per cent annual reduction in section 3(2)(c) be changed to 4.2 per cent in the period 2020 to 2050—by which time we will find that 3 per cent is not enough.

As other amendments that call for more effective targets to be set have so far failed, I argue that setting an ambitious target for the period 2020 to 2050 now is even more necessary than before.

Stewart Stevenson: I have often spoken to the committee and Parliament to affirm our commitment to deep and full meaningful emissions cuts being implemented as soon as possible, to enable us to meet our 80 per cent goal by 2050. The key words to keep in mind are “as soon as possible.” I agree that we have to build towards achieving that level of annual reduction as soon as possible. I note Des McNulty’s suggestion that we need to bring forward the date at which we move to 3 per cent annual targets. The important thing is that we do so based on the expert advice of the Committee on Climate Change. We consider that it is important that expert advice drives everything we do with regard to numbers.

Amendment 38 would increase the challenge that the Government faces, but it is nonetheless a proper amendment that we can accept. The other amendments, however, anticipate the expert advice and we cannot accept them.

We have, of course, brought forward our interim target from 2030 to 2020. We have always had the intention that targets for 2010 to 2019 will ensure that we deliver on the 2020 target. Des McNulty’s amendment is consistent with that goal and helps us clarify the actions that the Government needs to take.

The Convener: I call Alison McInnes to wind up the debate and indicate whether she wishes to press the amendment.

Alison McInnes: I will press amendment 36.

The Convener: The question is, that amendment 36 be agreed to. Are we agreed?
Members: No.

The Convener: There will be a division.

The Convener: The result of the division is: For 1, Against 7, Abstentions 0.

Amendment 78 disagreed to.

Section 3, as amended, agreed to.

Section 4—Setting annual targets

The Convener: Amendment 79, in my name, is grouped with amendments 80, 81, 83 to 86, 40, 41, 87, 42, 88, 89 and 109. I refer members to the notes on pre-emption.

On amendment 79, I refer members to the evidence that has been given to us by the Stop Climate Chaos Coalition and the proposals that it has made with regard to the criteria that ministers must apply to the setting of annual targets.

The amendments in my name in this group have two broad aims, the first of which is to ensure that the criteria include the concept of a fair and safe cumulative emissions budget. There are several approaches to the issue of cumulative emissions, and I know that members have attempted to address the issue at various points in the bill. Considering those amendments will give us a useful opportunity to debate a number of approaches. My amendments would simply ensure that the issue of cumulative emissions would have to be considered as a criterion in the setting of annual targets. In addition to that, issues of social disadvantage and environmental considerations would be included in the target-setting criteria.

My second aim is to ensure that, as well as ministers having regard to the criteria, the relevant body would be required to report on the target-setting criteria. That is, perhaps, a secondary concern, but it is important for a Scottish cumulative emissions budget to be measured and reported on by the relevant advisory body, given the scientific basis of the work.
Amendments in this group also cover issues that relate to amendment 93 in the next group. Although the amendments are in separate groups, I hope that members will see them as achieving a coherent objective.

I move amendment 79.

15:00

Alison McInnes: Like you, convener, I am supportive of the idea of a cumulative emissions budget being enshrined in the bill. The effect of my amendment 80 would be similar to that of your amendments 79 and 84, and I would be comfortable with either outcome. The introduction of a cumulative emissions budget is vital for the success of the bill. It is not enough simply to report on emissions; we must set a proper limit on how much Scotland can safely emit in total during the period 2010 to 2050. It is important to remember that limiting the impact of climate change is a question not of percentage reductions, but of the total amount of greenhouse gases in the atmosphere.

From that limit, and knowing the concentration of greenhouse gases at present, it is possible to work out how much more can safely be emitted in the next 40 years. From that, it is possible to work out Scotland's share of emissions. We need the two things to run together.

Des McNulty: Amendment 40 would add "jobs and employment opportunities" to the other economic criteria that the bill identifies. That seemed to be an omission, as I hope the minister will be prepared to accept.

It struck me that there is an inconsistency in approach, in that there appears to be a focus on communities in some parts of the list of criteria in section 4(4), whereas in relation to poverty the focus seems to be on individuals. Climate change and the measures that we might take to tackle it could impact in a different way on poorer and deprived communities compared with their impact on other communities. Amendment 41 gives the minister an opportunity to reflect on that and, I hope, to acknowledge the possibility of including in the bill issues around poorer and deprived communities.

Amendment 42 is a testing amendment for the minister. As we have debated the matter in the committee more than once, the minister is aware of the problems of defining what is rural and not rural, as well as the intermediate degrees of rurality. All of rural Scotland should be highlighted, irrespective of whether the communities concerned are on the outskirts of Inverness or Aberdeen, or more than 60 minutes away from a town with a 10,000 population. The point is worth posing to the minister. In that context, I raise the possibility of defining the relevant criteria not so much in terms of degrees of rurality, but based on more concrete factors such as access to the gas grid, which might define the impact of adaptation measures on particular households.

We are supportive of amendment 88, lodged by Patrick Harvie, which introduces environmental considerations, in particular the likely impact of targets on biodiversity. Patrick Harvie has not yet spoken on that amendment, but I wanted to mention it.

On the issue of having a "fair and safe Scottish emissions budget", we would like to hear more about that proposal from the members behind it and to hear the minister's response.

Stewart Stevenson: We find ourselves comfortable supporting a number of amendments in the group. Amendments 40 to 42, from Des McNulty, somewhat improve the bill. They provide a certain clarity and consistency that we are happy to accept. In the same spirit, the convener's amendment 88 would add a requirement to consider "the likely impact of the targets on biodiversity", and we agree that that is worth pursuing.

Other amendments in the group present challenges. Amendments 79, 81 and 83 seek to update the criteria that ministers must take into account in setting the new interim target. We believe that that is covered by amendments 5 and 6, on which the committee will vote later, but which were debated in group 3. Amendments 79, 81 and 83 would move the bill's reference to the interim and 2050 targets from being contained in a standalone subsection to being included among the target-setting criteria in section 4(4). That is not necessary, because the duty on the Scottish ministers to meet the interim and 2050 targets is already contained in the bill and, as such, that must influence the level at which annual targets are set.

However, the target-setting criteria are less obvious matters, which are not detailed elsewhere in the bill. Section 4(4) is designed to ensure that the criteria are in fact taken into account when decisions are taken about setting annual targets. On the ground that they are not necessary, I cannot support amendments 79, 81 or 83.

Amendments 80, 84, 89 and 109 attempt to introduce a concept that is referred to as a "fair and safe Scottish emissions budget".

In essence, that is a cumulative emissions budget for the period 2010 to 2050. That approach does not commend itself—it might be unwise, and it is
certainly unnecessary. The bill’s annual target approach contains many of the key elements that a cumulative emissions budget seeks to cover. Trying to fix an overall emissions budget lasting over 40 years is unwise at this stage, and would provide unworkable flexibility. It is worth reminding ourselves that we will have set targets up to 2027, which is basically half the period concerned, by October 2011. The bill has a great deal to say on that subject already.

I draw the committee’s attention to group 23, which we will come to at a later stage, and in particular to amendment 118 in Cathy Peattie’s name, which addresses the issue in what we think is a more appropriate way and in a way that, depending on what happens before we come to that amendment, we expect to be able to support. We are in the hands of the convener as far as procedure is concerned, but it appears to us that, if the committee were to agree to the amendments in the group that is now before us, amendment 118 would have to fall. We therefore direct members’ attention towards amendment 118.

We will always be setting batches of annual targets for between 12 and 17 years, based on expert advice. That is how Scotland’s total permissible cumulative emissions are defined. It is worth reminding ourselves that when we publish our emissions we will do so by tonnes of CO₂, not by percentages. We believe that that is the appropriate approach. The bill provides flexibility to react to the many uncertainties that will arise in the four decades to 2050. I oppose—and recommend that the committee oppose—amendments 80, 84, 89 and 109.

Amendments 85 and 86 would shorten the list of economic circumstances to which ministers must have regard in setting annual targets. I cannot support that, given that particular sectors will play a crucial role in the achievement of those targets. The inclusion of the subparagraph on “small and medium-sized enterprises” was a genuine attempt to recognise the significant difference between Scotland and England. We have a far larger proportion of SMEs, and it is important that we recognise that in the bill. I do not want to give the impression that the bill’s list of target-setting criteria is untouchable, but I think that it provides the way forward.

We are not opposed to the spirit of amendment 87, but we believe it to be unnecessary as the broader theme of equalities is covered more conclusively in section 62.

In conclusion, we oppose amendments 79 to 81, 83 to 87, 89 and 109 but we would be happy for amendments 40 to 42 and 88 to be incorporated into the bill.

The Convener: I welcome the indication that the minister can be flexible and willing to accept amendments. However, I still believe that certain aspects of my proposed approach would simplify things rather than increase complexity. A clearer and simpler approach to the target-setting criteria would benefit not only ministerial decisions on targets, but parliamentary scrutiny. Moreover, on the economic aspects that the minister referred to, I think that the impact on SMEs would not cease to be a consideration and would still be a relevant wider economic issue. However, referring specifically to SMEs and therefore setting them apart from other economic factors seems to me to add an unnecessary level of complexity.

As a result, I press amendment 79 and remind members that, if it is agreed to, it will pre-empt amendments 5 and 6, which were debated earlier, and amendment 80.

The question is, that amendment 79 be agreed to. Are we agreed?

Members: No.

The Convener: There will be a division.

FOR
Harvie, Patrick (Glasgow) (Green)
McInnes, Alison (North East Scotland) (LD)

Peattie, Cathy (Falkirk East) (Lab)
Somerville, Shirley-Anne (Lothians) (SNP)
The Convener: The result of the division is: For 2, Against 6, Abstentions 0. We seem to be establishing a pattern.

Amendment 80 disagreed to.

Amendment 81 not moved.

The Convener: Amendment 82, in my name, is grouped with amendments 90 to 93, 97, 49, 106 to 108 and 110.

Amendment 82 deals with the advisory body’s role in relation to annual targets. As it stands, section 21 makes it clear that sections 22 to 27 will take effect only when the Scottish Government designates an advisory body under section 19, so my comments relate to a scenario in which the Government has already made that designation.

It has been suggested that when the Government sets up an advisory body, there will still be problems with the process of proposing, advising and drafting annual targets, and amendment 82 seeks to ensure that the advisory body will be the primary driver of the targets by giving it primacy in proposing them. That has been done by lifting some wording from section 5, which requires ministers to seek “advice of the relevant body” on meeting a “fair and safe” cumulative emissions budget.

I apologise to members for not having all the papers with me that I should have to speak to this amendment. I might make other points when I wind up.

I move amendment 82.

15:15

Alison McInnes: Amendment 92 seeks to specify certain requirements for a report issued by “the relevant body”, which might not necessarily be the advisory body. Once the annual targets are set, it is important that the appropriate body reviews them comprehensively and that the Parliament is able to reflect on them with as detailed a report as possible. The amendment seeks to correct what I think is an anomaly in which a report that is made by a subsequently appointed advisory body would have more detailed direction and requirements than would automatically fall on the relevant body.

Stewart Stevenson: At the outset, I should say that amendments 90, 97 and 49, in the name of the convener, are acceptable to us. I will say more about those and speak to amendment 108.

On amendments 82 and 91, the bill currently requires Scottish ministers to request the advice of the relevant body prior to laying a draft order in the Scottish Parliament to set annual targets. When setting targets, ministers must also have regard to the interim 2050 targets and the specific target-setting criteria that are listed in section 4(4). Amendments 82 and 91 seek to require Scottish ministers to seek the relevant body’s advice on the target-setting criteria instead of ensuring that Scottish ministers retain the duty to have regard to the criteria themselves. Ministers will and must be informed by expert advice, and when they consider it they will quite rightly need to take account of the target-setting criteria. The ultimate responsibility for making decisions on the annual targets lies with Scottish ministers, subject to Parliament’s approval of the order to bring them into law. The amendments change that emphasis in the bill and potentially reduce the independent nature of the advice. Moreover, by seeking to transfer responsibilities to the UK Committee on Climate Change, they also reduce the ministers’ responsibilities. I do not think that that strikes the right balance and therefore cannot support amendments 82 and 91.

On amendments 92 and 93, which seek to place duties directly on the relevant body, I point out that the relevant body will in the first instance be the UK Committee on Climate Change. The bill does not place duties on the relevant body because section 38 of the UK Climate Change Act 2008 requires that that committee must provide the Scottish ministers with advice and other assistance that they request regarding climate change targets. Instead, the bill places duties on Scottish ministers to seek that body’s advice.

There are further technical flaws with the amendments. For a start, they are unnecessary, as section 22 already sets out the duties that they seek to create for any Scottish advisory body that is established under the bill. I therefore cannot support amendments 92 and 93.

Amendments 90 and 97 seek to require Scottish ministers to publish the advice that they receive from the relevant body on the setting of annual targets. Given that, in practice, I have already committed to publishing that advice, I have no difficulty in accepting the amendments.

With regard to amendment 49, section 7 requires Scottish ministers to request the advice of the relevant body prior to laying a draft order to modify any aspect of the annual targets. If the provision made by ministers is different from the advice that they are given, they must publish a statement setting out their reasons. Amendment 49 seeks to require ministers to lay that statement before Parliament. Although there is a small flaw in the amendment’s drafting—the word “and” appears to be missing from the beginning of the text—I can appreciate why the provision might be useful and am content to accept the principle
behind it. If it is agreed to, we are willing to commit to rectifying the drafting flaw.

We consider that there is a flaw in amendment 106 that renders it unnecessary. The amendment creates a duty to request the advisory body’s advice on the target-setting criteria. However, if a Scottish advisory body was established, that duty would be unnecessary by virtue of section 22, which requires that the advisory body explain its views on the proposed annual targets by reference to the target-setting criteria. For that reason, I cannot support amendment 106 or the consequential amendments 107 and 110.

The effect of amendment 108, in the convener’s name, would be to require the advisory body to state what annual targets are appropriate rather than what it thinks of the targets that ministers propose. In practical terms, it is difficult to see how the body could comment on the appropriateness of proposed annual targets without giving a view on what targets are appropriate. Therefore, on balance, I would be relaxed were the committee to accept amendment 108, which may be considered to add some useful clarity to the bill.

We would be content to accept amendments 90, 97 and 49 with a caveat that we would correct the drafting later. We would also be quite relaxed if the committee wished to agree to amendment 108.

The Convener: I acknowledge the minister’s willingness to accept some amendments. I am willing to think again about some of the technical drafting issues, particularly on amendment 93. However, the general issues that are raised in this group show that further work needs to be done to ensure that the independent and scientifically based advisory body—the UK Committee on Climate Change or a future Scottish body—is in the driving seat. It is widely recognised that our approach to the setting of targets must be scientifically, rather than politically, determined. Empowering the advisory body and, perhaps, placing further duties on it would be more likely to achieve that.

The group has been reasonably well debated. I have indicated my willingness not to move amendment 93, but I will press amendment 82. I remind members to note the pre-emptions in the group.

The question is, that amendment 82 be agreed to. Are we agreed?

Members: No.

The Convener: There will be a division.

Amendment 87 disagreed to.

Amendment 42 moved—[Des McNulty]—and agreed to.

Amendment 88 moved—[Patrick Harvie]—and agreed to.

The Convener: Well, there we are—that amendment is agreed to.

We move to the next group. Amendment 7, in the name of the minister, is the only amendment in the group.

Stewart Stevenson: Amendment 7 is designed to ensure that the Scottish ministers' duty to set annual targets for the periods that are specified in section 4(2) continues to apply if unforeseen circumstances cause any of the deadlines for setting targets to be missed. Without the amendment, the duty to set annual targets for a specified period could be considered to be lost if the relevant deadline were missed. That could leave ministers unable to fulfil one of the bill's principal objectives.

The Scottish ministers have no intention of failing to meet the deadlines in section 4; amendment 7 is simply a sensible precaution. It will not provide a licence to miss deadlines. The amendment includes the safeguard that, if a deadline is missed, ministers must set the relevant annual targets "as soon as reasonably practicable" thereafter.

I will give an example of circumstances that could be beyond ministers' control and which might cause one to miss a deadline. I have not worked out the exact years but, for argument's sake, if a Government fell halfway through a period at precisely the point when targets had to be set, laying the appropriate orders before Parliament might not be possible, because Parliament would not be in session. Without amendment 7, laying the appropriate orders would not be possible when Parliament resumed. That is one example of the technical reason why the amendment is important.

I move amendment 7.

The Convener: The question is, that amendment 7 be agreed to. Are we agreed?

Members: No.

The Convener: There will be a division.

**The Convener:** The result of the division is: For 5, Against 3, Abstentions 0.

**Amendment 92 agreed to.**

**Amendment 93 not moved.**

**The Convener:** Amendment 94, in the name of Alison McInnes, is grouped with amendments 95, 96 and 98 to 100. Again, members should refer to the notes on pre-emption in the groupings list.

**Alison McInnes:** Amendments 94 to 96 and 98 to 100 will strengthen the bill by giving Parliament a proper role in the scrutiny of its implementation. Under amendment 94, the Scottish ministers would have to lay before the Parliament a report setting out information in respect of the annual targets, which will be set by order. The power to set annual targets is probably one of the most important powers that the bill will confer on ministers, so it is hugely important that the Parliament has the opportunity to question ministers on that.

Amendments 95, 96 and 98 to 100 relate to situations in which ministers disregard the advice of the relevant body or choose to amend or modify targets with disregard to the advice of the relevant body. The amendments are worth while, so I hope that members will support them.

I move amendment 94.

**The Convener:** Do other members want to speak?

**Des McNulty:** Convener, is it possible to hear the minister’s response and reserve the right to comment after that?

**The Convener:** We will hear from the minister, and I will allow brief comments from members after that.

**Stewart Stevenson:** The key reason that Ms McInnes gives in support of her amendments is the need for a power to question ministers. I am not at all clear why any of the amendments would make the slightest difference in that regard, as committees and the Parliament have the power to question ministers in any event. Having a report laid before Parliament creates no additional powers in that regard.

I said during the stage 1 debate that I am willing to consider additional scrutiny and reporting duties, such as providing Parliament with an opportunity to consider proposals and policies that is similar to the 60-day scrutiny period for the
national planning framework under the Planning etc (Scotland) Act 2006. Alison McInnes’s amendments would not provide anything similar to that 60-day scrutiny period. I therefore ask her to seek leave to withdraw amendment 94, to allow ministers to produce proposals at stage 3 that more closely reflect the arrangements in the 2006 act.

The Convener: Does Des McNulty want to comment at this stage?

Des McNulty: The danger with a bill of this nature is that we end up with a series of mechanisms, all of which are intended to do the same thing. Members should consider how committees scrutinise what ministers provide for them. The focus must be on ensuring that ministers keep committee conveners and clerks properly informed about matters that come under their jurisdiction.

I lodged a couple of amendments that are designed to secure just that—we will consider them later in the meeting. Like the minister, I am not entirely sure whether publishing a statement or laying a report is precisely the right mechanism. If the minister is prepared to reflect on the matter and on the need to streamline the process as far as possible, I am inclined to support his view at this stage.

Stewart Stevenson: It may be useful for me to give the assurance that the member is seeking.

The Convener: Thank you.

Alison McInnes: I thank the minister for his commitment to reconsider the issue. The process must not be streamlined to the point that it is meaningless, and the Parliament must have the opportunity to scrutinise decisions that are taken, specifically when a minister departs from advice. I hope that the minister will stick to his commitment.

I seek leave to withdraw amendment 94.

Amendment 94, by agreement, withdrawn.

Amendments 95 and 96 not moved.

Amendment 97 moved—[Patrick Harvie]—and agreed to.

Section 5, as amended, agreed to.

Section 6—Modifying annual targets etc

The Convener: Amendment 43 is grouped with amendments 44 to 48. Again, I refer members to the note on pre-emption.

Although the group contains six amendments, the outcome that they seek to achieve is fairly straightforward. Essentially, the aim is to ensure that, consistent with members’ earlier comments, we recognise that the latest climate science increasingly suggests the need to move to earlier and more ambitious action.

Amendment 43 will ensure that ministers cannot weaken targets arbitrarily in future. It allows for targets to be made more ambitious but not for them to be weakened. That is the simple purpose of the group of amendments.

I move amendment 43.

Stewart Stevenson: Amendment 43 removes the ability for the Scottish ministers to modify the figure in the bill—it is set at 3 per cent—that provides the minimum annual reduction that must apply to annual targets in the period from 2020 to 2050. Amendments 45 and 48 are consequential amendments.

Essentially, the measure would restrict all annual targets in a manner that does not provide any flexibility for ministers to react to unforeseen circumstances between now and 2030. What would happen if, for example, Scotland managed to exceed its emissions reduction trajectory by a large amount and no longer required to reduce emissions by 3 per cent in order to meet its 80 per cent target by 2050? Annual reductions might still be required, but setting them at 3 per cent might be unnecessarily expensive or difficult, given the remaining scope for emissions abatement at the time.

Indeed, amendment 43 could provide a perverse incentive. There could be a severe inhibition to making a very large step-change emissions reduction of the order of, for the sake of argument, 12 per cent any sooner than is necessary—perhaps such a reduction would be associated with the closure of a power generation plant—because it would be likely that that 12 per cent reduction in one year would be followed by fallow years thereafter. The amendment could therefore create a perverse incentive not to close that plant. Having the ability to modify the annual percentage reduction requirement by affirmative order coupled with the requirement to consult the relevant body provides a sensible degree of flexibility for any eventuality.

Amendment 44 would add a new condition to the end of section 6(1)(b) to restrict ministers to being able to modify annual targets only so that the modified amount is lower than the original target. The bill already deals with that issue in section 6(6)(b), which prevents ministers from modifying annual targets in a manner that permits their increase in comparison with that of the previous year. Although amendment 44 goes further, it is unnecessarily restrictive for the same reasons that I have outlined with respect to amendment 43. Principally, it does not allow for
any degree of flexibility to react to the unforeseen circumstances that are bound to occur between now and 2050.

Amendment 46 appears to be consequential on amendment 44. However, section 6(3), which Patrick Harvie seeks to delete, applies the test that ministers must meet before they exercise the power to modify annual targets, whether or not it is amended by amendment 44. That test is that ministers may make an order under section 6(1)(b) only if they consider that it is appropriate to do so as a result of significant changes that have occurred to the basis on which the annual target that will be modified was set. Amendment 46 would remove that important safeguard, so I cannot support it.

Amendment 47 would delete another safeguard that is built into the bill. It would remove the restriction that ministers may introduce orders to modify the date ranges for batches of annual targets or the target-setting criteria only if they consider it appropriate. That restriction requires due consideration to be given before those powers are exercised. No amendments have been proposed to the relevant parts of section 4, so removing that test would simply allow ministers to exercise those powers unfettered, which would make their lives easier but is not justifiable in this case. Therefore, I oppose amendments 43 to 48.

The Convener: It might be overly cynical to suggest that, if ministers think that they would be freed up by a group of amendments but that does not justify their supporting them, perhaps something else is going on underneath the argument.

I do not accept the fundamental argument that has been put against the group of amendments as a whole. That argument is that it may be proved through events that reductions in one year are more achievable or more rapidly achievable than had been anticipated and that that could give an incentive not to take further action. It is clear that the bill and all Government policies that are related to reducing emissions to tackle climate change are a response to a global phenomenon. If Scotland reduces its emissions by more than expected in a particular year, that global phenomenon and the global responsibility to continue to act to reduce emissions at an ambitious pace will still exist. Just as I do not entirely approve of offsetting in its broadest sense, I do not think that we should allow the trading off of one year against another in the manner that is envisaged. I press amendment 43.

The question is, that amendment 43 be agreed to. Are we agreed?

Members: No.

The Convener: The result of the division is: For 5, Against 3, Abstentions 0.

Amendment 100 agreed to.

Section 7, as amended, agreed to.

After section 7

The Convener: Amendment 50, in the name of Des McNulty, is grouped with amendments 125, 51, 52, 10, 57, 12, 12A, 12AA, 12AB, 12C, 12D, 12B, 12E, 12F—I am looking forward to that bit—13, 14, 60, 19, 61 to 63, 65, 68 and 69. I refer members to the note on pre-emptions that has been provided.

Des McNulty: The number of amendments in the group perhaps attests to the degree of concern among people in Scotland about the need to ensure that we reduce our climate contribution predominantly from domestic sources and do not rely on international credits beyond what is strictly necessary.

Amendment 50 would set the parameters for putting a limit on the use of international credits. Amendment 125, in Robin Harper's name, addresses the same issue, although I do not necessarily accept it because it would be very difficult for the Parliament to specify so far in advance what the circumstances for the use of international credits might be. However, it is important that the Parliament sets out a clear ceiling for their use, in line with UK legislation. The Parliament should establish its intent.

Amendment 57 is intended to ensure that international credits will not be used in the initial period between now and 2012. I do not believe that it should be necessary for international credits to be used during that period.

Amendments 12A and 12B are amendments to amendment 12, in the name of the minister, and they carry on the argument about a limit on the net amount of carbon units. Amendment 12A suggests a tightening of the minister's position.

I accept the intention behind the further modifications that Alison McInnes proposes in her amendments in this group, but there is a problem that relates to varying the period of the cycles that the minister has set out in amendment 12. The minister has set out a basket of five-year cycles. I have sought to work within the minister's framework for 2010 to 2012 and for 2013 to 2017. It will be for members of future sessions of Parliament to work out what should be done after 2017. Amendment 12 indicates that limits will have to be set by 31 December 2016, but the Parliament can return to that issue. However, we should set out our intentions for the period up to that time and we should put in place a mechanism for putting a ceiling on the use of international credits. I hope that members will be able to support that idea.

I move amendment 50.

The Convener: I welcome Brian Adam to the meeting.

I call Robin Harper to speak to amendment 125 and the other amendments in the group.

Robin Harper: I was glad to see Des McNulty's amendment 50 among the amendments in this group, but it does not go far enough. In his book "Kyoto2", Oliver Tickell sets out his concerns about whether carbon credit schemes are working as well as they should be.

As we have discussed, if the bill is to be a success it must set emissions targets at the right level and set out a framework for how best to achieve those targets. Amendment 125 addresses that point.

As introduced, the bill allows for an unlimited number of carbon credits to be purchased and credited to the net Scottish emissions account. In effect, that could mean—although I am sure it would not happen—that the targets in the bill could be met entirely through purchasing credits from overseas, which would mean that there was absolutely no incentive for emissions reductions in Scotland.
We have consistently argued that countries such as ours, which have high current emissions, high historical emissions and huge potential for the use of renewables, must take the lead. We have clearly won that argument, as colleagues in the Government and the Labour Party have lodged amendments to include some form of restriction, but neither of their approaches is anywhere near strong enough.

Amendment 125 seeks to ensure that, during the period 2010 to 2019, the proportion of carbon units bought in should be no more than 20 per cent of the net Scottish emissions account, that that figure should reduce to 10 per cent in the period from 2020 to 2039, and that during the period from 2040 to 2050 all reductions in the net Scottish emissions account should be made within Scotland—without any use of carbon units bought from elsewhere. I will be happy to address any concerns that there may be about that. Amendment 125 would also allow the percentages to be revised—but only to ensure that fewer credits are used to meet our reduction targets.

The transformation to a low-carbon economy must begin at home, and preferably now. That is a fundamental factor in how we choose to meet our current targets.

16:00

By fixing such a limit on the use of carbon units, we would not only be taking responsibility for our own actions but providing an incentive for business and industry in Scotland to adopt and develop the groundbreaking technologies that will be fundamental to the future of the world.

Businesses in Scotland that are already engaging in carbon reduction believe that it has benefited them, but there is still a feeling among businesses in general that it is a problem. It is not a problem, however, but an opportunity for them. Scotland has the potential to be a world leader in tackling climate change—but only if we commit to solving our own problems by making reductions here instead of relying on the rest of the world to do it for us. The whole world cannot pay someone else to solve the problem: someone will have to take a lead. We should stand up and ensure that Scotland lives up to the minister’s rhetoric with real action.

Stewart Stevenson: I should say at the outset that we are minded to accept amendment 57, in the name of Des McNulty. I congratulate the committee, as I think I am correct in saying that this is the first time—certainly in the eight years that I have been in the Parliament—that we have had amendments to amendments to amendments. It is groundbreaking stuff, in the bill and in the committee.

I agree that the bill must focus on reducing greenhouse gas emissions in Scotland and completely understand why members of the committee are keen to have in it a mechanism to control the use of carbon credits in meeting the targets that are set in it.

The Government has lodged amendment 12 to ensure that the bill has a robust, flexible and future-proof mechanism by which each Administration can set a limit for the use of carbon credits, based on expert advice, prior to each set of annual targets coming into force. We believe that emissions reduction policy should be based on the best possible expert advice and that we must use expert advice on when and whether carbon credits should be considered.

I observe, as a small parenthetical comment, that we do not have the power to forbid the use of carbon credits in Scotland—we have it only in relation to those areas for which we have devolved responsibility. If we put in a general requirement, it could well be ruled ultra vires. That is particularly the case with regard to the power stations, which are covered by European legislation.

The issue is, as is the case with a range of other matters, too important for us politicians to deal with the numbers—we need the expert advisory body. Setting a fixed limit for carbon credits would be to second-guess the expert advice that we have yet to receive; who is to say what the limit should be in 2020 or on what basis we should plan to reduce emissions in 2030?

We continue to aspire to deliver the targets by reducing emissions in Scotland. As we approach the 80 per cent target, the scope for doing anything other than making our own efforts will certainly become extremely limited, but I do not have a crystal ball to enable me to be certain that the domestic targets that various members have proposed will be appropriate in decades to come. I respect the well-intentioned nature of the amendments, but we must use the expert advice that reflects Scotland’s particular circumstances.

The amendments—with the exception of amendment 57—could tie the hands of successive Scottish ministers. We cannot be sure that members’ alternative proposals will not lead to difficulties and incompatibilities for Scottish companies that are participating in schemes that are controlled outside Scotland, especially as 40 per cent of our emissions fall in the traded sector, the control of which is outwith the hands of the Scottish Parliament.

The point of the trading scheme is that it is a world-leading scheme that we know will lead to a downward curve of CO₂ emissions from our major industries. We cannot afford to do anything that would even tangentially put at risk that huge
reduction because, if we fail in that regard, we can be certain that we will not meet our targets.

A domestic effort target could create indirect interference with the European trading scheme because of its inflexibility, and it might force the Scottish ministers to pursue policies that require greater emissions from the traded sector than are necessary in the trading scheme. In any event, our overall emissions as recorded in our accounts are determined by what happens in the trading scheme.

Our ambitions to lead the world are important, and the trading scheme in Europe is a world-leading emissions trading scheme that will evolve over the period. I am recommending a more flexible, future-proof mechanism for establishing limits on carbon credits. Amendment 12 and its associated amendments deliver that. We believe that, essentially, we are responding to the committee’s stage 1 report. We will have to set a limit on the usage of carbon credits in advance of annual targets coming into force, using expert advice. Amendment 12 is the best mechanism for doing that.

I cannot support the majority of the amendments from Mr McNulty or the amendments from Ms McInnes and Mr Harper because of the difficulties that they would present, but in the spirit of demonstrating our commitment to meeting Scottish targets through addressing Scotland’s emissions, I am content to commit to not purchasing any carbon credits in the period from 2010 to 2012 as we work initially towards a 34 per cent target in 2020. On that basis, I can accept amendment 57. I am confident that we can make that commitment in the light of where we are at the moment, but I do not consider it wise to commit beyond that because we simply do not know whether Europe will commit to reducing emissions by 30 per cent. It is up to us to deploy arguments in that regard.

Amendment 10 makes it clear that the net Scottish emissions account may not be credited with an amount of carbon units that exceeds any statutory limit, which is the allowable amount set by amendment 12.

On amendment 13, it is possible that the Scottish ministers will need, on occasion, the power to modify the limit on carbon units if there is a significant change in the circumstances under which they were set. It is pragmatic and sensible to provide a power that might be required in some circumstances, but the bill as currently drafted would not permit such change. When I was speaking about other amendments, I spoke about the need to be able to respond to the presently unknown future.

Although the Committee on Climate Change has recommended to the UK Government that carbon units should not form part of a 34 per cent interim target, it recognises that they might be required for a 42 per cent target. Any order under this section will be subject to affirmative resolution, allowing the Scottish Parliament the opportunity fully to scrutinise modification proposals. Further, before any such order is laid, the Scottish ministers will be required to seek expert advice. That is where amendment 14 applies. It requires ministers to request advice from the relevant body—initially the UK Committee on Climate Change and, potentially, a Scottish body—before setting or modifying limits on the net amounts of carbon units that can be credited to the net Scottish emissions account for specified periods.

Amendment 19 requires that the advisory body must, when providing advice to the Scottish ministers on annual targets, also express a view on the extent to which the annual targets should be met by the use of carbon units, with reference to the allowable amount as set in accordance with amendment 12.

The Convener: For the record, I welcome Elaine Murray to the committee.

I call Alison McInnes to speak to amendment 12AA and other amendments in the group.

Alison McInnes: Listening to the debate, it is clear that we are all trying to achieve much the same thing, as we all want to minimise the use of international credits and maximise the effort that must be made domestically. I prefer Des McNulty’s approach, which is set out in amendment 50, and therefore think that my amendments 12AA and 12 AB are not required. I will support the amendments that limit ministers’ ability freely to set the cap.

The Convener: I call Des McNulty to wind up the debate and indicate whether he intends to press amendment 50.

Des McNulty: I am particularly indebted to Oxfam, Christian Aid and some of the other agencies that are involved in the Stop Climate Chaos Coalition for the work that they have done on this issue. Like other members, I have also been contacted by a wide range of constituents who have highlighted the importance of taking into account the international development dimension of climate change and of ensuring that that becomes part of the bill. Amendment 50 offers the clearest possible way forward in that regard and gives us a set of parameters that will enable us not only to set out our intentions clearly just now but establish a legal framework that we can build on in years to come.

I will press amendment 50.
The Convener: The question is, that amendment 50 be agreed to. Are we agreed?

Members: No.

The Convener: There will be a division.

Gibson, Rob (Highlands and Islands) (SNP)
Johnstone, Alex (North East Scotland) (Con)
Somerville, Shirley-Anne (Lothians) (SNP)

The Convener: The result of the division is: For 5, Against 3, Abstentions 0.

Amendment 50 agreed to.

The Convener: Does Robin Harper wish to press or withdraw amendment 125?

Robin Harper: May I ask the minister a question?

The Convener: I will allow one brief question, but I would prefer it if debates were kept within the initial debating period.

Robin Harper: Does the minister agree that the figures for domestic reductions and the figures for the purchases of carbon credits should be published separately so that we can be clear about the progress we are making?

Stewart Stevenson: I am quite content with that.

Robin Harper: As amendment 50, which has been agreed to, covers the ground that my amendment deals with, I shall not move amendment 125.

Amendment 125 not moved.

Section 8—Progress towards targets

The Convener: Amendment 9, in the name of the minister, is grouped with amendments 101, 111, 20, 112, 21, 64, 22 and 115. Again, I refer members to the notes on pre-emption.

Stewart Stevenson: Amendments 9 and 20 to 22 are, essentially, technical amendments that are designed to permit earlier requests for reports on progress against targets and earlier responses to those requests. As a team, we are committed to early reporting on progress on annual targets wherever possible.

Officials have identified that sections 8, 23 and 24, as drafted, create unhelpful rigidity in that respect. The amendments in my name seek to remove that rigidity to permit Scottish ministers to seek reports on progress and provide responses to those reports earlier than the timetable has indicated.

The amendments in the name of Ms Mclnnes seek to do a number of things. Amendments 101, 111 and 112 would change sections 8, 23 and 24 so that action would be required "as soon as reasonably practicable", but they do not specify specific deadlines and could be considered to weaken the provisions in the bill. Generally, the Government amendments 9 and 20 to 22 are better drafted and permit a more specific deadline to be applied, thereby guaranteeing the point by which the actions in question must occur.

16:15

I draw the committee's attention to amendments 64 and 115 in particular. Amendment 64 would introduce unhelpful rigidity by requiring the Scottish ministers to lay a response to the advisory body's report within two months. The deadline would be tight to achieve, particularly if a holiday period was included within those two months and, as I anticipate, Cabinet approval was required for the response document. I am committed to responding to all reports as quickly as possible, but I cannot envisage being able to guarantee that the Scottish ministers could, in all circumstances, meet a two-month deadline, particularly considering the wide range of interests that such a report may cover. I am equally sure that the Scottish Parliament would prefer to receive a comprehensive, carefully considered report that might take a little longer. For that reason, I oppose amendment 64.

Amendment 115 is fundamentally flawed and adherence to it might, in some circumstances, be impossible. The amendment would require all annual target reports to be laid no later than "the first 31 October after the data relating to the target year becomes available".

That would be impossible in all cases where the data became available close to that calendar date. For example, if the Scottish emissions data became available on 30 October, the Scottish ministers would still be obliged to lay the annual report the following day—an impossible task, as I am sure the committee appreciates.

Amendment 115 could also be considered to weaken the provision in the bill that requires that the annual report be laid "no later than 31 October in the second year after the target year."

The amendment changes that to 31 January in the third year after the target year and does not clarify when the backstop date of 31 January in the third
year after the target year comes into play. That complexity makes it unclear whether the combination of a duty and two dates connected by the words "in any case" creates a free choice of when to report.

For those reasons, I oppose amendment 115 and urge all committee members to reject it.

I move amendment 9.

Alison McInnes: I accept that the minister and I are both trying to speed up the process of gaining information on annual targets. When the committee took evidence on the matter, it was clear that there was frustration about the time lag in receiving the data and an acknowledgement that, as we got better at reporting on the targets as time went on, the data would become available earlier on.

I agree that amendments 101, 111, 112, 64 and 115 are complex and might well be clumsy, but I did my best with the lawyers to find a way of expressing my aim to speed up the process and give a little extra flexibility. They stretch the process over 15 months so that we are able to get the earliest possible data.

That is what I have attempted to do with amendments 101, 111, 112, 64 and 115. Therefore, I will move them.

Des McNulty: I ask the minister to go over again his reason for opposing amendment 101.

Stewart Stevenson: Amendment 101 would delete from section 8 the wording "In the second year following a year for which an annual target has been set … the Scottish Ministers must request the relevant body to prepare"

and replace it with:

"The Scottish Ministers must in each year, beginning with the year 2011, request the relevant body to prepare, as soon as reasonably practicable".

In other words, it would remove a particular date by which ministers have to do something and replace it with the statement that they must do it "as soon as reasonably practicable".

I would not be greatly upset if the committee were to agree to that, because it would relieve the minister of a current obligation, but I think that that would be unwise.

Alison McInnes: You will note that amendments 101 and 111 also say, "and in any case no later than", so there would be an end-stop as well as flexibility.

Stewart Stevenson: I cannot identify the requirement to which you refer in amendment 101; I can only find the wording:

"as soon as reasonably practicable".

Perhaps we will have to agree to differ on that.

We have had an adequate exploration of the issues. The amendments in my name create the opportunity for us to accelerate dates and do not carry with them the risks that the amendments in Ms McInnes's name carry of relieving ministers of obligations. I ask the committee to support the amendments in my name and to reject the amendments in Ms McInnes’s name.

The Convener: I remind members about pre-emption. If amendment 9 is agreed to, I will not be able to call amendment 101.

The question is, that amendment 9 be agreed to. Are we agreed?

Members: No.

The Convener: There will be a division.

Amendment 52 agreed to.
Section 8, as amended, agreed to.
Section 9—Greenhouse gases
The Convener: Amendment 53, in the name of Dr Elaine Murray, is grouped with amendments 102 and 54.

Elaine Murray (Dumfries) (Lab):
Chlorofluorocarbons and hydrochlorofluorocarbons were used as refrigerants and blowing agents in plastic foam insulation prior to January 2004. Foam insulation is widely used in roofs, walls and as the core of insulating foam panels used in steel-clad industrial buildings. They are ozone-depleting substances, which cause depletion of the stratospheric ozone layer and are controlled under the Montreal protocol. European Community regulation 2037/2000 requires that where practical, such substances are disposed of safely and, in the case of fridges and freezers, are recovered and disposed of under rigorous conditions. Unfortunately, the same is not true of the plastic foam insulation in steel-clad buildings when such buildings are demolished; despite the size of the ODS bank in pre-2004 foam insulation being estimated as 10 to 20 times that present in fridges and freezers.

Hydrofluorocarbons and perfluorocarbons are covered under the United Nations Framework Convention on Climate Change, as they are greenhouse gases. Unfortunately, despite the prevalence of chlorofluorocarbons and hydrochlorofluorocarbons in plastic foam insulation, they are not covered by the Kyoto agreement. The gases are also significant greenhouse gases; their carbon footprint is some 300 million to 400 million times that of carbon dioxide. In the UK, 357 tonnes of those gases was recovered through the recycling of 2 million domestic refrigerators. However, as I said earlier, there is 10 to 20 times as much of those gases in plastic foam insulation, yet it is not recovered in the same way or with the same care—indeed, it tends to go into hazardous landfill.

Amendment 53 would add chlorofluorocarbons and hydrochlorofluorocarbons to the list of greenhouse gases. Amendment 54 identifies their current levels under the Montreal protocol—the baseline in section 10. The amount of these gases that will go into the atmosphere is likely to increase given the increase in the number of ODS-clad buildings reaching the end of their life and requiring to be demolished.

By recognising that these substances are also greenhouse gases and accounting for them in the targets, the bill would place Scotland ahead of the rest of the world. I appreciate that the six greenhouse gases that are specified in the bill—carbon dioxide, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons and sulphur hexafluoride—are those that are covered by the Kyoto agreement. I also appreciate that section 9(2) enables ministers to add gases to the list and that section 11 enables them to set a baseline for additional greenhouse gases.

My aim in lodging amendments 53 and 54 was to highlight the importance of recovering these substances appropriately and recognising the significance of the materials that they contain in contributing to climate change. In the long term, we should not be content simply to monitor the Kyoto gases and ignore emissions from other climate-changing gases. We know where the gases are and how they should be processed at the end of the life of buildings. It is therefore possible to prevent emission.

Amendment 102, in the name of Patrick Harvie, requires ministers to monitor actively the effect of gases that are not included on the list and report to Parliament on whether they should be included. I am not a committee member but, having read the amendment, I have a fair amount of sympathy for the intention to enable ministers to update the list of greenhouse gases. I will listen carefully to the views of members and the minister before deciding whether to press amendment 53 and move amendment 54. I will also listen to the debate on amendment 102. I urge ministers to monitor the impact of chlorofluorocarbons and hydrochlorofluorocarbons with a view to including them on the list in future, if not at this stage.

I move amendment 53.

The Convener: Before I speak to amendment 102, I put on record my recognition of the spirit in which Elaine Murray has brought amendments 53 and 54 to the committee.

The idea of setting in stone the list of greenhouse gases that will be included in the framework is an issue, as is the potential for creating an impediment to flexibility if any change is required. Section 9 allows ministers to modify the list if, under an agreement or arrangement at
European level, a gas has been recognised as contributing to climate change. Ministers are required to lay a draft statutory instrument before the Parliament to do that.

In lodging amendment 102, I sought to make slightly more proactive the duty to monitor gases and report to Parliament from time to time on whether it is desirable for a gas to be added to the list. If the Scottish Government is contemplating undertaking that activity, either in association with the advisory body or independently, it would be helpful for the minister to indicate that.

Specifying the list in the way that the member proposes is perhaps too much of a binding position. Other gases may need to be included at future points. I am thinking of nitrogen trifluoride, which is a potent greenhouse gas, but which has not been included on the list because it has hardly been used in our society. However, the increasing use of plasma screens may be enough to make it a significant greenhouse gas. The issue is more to do with changes in the use of gases than with change in the science or our awareness of the climate impact of gases. All of this is not predictable, so having an approach that keeps things flexible is probably the right one to take.

The advisory body will be able to advise, and Parliament will be able to scrutinise, but amendment 102 would place some additional requirements on Government to take proactive steps to keep the issues under consideration and to report to Parliament from time to time. I hope that the minister will be able to accept the amendment.

As no other member wishes to contribute to the debate on this group of amendments, I invite the minister to respond.

16:30

Stewart Stevenson: Dr Murray has, as usual, made a well-informed contribution on a subject that might not otherwise have been debated by the committee or by Parliament. The discussion was well worth having.

Amendment 53 seeks to include CFCs and HCFCs in the list of greenhouse gases covered by the bill. However, we do not feel that that is necessary, because a legislative framework already exists. We are well ahead with CFCs and HCFCs, and further work is being undertaken in relation to the steel-clad buildings to which Dr Murray referred. There is an EU review of the disposal of material recovered from such buildings, and the Scottish Environment Protection Agency is part of that review. CFCs are no longer deployed in any new way, and HCFCs will cease to be deployed by the end of this year.

In the bill, we have deliberately followed the Kyoto protocol—not simply because it allows international comparisons but because it avoids picking up other protocols such as the Montreal protocol, which is the one that covers the gases that Dr Murray seeks to include. The bill gives ministers the power to add gases and to modify the description of gases, but it does not give ministers the power to remove gases—even ones that have been added by secondary legislation. The powers to modify are strictly circumscribed. Nitrogen trifluoride, for example, could be added if human use of the gas showed that it ought to be covered.

Amendment 102 is drawn in very general terms. Under the amendment, ministers would have to “monitor the impact on climate change of those gases in the atmosphere not listed in subsection (1)”. That would cover every single gas that is not listed, including gases that, in certain circumstances, have beneficial effects—such as clouds, although not necessarily water vapour. The amendment is very broadly drawn, and we would not encourage the committee to support it.

We are fully engaged in the issues that Dr Murray has raised, and we expect to introduce the necessary secondary legislation once the European framework is established. We believe that that would be a more appropriate way in which to deal with CFCs and HCFCs and with the disposal of material from buildings such as steel-clad buildings for which there currently is not a legislative environment that protects us adequately. We feel that the bill would be the wrong place in which to deal with such matters.

The Convener: I invite Elaine Murray to wind up the debate on this group and to indicate whether she wishes to press or withdraw amendment 53.

Elaine Murray: I am pleased with the progress that has been made over the past few months in acknowledging the problems with these chemicals. When I was first approached on the issue, I did not realise that they were not included among the Kyoto gases. At that time, the general awareness of the potential problems associated with the chemicals was much lower. I was pleased to hear from the minister about the actions that are being taken and the role that SEPA will play.

I note what the minister said about amendment 102, in the name of Patrick Harvie. If the amendment had referred to “greenhouse gases” instead of “those gases in the atmosphere not listed in subsection (1),” the problem to do with the large number of gases that potentially should be monitored might have been avoided.
I am inclined not to press amendment 53 and not to move amendment 54. My main concern in lodging the amendments was to raise awareness of problems to do with chlorofluorocarbons and hydrochlorofluorocarbons. I am assured—to an extent—that the Government is considering the matter. I will continue to monitor the situation and ask questions about it.

Amendment 53, by agreement, withdrawn.

The Convener: Without prejudice to my ability to lodge a slightly tweaked version of amendment 102 at stage 3, I will not move amendment 102.

Amendment 102 not moved.

Section 9 agreed to.

Section 10—The baseline

Amendment 54 not moved.

Section 10 agreed to.

Section 11 agreed to.

Section 12—the net Scottish emissions account

The Convener: Amendment 126, in the name of Robin Harper, is grouped with amendments 127 to 130.

Robin Harper: I lodged amendments 126 to 130 simply to improve the clarity and focus of section 12. I will be happy if the minister accepts them and not unduly despondent if he rejects them.

I move amendment 126.

Stewart Stevenson: Amendments 126, 128 and 130 would restrict the types of carbon unit that may be credited to the net Scottish emissions account to units purchased by the Scottish ministers, which would prevent ministers from accounting for the effect of trading schemes, in particular the EU emission trading scheme. It is vital to the setting and achieving of annual targets that we should be able to account for such emissions. The Scottish installations that participate in the EU emission trading scheme account for some 40 per cent of Scottish emissions. The EU emission trading scheme allocations help to moderate the effect of annual fluctuations, which can occur year on year. The variation can be as significant as plus or minus 6 per cent.

Amendments 127 and 129 would remove the provisions that will allow the Scottish ministers to require, in regulations, that carbon units debited from the net Scottish emissions account increase the account by the equivalent amount of emissions. If Scottish installations within the EU emission trading scheme sell carbon units to emitters abroad, they are, in effect, enabling an emission to be made. That should be reflected in the net Scottish emissions account. Amendments 127 and 129 would prevent that from happening and therefore lead us to understated our contribution to the carbon economy.

Global carbon markets are a key component of attempts to curb rising emissions, as Sir Nicolas Stern emphasised in his review of the economics of climate change. We cannot have our cake and eat it. If we reduce the net Scottish emissions account when we credit carbon units to it, we must take a fair and equitable approach and increase it when units are debited. The amendments in Robin Harper’s name would not mean that there was no carbon trading; they would mean only that carbon trading would not be reflected in the account, whether the effect was positive or negative. Therefore, I ask Robin Harper not to press amendment 126 and not to move amendments 127 to 130.

Robin Harper: Without prejudice to my ability to lodge similar amendments at stage 3, I seek to withdraw amendment 126 and will not move the other amendments in the group.

Amendment 126, by agreement, withdrawn.

Amendment 127 not moved.

Amendment 10 moved—[Stewart Stevenson]—and agreed to.

Amendments 128 and 129 not moved.

The Convener: Amendment 55, in the name of Des McNulty, is grouped with amendment 56.

Des McNulty: The objective behind amendments 55 and 56 is to ensure that, in trying to achieve greenhouse gas emission reductions, we take cognisance of the impact of schemes that operate in other parts of the world. It is sensible to ensure that the Scottish ministers have regard to the impact on sustainable development in other countries when they are engaged in a process to reduce emissions. Amendment 56 would ensure that our activities do not damage, but could benefit, other countries.

I move amendment 55.

The Convener: I will add a few words of support for the proposed approach. It is clear that we have focused substantially on the extent to which international credits can be used and on the proportion of domestic effort that is to be made to reach our targets. Less attention has been paid to the quality of activity that happens outwith Scotland and its impact on developing economies in particular. It is entirely appropriate that Des McNulty has lodged amendments 55 and 56 to raise the issue of sustainable development in this context.
Stewart Stevenson: I acknowledge Des McNulty’s principled and long-term engagement and interest in the development of less developed countries, and I suspect that we all associate ourselves with that. However, amendments 55 and 56 are somewhat problematic, so I offer him the opportunity to engage further to establish how we can develop the idea.

Proposed section 12(3)(b), which amendment 56 would insert, would not be able to be satisfied. Section 18(4) defines carbon units, which do not in themselves deliver reductions in greenhouse gas emissions. Carbon units represent emission allowances or reductions or removals that have already occurred. The most significant point is that proposed section 12(3)(c) would prevent ministers from crediting EU emission trading scheme units to the net Scottish emissions account. I do not think that the member intended that, which is why I offer to engage with him.

I draw members’ attention again to the fact that 40 per cent of Scotland’s emissions lie in the traded sector—in the EU emission trading scheme. We cannot recognise the participation of Scotland’s greatest emitters in that scheme while being unable to take account of the units that form part of it. The EU ETS is the greatest policy lever that we have to drive down emissions from our most significant emitters. I therefore ask the member to seek to withdraw amendment 55 and to take up the offer of further engagement, which we are willing to have.

16:45

Des McNulty: On the basis of the minister’s willingness to engage further with me on how the intention behind my amendments can be developed more effectively, I am happy to withdraw amendment 55 and return with revised amendments at stage 3.

Amendment 55, by agreement, withdrawn.

Amendment 56 not moved.

Section 12, as amended, agreed to.

After section 12

Amendment 57 moved—[Des McNulty]—and agreed to.

Section 13 agreed to.

Section 14—Scottish share of emissions from international aviation and international shipping

The Convener: Amendment 58, in my name, is grouped with amendments 11, 11A and 103.

Amendment 58 seeks to enact the committee’s broad acceptance that the inclusion of aviation and shipping emissions in the framework should be a requirement rather than merely a possibility that the Government can exercise. The Government’s amendment 11 seeks to achieve a similar objective and puts a timescale on it, and it might be seen as preferable to my amendment 58. However, if we were to take seriously the Government’s amendment 11, we should accept amendment 11A as an amendment to that amendment, and I urge the minister to do the same. There is little point placing a legal requirement on ministers but then positively permitting failure. One year seems a generous timescale that does not fall foul of the argument that was made in a similar group of amendments earlier. Given that the Government has already made that commitment in amendment 11, one year is an entirely achievable timescale and, in order to reject amendment 11A, there would need to be a clear reason why it could not be achieved.

With amendment 58, we arguably require immediate initiation of work on the matter. If we are to accept that amendment 11 is a preferable way of achieving the requirement, amendment 11A is a more than reasonable condition. In either case, amendment 103, which is also in the group, is clearly needed in order to implement the committee’s recommendation at paragraph 132 on radiative forcing. There is little point in counting only part of aviation’s contribution to climate change. Some have argued that aviation gets a raw deal sometimes and too much focus in the climate change debate, but it is clear that we should not give it too easy a ride. We should account for a full and fair assessment of the effect that aviation emissions have on climate change, and that includes the additional factor of emissions at altitude. My amendment 103 seeks to achieve that.

I move amendment 58.

Stewart Stevenson: The Scottish ministers recognise the importance of tackling emissions from international aviation and shipping. That is why we committed in the bill to including Scotland’s share of those emissions in our climate change targets.

I appreciate, and I have said before, that the way in which section 14 of the bill was drafted—using the word “may” instead of “must”—caused some to fear that ministers would not act on their commitment. I take this opportunity, again, to say that that is not the case.

I have been advised that the language in the bill is a drafting necessity to ensure that ministers retain the ability to use the power in section 14 more than once. That is why I have not brought forward a Scottish Government amendment to change, as amendment 58 does, “may” to “must”, because the “must” is discharged by ministers.
laying an order but does not necessarily mandate that such an order will be passed into law by Parliament. The “may” provides for the ministers successively to lay orders and leaves open that possibility.

Ministers may also require to lay further orders to adapt to future international agreements on international aviation and shipping. Our approach is intended to remove ambiguity, and our amendment 11 seeks to do that. It creates a new duty requiring a draft order to be laid no later than 2010, which gives certainty that the emissions will be included in Scotland’s annual targets from the start.

On Alison McInnes’s amendment 11A, I emphasise that the Scottish ministers have absolutely no intention of failing to meet the 2010 deadline. New section 14(2B), which amendment 11 introduces, is simply designed to ensure that, should unforeseen circumstances conspire to delay the first draft order being laid, the requirement remains and the power remains in force for that to happen. Ms McInnes’s amendment 11A would remove that safeguard, so I cannot support it.

We do not object to the principle of amendment 103, but there are drafting problems associated with it as it currently exists. It refers to the Scottish ministers “making an order”, but the Scottish ministers do not have the power to make orders. We have the power only to lay orders; it is the Scottish Parliament that makes them. As drafted, the amendment would also apply to shipping emissions—in the context of radiative forcing—which appears to be unnecessary. Nonetheless, we are happy to continue to engage on the issue to ensure that we reflect the variety of issues in the radiative forcing context, taking account not only of altitude but of matters such as the fuels that are burned and the method by which combustion takes place. I ask the committee to support amendment 11 but not to support other amendments in the group.

The Convener: I ask Alison McInnes to speak to amendment 11A and other amendments in the group.

Alison McInnes: I welcome the fact that ministers have agreed with the need to include shipping and aviation from the outset, but new section 14(2B), introduced by amendment 11, provides them with wriggle room. The minister says that it removes ambiguity; I believe that it is a get-out clause and that we need to remove it.

The Convener: As no other member wishes to contribute, I will say in winding up that the issue that I am most concerned about—the additional impact of emissions at altitude—clearly has to be addressed. I would like a requirement in the bill that that issue be addressed by the Government in the way that it brings forward the order, but at this point I would like to consider the minister’s response and decide whether an alternative version of amendment 103 might be more appropriate at stage 3.

Stewart Stevenson: Will the convener take a brief intervention?

The Convener: Yes.

Stewart Stevenson: It would be useful to point out to the committee that, if we delete the proposed subsection (2B) introduced by amendment 11, no requirement or power to bring anything forward would exist if ministers missed the target of 1 June 2010.

The Convener: I am a bit at variance with the minister’s view that a full year is insufficient to give a confident commitment that the June 2010 deadline can be met.

In any case, I seek agreement to withdraw amendment 58.

Amendment 58, by agreement, withdrawn.

A11 moved—[Stewart Stevenson.]

Amendment 11A moved—[Alison McInnes.]

The Convener: The question is, that amendment 11A be agreed to. Are we agreed?

Members: No.

The Convener: There will be a division.

FOR

Harvie, Patrick (Glasgow) (Green)
McInnes, Alison (North East Scotland) (LD)

AGAINST

Gibson, Rob (Highlands and Islands) (SNP)
Gordon, Charlie (Glasgow Cathcart) (Lab)
Johnstone, Alex (North East Scotland) (Con)
McNulty, Des (Gydebank and Milngavie) (Lab)
Peattie, Cathy (Falkirk East) (Lab)
Somerville, Shirley-Anne (Lothians) (SNP)

The Convener: The result of the division is: For 2, Against 6, Abstentions 0.

Amendment 11A disagreed to.

Amendment 11 agreed to.

Amendment 103 not moved.

Section 14, as amended, agreed to.

Sections 15 to 17 agreed to.

Section 18—Carbon units and carbon accounting

The Convener: Amendment 104, in my name, is in a group on its own.
In lodging amendment 104, I sought to explore issues around the operation of the carbon units scheme. However, I would now like to consider the debates on previous groups of amendments in relation to carbon units and consider before stage 3 whether a different approach is necessary, so I will not move the amendment.

Amendment 104 not moved.

Des McNulty: I have a procedural point. As the meeting has been going on for almost three hours now, I suggest that we go as far as dealing with amendment 59, for which Brian Adam has been patiently waiting, then halt at that point.

The Convener: The intention is to work to the end of part 2 of the bill, so your suggestion would allow us to do that. The remaining amendments will be rolled over to next week’s meeting.

Amendment 130 not moved.

Section 18 agreed to.

After section 18

Amendment 12 moved—[Stewart Stevenson.]
Amendment 12A moved—[Des McNulty.]
Amendment 12A not moved.
Amendment 12AB moved—[Alison McInnes.]

The Convener: The question is, that amendment 12AB be agreed to. Are we agreed?

Members: No.

The Convener: There will be a division.

Amendment 12F disagreed to.

Amendment 12, as amended, agreed to.

Amendments 13 and 14 moved—[Stewart Stevenson]—and agreed to.
understand; a community development approach must be adopted.

To measure how successful that engagement is, the methods that are used must be evaluated. People must have an opportunity to monitor the process and to assess whether it is the best way of making progress with communities. I am clear that unless we do a hearts and minds job, it will be extremely difficult for us to move forward, particularly at community level.

Des McNulty: If we do not have a successful public engagement strategy, we will not succeed in achieving the aspirations that are set out in the bill. It is clear that although the task of reducing climate change is not for Government alone, Government must play a co-ordinating role in bringing together other agencies, such as churches, schools and businesses, and encouraging individuals and groups to take their share of the load as far as reducing climate change is concerned.

I am particularly indebted, as Brian Adam will be, to the Church of Scotland for the work that it has done in advancing the initiative through its eco-congregation movement. The Church of Scotland has reflected not only on what has been achieved, but on what remains to be achieved and its desire to have a public engagement strategy. In expanding on the original intention and providing a framework within which the process of creating a succession of public engagement strategies can be taken forward, amendment 59 is highly appropriate. I want progress on that aim to be made on a cross-party basis, and I hope that we can all support amendment 59.

The Convener: I endorse the position that has been outlined by Brian Adam and other members regarding the public engagement strategy. The process that is established must be much more profound and proactive than the usual stakeholder consultation that Government conducts—quite correctly—on a host of issues. Given the behavioural change that is necessary in the context of climate change, a much stronger focus on public engagement is needed.

However, it should be remembered that public engagement is easier said than done. What has happened in the planning system, where there was a desire to achieve much more public participation, is an example of how fine intentions are not always easily delivered. We will have to proceed with the public engagement strategy in such a way that it is empowering—rather than finger wagging or lecturing people, we want to give them the tools that they need to make the changes that are sought by Government and Parliament.

That said, I am happy to support amendment 59.

Stewart Stevenson: I welcome the nature of the preceding discussion and echo Mr McNulty’s desire to see the adoption of a cross-party approach. I am slightly more sanguine than some about the current engagement process, at least with certain parts of the community. The young, in particular, are heavily engaged and are influencing adults.

Many of Scotland’s churches have taken an exemplar approach, in seeking to engage communities and through their individual actions. In principle, I support amendment 59. However, there are difficulties with the drafting. I presume that it is an unintended consequence that, although the amendment would oblige the Scottish ministers to produce an engagement strategy in 2010, another one in 2011 and then every five years until 2036, after 2036, there would not be a requirement for further engagement strategies. It is absolutely clear that that is not the intention of the members who spoke in favour of the amendment.

I wish to work with members to ensure that, at the end of stage 3, the bill has provisions that address the requirement and do not have the unintended consequence that amendment 59 would have. I am in the committee’s hands on the approach that should be taken. The amendment could be withdrawn and we could work together to produce a new one. Alternatively, if the committee is so minded, the provisions could be included in the bill and we could work to establish appropriate amendments. In any event, the shared objective is that, by the end of stage 3, we should have provisions that address the policy aim of amendment 59, but with drafting that is technically more fit for purpose.

Brian Adam: It is always a challenge for those who are not in the Government to produce technically sound amendments. I accept the minister’s point.

We should consider how consultation is carried out. I remember that, in the early days of the Parliament, when we dealt with the removal of clause 2A or section 28, the statutory consultees included the Potato Marketing Board. I am delighted that we have moved beyond that in relation to statutory consultees, but we have not necessarily nailed down the issue. Mr Harvie said that we do not always engage people. In the previous session of Parliament, I was in charge of the Interests of Members of the Scottish Parliament Bill. I recall that we could not get 30 members of the public throughout Scotland to respond to our consultations, on a matter that was interesting for us. There might be more interest in that matter in the current political climate, but there was not much then. However, tens of thousands of
people responded on the proposal to introduce a smoking ban.

I hope that, as part of the process and when the minister engages with us—if that is the direction that the committee decides to take—we can look beyond the statutory consultees and the usual suspects. The minister has made the case for an alternative amendment that would be more appropriate technically. I seek leave to withdraw amendment 59, on the basis that further engagement along the lines that have been discussed will be entered into prior to stage 3.

Amendment 59, by agreement, withdrawn.

The Convener: That brings us to the end of our consideration of amendments for today. I thank those who have borne with my bad throat throughout the meeting, and I thank the minister and his colleagues for attending.

At our next meeting, we expect to consider the bill up to and including the end of section 47, which is on forestry. Any amendments to those sections should be lodged by noon on Thursday at the very latest—that is the deadline. Of course, to enable the clerks to do their work as efficiently as possible, it would be better to lodge amendments early than to do so at 5 minutes to 12.

As I said, that concludes today’s consideration of amendments. I must go and see what the Potato Marketing Board said about section 28—

17:15

Rob Gibson (Highlands and Islands) (SNP): We have made steady, but not speedy progress. Are we content that enough time has been allocated for stage 2 consideration of the bill? Is there an alternative plan that will ensure that we can consider all the amendments in the designated time?

The Convener: I suppose that we have three broad options. First, I could allow speeches only of a certain length, so that things moved along more rapidly. Secondly, we could have longer meetings next week and the week after, given that only two more meetings at stage 2 are scheduled in the timescale that has been agreed by the Parliament. Thirdly, we could ask for more time. The serious implication of choosing the third option is—I think—that it would be impossible to reach stage 3 until September. Do members have a preference for one of those approaches? What do you think, Rob?

Rob Gibson: I will let other members give their views before I say anything.

Shirley-Anne Somerville (Lothians) (SNP): Given the importance of events that will take place in September and December, it would be appropriate to have an act to show people by September, whatever they think about certain amendments. It would be useful to the Parliament if the committee completed its consideration of the bill before the summer recess.

Cathy Peattie: I agree, but it is important that we have the opportunity to discuss matters and do not try to rush things forward. We must not end up with a bill that is not competent or with which people are not happy.

Charlie Gordon (Glasgow Cathcart) (Lab): If we are to have late meetings, let us not pretend that we are a family-friendly Parliament.

Rob Gibson: After next week’s meeting, perhaps we could consider whether it would be appropriate for us to have another meeting on a Monday.

The Convener: The option to meet on a Monday exists, as does the option to start our next two meetings earlier, rather than have meetings that run on very late. I see that the minister wants to comment, although this is really a matter for the committee.

Stewart Stevenson: I just thought that it might be helpful to say that we could plan for the possibility of the committee’s sitting considerably later in the evening and make ourselves available, subject to the details. We are your servants in the matter and will not constrain your decision making.

The Convener: Thank you. Will you apply the same flexibility in the context of earlier starts as well as later conclusions to meetings?

Stewart Stevenson: Broadly, yes. We will rearrange other matters as required.

The Convener: Thank you. I think that it would be best if I discussed the matter with the clerks and e-mailed members this evening or tomorrow morning to suggest an approach. Thank you for your co-operation.

Meeting closed at 17:19.
2nd Marshalled List of Amendments for Stage 2

The Bill will be considered in the following order—

Sections 1 to 20  Schedule 1
Sections 21 to 66  Schedule 2
Section 67  Long Title

Amendments marked * are new (including manuscript amendments) or have been altered.

Section 19

Des McNulty
187 In section 19, page 9, line 3, after <Ministers’> insert <duty under section 2 and>

Patrick Harvie
105 In section 19, page 9, line 4, at end insert—

<(  ) the function of providing advice, analysis, information and other assistance on climate change to any member of the Scottish Parliament;>

Des McNulty
188 In section 19, page 9, line 10, at end insert—

<(  ) for the conferral of functions on the advisory body relating to advice on the effectiveness of the Scottish Ministers’ proposals and policies for achieving the interim and 2050 targets;>

Section 20

Des McNulty
189 In section 20, page 9, line 28, at end insert—

<(  ) for the conferral of functions on the Committee relating to advice on the effectiveness of the Scottish Ministers’ proposals and policies for achieving the interim and 2050 targets;>

Cathy Peattie
131 In section 20, page 9, line 36, at end insert—

<(  ) Before making an order under subsection (1), the Scottish Ministers must consult the Scottish Parliament.>
Schedule 1

Cathy Peattie
132 In schedule 1, page 34, line 17, at end insert—
<(  ) Before appointing members of the Committee, the Scottish Ministers must consult the Scottish Parliament.>

Stewart Stevenson
15 In schedule 1, page 36, line 19, after <payment> insert <of>

Stewart Stevenson
16 In schedule 1, page 36, line 20, after <provision> insert <of>

Stewart Stevenson
17 In schedule 1, page 36, line 21, after <payment> insert <of>

Stewart Stevenson
18 In schedule 1, page 36, line 22, leave out first <of>

Section 21

Rob Gibson
190 In section 21, page 9, line 38, after <27> insert <and (Reports on programmes for adaptation)>

Rob Gibson
191 In section 21, page 10, line 6, at end insert—
<(  ) bringing section (Reports on programmes for adaptation) into effect comes into force, subsection (4) of section (Progress towards implementation of programmes for adaptation) ceases to have effect.>

Section 22

Patrick Harvie
106 In section 22, page 10, line 8, leave out subsection (1) and insert—
<(  ) The Scottish Ministers must, before laying an order under section 4(1), request and publish advice from the advisory body on the target-setting criteria set out under section 4(4).>

Patrick Harvie
107 In section 22, page 10, line 12, leave out <(1)(a)> and insert <(1)>
Patrick Harvie
108 In section 22, page 10, line 13, leave out <whether the> and insert <what>

Des McNulty
192 In section 22, page 10, line 13, leave out <appropriate> and insert <consistent with a reduction over time of the net Scottish emissions account which would allow the interim target and the 2050 target to be met>

Patrick Harvie
109 In section 22, page 10, line 14, at end insert—
<the objective of not exceeding the fair and safe Scottish emissions budget.>

Patrick Harvie
110 In section 22, page 10, line 15, leave out <(1)(a)> and insert <(1)>

Des McNulty
60 In section 22, page 10, leave out lines 17 to 20

Stewart Stevenson
19 In section 22, page 10, line 19, after <with> insert <section 12(1A) and>

Des McNulty
61 In section 22, page 10, line 21, after <targets> insert <and the domestic effort target>

Des McNulty
193 In section 22, page 10, line 24, at end insert—
<the respective contributions towards meeting the annual targets that should be made by—
(i) energy efficiency;
(ii) energy generation;
(iii) land use;
(iv) transport;>

Des McNulty
194 In section 22, page 10, leave out lines 25 to 27

Liam McArthur
195 In section 22, page 10, line 27, at end insert—
<(d) the proportion of the net Scottish emissions budget for the period 2010-2050 available for electricity generation and in particular as to—>
(i) an appropriate total lifetime greenhouse gas budget per megawatt hour of generating capacity;

(ii) appropriate initial levels of greenhouse gas emissions per megawatt hour.

Liam McArthur

196 In section 22, page 10, line 31, at end insert—

<(  ) In subsection (3)(d), “net Scottish emissions budget” means the aggregate amount of net Scottish emissions for the period 2010-2050 recommended by the relevant body which is consistent with achieving the targets set by or under Part 1.>

Section 23

Cathy Peattie

134 In section 23, page 10, line 33, leave out <prepare> and insert <lay before the Scottish Parliament>

Alison McInnes

111 In section 23, page 11, line 7, leave out from beginning to <year”),> in line 8 and insert <The first report under this section prepared after data relating to a year for which an annual target has been set (a “target year”) becomes available>

Stewart Stevenson

20 In section 23, page 11, line 7, leave out from <the> to <on> in line 8 and insert <a relevant year must also set out the advisory body’s views on the matters mentioned in subsection (3C).

(3A) In subsection (3), the “relevant year” means such year as the Scottish Ministers may, by order, designate in accordance with subsection (3B).

(3B) The year which may be designated under subsection (3A) is the first year following a year for which an annual target has been set (a “target year”) or the second year following a target year.

(3C) The matters referred to in subsection (3) are>

Des McNulty

62 In section 23, page 11, line 9, at end insert—

<(  ) whether the domestic effort target was met in that target year;>

Des McNulty

63 In section 23, page 11, line 10, leave out <way in which that target was or was> and insert <ways in which those targets were or were>

Alison McInnes

112 In section 23, page 11, line 13, leave out from <no> to end of line 16 and insert <as soon as reasonably practicable after the data relating to the target year becomes available and in any case no later than 31 January in the third year following the target year.>
Stewart Stevenson
21 In section 23, page 11, line 16, leave out <later>

Cathy Peattie
135 In section 23, page 11, line 16, at end insert—

< ( ) Before specifying a year under subsection (2) or appointing a date under subsection (4)(b), the Scottish Ministers must consult the Scottish Parliament.>

Section 24

Alison McInnes
64 In section 24, page 11, leave out lines 22 to 24 and insert <2 months after the report was so laid.>

Stewart Stevenson
22 In section 24, page 11, line 24, leave out <later> and insert <other>

Section 25

Cathy Peattie
237* In section 25, page 11, line 26, after <Ministers> insert <or any committee of the Scottish Parliament>

Section 27

Patrick Harvie
113 In section 27, page 12, line 2, leave out subsection (1)

Cathy Peattie
136 In section 27, page 12, line 3, at end insert—

< ( ) Before giving any directions under subsection (1), the Scottish Ministers must consult the Scottish Parliament.>

Patrick Harvie
114 In section 27, page 12, line 6, leave out subsections (3) and (4)

Section 28

Des McNulty
65 In section 28, page 12, line 16, at end insert—

< ( ) The report must also state whether the domestic effort target has been met in the target year to which the report relates.
( ) If the domestic effort target has not been met, the report must explain why.

Alison McInnes

115 In section 28, page 12, line 18, leave out <31 October in the second> and insert <the first 31 October after the data relating to the target year becomes available and in any case no later than 31 January in the third>

Section 29

Patrick Harvie

116 In section 29, page 12, line 23, at end insert—

<(ba) state the cumulative amount of net Scottish emissions in the period from the baseline year to the target year;>

Des McNulty

67 In section 29, page 12, line 31, at end insert—

<( ) state the proportion of the reduction in the net Scottish emissions account which is accounted for by reductions in net Scottish emissions;>

Patrick Harvie

117 In section 29, page 12, line 31, at end insert—

<( ) state the cumulative amount of net Scottish emissions reported under subsection (1)(ba);>

Liam McArthur

137 In section 29, page 13, line 4, at end insert—

<( ) state the average greenhouse gas emissions per megawatt hour of electricity generated in Scotland in the target year;

( ) state the average greenhouse gas emissions per megawatt hour, and the estimated lifetime cumulative emissions, of any new electricity generation capacity greater than 50 megawatts approved in Scotland in the target year.>

Liam McArthur

138 In section 29, page 13, line 4, at end insert—

<( ) in relation to any electricity generation permission granted in respect of a plant with average per megawatt greenhouse gas emissions which exceed—

(i) those achievable by a modern combined cycle gas turbine; or

(ii) any level specified in guidance issued in relation to consents granted under section 36 of the Electricity Act 1989 (c.29),

give reasons as to why such permission was granted and how such permission will be compatible over the plant’s lifetime with achievement of the targets set out in this Act.>
Cathy Peattie

118 In section 29, page 13, line 4, at end insert—

<(  ) The report for each year in the period 2011-2050 must—
(a) state the amount of the net Scottish emissions account for each preceding target year;
(b) state the cumulative amount of the net Scottish emissions account for the target year and all preceding target years.>

Stewart Stevenson

23 In section 29, page 13, line 9, at end insert—

<(  ) If the amount of the net Scottish emissions account for an earlier target year requires to be adjusted, the report must—
(a) explain why the adjustment is required;
(b) specify the adjustment required; and
(c) state the adjusted amount.>

Section 30

Des McNulty

68 In section 30, page 13, line 20, leave out <and the 2050 target> and insert <, the 2050 target and, in each target year, the domestic effort target>

Alison McInnes

119 In section 30, page 13, line 23, at end insert—

<(  ) In particular, the report must define and quantify the contribution that the following areas within the Scottish economy are expected to make to the meeting of targets under the Act—
(a) energy efficiency;
(b) energy generation;
(c) land use;
(d) transport.>

Section 31

Des McNulty

69 In section 31, page 13, line 32, at end insert <or that the domestic effort target has not been met in the target year to which the report relates>
After section 31

Shirley-Anne Somerville

After section 31, insert—

<Reports on emissions attributable to Scottish consumption of goods and services

(1) The Scottish Ministers must lay before the Scottish Parliament a report in respect of each year in the period 2010-2050 containing the following information.

(2) The report must, in so far as reasonably practicable, set out the emissions of greenhouse gases (whether in Scotland or elsewhere) which are produced by or otherwise associated with the consumption and use of goods and services in Scotland during that year.

(3) The report may also contain such other information as the Scottish Ministers consider appropriate.>

Des McNulty

After section 31, insert—

<Report on progress towards meeting the interim target

(1) The Scottish Ministers must, no later than 31 December 2015, lay before the Scottish Parliament a report on progress towards meeting the interim target.

(2) The report must, in particular, state the progress that has been made in reducing emissions and indicate whether this progress is consistent with a reduction over time of the net Scottish emissions account which would allow the interim target and the 2050 target to be met.>

Section 32

Stewart Stevenson

In section 32, page 13, line 39, leave out <2030> and insert <2020>

Stewart Stevenson

In section 32, page 14, line 4, leave out <2030> and insert <2020>

Stewart Stevenson

In section 32, page 14, line 6, leave out <2030> and insert <2020>

Cathy Peattie

In section 32, page 14, line 6, at end insert—

< ( ) state the cumulative amount of the net Scottish emissions account for the period 2010-2020;>

Stewart Stevenson

In section 32, page 14, line 9, leave out <2030> and insert <2020>
Stewart Stevenson

28 In section 32, page 14, line 10, leave out <2030> and insert <2020>

Stewart Stevenson

29 In section 32, page 14, line 11, leave out <2030> and insert <2020>

Stewart Stevenson

30 In section 32, page 14, line 13, leave out <2030> and insert <2020>

Stewart Stevenson

31 In section 32, page 14, line 18, leave out <2032> and insert <2022>

Section 33

Cathy Peattie

121 In section 33, page 14, line 27, at end insert—

<( ) state the cumulative amount of the net Scottish emissions account for the period 2010-2050;>

Section 34

Des McNulty

71 In section 34, page 15, line 3, after <must> insert—

<( ) immediately send a copy of the report to the persons who convene and chair such committees of the Scottish Parliament as are for the time being appointed by virtue of standing orders; and

( )>

Patrick Harvie

122 In section 34, page 15, line 5, at end insert—

<( ) But a statement in relation to a report mentioned in subsection (2)(a) or (b) must not be made before the period for Parliamentary consideration has expired.

( ) In this section, the “period for Parliamentary consideration” means the period of 60 days beginning on the day on which the draft is so laid; and in reckoning that period no account is to be taken of any time during which the Scottish Parliament—

(a) is dissolved, or

(b) is in recess for more than 4 days.

( ) Before making a statement under subsection (1) in relation to a report mentioned in subsection (2)(a) or (b), the Scottish Ministers must have regard to any resolution or report of, or of any committee of, the Scottish Parliament made, during the period for Parliamentary consideration, as regards the report.>
As an amendment to amendment 122, line 2, leave out from beginning to <not> and insert <; but no such statement may>

In section 34, page 15, line 15, leave out from <meet> to end of line 16 and insert <attend, if invited, the proceedings of any such committees of the Scottish Parliament as are for the time being appointed by virtue of standing orders, for the purposes of giving evidence on the report.>

In section 34, page 15, line 16, at end insert—

<( ) The Scottish Ministers must have regard to any resolution or report of, or of any committee of, the Scottish Parliament made following the laying of a report mentioned in subsection (2) as regards the contents of the report and any future reports.>

In section 34, page 15, line 16, at end insert—

<(4) The Scottish Ministers must not implement the proposals and policies set out in a report mentioned in subsection (2)(c) unless the Scottish Parliament has, by resolution, approved the report.

(5) Where the Scottish Parliament does not approve a report mentioned in subsection (2)(c), the Scottish Ministers must lay a further report under section 31(2), containing amended proposals and policies, before the Parliament; and subsection (4) and this subsection apply to such a further report as they apply to the report originally laid before the Parliament.

(6) Before submitting a further report by virtue of subsection (5), the Scottish Ministers must have regard to any resolution or report of, or any committee of, the Scottish Parliament in relation to the report previously laid before the Parliament.>

After section 35

After section 35, insert—

<Reporting on emissions associated with imports: consultation

The Scottish Ministers must, no later than 1 June 2010, consult such persons as they consider appropriate about possible methodologies for recording and reporting on emissions generated outwith Scotland which are associated with the importation of goods and services into Scotland.>

In section 36, page 15, line 27, at end insert—
(A1) A public body must, in exercising its functions, act—
   (a) in the way best calculated to contribute to the delivery of the targets set in or under Part 1 of this Act;
   (b) in the way best calculated to help deliver any programme laid before the Scottish Parliament under section 45;
   (c) in a way that it considers is most sustainable.

(A2) In this Part, a “public body” means a Scottish public authority within the meaning of section 3(1)(a) of the Freedom of Information (Scotland) Act 2002 (asp 13).

CHAPTER
ENVIRONMENTAL ASSESSMENT

Environmental assessment

(1) This section applies where the Scottish Ministers intend to adopt a plan or programme in respect of which an environmental report under section 14(1) of the Environmental Assessment (Scotland) Act 2005 (asp 15) identifies significant greenhouse gas emissions.

(2) Before adopting the plan or programme, the Scottish Ministers must—

(a) request advice from the relevant body (within the meaning of section 5(5)) as to—

(i) whether adoption of the plan or programme is likely to be compatible with achievement of the targets set by, or by virtue of, Part 1;

(ii) if not, what steps can be taken to ensure such compatibility; and

(b) consider and take account of that advice.

(3) Any advice requested under subsection (2)(a) must, after it has been sent to the Scottish Ministers, be published in such manner as the relevant body consider appropriate.

(4) After adopting a plan or programme of the kind mentioned in subsection (1) in respect of which advice has been received under paragraph (a)(ii) of subsection (2), the Scottish Ministers must—

(a) lay the plan or programme before the Scottish Parliament; and

(b) as soon as practicable after doing so, and in so far as reasonably practicable, make a statement to the Scottish Parliament explaining what steps of the kind mentioned in that paragraph will be taken.>

Rob Gibson

216 After section 45, insert—

<Reports on progress towards implementation of programmes for adaptation>

(1) This section applies where the Scottish Ministers lay a programme under section 45(2) before the Scottish Parliament.

(2) The Scottish Ministers must lay before the Scottish Parliament reports setting out their assessment of the progress made towards implementing the objectives, proposals and policies set out in the programme.
(3) The first report under this section must be laid before the Scottish Parliament no later than the expiry of the period of 12 months beginning with the day on which the programme is laid.

(4) The second and subsequent reports under this section must be laid before the Scottish Parliament no later than the expiry of each subsequent period of 12 months.

Rob Gibson

217 After section 45, insert—

<Progress towards implementation of programmes for adaptation>

(1) This section applies where—

(a) the Scottish Ministers lay a programme under section 45(2) before the Scottish Parliament;

(b) the Secretary of State lays a second or subsequent report under section 56 of the 2008 Act before Parliament.

(2) Where subsection (1)(a) applies, the Scottish Ministers must, before the expiry of the period of 2 years beginning with the day on which the programme is laid, request the relevant body to prepare a report setting out its assessment of the progress made towards implementing the objectives, proposals and policies set out in that programme.

(3) Where subsection (1)(b) applies, the Scottish Ministers must, as soon as reasonably practicable after they receive the copy of the report laid, request the relevant body to prepare a further report setting out its assessment of the progress made towards implementing the objectives, proposals and policies set out in the most recent programme laid by the Scottish Ministers under section 45(2).

(4) The Scottish Ministers must, as soon as reasonably practicable after they receive the relevant body’s report under subsection (2) or, as the case may be, further report under subsection (3), lay it before the Scottish Parliament.

Rob Gibson

218 After section 45, insert—

<Reports on programmes for adaptation>

(1) This section applies where—

(a) the Scottish Ministers lay a programme under section 45(2) before the Scottish Parliament;

(b) the Secretary of State lays a second or subsequent report under section 56 of the 2008 Act before Parliament.

(2) Where subsection (1)(a) applies, the advisory body must, before the expiry of the period of 2 years beginning with the day on which the programme is laid, prepare a report setting out its assessment of the progress made towards implementing the objectives, proposals and policies set out in that programme.

(3) Where subsection (1)(b) applies, the advisory body must, as soon as reasonably practicable after the report is laid, prepare a further report setting out its assessment of the progress made towards implementing the objectives, proposals and policies set out in the most recent programme laid by the Scottish Ministers under section 45(2).
The advisory body must, as soon as reasonably practicable after preparing a report under subsection (2) or, as the case may be, a further report under subsection (3), lay it before the Scottish Parliament.

After section 45, insert—

Land use strategy

Duty to produce a land use strategy

(1) The Scottish Ministers must, no later than 31 March 2011, lay a land use strategy before the Scottish Parliament.

(2) The strategy must, in particular, set out—
   (a) the Scottish Ministers’ objectives in relation to sustainable land use;
   (b) their proposals and policies for meeting those objectives; and
   (c) the timescales over which those proposals and policies are expected to take effect.

(3) The objectives, proposals and policies referred to in subsection (2) must contribute to—
   (a) achievement of the Scottish Ministers’ duties under section 1, 2 or 3(1)(b);
   (b) achievement of the Scottish Ministers’ objectives in relation to adaptation to climate change, including those set out in any programme produced by virtue of section 45(2); and
   (c) sustainable development.

(4) Before laying the strategy before the Scottish Parliament, the Scottish Ministers must publish a draft strategy and consult with such bodies as they consider appropriate and also with the general public.

(5) The strategy must be accompanied by a report setting out—
   (a) the consultation process undertaken in order to comply with subsection (4); and
   (b) the ways in which views expressed during that process have been taken account of in finalising the strategy (or stating that no account has been taken of such views).

(6) The Scottish Ministers must, no later than—
   (a) five years after laying a strategy before the Scottish Parliament under subsection (1); and
   (b) the end of every subsequent period of five years,
   lay a revised strategy before the Scottish Parliament; and subsections (2) to (5) apply to a revised strategy as they apply to a strategy laid under subsection (1).

Liam McArthur

226 In section 50, page 22, line 16, at end insert—
<( ) The Scottish Ministers must, within 12 months of this Act receiving Royal Assent, publish a report setting out—
(a) what measures they intend to take to reduce emissions from non-domestic buildings; and
(b) when they intend to make provision as mentioned in paragraphs (ha) and (hb).>
After section 50

Iain Smith (on behalf of the Economy, Energy and Tourism Committee)

After section 50, insert—

<Energy performance of living accommodation

Living accommodation: assessment of energy performance and emissions

(1) The Scottish Ministers may, by regulations, make provision relating to the assessment of—
   (a) the energy performance of living accommodation;
   (b) the emission of greenhouse gases produced by living accommodation.

(2) The regulations may in particular include provision about—
   (a) the circumstances in which the regulations apply;
   (b) the living accommodation to which the regulations apply;
   (c) the persons who may be required to have assessments carried out;
   (d) the periods within which such assessments must be carried out;
   (e) the procedure and methodology for assessing the energy performance of living accommodation;
   (f) the procedure and methodology for assessing the greenhouse gas emissions produced by the living accommodation;
   (g) the persons who may carry out such assessments;
   (h) the issuing of certificates, following such assessments, including the form, manner and content of such certificates;
   (i) subject to subsection (3), the enforcement authority in relation to the regulations;
   (j) subject to subsection (4), the functions of that authority;
   (k) the keeping of information and its production to the enforcement authority;
   (l) the enforcement of the duties imposed by the regulations;
   (m) offences in relation to failures to comply with requirements of the regulations.

(3) The enforcement authority provided for in the regulations is to be such person or body as the Scottish Ministers consider appropriate.

(4) The functions of the enforcement authority may include power to levy charges to recover the reasonable costs incurred by it in exercising its functions under the regulations.>

Leave out section 58

After section 58

After section 58, insert—

⟨Deposit and return schemes: designation of scheme administrator

(1) The Scottish Ministers may, by order, designate—

(a) a body established under section (Power to establish scheme administrator)(1); or

(b) such other person or body as they consider appropriate (an “existing body”),

as a scheme administrator of a deposit and return scheme established by virtue of section 58.⟩
(2) An order under subsection (1)(b) may, in so far as the Scottish Ministers consider it necessary or expedient to do so, modify the functions of an existing body by—
   (a) conferring functions on;
   (b) removing functions from; or
   (c) otherwise varying the functions of,
   the body.
(3) That order may in particular include provision about—
   (a) borrowing by the existing body (with the approval of the Scottish Ministers);
   (b) the charging by the body, in respect of the exercise of its functions in relation to a deposit and return scheme, of such reasonable amounts as the Scottish Ministers consider appropriate.
(4) In exercising functions in relation to a deposit and return scheme, a scheme administrator must comply with any written directions of a general or specific nature as the Scottish Ministers may from time to time give to it in relation to those functions.

Stewart Stevenson
183 After section 58, insert—

<Power to establish scheme administrator
(1) The Scottish Ministers may, by order, establish a body to be a scheme administrator of a deposit and return scheme established by virtue of section 58(1).
(2) A body established under subsection (1) is to be a body corporate.
(3) The body may do anything which appears to it—
   (a) to be necessary or expedient for the purpose of, or in connection with, the exercise of its functions in relation to a deposit and return scheme;
   (b) to be conducive to the exercise of those functions.
(4) In particular, the body may—
   (a) enter into contracts;
   (b) with the agreement of the Scottish Ministers, borrow money;
   (c) charge, in respect of the exercise of its functions in relation to a deposit and return scheme, such reasonable amounts as the Scottish Ministers consider appropriate.
(5) An order under subsection (1) may in particular include provision about—
   (a) the status and constitution of the body;
   (b) the status of the members and any employees of the body;
   (c) the remuneration, allowances and pensions of such members and such employees;
   (d) the conferral of functions on the body;
   (e) the keeping by the body of accounts and accounting records.

Stewart Stevenson
184 After section 58, insert—
<Finance of scheme administrator>

(1) The Scottish Ministers may, for the purpose of or in connection with the exercise by a scheme administrator of functions in relation to a deposit and return scheme—

(a) pay grants;

(b) make loans,

to the administrator of such amounts as Ministers may determine.

(2) Any such grant or loan may be paid or, as the case may be, made, on such terms and subject to such conditions (including, in the case of a loan, conditions as to repayment) as the Scottish Ministers consider appropriate.

(3) The Scottish Ministers may, from time to time after any grant or loan is paid or, as the case may be, made, vary the terms and conditions on which it was paid or made.

(4) The Scottish Ministers may guarantee, in such manner and on such conditions as they consider appropriate, the discharge of any financial obligation in connection with any sums borrowed by a scheme administrator for the purpose of, or in connection with, the exercise of its functions in relation to a deposit and return scheme.>

Climate Change (Scotland) Bill

2nd Groupings of Amendments for Stage 2

This document provides procedural information which will assist in preparing for and following proceedings on the above Bill. The information provided is as follows:

- the list of groupings (that is, the order in which amendments will be debated). Any procedural points relevant to each group are noted;
- a list of any amendments already debated;
- the text of amendments to be debated on the second day of Stage 2 consideration, set out in the order in which they will be debated. THIS LIST DOES NOT REPLACE THE MARSHALLED LIST, WHICH SETS OUT THE AMENDMENTS IN THE ORDER IN WHICH THEY WILL BE DISPOSED OF.

Groupings of amendments

**Progress towards meeting interim and final targets: advice and reports etc.**
187, 188, 189, 192, 197

**Advice etc. to members of the Scottish Parliament**
105

**Relationship between advisory body and Scottish Parliament**
131, 132, 134, 135, 237, 136

**Minor amendments**
15, 16, 17, 18, 139, 140, 145, 146, 147, 148, 32, 33, 34

**Programmes for adaptation**
190, 191, 141, 142, 143, 214, 144, 215, 216, 217, 218, 233, 235

**Contribution of different sectors: advice and reports**
193, 194, 195, 196, 137, 138, 119

**Power to give directions to advisory body**
113, 114

**Reports on targets etc.: content**
116, 67, 117, 118, 23, 120, 121

**Reports on certain kinds of emissions**
70, 124

**Reports: provision of information to the Scottish Parliament**
71, 122, 122A, 72, 73, 123
Public bodies: climate change duties
198, 199, 200, 201, 202, 203, 228, 230, 231, 234, 236

Role of relevant body etc.
204, 210, 211, 212

Public bodies: reporting on climate change duties
205, 206, 207, 208, 209

Environmental assessment
213

Land use strategy
219

Power to vary times for making muirburn
149, 150, 151, 152

Power to modify functions of Forestry Commissioners
220, 221, 153

Promotion of energy efficiency
222, 223, 232

Promotion of renewable heat
154, 155, 156, 161

Energy performance: non-domestic buildings
224, 157, 225, 158, 159, 160, 160A, 226, 229

Energy performance: living accommodation
227

Deposit and return schemes
162, 163, 164, 165, 166, 167, 168, 169, 170, 171, 172, 173, 174, 175, 176, 177, 178, 179, 180, 181, 185, 182, 183, 184, 186

Charges for supply of carrier bags
74

Amendments already debated

Interim target: modification
With 1 - 24, 25, 26, 27, 28, 29, 30, 31, 35

Setting annual targets: criteria
With 79 - 109

Role of relevant body in relation to annual targets
With 82 - 106, 107, 108, 110
Achievement of annual targets: respective contributions of domestic reductions and crediting of carbon units
With 50 - 60, 19, 61, 62, 63, 65, 68, 69

Notes on amendments in this group
Amendment 60 pre-empts amendment 19

Annual targets: progress towards achievement
With 9 - 111, 20, 112, 21, 64, 22, 115

Notes on amendments in this group
Amendment 111 pre-empts amendment 20
Amendment 112 pre-empts amendment 21
Amendment 64 pre-empts amendment 22
Present:

Rob Gibson               Charlie Gordon
Patrick Harvie (Convener) Alex Johnstone
Alison McInnes           Des McNulty
Cathy Peattie (Deputy Convener) Shirley-Anne Somerville

In attendance: Jim Hume, Liam McArthur, John Park and Peter Peacock.

**Climate Change (Scotland) Bill:** The Committee considered the Bill at Stage 2 (Day 2).

The following amendments were agreed to (without division): 15, 16, 17, 18, 190, 191, 108, 19, 193, 194, 20, 21, 22, 67, 137, 118, 23, 70, 197, 24, 25, 26, 120, 27, 28, 29, 30, 31, 121, 72, 73, 207, 139, 140, 212, 141, 142, 143, 214, 144, 145, 146, 147, 148, 215, 216, 217, 218, 219, 149, 150, 151, 152, and 153.

The following amendments were agreed to (by division)—

187 (For 5, Against 3, Abstentions 0)
61 (For 5, Against 3, Abstentions 0)
62 (For 5, Against 3, Abstentions 0)
63 (For 5, Against 3, Abstentions 0)
65 (For 5, Against 3, Abstentions 0)
68 (For 5, Against 3, Abstentions 0)
69 (For 5, Against 3, Abstentions 0)
71 (For 4, Against 3, Abstentions 1)
122A (For 5, Against 3, Abstentions 0)
198 (For 5, Against 3, Abstentions 0)
199 (For 5, Against 3, Abstentions 0)
200 (For 5, Against 3, Abstentions 0)
201 (For 5, Against 3, Abstentions 0)
203 (For 5, Against 3, Abstentions 0)
208 (For 5, Against 3, Abstentions 0)
221 (For 5, Against 3, Abstentions 0)

The following amendments were disagreed to (by division)—
105 (For 1, Against 7, Abstentions 0)
106 (For 2, Against 6, Abstentions 0)
109 (For 2, Against 6, Abstentions 0)
195 (For 2, Against 6, Abstentions 0)
196 (For 2, Against 6, Abstentions 0)
111 (For 2, Against 6, Abstentions 0)
112 (For 2, Against 6, Abstentions 0)
64 (For 2, Against 6, Abstentions 0)
115 (For 2, Against 6, Abstentions 0)
138 (For 2, Against 6, Abstentions 0)
122 (For 2, Against 6, Abstentions 0)
123 (For 2, Against 6, Abstentions 0)
204 (For 4, Against 4, Abstentions 0; amendment disagreed to on casting vote)
210 (For 4, Against 4, Abstentions 0; amendment disagreed to on casting vote)
211 (For 4, Against 4, Abstentions 0; amendment disagreed to on casting vote)

Amendments 131, 113, 116, 205, 213 and 220 were moved and, with the agreement of the Committee, withdrawn.

The following amendments were not moved: 188, 189, 132, 107, 192, 110, 60, 134, 135, 237, 136, 114, 117, 119, 124, 202, 206 and 209.

Sections 20, 25, 26, 27, 35, 39, 40, 41, 43 and 44 were agreed to without amendment.

Section 19, schedule 1, sections 21, 22, 23, 24, 28, 29, 30, 31, 32, 33, 34, 36, 37, 38, 42, 45, 46 and 47 were agreed to as amended.

The Committee ended consideration of the Bill for the day section 47 having been disposed of.
Scottish Parliament
Transport, Infrastructure and Climate Change Committee
Tuesday 2 June 2009

[THE CONVENER opened the meeting at 13:31]

Climate Change (Scotland) Bill: Stage 2

The Convener (Patrick Harvie): Good afternoon. If everybody is settled, we can proceed. Welcome to the 15th meeting this year of the Transport, Infrastructure and Climate Change Committee. I remind members and everybody else present that mobile devices should be switched off. We have received no apologies. As yet, no non-committee members are present, but I gather that some may attend later.

We have two items on the agenda today, item 1 being continued consideration of amendments at stage 2 of the Climate Change (Scotland) Bill. I welcome once again the Minister for Transport, Infrastructure and Climate Change, Stewart Stevenson; Philip Wright, deputy director for climate change; Fiona Page, the bill team leader; Frances Beck, solicitor; Max McGill, assistant Scottish parliamentary counsel—and do we have David Henderson-Howat with us?

The Minister for Transport, Infrastructure and Climate Change (Stewart Stevenson): He will come to the table later.

The Convener: Thank you, minister.

I remind members of the situation, as I explained it at the start of our previous meeting, regarding the use of the casting vote and the procedures that we will use. The situation is no different from last week.

We have two items on the agenda today, item 1 being continued consideration of amendments at stage 2 of the Climate Change (Scotland) Bill. I welcome once again the Minister for Transport, Infrastructure and Climate Change, Stewart Stevenson; Philip Wright, deputy director for climate change; Fiona Page, the bill team leader; Frances Beck, solicitor; Max McGill, assistant Scottish parliamentary counsel—and do we have David Henderson-Howat with us?

The Minister for Transport, Infrastructure and Climate Change (Stewart Stevenson): He will come to the table later.

The Convener: Thank you, minister.

I remind members of the situation, as I explained it at the start of our previous meeting, regarding the use of the casting vote and the procedures that we will use. The situation is no different from last week.

Section 19—Meaning of advisory body

The Convener: Amendment 187, in the name of Des McNulty, is grouped with amendments 188, 189, 192 and 197.

Des McNulty (Clydebank and Milngavie) (Lab): Amendment 187 adds “duty under section 2” to 
“functions under sections 5, 7, 8”
in section 19. That is explicitly to allow the relevant advisory body, whether it be the United Kingdom Committee on Climate Change or a Scottish climate change committee, to advise ministers on the interim target, should they require that. Putting something into the bill to allow that process to take place seems sensible and worth while.

Amendments 188 and 189 are, in a sense, probing amendments. I want to be sure that the advisory body is in a position not just to give ministers “advice on climate change” in general terms—such advice could be defined in a variety of ways—but to give ministers “advice on the effectiveness of the Scottish Ministers’ proposals and policies for achieving the interim and 2050 targets”.

There must be dialogue between the advisory body and ministers, not just on the task of tackling climate change but on the mechanisms that ministers employ. I presume that ministers intend to allow the Committee on Climate Change or a Scottish committee on climate change to give advice on the effectiveness of their policies and proposals. My amendments would include a provision on that in the bill, so I will be interested in the minister’s response.

Amendment 192 uses a similar form of words to that in an amendment of mine that we discussed at our previous meeting. The aim is to ensure that the advisory committee considers the way in which the trajectory of cuts in emissions is maintained, particularly to achieve the interim target. The form of words was accepted in a previous amendment, so I hope that it will be accepted again today.

Amendment 197 is probably the most important of the five amendments. It would require a report to be produced in 2015 on progress towards meeting the interim target. That would give the Parliament a break point to identify how we are getting on and, I hope, to put in place any measures that are needed to ensure that we meet the interim target. I hope that amendment 197 will receive the support of my fellow committee members.

I move amendment 187.

Stewart Stevenson: I am glad that Mr McNulty said that he regards amendment 197 as the most important one in the group, because I am pleased to say that I am content to support it. It will place a duty on the Scottish ministers to report on progress towards the interim target. That will give the Parliament a break point to identify how we are getting on and, I hope, to put in place any measures that are needed to ensure that we meet the interim target. I hope that amendment 197 will receive the support of my fellow committee members.

I move amendment 187.

Stewart Stevenson: I am glad that Mr McNulty said that he regards amendment 197 as the most important one in the group, because I am pleased to say that I am content to support it. It will place a duty on the Scottish ministers to report on progress towards the interim target. The proposed content and timing of the report are sensible. It is reasonable that it should be laid by the end of December 2015, which is about the midway point between the commencement of the annual emissions targets in 2010 and the date of the interim target in 2020.

I appreciate Mr McNulty’s intentions in lodging amendment 197 and the remaining amendments in the group, but we have minor difficulties with those other amendments. Although we support the policy direction in which Mr McNulty is trying to
take us, I cannot currently support those amendments.

Amendment 187 seeks to add to the functions of the advisory body the function of giving advice on the Scottish ministers' duty under section 2 to ensure that the interim target is met. I can understand why members might want to add that to the advisory body's functions, but amendment 187 goes about that in the wrong way. In a real sense, the advisory body already has that function under the bill.

The advisory body's functions are listed in section 19(3). The sections that are listed in section 19(3)(a), which are all in part 1 of the bill, place a duty on ministers to request advice or a report from the advisory body. Section 2 contains no such duty, but section 8, which is listed in section 19(3)(a), contains a duty on ministers to request from the advisory body a report on our progress towards the achievement of the interim target. Although that is not framed as a duty to request or give advice, in essence it amounts to the same thing. Therefore, amendment 187 is not necessary.

Amendments 188 and 189 are well intentioned. I would like to accept them, as I appreciate their aim of adding an extra element to the functions of the body that provides advice, but I suggest that a more suitable place in the bill to achieve what amendment 188 seeks is section 19(3). The amendment would insert material into section 19(4), but that would not guarantee that the advisory body had that function. Section 19(4) lists things that "may" be included in an order under section 19(3)(c). Amendment 188 would therefore not guarantee that the function was conferred on the advisory body. However, I am perfectly happy to take the view of the committee on that and to consider in advance of stage 3 how we can amend the bill to take that policy point forward in a way that is effective and consistent with the bill as a whole.

I can see the intention behind amendment 192. It follows amendment 38, which the committee agreed to last week and which inserted similar words into section 3. However, amendment 192 would require the advisory body to provide advice on the consistency of achieving the interim target after 2020. I therefore cannot support amendment 192, but I am happy to work on tightening up the wording and to lodge an amendment at stage 3 to achieve Des McNulty's aim.

Des McNulty: I am minded not to move amendments 188 and 189 and to work with the minister to find a sensible way of delivering the intention behind the amendments. The minister made the same offer in relation to amendment 192, and I am happy to co-operate in that and not to move amendment 192.

I was not entirely convinced by what the minister said about amendment 187. The amendment would allow the advisory body the opportunity not just to contribute to whether the target is achieved but to consider the target in the round. That is why the particular form of words was chosen—it was to expand the capacity of the advisory body beyond the bill's intention. I therefore intend to press amendment 187.

The Convener: The question is, that amendment 187 be agreed to. Are we agreed?

Members: No.

The Convener: There will be a division.

Amendment 187 agreed to.

The Convener: Amendment 105, in my name, is in a group on its own.

The amendment is intended to give the advisory body the function of providing advice, analysis, information and assistance to members of the Scottish Parliament, including committees composed of members of the Scottish Parliament.

We have previously been told on the record during our formal meetings, and it has been stated in other public forums, that the UK Committee on Climate Change—the existing body—will have some form of relationship to the Parliaments here and at Westminster. It will not have a direct relationship just with Government. Amendment 105 seeks to formalise that system to some extent.

The committee has expressed some surprise that the Scottish Government decided not to seek formal advice from the UK Committee on Climate Change in advance of the passage of the bill and that it argued that such a move would be inappropriate. It is possible that a future Scottish Government might seek to take a different approach to climate change from that which is recommended by the advisory body or supported by the Parliament. In that situation, it would be of great value if the Parliament, or a successor committee to this one, were able formally to seek advice on the same basis from the advisory body. That is all that amendment 105 seeks to achieve.
It is consistent with the approach of giving the advisory body a degree of independent status. Having a slightly formalised relationship with Parliament outside of the relationship to Government would be helpful.

Stewart Stevenson: Will the convener take an intervention?

The Convener: That is all I was going to say. The minister will have the opportunity to contribute to the formal debate on the amendment.

Stewart Stevenson: I just wondered whether, as the mover of the amendment, you are able to inform us as to the cost to Parliament.

The Convener: The cost to Parliament?

Stewart Stevenson: Of having access to the advisory body or committee. Those who have access to and take advice from that committee will have to pay for it and to provision that body accordingly.

The Convener: I would suggest that that is a case-by-case scenario. The Parliament, in making such approaches, would consider the implications at the time.

I move amendment 105.

13:45

Des McNulty: Amendment 105 seems to be very widely drawn. It would allow "any" individual member of the Scottish Parliament to seek "advice, analysis, information and other assistance" from the UK Committee on Climate Change or the Scottish climate change committee. The body that ought to provide advice to individual members is probably the Scottish Parliament information centre. If committees, as parliamentary bodies, wish to seek advice from the relevant advisory body, they should be allowed to do so, but through a proper process. That might be through a response to a report, an invitation to give evidence or some other such mechanism.

There are other amendments later in the marshalled list that allow that process to take place, and I am reluctant to support amendment 105, given how widely it is drawn. There are perhaps more suitable mechanisms for delivering an appropriate interface between parliamentary committees and the UK Committee on Climate Change or a Scottish climate change committee.

Stewart Stevenson: Mr McNulty has made many of the points that I too would make. SPICe is certainly the in-house source of advice here, and it can commission advice on behalf of parliamentarians. The committee and Parliament would need to consider it carefully if they were to remove responsibilities that SPICe might be thought to have in that respect and to place them elsewhere. The associated costs would have to be considered. If the source of the questions was from Parliament, it would properly be for Parliament to pay for the advice that it received, just as the Government has to pay out of its own resources for the resourcing of any committee or body that provides advice to ministers. Those are issues that bear further thinking about. I encourage committee members not to support amendment 105.

I should also point out that committees have the power, which they have exercised in many instances, to appoint their own advisers. That has often provided a useful way of getting the particular expertise that committees wish and of developing a more intimate, on-going relationship with the sources of advice than would be likely to be possible with a UK or Scottish advisory committee.

The Convener: In response to the financial question, I entirely concede that the consideration of cost would have to be taken seriously, although I do not think that it is a reason for prohibiting members of the Scottish Parliament from seeking advice, on a formal basis, from the advisory body. Such decisions would have to be made on a case-by-case basis, and permission should be given for them to be taken at the time.

In response to Des McNulty’s comments, I will say that I deliberately did not restrict amendment 105 to parliamentary committees. If the amendment were agreed, parliamentary committees would certainly be able to seek advice formally from the advisory body. However, as the committee has acknowledged on a number of occasions, climate change is such a cross-cutting issue that individual members will have a clear interest in it, even if they are not members of a committee with a particular remit for climate change. I therefore intended to make amendment 105 broad so that it includes individual members who are not members of a committee with a specific remit.

Amendment 105 would simply give permission to members of the Scottish Parliament to seek such advice. I hope that it is not a probability, but it is certainly a possibility that the Government does not put to the advisory body a specific question that members of the Scottish Parliament consider important. Amendment 105 will allow members to ask the question.

The question is, that amendment 105 be agreed to. Are we agreed?

Members: No.

The Convener: There will be a division.
FOR
Harvie, Patrick (Glasgow) (Green)

AGAINST
Gibson, Rob (Highlands and Islands) (SNP)
Gordon, Charlie (Glasgow Cathcart) (Lab)
Johnstone, Alex (North East Scotland) (Con)
McInnes, Alison (North East Scotland) (LD)
McNulty, Des (Clydebank and Milngavie) (Lab)
Peattie, Cathy (Falkirk East) (Lab)
Somerville, Shirley-Anne (Lothians) (SNP)

The Convener: The result of the division is: For 1, Against 7, Abstentions 0.

Amendment 105 disagreed to.
Amendment 188 not moved.
Section 19, as amended, agreed to.

Section 20—Scottish Committee on Climate Change
Amendment 189 not moved.

The Convener: Amendment 131, in the name of Cathy Peattie, is grouped with amendments 132, 134, 135, 237 and 136.

Cathy Peattie (Falkirk East) (Lab): The amendments in this group are probing amendments on the relationship between the Scottish Parliament and the advisory body. Ministers will have a role in ensuring that the Scottish Parliament is aware of the establishment of the Scottish committee on climate change, and of its staffing, its role and remit, and its targets and direction. The amendments are about involving the Parliament in every way possible.

Amendment 237 is similar to Patrick Harvie’s amendment 105 in that it concerns the right of committees of the Scottish Parliament and the advisory body. Ministers will have a role in ensuring that the Scottish Parliament is aware of the establishment of the Scottish committee on climate change, and of its staffing, its role and remit, and its targets and direction. The amendments are about involving the Parliament in every way possible.

Amendment 237 is similar to Patrick Harvie’s amendment 105 in that it concerns the right of committees of the Scottish Parliament to call for evidence so that they are aware of issues that may have moved on since the time of the original bill. That could help with inquiries, for example. I want committees of this Parliament to have the right to call the advisory body to give evidence. The committees would then be able to report to Parliament.

I move amendment 131.

Stewart Stevenson: The amendments in this group would require the Scottish ministers to consult the Scottish Parliament in specific circumstances before setting up the advisory body or giving it any direction.

If ministers establish a Scottish committee on climate change, it will be a significant step. I would be content to consult the Parliament before introducing an order to establish the committee; I am therefore content to accept the principle of amendment 131. However, the drafting appears to contain an error: it refers to consulting “Before making an order”.

That expression is not appropriate for an order that is subject to the affirmative procedure, as this one would be. The draft of the order will, of course, be presented to Parliament for approval, so Parliament will have an opportunity to scrutinise it and decide whether or not to approve it. I am therefore not entirely sure what is intended by amendment 131.

I am happy to give a commitment to the committee and to Parliament that ministers will consult before bringing forward a draft order—before the start of the 40 days—on establishing a Scottish climate change committee. Under what Bill Aitken has previously described as the mischief of the law, that commitment now has legal force.

Amendment 135 provides for a requirement to consult the Scottish Parliament. Given that the Parliament must scrutinise and approve the affirmative order, it is not clear what additional scrutiny the consultation duty affords, so I will not support that amendment. Although the same applies to amendment 131, I understand the significance of ministers seeking to establish a Scottish climate change committee, which is why I have said what I have.

On amendment 132, I remind the committee that the main purpose of the advisory body is to provide expert advice to the Scottish ministers. The amendment would require ministers to consult the Scottish Parliament before appointing members to the Scottish climate change committee. That would create a division and a potential conflict of responsibilities that would be likely to be unhelpful.

If appointments to the committee were to be agreed by the Scottish Parliament and ministers, accountability would become difficult as the members of the advisory body would be looking in more than one direction. Paragraph 2 of schedule 1 sets out the expertise and experience that the committee should have, and ministers would need to have regard to that when making the appointments. That is a sufficient and normal safeguard, and there are, of course, procedures already in place on public appointments.

To require that the ministers consult the Parliament prior to appointing members would be a departure from existing practice and could potentially deter applicants. It is already difficult in some circumstances to get a sufficient range of good-quality applicants. There are questions about how Parliament would be consulted and whether that would involve all members or only the members of relevant parliamentary committees. What would Parliament do as part of the process? There are a considerable number of questions and
uncertainties, so I do not wish members to support amendment 132.

Amendment 134 requires the advisory body to lay a report before Parliament in each year from the specified year onwards. Section 23(4) already provides for the laying of reports under section 23 and the time limits that are to apply to that. Amendment 134 carries the risk of introducing some confusion, given the provisions that are already in the bill.

On amendment 136, it is appropriate that ministers can give directions to the climate change committee about the exercise of functions without first clearing that with the Scottish Parliament. As is the case with amendment 132, it is not clear exactly how ministers would consult Parliament in a way that fulfilled the duty that the amendment encompasses.

I remind members that section 27(2) prohibits ministers from directing the advisory body as to the content of any advice or report, which protects its ability to publish its expert views unhindered and untrammelled by directions from ministers.

Amendment 237 provides a new duty under section 25 for the advisory body to provide advice, analysis and information on ministers’ functions under the act. We have, in some ways, already discussed that in relation to amendment 105. Amendment 237 potentially asks the committee to comment on areas in which it does not actually have, or require to have, the expertise that would enable it to provide information on ministers’ functions. In practice, it would be difficult to go down that road, and I ask members not to proceed on that.

I hope that my assurances to Cathy Peattie will encourage her to feel that it has been worth lodging those probing amendments and getting statements from the minister—which I hope she feels are adequate for the purpose—on the record.

14:00

Cathy Peattie: The minister is aware that I strongly support the establishment of a Scottish committee on climate change and that I am trying to ensure its success. As I said at the start, my amendments are probing. I am content with what the minister has said and seek leave to withdraw amendment 131.

Amendment 131, by agreement, withdrawn.

Section 20 agreed to.

Schedule 1

The Scottish Committee on Climate Change

Amendment 132 not moved.
At present, the Scottish Government is developing its first climate change adaptation programme, which is out for public consultation. The programme will run from 2009 to 2011, when it will be reviewed in the light of the first UK climate change risk assessment. The subsequent programme will, therefore, run from 2012 to 2017.

I should say a bit about the UK climate change risk assessment. It will assess the current and predicted impacts in Scotland as well as the rest of the UK. Many risks will be similar throughout the UK, but some will be specific to Scotland or parts of Scotland, for example those associated with deep peat or native pine woods.

The UK CCRA will provide unprecedented information for Scotland by sector and climatic region—those regions are north, east and west. The Scottish ministers have elected to participate in the assessment, as it will be conducted by a consortium of the UK’s leading experts and will draw on the knowledge of the adaptation sub-committee of the UK CCC. I realise that there are a lot of UK CCRA and UK CCCs in this—trust me.

The Scottish Government funds the UK CCRA along with the UK, Northern Irish and Welsh Administrations. To ensure that the assessment meets Scottish requirements, the Scottish Government will continue to play an active role throughout its development. The Government is part of the steering group that directs the work and will also play a leading role in the provision of Scottish data and information for the assessment, and intends to draw on the expertise of the Scottish Environment Protection Agency, Scottish Natural Heritage and others to assist in the exercise.

The first UK CCRA will be delivered in 2011, and subsequent reports will be produced every five years. Adaptation requires a long-term approach, as developments in climate change science run on a more or less five-year cycle and impacts and adaptation measures affect us over the long term.

The findings of the UK CCRA will inform policy development within Scotland. In formulating the Scottish ministers’ programme for adapting to climate change, further consideration of the findings will necessarily be carried out by relevant Scottish policy developers, particularly within the Scottish Government and its agencies.

I submit that amendments 190, 191, 215 to 218, 233 and 235 strengthen the Government’s approach to adaptation, increase scrutiny of it and accountability for it, and underline the annual reporting on it.

I move amendment 190.

**Stewart Stevenson:** Last week, we focused on numbers and targets; this week, we are starting to engage on the activities that we need to undertake. Adaptation is an important activity, and I am happy to encourage committee members to support all the amendments in the group.

No Government can address climate change alone; adapting to the changes in our environment will require the engagement of every part of our community. The Scottish Government is working to clarify roles for key stakeholders and define how it will work with them. Mr McNulty’s amendment 214 is in line with that, therefore I am happy to commend it to the committee.

Adapting to climate change is also vital to laying the foundations for our future economy, environment and social wellbeing. The Scottish Government wants to do all that it can to foster innovation, and this group of amendments will strengthen progress reporting on the Scottish ministers’ programme for adapting to climate change. I am therefore content to support all the amendments, but particularly amendments 190, 191, 215 to 218, 233 and 235.

The Government’s amendments 141 to 144 are quite straightforward: they simply seek to amend section 45 to give priority to the Scottish ministers’ programme for adapting to climate change.

I hope that the committee will see its way to supporting all the amendments in the group.

**Des McNulty:** The proposals in amendment 214 take forward two recommendations that we made in our stage 1 report: the requirement for public engagement and the need to involve stakeholders, particularly employers and trade unions. I am pleased that the minister is willing to accept the amendment. For our part, we are keen to support the amendments in the name of Rob Gibson.

**Rob Gibson:** In winding up, I thank members for their contributions and the minister for his support. Amendment 215 is necessary, because there is an error in the bill. It says that we will receive a report from the UK secretary of state; in fact, we will receive a copy of the report. Amendment 215 corrects that error. I did not mention that earlier; I kept it for last. I wanted to see whether everyone was still awake. I will press amendment 190.

Amendment 190 agreed to.

Amendment 191 moved—[Rob Gibson]—and agreed to.

Section 21, as amended—[Rob Gibson].

**Section 22—Advice on annual targets etc**

Amendment 106 moved—[Patrick Harvie].
The Convener: The question is, that amendment 106 be agreed to. Are we agreed?

Members: No.

The Convener: There will be a division.

For
Harvie, Patrick (Glasgow) (Green)
McInnes, Alison (North East Scotland) (LD)

Against
Gibson, Rob (Highlands and Islands) (SNP)
Gordon, Charlie (Glasgow Cathcart) (Lab)
Johnstone, Alex (North East Scotland) (Con)
McNulty, Des (Clydebank and Milngavie) (Lab)
Peattie, Cathy ( Falkirk East) (Lab)
Somerville, Shirley-Anne (Lothians) (SNP)

The Convener: The result of the division is: For 2, Against 6, Abstentions 0.

Amendment 106 disagreed to.

Amendment 107 not moved.

Amendment 108 moved—[Patrick Harvie].

The Convener: Can I see all those in favour?

Alex Johnstone (North East Scotland) (Con):
Instead of moving to a vote, do you not want to put the question, convener? We are agreed—I am agreed.

The Convener: You are? Are others agreed?

Members: Yes.

Alex Johnstone: Show more optimism, convener.

The Convener: There is no need to vote on amendment 108.

Amendment 108 agreed to.

The Convener: Where are we now? You have thrown me. [Laughter.]

I call amendment 192, in the name of Des McNulty, which has already been debated with amendment 187.

Des McNulty: I think that I had an assurance on the matter from the minister.

Amendment 192 not moved.

Amendment 109 moved—[Patrick Harvie].

The Convener: The question is, that amendment 109 be agreed to. Are we agreed?

Members: No.

The Convener: Clearly, Alex Johnstone does not want a precedent to be set.

There will be a division.

For
Harvie, Patrick (Glasgow) (Green)
McInnes, Alison (North East Scotland) (LD)

Against
Gibson, Rob (Highlands and Islands) (SNP)
Gordon, Charlie (Glasgow Cathcart) (Lab)
Johnstone, Alex (North East Scotland) (Con)
McNulty, Des (Clydebank and Milngavie) (Lab)
Peattie, Cathy (Falkirk East) (Lab)
Somerville, Shirley-Anne (Lothians) (SNP)

The Convener: The result of the division is: For 2, Against 6, Abstentions 0.

Amendment 109 disagreed to.

Amendment 110 not moved.

The Convener: I call amendment 60, in the name of Des McNulty, which has already been debated with amendment 50. If amendment 60 is agreed to, amendment 19 will be pre-empted.

Amendment 60 not moved.

Amendment 19 moved—[Stewart Stevenson]—and agreed to.

Amendment 61 moved—[Des McNulty].

The Convener: The question is, that amendment 61 be agreed to. Are we agreed?

Members: No.

The Convener: There will be a division.

For
Gordon, Charlie (Glasgow Cathcart) (Lab)
Harvie, Patrick (Glasgow) (Green)
McInnes, Alison (North East Scotland) (LD)
McNulty, Des (Clydebank and Milngavie) (Lab)
Peattie, Cathy (Falkirk East) (Lab)

Against
Gibson, Rob (Highlands and Islands) (SNP)
Johnstone, Alex (North East Scotland) (Con)
Somerville, Shirley-Anne (Lothians) (SNP)

The Convener: The result of the division is: For 5, Against 3, Abstentions 0.

Amendment 61 agreed to.

Amendment 193, in the name of Des McNulty, is grouped with amendments 194 to 196, 137 to 138 and 119.

14:15

Des McNulty: Amendments 193 and 119 are, in a sense, similar; the issue is their positioning in the bill. The committee has adopted an approach of asking for the respective contributions that the four main areas of energy efficiency, energy generation, land use and transport should make towards meeting the annual targets. That approach should be identified in section 22, which deals with the giving of advice, because that will provide the earliest indication of what is accepted. I half take the view that if amendment 193 is agreed to, amendment 119 might not be
necessary, but I will leave it to Alison McInnes to make her own case in that regard.

The committee is keen on amendment 193 being incorporated in the bill, as that will carry forward an approach that the committee agreed to in its stage 1 report. On that basis, I commend amendment 193 to members.

I move amendment 193.

The Convener: I welcome Liam McArthur, who has joined us.

Liam McArthur (Orkney) (LD): Thank you very much, convener.

At the outset, I should probably declare an interest. As committee members and the minister will be aware, there were press reports at the weekend that it is likely that the Orkney island on which I grew up—Sanday—will be uninhabitable by the end of the century as a consequence of climate change. According to some projections, Sanday and the neighbouring island of North Ronaldsay will be completely under water by then. My parents still live happily and healthily at the north end of Sanday, and I am painfully conscious that my prospective inheritance may sink below the waves in the decades ahead.

I represent a constituency that is seen as a bellwether for climate change. That brings home to me the purpose of my amendments and the bill. My amendments seek to ensure that decisions on new electricity generating plants such as coal-fired plants are made with the full understanding of their impact on the budgets and targets that we set for Scotland's overall greenhouse gas emissions. The amendments build on the sound principle in section 29 that recognises the importance of electricity generation to our overall emissions and the proportionate, given the importance of electricity to the overall achievement of our climate change targets.

I do not want to put words into the minister's mouth, but he may be uncomfortable with the levels of detail in amendments 195 and 196. However, I argue that the detail can be seen as proportionate, given the importance of electricity generation to our overall emissions and the achievement of the targets that will be set.

Amendments 195 and 196 reinforce Des McNulty's amendment 193 by specifying that the advice should address lifetime emissions against a cumulative budget, not simply against annual emissions. The UK Committee on Climate Change increasingly supports that approach, which is borne out by its decision to assess and recommend average greenhouse gas emissions per megawatt hour of capacity for the UK at several dates in the timeline towards the virtual decarbonisation of the electricity supply. It would clearly be reasonable and useful to seek such advice from the advisory body.

Amendments 137 and 138 reinforce amendment 119 by requiring the reports that are called for also to address the lifetime emissions of new consents and to explain the logic behind granting new consents that are likely to cause concern. Ministers may wish to define an appropriate level through guidance in due course, but I think that the California standard—which measures against the emissions of a modern gas plant—is appropriate, at least in probing the amendments with ministers.

In recent weeks and months, there have been many welcome carbon capture and storage developments from the Governments north and south of the border and at the European Union level. The bill is probably not the place to mandate CCS, but the amendments on advice and reporting would mean that a carbon capture and storage station consent would not trigger a ministerial statement, although an unabated coal permission would. That is a helpful distinction.

Alison McInnes (North East Scotland) (LD): Amendment 119 introduces a new subsection. It was lodged in response to a unanimous committee recommendation that the bill ought to contain some broad sectoral targets. The amendment does not get into the matter of what those targets should be; rightly, it leaves that to ministers through the development of action plans. However, it is important for the bill to acknowledge at the outset the role that everyone will play in trying to meet the targets.

In order to meet emissions reduction targets, it will be important for all sectors to contribute, and my amendment 119 will ensure from the start that ministers have a duty to direct the four major contributors to Scottish emissions on the efforts that they have to make towards meeting the overall annual targets. Enshrining basic sectoral targets in the bill will help to ensure that emissions are reduced across the Scottish economy. That is the most efficient way of ensuring that the majority of our reduction targets are met through domestic effort rather than the use of carbon units. Sectoral targets will encourage innovation in those sectors, which might result in the development of new technologies, techniques and policies that can play a role in boosting Scotland's economy as other countries look to adopt those innovations.

I support Liam McArthur's amendments 195, 196, 137 and 138. I support Des McNulty's amendment 193, but I query the need for amendment 194.

Stewart Stevenson: I am pleased to confirm that we encourage the committee to support amendment 193 and that, if Mr McNulty feels that it is required, we have no difficulty with amendment 194.
As the committee said in its stage 1 report, energy efficiency, energy generation, land use and transport will be important areas in any strategy to reduce Scotland’s emissions. Mr McNulty’s amendments 193 and 194 clearly address those issues, ensuring that they are not excluded from any advice that the advisory body gives to the Scottish ministers on annual targets. I doubt that, in practice, they would be excluded, but it is entirely proper that we seek to amend the bill to ensure that they are formally covered.

Alison McInnes’s amendment 119 is on a similar subject. We are quite comfortable with the general policy intention that underpins the amendment, but there are some drafting problems that mean that we cannot support it as it stands. It is rather difficult to argue that energy efficiency is a sector of or an area within the Scottish economy, which is where the difficulty lies. However, I am comfortable with the policy direction and, if Alison McInnes is content, I am quite happy to bring forward a Government amendment at stage 3 to achieve the same outcome, however that is done.

On Liam McArthur’s amendments 195, 196, 137 and 138, I had not been aware that Sanday and Ronaldsay were going to disappear beneath the waves. It is a statement of the obvious to say that I would not welcome our losing any part of Scotland, but I would also not like Mr McArthur’s inheritance to be affected, so we will see what help we can give him on that one.

We have sympathy with the general ethos of Mr McArthur’s amendments, because it is worth while to be able to demonstrate how green our electricity generation is, as that have the benefit of motivating innovation and so on. That was the reason why we included details of electricity consumption in section 29(4). I am therefore content to recommend that the committee support amendment 137, because reporting greenhouse gas emissions that are associated with electricity generation would be a useful addition to the bill. We will want to consider further whether there might be some difficulties around the data that will be available to support and sustain that reporting. If we establish that that is the case, we will seek to fine-tune the bill at stage 3. However, we are content for the amendment to be passed at this stage—we will not try to tinker with the policy intention.

Amendments 195 and 196 present us with some difficulties. Amendment 195 is intended to require the advisory body to provide advice to the Scottish ministers in respect of emission standards for electricity generators. However, the drafting makes it difficult to know what the advisory body would actually be required to include in that advice. There is also a discrepancy with the time periods in amendment 195. The amendment refers to “the net Scottish emissions budget for the period 2010-2050”, but is placed within section 22, which requires the advisory body to provide advice in relation to the setting of annual targets. Batches of annual targets will be set in 2010, 2011, 2016, 2021 and so on. Annual target batches will cover 12 to 16 years at any given time, prior to the immediate run-in to 2050. Amendment 195 would require the advisory body to provide advice on electricity generation emissions every time that batches of annual targets were set. That would be done without reference to the annual targets but, instead, with reference to the net Scottish emissions budget for the whole period from 2010 to 2050, which is somewhat at odds with other reporting timescales in the bill.

The proposed new section 22(3)(d)(i) in amendment 195 would require the advisory body, when providing advice to the Scottish ministers on the setting of annual targets, to express a view as to the “appropriate total lifetime greenhouse gas budget per megawatt hour of generating capacity”, but it is not clear from the amendment whether that would be a single average figure per megawatt hour for the period 2010 to 2020, although we find it difficult to see what else it could be.

The units are also a problem. The term “megawatt hour” is incorrect in the context. Megawatt hours are measures of energy that is generated over time, in other words, power delivered. Energy generation capacity, to which the amendment refers, is measured simply in megawatts—no time factor is associated with it. A budget, which in this context is an amount of emissions over time, cannot be set in relation to measures of energy generated over time.

The proposed section 22(3)(d)(ii) refers to “appropriate initial levels of greenhouse gas emissions per megawatt hour.” Setting aside the issue of the measurement units, which I have already referred to, the advisory body would have to give its views on that matter at least every five years, and it would not be possible for it to give its views on initial levels of emissions each time.

Amendment 196 also contains a technical flaw as it refers to “the relevant body” but is placed within section 22, which is concerned with advice that the advisory body must provide to the Scottish ministers.
Amendment 138 uses the term "modern combined cycle gas turbine" as a reference point. We are not clear what the legal interpretation of the term "modern" might turn out to be, given that the bill is designed to last until 2050. We also have difficulties with the fact that the amendment's reference point is gas, and does not appear to take other energy sources into account.

We need a balanced energy mix. Reference was made to carbon capture and storage. The post-combustion CCS proposals for Longannet are welcome. We are leading the way on that. That technology and others have the potential to reduce emissions, and the Government has made clear that we place huge importance on that and are committed to the decarbonisation of our electricity by 2030, which follows the recommendations of the Committee on Climate Change.

The factors that I have outlined explain our difficulties with the detail of many of the amendments, which is why we cannot support them, although we absolutely understand why members lodged them.

The Convener: I ask Des McNulty to wind up the debate on this group and indicate whether he wishes to press or withdraw amendment 193.

Des McNulty: It has been interesting to listen to the minister speak about Liam McArthur's amendments. I took from that that there is a shared objective, but there are some concerns about the drafting. Perhaps we can come back to that at stage 3.

I hope that the committee will agree to amendment 193. We might consider a revised version of amendment 119 in due course, if that proves to be necessary.

I press amendment 193.

Amendment 193 agreed to.

Amendment 194 moved—[Des McNulty]—and agreed to.

The Convener: Amendment 195, in the name of Liam McArthur, has already been debated with amendment 193. I ask Liam McArthur whether he wishes to move the amendment.

Liam McArthur: I am inclined to move amendment 195. Although the minister was sympathetic to the rationale behind it, I am not sure that he made clear whether he proposed to return with wording to address his concerns about amendments 195, 196 and 138. In the absence of that clarification, I move amendment 195.

The Convener: The question is, that amendment 195 be agreed to. Are we agreed?

Members: No.

The Convener: There will be a division.

FOR
Harvie, Patrick (Glasgow) (Green)

Section 24—Scottish Ministers' response to reports on progress

The Convener: Amendment 64, in the name of Alison McInnes, was debated with amendment 9. I point out that, if amendment 64 is agreed to, I will be unable to call amendment 22, in the name of the minister.

Amendment 64 moved—[Alison McInnes].

The Convener: The question is, that amendment 64 be agreed to. Are we agreed?

Members: No.

The Convener: There will be a division.
Amendment 64 disagreed to.

Amendment 22 moved—[Stewart Stevenson]—and agreed to.

Section 24, as amended, agreed to.

Section 25—Duty of advisory body to provide advice or other assistance

Amendment 237 not moved.

Section 25 agreed to.

Section 26 agreed to.

Section 27—Power to give directions to advisory body

The Convener: Amendment 113, in my name, is grouped with amendment 114.

Amendment 113 amends the section that gives ministers the power to give directions to the advisory body. Once again, I return to the theme of the independence of the advisory body. It seems to me entirely reasonable that ministers should be able to give guidance on specific issues to the advisory body. However, the power to give directions seems to go further than is required and, if we are to agree that ministers should be able to exercise the power to give directions to the advisory body, I would like the minister to give us specific reasons for that.

We have made it clear all along that we want the Scottish Government’s approach to climate change to be science led. As the advisory body will be the principal source of scientific advice on the issue, it is important that that body can exercise its functions in a manner that is at least broadly independent. I am as sure as I can be that the current Government would not wish to frustrate the efforts to tackle climate change. However, we are setting up a system that must be robust whatever future Government might exist and in the face of significant challenges. The ambition to secure substantial and dramatic long-term cuts in carbon emissions and greenhouse gas emissions will result in some difficult decisions being made, and some aspects of what is required will be unpopular. It is possible that a future Government might want to take a different approach from that which the science suggests is required. Therefore, it seems necessary that the advisory body should be able to exercise its functions independently, and that a future Government is not allowed to take an easy option that may be politically less damaging but environmentally more damaging.

Amendment 113 simply removes the section that allows ministers to give directions to the advisory body.

I move amendment 113.

Stewart Stevenson: Amendment 113 would delete all of section 27 apart from the statement:

"The Scottish Ministers may not direct the advisory body as to the content of any advice or report."

The convener appeared to suggest that, without the amendment, ministers could influence the expert advice that is to be provided by the advisory body. However, section 27(2) makes it perfectly clear that that cannot happen.

It might be worth pointing out that the corresponding powers in the UK Climate Change Act 2008 are more broadly drawn. The act says:

"The national authorities may give the Committee directions

"as to ... the exercise of ... its functions generally, or ... any of its functions under schedule 1."

With section 27(2), we have ensured that the powers are more tightly drawn and that the advisory body can provide independent expert advice.

Why would ministers wish or require to give directions to the advisory body? One mechanical example of what might happen if the powers were to be deleted—I make it clear that this is as much speculation as a situation in which a minister might wish to damage the body’s powers, which of course would not happen under any Administration—is that if, say, the body wished to take over the whole Royal high school campus for its headquarters, the minister would have no power to direct that it should not do so or that it should set itself up at a more appropriate location or in a more appropriate size of building. Once the exclusion in section 27(2) is taken into account, the direction retained is the direction that it would be proper to give to any body. I simply do not think that amendment 113 is directing its fire in the right direction and I encourage the committee not to support it.
body’s ability to perform its functions. It is, however, worth reflecting on whether the intention behind amendment 113 might be better expressed by taking a different approach to section 27(2), which it seeks to retain.

Amendment 113, by agreement, withdrawn.
Amendments 136 and 114 not moved.

Section 27 agreed to.

Section 28—Reports on annual targets

Amendment 65 moved—[Des McNulty].

Amendment 115 disagreed to.

Section 28, as amended, agreed to.

Section 29—Reports on annual targets: content

The Convener: Amendment 116, in my name, is grouped with amendments 67, 117, 118, 23, 120 and 121.

Amendment 116 relates to paragraphs 66 to 72 of the committee’s stage 1 report, which deal with the question of reporting on cumulative emissions. In particular, we recommended that, although a reporting regime on cumulative emissions must be separate from reporting on the targets that the bill will establish formally, the Government should develop an approach on the data for cumulative emissions.

14:45

I acknowledge that several approaches could be taken. It could be argued fairly that Cathy Peattie’s amendments 118, 120 and 121 provide a better and more effective method of achieving the aim than my suggestion provides. Either approach would work better alongside the approach that I suggested in other amendments, which was that we should use the form of words a “fair and safe” level of emissions. We might still have time to address the need for that form of words.

We have heard the arguments in favour of reporting on cumulative emissions. The committee is well aware that the emissions in any one year, whether in 2020, 2050 or any other point in time, are not the emissions that have an impact on climate change—that impact is a result of the total emissions over the period. It is therefore a requirement that the committee’s recommendation should be taken into account. I am happy to hear arguments for other approaches and to hear the minister’s response. However, I hope that, at the end of the debate, a version of our agreed recommendation—that we need reporting on cumulative emissions—is agreed by the committee.

I move amendment 116.

Des McNulty: I will leave Cathy Peattie to speak to her amendments on cumulative assessment. I simply say that I broadly prefer her approach to that which was suggested by Patrick Harvie.

Amendment 67 in my name is intended to ensure that we have a record of the extent to which the reduction in the net Scottish emissions account can be accounted for by reductions in net Scottish emissions. In other words, it seeks to include information on the proportion of domestic reductions in the overall reductions that are derived from the efforts that are undertaken.

Cathy Peattie: It is obvious from our debates and discussions that there is a fair amount of common ground on the call for cumulative
targeting and measuring. Amendments 118, 120 and 121 are fairly simple, I guess. They would require annual reporting on cumulative emissions from 2010 to 2050, with a breakdown for the periods 2010 to 2020 and 2010 to 2050. We must be clear about how we measure emissions, and we should recognise the importance of cumulative targets. It is vital that the provisions are included so that there is no ambiguity on how cumulative emissions are measured and the role of cumulative targets.

Stewart Stevenson: We are relaxed about the amendments in the group, although we particularly commend those in the name of Cathy Peattie as ones that should attract support, as I think the convener acknowledged.

Amendment 23, which is in my name, is relatively technical. There might be occasions when it is necessary for us to adjust the amount of the Scottish net emissions account for a past year, because of either significant changes in emissions or the use of credits. It is important that we can correct the account in a variety of circumstances. The amendment would require the Government to give an account to Parliament of why an adjustment is required and to restate the accounts. As we proceed to 2050, international standards and measurements will change and we will find from time to time omissions or double counting in published numbers, so it is important to have the power but to be accountable for its exercise.

The Convener: I welcome the clear recognition that an approach of cumulative emissions reporting is required. I endorse again the approach that Cathy Peattie proposes. On that basis, I seek leave to withdraw amendment 116.

Amendment 116, by agreement, withdrawn.

Amendment 67 moved—[Des McNulty]—and agreed to.

Amendment 117 not moved.

Amendment 137 moved—[Liam McArthur]—and agreed to.

Amendment 138 moved—[Liam McArthur].

The Convener: The question is, that amendment 138 be agreed to. Are we agreed?

Members: No.

The Convener: There will be a division.

Meeting suspended.

14:59

On resuming—

The Convener: I welcome Jim Hume, Peter Peacock and John Park to the meeting. They have joined us for the resumption of our consideration of amendments.

After section 31

The Convener: Amendment 70, in the name of Shirley-Anne Somerville, is grouped with amendment 124.

Shirley-Anne Somerville (Lothians) (SNP): With the exception of specified emissions from international aviation and shipping, Scottish emissions, according to the bill, are emissions that "are emitted from sources in Scotland". That approach is consistent with the reporting methodology that is required under the protocols of the United Nations Framework Convention on Climate Change. However, measuring Scotland’s emissions using that production-based methodology does not take account of emissions that are generated outside Scotland in the creation of goods and services that are ultimately consumed in Scotland. A frequently used example is the closure of the Ravenscraig steelworks in 1991. Scotland’s carbon emissions reduced considerably as a result of that closure, but our consumption of steel has increased since 1991 and we use a greater quantity of imports.

The purpose of amendment 70 is to place a duty on the Scottish ministers to produce "a report in respect of each year in the period 2010-2050", which must "set out the emissions of greenhouse gases … which are produced by or otherwise associated with the consumption and use of goods and services in Scotland during that year."

Measuring and reporting emissions on the basis of consumption is a developing area. In its stage 1 report, the committee recommended that any provisions in that respect “should be flexible enough to take account of developing international understanding of the methodology for consumption reporting.”

Amendment 70 provides such flexibility, and it has the support of the Stop Climate Chaos Coalition, which I thank for its assistance in putting together the amendment.

I move amendment 70.

The Convener: Amendment 124 is in my name. Like Shirley-Anne Somerville’s amendment, it emphasises the importance of finding mechanisms to address consumption-based emissions. The effort to cut Scotland’s long-term greenhouse gas emissions will be worth very little if all that we end up doing is exporting emissions to other countries. It is clear to most people that a substantial chunk of Scotland’s and the UK’s emissions reduction over recent decades is a result of industries moving overseas, rather than of practices changing. Carbon emissions that are moved from one country to another should not really be thought of as reductions in emissions.

The committee explored those issues in its stage 1 report and recommended “that a mechanism for reporting on consumption should be established which is in addition to, but separate from, the framework of targets set out in the Bill.”

Amendment 124 seeks to ensure that the Scottish Government’s development of a methodology to achieve that would be put to public consultation. It stands together reasonably well with Shirley-Anne Somerville’s amendment 70, which I intend to support. Amendment 70 requires ministers to lay a report containing information on emissions that are produced in association with "the consumption and use of goods and services in Scotland".

Amendment 124 simply adds that there should be a process of consultation around the methodology. On its own, amendment 124 places a requirement on the Government to come forward with proposals; in association with amendment 70, it makes it clear that the process should happen more or less immediately, and certainly for the 2010 report. For that reason, I think that the two amendments in the group are compatible.

Stewart Stevenson: Amendments 70 and 124 address the need for a consumption reporting duty. The production-based measurement that the bill establishes is consistent with international emissions reporting practice, as established under the UN Framework Convention on Climate Change. However, like other members, I recognise that measuring Scotland’s emissions using production methodology does not tell the full story, as it does not account for the emissions that are produced by the goods and services that we import. For that reason, I am happy to support
amendment 70, which will help to provide a fuller picture when it comes to calculating and reporting Scotland’s emissions.

By contrast, amendment 124 in the convener’s name focuses on consultation about possible ways of recording and reporting consumption. If amendment 70 is agreed to, amendment 124 is not necessary because the information to which it refers is a subset of the information that is required under amendment 70.

More fundamentally, amendment 124 deals only with the process of importation and does not deal with any other issues that are associated with the goods and services. Therefore, it is extremely restrictive with regard to the effect of goods and services that have come from elsewhere. The act of importation is but a small part of the carbon cost of such an activity.

Accordingly, I invite the committee to support amendment 70 but not amendment 124.

Shirley-Anne Somerville: Given the minister’s remarks on amendment 124 and its narrow interpretation, I am reluctant to request that the committee support it.

I stress the fact that WWF Scotland has advised me that, if amendment 70 is agreed to, the bill would be the first to make consumption reporting a legislative requirement. Although we may disagree about whether other parts of the bill are world leading, the proposed new section that amendment 70 would insert truly would be.

Amendment 70 agreed to.

Amendment 197 moved—[Des McNulty]—and agreed to.

Section 32—Report on the interim target
Amendments 24 to 26 moved—[Stewart Stevenson]—and agreed to.
Amendment 120 moved—[Cathy Peattie]—and agreed to.
Amendments 27 to 31 moved—[Stewart Stevenson]—and agreed to.
Section 32, as amended, agreed to.

Section 33—Report on the 2050 target
Amendment 121 moved—[Cathy Peattie]—and agreed to.
Section 33, as amended, agreed to.

Section 34—Reports: provision of further information to the Scottish Parliament
The Convener: Amendment 71, in the name of Des McNulty, is grouped with amendments 122, 122A, 72, 73 and 123.

Des McNulty: My purpose in lodging amendments 71 to 73 was to attempt to streamline the reporting process so that the Parliament’s requirements and the Government’s responsibilities mesh. I sought advice from the clerk on the best mechanism to do that, so there is a weight of consideration behind introducing the right mechanisms to trigger reports being sent to the right places and dealt with correctly by the Parliament’s committees.

On amendment 122, in the convener’s name, and amendment 122A, in the name of Alison McInnes, I seem to remember that the convener was one of the critics of the national planning framework reporting system, and I wonder whether a restricted 60-day consultation period would give all committees in all circumstances the maximum flexibility and opportunity to fulfil their reporting responsibilities. I would prefer the mechanism that I suggest.

I will wait to hear what Alison McInnes has to say on amendment 123, but I fear that the amendment as drafted might inhibit the Scottish Government from doing good things in advance of Parliament holding a meeting to agree to put them in place. I am not sure that the proposed mechanism is the best approach, and I commend instead the approach that I put forward in amendments 71 to 73.

I move amendment 71.

The Convener: I will speak to amendment 122 and the other amendments in the group. I acknowledge that the basic model that I am proposing is the one that was adopted in relation to the national planning framework: the idea of a fixed period for parliamentary consideration.

I acknowledge the spirit in which the Government introduced its proposal for a process of communication or debate with the committee conveners. It was broadly recognised that, although that mechanism was not quite the right one for enhanced scrutiny, it was brought forward in the right spirit. The Government recognises that the consideration of the reports is more than a small piece of business that a committee might polish off in one agenda item in an afternoon, and that we require something more.

That was similarly acknowledged in relation to the national planning framework. I argued for the mechanism in that case to be strengthened in some aspects, and there was debate on the length of time that should be allowed, but a more fundamental argument was about whether ministers should approve the NPF or Parliament should approve it through a vote. That argument is perhaps less relevant to the application of the mechanism to the parliamentary consideration of reports in this area. The parliamentary
consideration period of 60 days would allow not only the committee that has climate change as a specific part of its remit—this committee or a successor committee—but other committees that have responsibility for policy areas with a clear relevance to climate change, such as housing, agricultural land use or energy, to consider the report and to produce a report if they saw fit.

I do not object, as such, to some of Des McNulty’s proposal, but I am not entirely sure that it adds to what parliamentary committees are already able to do. Committees can call ministers to appear before them—as the minister who is before us today does from time to time—to answer questions. I am not sure what specific benefit arises from expressing that power, which we already have, in the bill. I emphasise the additionality of the mechanism that I am proposing, which requires a pause of 60 business days in which parliamentary committees can conduct a process, after which the minister can bring forward a statement.

I am happy to accept Alison McInnes’s amendment to amendment 122, as it clarifies it somewhat. I ask Alison McInnes to speak to amendment 122A and other amendments in the group.

Alison McInnes: I support amendment 122, as amended by my minor amendment 122A, which provides a bit of clarity and does not need much further explanation. On a point of principle in relation to amendment 122, I agree that the idea of assessing the situation in the same way as the national planning framework deserves a great deal of consideration and carries a lot of merit. If we are to make the changes that are needed in response to climate change, we need cross-party support and thorough, on-going debate, and we need to encourage the iterative process that will emerge from such debate, to ensure that over the years all members of the Parliament are properly engaged.

The approach would ensure that, although it would remain the responsibility of the Government of the day to develop proposals to compensate for the excess emissions, the Government would be required to take on board the Parliament’s views, as happens with the national planning framework. The requirement to gain the Parliament’s approval for the proposals should enable us to come up with the most effective approach.

Mr McNulty said that a delay of 60 days would prevent the Government from taking effective action. However, we are talking about a long-term programme. If we miss a target, it will be appropriate to take a little time to reflect on how we can get back on track.

Stewart Stevenson: This group of amendments is very much about how the Parliament will be informed. I do not want to be unduly prescriptive about the matter on behalf of the Government, because it is substantially for the Parliament to determine how it wants information to be provided and how it wants to interact with ministers. The point was made that ministers are regularly required to appear before committees of the Parliament. I have done a quick check and I think that I have appeared before six or seven committees so far, and I am sure that other ministers operate on a similar basis.

I am relatively relaxed about amendment 71, in Des McNulty’s name. However, amendment 71 would not add a great deal to the bill and there is a risk that its proposed approach is at odds with rule 14.1.1 of the standing orders of the Scottish Parliament, which envisages a single gateway for the provision of information to the Parliament. I suggest to Mr McNulty that the debate will serve the purpose that he seeks to achieve and I ask him not to press amendment 71.

The language of the debate on amendments 122, 122A and 123 was interesting. The convener talked about a mechanism that “requires a pause of 60 … days” and Ms McInnes talked about the need to “take a little time” to consider missed targets. If there is any subject in relation to which the Government has been under intense pressure as the bill has progressed, it has been the need for urgent action.

The approach that is set out in amendment 123 would provide for a pause in circumstances in which a target was missed. It is worth making the point that a report would be laid before the Parliament some two years after the year in which the target should have been met. Amendment 123 carries the risk that ministers would not be able to engage in advance of the report being laid. In general, the missing of a target will be foreseen as a result of early data, which will be available to members and ministers. In any event, failure to
meet a target will be precisely the point at which the urgent action that is asked of the Government will be most needed.

It is certainly the case that, when there is a missed target, substantial account has to be taken of the circumstances and Government response. That said, it would be a particularly inopportune point in the cycle at which to put the handcuffs on ministers and prevent them from taking any necessary actions that might just make the difference. I strongly suggest that we do not proceed along the way that is set out in amendment 123.

Amendment 72 does not add anything significant to the bill, as we attend parliamentary committees already. In fact, the requirements are less onerous than the provision in section 34 that it seeks to replace. We recognise the cross-cutting nature of climate change. Some have suggested that the meetings with conveners would be held in private, but we would be very disappointed if that were the case, as it is important that things are done in public.

On amendment 73, of course, Parliament must hold ministers to account on this subject as it does on so many others. The bill probably goes further than anything that we have done so far to ensure high levels of scrutiny. However, the contents of reports should be a matter for ministers to decide and Parliament should question ministers on what they should include in reports, what their actions are and what reports are about. If Parliament were to control and dictate the content of reports, there would be little role for ministers in defending them and it would be difficult to hold ministers to account for them.

I hope that that is helpful. We take the view that it is fundamentally for the Parliament to come to its conclusions on this matter, but I hope that, in coming to its decisions, the committee will take account of my remarks.

Des McNulty: I do not have much to add to what the minister and I have said on amendment 123 other than to say that it is well intentioned but probably not the right thing to do.

On amendment 122, the national planning framework mechanism was deemed appropriate for something that would be brought forward every five, six or 10 years—an event with a process defined for dealing with it. However, that mechanism is being applied here to an annual process of target review. Is the NPF mechanism, with all its associated constraints and timescales, as relevant in this context as it is in other settings?

We have heard that amendments 71 to 73 do not add much to the standing orders. In fact, they are a reflection of standing orders and the mechanism for ensuring that committees get information and can respond speedily.

Amendment 71 contains a requirement for copies of reports to be sent to committee conveners. We are unhappy about the proposed use of the Conveners Group, which meets in private, as the mechanism for scrutiny. We want that task to involve a committee that meets in public.

If we agree to amendments 71 to 73, we will not only get the information but committees will be enabled explicitly to call witnesses before them to give evidence on the report and require ministers to have regard to resolutions or reports from the Parliament or its committees. The proposed mechanism is simple and straightforward. I hope that members support the amendments.

I will press amendment 71.

The Convener: The question is, that amendment 71 be agreed to. Are we agreed?

Section 36—Duties of public bodies relating to climate change

The Convener: That brings us to climate change duties on public bodies. Amendment 198, in the name of Cathy Peattie, is grouped with amendments 199 to 203, 228, 230, 231, 234 and 236.

Cathy Peattie: It will be important that duties are placed on public bodies, to ensure that the ideas in the bill are taken forward.

It is perhaps starting the wrong way round, but amendment 236 seeks to amend the reference to public bodies in the long title. The duties on public bodies in relation to climate change are reflected in this suite of amendments.

The voluntary approach did not work for equalities. Right at the start of the bill team’s work, the team told us of the hope that local authorities and other public bodies would accept the commitments on climate change. It took 20 years for commitments on equalities to go through and for public bodies to take on their role; we do not have 20 years in which to be hopeful that climate change will be taken seriously by local authorities and other public bodies. However, many local authorities have done a lot of work so far, so I do not think that they have anything to worry about in this legislation.

Public bodies will contribute to the climate adaptation programme. Amendment 234 mentions the timescale—18 months would be allowed after royal assent. That will allow time for local authorities and other public bodies to organise funding and consider their climate change role. This is not about being prescriptive; it is about organisations considering their duties and what they can do to meet climate change targets.

We think that there needs to be clarity on the definition of a public body. Amendment 198 would make it clear which bodies are covered; the amendment refers to the Freedom of Information (Scotland) Act 2002. The national health service, Scottish Water, SEPA, SNH, Scottish Enterprise and others would be included. All of those organisations will have an important role to play. That might relate to the ethos of the organisation, or to how they use transport. I know that we will hear about the NHS and public procurement later on.

My amendments are about ensuring that the bill contains a broad commitment to the introduction of public sector duties. They will mean that if, in 10 years’ time, the Scottish ministers learn of best practice evidence from another country that has better public sector duties, they could decide to adopt one of that country’s initiatives. As well as allowing us to look at where we are now, my amendments provide for a timescale and allow for future flexibility as regards public bodies’ duties.

I move amendment 198.

15:30

The Convener: Thank you very much. I will speak to amendment 202 and others.
I welcome what Cathy Peattie said in her introduction on amendment 198. Section 36(1) will give the Scottish ministers the power to introduce an order to impose climate change duties on public bodies. I recognise the value of the introduction of such duties; in lodging amendment 202, all that I sought to do was to put a timescale on the requirement for ministers to make an order under section 36(1). I have suggested that that should be done within a year of the bill being passed.

However, it seems to me that Cathy Peattie’s amendments are preferable, in that they would create a framework for such duties immediately on the passing of the bill. I certainly intend to support Cathy Peattie’s amendments and to move amendment 202 only if hers should fall; I hope that they do not.

During stage 1, I was greatly encouraged by the number of public bodies that were genuinely supportive of the idea of having public sector duties. Their attitude was analogous to that of certain individuals in more enlightened parts of the private sector, who argue for clear regulation on the basis that they know that the climate change agenda has to be followed and that clarity is necessary so that they can direct investment in the right direction or set up systems to ensure that their businesses can adapt to it. The enlightened public sector bodies, too, have nothing to fear from such duties and much to welcome from the clarity that they will provide. It will not be enough, a few years hence, to look around the public sector in Scotland and see that there are a few islands of excellence from which other people can learn great lessons. We need to ensure that those lessons are rolled out and implemented across the board, and I think that Cathy Peattie’s public sector duties proposal will achieve that.

I repeat that I will pursue amendment 202 only if Cathy Peattie’s amendments are not agreed to, which I hope does not happen.

Des McNulty: We are discussing a section of the bill on which there are differences of principle between the Government and some of the other parties as regards whether climate change duties should be imposed on public bodies. I am keen that that debate—the debate about the principle—does not prevent us, if Parliament wills that there should be such duties, from having a proper debate about the best mechanism for ensuring that those duties are not inappropriate or unduly onerous. We must make a decision about the principle and then ensure that the mechanisms that are put in place give best effect to that decision.

It is important that I put on record that in supporting the principle of creating climate change duties for public bodies, it is certainly not my intention—nor, I am sure, is it Cathy Peattie’s—to imply that local authorities or other public bodies are in any way deficient. We believe that many local authorities are doing an excellent job in addressing climate change. We want to regularise that position and link it to the Government’s broad efforts, rather than see a duty in the bill as a stick to beat local authorities or any other public body. Guidance that binds what is done by public bodies—including local authorities—with what is done by Government is inherently desirable.

Cathy Peattie’s amendment 206 could be interpreted as requiring public bodies to make separate annual reports. I do not think that that is Cathy’s intention. Public bodies already make annual reports and the idea is that information on how they are getting on with addressing climate change should become an integral part of those reports. There are issues that may need to be tidied up, but I hope that we can progress at both levels: that we can have a decision in principle about whether there should be a public duty, and then a sensible discussion about how to configure that in a way that is supportive and constructive rather than onerous and burdensome.

Stewart Stevenson: As Mr McNulty highlighted, this is an area in which—probably uniquely so far—there is a pretty fundamental difference of opinion. In large part, that is driven by the concerns expressed by the Liberal councillor Alison Hay, who speaks for the Convention of Scottish Local Authorities on the subject. I do not wish to overstate this, but on behalf of the local authorities, she believes that the development of a new relationship of partnership, equality and mutual respect between central and local government could be damaged by a return to central Government dictating what local authorities should do.

I put that in the context of the remarks that several who have contributed to the debate quite properly made, which is that local government is making good progress on the subject of climate change. I hope that that puts the issue in context and that there is no suggestion that local authorities are not up for the task—it is clear that they have all signed up to address climate change. The issue is simply a principled disagreement about how local government should come to a conclusion about its contribution.

More generally, though, public bodies for which ministers are responsible are a different matter. To impose duties on such bodies—which is essentially to impose duties on ministers—is quite proper. Des McNulty said that if amendment 198 is agreed to we must not use it as a stick to beat local authorities. I absolutely concur. I know that Des McNulty said that in good faith.
Further, I have no difficulty in agreeing with Mr McNulty when he says that we should have the best mechanism. He referred to the need to tidy up some issues. I hope that we live up to that aspiration. We would certainly not want legislation that was ambiguous or too draconian, or that created difficulties that local authorities felt that they could not manage.

Cathy Peattie’s amendments provide for a period for engagement with local authorities. However, that comes from a point of view of mandating the nature of the outcome that must follow that engagement, which is an approach that does not meet my preference.

The convener’s amendment 202 would be my preferred option. It places a duty on ministers to activate the powers in section 36(1) of the bill within a year. I would have no objection to that amendment.

The Convener: Minister, you say that you are comfortable with activating the powers, as you put it; within a year, but I am a little bit at a loss to understand the principled objection to Cathy Peattie’s proposals, which would do exactly the same thing, in a sense, but that bit sooner.

Stewart Stevenson: The beginning of section 36 is phrased: “The Scottish Ministers may, if they consider it appropriate to do so, by order, make provision relating to the imposition…”.

The point is that amendment 202 would give us a year to discuss with local authorities their plans—which will be produced via COSLA, I imagine—for taking the principal objection to Cathy Peattie’s proposals, which would do exactly the same thing, in a sense, but that bit sooner.

I suspect that we will end up in the same place on this matter, in the end. I do not seek to make an argument that we should end up elsewhere, as I genuinely think that local councils are up for this. I am giving respect to the strongly expressed opinion—which has been expressed to me as minister on a number of occasions—that COSLA does not wish, at this stage, to have duties imposed upon it before it has been able to do the work to produce its own proposals. It is simply on that relatively fine point that we are likely to continue to divide.

I assure the committee that, whatever decisions it comes to in this regard, the Government will, of course, work with and take forward whatever the outcome of this debate happens to be. I am sure that you would expect me to say that, but I take the opportunity to put it on the record.

Cathy Peattie: I feel strongly that amendment 198 should proceed. The minister spoke about our getting to the same place; I do not think that we can wait for more time to pass, and I do not think that it is enough to be hopeful. With respect, convener, your amendment 202 does not help to move things forward. It would lead to a whole lot of uncertainty, and it smacks of being hopeful.

The Convener: Heaven forbid that I should ever be hopeful.

The question is, that amendment 198 be agreed to. Are we agreed?

Members: No.

The Convener: There will be a division.

Amendment 203 agreed to.
Amendment 212 seeks to require the Scottish ministers to lay before the Scottish Parliament any report that they receive from the monitoring body. I am happy to accept the underlying principle and, indeed, am content to accept the amendment in the interests of open government and to ensure that the Parliament receives full and frank information.

Amendment 204 seeks to require that, prior to giving guidance to public bodies under section 43 of the bill, the Scottish ministers have regard to advice that they have been given by the advisory body—I beg your pardon, by the relevant body. This is where the confusion can arise. The Scottish ministers do not believe that the relevant body should have a direct role in Scottish public bodies’ discharge of their climate change duties. Over the next few years, the body in question will be the UK Committee on Climate Change, whose strength lies in giving expert advice that draws on the science and an analysis of what is going on, not in helping us to understand what policies would be appropriate for different parts of the Scottish public sector. That is the role of Government, using the expert advice. On a more technical level, amendment 204 does not work because it does not clearly impose any duty either to seek or to give advice.

Amendments 210 and 211 are similar to amendment 204 in that they risk muddying the functions of the relevant body by placing on it unnecessary and potentially costly duties with respect to the operation of Scottish public bodies. If it becomes necessary to monitor how public bodies are complying with their duties, the Scottish ministers have powers under section 39 to create a monitoring body. Moreover, if ministers ever feel that they need specific advice on the functions of public bodies in relation to climate change, they have powers to request such advice under section 38 of the UK act and section 25 of the Scottish bill. Again, on a technical level, there is neither provision in the bill to require the monitoring body to ask for advice nor any duty on the relevant body to provide advice—there is no provision because it is simply not necessary.

At stage 1—I think in making a more general point—Des McNulty said that he did not want the reporting arrangements in the bill to become overelaborate. This set of amendments carries the risk of overelaboration. We should seek to avoid that.

I am happy to commend amendment 212 to the committee.

Cathy Peattie: I understand what the minister is saying, but it is important that public bodies should gain from advisory body advice or reports and ministerial guidance. How can they take forward their work otherwise?

Public bodies have to look at their plans; they need to design their plans over 18 months or so in order to do that. They need to look at what is said at the time, the available advice and how their organisation can take that forward. Amendment 204 allows for that. I press amendment 204.

The Convener: The question is, that amendment 204 be agreed to. Are we agreed?

Members: No.

The Convener: There will be a division.

The Convener: The result of the division is: For 4, Against 4, Abstentions 0.

The Convener: As I indicated previously, my casting vote is for the status quo.

Amendment 204 disagreed to.

Section 37, as amended, agreed to.

Section 38—Reporting on climate change duties

The Convener: Amendment 205, in the name of Cathy Peattie, is grouped with amendments 206 to 209.

Cathy Peattie: Forgive me, convener, for my error in speaking to amendment 205 earlier in the meeting. My colleague pointed it out and I am grateful for that.

Amendment 205 seeks to ensure that ministers require relevant public bodies to produce reports on an annual basis, including annual reports—obviously they tend to be done on an annual basis.

Sections 40 to 42 are about the monitoring body having regard to the relevant advisory body. I heard what the minister said on the matter and I am willing to hear what more he has to say. Section 42 will trigger the process of reporting powers that are currently used to enable parliamentary consideration of the national planning framework.

Do you want me also to speak to amendment 62, or is it too early for that?

The Convener: Speak only to amendment 209.

Cathy Peattie: Amendment 209 is an important amendment. The committee discussed equal
opportunities and found that the bill was weak in that regard. Amendment 209 seeks to add public bodies to the list in section 62, referring to the definition of public bodies in a new section that will be created by amendment 198.

I move amendment 205.

**John Park (Mid Scotland and Fife) (Lab):** The thinking behind the amendments in the group is to strengthen the quality and calibre of information that the public sector makes available, and to highlight the important role that the public sector and public bodies play with regard to climate change. I am thinking in particular of the procurement decisions that they make, including on low-carbon energy choices and electric vehicles. There are other examples that we can highlight.

We recognise the importance of workplace policies, and there are a number of good examples in which such policies have driven climate change targets, whether in the workplace or more widely. They also result in culture change that can lead to individuals taking on good habits.

Through amendments 208 and 209 we want to establish a reporting structure that provides an opportunity for such activity to be highlighted so that other bodies can learn from it—not only public sector bodies but private sector organisations, the voluntary sector and Scotland more widely.

**Cathy Peattie:** As I said, the whole issue around public procurement is important and would make a tremendous difference to the legislation. I gave many examples of how the ethos of organisations can be affected in respect of how they operate and how they use transport to get from conferences and whatever. General consideration of public procurement in the national health service and in wider public organisations in relation to climate change would make a substantial difference. I support John Park’s amendments 208 and 209.

**Stewart Stevenson:** We commend Cathy Peattie’s amendment 207 to the committee. It seems eminently sensible that Scottish ministers should be able to require any relevant public body that is found to be failing to comply with its climate change duties, following investigation by the monitoring body, to prepare a report on the actions that it is taking to secure future compliance with those duties.

On John Park’s amendments 208 and 209, I acknowledge his long-term interest in procurement. We are well disposed to the principles that underpin the amendments. Procurement policy is an area in which public bodies should have scope to make improvements that contribute to tackling climate change. To focus minds by making reporting on that a specific requirement would be no bad thing. However, there are one or two drafting problems with the amendments as they stand. The use of the word “wider” creates a problem, because it suggests that procurement policies are a narrower form of workplace policy. That could create some difficulties, because that is not necessarily the case. Workplace policies include such things as employee relations, but procurement is an economic activity, as distinct from a workplace policy. I am simply exploring some of the difficulties in the drafting: we would be happy to lodge at stage 3 a Government amendment that will achieve John Park’s policy intention, if he feels that that will be helpful.

On amendments 205 and 206, I think that Cathy Peattie is imagining that Scottish ministers will seek to let public bodies off the hook by imposing climate change duties and then not ensuring that they are met. The bill as a whole, of course, gives Scottish ministers every reason to wish that actions are being taken across Scotland. In practice, it is highly likely that wherever Scottish ministers impose statutory climate change duties on public bodies, they will also impose a duty to report on compliance. However, to require in primary legislation that that must be the case in every circumstance and—more to the point—that the reports must be annual, is inflexible and somewhat disproportionate. For those reasons, I cannot suggest that the committee should support amendments 205 or 206.

**Cathy Peattie:** As I said, I think the amendments are important, but I understand what the minister is saying, so I would like not to press amendments 205 and 206. That will give me an opportunity to hear what the minister has to say in the future and—if I am not happy—to bring back the issue at stage 3.

Amendment 205, by agreement, withdrawn.

16:00

Amendment 206 not moved.

Amendment 207 moved—[Cathy Peattie] and agreed to.

Amendment 208 moved—[John Park].

Amendment 211 disagreed to.

Amendment 212 moved—[Cathy Peattie]—and agreed to.

Section 42, as amended, agreed to.

Sections 43 and 44 agreed to.

After section 44

The Convener: Amendment 213, in the name of Alison McInnes, is in a group on its own.

Alison McInnes: Amendment 213 links strategic environmental assessment more closely with the Climate Change (Scotland) Bill. It is intended to ensure that, when strategic environmental assessments identify that Government plans and programmes will have a large climate change impact, they will be reported on and scrutinised to ensure that they are compatible with the climate change targets. The idea is that, when a minister is minded to approve a plan or programme and the strategic environmental assessment has identified a significant greenhouse gas emission, the minister will be obliged to seek advice from the relevant body on whether or how the plan or programme could be made compatible with the annual targets. Any decision on such a plan or programme could not be made until the advice was given. If the minister wanted the plan or programme to proceed, it could proceed but the minister should make a statement to Parliament setting out why, how the targets would still be met and what other measures would be taken to ensure compliance with the annual targets.

It would be useful to hear whether the minister agrees that the strategic environmental assessment process must be properly aligned with the bill.

I move amendment 213.

Des McNulty: I have some questions about the possible impacts of the amendment. I will use a couple of projects in north-east Scotland as examples, as I know that they will be relevant to both the minister and Alison McInnes. In the event of a future Trump development requiring a strategic environmental assessment, would the provision in amendment 213 require that the decision be made in Parliament rather than by the planning authority? Would that be a good thing? The implication for such developments is not clear to me. Furthermore, would the provision be a barrier to the go-ahead of the Aberdeen western peripheral route, which also requires a strategic environmental assessment? Would either Alison McInnes or the minister regard that as a good
thing? I ask those questions simply for clarification and detail.

Stewart Stevenson: None of my remarks should be taken as applying to the private sector project to which Des McNulty referred, for which planning applications were, I believe, submitted yesterday. Ministers may be involved in making decisions on that project at a later stage.

Des McNulty mentioned the AWPR project, for which the Government is responsible. One of the key questions that are being asked is what would be the effect of the additional provision in amendment 213. We estimate that its effect would be to delay decisions by something in the region of six to nine months. It would also be necessary to increase significantly the resourcing of the UK Committee on Climate Change for that to be reflected in its business plan and to ensure that it would be in a position to undertake the work that would be involved. It is clear that the amendment would create a significant, and unnecessarily cumbersome and unhelpful, layer of bureaucracy.

It is worth revisiting the Environmental Assessment (Scotland) Act 2005, which requires that those who prepare public plans, programmes and strategies that are likely to have a significant impact on the environment—that includes on climatic factors—outline measures in an environmental report to prevent, reduce and, as far as possible, offset any significant adverse effects. People with an interest in or who are likely to be affected by the plan, programme or strategy will then have an opportunity to express any concerns or to make suggestions at the appropriate point in the consultation process. It is a mandatory requirement that those who prepare strategic environmental assessments under the 2005 act must consult Scottish Natural Heritage, the Scottish Environment Protection Agency and Historic Scotland for their expert advice during its preparation.

The post-adoption statement that the 2005 act requires means that responsible authorities, which include the Scottish ministers, already have to outline how their environmental report, and the consultation responses that have been received on it, have been taken into account in preparing the final plan, programme or strategy. In addition, if planning permission or other consent is required to which the Environmental Impact Assessment (Scotland) Regulations 1999 apply, it is likely that an environmental impact assessment will also be required. Scottish ministers must also lay before Parliament a significant report on proposals and policies to meet annual targets each time annual targets are set.

The safeguards do not stop there. As members will be aware, the Scottish Government is developing a carbon assessment tool to calculate the carbon impact of all Government spending decisions. That information will be available to Parliament and will undoubtedly inform debate and decision making on the budget bill each year.

Amendment 213 contains problematic language. I presume that the term "plan or programme" is used with the intention of importing that term’s meaning under the 2005 act, although that is not specified. However, the bill uses the words “plan” and “programme” in different contexts, so there could be significant confusion.

In addition, amendment 213 contains no timescales. Regardless of that, it is inconceivable that it could be implemented without delaying the preparation and delivery of vital plans, programmes and strategies.

The bill’s overarching objective is to reduce Scotland’s greenhouse gas emissions. That is why it places duties on Scottish ministers to ensure that Scotland’s emissions are reduced to meet statutory targets.

I hope that members have been reassured that amendment 213 is unnecessary. Members can think of the effects on a number of projects. An answer that I recently gave to a parliamentary question, for example, indicated that the original evaluation of the Edinburgh tram system showed that it would have a carbon cost of 177 kilotonnes. It is clear that that project would have been significantly delayed if the process in question had been in place. I leave it to others to consider whether that would have been a good or a bad thing.

Alison McInnes: I thank the minister for his thorough response. It would be utterly remiss of us to ignore strategic environmental assessments so I lodged amendment 213 in an attempt to align the processes. However, I accept that there are drafting and timescale issues and I will not press the amendment, although I do not want to jeopardise the opportunity to consider the matter at stage 3. We must accept that business as usual cannot continue. Mr McNulty and the minister cannot say on one hand that we need strong targets and on the other that we must do nothing that might slow down the process or make us rethink our approach. We must start to align our thinking with our ambition.

Amendment 213, by agreement, withdrawn.

Section 45—Programmes for adaptation to climate change

Amendments 141 to 143 moved—[Stewart Stevenson]—and agreed to.

Amendment 214 moved—[Des McNulty]—and agreed to.
Amendments 144 to 148 moved—[Stewart Stevenson]—and agreed to.

Amendment 215 moved—[Rob Gibson]—and agreed to.

Section 45, as amended, agreed to.

After section 45

Amendments 216 to 218 moved—[Rob Gibson]—and agreed to.

The Convener: Amendment 219, in the name of Peter Peacock, is in a group on its own. Peter Peacock has been waiting patiently to speak to his amendment.

Peter Peacock (Highlands and Islands) (Lab): As members know, the Rural Affairs and Environment Committee, of which I am a member, is a secondary committee in the scrutiny of the bill.

The dilemma of competing land uses has become apparent during the committee’s recent work. For example, when we considered the serious implications of the increasing incidence of flooding resulting from climate change, a ready conclusion was that the restoration of peatlands, the creation of marshlands and the planting of upland forests can make a considerable contribution to flood management. Similarly, reconnecting rivers to their flood plains and planting on river banks, on land that is currently cropped, can help to stem the flow of water. However, if we take a food security perspective, we might come to very different conclusions about how the same piece of land should be used. There are competing public policy objectives.

Land use came up again strongly during the committee’s scrutiny of the forestry provisions in the bill. There is no question but that the extension of forestry has a role to play in managing climate change, but where we plant trees and on what types of soil we do so are critical considerations. If we add to the mix the need for land for wind farms, hydro power and so on, we end up with a rich cocktail of policy questions, some of which are in conflict.

16:15

Other climate change issues come into play in the context of agriculture, which is a principal use of land. Although it accounts for about 25 per cent of Scotland’s greenhouse gas emissions, agriculture also acts as a greenhouse gas sink through sequestering sufficient carbon dioxide emissions. For example, grassland cropping can offset nearly 20 per cent of agricultural emissions, while an estimated 300 million tonnes of carbon are stored in our deep peatlands. That is about 20 times more carbon than is stored in all the UK’s forests and is equivalent to 190 years’ worth of Scotland’s total emissions. It has also been suggested that UK agriculture and land use change could mitigate around 6 per cent of current greenhouse gas emissions by 2012 and nearer 25 per cent by 2022, and that emissions from agriculture could by 2050 be around 50 per cent of 1990 levels if high feasible abatement potential is fully achieved.

Given those figures and the potential for delivering land use-related climate change action with the right policy drivers, I think it makes sense for the bill to address the agricultural and other wider policy issues. As it is becoming increasingly clear that better strategic consideration of land use is necessary, and that a land use strategy would be an important tool in creating a framework for reconciling the various aspects, amendment 219 seeks to place a duty on ministers to produce, consult on and lay before Parliament such a strategy. It would also require that the strategy contribute to achieving ministers’ wider climate change duties under the bill.

Amendment 219 also seeks to give effect to Parliament’s decision on 19 March to ensure that “all forestry proposals in future must be part of an integrated land-use strategy” and to call on “the Scottish Government to introduce a comprehensive sustainable land-use strategy”.

I am aware that the Government has been exploring the issues around a land use strategy, and I very much welcome its consideration of the matter. However, amendment 219 seeks to put beyond doubt the production of such a strategy after consultation, and to ensure that successive Administrations are required to keep it up to date.

I will listen very carefully to what the minister has to say but, notwithstanding his comments, I hope that the committee will approve amendment 219 to make clear the will of Parliament on this issue. If the minister wishes to come back at stage 3 with any technical improvements to the amendment I, like everyone else, will be happy to listen to his proposals. I live in hope—though not in expectation—that he will accept the amendment.

I move amendment 219.

Rob Gibson: I very much welcome this chance to discuss this proposal for a land use strategy, particularly given that a bill on crofting reform is about to be introduced. For many years, people have struggled with the concept of land use in crofting areas and have come to realise that much of its potential has been underutilised. Such considerations would fit in well with an assessment of what would be required in a strategic land use policy which would, after all, touch on food production and the need to protect...
areas of high natural value. Indeed, as far as the crofting bill is concerned, local discussions about what would comprise the best land use strategy would be valuable to many communities in ensuring that we do not perpetuate the kinds of monocultures that have not been good to the land.

I could mention other issues, but that is a good example of an area in which we must work carefully towards a conclusion. In any case, I think that a strategic land use policy is a very good idea.

Stewart Stevenson: Mr Peacock will not need any “notwithstandings”, because I am entirely content to support amendment 219. However, I have a certain amount to say about it.

Amendment 219 seeks to place on Scottish ministers a new duty to produce a new land use strategy. I am aware of the very significant support for such a move, although I should make the rather obvious points that we are talking about a general rather than a rural land use strategy and that in legal terms “land” covers inland waters, waterways and estuaries, all of which it would be appropriate to cover in such a strategy.

As committee members will be aware, several significant initiatives on various aspects of land use in Scotland are already under way. In August 2008, the Scottish Government launched its rural land use study with the aim of providing an integrated evidence base for the contributions that Scotland’s land might make to delivering sustainable economic growth and underpinning the implementation of policies such as the Climate Change (Scotland) Bill and the food policy. The research, which consultants are undertaking in three workstreams, is supported by stakeholder advisory groups, which include representatives of farmer and landowner groups as well as non-governmental conservation organisations, Scottish Natural Heritage and the Scottish Environment Protection Agency. The study’s findings will be discussed and debated at a rural land use summit that is scheduled for November 2009, which will identify how Scotland’s rural land contributes to a wide range of objectives, where the key conflicts and complementarities between different objectives lie, and in what ways such aspects can be addressed by policy and practice.

In implementing the European Union’s water framework directive, we introduced a new system of river basin management planning to enable Scotland to develop an integrated ecosystem approach to managing the impacts on our water resources. The proposed land use strategy could be a useful tool in delivering successful river basin management planning by ensuring that we strike the right balance between protection and sustainable use of our valuable natural resources.

As a major land use, forestry has a strategy of its own; however, it is important to see forest use and management in the wider land use context. Moreover, “The Scottish Soil Framework”, which was published in May 2009, sets out the Government’s vision for Scottish soils and ensures that they are recognised as a vital part of our economy, environment and heritage, and are to be safeguarded for existing and future generations.

All those areas of work are important. However, I agree that a comprehensive land use strategy could usefully pull together those and other key strands of strategic land use policy including crofting across the Scottish Government and could helpfully focus them on climate change.

I support amendment 219 and commend it to the committee.

Peter Peacock: I will not detain the committee any longer. I am grateful for the support of the minister and Rob Gibson and remind Alex Johnstone, who is seated on my immediate left, that the Conservatives supported the parliamentary motion that I mentioned. I will press the amendment and hope that the committee agrees to it.

Amendment 219 agreed to.

Section 46—Variation of permitted times for making muirburn

The Convener: Amendment 149, in the name of the minister, is grouped with amendments 150 to 152.

Stewart Stevenson: In discussions on the bill that officials held with key stakeholders during stage 1, NFU Scotland, the British Association for Shooting and Conservation, the Tenant Farmers Association of Scotland and the Game and Wildlife Conservation Trust expressed concern that the enabling power provided for in proposed new section 23A of the Hill Farming Act 1946, as inserted by section 46 of the bill, could be used to shorten the muirburn season. That concern was then mirrored in the Game and Wildlife Conservation Trust’s written submission.

Amendments 149 to 152 seek to address those concerns. Amendment 151 limits the order-making power in proposed new section 23A(1) of the 1946 act to ensure that the power is not exercised to reduce the length of the muirburn season to less than that provided for in section 23 of the act.

Addressing a commitment made in my additional written evidence at stage 1, I confirm that amendment 152 requires that an order made under proposed section 23A(1) of the 1946 act is subject to affirmative parliamentary procedure.

I move amendment 149.
Rob Gibson: A fire at Dunnet Head in April, which affected several hundred acres of ground where seabirds nest, might well have been covered by this set of amendments. The fact that the muirburn code did not seem to have been applied in that case caused disaster. The muirburn proposals will be helpful to clarify matters, so I hope that the committee will accept the amendments.

The Convener: I invite the minister to wind up and to press or withdraw amendment 149.

Stewart Stevenson: I wish to press amendment 149. Legislation is but part of the solution. Mr Gibson referred to the muirburn code, and it is important that everyone who carries out muirburn as part of their conservation activities takes full account of that.

Amendment 149 agreed to.

Amendments 150 to 152 moved—[Stewart Stevenson]—and agreed to.

Section 46, as amended, agreed to.

Section 47—Power to modify functions of Forestry Commissioners

The Convener: Amendment 220, in the name of Jim Hume, is grouped with amendments 221 and 153.

Jim Hume (South of Scotland) (LD): The amendments relate to the power to modify the functions of the forestry commissioners. The recent consultation and proposals to lease off around a quarter of the Forestry Commission estate revealed many concerns. They also highlighted the importance of the forestry estate in its diverse uses not just in providing a possible carbon sink to help to tackle climate change but in securing a supply of timber for industry and in providing benefits for recreational sport, tourism and access to forests, biodiversity and for the communities that live in and around those areas.

I lodged the amendments to ensure that the forestry estate is valued and protected for the many benefits that it provides. It is not simply an asset, nor a debatable carbon sequestration tool—as Peter Peacock mentioned, it is well known that planting in peat releases a huge amount of carbon into the atmosphere.

I agree that the Forestry Commission could benefit from joint ventures and that, therefore, it should have the power to progress its functions. I ask members to consider the benefits that the Forestry Commission has brought for tourism with the likes of the 7stanes mountain biking project in the south. The 7stanes trail would not have happened without co-operation from the Forestry Commission and stakeholders.

To safeguard the biodiversity of our forests, amendment 221 would ensure that the commission’s functions or any body and person that is formed with them—whether through a joint venture or not, including for renewable energy projects—takes biodiversity into account. Amendment 221 would make that duty explicit.

It is also important that any variation of the Forestry Commission’s functions takes into account the sustainability of developments. Some soils—I have mentioned peat-based soils—are inappropriate for tree production. The Forestry Commission also owns moorland, peat bogs and some biodiverse pasture land. There is a need to preserve and improve those areas, and the many functions of the forestry estate must be protected and enhanced. That is what amendment 220 would do.

Amendment 153 would remove the possibility of the Forestry Commission entering into long-term leases, which has been shown to be unpopular and unlikely to deliver long-term benefits. The Minister for Environment is on record as saying that she will not pursue the leasing proposals. Amendment 153 would ensure that such proposals would not be pursued by future Governments and ministers.

I move amendment 220.

Shirley-Anne Somerville: I advise ministers and Mr Hume that I have been in intensive discussions on the possibility of introducing a general sustainable development duty for ministers in respect of the functions under the bill. Although I do not object to the principle behind amendment 220, I think that the creation of an overarching sustainable development duty would be preferable. I worry that agreement to a specific amendment at this stage would result in a clash with the overarching duty that I hope to propose. My discussions are almost complete, and I hope to lodge within the next day an amendment that creates a general duty. I appreciate that it would have been better if the amendment had been available for Mr Hume to look at today, but I ask him to consider withdrawing amendment 220. If my amendment is not to his liking or the committee does not agree to it next week, he will be free to lodge his amendment again at stage 3.

16:30

The Convener: As no other members wish to comment, I invite the minister to respond.

Stewart Stevenson: I wrote down the point that Ms Somerville made and will respond to it later.

As we submitted an identical amendment to amendment 153, it will come as no surprise that we will support it. I am happy to confirm that we
are content not to proceed with the forestry leasing proposals that were initially planned. We support the removal of section 47(4).

Amendment 221 seeks to apply the biodiversity duty under the Nature Conservation (Scotland) Act 2004 to any body corporate or trust formed by the Forestry Commission. Although we agree that any such body would need to comply with the commission’s continuing duty to further the conservation of biodiversity on the national forest estate, amendment 221 is unnecessary and could lead to confusion and legal conflict.

The 2004 act defines the public bodies to which the biodiversity duty applies. The definition includes any person who exercises functions of a public nature, which could include private sector bodies established by the commission. Section 1 of the 2004 act therefore already applies to private bodies that exercise functions of a public nature, so we feel that amendment 221 is unnecessary and could lead to conflict between different pieces of legislation.

The principles of amendment 220 cause us no difficulties at all, but if Ms Somerville can lodge for debate next week an amendment that creates an overarching sustainable development duty, provided that the committee is happy with the details of that amendment, it is likely to commend itself as a preferred alternative.

The Convener: I ask Jim Hume to wind up and to indicate whether he wishes to press or withdraw amendment 220.

Jim Hume: At this stage, I will seek to withdraw amendment 220, although I leave open the possibility of lodging it again at stage 3 if Ms Somerville does not lodge an amendment of the kind that she has described. I agree that it would be better to cover the whole bill, so I do not have a problem with what she has proposed.

I will move amendments 221 and 153. I am glad that the minister has accepted amendment 153, but I still believe that amendment 221 is important, as it would make it absolutely explicit that any bodies, trusts or persons appointed by the commission are covered under the 2004 act.

The Convener: We will come to amendments 221 and 153 in a moment.

Amendment 220, by agreement, withdrawn.

Amendment 221 moved—[Jim Hume].

The Convener: The question is, that amendment 221 be agreed to. Are we agreed?

Members: No.

The Convener: There will be a division.

FOR
Gordon, Charlie (Glasgow Cathcart) (Lab)
Harvie, Patrick (Glasgow) (Green)
McInnes, Alison (North East Scotland) (LD)
McNulty, Des (Clydebank and Milngavie) (Lab)
Peattie, Cathy (Falkirk East) (Lab)

AGAINST
Gibson, Rob (Highlands and Islands) (SNP)
Johnstone, Alex (North East Scotland) (Con)
Somerville, Shirley-Anne (Lothians) (SNP)

The Convener: The result of the division is: For 5, Against 3, Abstentions 0.

Amendment 221 agreed to.

Amendment 153 moved—[Jim Hume]—and agreed to.

Section 47, as amended, agreed to.

The Convener: That ends our consideration of amendments for stage 2—I mean, for day 2 of stage 2. [Laughter.] We can see light at the end of the tunnel but we are not quite there yet.

I remind members that the deadline for all amendments for the rest of the bill is noon this Thursday—so it will be BlackBerrys out on Thursday morning for all of us on the election trail.

We hope to be able to consider all the remaining amendments in one further meeting. As happened today, next week’s meeting will start at 1.30.
Climate Change (Scotland) Bill

3rd Marshalled List of Amendments for Stage 2

The Bill will be considered in the following order—

Sections 1 to 20 Schedule 1
Sections 21 to 66 Schedule 2
Section 67 Long Title

Amendments marked * are new (including manuscript amendments) or have been altered.

Section 48

Iain Smith (on behalf of the Economy, Energy and Tourism Committee)
Supported by: Lewis Macdonald

222 In section 48, page 20, line 16, leave out from second <the> to end of line 19 and insert—

<(  ) promoting energy efficiency; and
(  ) improving the energy efficiency of living accommodation,
in Scotland.>

Iain Smith (on behalf of the Economy, Energy and Tourism Committee)

223 In section 48, page 20, line 19, at end insert—

<(  ) The plan must set annual energy efficiency targets and describe how those targets are to be reported on.>

Sarah Boyack

251* In section 48, page 20, line 19, at end insert—

<(  ) The plan must include details of how the Scottish Ministers intend to update planning and building regulations to ensure that all new buildings avoid a specified and rising proportion of their projected operational greenhouse gas emissions, calculated on the basis of the approved design and plans for the specific building, through the installation and operation of low and zero-carbon generating technologies.>

Patrick Harvie

252 In section 48, page 20, line 19, at end insert—

<(  ) The plan must include the following targets—
(a) by 2020, the level of energy efficiency in domestic buildings to be 20% higher than in 2010;
(b) by the end of 2020, the level of energy used in non-domestic buildings to be at least 10% less than the level of energy used in 2010;
(c) by the end of 2016, in so far as reasonably practicable, all domestic buildings to be low-carbon buildings;

(d) by the end of March 2013, the number of domestic buildings with one or more microgeneration installations to be at least eight times the number of domestic buildings with such installations in 2007;

(e) by the end of 2016, all new buildings constructed to be net zero carbon buildings;

(f) in 2010, the following greenhouse gas emissions reductions to be achieved compared to the level set in guidance documents issued in 2007 under section 4(1) of the Building (Scotland) Act 2003 (asp 8)—
   (i) 30% for new domestic buildings;
   (ii) 50% for non-domestic buildings;

(g) in 2013, the following greenhouse gas emissions reductions to be achieved compared to the level set in guidance documents issued in 2007 under section 4(1) of the Building (Scotland) Act 2003 (asp 8)—
   (i) 60% for new domestic buildings;
   (ii) 75% for non-domestic buildings.

( ) The Scottish Ministers may, by regulations, define the terms “low carbon” and “zero carbon”.

Stewart Stevenson

In section 48, page 21, line 1, after <technologies> insert <(other than those used for the production of heat)>

Iain Smith

In section 48, page 21, line 3, at end insert <and

( ) surplus heat from electricity generation or other industrial processes for district heating or other purposes;>

After section 48

Stewart Stevenson

After section 48, insert—

<Promotion of renewable heat

Duty of Scottish Ministers to promote renewable heat

(1) The Scottish Ministers must prepare and publish a plan for the promotion of the use of heat produced from renewable sources.

(2) The plan prepared under subsection (1) must be published no later than 12 months after the day on which this section comes into force.

(3) The Scottish Ministers—
   (a) may, from time to time; and
   (b) must, before the end of the period mentioned in subsection (4),
review the plan prepared and published under this section.

(4) The period referred to in subsection (3)(b) is the period of 2 years beginning with the date on which—
   (a) the plan is first published; or
   (b) the plan was last reviewed under subsection (3).

(5) Where, following a review under subsection (3), the Scottish Ministers vary the plan, they must, as soon as reasonably practicable after so doing, publish the plan as so varied.

(6) In this section, “renewable sources” has the same meaning as in section 48(8).

Rob Gibson

155A As an amendment to amendment 155, line 5, at end insert—

<( )  The plan must, in particular—
   (a) set—
       (i) targets for the percentage of heat to be produced from renewable sources; and
       (ii) in relation to each target, the date by which it should be met; and
   (b) describe how those targets are to be reported on.>

Section 49

Stewart Stevenson

156 In section 49, page 21, line 16, after <(6)> insert <or section <Duty of Scottish Ministers to promote renewable heat>(1) or (5)>

Rob Gibson

254 In section 49, page 21, line 23, at end insert—

<( )  Where the Scottish Ministers lay a plan mentioned in subsection (1) or a report mentioned in subsection (2) before the Parliament, they must, as soon as reasonably practicable after doing so, and in so far as reasonably practicable, make a statement to the Parliament relating to the plan or, as the case may be, report.>

After section 49

Liam McArthur

255 After section 49, insert—

<Emissions performance standard for new or extended energy generating stations

Energy generating stations: efficiency guidance

(1) The Scottish Ministers must provide or revise existing guidance under section 36 of the Electricity Act 1989 (c.29) setting out the conditions subject to which consent will be granted for the construction of new, or for the extension of existing, energy generating stations of a capacity greater than 50 megawatts.
(2) The guidance required under subsection (1) must set out—
   (a) the maximum greenhouse gas emissions permitted per megawatt hour of energy
       generated; and
   (b) how heat energy produced from combined heat and power stations is to be
       included when calculating levels of emissions.

(3) The guidance required under subsection (1) may include provision for different
maximum greenhouse gas emissions to be permitted in respect of—
   (a) different dates;
   (b) different technologies.

(4) The Scottish Ministers must comply with subsection (1) no later than 12 months after
the day on which this section comes into force.

(5) The Scottish Ministers must, before providing such guidance, request advice from the
advisory body regarding the total cumulative emissions budget available for electricity
generation in the period 2010-2050 and, in particular—
   (a) an appropriate total lifetime greenhouse gas budget per megawatt of generating
       capacity;
   (b) the appropriate initial levels of greenhouse gas emissions per megawatt hour of
       energy generated.

(6) If, in relation to the matters mentioned in subsection (5), the guidance under subsection
(1) differs from that which is recommended by the advisory body, the Scottish Ministers
must publish a statement setting out the reasons why.

Patrick Harvie

256 After section 49, insert—

Energy efficiency finance scheme for homeowners

(1) The Scottish Ministers must establish a scheme under which they may provide or
arrange for the provision of financial assistance to a person in connection with—
   (a) the improvement of the energy performance of a domestic building; or
   (b) the reduction in emissions of greenhouse gases produced or otherwise associated
       with a domestic building.

(2) Such assistance may, in particular, take the form of—
   (a) guaranteeing or joining in guaranteeing the payment of the principal of, and
       interest on, money borrowed by the person (including money borrowed by the
       issue of loan capital) or of interest on share capital issued by the person;
   (b) grants;
   (c) standard loans;
   (d) subsidised loans.

(3) Assistance may be provided on such terms as the Scottish Ministers think fit (subject to
any provision about such terms made by or under this section).
(4) The Scottish Ministers may by regulations make further provision about the provision of assistance under subsection (1).

(5) Those regulations may, in particular, make provision as to—

(a) the procedure for application for financial assistance under subsection (1);
(b) the determination of applications;
(c) the approved expense in relation to any grant or loan;
(d) the amount of any grant or loan;
(e) the terms of any grant or loan;
(f) the payment of any grant or loan;
(g) the conditions applicable to any grant or loan;
(h) any penalties in the event of any breach of conditions of any grant or loan.

Section 50

Liam McArthur

224 In section 50, page 21, line 26, leave out <may> and insert <must>

Stewart Stevenson

157 In section 50, page 21, line 26, leave out <make provision relating to> and insert—

<(  ) provide for>

Liam McArthur

225 In section 50, page 21, line 26, after <assessment> insert <and cost-effective improvement>

Stewart Stevenson

158 In section 50, page 21, line 30, at end insert—

<(  ) require owners of such buildings to take steps, identified by such assessments, to—

(i) improve the energy performance of such buildings;
(ii) reduce such emissions.>

Stewart Stevenson

159 In section 50, page 22, line 2, after <activities> insert <carried out in buildings>

Stewart Stevenson

160 In section 50, page 22, line 5, at end insert—

<(ha) the form of any recommendations, contained in such certificates, as to the improvement of the energy performance of buildings and the reduction of emissions produced by or otherwise associated with buildings or activities carried out in buildings;>
(hb) the manner in which and periods within which persons must take steps to comply with any recommendations contained in such certificates;

(hc) the registration of such certificates;

(hd) the disclosure of information which is entered in the register;

Liam McArthur

160A As an amendment to amendment 160, line 2, after <to> insert <cost-effective measures for>

Liam McArthur

226 In section 50, page 22, line 16, at end insert—

<( ) The Scottish Ministers must, within 12 months of this Act receiving Royal Assent, publish a report setting out—

(a) what measures they intend to take to reduce emissions from non-domestic buildings; and

(b) when they intend to make provision as mentioned in paragraphs (ha) and (hb).>

After section 50

Iain Smith (on behalf of the Economy, Energy and Tourism Committee)
Supported by: Lewis Macdonald

227 After section 50, insert—

<Energy performance of living accommodation

Living accommodation: assessment of energy performance and emissions

(1) The Scottish Ministers may, by regulations, make provision relating to the assessment of—

(a) the energy performance of living accommodation;

(b) the emission of greenhouse gases produced by living accommodation.

(2) The regulations may in particular include provision about—

(a) the circumstances in which the regulations apply;

(b) the living accommodation to which the regulations apply;

(c) the persons who may be required to have assessments carried out;

(d) the periods within which such assessments must be carried out;

(e) the procedure and methodology for assessing the energy performance of living accommodation;

(f) the procedure and methodology for assessing the greenhouse gas emissions produced by the living accommodation;

(g) the persons who may carry out such assessments;

(h) the issuing of certificates, following such assessments, including the form, manner and content of such certificates;

(i) subject to subsection (3), the enforcement authority in relation to the regulations;
(j) subject to subsection (4), the functions of that authority;
(k) the keeping of information and its production to the enforcement authority;
(l) the enforcement of the duties imposed by the regulations;
(m) offences in relation to failures to comply with requirements of the regulations.

(3) The enforcement authority provided for in the regulations is to be such person or body as the Scottish Ministers consider appropriate.

(4) The functions of the enforcement authority may include power to levy charges to recover the reasonable costs incurred by it in exercising its functions under the regulations.

Patrick Harvie

227A As an amendment to amendment 227, line 4, after <assessment> insert <and improvement>

Patrick Harvie

227B As an amendment to amendment 227, leave out line 24

Lewis Macdonald

257 After section 50, insert—

Alterations to buildings: impact on energy performance

(1) The Scottish Ministers must, by regulations, make provision relating to the impact on the energy performance of buildings of building work being carried out, where such work consists of—

(a) an extension of the building;
(b) the provision of any fixed building services;
(c) any increase in the capacity of any fixed building services.

(2) Regulations under subsection (1) must—

(a) include provisions to encourage compliance with relevant guidance documents issued under section 4(1) of the Building (Scotland) Act 2003 (asp 8); and
(b) be laid before the Scottish Parliament no later than 12 months after the day on which this section comes into force.

Alex Johnstone

238 After section 50, insert—

Energy efficiency discounts

Council tax and non-domestic rates: discounts for energy efficiency etc.

(1) In section 79 (council tax discounts) of the Local Government Finance Act 1992 (c.14), after subsection (2), insert—

“(2A) The Scottish Ministers may by regulations prescribe—

7
(a) categories which chargeable dwellings may fall into, based on the levels of energy efficiency and greenhouse gas emissions achieved by those dwellings;

(b) a percentage in relation to each such category.

(2B) Where subsection (2C) applies, the amount of council tax payable in respect of a chargeable dwelling and any day shall be subject to a discount equal to the percentage prescribed in relation to the category of chargeable dwellings into which the chargeable dwelling falls.

(2C) This subsection applies where a resident of a chargeable dwelling shows that the dwelling falls into a category prescribed under subsection (2A)(a).

(2D) Regulations under subsection (2A) may also make provision in relation to how residents may show that a chargeable dwelling falls into a category prescribed under paragraph (a) of that subsection.”.

(2) In section 153 (power to prescribe amount of non-domestic rate) of the Local Government etc. (Scotland) Act 1994 (c.39), in subsection (3)—

(a) the words “whose rateable value exceeds, and those whose rateable value does not exceed, a prescribed figure” become paragraph (a), and

(b) at the end insert—

“(b) whose energy efficiency and greenhouse gas emissions fall into different categories prescribed for the purpose of this paragraph in rules under subsection (1).

(3A) Regulations under this section may make provision in relation to how lands and heritages are to be determined to fall within a category prescribed for the purpose of subsection (3)(b) in rules under subsection (1).”.

Alex Johnstone

258 After section 50, insert—

<Local authority’s power to reduce amount of tax payable

After section 80 (reduced amounts) of the Local Government Finance Act 1992 (c.14), there is inserted—

“80A Local authority’s power to reduce amount of tax payable

(1) Subject to subsection (3), where a person is liable to pay council tax in respect of any chargeable dwelling and any day, the local authority for the area in which the dwelling is situated may reduce the amount which the person is liable to pay as respects the dwelling and the day to such extent as it thinks fit.

(2) The power under subsection (1) above includes power to reduce an amount to nil.

(3) The power under subsection (1) may only be exercised where the local authority is satisfied, by reference to guidance set out in regulations under subsection (4), that investment has been made in the chargeable dwelling for the purpose of improving the energy efficiency of the dwelling.

(4) The Scottish Ministers may, by regulations, set out guidance on how investment in a chargeable dwelling for the purposes of improving energy efficiency under subsection (3) may be demonstrated.”.>
After section 50, insert—

<Energy efficiency discounts

Council tax reductions to promote energy efficiency

(1) The Scottish Ministers must make regulations under section 80 of the Local Government Finance Act 1992 (c.14) to provide that, in respect of a person who—

(a) can demonstrate to a local authority that an energy efficiency improvement has been made, during any qualifying financial year, to a dwelling; and

(b) is liable to pay an amount to that authority in respect of council tax for that dwelling in the next financial year,

the amount that the person is liable to pay for that next financial year shall be reduced (from the amount it would be otherwise than by virtue of this subsection) in accordance with section (Amounts of reductions in council tax).

(2) The regulations made by virtue of subsection (1) must further provide that, in respect of a person who—

(a) is liable to pay an amount to a local authority in respect of council tax for a dwelling;

(b) can demonstrate to that local authority that the dwelling meets a reasonable standard of energy efficiency; and

(c) can demonstrate to that local authority that a system using technologies reliant on renewable sources of energy or heat has been installed in or on the dwelling during any qualifying financial year,

the amount that the person is liable to pay for the next financial year must be reduced (from the amount it would be otherwise than by virtue of this subsection) in accordance with section (Amounts of reductions in council tax).

(3) Subject to subsection (4)—

(a) any reduction made by virtue of either subsection (1) or (2) is without prejudice to any reduction made by virtue of the other of those subsections, whether those reductions apply in the same financial year or in different financial years; and

(b) any reduction made by virtue of subsection (1) is without prejudice to any further reduction made by virtue of that subsection, whether those reductions apply in the same financial year or in different financial years.

(4) The regulations made by virtue of subsection (1) may specify a maximum number of reductions, or a maximum total reduction, in the amount of council tax payable in respect of any one dwelling in any one financial year.

(5) The regulations made by virtue of subsection (1) must include provision for the sort of evidence that a local authority is to accept as demonstrating that—

(a) an energy efficiency improvement has been made to a dwelling;

(b) a dwelling meets a reasonable standard of energy efficiency,

and shall provide that evidence sufficient to demonstrate that specified energy efficiency improvements, or specified combinations of such improvements, have been made to a dwelling is sufficient to demonstrate that the dwelling meets a reasonable standard of energy efficiency.
A draft of a statutory instrument containing the first regulations under subsection (1) must be laid before the Scottish Parliament no later than 31 December 2009.

In this section—

“cogeneration unit” has the same meaning as in the Electricity and Gas (Carbon Emissions Reduction) Order 2008 (S.I. 2008/188);

“energy efficiency improvement” means a significant improvement to the energy efficiency of a dwelling by means of substantially all of one (and only one) of the following measures—

(a) the provision of insulation in any accessible roof space in the dwelling, including the insulation of any cold water tank and any water supply, overflow and expansion pipes in such a space;

(b) the provision of insulation between the internal and external leaves of cavity walls of the dwelling;

(c) improvements to the energy efficiency of any space or water heating system installed in the dwelling;

(d) the provision of draught proofing to or in the dwelling together with additional means of ventilation for any rooms which would otherwise be inadequately ventilated after such provision;

(e) connection to a cogeneration unit or district heating system;

“qualifying financial year” means the financial year beginning on 1 April 2010 or any subsequent financial year.

The Scottish Ministers may, by regulations, amend subsection (7) by adding to the list of measures in the definition of “energy efficiency improvement”.

Sarah Boyack

After section 50, insert—

<Non-domestic rates reductions to promote energy efficiency

After section 25A of the Local Government (Scotland) Act 1966 (c.51), insert—

“25B Reduction in rates for energy efficiency improvements or installation of technologies reliant on renewable sources of energy or heat

(1) Where a rating authority is satisfied that an energy efficiency improvement has been made during any qualifying financial year to qualifying lands or heritages, the rates payable in respect of those lands and heritages in the next financial year shall be reduced (from the amount they would be otherwise than by virtue of this subsection) in accordance with section (Amounts of reductions in non-domestic rates) of the Climate Change (Scotland) Act 2009 (asp 00) (“the 2009 Act”).

(2) Where a rating authority is satisfied that—

(a) qualifying lands and heritages meet a reasonable standard of energy efficiency; and

(b) a qualifying technology reliant on renewable sources of energy or heat system has been installed in or on the lands and heritages during any qualifying financial year,
the rates payable for the next financial year shall be reduced (from the amount they would be otherwise than by virtue of this subsection) in accordance with section (Amounts of reductions in non-domestic rates) of the 2009 Act.

(3) Subject to subsection (4)—

(a) any reduction made by virtue of either subsection (1) or (2) is without prejudice to any reduction made by virtue of the other of those subsections, whether those reductions apply in the same financial year, or in different financial years; and

(b) any reduction made by virtue of subsection (1) is without prejudice to any further reduction made by virtue of that subsection, whether those reductions apply in the same financial year, or in different financial years.

(4) The Scottish Ministers must by regulations specify a maximum number of reductions, or a maximum total reduction, in the amount of rates payable in respect of the same lands and heritages in any one financial year.

(5) The Scottish Ministers must by regulations make provision specifying the sort of evidence that a rating authority is to accept as demonstrating that—

(a) an energy efficiency improvement has been made to qualifying lands and heritages;

(b) qualifying lands and heritages meet a reasonable standard of energy efficiency;

and may provide that evidence sufficient to demonstrate that specified energy efficiency improvements, or specified combinations of such improvements, have been made to lands and heritages is sufficient to demonstrate that the lands and heritages meet a reasonable standard of energy efficiency.

(6) A statutory instrument containing regulations made under this section shall be subject to annulment pursuant to a resolution of the Scottish Parliament.

(7) In this section—

“energy efficiency improvement” and “technologies reliant on renewable sources of energy” have the same meanings given by section (Council tax reductions to promote energy efficiency) of the 2009 Act;

“qualifying financial year” means the financial year beginning on 1 April 2010 or any subsequent financial year;

“qualifying lands and heritages” means such lands and heritages, or such classes of lands and heritages, as are specified in regulations made under this section.”>

Sarah Boyack

261 After section 50, insert—

<Amounts of reductions in council tax

(1) For the purposes of regulations made by virtue of section (Council tax reductions to promote energy efficiency) the reduction in council tax is to be—

(a) in the circumstances referred to in subsection (2)(a), £100; and

(b) in the circumstances referred to in subsection (2)(b), £250.
(2) The circumstances are that the local authority assess the relevant cost of the energy efficiency improvement or the installation of technologies reliant on renewable sources of energy or heat, as the case may be, to be—
   (a) at least £250 but less than £1,000;
   (b) £1,000 or more.

(3) In this section, “relevant cost of energy efficiency improvements” means the amount paid for securing those improvements, minus the amount of any grant received (including a grant made under the Home Energy Efficiency Scheme (Scotland) Regulations 2006 (S.S.I. 2006/570)).

Sarah Boyack

262 After section 50, insert—

<Amounts of reductions in non-domestic rates

(1) For the purposes of section 25B of the Local Government (Scotland) Act 1966 (c.51), the reduction in non-domestic rates is to be—
   (a) in the circumstances referred to in subsection (2)(a), £100; and
   (b) in the circumstances referred to in subsection (2)(b), £250.

(2) The circumstances are that the local authority assess the relevant cost of the energy efficiency improvement or the installation of technologies reliant on renewable sources of energy or heat, as the case may be, to be—
   (a) at least £250 but less than £1,000;
   (b) £1,000 or more.

(3) In this section, “relevant cost of energy efficiency improvements” means the amount paid for securing those improvements, minus the amount of any grant received (including a grant made under the Home Energy Efficiency Scheme (Scotland) Regulations 2006 (S.S.I. 2006/570)).

Sarah Boyack

263 After section 50, insert—

<Review of provision made by virtue of or under sections (Amounts of reductions in council tax) and (Amounts of reductions in non-domestic rates)

(1) The Scottish Ministers must, as soon as practicable after 31 March 2012 and annually thereafter, lay before the Scottish Parliament a report on the operation of—
   (a) the regulations made by virtue of section (Council tax reductions to promote energy efficiency); and
   (b) section 25B of the Local Government (Scotland) Act 1966 (c.51), (“the 1966 Act”),

including an assessment of whether the reductions in council tax or in non-domestic rates, as the case may be, thereby provided for have contributed effectively to promoting energy efficiency improvements and technologies reliant on renewable sources of energy or heat.
(2) Where the Scottish Ministers conclude in a report made under subsection (1) that the provisions referred to in paragraphs (a) and (b) of that subsection would contribute more effectively to energy efficiency improvements and technologies reliant on renewable sources of energy or heat if—

(a) one or both of the amounts referred to in section (Amounts of reductions in council tax)(1) or section (Amounts of reductions in non-domestic rates)(1) were greater;

(b) one or both of the amounts referred to in section (Amounts of reductions in council tax)(2) or section (Amounts of reductions in non-domestic rates)(2) were varied,

they may by regulations increase or, as the case may be, vary the amounts in question.

(3) Where the Scottish Ministers conclude in a report made under subsection (1) that the regulations referred to in that subsection and section 25B of the 1966 Act would contribute more effectively to promoting energy efficiency improvements and technologies reliant on renewable sources of energy if the mechanism prescribed by sections (Amounts of reductions in council tax) and (Amounts of reductions in non-domestic rates) for calculating the amount of reduction in council tax or non-domestic rates, as the case may be, from the relevant cost of energy efficiency improvements or technologies reliant on renewable sources of energy was different from the mechanism for the time being prescribed, they may, by regulations, amend sections (Amounts of reductions in council tax) and (Amounts of reductions in non-domestic rates) to prescribe that different mechanism.

Iain Smith (on behalf of the Economy, Energy and Tourism Committee)

After section 50, insert—

<Energy efficiency discounts
Use of local and national tax incentives to reward investments in energy efficiency or microgeneration

(1) The Scottish Ministers may, by regulations, establish a scheme under which the amount of council tax or non-domestic rates payable in respect of a chargeable dwelling or, as the case may be, any lands and heritages is reduced to take account of the installation of—

(a) an energy efficiency measure;

(b) a microgeneration system.

(2) Regulations under subsection (1) may make such modifications of enactments as are necessary in consequence of or for the purpose of giving full effect to a scheme established under that subsection.

(3) In subsection (1)—

an “energy efficiency measure” is a measure to improve efficiency in the use of energy in the property;

“microgeneration system” has the same meaning as in section 4(9) of the Climate Change and Sustainable Energy Act 2006 (c.19).

Lewis Macdonald

After section 50, insert—
Rateable value of plant and distribution system associated with combined heat and power plants

(1) The Scottish Ministers must bring forward an amendment to the Valuation for Rating (Plant and Machinery) (Scotland) Regulations 2000 (SSI 2000/58).

(2) The amendment required under subsection (1) must specify the circumstances in which combined heat and power district heating equipment which meets the CHPQA standard does or does not fall within the definition of “lands and heritages” in section 42 of the Lands Valuation (Scotland) Act 1854 (c.91).

(3) Regulations making the amendment required under subsection (1) must be laid before the Scottish Parliament no later than 6 months after the day on which this section comes into force.

(4) Before bringing forward the amendment required under subsection (1), the Scottish Ministers must consult, and seek to reach agreement on the contents of the amendment, with organisations which in the opinion of the Scottish Ministers represent relevant business interests, including, in particular, organisations representing the combined heat and power industry.

(5) In this section, “CHPQA” refers to the Combined Heat and Power Quality Assurance Standard, Issue 1, November 2000 originally published by the Department for the Environment, Transport and the Regions (the “Standard”) (including the later of version Final 1.0 or 2.0 of CHPQA Guidance Notes(c) 0 to 4 (including 2(S), 3(S) and 4(S)), 10 to 28 and 30).

Sarah Boyack

After section 50, insert—

Climate change burdens

After section 46 (health care burdens) of the Title Conditions (Scotland) Act 2003 (asp 9), insert—

Climate change burdens

46A Climate change burdens

(1) On and after the day on which this section comes into force, it shall be competent to create a real burden in favour of a public body, or of the Scottish Ministers, for the purpose of reducing greenhouse gas emissions; and any such burden shall be known as a “climate change burden”.

(2) A climate change burden may only consist of an obligation, in the event of the burdened property being developed, for the property to meet specified energy efficiency and sustainability standards.

(3) A climate change burden may not be created after land which would, but for this subsection, be the burdened property has been advertised for sale.

(4) For the purposes of this section, a “public body” means a person or body with functions of a public nature.”.
<Repairing standard>

**Tenanted housing: inclusion of energy efficiency in the repairing standard**

In section 13 (the repairing standard) of the Housing (Scotland) Act 2006 (asp 1)—
(a) in subsection (1)—
   (i) the word “and” immediately following paragraph (e) is repealed; and
   (ii) after paragraph (f), insert “, and
   (g) the house achieves a satisfactory standard of energy efficiency”.
(b) after subsection (5), insert—
   “(6) The Scottish Ministers must, by regulations, define what constitutes a satisfactory standard of energy efficiency for the purposes of subsection (1)(g).
   (7) In drawing up the regulations under subsection (6), the Scottish Ministers must have regard to any guidance they have issued on the energy efficiency of living accommodation.
   (8) The regulations mentioned in subsection (6) must, in particular, include provision about—
      (a) the procedure and methodology for assessing the energy performance of the house, and
      (b) the minimum energy performance standard that must be achieved in relation to the house.”.

<Tolerable standard>

**Amendment of the tolerable standard**

In section 86 (definition of house meeting the tolerable standard) of the Housing (Scotland) Act 1987 (c.26), in subsection (1)(ca), after “thermal” insert “roof and wall”.

<Tenement Management Scheme>

**Tenement Management Scheme: definition of “maintenance”**

In schedule 1 (Tenement Management Scheme) to the Tenements (Scotland Act 2004 (asp 11), in the definition of “maintenance” in rule 1.5, after “replacement,” insert “the installation of insulation,”.
Section 51

In section 51, page 22, line 27, leave out <may> and insert <must>

Iain Smith (on behalf of the Economy, Energy and Tourism Committee)

In section 51, page 22, line 28, leave out <, in particular,> and insert <the preparation and publication of a plan for the promotion of heat produced from renewable sources in Scotland which includes>

Stewart Stevenson

Leave out section 51

After section 51

Sarah Boyack

After section 51, insert—

<Targets for renewable heat

(1) The Scottish Ministers must, not later than three months after this section comes into force—

(a) designate one or more renewable heat targets; and
(b) publish a statement of that fact together with a copy of the target or targets.

(2) The matters to which the Scottish Ministers must have regard in designating a renewable heat target or targets under subsection (1) include—

(a) such target or targets as may have been designated by the Secretary of State under section 4 of the Climate Change and Sustainable Energy Act 2006 (c.19) (“the 2006 Act”) in respect of electricity microgenerating systems installed in Scotland;
(b) the number of renewable heat systems installed in Scotland;
(c) the strategy published under section 82 of the Energy Act 2004 (c.20); and
(d) the results of any research carried out into the effect that designating a target under subsection (1) could be expected to have on the number of renewable heat systems that are installed in Scotland by the target date.

(3) The Scottish Ministers must take reasonable steps to secure that the designated target or targets are met, including by requiring local authorities to set objectives for promoting renewable heat in their areas.

(4) At any time before the target date, the Scottish Ministers may review the target or targets and, if they consider it appropriate, revise it or them (and subsection (2) applies in relation to revising a target as it applies in relation to designating a target under subsection (1)).

(5) If under subsection (4) the Scottish Ministers revise a target—

(a) they must publish a statement of that fact together with a copy of the revised target; and
(b) the revised target is treated for the purposes of subsection (3) as a target designated under subsection (1) (in place of the target which has been revised).

(6) For the purposes of this section, a “renewable heat target” is a target in respect of the number of renewable heat systems installed in Scotland as at a date specified in the target (“the target date”).

Sarah Boyack

271 After section 51, insert—

<Development plans

Development plans: inclusion of greenhouse gas emissions policies

After section 3E of the Town and Country Planning (Scotland) Act 1997 (c.8) insert—

“3F Greenhouse gas emissions policies

A strategic development planning authority, in their strategic development plan, and a planning authority, in any local development plan for land not within a strategic development plan area, must include policies requiring all relevant developments in the strategic development plan area or (as the case may be) local development plan area to be so designed to ensure that all new buildings avoid a specified and rising proportion of their projected operational greenhouse gas emissions, calculated on the basis of the approved design and plans for the specific development, through the installation and operation of low and zero-carbon generating technologies.”.

Sarah Boyack

272 After section 51, insert—

<Annual report on operation of section (Development plans: inclusion of greenhouse gas emissions policies)

(1) The Scottish Ministers shall—

(a) not later than one year after section (Development plans: inclusion of greenhouse gas emissions policies) comes into force; and

(b) annually thereafter,

lay before the Scottish Parliament a report on the operation of the requirement on planning authorities to include policies within development plans under that section, including an assessment of whether those requirements have contributed effectively to the reduction of greenhouse gas emissions from developments.

(2) The fourth and subsequent reports under subsection (1) shall include an assessment of the continuing need or otherwise for the requirement on planning authorities to include policies within development plans; and if the requirement is considered by the Scottish Ministers to be no longer necessary, the Scottish Ministers may by order repeal section (Development plans: inclusion of greenhouse gas emissions policies) and this section.

Sarah Boyack

273 After section 51, insert—
Air source heat pumps and micro wind turbines in domestic properties: permitted development rights

(1) The Scottish Ministers must bring forward an amendment to the Town and Country Planning (General Permitted Development) (Domestic Microgeneration) (Scotland) Amendment Order 2009 (SSI 2009/34).

(2) The amendment required under subsection (1) is to specify the circumstances under which the installation, alteration or replacement of—
   (a) air source heat pump microgeneration equipment; or
   (b) wind turbine microgeneration equipment,
within the curtilage of a dwellinghouse or building containing a flat is considered a permitted development under the meaning of sections 30 and 31 of the Town and Country Planning (Scotland) Act 1997 (c.8).

(3) An order making the amendment required under subsection (1) must be laid in the Scottish Parliament no later than six months after the day on which this section comes into force.

(4) Before making the amendment required under subsection (1), the Scottish Ministers must consult with organisations which, in the opinion of the Scottish Ministers, have relevant business interests and, in particular, organisations representing—
   (a) the energy efficiency industry;
   (b) the renewables industry; and
   (c) the microgeneration industry.

(5) In this section, “microgeneration” has the meaning given in section 82(6) of the Energy Act 2004 (c.20).

Liam McArthur

After section 51, insert—

Microgeneration in non-domestic buildings: permitted development rights

(1) The Scottish Ministers must exercise their powers under sections 30 and 31 of the Town and Country Planning (Scotland) Act 1997 (c.8) so as to make provision of the kind specified in subsection (2).

(2) That provision is provision specifying the circumstances in which the installation, alteration or replacement of microgeneration equipment within the curtilage of a non-domestic building is considered a permitted development within the meaning of those sections of that Act.

(3) The Scottish Ministers must comply with subsection (1) no later than 12 months after the day on which this section comes into force.

(4) Before complying with subsection (1), the Scottish Ministers must consult and seek to reach agreement about the provision to be made by virtue of that subsection with organisations which, in the opinion of the Scottish Ministers, have relevant business interests and, in particular, organisations representing—
   (a) the energy efficiency industry;
(b) the renewables industry; and
(c) the microgeneration industry.

(5) In this section—

“microgeneration” has the meaning given in section 82(6) of the Energy Act 2004 (c.20);
“non-domestic building” has the meaning given in section 50(5).>

Shirley-Anne Somerville

275 After section 51, insert—

CHAPTER
THE SCOTTISH CIVIL ESTATE

Energy performance of new buildings procured for the Scottish civil estate

(1) The Scottish Ministers must, in so far as reasonably practicable, ensure that the energy performance of any newly constructed building that becomes part of the civil estate in Scotland falls within the top quartile of energy performance.

(2) For the purposes of subsection (1), a building becomes part of the civil estate if it is procured or constructed by or on behalf of the Scottish Ministers.>

Shirley-Anne Somerville

276 After section 51, insert—

Report on the Scottish civil estate

(1) The Scottish Ministers must, in respect of each financial year beginning with 2010-2011, lay before the Scottish Parliament a report containing an assessment of the progress made in the year towards improving—

(a) the efficiency; and
(b) the contribution to sustainability,
of buildings that are part of the civil estate in Scotland.

(2) If the energy performance of a building mentioned in subsection (3) does not fall within the top quartile of energy performance, the report must state the reasons why the building has become part of the civil estate.

(3) That building is a building—

(a) to which section (Energy performance of new buildings procured for the Scottish civil estate) applies; and
(b) which becomes part of the civil estate in the financial year to which the report relates.

(4) The report under this section must be laid before the Parliament no later than 31 October next following the end of the financial year to which the report relates.>

Shirley-Anne Somerville

277 After section 51, insert—
Scottish civil estate: supplementary

(1) For the purposes of this section and sections (Energy performance of new buildings procured for the Scottish civil estate) and (Report on the Scottish civil estate)—

(a) “building” means a building that uses energy for heating or cooling the whole or any part of its interior; and

(b) a building is part of the civil estate in Scotland if it—

(i) is used for the purposes of Scottish central government administration; and

(ii) is of a description of buildings for which the Scottish Ministers have responsibilities in relation to efficiency and sustainability.

(2) The Scottish Ministers may, by order, provide—

(a) for buildings of a description specified in the order to be treated as being, or as not being, part of the civil estate;

(b) for uses specified in the order to be treated as being, or as not being, uses for the purposes of Scottish central government administration.

Cathy Peattie

After section 51, insert—

Procurement of public sector buildings

(1) The Scottish Ministers must, when procuring a building for use as an office by—

(a) the Scottish Administration; or

(b) any executive agency or non-departmental public body for which the Scottish Ministers are responsible,

ensure that the building has an energy efficiency rating of A or B, calculated on the basis of information obtained within the previous 12 months, and in accordance with the energy rating system used for the purposes of an energy performance certificate.

(2) In this section—

“energy performance certificate” means a certificate issued in accordance with Regulation 6 of the Energy Performance of Buildings (Scotland) Regulations 2008 (SSI 2008/309);

“procure” means rent, lease, purchase or acquire through a private developer scheme, a public private partnership, private finance initiative or similar arrangement.

Section 52

Elaine Murray

In section 52, page 23, line 26, at end insert—

A draft of a statutory instrument containing the first regulations under subsection (1) must be laid before the Scottish Parliament no later than one year after this Act receives Royal Assent.
After section 52

Elaine Murray

242 After section 52, insert—

<Disposal of waste

Disposal of waste

(1) The Scottish Ministers may, by regulations, require persons responsible for the management of waste disposal facilities to comply with specified rules about the disposal of waste.

(2) The regulations under subsection (1) must—

(a) prohibit the disposal to landfill of—

(i) unsorted household and industrial waste;

(ii) wastes that were selectively collected for the purpose of recovery;

(iii) wastes that can be recovered because of their nature, quantity and homogeneity;

(iv) combustible residues from the sorting of household waste or comparable commercial or industrial waste;

(v) waste pharmaceuticals;

(b) prohibit the disposal to, or treatment by incineration of—

(i) selectively collected wastes that can be recycled;

(ii) unsorted commercial or industrial wastes;

(iii) unsorted household wastes.

(3) The regulations under subsection (1) may in particular also include provision about—

(a) the kinds of waste covered by the regulations;

(b) the kinds of facility covered by the regulations;

(c) the criteria for acceptance of different kinds of waste at different kinds of facility;

(d) derogations from the criteria for waste volumes below specified levels;

(e) temporary derogations from the criteria based on the availability of appropriate alternative treatment capacity;

(f) exemptions from the criteria for high calorific wastes for renewable energy purposes;

(g) the testing of wastes required to establish compliance with the criteria;

(h) the enforcement of the duties imposed by the regulations;

(i) offences in relation to failures to comply with the requirements of the regulations.

(4) The enforcement authority must have regard to any guidance given by the Scottish Ministers to it in relation to the functions conferred on it by the regulations.>

Elaine Murray

242A As an amendment to amendment 242, line 33, at end insert—
A draft of a statutory instrument containing the first regulations under subsection (1) must be laid before the Scottish Parliament no later than one year after this Act receives Royal Assent.

Elaine Murray

279 After section 52, insert—

<Waste reduction schemes

Waste reduction schemes

(1) The Scottish Ministers may, by regulations, establish a waste reduction scheme.

(2) A “waste reduction scheme” is a scheme to reduce the amount of residual domestic waste by providing a financial incentive to—

(a) produce less domestic waste; and

(b) recycle more of what is produced.

(3) The scheme may provide for the financial incentive to be provided—

(a) by means of rebates from council tax or by other payments; or

(b) by means of charges under subsection (4),

or by any combination of those means.

(4) The scheme may include provision for charging by reference to—

(a) the amount of residual domestic waste collected from premises;

(b) the size of receptacles used for the purposes of the collection of residual domestic waste from premises;

(c) the number of receptacles used for such purposes;

(d) the frequency with which residual domestic waste is collected from premises,

or by reference to any combination of those factors.

(5) The regulations must include provision about—

(a) the areas in which the scheme is to operate;

(b) the person or persons by whom any charge is payable;

(c) the manner in which any charge or rebate may be calculated or levied;

(d) the extent and means of notification to persons regarding the implementation, amendment or revocation of such a waste reduction scheme;

(e) the process by which appeals by persons regarding any liabilities for charge or entitlements to rebates under the scheme may be made;

(f) the maintenance of a separate public account of any charges or rebates made under the scheme;

(g) the standards of recycling service which must be provided in areas covered by the scheme;

(h) the measures that must be in place in such areas to prevent, minimise or otherwise deal with the unauthorised deposit or disposal of waste;

(i) the measures to be put in place to ensure that specific groups are not disadvantaged by the scheme.
(6) Regulations may also include provision for—
   (a) the type of domestic premises to which the scheme applies;
   (b) the nature and identification of specified containers for the collection of waste;
   (c) any charges that may be made for the provision or identification of specified containers;
   (d) the payment arrangements for any charge, including whether charges can be paid on account or in instalments;
   (e) any limit that might be imposed on the charge for any premises;
   (f) the means by which unpaid charges may be recovered.

(7) The first regulations under subsection (1) must provide for the scheme to be piloted in one or more specified area for a specified period; and the scheme must be reviewed at the end of that period.

(8) After the review mentioned in subsection (7) has taken place, the Scottish Ministers must—
   (a) revoke the scheme; or
   (b) extend the scheme—
      (i) to such further areas as may be specified; or
      (ii) across Scotland.

(9) In this section—
   “domestic premises” means any building, self-contained part of a building, caravan or moored vessel used wholly for the purposes of providing living accommodation;
   “domestic waste” means household waste from domestic premises;
   “residual domestic waste” means domestic waste that is not waste meeting any conditions in a particular local authority area for collection by the authority as recyclable waste.

Stewart Stevenson  
182 After section 58, insert—  

<Deposit and return schemes: designation of scheme administrator  

(1) The Scottish Ministers may, by order, designate—
(a) a body established under section (Power to establish scheme administrator)(1); or
(b) such other person or body as they consider appropriate (an “existing body”),
as a scheme administrator of a deposit and return scheme established by virtue of section 58.

(2) An order under subsection (1)(b) may, in so far as the Scottish Ministers consider it
necessary or expedient to do so, modify the functions of an existing body by—
(a) conferring functions on;
(b) removing functions from; or
(c) otherwise varying the functions of,
the body.

(3) That order may in particular include provision about—
(a) borrowing by the existing body (with the approval of the Scottish Ministers);
(b) the charging by the body, in respect of the exercise of its functions in relation to a
deposit and return scheme, of such reasonable amounts as the Scottish Ministers
consider appropriate.

(4) In exercising functions in relation to a deposit and return scheme, a scheme
administrator must comply with any written directions of a general or specific nature as
the Scottish Ministers may from time to time give to it in relation to those functions.

Stewart Stevenson

183 After section 58, insert—

<Power to establish scheme administrator

(1) The Scottish Ministers may, by order, establish a body to be a scheme administrator of a
deposit and return scheme established by virtue of section 58(1).

(2) A body established under subsection (1) is to be a body corporate.

(3) The body may do anything which appears to it—
(a) to be necessary or expedient for the purpose of, or in connection with, the exercise
of its functions in relation to a deposit and return scheme;
(b) to be conducive to the exercise of those functions.

(4) In particular, the body may—
(a) enter into contracts;
(b) with the agreement of the Scottish Ministers, borrow money;
(c) charge, in respect of the exercise of its functions in relation to a deposit and return
scheme, such reasonable amounts as the Scottish Ministers consider appropriate.

(5) An order under subsection (1) may in particular include provision about—
(a) the status and constitution of the body;
(b) the status of the members and any employees of the body;
(c) the remuneration, allowances and pensions of such members and such employees;
(d) the conferral of functions on the body;
(e) the keeping by the body of accounts and accounting records.>

Stewart Stevenson

184 After section 58, insert—

<Finance of scheme administrator>

(1) The Scottish Ministers may, for the purpose of or in connection with the exercise by a scheme administrator of functions in relation to a deposit and return scheme—

(a) pay grants;

(b) make loans,

to the administrator of such amounts as Ministers may determine.

(2) Any such grant or loan may be paid or, as the case may be, made, on such terms and subject to such conditions (including, in the case of a loan, conditions as to repayment) as the Scottish Ministers consider appropriate.

(3) The Scottish Ministers may, from time to time after any grant or loan is paid or, as the case may be, made, vary the terms and conditions on which it was paid or made.

(4) The Scottish Ministers may guarantee, in such manner and on such conditions as they consider appropriate, the discharge of any financial obligation in connection with any sums borrowed by a scheme administrator for the purpose of, or in connection with, the exercise of its functions in relation to a deposit and return scheme.>

Elaine Murray

246 After section 58, insert—

<Charges for single-use or disposable products>

Charges for single-use or disposable products

(1) The Scottish Ministers may, by regulations, require persons of the kinds specified—

(a) to impose, at the point of sale, a charge under this section for single-use or disposable products of the kinds specified;

(b) to apply the net proceeds raised by such charges to the advancement of environmental protection or improvement or to any other purposes that may be reasonably regarded as analogous.

(2) The regulations may in particular include provision about—

(a) the circumstances in which the requirement applies;

(b) the minimum amount to be charged for each specified single-use or disposable product;

(c) how the net proceeds raised by the charge are to be ascertained;

(d) the purposes to which those net proceeds are to be applied;

(e) subject to section 60—

(i) the enforcement authority in relation to the regulations; and

(ii) the functions of that authority;

(f) the keeping of records and their production to the enforcement authority;
(g) the enforcement of the duties imposed by the regulations;
(h) offences in relation to failures to comply with requirements of the regulations.

(3) The enforcement authority must have regard to any guidance given by the Scottish Ministers to it in relation to the functions conferred on it by the regulations.

74 Leave out section 59

After section 61

Elaine Murray

247 After section 61, insert—

<!Civil penalties for waste offences>

(1) The Scottish Ministers may, by regulations, make provision for or in connection with—
(a) the imposition by the enforcement authority of penalty charges in respect of such offences under this Chapter as are specified;
(b) the payment of such charges.

(2) The regulations must include provision specifying the person or persons by whom a penalty charge in respect of an offence is to be paid (who may be or, as the case may be, include a person other than the person who committed the offence).

(3) The regulations must include provision—
(a) prohibiting criminal proceedings in respect of any description of conduct for which a penalty charge may be imposed; or
(b) securing that a penalty charge is not payable or is refunded where the conduct is the subject of criminal proceedings.

(4) The regulations must include provision about the standard of proof required to establish the commission of an offence in respect of which a penalty charge may be imposed and may include other provision for or in connection with evidence and procedure.

(5) The regulations may set different levels of penalty charges in respect of different offences and in respect of the same offences committed in different circumstances.

(6) The regulations may provide for the level of penalty charge to be determined, in specified circumstances, by reference to the turnover of any business involved in the offence in a specified way or to the costs avoided, or income gained, by any such business as a result of the commission of the offence.

(7) The regulations may include provision for and in connection with—
(a) the notification of penalty charges to persons appearing to be liable to pay them;
(b) the enabling and effect of the making of representations to the enforcement authority by persons who are or may be liable to pay those charges;
(c) appeals by those persons against the imposition of those charges.
(8) Before laying a draft of a statutory instrument containing regulations under subsection (1) before the Scottish Parliament, the Scottish Ministers must carry out such consultation with the public on a draft of the regulations as they consider appropriate.

Before section 62

Alison McInnes

248 Before section 62, insert—

<Judicial review

(1) In any application for judicial review relating to or arising out of the provisions of this Act, it will be enough for any party to show sufficient interest in order to satisfy the common law tests of title and interest.

(2) “Sufficient interest” is to be interpreted in accordance with the criteria laid out in Article 9 of the Convention on Access to Information, Public Participation in Decision-Making and Access to Justice in Environmental Matters signed at Aarhus on 25 June 1998 (“the Aarhus Convention”).

(3) In relation to the expenses associated with any judicial review proceedings under this Act, the court may impose a cap on, or otherwise regulate, the extent of liability for expenses between the parties; and such applications may be competently made at any stage of the proceedings.

(4) When determining an application made under subsection (3) above, the court is to have regard to the need to remove or reduce financial or other barriers to access to justice, in accordance with the principles laid out in Article 9 of the Aarhus Convention.

(5) In any application for judicial review under this Act, the court may competently consider both the substantive and the procedural legality of the decision, act or omission under review.>

Des McNulty

249 Before section 62, insert—

<Sustainable development

(1) The persons mentioned in subsection (2) must, in exercising functions conferred on them by virtue of this Act, take into account the need to do so in a way that contributes to the achievement of sustainable development.

(2) Those persons are—

(a) the Scottish Ministers;

(b) each relevant public body.>

Alison McInnes

249B As an amendment to amendment 249, leave out line 8

Shirley-Anne Somerville

249A As an amendment to amendment 249, line 8, at end insert—

<( ) the advisory body>
Patrick Harvie

280 Before section 62, insert—

<Scottish Executive budget: impact on greenhouse gases

The Scottish Ministers must, at the same time as laying before the Scottish Parliament any document setting out preliminary draft budgets of public expenditure in any financial year, lay before the Scottish Parliament a document describing the impact of that expenditure on greenhouse gas emissions.>

Section 62

Cathy Peattie

228 In section 62, page 30, line 23, at end insert—

<( ) public bodies (as defined in section 36(A2))>

Section 64

Iain Smith (on behalf of the Economy, Energy and Tourism Committee)

229 In section 64, page 31, leave out lines 29 and 30

Alex Johnstone

186 In section 64, page 31, leave out lines 31 to 35

Maureen Watt (on behalf of the Rural Affairs and Environment Committee)

250 In section 64, page 31, line 39, at end insert—

<(9) Before laying a draft of any regulations under sections 52 to 59 (other than regulations mentioned in subsection (7)(d) or (e)) before the Scottish Parliament, the Scottish Ministers must—

(a) lay before the Scottish Parliament—

(i) a copy of the proposed regulations, and
(ii) a statement of their reasons for proposing to make the draft regulations,

(b) publicise the proposed draft regulations in such manner as they consider appropriate, and

(c) have regard to—

(i) any representations about the proposed draft regulations,
(ii) any resolution of the Scottish Parliament about the proposed draft regulations, and
(iii) any report by a committee of the Scottish Parliament about the proposed draft regulations,

made during such period as the Scottish Ministers may specify when laying the proposed draft regulations.

(10) The period so specified must—
(a) be no shorter than 60 days, and
(b) include at least 30 days during which the Scottish Parliament is not dissolved or in recess.

(11) When laying a draft of any regulations to which subsection (9) applies before the Scottish Parliament, the Scottish Ministers must also lay a statement giving details of—

(a) any representations, resolution or report falling within paragraph (c) of that subsection; and

(b) the changes (if any) which in the light of any such representations, resolution or report, the Scottish Ministers have made to what was laid under paragraph (a)(i) of that subsection.

Section 65

Stewart Stevenson
32 In section 65, page 32, line 8, leave out <section 10(2)> and insert <subsection (2) of section 10>

Stewart Stevenson
33 In section 65, page 32, line 9, leave out <subsection (2)(a)> and insert <paragraph (a)>

Stewart Stevenson
34 In section 65, page 32, line 9, at end insert <of that subsection>

Cathy Peattie

Climate Change (Scotland) Bill

3rd Groupings of Amendments for Stage 2

This document provides procedural information which will assist in preparing for and following proceedings on the above Bill. The information provided is as follows:

- the list of groupings (that is, the order in which amendments will be debated). Any procedural points relevant to each group are noted;
- a list of any amendments already debated;
- the text of amendments to be debated on the third day of Stage 2 consideration, set out in the order in which they will be debated. THIS LIST DOES NOT REPLACE THE MARSHALLED LIST, WHICH SETS OUT THE AMENDMENTS IN THE ORDER IN WHICH THEY WILL BE DISPOSED OF.

Groupings of amendments

Promotion of energy efficiency: general duties and targets
222, 223, 252, 232

Contribution of planning and building regulation to reduction of emissions
251, 271, 272

Promotion of renewable heat
154, 155, 155A, 156, 254, 239, 240, 161, 270

District heating
253, 265

Energy generating stations: efficiency guidance
255

Energy efficiency finance scheme
256

Assessment and improvement of energy performance: non-domestic buildings
224, 157, 225, 158, 159, 160, 160A, 226, 229

Assessment of energy performance of living accommodation
227, 227A, 227B

Alterations to buildings: impact on energy performance
257

Council tax and non-domestic rates: energy efficiency discounts
238, 258, 259, 260, 261, 262, 263, 264
Climate change burdens
266

Promotion of energy efficiency: housing-related measures
267, 268, 269

Permitted development rights: microgeneration equipment
273, 274

Energy performance: public sector buildings
275, 276, 277, 278

Date certain waste regulations to be made by
241, 243, 244

Disposal of waste
242, 242A

Waste reduction scheme
279

Deposit and return schemes
162, 163, 164, 165, 166, 167, 168, 169, 170, 171, 172, 173, 174, 175, 245, 176, 177, 178, 179, 180, 181, 185, 182, 183, 184, 186

Charges for single-use or disposable products
246

Charges for carrier bags
74

Civil penalties for waste offences
247

Judicial review
248

Sustainable development
249, 249B, 249A

Scottish Executive budget: impact on greenhouse gases
280

Waste regulations: procedure
250

Amendments already debated

Interim target: modification
With 1 – 35
Minor amendments
With 15 - 32, 33, 34

Programmes for adaptation
With 190 - 233, 235

Public bodies: climate change duties
With 198 - 228, 230, 231, 234, 236
Climate Change (Scotland) Bill: The Committee considered the Bill at Stage 2 (Day 3).

The following amendments were agreed to (by division)—

255 (For 5, Against 3, Abstentions 0)
259 (For 5, Against 3, Abstentions 0)
261 (For 5, Against 3, Abstentions 0)
263 (For 5, Against 3, Abstentions 0)
273 (For 5, Against 3, Abstentions 0)
274 (For 5, Against 3, Abstentions 0)
250 (For 4, Against 3, Abstentions 1)
230 (For 5, Against 3, Abstentions 0)
231 (For 5, Against 3, Abstentions 0)
234 (For 5, Against 3, Abstentions 0)

The following amendments were disagreed to (by division)—

251 (For 4, Against 4, Abstentions 0; amendment disagreed to on casting vote)
256 (For 2, Against 6, Abstentions 0)
245 (For 0, Against 4, Abstentions 4)
74 (For 4, Against 4, Abstentions 0; amendment disagreed to on casting vote)
The following amendments were moved and, with the agreement of the Committee, withdrawn: 257, 238, 266, 267, 241, 242A, 242, 279, 246, 247, 248 and 280.

The following amendments were not moved: 252, 225, 160A, 226, 227B, 258, 260, 262, 264, 265, 268, 239, 240, 270, 271, 272, 278, 244, 185, 228, 186, 232 and 236.

Sections 48, 49, 50, 53, 58, 64, 65, 67, and the long title were agreed to as amended.

Sections 52, 54, 55, 56, 57, 59, 60, 61, 62, 63, schedule 2, and section 66 were agreed to without amendment.

The Committee completed Stage 2 consideration of the Bill.
The Convener (Patrick Harvie): Good afternoon and welcome to the 16th meeting this year of the Transport, Infrastructure and Climate Change Committee. I remind members and everyone else that all mobile devices should be switched off. We have no apologies to record. I welcome Iain Smith, Sarah Boyack and Lewis Macdonald, and we expect to see Liam McArthur at some point during the meeting. We also welcome to the committee a representative of the Ugandan official report.

The only item on today’s agenda is our continuing stage 2 consideration of amendments to the Climate Change (Scotland) Bill. I welcome once again the Minister for Transport, Infrastructure and Climate Change, Stewart Stevenson, and his officials. They are Fiona Page, who is the Climate Change (Scotland) Bill team leader; Ian Young, who is a depute parliamentary counsel; Norman Macleod and Louise Miller, who are solicitors; Sally Moxham, who is head of the energy efficiency team; and Gavin Peart who is from building standards. Kevin Philpott, the waste regulation team leader, will join us later.

I gather that the minister would like to make one or two brief remarks before we resume consideration of amendments.

The Minister for Transport, Infrastructure and Climate Change (Stewart Stevenson): Thank you very much, convener.

I am sure that members will appreciate the complicated nature of the bill’s provisions on the “relevant body” and the “advisory body”. I would like to take the opportunity to clarify the statement that I made on the matter last week, which might have left some members confused. In all honesty, once I read it in the Official Report, I was among them.

The relevant body is, indeed, recognised in the bill—it is defined in section 5. It is the UK Committee on Climate Change, unless another body is designated under section 19(1) of the bill, in which case the relevant body will be that other body. The other body is the advisory body. "Why,” you ask, “does the bill provide for two bodies to give us advice?” The answer is that, technically, it does not. We will only ever get advice from one body. As we made clear when we introduced the bill, we want initially to get our advice from the UK Committee on Climate Change, but we want to have the facility to use instead an existing Scottish public body, or to set up and use a Scottish committee on climate change. Initially, at any rate, we will request and get advice from the UK Committee on Climate Change—the relevant body. If we subsequently set up a Scottish committee on climate change, we will request and get advice from that body—the advisory body.

I trust that that clarifies the matter. I thank members for their patience, and I thank the convener for allowing me the opportunity to set the record straight.

The Convener: Thank you. Now that that is on the record, we will proceed with our consideration of amendments. Members will be familiar with the process. I repeat what I have said before about occasions on which a casting vote is necessary: my intention will be to vote for the status quo, which is the bill as it stands. At the beginning of each group, the first amendment in the group should be moved. Subsequent amendments will be moved later. Members who do not wish to move their amendments should simply say, “Not moved.”

Section 48—Duty of Scottish Ministers to promote energy efficiency

The Convener: Amendment 222, in the name of Iain Smith, is grouped with amendments 223, 252 and 232.

Iain Smith (North East Fife) (LD): I am pleased to open day 3 of the committee’s stage 2 proceedings. I start by saying that in speaking to most of the amendments in my name this afternoon, I will be speaking on behalf of the Economy, Energy and Tourism Committee, which agreed unanimously to their being lodged at one of its meetings. The amendments in question arose from the stage 1 report that we published on the sections of the bill to do with energy efficiency and renewable heat.

Amendments 222, 223 and 232 relate to the duty on ministers to promote energy efficiency, which the Economy, Energy and Tourism Committee feels would weaken the current legislative position, especially as regards the energy efficiency of living accommodation. The Housing (Scotland) Act 2006 requires ministers to improve the energy efficiency of living accommodation; as it stands, the bill would reduce the requirement to improve the energy efficiency of living accommodation to that of promoting it.
When the Economy, Energy and Tourism Committee took evidence on the matter at stage 1, there was discussion about legislative competence: in my view, if it was within Parliament’s legislative competence in 2006 to provide for improvement in the energy efficiency of living accommodation, that remains the case. There might be an issue to do with the wider promotion of energy efficiency, but there is certainly no case for weakening the current provision on the energy efficiency of living accommodation. The primary purpose of amendment 222 is to make it clear that the requirement to improve the energy efficiency of living accommodation will remain a statutory obligation.

Amendment 223 proposes a requirement to set annual energy efficiency targets and says that the plan for the promotion of energy efficiency in Scotland must “describe how those targets are to be reported on.”

Its purpose is to ensure that Scottish ministers spell out in their energy efficiency plan their goals in relation to energy efficiency and reducing energy consumption. Without clear targets or objectives, it will be hard to assess progress. The committee considered proposing an energy efficiency target in the bill, but it has settled for having that target and the detail of how it will be achieved as part of energy efficiency plans. Ministers have produced no energy efficiency plan, although they have produced an outline plan after lobbying by the Economy, Energy and Tourism Committee.

Amendment 223 is supported by, among others, Elizabeth Leighton of WWF Scotland, who recommended that the action plan “include targets for energy efficiency and that progress is reported, either in the annual report or as part of an emissions reduction plan addressing demand reduction, energy efficiency and renewables.”—[Official Report, Economy, Energy and Tourism Committee, 4 February 2009; c 1561.]

Finally, amendment 232, in my name and on the Economy, Energy and Tourism Committee’s behalf, would remove the provision to repeal section 179 of the Housing (Scotland) Act 2006, which places a duty on Scottish ministers to prepare a strategy for improving the energy efficiency of living accommodation. That repeal is unnecessary and could, as I have said, weaken the legislative position on improving the energy efficiency of living accommodation.

With those comments, I move amendment 222.

The Convener: I welcome the amendments from Iain Smith and the Economy, Energy and Tourism Committee. The emphasis on energy efficiency in recent years has increased slowly but steadily to the point at which broad agreement has been reached—as it was in the Transport, Infrastructure and Climate Change Committee—that a commitment needs to be made to more specific action. The committee has agreed that energy efficiency is a key area for achieving improvements in Scotland’s carbon emissions. We have called for more specific action from the Government, as has the Economy, Energy and Tourism Committee.

Amendment 252 in my name is supported by the Association for the Conservation of Energy, and would specify some energy efficiency targets for the first 10 years or so of the bill’s operation. It would also give ministers the power to define the terms “low carbon” and “zero carbon”, which could be used in the bill.

If the minister were minded to accept the amendments from the Economy, Energy and Tourism Committee, it would help us to have an indication of the targets that he would expect to set and of whether the targets in amendment 252 seem reasonable to the Government. If the Government accepts the principle that there should be targets, that will probably command strong support from throughout the Transport, Infrastructure and Climate Change Committee.

Do other committee members wish to comment?

Des McNulty (Clydebank and Milngavie) (Lab): The committee is in a wee bit of difficulty, because it argued explicitly in its stage 1 report against targets for sectors and said that “indications” should be given for each sector. Notwithstanding that, a case can be made for amendments 222 and 232 from the Economy, Energy and Tourism Committee. I have no problem with those amendments.

Amendment 223 refers to targets. Should we have annual targets, or would it be better to link targets with the periodic review of the energy efficiency plan? We have waited some time for that plan, but I presume that ministers intend to renew it regularly. I have no particular view on whether that should fit in with a profile of annual targets or whether two-year or three-year targets should be set.

Labour members are in favour of amendments 222 and 232. Amendment 252 is perhaps too specific and it is questionable whether the numbers are right. However, I support the convener’s request to the minister to say what energy efficiency improvement targets he expects to set, although I would not want the bill to set out percentages in that regard.
13:45

**Stewart Stevenson:** I am content to support amendments 222 and 223. Amendment 222 would require the Scottish ministers to publish a plan that included provision for “improving the energy efficiency of living accommodation”.

The Scottish ministers are happy to support that principle. Amendment 223 would require the energy efficiency action plan to include annual energy efficiency targets and to describe how the targets should be reported on. The approach is in line with our plans, so I am pleased to support it. Of course, the committee must reach its own conclusions on the matter.

The convener asked where we would get our energy efficiency targets. In previous debates I have said that we would always want our targets to be driven by expert advice. We would not take a different approach to energy efficiency targets. There is no question of the Government producing figures yet. However, I make clear our commitment to accept amendments 222 and 223.

Amendment 252, in the convener’s name, would require the energy efficiency action plan to include a broad range of targets for energy efficiency, microgeneration installations and the reduction of greenhouse gas emissions from new and existing domestic and non-domestic buildings. It is probably too early to set meaningful targets for microgeneration and greenhouse gas reduction in buildings. I expect to have the evidence base to set such targets in the future, but currently there is no solid evidential base on which to set targets in primary legislation. That brings me back to my point about the need for expert advice.

Three of the targets that are proposed in amendment 252 are significantly more demanding than the approach that was recommended by the expert panel that produced the Sullivan report, “A Low Carbon Building Standards Strategy for Scotland”, which recommended that from 2016 all new buildings should be net zero-carbon buildings. Due to building warrant duration, amendment 252 would bring in such a target three years earlier than envisaged in the Sullivan report.

The Sullivan report’s recommendations on the interim emissions reduction targets for non-domestic buildings—to deliver CO₂ savings of 50 per cent and 75 per cent more than current standards in 2010 and 2013 respectively—would apply not only to new buildings, as Sullivan envisaged, but to the entire existing building stock, if amendment 252 were agreed to. Therefore, I cannot support amendment 252.

Amendment 232, to which Iain Smith spoke on behalf of the Economy, Energy and Tourism Committee, would prevent the repeal of section 179 of the Housing (Scotland) Act 2006. We have accepted amendment 222, which would confer on the Scottish ministers a duty to prepare and publish an action plan on “improving the energy efficiency of living accommodation”.

If amendment 222 is agreed to, section 48 of the bill will also cover the matter that is covered by section 179 of the 2006 act. It would be unnecessary to retain section 179 of the 2006 act if the same duty were to be incorporated into the Climate Change (Scotland) Bill and there could be confusion if we were to have legislated for the same purpose in two acts. Furthermore, the Government would potentially be required to produce two action plans on the same topic, because there would be separate duties to do so in two acts. Therefore, the repeal of section 179 remains necessary and I am unable to support amendment 232.

**Iain Smith:** I welcome the minister’s support of amendments 222 and 223. I also listened with care to his comments on amendment 232, which is, it is fair to say, a backstop amendment. If the other amendments are agreed to, my intention is not to move amendment 232.

I will press amendment 222.

**Amendment 222 agreed to.**

**Amendment 223 moved—[Iain Smith]—and agreed to.**

**The Convener:** Amendment 251, in the name of Sarah Boyack, is grouped with amendments 271 and 272.

**Sarah Boyack (Edinburgh Central) (Lab):** The provisions in amendment 251 form part of the member’s bill on which I have been working since 2005. At the outset of speaking to the amendments, I record my thanks to the advocate Morag Ross, who helped me to draft them, and to the steering group. I also thank colleagues, some of whom are here and others of whom are elsewhere in the Parliament, for their fantastic support over the past few years.

The amendments address a key part of the bill. As the committee knows from its evidence taking over the past few months, our buildings are a crucial part of the solution to tackling climate change and reducing our CO₂ emissions. The amendments in the group recognise that. Other countries are ahead of us in making that recognition, but we have a lot of expertise in this field. Scottish community and householder renewables initiative grants have enabled a lot of technology to be tested around the country. However, despite many years of debate and exhortation, we still have no mass application of these technologies in our buildings and they have not yet become mainstream.
In essence, what I have put on the table for discussion today is a development of the position of two years ago in Scottish planning policy 6, in which we introduced our version of the Merton rule. SPP 6 requires developers of major developments of more than 500m² to incorporate planned reductions of CO₂ emissions, calculated on the basis of the predicted CO₂ emissions, to be provided for through renewable energy generated on site. The aim was to reduce CO₂ emissions and to stimulate decentralised energy production and to do the two things together. It could be combined heat and power or ground-source heating in some sort of communal provision, or a specific building-related renewables system, which could be solar or air-source heating in individual units.

SPP 6 has been in place for a couple of years and we have had SCHRI grants for several years, but we have not seen the rapid progress that was hoped for at the time. The critical issue is how to move forward. SPP 6 was drafted in such a way that developers can gain the benefit. If they design a low-carbon development, they can produce slightly less renewable energy to power it and heat it. However, some of that initial objective was lost in the translation into the new planning guidelines.

Crucially, this is not about tying in the requirement to existing building standards, which move over time—they have to be a given for any new development. This is about putting pressure on developers to achieve the lowest carbon emissions for their site and to meet a proportion of the power that is needed for the development on site in a way that reduces carbon emissions.

The amendments can operate whatever the level of building standards that ministers set, so they are not tied to where we are now; ministers can change things. They are also not technology specific; it is left to the judgment of the developer to decide what is most important.

Amendment 251 would require ministers to include a report on how the objectives in their energy efficiency plan will be delivered, which ties the provision into their other work. I hope that that enables clarity. It also highlights the leadership of the Scottish Government on the matter.

I have not specified the level of emissions that will be required. When we first debated SPP 6, we had a long discussion about whether the level should be 15 or 20 per cent. At the time, our expectation was that we would start at a lower level and move higher. That was the approach that the City of Edinburgh Council and Midlothian Council took in setting similar policies. It allows more pressure to be put on every single planning decision that we take.

Research into the amendment of development plans since the introduction of SPP 6 shows the incredibly slow uptake. Although some authorities such as Edinburgh and Midlothian are ahead of the game, most councils have not really engaged. There is a bit of uncertainty in terms of expertise. There is also the sheer fact that it takes ages to review development plans.

Amendment 271 would amend the Town and Country Planning (Scotland) Act 1997. It would be a step forward in that it would provide clarity for all local authorities and require them to review their development plans rather than simply encourage them to do so.

Amendment 272 would require ministers to produce an annual update on the operation of the policy. I have not said that that requirement should be for all time but suggested that it should be for the first four years after the provision comes into force. That ties in well to the Sullivan report’s timescale of 2016. I have not included a sunset clause, so the provision would not fall after four years, but ministers would be required to review its effectiveness.

The key problem that we have had in the past two years is that, although SPP 6 exists, it has not been widely adopted. From talking to ministers over the past few years, I have the impression that they are committed to it, so I have made my proposals to help to move us forward. The planning profession is aware of the challenge and developers are beginning to engage in addressing emissions. Architects, surveyors and building professionals are all beginning to deliver, as we can see in new developments in Edinburgh. I accept that new build is not the whole story, but it can see in new developments in Edinburgh. I accept that new build is not the whole story, but it is crucial if we are to get mass installations of low and zero-carbon generating technologies to stimulate the market and increase the amount of decentralised energy that is available.

My proposals are not technology specific but would leave the judgment on technology to developers and would help to move us on from where we think we are to a better place. They would also remove the current threshold to ensure that we have a more widespread application of this approach.

I move amendment 251.

Stewart Stevenson: I will consider all the amendments in the group, starting with amendment 271. I will then speak to amendment 272, after which I will come to amendment 251. It may be useful to indicate at the outset that, although I will speak to some of the difficulties in amendment 251, we are willing to address them through a stage 3 amendment. I will discuss that further.

Amendments 271 and 272 aim to introduce new legislative requirements to increase the role of development plans and the planning system
generally in securing the installation of low and zero-carbon technologies in all new buildings. That is a perfectly reasonable objective, but we have difficulties with the structure of the amendments. I will run through some of those difficulties in relation to amendment 271.

I understand the intention of the amendment’s first lines. Strategic development plans are expected to operate at a broad-brush level in the four main city regions, which cover 20 of our 32 councils, and would be an inappropriate place for the level of detail that the amendment seeks on specific requirements for new buildings. If anything, the local development plans within those areas would have a role to play. However, section 3E of the Town and Country Planning (Scotland) Act 1997—inserted by the Planning (Scotland) Act 2006—already places a statutory duty on planning authorities to exercise their functions under that act “with the objective of contributing to sustainable development.”

The Scottish ministers’ intention is to supplement that legislative requirement with planning guidance to ensure that development plans facilitate sustainable economic growth.

Amendment 271 is not clear about what “relevant developments” means. The meaning of “specified and rising proportion of … emissions” also remains unclear and raises many questions that would require to be clarified for planning authorities. Moreover, I am advised that it is not possible to predict a building’s “operational greenhouse gas emissions”. Once they are occupied, buildings are subject to the behaviour of residents and domestic or commercial tenants, and the condition of the building will vary hugely.

We have already introduced permitted development rights for many forms of low and zero-carbon generating technologies. Development plans should certainly support the provision of on-site low-carbon and renewable sources of energy in new developments, but seeking to prescribe in legislation how that should be done risks stifling initiative and innovation. In addition, a legislative requirement would become progressively unnecessary as we ramped up efforts to decarbonise electricity and heat.

14:00

Our approach is proportionate. Planning is undergoing significant change at the moment; we want to ensure that the system is simplified and quicker and that it truly focuses on supporting increasing sustainable economic growth. The amendments would not add to the mix; rather, they would simply add further layers of unnecessary and overprescriptive bureaucracy to a planning system that we are trying to streamline so that we can get things moving faster. However, I assure Miss Boyack that the Scottish Government will take the issue seriously in dealing with the new development planning arrangements. For all of those reasons, the reporting arrangements that are proposed in amendment 272 are unnecessary.

Amendment 251 would require that the energy efficiency action plan “must include details of how the Scottish Ministers intend to update planning and building regulations to ensure that all new buildings” demonstrate how “their projected operational greenhouse gas emissions” could be reduced “through the installation and operation of low and zero-carbon generating technologies.”

Again, there is a lack of clarity in expression in the amendment, which would create difficulties. It is important for local authorities to develop opportunities for renewable energy and low-energy delivery, including heat, of course. However, as I have explained, I expect the planning system to play a full yet proportionate role in that field. We support what is proposed in amendment 251 but think that it will be necessary for us to consider lodging an amendment at stage 3 that is cast in a different way to deliver the objectives that Ms Boyack seeks.

Sarah Boyack: If amendment 251 is agreed to, do you intend to lodge an amendment to change some of its terms, although you are happy with its spirit?

Stewart Stevenson: I do not require that the amendment be passed today to lodge an amendment at stage 3. I am in the committee’s hands. However, I make the general comment that it is certainly easier to lodge a new amendment. Of course, we will have to lodge our amendment in advance of members lodging an amendment. If, on viewing the amendment that we have lodged at stage 3, the member thinks that it does not address the relevant issues, she will still, of course, have the opportunity to lodge further amendments to what we propose. Indeed, I am happy to engage with her at the earliest possible moment to enable her to see what we propose. We have not quite formulated an amendment yet.

Sarah Boyack: My difficulty is that I was in with the bricks with the Scottish Government’s original policy, so I have tried to word all my amendments on the basis of our original policy objectives in 2007. We considered projected greenhouse gas emissions, and I understand that we had a
formulation at the time that worked, which SPP 6 was introduced to deliver.

**Stewart Stevenson:** The word that is causing us difficulty is “operational”. I wonder whether the member is confident that previous work addressed that issue in a robust legal way. That is primarily where our difficulty hangs.

**Sarah Boyack:** That is useful.

My main problem with not pressing the matter is that we have not made the progress on planning aspects in the past two years that ministers were looking for in 2007. There is certainly a commitment in the building industry to working on the issues, but things are not happening. That is why I lodged amendment 251 and why I have wanted to amend the planning legislation.

Amendment 271 refers to strategic development planning authorities and local development plans because they may change in the future, as they have done in the past few years when local government and planning arrangements have been reorganised. My proposals cover both the strategic and the local development plan levels. I would expect to see the policies in depth at the local development plan level, but it would be entirely consistent with how the planning system works for them to be mentioned at the strategic level and followed through in detail at the local level. Therefore, I do not see the argument against my proposals in that regard.

Having sustainable development as an objective is not the same as the requirement to reduce carbon emissions in developments. There is a world of difference between a general desire to deliver sustainable development and the practical policies that will deliver that on the ground, which is why amendments 271 and 272 have been put together in this way.

I am more than happy to talk to the minister about the phrase “projected operational greenhouse gas emissions”, which, I should point out, is from SPP 6. I am concerned that if we draw back from the planning policy suite that the Government has inherited, we will reduce the amount of planning policy guidance that local authorities receive and that, in moving from SPP 6, which was not applied widely, to a much smaller suite of planning policy, we will simply cause the issue to disappear. The term “sustainable development” alone will not cover all the issues or ensure that all new developments have some form of decentralised energy built in from the start.

Although I am happy to discuss in detail any amendments that the minister might wish to lodge afterwards, I would much prefer to press my amendments now. I believe that the technical issues that the minister has raised can be bottomed out, and I do not think that he has made a strong case for not taking the approach set out in the amendments.

**The Convener:** The question is, that amendment 251 be agreed to. Are members agreed?

**Members:** No.

**The Convener:** There will be a division.

**FOR**
- Gordon, Charlie (Glasgow Cathcart) (Lab)
- Harvie, Patrick (Glasgow) (Green)
- McNulty, Des (Clydebank and Milngavie) (Lab)
- Peattie, Cathy (Falkirk East) (Lab)

**AGAINST**
- Gibson, Rob (Highlands and Islands) (SNP)
- Johnstone, Alex (North East Scotland) (Con)
- McInnes, Alison (North East Scotland) (LD)
- Somerville, Shirley-Anne (Lothians) (SNP)

**The Convener:** The result of the division is: For 4, Against 4, Abstentions 0. Because, as I indicated earlier, the casting vote is for the status quo, which is the bill as it stands, amendment 251 falls.

Amendment 251 disagreed to.

Amendment 252 not moved.

**The Convener:** Amendment 154, in the name of the minister, is grouped with amendments 155, 155A, 156, 254, 239, 240, 161 and 270.

**Stewart Stevenson:** Amendments 154, 155, 156 and 161 seek to strengthen the bill by introducing a new obligation to produce and update an action plan on renewable heat. At around 1.4 per cent of demand, current renewable heat use in Scotland is minimal and needs to increase significantly if we are to meet our target of producing 20 per cent of Scotland’s total energy consumption from renewable sources by 2020.

We are well aware of the challenge of increasing the uptake of renewable heat in Scotland. However, we are prepared to face up to it and the renewable heat action plan will provide a focus for our various actions to develop, grow and promote the sector. By strengthening the bill in this way, we will ensure that the policy remains under scrutiny during the important period of early growth leading to the expansion that is necessary to meet European 2020 renewable energy targets and to play a part in reducing carbon emissions.

We are well aware of the challenge of increasing the uptake of renewable heat in Scotland. However, we are prepared to face up to it and the renewable heat action plan will provide a focus for our various actions to develop, grow and promote the sector. By strengthening the bill in this way, we will ensure that the policy remains under scrutiny during the important period of early growth leading to the expansion that is necessary to meet European 2020 renewable energy targets and to play a part in reducing carbon emissions.

Turning to Mr Gibson’s amendments, I am content to support amendment 155A, which seeks to introduce a requirement for the renewable heat action plan to set targets and to describe how those targets will be reported on. Amendment 254 seeks to require Scottish ministers to make a statement on the renewable heat action plan when
it is laid before the Parliament. As that is in line with other provisions in the bill, I am content to support it.

Amendments 239 and 240, which have been lodged by Iain Smith on behalf of the Economy, Energy and Tourism Committee, seek to require ministers to prepare a plan about the promotion of renewable heat. I agree that the best way to do that is to put a duty on Scottish ministers to prepare and publish an action plan for the promotion of renewable heat. However, given that our amendments 154, 155, 156 and 161 seek to achieve the same outcome but articulate things in greater detail by, for example, creating stronger links between the energy efficiency and renewable heat action plans, I hope that Mr Smith will recognise that amendments 239 and 240 are probably unnecessary and agree not to move them.

Amendment 270, in the name of Ms Boyack, seeks to require Scottish ministers to introduce renewable heat targets. The targets are defined in the amendment as

"the number of renewable heat systems installed in Scotland"

at a specified date. Subsection (3) of the new section that the amendment would insert requires that Scottish ministers take steps to meet the targets,

"including by requiring local authorities to set objectives for promoting renewable heat in their areas."

Under the Scottish Government’s concordat with local government, it is for local authorities to determine how the money that is made available to them is spent to fulfil their statutory duties and to deliver the agreed outcomes in their single outcome agreements. By focusing on outcomes and removing substantial bureaucracy, that approach simplifies the delivery of government for the benefit of people and communities in Scotland. Amendment 270 runs counter to that by taking a prescriptive approach to local authorities, so I cannot support it.

Ministers agree that a renewable heat target is needed, but we do not agree that it should be set in respect of the number of renewable heat systems that are installed by a specified date. It is better to designate a target share for the contribution of renewable heat to energy consumption from renewables by 2020 than to specify the number of systems that must be installed. That is in line with the European Commission’s commitment to increase the share of renewable energy to 20 per cent of final European Union energy consumption by 2020.

Although we are broadly supportive of what Sarah Boyack seeks to achieve through amendment 270, we believe that amendments 155A and 254, in the name of Rob Gibson, already cover the need for targets and reporting, and that they do so in a way that does not cut across the concordat with local government and local government’s responsibilities. For the reasons that I have set out, I cannot recommend support for amendment 270.

I move amendment 154.

Rob Gibson (Highlands and Islands) (SNP): Amendment 155A, in my name, seeks to increase the clarity of the renewable heat action plan and the scrutiny to which it is subject. The percentage of heat to be produced from renewables must be worked out at some point, when we have a clear idea of what is possible. The level of the target should not appear in the bill; ministers should have discretion to decide it in the action plan. The target could be amended by subsequent modification of the plan.

Amendment 254 allows for greater parliamentary scrutiny and is in line with our preferred approach to the energy efficiency process. There will be regular reports, statements and scrutiny. The organisation that is most involved in delivering renewable heat schemes—Scottish Renewables—is keen that we adopt that approach and supports both the minister’s amendment and my amendments. The amendments will strengthen the bill’s clear goal that there should be a renewable heat action plan and provide Parliament with better opportunities to scrutinise progress. I am happy to support that combination of measures.

Iain Smith: I have lodged amendments 239 and 240 with the unanimous support of the Economy, Energy and Tourism Committee. The minister was right to point out that the proposals in the amendments are largely covered by amendment 155 in his name. We have lodged the amendments as a backstop, in case the Government’s amendments are not agreed to. It is important that it is more than just a possibility that the Government will produce a renewable heat action plan—it is essential that there is a duty on ministers to do so. Heat makes up 50 per cent of Scotland’s energy use; at present, renewable heat sources make up a tiny proportion of that. If we are to meet any of our future targets on climate change and increasing the use of renewables, the Scottish Government and others must make significant progress on the use of renewable heat as a primary source of heating. It is therefore vital that the Government produces a renewable heat action plan, and I agree—as I am sure that the Economy, Energy and Tourism Committee does—with the general principle that that plan should include targets.
I am happy to support the amendments in the name of the minister. If they are agreed to, I will not move the amendments in my name.

14:15

Sarah Boyack: Like Iain Smith, I am glad that the minister has moved amendment 154 on renewable heat, and I support the amendments in Rob Gibson’s name, which take a comprehensive approach. I do not intend to move my amendment, because the minister has now put on the table an amendment that meets the objectives that I was seeking. However, I almost lost my support when he extolled the concordat, which I do not think is a particularly good model with regard to renewable heat.

I will make two points. I understand why there might be a reluctance to focus on the number of renewable heat installations, but I would still like that to be recorded in the minister’s work, and I wonder whether he would agree to do that. It is crucial that we have not only large heat plants but decentralised and local energy at community and household level.

I ask the minister whether he is prepared to examine the role of local authorities, because it is not enough to say that it is not up to ministers to set targets for authorities. Amendment 270 is constructed in such a way that authorities would be required to set their own targets—rather than the minister being centralist and telling authorities what to do. I ask the minister to reflect on that point.

That approach is appropriate, because each local authority will have its own different opportunities in relation to renewable heat. Some local authorities may use community systems, while stand-alone developments would be more appropriate in other authorities. I am prepared not to move my amendment, but I would like the minister to address those two specific points.

Stewart Stevenson: We have had a helpful debate on the subject, and it is clear that we all seek to point in the same direction. I was glad to hear Iain Smith confirm that, as I thought, amendments 239 and 240 are backstops, and I hope that the committee will agree to the amendments in my name.

In response to Sarah Boyack’s comments, I say that the number of installations plays to the agenda of engaging as many people as possible, as well as the localisation of delivery and the ability to take advantage of different opportunities. I associate myself with her remarks about each local authority having different opportunities—that is spot on. It is clear that a rural authority that has local access to significant supplies of wood will have one particular opportunity, while an urban local authority may be able to divert some of its waste into heat and power generation and will therefore have a different set of objectives. It is proper that local authorities have different objectives.

I reassure Ms Boyack that we regularly discuss that subject and a wide range of others with local authorities, and we will continue to do so. There is good faith among local authorities in moving forward on that agenda, and we will certainly help them to do so in a spirit of partnership.

Amendment 154 agreed to.

The Convener: Amendment 253, in the name of Iain Smith, is grouped with amendment 265.

Iain Smith: Amendment 253 is the only amendment in my name that we will consider today that was not lodged on behalf of the Economy, Energy and Tourism Committee. That is because it relates to an issue that the committee did not consider. I should not speak for the committee in this context, but I think that it would probably support amendment 253, given our work on our inquiry on determining and delivering Scotland’s energy future, the report on which will be published later this month.

Heat accounts for 50 per cent of our energy use, but we do not consider how much heat is wasted in the production of energy. Around 60 per cent of heat in the generation process just goes up the chimney or is pumped into the sea or the river Forth as part of the cooling process. That considerable waste of energy and fossil fuels has a considerable impact on the climate, because we burn more fossil fuel than we need for energy use.

I lodged amendment 253 because I was concerned that waste heat does not fall neatly into a particular aspect of the bill and might therefore be missed. The issue does not belong in section 51, “Renewable heat”, because unless the electricity generation is from a renewable source such as biomass, a district heating scheme or combined heat and power scheme will not come under that section. Nor does the issue fit clearly into the sections on energy efficiency, although it is the clearest example of an area in which energy efficiency is needed.

Amendment 253 would make it clear that, in the context of energy efficiency, consideration would be given to how to make best use of surplus heat from electricity generation—and other industrial processes, given that, for example, oil refineries and even whisky distilleries produce a substantial amount of spare heat.

District heating schemes are widely used throughout the continent. The approach is particularly well developed in Denmark, where the Economy, Energy and Tourism Committee visited...
a scheme. We do not use district heating to any extent in Scotland and the United Kingdom; nor do we much use combined heat and power schemes. We should be considering such schemes much more carefully. The purpose of amendment 253 is to encourage the Government to ensure that surplus heat is addressed as part of its energy efficiency plan and other plans under the bill.

I move amendment 253.

Lewis Macdonald (Aberdeen Central) (Lab): I support what Iain Smith said about amendment 253, which reflects findings of the Economy, Energy and Tourism Committee’s inquiry on determining and delivering Scotland’s energy future. In March, the committee visited one of Aberdeen’s combined heat and power schemes, at Seaton in my constituency. Local residents told us about the benefits that the scheme had brought. For tenants of local authority sheltered housing such as Seaview House there were immediate benefits. Bills were reduced and homes and common areas of the high-rise buildings were warmer. Such things matter a great deal to retired people who have modest incomes.

There are wider benefits of CHP schemes. There is reduced demand for electricity from the grid and carbon emissions are reduced. I think that there is a policy consensus in Scotland that we should find ways to enable more such schemes to be developed. However, that is not happening. Aberdeen Heat and Power Company was set up in 2002 by Aberdeen City Council and has connected 850 homes in high-rise buildings, half of which are sheltered accommodation, and two public buildings in the same parts of the city. The company aspires to grow its network. Why have other councils not been able to follow that good example?

Amendment 265 would address a specific obstacle in that regard, which is a difference in the practice of valuation in authorities in different parts of the UK. CHP schemes in Scotland pay business rates on the pipes and risers that carry heat and water to the doors of residents’ flats, including equipment that is inside a high-rise building but not with the individual property. Similar schemes in England do not pay business rates in that way. Amendment 265 would require ministers to put that right.

What would that mean in practice? In Aberdeen, 850 tenants share the burden of the £40,000 that is paid in business rates on domestic heating equipment. Removing that burden would save each of those residents £47 a year—£1 a week, which is a significant sum for people on low incomes. More widely, it would remove one of the obstacles to other public authorities developing similar schemes and would achieve the magic combination of tackling carbon emissions and, at the same time, tackling fuel poverty. That is the basis of amendment 265.

Stewart Stevenson: I will start with Iain Smith’s personal amendment, amendment 253, which I am content to support. It requires the new energy efficiency action plan that will be prepared under section 48 of the bill to cover “surplus heat from electricity generation or other industrial processes for district heating or other purposes”.

Although currently the bill does not mention the use of heat for district heating or other purposes, it has always been the Government’s intention to include that in the energy efficiency action plan. I am happy for that to be made explicit in the bill. I am, therefore, pleased to support amendment 253.

I know about Mr Macdonald’s long-term engagement with and constituency interest in the issue to which amendment 265 relates. I am glad to hear that the residents of Seaview House are so pleased with the outcome of the combined heat and power scheme that has been put in place there. However, if combined heat and power can be developed in Aberdeen, it is not entirely clear to me that legal valuation barriers are stopping that happening elsewhere. In any event, we have specific difficulties with the amendment.

It is not as clear to us as it is to Mr Macdonald that the basis of valuation in Scotland is sufficiently different from that in England to make the kind of differences that he suggests will matter. The advice that I have currently suggests that, if the amendment were agreed to, we could fall foul of European state aid rules, because of the way in which the amendment is constructed. I do not say at the moment that we would fall foul of those rules, as we have not consulted on the matter.

We already exempt much of the plant and machinery that is associated with combined heat and power plants from valuation for rating purposes in Scotland. It is not entirely clear to me what difference the amendment would make, but there is a real difficulty associated with it. If there were financial implications for local government—or central Government, for that matter—we would need to understand those. If local government were deprived of money, the amendment could precipitate reductions in services elsewhere and increases in council tax and non-domestic rates precisely at a time when those are undesirable.

For a range of reasons, I do not recommend that the committee agrees to amendment 265. I ask Lewis Macdonald not to move the amendment.

Iain Smith: In principle, I support the policy intention behind amendment 265, in the name of Lewis Macdonald. There seems to be some difference between how certain parts of the plant
and equipment for combined heat and power are treated in Scotland and how they are treated in the rest of the United Kingdom. We may want to reflect on that point between now and stage 3.

**Stewart Stevenson:** Will the member care to be specific, so that we can examine the issue?

**Iain Smith:** We can provide the detailed information that we received during our visit. I do not have it in front of me at the moment, but I can ensure that it is given to the minister in early course. I think that the issue relates to pipework and connections.

I thank the minister for his support for amendment 253. It is important that we make it clear that district heating and CHP are part of the energy efficiency programme.

**The Convener:** I remind members that if they wish to intervene they should ask the member speaking to give way.

*Amendment 253 agreed to.*

*Section 48, as amended, agreed to.*

**After section 48**

14:30

**Section 49—Laying of plans and reports**

*Amendment 156 moved—[Stewart Stevenson]—and agreed to.*

*Amendment 254 moved—[Rob Gibson]—and agreed to.*

*Section 49, as amended, agreed to.*

**After section 49**

**The Convener:** Amendment 255, in the name of Liam McArthur, is in a group on its own.

All members should be aware that time is moving on and that we have a large number of groups of amendments to get through. Speeches should therefore be reasonably direct and to the point. I am sure that Liam McArthur will be the very spirit of that approach.

**Liam McArthur (Orkney) (LD):** You have not said anything that my colleagues have not already said to me, convener.

I return to an issue that was covered to some extent last week in considering amendment 136 and the requirement to report on the emissions intensity of electricity generation and new generation plants as part of annual reporting. Amendment 255 aims to ensure that decisions that are made about new plants reflect the goals of the bill over the course of the entire period up to 2050.

New or refurbished unabated or even carbon-capture-ready coal-fired power plants exemplify why the cumulative amount of greenhouse gases that are emitted is what matters. Most of the legislative powers that relate to such plants are, of course, reserved to Westminster, but the Scottish ministers currently have administrative responsibility for granting or refusing consents for such plants and establishing guidelines and guidance that set out the conditions under which such decisions are taken. Amendment 255 would require ministers to use those existing powers to set guidance for consents for new and extended plants, including a limit on emissions per megawatt hour of energy generated. It would leave the detail of the levels and scheduling of such a standard to the guidance process, but would ensure that the guidance addressed how heat recovery was accounted for and would allow for different standards for different technologies at different times. That addresses a point that the minister made last week about other amendments. To ensure that the guidance links in with the bill, ministers will be required to take advice from the advisory body before setting it. If they take a different approach than that which is recommended, they must explain why.

The minister will be aware that, as well as being supported by a wide range of non-governmental organisations that work closely in the climate change field, such an approach has recently been proposed in a private member’s bill at Westminster that my Liberal Democrat colleagues and the minister’s Scottish National Party colleagues have supported. The approach has also received support from some Labour MSPs and Lib Dem MSPs and is already in operation in other parts of the world—in California, for example, where it has demonstrated its effectiveness in bearing down on emissions as well as in improving energy security through enhancing investment certainty.

I am conscious of the convener’s remarks and am pleased to move the amendment.

I move amendment 255.

**Stewart Stevenson:** I acknowledge, as Liam McArthur has, that the SNP supports such an approach, as is evidenced by actions that have been taken elsewhere. To give Mr McArthur hope, I can tell him that it is likely that I will commend to the committee his next amendment, which is in another group.
I say that because amendment 255 has difficulties, which I will deal with. We have made it clear that we want to decarbonise the electricity generation sector by 2030. That is consistent with the UK Committee on Climate Change and the overall 80 per cent target in the bill. Our first and most important concern is that the amendment carries the serious risk of being outside the Parliament’s legislative competence—I will say a bit more about that in a moment. Secondly, the amendment could prejudge the outcome of the consultation that the UK Government will undertake this summer on an emissions performance standard.

The amendment would introduce a requirement in relation to how consent is to be granted for the generation of electricity. Members will know that the generation of electricity is a reserved matter under the Scotland Act 1998. The Scottish ministers can exercise the function of granting consent for the construction of electricity generating stations under section 36 of the Electricity Act 1989, but that function was conferred by a transfer of functions order under the 1998 act. That order in no sense increased the Scottish Parliament’s legislative competence; it purely gave us scope to exercise the functions that were given to us.

The requirement that the amendment would impose relates to the generation of electricity per se, which is still reserved. If we agree to the amendment, the danger is that we will risk causing legal debate and referral to the Privy Council, which could delay the bill’s obtaining royal assent, and that we will face other challenges.

I agree that the policy intention to create an emissions performance standard could be consistent with our decarbonisation objective. However, other routes to decarbonising the power sector exist. Members will know of the recent progress that the UK Government made on the matter as part of its budget announcement in April, on which Liam McArthur has previously commented.

If carbon capture and storage is to apply fully in the 2020s, it must be demonstrated in the 2010s. That requires a clear commitment to funding demonstration, which is why the UK budget announcement that funding for up to four demonstrators would be provided through a carbon capture and storage levy is welcome.

Until the UK consultation is concluded later this year, whether the emissions performance standard is the most effective route for progress will not be clear. Given that the electricity market is UK wide, a strong view is in favour of a consistent consenting framework throughout the UK. The competence issue is complex, but we are pretty confident that the amendment would be outwith our competence and could cause difficulties later that none of us would wish to have. On another occasion, we could always seek additional powers, but that is a wider debate for another time.

Liam McArthur: After letting me down gently with a promise of future success, the minister spoiled it all with his final remarks.

The argument that my amendment falls outside the Parliament’s legislative competence is at the heart of the matter. The minister might not accept a countermand from me, but I understand that advice from a senior Queen’s counsel suggests that the Scottish ministers do enjoy powers that would enable the amendment to be agreed to. I do not expect the minister to change his mind now, but perhaps he will reflect on the legal advice and reconsider his position before stage 3.

I will press the amendment.

The Convener: The question is, that amendment 255 be agreed to. Are we agreed?

Members: No.

The Convener: There will be a division.

FOR
Gordon, Charlie (Glasgow Cathcart) (Lab)
Harvie, Patrick (Glasgow) (Green)
McIlwes, Alison (North East Scotland) (LD)
McNulty, Des (Clydebank and Milngavie) (Lab)
Peattie, Cathy (Falkirk East) (Lab)

AGAINST
Gibson, Rob (Highlands and Islands) (SNP)
Johnstone, Alex (North East Scotland) (Con)
Somerville, Shirley-Anne (Lothians) (SNP)

The Convener: The result of the division is: For 5, Against 3, Abstentions 0.

Amendment 255 agreed to.

The Convener: Amendment 256, in my name, is in a group of its own. It is intended to require ministers to establish a scheme for providing or arranging the provision of financial assistance to householders in relation to energy efficiency.

In a discussion on an earlier group, Sarah Boyack said that other countries are ahead of Scotland and the UK in several areas, and that is certainly the case with the provision of loans. The German Government invests some €2.6 billion a year in the area and its scheme is estimated to have saved about 1 million tonnes of CO₂ in the first year of operation alone. A country the size of Scotland might not achieve anything on that scale, but that example shows that there are opportunities to provide financial assistance to householders to enable them to improve the energy performance of their homes.
That is happening not only in Germany but at local authority level in the UK. Kirklees Council’s scheme has attracted interest and attention from across the political spectrum. In addition to the free, universal provision of low-cost measures such as loft and cavity wall insulation, a loan scheme based on an equity release model is available to householders for more expensive measures, and the council can recycle the funds that come in from the repayment of those loans to ensure that more householders benefit.

Earlier this year, the Scottish Government indicated its intention to do something along those lines. The Cabinet Secretary for Finance and Sustainable Growth said:

“The Government will ... produce proposals for a significant loan mechanism to improve hard-to-treat properties that do not have lofts or cavity walls that can be insulated.”—[Official Report, 28 January 2009; c 14407.]

He went on to say that the initiative would create valuable employment in every part of the country. That has certainly been the experience in Kirklees, where both economic and environmental benefits have been achieved, including job creation and reduced bills to householders.

As it is nearly half a year since the Government made that commitment, I hope that the minister will give us any details that he can spell out about the operation of the loan scheme that the Government intends to introduce. Amendment 256 would not interfere with that commitment but would reinforce it and give ministers an opportunity to specify by regulations other forms of financial assistance to householders in respect of energy efficiency. I hope that the minister will consider the amendment in a constructive spirit and respond accordingly.

I move amendment 256.

Alison McInnes (North East Scotland) (LD): Amendment 256 has much merit. It would be particularly useful to constituents in my area, which contains many hard-to-heat homes. I wait with interest to hear what the minister says about it.

Stewart Stevenson: Others have suggested that if we treated 80 per cent of Scotland’s homes, that would deliver a total saving of 0.4 million tonnes of CO₂. I do not know whether that helps to inform the committee. I would not put my personal reputation behind that estimate, but the figure seems about right.

I acknowledge the spirit in which amendment 226 was lodged. The convener acknowledged that, as part of our budget, we announced in January that we would make proposals for a significant loan mechanism to help householders who wish to undertake more expensive energy efficiency measures such as solid wall insulation and the installation of renewables technologies. We are undertaking development work for a loan scheme and we will make an announcement about it later in the year. To legislate before the development work has been done would be premature and could be unhelpful.

Ministers already have powers in the Housing (Scotland) Act 2006 to provide financial assistance to persons in connection with the improvement of a house. Works that improve the energy performance of a house would be regarded as improvements for that purpose. I am therefore confident that we have a legislative vehicle. I believe that it is more important for Scottish ministers to focus their energies on developing a scheme for funding the best energy efficiency and renewable energy mechanisms in the most effective way.

Amendment 256 has one or two problems. For example, it does not restrict itself to home owners. The amendment is also not clear about the difference between standard and subsidised loans. In not providing any detail of the scheme about which it seeks to legislate, the amendment creates a number of risks. By comparison, section 71 of the 2006 act, which gives ministers a power to provide financial assistance for housing improvements, contains detailed definitions of key terms and deals with all the practical components to make the system work. Amendment 256 leaves that until later.

The lodging of amendment 256 sets it up in competition with section 71 of the 2006 act, and it could create duplication and conflict, which may make progress difficult with the work that we are undertaking. We will bring forward that work over the course of this year.

I therefore ask the convener to accept my assurances on behalf of the Government that we are making good progress on this issue. We will present details later this year, and the appropriate—

The Convener: Will the minister take an intervention?

Stewart Stevenson: Yes, of course.

The Convener: The minister used the phrase “later this year”, but can he be more specific?

Stewart Stevenson: I will say, later this calendar year.

The Convener: I will take that as a no.

Stewart Stevenson: One moment, convener. I am now being told by my officials that the answer is October—but I will not be bid any further.
The Convener: Did you want to say anything else on amendment 256?

Stewart Stevenson: No, that is it. Thank you.

The Convener: The objections that the minister raises seem to me to be slightly confused. On the one hand, he argues that there are restrictions in the amendment; on the other hand, he argues that there are no restrictions and no details.

Amendment 256 deliberately places a requirement on ministers to establish a scheme. It does not enable ministers to do that, but it places a requirement on them. However, the amendment then leaves it open to ministers to determine the details of the availability of the scheme, the conditions that may be attached, the terms of loans or grants, and so on.

If the committee were to agree to amendment 256, it would not interfere with the work that the Government is committed to—in October or at any other time. However, the amendment would place a clear expectation on Government—I see that the minister is about to ask to intervene.

Stewart Stevenson: Yes, please. I am looking at subsection (5) of the new section that amendment 256 seeks to introduce. It provides a list of what regulations may do. Does the convener agree that such a list could create difficulty, because it may exclude things that ministers may wish to include in the scheme? Agreeing to the amendment may lead to restrictions in the scope of what we will bring forward in October.

The Convener: My response to that is—as I was about to say—to press amendment 256 and to encourage the minister to address at stage 3 any tweaks to the amendment that he feels are necessary.

Stewart Stevenson: May I comment, convener?

The Convener: Very briefly, minister.

Stewart Stevenson: I will not be in a position to identify, in time for stage 3, what would have to be in a list, were one to be included in the bill.

The Convener: That is noted.

I have one final point, on the objection to legislating in advance of work being done. That objection could be raised to this entire bill. The bill is about placing requirements on the statute book to prompt Government and others to take the climate change agenda more seriously. I therefore press amendment 256.

The question is, that amendment 256 be agreed to. Are we agreed?

Members: No.

The Convener: There will be a division.

FOR
Harvie, Patrick (Glasgow) (Green)
McInnes, Alison (North East Scotland) (LD)

AGAINST
Gibson, Rob (Highlands and Islands) (SNP)
Gordon, Charlie (Glasgow Cathcart) (Lab)
Johnstone, Alex (North East Scotland) (Con)
McNulty, Des (Clydebank and Milngavie) (Lab)
Peattie, Cathy (Falkirk East) (Lab)
Somerville, Shirley-Anne (Lothians) (SNP)

The Convener: The result of the division is: For 2, Against 6, Abstentions 0.

Amendment 256 disagreed to.

Section 50—Non-domestic buildings: assessment of energy performance and emissions

The Convener: Amendment 224, in the name of Liam McArthur, is grouped with amendments 157, 225, 158 to 160, 160A, 226 and 229.

Liam McArthur: The minister has taken some of the suspense out of this group with his earlier remarks. He indicated some figures on which he would not like his reputation to hang, but I will give him a figure to which it is already firmly wedded: 17 per cent of annual United Kingdom CO2 emissions can be attributed to non-domestic building stock. That simply illustrates the importance of addressing that concern.

Last summer, the Scottish Government consulted on how best to tackle emissions from non-domestic buildings. The findings of that consultation were interesting: 80 per cent of respondents agreed that current policies and support would not deliver significant carbon reductions. There are probably a number of reasons for that. Building regulations address new build in particular and, therefore, are most effective with only about 1 per cent of the building stock in any given year. Although some of the financial support mechanisms such as the central energy efficiency fund and the energy saving Scotland small business loan scheme have undoubtedly made some mark, they are undermined slightly by the split incentive whereby the people who pay the fuel bills have a great incentive to improve energy efficiency but are seldom the ones who make the investment decisions about installations and adaptations.

The Scottish Government’s amendments 158 and 160 would introduce the power to require building owners to take up energy improvements that were specified in their energy performance certificates, which is welcome. In fact, they helpfully exceed amendments 225 and 160A in my name. Those amendments were not backstops, but that illustrates the risk of acting before one
sees the whites of a minister's eyes. Therefore, I will not move amendments 225 and 160A.

Amendments 224 and 226 pick up the industry's needs for certainty about planning, investment and the best way to ensure that the supply of material and product can fulfil what we hope will be a rising demand. Amendment 226 would provide clarity by setting a clear timetable for ministers to use the powers that they are taking.

I move amendment 224.

Stewart Stevenson: I am perfectly happy to accept amendment 224 in Liam McArthur's name and, indeed, amendment 229 in Iain Smith's name.

On amendments 157 to 160 in my name, we recognise the divergence of views on mandatory versus discretionary improvements to buildings in the responses to the public consultation. Therefore, we have agreed to take forward the implementation of cost-effective energy improvement recommendations to non-domestic buildings on a voluntary basis initially.

We wish to continue to work with business and industry to maximise emissions reductions by allowing voluntary implementation, particularly in the current economic climate. However, we need to make provision in primary legislation to enable improvements to be required through secondary legislation at a future date if voluntary action is not sufficient to make the necessary cuts in greenhouse gas emissions.

Amendments 157 and 158 will allow the Scottish ministers to require the implementation of recommendations that arise from the assessment of buildings. Amendment 160 will enable regulations to include provision about the form of recommendations, the manner of complying with them and the periods allowed to comply with them. It will also enable the setting up of a register for certificates and the disclosure of information in that register. Amendment 159 is a technical amendment that makes it clear that the activities that are referred to are only those carried out in buildings.

In summary, the amendments will make provision in section 50 for the Scottish ministers to require, through secondary legislation, the implementation of improvements to non-domestic buildings arising from the assessments of energy performance and emissions of greenhouse gases.

I turn to amendments 226, 225 and 160A. Amendment 226 aims to place a duty on the Scottish ministers to publish a report, within 12 months of royal assent, on measures that are to be taken to reduce non-domestic building emissions and when provision will be made. I welcome amendment 226, which will allow ministers to demonstrate progress on the implementation of section 50. However, there is a technical flaw as it refers to the date on which royal assent is given to "this Act". Royal assent is the means by which a bill becomes an act, so the amendment should refer to the date on which the bill for the act receives royal assent. I therefore invite Liam McArthur not to move amendment 226. I offer to lodge an amendment in exactly those terms at stage 3. We are in the member's hands on that.

Amendment 225 seeks to make it mandatory for the Scottish ministers to introduce regulations on cost-effective improvements to existing non-domestic buildings. Under such a provision, building owners would not have discretion to implement alternative improvements that could provide a greater improvement in energy performance and reductions in emissions. We absolutely recognise the spirit in which the amendment was lodged, but it would unnecessarily restrict improvements to buildings to those that were cost effective. Respondees to the consultation proposed that there should be flexibility regarding the type of improvements that are implemented. That applies particularly to historic and traditional buildings, for which the application of the term "cost effective" might present a real challenge and restrict opportunities to make changes. Owners, as part of a maintenance programme, might intend to carry out other improvements that could produce greater energy performance and emissions improvements. I therefore invite Mr McArthur not to move amendment 225.

Similarly, amendment 160A would restrict the recommendations that could be included in certificates on the energy performance of buildings and reduction of emissions to those that were cost effective. Again, the Scottish ministers recognise the spirit of the amendment but, for the same reasons, I invite Mr McArthur not to move it.

Iain Smith: I speak on behalf of the Economy, Energy and Tourism Committee. Amendment 229 is fairly straightforward. In our stage 1 report, we recommended that

"all the relevant secondary legislation proposed under sections 48-51 is subject, if they are not already, to affirmative resolution".

Amendment 229 would ensure that regulations under sections 50(1) and 50(4) would require affirmative resolution. I hope that, as the minister has indicated, he will support that amendment.

I welcome the amendments in the group from the minister and Liam McArthur. The Economy, Energy and Tourism Committee was concerned about the lack of clarity on the policy intent behind the assessments of energy performance of non-domestic properties and on how we will assess
whether the system is working and doing what it is intended to do. The amendments will, I hope, address some of those concerns.

Liam McArthur: I welcome the minister’s acceptance of my amendment 224. Initially, I thought that he had raised unfairly my expectations that he was about to accept amendment 226, but I accept the reason why he cannot do so and I welcome the fact that he will lodge a reworded amendment at stage 3. I reiterate what I said earlier on amendments 225 and 160A. If I had had the opportunity to remove them prior to today, I would have done so, but I certainly will not move them.

Amendment 224 agreed to.

Amendment 157 moved—[Stewart Stevenson]—and agreed to.

Amendment 225 not moved.

Amendments 158 and 159 moved—[Stewart Stevenson]—and agreed to.

Amendment 160 moved—[Stewart Stevenson].

Amendment 160A not moved.

Amendment 226 not moved.

Section 50, as amended, agreed to.

The Convener: I am tempted to have a short comfort break. If we are to conclude our business by a reasonable time, it will have to be a short break and perhaps the only one, so make the most of it. Five minutes, please.

15:01
Meeting suspended.

15:06
On resuming—

After section 50

The Convener: Amendment 227, in the name of Iain Smith, is grouped with amendments 227A and 227B.

Iain Smith: I lodged amendment 227 on behalf of the Economy, Energy and Tourism Committee. In our stage 1 report, we noted the calls in evidence for the provisions in section 50 to be extended to the domestic sector. Indeed, amendment 227 has the support of bodies such as the Association for the Conservation of Energy, WWF Scotland and others. Our aim is to apply the assessment of energy performance and emissions for non-domestic buildings under section 50 also to living accommodation. Essentially, the amendment is an enabling provision: if ministers want to do such assessment at some future date, they can do so.

Current efforts to achieve greater energy efficiency in the domestic sector are not well represented in the bill and yet the sector is a crucial part of our economy and society. The Economy, Energy and Tourism Committee’s view is that it must be included. Amendment 227 seeks to ensure that we have a better idea of energy efficiency and performance in the domestic sector and of the greenhouse gas emissions that can be attributed to the sector.

It is important to note that we are gradually improving building standards for new-build domestic accommodation. However, for many years to come, most people will continue to live in existing housing stock. Indeed, it has been estimated that, by 2050, around 85 per cent of people will still be living in houses that were built before the existing building regulations came into force. The timescale for the turnover of housing is such that we need to take action to ensure that existing living accommodation is improved. Opportunities to improve the quality of a property should be taken when there is a change of tenancy in the rented sector or a property sale in the owner-occupier sector. Also, when people make a significant improvement to their homes, we should ensure that they build in energy efficiency measures.

As I said, amendment 227 is an enabling provision. We see it as part of the climate change toolkit that the bill provides to ministers. As such, we hope that the committee will accept the amendment. It is a sensible provision to add to the bill.

I move amendment 227.

The Convener: Amendments 227A and 227B are in my name.

The two amendments to amendment 227 are relatively minor. Amendment 227A simply expands the scope of amendment 227, so that the regulations that Scottish ministers may make under the proposed powers relate not only to the assessment of energy performance and greenhouse gas emissions but to improvements in relation to those two issues. Amendment 227A slightly broadens the scope of the regulations, and I hope that that is seen as helpful.

Amendment 227B simply removes the final element in the list of what the proposed regulations provide for, which is:

“offences in relation to failures to comply with requirements of the regulations.”

I am certainly not arguing that we should not contemplate creating offences; I just have a wee feeling that specifying offences by way of
regulation might be a little bit much, and that it is better to introduce offences through primary legislation, so that they can be subjected to parliamentary scrutiny. I lodged amendment 227B simply to provide the committee with the opportunity to consider that question.

I move amendment 227A.

Stewart Stevenson: In the interests of time, I will simply say that we are content to accept amendments 227 and 227A. I take some issue, however, with the suggestion that amendment 227B is comparatively minor. To remove from the bill the ability of ministers to create offences in this area is quite significant.

When secondary legislation is brought to the Parliament, there is of course a scrutiny process, and there is a period during which the Government undertakes consultation before secondary legislation is laid. I hope that the committee will feel that, in pursuing the objectives of the Climate Change (Scotland) Bill, it is important for ministers to have the necessary powers to hand, to ensure that, over the years, we make the necessary progress. Therefore, we will not respond to the invitation to delete the power to create criminal offences.

Iain Smith: I am at a loss for words, as I do not think that I have ever been in a situation in which an SNP minister has been so generous to me.

Alison McInnes: Make the most of it.

Iain Smith: I will.

I thank the minister for accepting the principle behind amendment 227. I have no difficulty with amendment 227A in principle. Amendment 227 was phrased to mirror section 50, before amendment. As a result of the amendments that have now been made to that section, it may be that further amendments to the provisions that are contained in amendment 227 will be required at stage 3.

Stewart Stevenson: We are conscious that there might be some tidying up to be done at stage 3, and our loins are girded so to do.

Iain Smith: I thank the minister for that assurance.

My main point is that subsection (2)(m) of the new section that amendment 227 would insert, on offences, which amendment 227B seeks to delete, is lifted from the existing provision in the bill, which has not been deleted from section 50 by any amendment. It would seem strange to have that provision in one section but not in the other. I leave it up to the committee’s wise judgment whether it accepts amendment 227B; I intend to press amendment 227 when the time comes.

The Convener: I think that the official reporters will have to be particularly careful in this part of the debate.

I welcome the general sense that amendment 227A offers a helpful suggestion, and I take a reasonable amount of comfort from the comments that the minister made on amendment 227B, in which he indicated that due parliamentary consideration of offences that are created will be provided for.

Amendment 227A agreed to.

Amendment 227B not moved.

Amendment 227, as amended, agreed to.

15:15

The Convener: Amendment 257, in the name of Lewis Macdonald, is in a group on its own.

Lewis Macdonald: Members will know that around half Scotland’s carbon emissions are associated with buildings and that only about 1 per cent of buildings are replaced a year. Therefore, members will agree that intervening in relation to the 2 or 3 per cent a year that are subject to extension or other works is an opportune way to attempt to deal with those emissions and that that approach will deal with them more quickly than simply relying on regulations that affect new buildings. If we want building regulations to make a real difference with regard to climate change, we need to consider how that can be done at the point at which owners are considering investing in and improving their buildings.

Two years ago, the Sullivan report recognised the need for action in this area. It also recognised that any change would have to be carefully framed in order not to create a perverse incentive to operate outwith the law or, indeed, not to improve properties in the first place.

The amendment is designed to bring about amendments to housing regulations to ensure that a proportion of the budget for any improvements or extensions would have to be spent on measures to improve the energy efficiency of the building. The precise requirement is something on which ministers would, no doubt, wish to consult, but the principle of taking action seems clear.

UK ministers have already consulted on similar measures that may well lead to new building regulations in England next year. Amendment 257 gives Scottish ministers the opportunity to take action here as well, and I hope that the minister will tell us today that that is their intention.

I move amendment 257.

Stewart Stevenson: I am absolutely happy to support the principles behind amendment 257.
However, the detail of the amendment presents a couple of challenges.

The amendment would require Scottish ministers to make regulations to encourage compliance with guidance that is voluntary, and offers no powers to compel compliance. It is not entirely clear what, apart from encouraging compliance with guidance, the regulation-making power could do that could not be done more effectively under building regulations. The powers that are proposed by the amendment already exist in the Building (Scotland) Act 2003.

However, we are making progress with a series of building regulation amendments, and we certainly want to address in that process the matters that amendment 257 is concerned with. If Lewis Macdonald were to consider that an inadequate response, I am sure that we could see our way to making some sort of suitable amendment at stage 3. However, I am sure that that would be unnecessary. It is certainly our intention to proceed on the same basis as laid out in the amendment. I hope that that reassures him.

**Lewis Macdonald:** Does the minister intend to consult on such energy efficiency measures in the forthcoming consultation on building regulations?

**Stewart Stevenson:** Yes, we shall do so.

**Lewis Macdonald:** The minister’s assurance clearly meets the aim of the amendment, so I am happy to seek leave to withdraw it.

Amendment 257, by agreement, withdrawn.

**The Convener:** Amendment 238, in the name of Alex Johnstone, is grouped with amendments 258 to 264.

**Alex Johnstone (North East Scotland) (Con):** The commitment that I gave during stage 1 to lodge amendments that would allow the introduction of so-called green council tax rebates has manifested itself in amendment 238, which would introduce a section headed, “Council tax and non-domestic rates: discounts for energy efficiency etc.” I want to put the matter before the committee and the minister for discussion.

I am well aware that the minister, and other ministers in this Government, have previously set themselves against the concept of council tax discounts. The main reason for that is the Government’s desire to remove council tax from Scotland entirely. However, given that the Government has apparently conceded that that is unlikely to happen in the foreseeable future, the opportunity exists for us to take action, whether or not we approve of the council tax, to use the mechanism that the tax provides to give people an incentive to move towards greater energy efficiency in the domestic setting. The amendment seeks to extend that approach to non-domestic rates as well.

I commend to the minister the argument that lies behind amendment 238, and look forward to hearing his views on it.

Amendment 258 does something slightly different. According to correspondence that I have received, particularly from Scottish Gas, it appears that, although carbon emissions reduction target money can be used extensively in local authority areas south of the border to provide support for energy efficiency measures and rebates on council tax, enabling legislation would have to be changed in order for that to happen in Scotland.

Scottish Gas writes:

“We urge changes to be made to allow energy companies to play their part in encouraging better take-up of microgeneration.”

From the correspondence that I have received, it appears that there is some legislative barrier that prevents utility companies from participating with local authorities in Scotland in schemes that are similar to those in which they participate south of the border. Amendment 258 attempts to remove that legislative block, should it exist. I am interested to hear the minister’s opinion on whether legislation needs to be changed in order to implement the proposal in Scotland. I look forward to hearing his comments on whether amendment 258 would achieve that objective.

I move amendment 238.

**Sarah Boyack:** As Alex Johnstone has said, there is an issue about whether Scottish councils can give council tax rebates. Following parliamentary questions to Scottish ministers, I have received the clear answer that, under the current system, councils cannot do that.

I have lodged a series of amendments that concern the proposals that I have been campaigning on for the past five years. I have separated my amendments on council tax from my amendments on business rates for the key reason that, having spoken to members from various parties, I know that people have differing views about those two issues. Separating the two issues will allow them to be debated separately.

Amendment 259 would enable a one-off council tax reduction and would enable people to make energy efficiency improvements and use microgeneration technologies. Crucially, it would also give people the ability to link to district heating systems or co-generation systems. As more sustainable developments take place, the ability to connect to a district heating system will become more important.
The Energy Saving Trust has carried out lots of research that shows that people’s awareness of the council tax is such that council tax rebates would lead to people getting energy efficiency or microgeneration measures. We are all aware of making our council tax payments.

Alex Johnstone summarised the obvious reasons why some people around the table might have been less than keen to support the proposal, but I would say that, over the past few months, the parliamentary mood has shifted. The awareness-raising potential of the proposal cannot be overestimated. If we are trying to reduce people’s overall CO$_2$ emissions, getting them to focus on their own houses is a key way of doing that quickly.

Some 23 per cent of our households in Scotland are now in fuel poverty, as domestic fuel bills have doubled in the past five years. Crucially, many of those people will not be eligible for the new energy efficiency scheme introduced by the Scottish Government and supported by us in the budget earlier this year. The proposal in my amendments would expand the number of people who are able to implement energy efficiency measures.

In England and Wales, 68 local authorities now implement such schemes, and there are established partnerships with utility companies. Scottish Gas is keen to be allowed to do in Scotland what it is allowed to do down south, and Scottish and Southern Energy thinks that we should amend the bill to enable it to take part in such projects. South of the border, British Gas certifies the work, so local authorities do not have to pay to do that. The same would happen here—the scheme would be relatively straightforward for local authorities to administer.

Amendment 261 sets out the size of the council tax reductions that I propose. I have looked into the issue in great depth and have consulted not just environmental organisations, which are keen to support the proposals, but, crucially, the energy efficiency companies and sector, which are involved in delivering existing programmes. I have set two levels. Installation of technologies costing between £250 and £1,000 would qualify someone for a discount of £100; installation of technologies costing more than £1,000 would qualify them for a discount of £250. Those levels reflect the fact that, although many relatively straightforward measures fall within the £250 to £400 range, there are other, much more expensive measures. A discount of £100 would not incentivise people to pursue those.

The amendment recognises the differing costs of the different measures that can be taken. It is appropriate that there should be a one-off council tax discount. I have crafted the amendment in such a way that it does not exclude people from coming back for more, if that is justified. The energy efficiency requirement will apply to those who want to install microgen, as it would be crazy to put microgen on top of an energy-inefficient house that could be improved. The amendment takes into account the need to pursue both microgeneration and energy efficiency.

The amendment would enable council tax reductions to be made. We are still nowhere near having a mass market for microgeneration. The Energy Saving Trust estimates that 2,000 to 3,000 microgen systems have been installed in Scotland, which does not make a mass market—we need to go way beyond that. The Renewables Advisory Board has provided estimates of the amount of microgeneration that it expects to be installed in the UK. If Scotland’s share of the figures is set at 10 per cent, we should be installing 6,000 to 8,000 photovoltaic cell systems, 130,000 solar water heating systems and 150,000 air-source heat pumps. We all know that we will not get them with the current system of grants—we need to add something that complements that.

Amendment 263 is not crucial, but it sets out the process for a review. The Government of the day would examine the levels of council tax and discounts and would report on whether the promotion policy was working.

I have lodged two amendments on business rates, to extend similar provisions to businesses. The vast majority of our businesses are in relatively small premises, of the order of households. They should be encouraged and enabled to take forward both energy efficiency and microgen measures. I hope that colleagues will consider supporting both amendments and will accept that a huge amount of thought has been put into working out the detail of the requirements that they include.

Amendment 264, in the name of Iain Smith, is helpful, because it is along the same track. I accept that there are various ways in which the matter can be pursued and welcome the fact that Alex Johnstone has lodged an amendment on the issue. However, given the amount of work and consultation that has gone into my amendments, I hope that colleagues will consider supporting them.

Iain Smith: Again I speak on behalf of the Economy, Energy and Tourism Committee, which agreed unanimously to lodge an amendment along the lines of amendment 264. The purpose of the amendment is to give ministers the power to consider introducing by regulation the powers to enable local authorities to reduce council tax bills or business rates for anyone who invests in microgeneration or renewable energy. Some parties, including the Liberal Democrats, wish to see an end to the council tax. We were advised, when framing the amendment, that if there were to
be a successor to the council tax the updated provisions that would be necessary could be dealt with in the primary legislation that would be required to replace the council tax.

The amendment was heavily supported by many of the organisations that gave evidence to committees, most of which pointed to the success of similar regimes in other jurisdictions in the United Kingdom. For example, Scottish and Southern Energy said in its submission to Transport, Infrastructure and Climate Change Committee:

“All avenues should be explored, such as using local and national tax incentives to reward energy efficiency or microgeneration.”

Similarly, Elaine Waterson of the Energy Saving Trust told the Economy, Energy and Tourism Committee:

“council tax incentives have, in theory, a big role to play in encouraging consumers to take action.”—[Official Report, Economy, Energy and Tourism Committee, 4 February 2009; c 1571.]

15:30

It is for members of this committee to determine which of the three options that have been proposed it should support. In its stage 1 report, the Economy, Energy and Tourism Committee said:

“The Committee recommends that the Scottish Government investigates and reports back to the Committee, if possible before stage 2, on whether some form of rebate through local taxation systems ... should be introduced”.

The Government responded:

“councils in Scotland do not have the same level of discretionary powers to offer council tax discounts as councils in England. To give Scottish councils similar powers would require primary legislation.”

Amendment 264 would remove that barrier, by giving the Scottish ministers the power to establish a scheme. The amendment does not specify the details of the scheme, which would be subject to further consultation. Members might want the bill to specify what scheme would be implemented, in the way that is envisaged in the amendments in Sarah Boyack’s name and Alex Johnstone’s name. My purpose in lodging amendment 264 on behalf of the Economy, Energy and Tourism Committee was to ensure that the bill is an enabling bill and is part of the climate change toolkit that is available to ministers.

Rob Gibson: I think that I am right in saying that Sarah Boyack’s proposed rebates for energy efficiency would be gauged at current council tax levels, which are frozen. Would the proposed increase in council tax, of which we hear news from the Labour Opposition, negate the rebates?

Can she give us an assurance that the proposed increases that her party suggests for council tax will allow for the proposed rebate for energy efficiency to remain attractive?

Des McNulty: Will you read that last bit again? [Laughter.]

Rob Gibson: Can the member give us an assurance that the proposed increases that her party suggests for council tax will allow for the proposed rebate for energy efficiency to remain an attractive proposition?

The Convener: It is nice to know that we have that word for word. I give Sarah Boyack an opportunity to respond to Rob Gibson.

Sarah Boyack: Thank you. I am not aware of a Labour Party proposal to increase council tax. The amendments in my name would provide for a review mechanism, so ministers would be able to review the levels at which rebates were set. That is the right approach. The key point is that a person would get a discount regardless of what their council tax was.

Stewart Stevenson: I acknowledge the work that Sarah Boyack has done over the past few years to keep the issue of incentivising the uptake of energy efficiency and microgeneration measures to the fore of the debate on practical ways to reduce greenhouse gas emissions. If it were not for her work, I doubt that all parties would be debating the amendments in this group so vigorously.

The chief executive of Scottish and Southern Energy, Ian Marchant, wrote to the Cabinet Secretary for Finance and Sustainable Growth on 16 April, in relation to ideas to which members have referred. In his response of 28 April, the cabinet secretary assured Mr Marchant that “we will, however, consider your proposal further”—the “however” was there because my party, like Iain Smith’s party, wants a fairer system. However, we are where we are, and we have considered the matter further. We have certainly looked at the amendments, to which I will turn in a second.

Before I do so, I should respond to the question whether legislation needs to be changed to allow CERT payments. The answer is no. However, legislation needs to be changed to allow council tax rebates. Although the point might have been clear in members’ minds, it might not have been expressed in those terms.

We have been working on an amendment that, depending on how things go, we will lodge at stage 3. Basically, we want the CERT money that is available from energy generators to leverage in private money for public good. In that respect, our intentions are similar to Alex Johnstone’s
approach in amendment 258, in that we would seek to transpose the English and Welsh provisions into Scots law. We are in the final stages of completing our amendment, but the drafting needs to be tightened up.

Moreover, the Government supports the principles underpinning amendment 259, in the name of Sarah Boyack, and amendment 264, in the name of Iain Smith, so I think that there is a very broad consensus in the room on this matter. That said, the drafting of Sarah Boyack’s amendment in particular poses a number of risks. Although it would be something of a minority sport, I think that if we followed her proposal and provided opportunities for people to come back for more, we would give them almost a perverse incentive to break their improvements down into segments spanning a number of financial years in order to get a number of successive awards. I am sure that she did not seek to introduce such a technical defect, but we feel that the amendment needs to be tightened up.

It should also be made clear that the person who pays the council tax gets the benefit. With the sale of a house, for example, there is almost a perverse incentive for the seller not to make improvements in certain circumstances, given that it will be the buyer who will derive the benefit. I accept that the house price might well be adjusted to reflect such matters, but I think that there are some difficulties to address in that regard.

On amendment 264, the Scottish Government has already acted on microgeneration in relation to non-domestic rates and we believe that we also have the power to act on energy efficiency. As a result, we are not clear that the amendment adds anything to the statutory framework that is available to ministers. In fact, it is likely to be less substantial than the stage 3 amendment that the Scottish Government will lodge—depending, of course, on what happens today.

We are pointing broadly in the same direction, but we have to take care and ensure that we understand all the financial implications. That is a matter for another day, but I point out that, if things were implemented in the wrong way, any such implications could be quite significant. We also have to examine a number of state-aid issues in relation to non-domestic rates to ensure that we are not creating real difficulties for ourselves.

Nevertheless, what has been proposed is useful and helpful, and I think that we have arrived at some kind of consensus. I commend to the committee the amendment that we will lodge; as I said in speaking to a previous group of amendments, we will be required to disclose it at stage 3 while members still have a chance to amend the bill or to resubmit any amendments either in their present form or in a new form. My preference is for the committee not to proceed with the amendments in this group and to allow the Government to lodge its amendment.

Des McNulty: I seek clarification on two points. First, will the costings that are associated with your proposed amendment be incorporated in a revised financial memorandum? Secondly, will your amendment be closer to Alex Johnstone’s proposal, Sarah Boyack’s proposal or Iain Smith’s proposal? I presume that you know what you intend to propose. Will you give us at least some indication of which of the three models, if any, you are most likely to follow?

Stewart Stevenson: We will certainly seek to ensure that the financial memorandum reflects as far as possible the significant changes that are made.

Mr McNulty’s second question is a rather difficult one, and I will inevitably have to give a pretty subjective answer. In essence, with our amendment, which we have not yet signed off internally, we will seek to transpose the provisions that exist in English and Welsh law, which probably align most closely with Alex Johnstone’s proposal.

We will take the sense of today’s debate in coming to our final conclusion, but we picked up the English and Welsh model to ensure that we can leverage private money from the utility companies. We note the approach that has been adopted in England and Wales. Sarah Boyack mentioned that 68 local authorities in England and Wales are using CERT money, and that is the approach that we want to take. However, we will take the sense of everything that has been said and all the amendments that have been lodged at stage 2.

Sarah Boyack: I deliberately did not propose that we should have the same provisions as England and Wales because I wanted us to have more options. The scheme there is great as far as it goes, but we have the opportunity to do more on energy efficiency and, potentially, microgeneration.

The minister hinted that there might be an endless number of applications, because people would split up their applications, but my idea in giving the Scottish ministers the power to produce regulations was that such anomalies would be sorted out there. My amendments would not make it impossible for somebody to receive free energy efficiency measures under other schemes, but if they did so, they would not qualify for a grant. We would expect things to be tidied up in regulations. My amendments do not include specific measures; instead, they set out general principles.

The Convener: If you could finish fairly promptly, minister.
Stewart Stevenson: Clearly, I am in the hands of the committee on the matter. However, I make the point that, as drafted, Ms Boyack’s amendments would create in primary legislation an opportunity for people to break down their improvements into segments. I do not believe that the majority of people would seek to do that, but I would not be able to remove their ability to do so through secondary legislation. However, as I said, it is important that we take the sense of all that has been said—in good faith, on everybody’s part—at stage 2.

Alex Johnstone: My objective in lodging amendment 238 was to ensure that the matter was discussed and to seek the views of the minister and the Government. Although I will not ask the minister any further questions, I will make some sweeping statements, and if he wishes to defer to my judgment, he can simply allow that to happen.

The Government appears to have accepted the principle that underlies my amendment. The minister has undertaken to lodge an amendment at stage 3 that will give effect to the objective that has been expressed by the committee. In doing so, the minister can take advantage of the greater human resources that are available to him. Most members who draft and lodge amendments at stage 2 have to rely on a limited pool of expertise that is vastly overworked at such times, and we are lucky to have that assistance.

In contrast, Sarah Boyack’s amendments are extremely detailed, which is as one would expect from a member who has been preparing proposals for a long time. However, my concern is that they are too detailed, to the extent that some might describe them as prescriptive. When the bill is finally passed, I wish it to contain measures that allow flexibility and give ministers the power at some point in the future to use the legislation to introduce flexible and effective schemes to achieve our objectives. Initially, such measures might resemble closely the proposals introduced by Sarah Boyack, but I am reluctant to see such prescriptive measures in the bill.

If the minister concedes the principle behind amendment 238 and is preparing a stage 3 amendment to give effect to my proposals, I ask leave of the committee to withdraw amendment 238.

15:45

Amendment 238, by agreement, withdrawn.
Amendment 258 not moved.
Amendment 259 moved—[Sarah Boyack].

The Convener: The question is, that amendment 259 be agreed to. Are we agreed?

Members: No.

The Convener: There will be a division.

FOR
Gordon, Charlie (Glasgow Cathcart) (Lab)
Harvie, Patrick (Glasgow) (Green)
McInnes, Alison (North East Scotland) (LD)
McNulty, Des (Clydebank and Milngavie) (Lab)
Peattie, Cathy (Falkirk East) (Lab)

AGAINST
Gibson, Rob (Highlands and Islands) (SNP)
Johnstone, Alex (North East Scotland) (Con)
Somerville, Shirley-Anne (Lothians) (SNP)

The Convener: The result of the division is: For 5, Against 3, Abstentions 0.
Amendment 259 agreed to.
Amendment 260 not moved.
Amendment 261 moved—[Sarah Boyack].

The Convener: The question is, that amendment 261 be agreed to. Are we agreed?

Members: No.

The Convener: There will be a division.

FOR
Gordon, Charlie (Glasgow Cathcart) (Lab)
Harvie, Patrick (Glasgow) (Green)
McInnes, Alison (North East Scotland) (LD)
McNulty, Des (Clydebank and Milngavie) (Lab)
Peattie, Cathy (Falkirk East) (Lab)

AGAINST
Gibson, Rob (Highlands and Islands) (SNP)

Gibson, Rob (Highlands and Islands) (SNP)
Johnstone, Alex (North East Scotland) (Con)
Somerville, Shirley-Anne (Lothians) (SNP)

The Convener: The result of the division is: For 5, Against 3, Abstentions 0.
Amendment 263 agreed to.

The Convener: Does Iain Smith intend to move amendment 264?

Iain Smith: On the ground of quitting while I am ahead, I will not move amendment 264.

Amendment 264 not moved.

The Convener: Does Lewis Macdonald intend to move amendment 265?

Lewis Macdonald: The minister expressed uncertainty about the position in England. I can tell him that the Lands Tribunal appeal cases that his officials should look at are RA/60-69/2005 and RA/71-72/2005, between the valuation officer and Mansfield District Council and Bassetlaw District Council. I hope that the minister will do that and consider the evidence before stage 3. He is nodding in assent, so on that basis I will not move amendment 265.

The Convener: That is on the record.

Stewart Stevenson: It could not be more on the record, convener.

Amendment 265 not moved.

The Convener: Amendment 266, in the name of Sarah Boyack, is in a group on its own.

Sarah Boyack: Amendment 266 comes from people in the field looking at how we make the most of our buildings and our assets in relation to climate change objectives. It recognises that large quantities of land and the built environment are owned by the public sector and emit greenhouse gases, and seeks to introduce a new burden, to be called the climate change burden, which would be applicable under the Title Conditions (Scotland) Act 2003. The burden would enable public bodies, at their discretion, to add heightened mitigation or adaptation performance standards to the title deeds of built and land assets that they wish to sell and which could be developed in the future by a purchaser. Those standards would be applied in advance, before land was put up for sale, so it would not be possible to flog a piece of land for a very high price and then say to the developer, “By the way, you will have to do X, Y and Z before you develop this land.”

Amendment 266 seeks to create a further category of personal real burdens that relate to the objectives of the bill. Imposing such burdens would not be mandatory; the amendment seeks to introduce an enabling mechanism that a public body could use if it wished to do so. The mechanism would be available to any public body or agency in Scotland, such as local authorities, the Scottish Environment Protection Agency or Scottish Water. It would enable local authorities to exercise leadership and send a clear signal about expectations to people who want to develop land or buildings.

We are talking, potentially, about a great deal of land. Public bodies have a keen interest in selling their land, and they often negotiate and set conditions when they do so. The provisions in the amendment would allow for a much more up-front approach: the burdens would be specified in advance before somebody indicated that they were interested in buying the land, and developers would be able to assess the cost when negotiating for the land with the public body. A local authority or public body would want to use the burdens only when it clearly fitted its objectives.

The provisions build on the current legal framework in the Title Conditions (Scotland) Act 2003. The act contains several references to “real burdens” and states:

“A real burden is enforceable by any person who has both title and interest to enforce it”

and

“An affirmative burden is enforceable against the owner of the burdened property.”

It also states:

“The holder of a personal real burden is presumed to have an interest to enforce the burden.”

A climate change burden would build on the existing burdens. It would be a new type of burden. The closest comparator is section 45 of the 2003 act, on economic development burdens, which states that it is possible for a public authority “to create a real burden in favour of a local authority, or of the Scottish Ministers, for the purpose of promoting economic development”.

The new burden would be wider in terms of who could exercise it, and would be exercised in relation to climate change.

I move amendment 266.

Stewart Stevenson: I am content with the principle behind amendment 266, and with many of the arguments that Sarah Boyack has deployed, but some drafting issues need to be addressed. In particular, the insertion of the new section into the Title Conditions (Scotland) Act 2003 would offer an opportunity to examine the definitions of some of its terms—for example, there are particular difficulties with the phrase “advertised for sale” in proposed section 46A(3)—but we support the principle behind the amendment, and it could in certain circumstances be a useful piece of armour in the lockers of ministers and public bodies.
Sarah Boyack: I am grateful to the minister for his technical knowledge, which is not my area of expertise as I am not a property lawyer. As the minister says that he entirely supports the spirit of amendment 268, I am happy to withdraw it in the hope that we can come back at stage 3 with something that is fit for purpose.

Amendment 266, by agreement, withdrawn.

The Convener: Amendment 267, in the name of Lewis Macdonald, is grouped with amendments 268 and 269.

Lewis Macdonald: It is almost 25 years since I carried out a number of feasibility studies in disadvantaged areas of Aberdeen, on behalf of the energy advice and insulation agency SCARF. It is striking that many of the things that we found then are still true today.

It is still the case that the private rented sector has a particular burden of energy inefficient homes: almost four times as many homes in that sector are rated as poor in energy efficiency terms. The people who live in that sector are still more than twice as likely as those who live in council housing to suffer from fuel poverty. However, the Scottish housing quality standard, which applies to social rented housing, does not apply in the private rented sector, so landlords need not make the improvements that are required to achieve comparable energy efficiency.

I hope that the minister will recognise the merit in amendment 267, which would apply the standard to the private rented sector. Proposed section 13(7) of the Housing (Scotland) Act 2006 would apply the standard in line with the guidance that is issued in relation to living accommodation. As the Scottish housing quality standard requires council housing and social rented housing to reach a rating of five out of 10 by 2015, the same requirement would be imposed on the private rented sector. That would give landlords—who have access to tax breaks and small business loans—the opportunity to meet the appropriate standard in good time.

Amendment 269 relates to the tenement management scheme. Tenements account for many homes in my area and for many homes in the private rented sector. Whatever the tenure and whatever the sector, tenements are a significant part of the housing stock in our towns and cities. The Tenements (Scotland) Act 2004 allows measures to be taken to improve homes even when one owner or occupier does not wish to participate, because the Parliament recognised the greater public interest in ensuring that such works are done. The amendment would extend that principle to energy efficiency and insulation works and therefore simply recognises the climate change and carbon emissions aspect of our common interest in higher-quality tenement housing, whether in the rented or owner-occupied sectors. I hope that the minister will support the principle behind the amendment.

I move amendment 267.

Cathy Peattie (Falkirk East) (Lab): Amendment 268 is a short probing amendment. The Housing (Scotland) Act 2006 amended the tolerable standard that all homes must meet to include a requirement on thermal insulation. Amendment 268 would include cavity wall insulation in the tolerable standard, but it would not require people whose walls are unsuitable for cavity wall insulation to install costly solid wall insulation. The 2006 act allows the Scottish Government to offer guidance on what constitutes satisfactory wall insulation, which would allow the Government to exclude solid-wall properties from the requirement.

It is important to find ways to make progress and to make it easier for people to install cavity wall insulation. I also support Lewis Macdonald’s amendments.

Stewart Stevenson: The Scottish ministers are comfortable with amendment 269. We align with the principles behind it and we are happy to recommend that the committee support it.

I will talk about amendment 267 in a little more detail. We accept that Lewis Macdonald raises a real issue, but there are some difficulties with the amendment and it does not necessarily provide the way to deal with the issue.

In our recently published review of the private rented sector, we committed to consulting further on measures to reduce emissions from houses, including those in the private rented sector. That consultation should clarify the impact that the proposal in the amendment would be likely to have on the private rented sector and its ability to support housing supply arrangements.

As Lewis Macdonald knows, tenants can experience difficulty in exercising existing powers. That is one reason why I am reluctant to place too much reliance on the difference that the amendment would make. We will have several opportunities later to consider other ways to deal with the matter.

Cathy Peattie helpfully described amendment 268 as a probing amendment. The difficulty with it is that its practical effect would be to narrow the primary legislation’s scope, because the provision that would be amended refers to thermal insulation in general and not simply to roof and wall insulation.
16:00

The tolerable standard is applied by local authorities, which have the discretion to decide what is satisfactory. We are content to explore further the issue through the guidance that we will provide. That will ensure that we address the issues that the member has brought forward. As I said, the effect of amendment 268 is at odds with the member’s stated aim.

In summary, we think that amendment 268 is misplaced, but we are happy to accept amendment 269. On amendment 267, we see an excellent opportunity in the proposed housing bill, which is currently out for consultation, to look at the issue more widely to ensure that we genuinely provide something that gives powers to tenants to get the results that we are looking for, given the real difficulties that they can experience in exercising the existing powers.

Lewis Macdonald: I listened carefully to what the minister said. He indicated an intention to consult on the matter and to include the outcome of the consultation in the proposed housing bill. However, I think that we need to hear more on the issue at stage 3. It is one thing to say that there is a problem, but it is quite another to outline the solution. The minister made one or two points, but—

Stewart Stevenson: I am happy to take further advice from my colleague the Minister for Housing and Communities to ensure that I can make appropriate comments at stage 3.

Lewis Macdonald: That is helpful. I share the minister’s view that we do not want to overburden tenants. However, we need to protect them from the consequences of living in energy-inefficient homes. I hope that we will hear more on that at stage 3.

On that basis, I am content to withdraw amendment 267.

Amendment 267, by agreement, withdrawn.

Amendment 268 not moved.

Amendment 269 moved—[Lewis Macdonald]—and agreed to.

Section 51—Promotion of renewable heat

Amendments 239 and 240 not moved.

Amendment 161 moved—[Stewart Stevenson]—and agreed to.

After section 51

The Convener: Amendment 270, in the name of Sarah Boyack, has been debated with amendment 154.

Sarah Boyack: I will not move amendment 270. I will sweep up the issue in my conversation with the minister on an amendment in another group. On the same basis, I will not move amendments 271 and 272.

Amendments 270 to 272 not moved.

The Convener: Amendment 273, in the name of Sarah Boyack, is grouped with amendment 274.

Rob Gibson: On a point of order, convener, I am sorry to interrupt, but I think that we have passed over a section without agreeing to it.

The Convener: I think we are in order. The committee agreed to amendment 161, which means that we are okay. I thank Rob Gibson for his point; it is important to keep me on my toes.

I call Sarah Boyack to speak to and move amendment 273.

Sarah Boyack: The new section that is proposed in amendment 273 was one of the original sections in my first attempt to present a bill to Parliament. I withdrew the proposal in 2007 because I had been reassured by, I think, three ministers that they would deal with permitted development rights. Two of those reassurances were in writing. I therefore dropped the section from my bill. However, when I saw the draft statutory instrument, I was deeply disappointed, because it included a rather bizarre requirement that people could obtain permitted development rights only if they were at least 100m away from the next house. Technology offers a way of sorting the problem: we can consider the certified performance of equipment rather than the geography.

The final version of the statutory instrument was really not acceptable. Air-source heat pumps and micro wind turbines were both removed and kicked into touch. Nobody in the industry understands why air-source heat pumps disappeared from the agenda. Noise issues arose to do with micro wind turbines, but such issues can be resolved by certification.

Amendment 273 seeks to put pressure on ministers as to when they should come back to Parliament with answers. I have not specified what ministers must put in the statutory instrument, but I have specified a timescale, because people in the renewables industry and householders who are desperately keen to install such technology are now disadvantaged.

Not having permitted development rights does not mean that people cannot seek planning permission, but there would certainly be a lot of red tape. The interpretation of planning authorities is that both air-source heat pumps and micro wind turbines are problematic because they did not go through the statutory instrument. Amendment 273
would require Scottish ministers to amend an amendment order in respect of town and country planning legislation on permitted development rights in relation to these two types of technology. I have not said exactly what ministers must do, but I have said that they must get on with it.

Subsection (4) of the proposed new section is unusual. The organisations that are mentioned are not the only people whom ministers would have to consult, but paragraphs (a), (b) and (c) in the subsection mention industries that were aggrieved at the outcome of the previous statutory instrument, and felt that their views had not been properly listened to. I hope that there will be better dialogue before the next statutory instrument comes out.

I will keep my comments brief, convener, because I know that we are short of time.

I move amendment 273.

Liam McArthur: I echo what Sarah Boyack said about her amendment 273.

Earlier, I quoted the minister in highlighting the impact of emissions from non-domestic buildings, in order to make the case for more timetabled action in relation to energy efficiency. However, non-domestic buildings can also contribute to microgeneration development.

In a written answer to a parliamentary question from Sarah Boyack, the Cabinet Secretary for Finance and Sustainable Growth said:

“Research published in early 2007 recommended that permitted development rights distinguish between domestic and non-domestic buildings ... The research recommended that the same rights apply to all non-domestic buildings.”—[Official Report, Written Answers, 20 March 2009; S3W-21781.]

I certainly accept that there are differences between the categories, and that complexities arise in relation to non-domestic buildings. The Government has made it clear that it wants to prioritise action in relation to permitted developments on domestic buildings.

Sarah Boyack has suggested that there was a failure to stimulate the mass market, which is what SCHRI and other initiatives were attempting to achieve. The value of permitted development rights in relation to promoting take-up and reducing costs, and thereby providing further incentives, is pretty well established and accepted. The benefits to the microgeneration industry are not difficult to see: it could build on robust domestic demand and create the green-collar jobs that we all want to see. Ministers have set their own targets for that.

Amendment 274 provides a degree of flexibility, but the Scottish Government must now consult on a new order, and then bring that forward, building on the research that was commissioned and published by the previous Executive. The research has been accepted by the current cabinet secretary, and the case has been made for proceeding in relation to non-domestic buildings as well.

Des McNulty: I have no issues at all with air-source heat pumps having permitted development rights, but there are one or two caveats relating to micro wind turbines that one might want to highlight. I refer to the definition of the word ‘micro’. I am a former planning minister, and was involved in planning in local authorities before I was a minister. It seems to me that if there are unfettered permitted development rights, there could be problems with installed turbines’ visual obtrusiveness and noise. Such things can be sorted out by regulation, but I would not want us to agree to what has been proposed in principle without highlighting the need for some sort of regulatory framework to protect people. Perhaps we also need to consider neighbour notification in the context of planning regulations. I know that Sarah Boyack and Liam McArthur will have thought of those issues, but people will have practical concerns about what others might do that will affect them by putting up certain types of installation. We need to be careful.

Rob Gibson: I am interested in Liam McArthur’s amendment 274, on microgeneration. I am conscious of a case involving a larger wind turbine that has been proposed in Hatston, which is in his constituency. Does he think that our discussion of permitted development rights ought to be extended to include machines that are larger than micro machines, given what he has just said about the definition of the word “micro”?

Liam McArthur: That is an intriguing question, but it is not necessarily particularly pertinent to microgeneration. I accept the sentiments that Des McNulty articulated. The inappropriate siting of any microgeneration or large-scale device is likely to bring into disrepute what we are seeking to achieve. However, my amendment 274 is not the only people whom ministers would have to consult, but paragraphs (a), (b) and (c) in the subsection mention industries that were aggrieved at the outcome of the previous statutory instrument, and felt that their views had not been properly listened to. I hope that there will be better dialogue before the next statutory instrument comes out.

I will keep my comments brief, convener, because I know that we are short of time.

I move amendment 273.

Liam McArthur: I echo what Sarah Boyack said about her amendment 273.

Earlier, I quoted the minister in highlighting the impact of emissions from non-domestic buildings, in order to make the case for more timetabled action in relation to energy efficiency. However, non-domestic buildings can also contribute to microgeneration development.

However, my amendment 274 is not the only people whom ministers would have to consult, but paragraphs (a), (b) and (c) in the subsection mention industries that were aggrieved at the outcome of the previous statutory instrument, and felt that their views had not been properly listened to. I hope that there will be better dialogue before the next statutory instrument comes out.

I will keep my comments brief, convener, because I know that we are short of time.

I move amendment 273.
The Government responded:

“Following competitive tender, the Government expects to appoint contractors to undertake research over the summer on whether permitted development rights should be extended to domestic wind turbines and air-source heat pumps.”

My response to that was that, rather than spend £25,000 on a contractor, the Government could spend 25 quid to send the minister and an official to Uphall by train—the minister will be pleased that I said that—so that they can stick their ears next to the air-source heat pump at the Mitsubishi factory and find out whether they can hear it. Modern air-source heat pumps make virtually no noise. It is beyond belief that they do not yet have permitted development rights.

I have only one concern about amendment 273. I know how Government officials operate. Subsection (3) of that amendment states:

“No order making the amendment required under subsection (1) must be laid in the Scottish Parliament no later than six months after the day on which this section comes into force.”

That means that, rather than get on with things, Government officials will delay things until the section comes into force, and it might take even longer to get permitted development rights for air-source heat pumps. I hope that the minister will give us more assurances in summing up.

**The Convener:** I have been to the factory that Iain Smith mentioned—by train—in recent weeks, and I endorse and underline the arguments that Sarah Boyack put forward. I am conscious of the improvement in air-source heat pump technology. The noise from such heat pumps is trivial compared with many other noises that people in residential settings happily put up with and barely notice. As well as the increased profile of microrenewables in the political agenda, the improved technology and the work that is being put into continuing its improvement should allow us to move forward with permitted development rights. I hope that the minister will give us more assurances in summing up.

**Stewart Stevenson:** I am reminded that 25 years ago I invested £200 in an air-source heat pump company in West Lothian. I never got the money back and no dividend was ever paid. It was an idea that was ahead of its time: clearly, its time has come. I take tent of members’ references to the silence of the pump at the Mitsubishi factory at Uphall. However, that draws us immediately to the issue of ensuring that people are protected from unnecessary noise. Four miles from where I live, two 3MW wind turbines have just been opened. At the weekend, in a 20 knot wind, I stood immediately under the turbines and, with my eyes shut, I could not hear them at all. However, where I stay here in Edinburgh, I am a greater distance away from a very small wind turbine, but at that wind speed it makes a considerable noise. We should not discount and downplay the problem of noise.

This week, we have received the tender bids for the research. We will open the envelopes next week and decide who will get the work. I clarify that it is officials, not ministers, who do that. We are making the progress that we promised we would make. We should not proceed in the absence of an appropriate regime for certifying the noise limits that should be applied to urban installations. South of the border, difficulties in that regard have been experienced.

We are moving ahead and will receive recommendations through the work that we are undertaking. We should therefore not seek, through amendments 273 and 274, to pre-empt that work, but should instead allow that process to take its course, so the amendments should not be agreed to. We must reinforce the work that we are doing, as well as the work that is being undertaken in conjunction with the UK Government on issues such as feed-in tariffs, which is a more general issue for microgeneration capability. There are a range of issues that will be better progressed without the amendments.

**Sarah Boyack:** Des McNulty’s questions and comments must be taken on board. He is right that there are issues that must be bottomed out properly. That is why the permitted development rights under amendment 273 would not allow people to put up mini wind turbines just anywhere. As is only right, there would be restrictions; for example, in relation to listed buildings, conservation areas and—dare I say it—world heritage sites. That would not automatically mean that people in such areas would not be allowed to use the technology, but it would mean that different requirements would be in place.

The key points are that pressure must be put on the industry to get the certification right, but the Government must also be required to get going with a statutory instrument on permitted development. I want to press amendment 273. It does not tell ministers how to do their job—it tells them to come back to us with a statutory instrument on the table, so that there is clarity and so that the industry can make progress with the right framework and limitations.

**The Convener:** The question is, that amendment 273 be agreed to. Are we agreed?

**Members:** No.

**The Convener:** There will be a division.
FOR
Gordon, Charlie (Glasgow Cathcart) (Lab)
Harvie, Patrick (Glasgow) (Green)
McInnes, Alison (North East Scotland) (LD)
McNulty, Des (Clydebank and Milngavie) (Lab)
Peattie, Cathy (Falkirk East) (Lab)

AGAINST
Gibson, Rob (Highlands and Islands) (SNP)
Johnstone, Alex (North East Scotland) (Con)
Somerville, Shirley-Anne (Lothians) (SNP)

The Convener: The result of the division is: For, 5, Against 3, Abstentions 0.

Amendment 273 agreed to.

Amendment 274 moved—[Liam McArthur].

The Convener: The question is, that amendment 274 be agreed to. Are we agreed?

Members: No.

The Convener: There will be a division.

Somerville, Shirley-Anne (Lothians) (SNP)

The Convener: The result of the division is: For, 5, Against 3, Abstentions 0.

Amendment 274 agreed to.

Shirley-Anne Somerville (Lothians) (SNP):
Amendments 275 to 277 are all about the Scottish Government showing leadership on the energy performance of buildings in the Scottish civil estate.

Amendment 275 would place on ministers a duty to ensure that the energy performance of newly constructed buildings falls within the top quartile of energy performance. Amendment 276 would require ministers to lay before Parliament a report that assessed progress towards improving the efficiency of buildings, and those buildings’ contribution to sustainability. Both amendments would promote good practice and reduce wasted energy in public buildings. My understanding is that, if amendment 277 is agreed to, amendments 275 and 276 will cover not only the core central Government buildings but those of non-departmental public bodies and agencies. That was certainly my intention, but I ask the minister for reassurance that it is also his interpretation.

Amendment 278 is in the name of Cathy Peattie. We are trying to get to the same conclusion, but her amendment contains two competing measurements: the energy performance certificates for office buildings that amendment 278 mentions measure carbon dioxide emissions, not energy efficiency, as the amendment suggests. As my amendment 275 discusses energy performance, I suggest that it will deal better with the problem that Cathy Peattie and I are both trying to alleviate.

I move amendment 275.

Cathy Peattie: I agree with Shirley-Anne Somerville and agree with amendment 275. Amendment 278 seeks to widen the definition of public sector buildings for the purposes of the bill. I am aware that it contains a technical fault, so I will be interested to hear what the minister says on it.

Des McNulty: I presume that the annual report for which Shirley-Anne Somerville is calling would be an update report that would not require an assessment of the estate every year but would be more an indication of what had changed. I ask the minister to reassure me on that point.

Stewart Stevenson: I will not say much, as Shirley-Anne Somerville has made well the points on amendments 275 to 277. I confirm, as she asked me to, that they would cover NDPBs and agencies. To answer Des McNulty’s question, it would be sensible and appropriate to provide a report that says what has changed. The proposals in amendment 276 appear to provide for that.

Cathy Peattie acknowledged that the building energy performance scale from A to G is quite different for buildings other than dwellings, as they are described in the heading on the bit of paper that is before me. Therefore, amendment 278 is inappropriate. Shirley-Anne Somerville’s amendments 275 to 276 cover what is appropriate in the circumstances and I commend them to the committee.

Shirley-Anne Somerville: I have had the reassurance that I was looking for from the minister, so I am content to press amendment 275.

Amendment 275 agreed to.

Amendments 276 and 277 moved—[Shirley-Anne Somerville]—and agreed to.

Amendment 278 not moved.

Section 52—Waste prevention and management plans

The Convener: Amendment 241, in the name of Elaine Murray is grouped with amendments 243 and 244. I welcome Elaine Murray to the committee.
Stewart Stevenson: Before Elaine Murray speaks to her amendments, I indicate as a matter of courtesy that we are changing personnel at the top table. I hope that that is acceptable.

The Convener: Thank you. That is fine.

Elaine Murray (Dumfries) (Lab): I am grateful to Friends of the Earth Scotland and the committee clerks for their invaluable assistance in the preparation of the amendments.

The powers for which section 52 provides are welcome. The establishment and implementation of waste management plans for certain commercial and industrial facilities such as supermarkets and construction sites is a key measure to enable a reduction in commercial and industrial waste volumes. Amendment 241 ensures that those powers will be enacted promptly in order to provide certainty for businesses and to avoid the risk that companies that take voluntary steps to adopt such plans are disadvantaged in comparison with competitors that are making less effort to improve waste management.

The powers for which section 53 provides were widely welcomed. Discussions with witnesses during stage 1 revealed widespread concern about the lack of reliable data on waste and carbon accounting. There are gaps in information about waste, especially in respect of commercial wastes, which hamper effective waste management and waste reduction. Amendment 243 ensures that the powers for which section 53 provides will be enacted promptly to provide certainty for business and to ensure that full and consistent information becomes available to policy makers, regulators and local authorities.

Amendment 244 is similar and refers to section 56, which is welcome. The limited development of markets for recycled materials has led to unnecessary transport of wastes for processing—even export to China, in some cases—and to Scotland’s failing to capture the maximum economic and employment benefits from the development of recycling facilities, and to grasp an opportunity to create green jobs in Scotland. The amendment ensures that the powers for which section 56 provides will be enacted promptly and in a concerted fashion. The critical step towards capturing the economic benefits of recycling is the establishment of a critical mass, in which markets are at a scale that merits the establishment of local processing facilities. That can be achieved only by implementing the powers, not through a voluntary approach.

It is slightly unfortunate that amendment 250, which was proposed by the Rural Affairs and Environment Committee and to which my colleague Maureen Watt will speak later, will be debated later than this group, because amendment 250 seeks to make all the provisions subject to super-affirmative procedure. That will ensure enhanced scrutiny—by both the Transport, Infrastructure and Climate Change Committee and the Parliament—of any regulations that are introduced. I hope that that will be an additional reassurance for the committee.

I will listen carefully to what committee members and the minister have to say. The purpose of all three amendments is to ensure that the provisions in the bill, which were widely welcomed, become intentions, rather than just aspirations.

I move amendment 241.

Stewart Stevenson: I am happy to support amendment 243, in the name of Dr Murray. Information on waste is clearly a prerequisite for establishing effective regimes, so we wish to see such information gathered. I hasten to add that that is not a trivial undertaking, but a substantial one.

In accepting amendment 243, I draw the committee’s attention to an error in its drafting. Like a previous amendment, amendment 243 refers to the “Act” receiving royal assent, when it is the bill that receives royal assent. However, that is a technical matter that can be dealt with without difficulty at stage 3, through a technical amendment. I do not offer the drafting error to the committee as a reason for not agreeing to the amendment.

I welcome the fact that Dr Murray has welcomed what we are trying to do in this regard. It is difficult to proceed with amendments 241 and 244 on a similar timescale, because before we can do so we require the information that we will gather through implementation, over a particular period, of amendment 243. On that basis, I ask the member not to press amendment 241 and not to move amendment 244.

Members have already referred to amendment 250 and its use of super-affirmative procedure. It might be useful to point out that introducing into the process such a procedure, about which I will speak at much greater length later, would add a minimum of seven months to delivery. Given that we are constantly being encouraged to act with greater speed in such matters, I see no clear benefit in the use of super-affirmative procedure. As I say, I will speak later on the issue at greater length but I thought, as it formed part of this debate, that it might be useful to make an early comment.

16:30

Elaine Murray: I am grateful to the minister for accepting amendment 243, but I wonder whether
he can indicate when he expects the provisions in sections 52 and 56 to be enacted. I accept that there might be a problem in bringing them forward without the data that are referred to section 53.

Stewart Stevenson: I am unable to give a specific response, but I am happy to confirm that we regard this part of the bill to be a very important part of the agenda. I think that I am, by accepting the important part in amendment 243, showing willing; we would certainly seek to move at best possible speed, although gathering the data is a necessary prerequisite to understanding the scale of the problem that we will have to engage with in the regulations that are set out in sections 52 and 56. I cannot give the absolute certainty that Elaine Murray seeks, but I hope that she accepts that good will is being shown and that there is the desire to proceed at reasonable speed. In accepting the time limit on data gathering, we are showing—to use a Jim Mather phrase—that we are willing to step up to the plate.

Elaine Murray: I thank the minister for his intervention. I will withdraw amendment 241, but move amendment 243.

The Convener: We will come to that in a moment.

Amendment 241, by agreement, withdrawn.

Section 52 agreed to.

After section 52

The Convener: Amendment 242, in the name of Elaine Murray, is grouped with amendment 242A.

Elaine Murray: I now realise that I was getting a little ahead of myself.

When I lodged these amendments, I was not aware that we would have the opportunity to discuss some of the issues in Parliament this week. However, it is still important to look at what is happening in other parts of Europe, and I know that the Government has reviewed international practice on waste disposal. If Scotland is to meet its European targets for the diversion of waste from landfill and fulfil the Government’s aim of recycling 70 per cent of domestic waste by 2020 as part of a move towards zero waste, we need to look at what is done well elsewhere.

Flanders in Belgium has achieved 70 per cent recycling primarily through selective bans on the waste going to landfill and incineration, which are designed to stimulate the high-quality separated collection of waste for reuse, recycling and, where recycling is not possible, energy recovery. Achieving high levels of waste reduction and recycling is the best way of cutting the greenhouse gas emissions associated with waste disposal and the replacement of the materials in those products. As a result, Stop Climate Chaos Scotland, which represents 60 organisations as diverse as Friends of the Earth Scotland and Unison and whose membership totals 2 million people, fully supports amendment 242, which seeks to set out the framework for regulations to deliver in Scotland the approach taken in Flanders, complete with the same exemptions and derogations to ensure that the necessary facilities are in place before bans come fully into effect.

Ministers have previously indicated that they were exploring the introduction of landfill bans, but they have made no commitment to selective incineration bans. Such bans are an essential complement to landfill bans if we are to maximise the recovery of materials and energy through modern advanced technologies instead of encouraging conventional mass-burn incineration.

Amendment 242 deliberately seeks to embrace industrial and commercial wastes, as well as household waste, because they must be addressed urgently. As they are typically less mixed up to begin with, they have greater potential for effective segregation to maximise recovery. The amendment is drafted in an enabling fashion, and I hope that ministers will support and make use of the framework that it proposes.

Amendment 242A is similar to amendments 241, 243 and 244. It was designed to enable the committee to place a timescale on the introduction of regulations, but I later noted that amendment 242A, as it is written, would not be competent. I have said in amendment 242, “The Scottish Ministers may,” which might make the measures more difficult to bring in, although I am not quite sure.

I will listen to what the minister has to say. I lodged the two amendments in this group in the hope that amendment 250, which we will discuss later, might be agreed to. I am aware that members might have a concern that the provisions were not discussed fully at stage 1 as they were not originally in the bill—as there was no opportunity to discuss the provisions, we have not taken evidence on them in the way that we did for the existing sections of the bill. I hoped that the adoption of the super-affirmative process would allow such a level of consultation, which would compensate for the inability to engage in that level of consultation at this stage of scrutiny of the bill.

I will move my amendment.

The Convener: Could you move both the amendments, please?

Elaine Murray: I will not move the second one, as I am slightly unsure as to whether the wording is correct.
The Convener: Can I ask you to move the amendment and the amendment to the amendment, please?

Elaine Murray: Sorry. I move amendment 242. Obviously, the amendment to it imposes a time restriction—I move amendment 242A.

The Convener: Okay.

Stewart Stevenson: We agree with Elaine Murray that that there are materials that should not be in landfill or incinerated. Fortunately, full powers to ban polluting materials from landfill and incineration already exist, in section 2 of the Pollution Prevention and Control Act 1999. Indeed, those powers have already been exercised, most recently in respect of industrial and automotive batteries, which are banned from landfill and incineration alike by the Waste Batteries (Scotland) Regulations 2009, which the Parliament approved last week.

Disposal by landfill and incineration are at the bottom of the waste hierarchy as set out in the revised waste framework directive, and we have powers under the European Communities Act 1972 to make legislation to prioritise forms of waste management further up that hierarchy.

We are co-operating with other UK Administrations on related work. A UK-wide packaging strategy is launched today, which could lead to the consideration of bans on landfill and incineration. Members may be interested to know that, in any case, we initiated a project, which other UK Administrations have now joined, to examine additional landfill bans. That work is ongoing.

We have always anticipated making any necessary regulations under existing powers. Given that the relevant powers already exist, it is unnecessary to insert them into the bill. Indeed, having duplicate powers could create confusion, since the respective powers would be worded differently. Given all those circumstances, I invite Elaine Murray to withdraw amendments 242A and 242.

Elaine Murray: I welcome the minister’s reference to the revised EU waste framework. It is important that any waste management strategy is developed in line with the waste hierarchy and that incineration, like landfill, is placed at the bottom of that hierarchy. Energy from waste is not—it is classified as recovery. I was pleased to hear the minister refer to the need to comply with the waste framework directive, which will have to be transposed into our law by the end of next year.

Given the minister’s assurances that the powers already exist in legislation, and noting the detail that he has given of the regulations that may be applied, I will be happy to withdraw amendments 242A and 242. However, I will be interested to hear further—in the context of the national waste management plan, which is being consulted on—how some of the issues will be addressed. I hope sincerely that we use those existing powers to tackle waste management and reduce the amount of waste that we produce.

Amendments 242A and 242, by agreement, withdrawn.

The Convener: Amendment 279, also in the name of Elaine Murray, is in a group on its own.

Elaine Murray: Amendment 279 is another amendment intended to promote discussion in committee of some of the issues. It is concerned with waste reduction measures and the introduction of possible pilot schemes. Waste reduction measures are rightly included in the bill. Waste reduction cuts greenhouse gas emissions from waste management—most notably from methane from landfill and carbon dioxide from incineration—and from the processing and manufacture of new products that are avoided or substituted for by reuse or recycling.

Scotland has established an aspiration to move beyond European targets for waste diversion towards zero waste, setting a welcome target of 70 per cent recycling by 2020. The Belgian region of Flanders has already achieved such a target by the use of two principal tools: selective landfill and incineration bans, referred to in amendment 242, and waste charging. Although waste charging is an extremely controversial method, there are ways in which we can use either charging or council tax rebate to encourage behaviours that lead towards waste reduction.

The waste charging route was taken in Flanders, where charges average around €60 per household per year. Amendment 279 would allow waste charges to be established in the form of variable rebates from local taxation, and regulations could allow for the exemption of certain individuals from charges when there are acceptable reasons why more waste is being produced by, for example, certain families or people with medical conditions.

Local authorities are currently experimenting with a variety of methods of trying to encourage residents to cut down on their waste, many of which have been extremely unpopular—including some of those in Dumfries and Galloway. The regulations to establish the pilot include a requirement to establish standards of recycling services to be in place before the pilot is introduced, and the scheme would have to be reviewed after a certain period before decisions could be made about its roll-out.

We have been told that the Scottish Government believes that waste charging is too controversial to merit introducing provisions, and experience in
some areas indicates that the Government is not likely to introduce such provisions. However, the UK Government has introduced such provisions for England and Wales in the Climate Change Act 2008. Amendment 279 is modelled directly on those provisions, albeit leaving much of the detail to the consultation on the regulations.

Amendment 279 provides the Scottish ministers with the powers to establish waste reduction incentive pilot schemes based on Scottish conditions, rather than rely solely on learning from elsewhere.

I move amendment 279.

Cathy Peattie: I normally support Elaine Murray in all that she proposes because of the wisdom that she brings, but I am concerned about the proposal in amendment 279. There are issues around incentives and education to encourage people to handle their waste appropriately and around local authorities and others taking risks to achieve better waste management and waste reduction. The amendment is counterproductive. In my experience, where people are charged for not handling their waste properly, they dump their rubbish wherever. If the intention is to charge people for not using properly their wheelie bins or whatever, I am reluctant for the committee to pass the amendment.

Stewart Stevenson: I thank Elaine Murray for lodging amendment 279 and giving us the opportunity to discuss an important issue. Cathy Peattie’s comment about the risks associated with charging is well made.

We have an ambitious target to achieve a recycling rate of 70 per cent of municipal waste by 2025. We take note of the high-performing parts of Europe, in particular the Government in Flanders, with which we worked recently on issues to do with ferries. The national waste management plan for Scotland will show how we intend to meet our targets. There will be more collections of material, better recycling centres, work on markets and education to raise awareness, in line with what Cathy Peattie said.

16:45

We note the powers that exist south of the border and that no council has yet volunteered to pilot waste charging. I should say in all fairness that it is early days, although I suspect that that is a difficult issue.

There are successes in recycling. In my capacity as minister, I opened the EU’s biggest food recycling facility, which is in my constituency. The facility represents an exciting step forward.

There are practical difficulties to do with how the approach that is proposed in amendment 279 might interface with the council tax. We think that there could be implications for council tax benefit, but more work would be required on that.

If amendment 279 were agreed to, provision could be made for “the means by which unpaid charges may be recovered.” However, the amendment would create no offence or power to create an offence of non-payment, so it would be potentially difficult to proceed with recovery.

The definitions in subsection (9) of the new section that amendment 279 would introduce would create difficulties. For example, “domestic premises” would include hotels, given that hotels are “living accommodation”.

I hope that Elaine Murray will not press amendment 279. We can make progress through the national waste management plan for Scotland.

Elaine Murray: I lodged amendment 279 so that the committee could debate the matter on the record and learn of the Government’s intentions in relation to the national waste management plan. I am concerned about the piecemeal approach that local authorities are taking. Some measures have been counterproductive, such as charging people a lot to use bin bags when their wheelie bins are too full, and charging for the removal of white goods from domestic premises, which has probably led to the dumping of things in lay-bys because people do not want to pay the high charge for disposal.

There might be merit in more systematic experimentation about how to use charges or rebates to encourage people to cut down on waste. I am not certain that amendment 279 offers the best approach, but many different methods of getting people to cut down on waste are currently being used, many of which are not particularly successful. Moreover, my local authority is introducing such measures at the same time as it is proposing to remove recycling points and stop blue bin waste paper collections, which seems counterproductive. I would like more scientific research into how to influence people’s behaviour.

I sense that there is little enthusiasm for the approach that is proposed in amendment 279. I hope that we can continue to discuss the matter and consider how to collate data from throughout Scotland on methods of encouragement that alter people’s behaviour.

Amendment 279, by agreement, withdrawn.

Section 53—Information on waste

Amendment 243 moved—[Elaine Murray]—and agreed to.

Section 53, as amended, agreed to.
Sections 54 and 55 agreed to.

Section 56—Procurement of recyclate
Amendment 244 not moved.

Section 56 agreed to.

Section 57 agreed to.

Section 58—Deposit and return schemes

The Convener: Amendment 162, in the name of the minister, is grouped with amendments 163 to 175, 245, 176 to 181, 185, 182 to 184 and 186. The minister is checking that I have read correctly all the amendments.

Stewart Stevenson: I would not wish to cross you in any dispute, convener.

Amendments 162 to 184 seek to ensure that powers are made available to set up effective deposit and return schemes by means of a clearing-house system. My colleague Richard Lochhead mentioned those schemes in evidence to the Rural Affairs and Environment Committee on 4 February. On 13 February, he wrote to the committee about them in more detail.

In contrast, amendments 185 and 186, in the name of Alex Johnstone, seek to ensure that ministers are given no powers to set up a deposit and return scheme—none at all.

Amendment 245 seeks to ensure that materials that are subject to a deposit and return scheme may be reused as well as recycled.

In the consultation paper on potential measures to implement zero waste, one deposit and return scheme option for which we canvassed consultee response was a clearing-house scheme on the Danish model. Denmark has been operating a successful scheme for some years now. A body, which in the amendments is called the “scheme administrator”, may be required to help retailers and producers by carrying out clearing-house functions on their behalf. The amendments allow ministers to give those functions to either an existing body or a new body that is created for that purpose.

In either case, we need to ensure that the powers that the scheme administrator enjoys are sufficiently wide to operate a successful scheme. The amendments give any new body that ministers establish the power to do things that are necessary or expedient for it to do. They also enable ministers to set out such powers in greater detail in subordinate legislation and to adjust the functions of any existing body that might be selected to run a deposit and return scheme.

Specific mention is made of the powers of borrowing and charging, given that any scheme will have to operate in a quasi-commercial manner and cover its costs. The administrator will need to have access to Government financing, whether by grant or loan, and not only for start-up—there may be need for Government financial intervention thereafter. One example is the need to smooth out financial cycles or gaps between costs that arise and income that is generated. Amendments 170, 173 and 181 to 184 deal with the scheme administrator.

On 4 February, the Rural Affairs and Environment Committee heard in evidence that packaging is not the only material that might be handled by a deposit and return scheme. It was pointed out that consumer articles might also usefully be included. The example suggested was that of low-energy light bulbs, which will be disposed of in increasing numbers as incandescent bulbs are phased out. Separate collection and appropriate recycling is desirable in their case because of the mercury that they contain. The Government accepts that that is a sensible change. Amendments 162 to 169, 171, 172, 174, 175 and 177 to 180 give it effect by extending powers in connection with setting up schemes to cover articles, packaging or both.

Amendment 176 empowers ministers to include provision in the regulations to provide for a non-returnable element in the sale price of articles. That element, which may be regarded as part of the deposit that is paid by the customer, would be used to defray the expenses that are involved in operating the scheme. It would be desirable to cover those expenses in a transparent way rather than leave it to producers to cover them through retail prices. Such a provision might also make consumers think about the environmental consequences of their consumption, which is in keeping with the polluter-pays principle. As the holder of the waste, the consumer is one of the polluters on whom, in terms of article 14(1) of the revised waste framework directive, the costs of waste treatment are to fall.

I turn to amendments 185 and 186, in the name of Mr Johnstone. Two petitions are currently before Parliament in support of deposit and return schemes, and supportive evidence was given at stage 1, but I acknowledge the strong representations from industry against such schemes. Some of those may be dealt with briefly. It is notable that one member of the British Soft Drinks Association, which opposes the measure, is A G Barr, which operates its own deposit and return scheme. It is simply not true to suggest that such schemes do not work, as they work not only in several European countries, such as Sweden and Denmark, but in individual states and provinces of the United States and Canada. Denmark’s experience is particularly instructive, as it is a nation of five million that has a very porous
It is simply unrealistic to suggest, as the BSDA does, that the detail of any such measure should be set out in primary legislation—the statutory instrument that sets out the Danish scheme runs to more than 50 pages—but the matter is not just about length and balance. Successful schemes relate to materials for which there is a market, and prices for recyclate can rise and fall fairly rapidly. It would not help the speed of our reactions to have to change primary legislation every time, which is why we need full powers to make the kind of secondary legislation that I outlined.

In any event, as with other waste provisions in the bill, we have indicated that we do not intend to move to regulation in the current economic circumstances. We will do so only if voluntary efforts fail to achieve the desired results. We are giving time for such efforts, and progress has already been made, such as the reverse vending machines that are in place at some Tesco stores in Scotland—Richard Lochhead opened the facilities at the Tesco store in Shettleston earlier this year. I acknowledge that Mr Johnstone is a strong supporter of the better use of resources, so I am sure that he would wish to encourage those efforts, as I do. However, should those efforts fail, we will need an armoury of measures to improve our resource efficiency and thus mitigate climate change. That is the background to everything that we seek to do through the bill, and the deposit and return provision is one of those measures.

There has been mention of alarming costs—in the BSDA’s version, the costs would be hundreds of millions of pounds. That level was not reflected in our financial memorandum, which was built on the actual experience of the Danish and Norwegian schemes, but in response to a recommendation of the Rural Affairs and Environment Committee we have agreed to set out detailed costings for any scheme at the time of consultation on the new regulations. That committee and others will have plenty of time to discuss those costings. If they showed the levels of expense that the BSDA suggests, Parliament would be able to block the scheme, although I cannot imagine that we would proceed with it in the first place.

I completely agree with the purpose of amendment 245, which is to ensure that it is possible to reuse, as well as recycle, materials that are subject to such schemes, but the amendment is unnecessary as the term “recycling”, as used in chapter 4 of part 5, is defined to include reuse under section 52(4). The amendment would therefore add nothing to the bill.

I invite Mr Johnstone not to move amendments 185 and 186, and I invite Dr Murray not to move amendment 245.

I move amendment 162.

The Convener: In the interests of time, I again ask members to keep their comments reasonably straightforward and brief.

Elaine Murray: Given the restrictions on time, I will speak mainly to amendment 245. The amendment would insert the term “or reuse” after “recycling” in section 58(6). In the revised European waste framework directive, to which the minister referred, reuse is higher up the hierarchy than recycling. We should promote reuse. Although, obviously, not everything can be reused, materials can be reused, particularly those that might be involved in deposit and return schemes.

People can take containers back to be refilled with certain materials, and we should encourage that practice as well as recycling. My purpose in lodging amendment 245 is to tie the provisions into the revised EU directive.

17:00

Alex Johnstone: I will speak exclusively to amendment 185, in my name, which would strike section 58 entirely. I apologise to the minister and members for my amendment’s heavy-handedness. My objective was to reflect the sudden and last-minute lobbying that I experienced in the build-up to stage 2 and particularly the work of the Scottish Beer and Pub Association and several of its constituent members—the papers that I am holding up represent today’s correspondence alone.

The association is concerned about the impact of a deposit and return scheme on the businesses of pub owners—particularly those who find themselves in a marginal position. I ask the minister to justify the scheme’s introduction—he did that effectively in his opening remarks—and to give the assurances that the pub trade will be fully consulted on the form of any such scheme, that the scheme will take into account the impact of potential additional costs on very marginal businesses in some of our marginal communities and that when the efficiency of energy use in the cycle of deposit and return is considered the full cycle’s energy usage will be reflected in the balance of energy efficiency.

I do not oppose the creation of such schemes; in fact, I believe that they have much to contribute. My amendment was lodged to provoke discussion, and I give the minister the undertaking that I will not move it.

Charlie Gordon (Glasgow Cathcart) (Lab): I am prompted to break my 10-hour stage 2 silence.
The Convener: It had to happen.

Charlie Gordon: I was struck by the fact that the minister cited the soft drinks industry but Alex Johnstone cited the beer industry, with which he appears to have well-developed social contacts. If I go way back, we used to take back beer bottles under a deposit and return scheme in the way that we still return Irn-Bru bottles in the city of Glasgow. However, the beer industry and the pub industry withdrew from that approach quite a long time ago.

As a street urchin in Glasgow many years ago, I would have been after empty soft drink bottles—that is the term that I must use—and empty beer bottles. In the days when people were allowed to carry alcohol into football matches, a small army of small boys waited for people to come out of a big football match, so that they could pick up the empty beer bottles that football fans had discarded—the same applies to soft drink bottles.

Over the years, I have seen a cultural change. Children in Glasgow—and in other places, I presume—are now embarrassed to be seen gathering empty bottles and taking them back to the shop. The culture has changed so much that I have seen school playgrounds in which hundreds of 5p pieces have been left on the ground, because children regard picking them up as a badge of shame.

I am making a serious point. Deposit and return schemes for bottles must be driven not by people who are necessarily environmental activists but by those who are interested in getting the money back on the packaging—the bottles. However, a cultural change has occurred—we do not have the thousands of street urchins that we had a generation or two ago to help to keep such litter off the streets.

Alison McInnes: I am not sure whether I should admit that I am old enough to remember collecting ginger bottles—that is what we called them.

Charlie Gordon: That is the generic Glaswegian term.

Alison McInnes: That was a useful way of augmenting pocket money, but things have moved on.

In our stage 1 report, we expressed concern about the lack of detail on section 58. I support the principle, but significant issues need to be addressed. Members have spoken about the impacts and the costs on the drinks industry.

I am interested in hearing from the minister about the impact of such schemes on councils’ well-established kerbside collection schemes. Councils have put significant resources of personnel and capital into those schemes and into creating the markets for them. I am a little concerned that some of the best-quality packaging will be extracted from kerbside collections and about the impact of that on the markets for such items.

Des McNulty: Alex Johnstone apologised for the brutality of his amendment, but he demonstrated that he is a pussycat by offering to withdraw it.

The fact that the minister lodged a substantial number of amendments at stage 2 suggests to me that the scheme was not as well worked as out as it might have been. I listened carefully to the minister’s remarks, and it is clear that the issue is not just about bottles. Deposit and return schemes for other packaging are potentially envisaged in the bill but are not necessarily worked through.

Alex Johnstone has removed the possibility for me to vote down the proposal at stage 2, but we will want some reassurance from the minister before stage 3 about the circumstances in which a scheme might be introduced and the amount of consultation that there would be with the soft drinks industry, the Scottish Beer and Pub Association and other industries that might be subject to the introduction of deposit and return schemes. The last thing that we should do is push on to any of those industries a scheme that has not been properly worked out. However, that is not to say that a scheme could not be properly worked out and introduced.

I do not want to vote down the proposal, but I would like the minister to reassure me that all the wrinkles will be ironed out before a scheme is introduced and that there will be consensus not only that it is in the overall interests of dealing with climate change but that it is a business proposition that will not adversely affect the interests of the industries that are subject to it.

The Convener: Believe it or not, I, too, am old enough to remember collecting empty bottles for extra pocket money. Charlie Gordon might have been an environmental activist without knowing it.

Charlie Gordon: That is the only way I could have been one.

The Convener: The effect is what is important, rather than the motivation.

I reiterate the case for keeping the provisions. If objections were coming from an industry that had made dramatic moves of its own accord to reduce unnecessary packaging, it might be reasonable to take those objections seriously, but during the period of the culture change that Charlie Gordon mentioned, there has also been a dramatic increase in unnecessary packaging, and it is entirely reasonable to take steps to prevent that.

Earlier, we debated an amendment about public engagement. I argue that an approach to public
engagement should also focus on increasing participation in and acceptance of the proposed deposit and return schemes. [Interruption.] I am not sure what the noise pollution is, but I think that we will have to ignore it for the moment.

Rob Gibson: Do not bottle it now.

The Convener: I ask the minister to wind up on the group and indicate whether he wishes to press amendment 162.

Stewart Stevenson: Thank you, convener. I will press amendment 162.

In my concluding remarks on the group, I will address a number of the issues that members raised. It is deeply worrying that the group that engaged and animated the widest cross-section of the committee is the one that involves discussion about the subject of drink, but there we are. I just hope that that is not more widely commented upon outside the room in tomorrow’s papers.

Convener, you made a point about public engagement and the change of behaviours. It is entirely proper for you to make that linkage and I take that point on board.

Charlie Gordon stole my best line when he referred to the intimate association between Mr Johnstone and the Scottish Beer and Pub Association. However, a good line is always worth repeating.

I was asked whether we will consult fully if we bring forward a scheme, and Des McNulty requested that at an early stage we describe the circumstances under which we would envisage doing so. The Government will write to the committee on the matter before stage 3—I hope that the committee is comfortable with that suggestion. I acknowledge that we have a limited window of time in which to do that, so I am not sure that the information will necessarily reach the committee, although we can certainly ensure that it reaches the committee clerks in time for members to receive it—I hope that members understand the formal distinction that I make in that regard.

Mr Johnstone referred to the bill’s impact on the financial viability of marginal pubs, in particular in rural areas and in some urban areas. We want to take account of the matter and ensure that we do not impose onerous duties.

Alison McInnes said that the implementation of deposit and return schemes could disadvantage councils. If councils are operating good systems, it would be perverse of the Administration to require such systems to be supplanted. Any Administration would want actively to consider the existing infrastructure, and the amendments in the Government’s name will allow that to happen.

Mr Johnstone mentioned full cycle energy usage. We want to take account of that.

Charlie Gordon talked about the recycling of beer bottles. I think that some bottles, such as bottles of certain brands of Belgian beer, are still recycled in Scotland. I am familiar with pilots who regularly fly to Brussels and buy beer that is so cheap that the bottle’s recycling cost in Scotland exceeds its purchase price in Belgium. I do not encourage such behaviour as a climate-friendly approach, but at least it shows that beer-bottle recycling is still going on.

Amendment 162 agreed to.

Amendments 163 to 175 moved—[Stewart Stevenson]—and agreed to.

Amendment 245 moved—[Elaine Murray].

The Convener: The question is, that amendment 245 be agreed to. Are we agreed?

Members: No.

The Convener: There will be a division.

AGAINST

Gibson, Rob (Highlands and Islands) (SNP)
Harvie, Patrick (Glasgow) (Green)
Johnstone, Alex (North East Scotland) (Con)
Somerville, Shirley-Anne (Lothians) (SNP)

ABSTENTIONS

Gordon, Charlie (Glasgow Cathcart) (Lab)
McInnes, Alison (North East Scotland) (LD)
McNulty, Des (Clydebank and Milngavie) (Lab)
Peattie, Cathy (Falkirk East) (Lab)

The Convener: The result of the division is: For 0, Against 4, Abstentions 4.

Amendment 245 disagreed to.

Amendments 176 to 181 moved—[Stewart Stevenson]—and agreed to.

Amendment 185 not moved.

Section 58, as amended, agreed to.

After section 58

Amendments 182 to 184 moved—[Stewart Stevenson]—and agreed to.

The Convener: Amendment 246, in the name of Elaine Murray, is in a group on its own.

17:15

Elaine Murray: The intention behind amendment 246 is to float some ideas in the context of possible steps to reduce the use of single-use and disposable products.

I support Des McNulty’s amendment 74, which would delete the proposals on carrier bags. Carrier bags have been erroneously singled out as single-
use products. In fact, they are often not single-use products—they are often used again as bags or for other purposes. Less public attention has been paid to a large number of other single-use products, such as plastic cups—the coolers in the Parliament and the coolers in my office have plastic cups, so people pour themselves a glass of water and throw the cup away. I am not sure why we have plastic spoons, forks and knives in the canteen, because we could use the other ones and wash them. Single-use razors and a plethora of other things, such as PVC advertising displays and so on, are used once and thrown away.

If we are to try to reduce the application of single-use and disposable products and to educate the public about the effect on the environment of using those types of disposable products, we must widen the debate a lot further than only plastic bags and we must address other single-use products. There has not been discussion about the issue, so it might be controversial to put the provision into the bill at this point, but I would like there to be consideration of how the education process might be effected and whether, in the future, regulations could be made to apply to, for example, takeaway food and drink shops to cut down the amount of disposable packaging or disposable materials and so on that are used in that context.

I am floating amendment 246 so that we can explore these ideas on the record and in the hope that the national waste plan will look at ways in which we can deter people from the excessive use of single-use and disposable products.

I move amendment 246.

**Stewart Stevenson:** Amendment 246 seeks to give very broad powers to require charges to be paid for a range of goods alongside whatever is the purchase price. Of course, the amendment’s use of the word “disposable” raises a substantial issue as to what that means, since it is possible to argue that everything is, ultimately, disposable; it is very difficult to work out what products would be excluded from any reasonable definition of “disposable”.

The amendment would also, in certain respects, drive against what we are trying to achieve. A banana skin or an orange peel is disposable, but we would wish people to put them on the heap and recycle them into the garden. We would not wish to charge people for them. I say that only to illustrate the genuine difficulties that the amendment would create.

We will find out what the committee’s view is on Mr McNulty’s amendment 74 to delete the proposal on carrier bags. Amendment 246 would, as currently written, reintroduce the carrier bags issue back into the bill. I would be interested to see whether that is something that Mr McNulty, in view of his clear position on carrier bags, would wish to support. The Government certainly encourages the committee not to proceed with amendment 246.

**Elaine Murray:** I wonder whether the minister recognises that there is a problem. I accept his arguments about the amendment, which is an attempt to bring the subject to people’s attention and to explore some of the issues.

**Stewart Stevenson:** I am happy to recognise that there is a genuine problem. We certainly want to minimise the impact of things that are disposed of after light use, but we do not think that the approach outlined in the amendment is one that commends itself. It is an issue that will require further consideration.

**Elaine Murray:** On the basis of that assurance, I am happy to withdraw the amendment.

*Amendment 246, by agreement, withdrawn.*

**Section 59—Charges for supply of carrier bags**

*The Convener: Amendment 74, in the name of Des McNulty, is in a group on its own.*

**Des McNulty:** I know that time is pressing, convener, but I have three arguments to make. The first relates to the consistency of the parliamentary approach. In the previous session, a sustained consultation was undertaken on the Environmental Levy on Plastic Bags (Scotland) Bill, which was introduced by Mike Pringle. Rob Gibson was on the committee that considered the bill. Many committee members were sympathetic to the bill, but the committee rejected it for a range of reasons. The committee heard a substantial amount of evidence from a variety of sources, including witnesses from the packaging industry in Scotland, who would have been directly affected by the proposal. The committee found their arguments convincing. Given the legislative process that was undergone at that time, it seems unfortunate to say the least that the bill that is before us proposes to introduce a similar provision. It may not be exactly the same proposition—the measures in the bill are not confined to plastic bags—but it is substantially the same.

One reason why the committee moved away from Mike Pringle’s approach was that other mechanisms, particularly those that supermarkets and other bodies can undertake voluntarily, may prove to be a more successful way in which to meet the objectives that were set out in the bill. Indeed, that has proved to be the case. Some measures have achieved some of the objectives that were set out at the time. We should not accept into a bill that is a climate change bill a measure that has been defeated in the...
parliamentary process, particularly when that rejection was made on the basis of a substantial amount of evidence.

The second point is to highlight some of the issues that were flagged up in evidence. At the time, much was made of the Irish experience. Some committee members travelled to Ireland as part of the evidence taking—[Interruption.] Unfortunately, Rob Gibson was not part of the trip. The evidence from Ireland showed that the introduction of a tax on plastic bags led to people turning to other forms of packaging that are less climate friendly. The point that the industry made in that regard was telling. We heard that the weight of material in a quantity of plastic bags is about a thirtieth of the amount in the equivalent quantity of paper packaging. The point is that it is possible to do something for the best of reasons that has a worse set of consequences.

Recently, we all received information from Canada about hygiene issues associated with the reuse of plastic bags. I found it captivating. If the provision is to be introduced, it should be explored in greater depth than it is possible for us to do in the context of the bill.

There is also genuinely an issue of employment. A significant number of jobs in Glasgow are in the packaging industry and are associated with the manufacture of plastic bags and other packaging. Those jobs will be adversely affected by the measure. It will affect the Scottish industry’s competitive position. That is something that we should not do lightly or without an appropriate degree of consultation.

The most pressing argument against the provision is that we are dealing with a climate change bill, and the test of any measure in that context is whether it contributes to a reduction in climate change emissions. Plastic bags can be recycled relatively quickly, the material costs of their production are not high and the material that goes into them is an otherwise not useful by-product of the oil industry. The alternatives, which are predominantly paper, have a significant impact on climate change, as chopping down trees has a direct effect on carbon dioxide levels in the atmosphere. We are being asked to support a measure that is perverse in relation to the objectives of the bill. I suggest that the simplest thing to do is delete section 59 from the legislation.

I apologise on behalf of Angela Constance, who has unfortunately had to attend a funeral this afternoon but would otherwise have been here to speak in support of my amendment. I hope that I can persuade members of the committee to strike out section 59, on the basis that the measure has not been properly thought through and is inappropriate in a climate change bill.

I move amendment 74.

The Convener: I will call other members who wish to speak in a moment, but for once I will abuse my position and be the first to speak.

I am speaking against the amendment. It seems that Des McNulty has, in several parts of his argument, mistaken the current proposal in the bill for the previous proposal in Mike Pringle’s bill, which focused specifically on plastic bags. Des McNulty has mentioned several times the disadvantages of substituting paper bags for plastic bags, but the current proposal refers to carrier bags. We have the opportunity to consider other forms of packaging if non-bag packaging is being substituted through the provisions on deposit and return schemes, which can apply to other forms of packaging. The argument about consistency of approach does not hold: the proposal that we are currently considering is different from the one that we rejected, so the arguments that were used to reject that proposal do not apply in this case.

Des McNulty argued that plastic bags are easily recycled or reused. They are easily recycled if there is provision for that, but many people—certainly in my own city of Glasgow—collect a large bag full of bags somewhere in their house and eventually get so sick of the growing pile of bags that they throw them out. The bags must be taken back to a supermarket to be recycled, as the local authority collection does not accept plastic bags. The provision of recycling services throughout Scotland will hopefully improve, but while such provision does not exist, we should recognise that there is not always an opportunity to recycle.

Plastic bags can be reused, but that argument undermines one of Des McNulty’s other arguments with regard to hygiene. I do not often use phrases such as “health and safety gone mad”, but people are having a bit of a funny turn if they think that reusing a bag will lead to a public health epidemic. I reuse plastic bags occasionally, and I try to reuse cloth bags as often as I can. If there is a hygiene issue, it applies to the reuse of any other type of bag as much as to the reuse of plastic bags.

With regard to the relevance of the measure to climate change, there is a cultural factor that relates to public engagement, for which Des McNulty has argued on other occasions. Asking people to make a different choice on a daily basis, and not accepting unnecessary plastic bags, paper bags or any other type of packaging, is a mental trigger. It is very much part of the public engagement on climate change and resource use, which are deeply connected in many ways.
Finally, in response to the argument that voluntary measures have proved to be effective, we can all take a walk down many high streets or shopping streets and see some people—more than perhaps there were five years ago—using their own bags, such as bags for life or cloth bags, but we can also stand at a till in a supermarket and see hundreds of plastic bags being put out every minute of every hour.

It is not true to say that voluntary measures have solved the problem; we still see far too much use of packaging, including plastic and paper bags. The proposal is one way of reducing that, and it seems to me that we should not be prohibiting ministers from coming forward with regulations of this sort by removing section 59 from the bill.

17:30

Rob Gibson: The convener has made many of the arguments for rejecting amendment 74.

When evidence was being taken on Mike Pringle’s bill, it was suggested that people would buy black bin bags and so on as a substitute for the supermarkets’ plastic bags if they were banned. If we keep going down a route that involves people not changing their habits but instead trying to find other polluting means of carrying things around, we will have to take a stand at some point. That is not an argument against the people who make plastic bags, as many kinds of bags are being discussed in this context. Many of us on the greener wing of the debate have collections of cotton bags and other sorts of bags that are handed out freely by organisations to encourage us not to use plastic or paper ones. However, the point is that we need to have a climate change in how people carry their goods about.

In the countryside, we have barbed-wire fences festooned with plastic, and plastic bags are the main reasons for that. As plastic bags can escape and end up in our environment in that way, there must be some means of curbing their use. I do not believe that the voluntary approach works in that regard. I rarely use large supermarkets, but I see people routinely handing out plastic bags in small village shops. I refuse them all the time, if I can.

In the circumstances, we have to keep a provision in the bill that makes it possible for action to be taken. We need to assure people that we are not in any way trying to stop people doing jobs that are legitimate or from making the things that they do. However, we need to recognise that the way in which people must change their behaviour must be asserted in the bill.

Alison McInnes: I was not in the Parliament when Mike Pringle’s bill was dealt with, but I have to say that my colleague was right to raise that debate at that time. I think that the situation has moved on significantly since then. The pace of change might not be as great as we would like it to be, but we have seen what voluntary effort can do.

It was clear at stage 1 of this bill that members have quite strong feelings about this issue, and I have been trying to weigh up the arguments.

It seems to me that there is some benefit to leaving section 59 in the bill, as it is only an enabling power. I am not yet persuaded by the arguments that have been put forward in favour of removing it.

Stewart Stevenson: I was interested that Des McNulty said that he was captivated by unhygienic bags. I would gently make the point that the study to which he referred was funded by the plastic bag industry, which means that one might wish to look again at its terms of reference and the independence of those who conducted it. I should, of course, say that I do not automatically conclude that an industry funding a study is necessarily at it, as it were.

I draw colleagues’ attention to the fact that the UK Government included the power to introduce charges for single-use bags in its Climate Change Bill.

Alex Johnstone: Disgraceful.

Stewart Stevenson: As the member says, that was quite disgraceful. However, the principled argument that was put forward against a similar power being included in our bill is, perhaps, undermined by that.

I also note that my good personal friend—even if she is my political opponent—Jane Davidson, the Minister for the Environment, Sustainability and Housing in the Welsh Assembly Government, has announced that she is planning to implement a levy on plastic bags in Wales. I wish her every success in that.

The voluntary work by retailers that Alex Johnstone rightly praised at stage 1 has delivered some encouraging early results, but it is clear that we cannot rely solely on a voluntary approach to deliver the goods and, therefore, that we should retain the powers in section 59 to exercise them if and when they are required.

Des McNulty: The minister and other members have made much of being driven by the evidence, which inevitably relies on numbers. It seems to me that the evidence against section 59—the numerical argument against taking out plastic bags in particular and allowing their substitution by other materials—

Stewart Stevenson: I hope that Des McNulty will acknowledge that section 59 is not about plastic bags but about bags generally.
Des McNulty: I acknowledge that, but it is likely to be targeted at plastic bags. That is obviously the approach that the minister wants to take. Ministers will need to consider how to implement it, but the presumption behind it is the removal of plastic bags. The reality is that significant consequences are associated with replacing single-use plastic bags with heavier-duty bags that are often plastic coated and much less easily recyclable. It is important that we consider the consequences of substituting something that is relatively light and that can be reused or recycled with something that is intended for reuse but causes a significant amount of additional carbon in its production and is difficult to recycle.

It strikes me that there is a considerable debate to be had about packaging in Scotland and the rest of the UK. Supermarkets provide many goods pre-packaged. The packaging consists of lots and lots of cardboard and exists for the supermarkets’ use, as it allows them to organise their shelves. If we want to tackle packaging, we should start by focusing on how the supermarkets organise themselves rather than on the bags that the consumer uses. That is an easy target for Governments and the industry and there is a considerable anti-consumer aspect to the matter.

There are good arguments against section 59. It is a bad principle to introduce enabling powers for a measure that the Government says it does not have the case for putting into effect. The minister has not made an adequate case for introducing it, especially in the context of previous consideration, and I hope that the committee will support my amendment and remove the section from the bill.

The Convener: The question is, that amendment 74 be agreed to. Are we agreed?

Members: No.

The Convener: There will be a division.

For
Gordon, Charlie (Glasgow Cathcart) (Lab)
Johnstone, Alex (North East Scotland) (Con)
McNulty, Des (Clydebank and Milngavie) (Lab)
Peattie, Cathy (Falkirk East) (Lab)

Against
Gibson, Rob (Highlands and Islands) (SNP)
Harvie, Patrick (Glasgow) (Green)
McInnes, Alison (North East Scotland) (LD)
Somerville, Shirley-Anne (Lothians) (SNP)

The Convener: The result of the division is: For 4, Against 4, Abstentions 0.

The casting vote will be for the status quo.

Amendment 74 disagreed to.

Sections 60 and 61 agreed to.

After section 61

The Convener: Amendment 247, in the name of Elaine Murray, is in a group on its own.

Elaine Murray: This is a probing amendment, so I will be brief. I am interested to know whether the Government would be prepared to take civil penalties for waste offences further. At one time, I think, the Scottish Environment Protection Agency hoped to explore such issues.

The current statutory maximum on summary conviction is £10,000, which acts as little disincentive to supermarkets or major developers, but which might be a fairly severe penalty for small businesses such as small shops.

There are several ways in which the penalty could be made proportionate to the size of the business. I know that Bill Wilson’s proposed member’s bill deals with the imposition of equity fines on companies, including for environmental offences. Civil penalties could be used, as happens under certain transport provisions, such as those to do with road works and renewable fuels obligations. Competition law could be used, too, although that would probably fall within the UK Government’s competence.

Amendment 247 suggests a framework for the application of variable civil penalties. The scale of such penalties would be a matter for subsequent regulations and would therefore be subject to consultation and parliamentary approval, but the amendment provides scope for the penalty to vary in relation to the financial turnover of the business concerned,

"or to the costs avoided, or income obtained ... as a result of the commission of the offence."

It would enable effective and fair deterrents to be established by the relevant regulatory body.

I move amendment 247.

The Convener: As no members wish to comment, I invite the minister to respond.

Stewart Stevenson: I will be relatively brief. First, I make the technical point that although the maximum fine for such offences in summary proceedings is £10,000, there is no limit in cases of conviction on indictment, so it would be perfectly possible for substantially greater fines to be imposed on large institutions, albeit that that would probably be relatively uncommon.

The environmental crime directive, directive 2008/99/EC, which was agreed last year, restricts the scope of the use of civil penalties, as it requires a variety of environmental offences, including some that relate to waste management, to be subject to criminal penalties.
There are some practical difficulties with amendment 247, in that the penalties that it seeks to impose are not civil penalties in the strict sense. As the amendment is drafted, they would apply only in respect of what the bill establishes as criminal offences. As the new section that amendment 247 proposes is predicated on criminal offences having been committed, it would lead to the possibility that two forms of proceedings, involving very different standards of proof, would be available to deal with the same act—an act that was a criminal offence. The fact that there are issues of fairness at stake is compounded by the provision in subsection (2) of the proposed new section, under which penalties could be levied on persons who had not committed an offence. There might be European convention on human rights issues associated with that.

Subsection (3) of the proposed new section creates a number of difficulties. For example, prosecution in the courts should be prevented only if a penalty is paid, not merely if it “may” be imposed. As all the triggers for civil penalties are criminal offences, it is difficult to envisage that a situation in which any police investigation led to a charge should not, at least arguably, be the subject of criminal proceedings, but all criminal proceedings are to be banned if a civil penalty may be imposed. That, coupled with the fact that no penalty is stated and no maximum is imposed, means that the Government would have unusually broad powers. I am not wholly opposed to that, but I think that it is probably inappropriate and that it was not the intention behind the amendment, so I invite Dr Murray to withdraw it.

Elaine Murray: I invite the minister to indicate whether the opportunity to make the penalty in such cases proportionate to the offence that has been committed will be investigated at a later date.

Stewart Stevenson: I note that Dr Murray referred to Dr Wilson’s proposed equity fines bill, the progress of which we will watch with interest—I have to put it that way, because I am not quite certain that the Government has yet expressed a position on it. It is clearly an interesting proposal and there are a number of opportunities for pursuing the matter in other areas.

Amendment 247, by agreement, withdrawn.

Before section 62

17:45

The Convener: Amendment 248, in the name of Alison McInnes, is in a group on its own.

Alison McInnes: I am grateful to Stop Climate Chaos Scotland for its support and advice in relation to amendment 248. We should all be keen to support access to justice. The amendment aims to ensure that ministers are fully accountable for the conduct of their duties under the bill. Parliamentary responsibility is established under the bill, although perhaps not as clearly as I would like. Given the 40-year lifespan of the bill, it is right to ensure that appropriate opportunity is established for the courts to be able to enforce its provisions. At stage 1, my colleague Ross Finnie criticised the bill because it did not contain such provisions.

Judicial review is the key process by which such enforcement can be delivered. As is normal, such a procedure does not overturn the decision making of the courts but enables them to quash decisions. The procedure follows the Aarhus convention, which has been ratified in the UK but not completely transposed into European law. The convention says that access to judicial review should be available to the “interested public” in environmental matters, such as those that arise from the bill.

In Scotland, unlike in England, there are uncertainties about the standing of environmental interests and no established provisions to limit the financial risks that are associated with taking a case. The English courts have established the use of protective costs orders. Further, judicial review cases do not typically consider the full range of aspects of substantive and procedural legality that are required by the convention.

Amendment 248 was drafted by a leading QC. It would ensure that, as a minimum—perhaps it would be best to say that a precedent would be set—cases arising under the bill meet the Aarhus standards for access to justice. The amendment deals with the three key issues of standing, affordability and the scope of challenges. As a result, it also provides a valuable backstop to existing accountability provisions in the bill and enhances incentives for all ministers to comply fully with the duties that are set out in the bill. The Aarhus convention was developed under the auspices of the United Nations. It sets out three strands: access to information, public participation and access to justice, which is the strand with which my amendment deals.

I have been heartened by the level of engagement of individual citizens and stakeholders during the bill’s development. Stop Climate Chaos Scotland is a fine example of what should happen in a mature democracy and provides a counterargument to everybody who says that there is so much apathy around and that people are not interested in what is happening.

Amendment 248 acknowledges that proper access to judicial review is part of the toolkit that we should make available to active citizens. I hope that members will support it.
I move amendment 248.

Stewart Stevenson: I start by echoing what Alison McInnes said about Stop Climate Chaos Scotland. We have not found ourselves able to support every stage 2 amendment from that source, but the contribution made by that alliance of third sector bodies and the wider public has been important in setting much of the bill’s agenda. It is important to recognise that.

There is a wide range of difficulties with amendment 248, which Ms McInnes has brought to the committee. Transposition of the Aarhus convention is already reflected in Scots law. Indeed, if that were not the case, we would expect the European Commission to review the situation, and I am not aware of any infraction proceedings. There is no question of Scots law not having been brought into line with the requirements of the convention on title and interest. Therefore, subsections (1) and (2) of the proposed new section that the amendment would insert are simply not necessary. If the concern is that the Court of Session would take a narrow approach, there is no past evidence of that happening.

Subsections (3) and (4) of the proposed new section would create a specific procedure for a party to follow when asking the court to impose a cap on their liability for another party’s expenses. It has been recognised that the Court of Session may make such an order—a protective costs order, as it is described in England—and therefore I cannot see that those subsections would add anything to the court’s existing power. I make the point strongly that court rules are generally set by the Lord President of the Court of Session. Albeit that the orders in question are put to Parliament, they are not made or laid by Scottish ministers. That is an important part of the separation of the Scottish legal system that should continue.

The Lord President is currently considering the issue of protective costs orders with a view to determining whether any changes to court rules are necessary.

Subsection (5) of the proposed new section would make provision regarding the scope of any judicial review. The question of what may or may not be competentely looked at in a judicial review falls to be determined by reference to the case law of the Court of Session. I have not been made aware of any undesirable gaps in the court’s approach.

All in all, I do not believe that amendment 248 is necessary, and I strongly recommend that the committee does not support it.

In any event, we will shortly receive the report of Lord Gill’s wide-ranging review of the Scottish civil courts, which expressly considers issues of court procedure and the cost of litigation to parties. It would, at any rate, be wrong to make piecemeal changes in advance of that report, which might well bring forward more substantial and wide-ranging changes to court procedure.

Alison McInnes: The minister has referred to Lord Gill’s review and seemed to accept the principles and the philosophy behind the amendment. Will he have a discussion with the Lord President to ensure that there are no gaps in this instance?

Stewart Stevenson: My apologies—I got distracted there. Could the member replay that for me, please?

Alison McInnes: Certainly. In the first instance, you seemed to support the philosophy behind amendment 248, and you suggested that the Aarhus convention was already enshrined in Scots law.

Stewart Stevenson: Yes, in essence. I am asserting—to summarise it very concisely—that the provisions are all there already.

Alison McInnes: I wish to ask for two things. Can the minister check before stage 3 that there are no gaps in here, and will he have a discussion with the Lord President about the wider impact?

Stewart Stevenson: Yes.

Alison McInnes: In light of that, I will not press the amendment.

Amendment 248, by agreement, withdrawn.

The Convener: Amendment 249, in the name of Des McNulty, is grouped with amendments 249B and 249A.

Des McNulty: Amendment 249 is intended to require the persons mentioned in it to behave in a way that contributes to the achievement of sustainable development. It continues the approach—which I think I initiated under the Water Industry (Scotland) Act 2002, as a member of the equivalent committee in the first session of the Parliament—of imposing a sustainable development duty. It seems entirely appropriate, in the context of climate change, to require ministers and the various public bodies that will be given duties to operate in a way that is consistent with the principles of sustainable development.

The amendment is also consistent with the approach to duties on public bodies that Cathy Peattie has introduced into the bill. I hope that there is coherence between where we will end up as regards those duties and the idea of a general duty of sustainable development.

I note the amendments to amendment 249, in the names of Alison McInnes and Shirley-Anne Somerville, and I will be interested to hear, and will then respond to, the points that those colleagues
make in speaking to their amendments. It is important, in the context of a climate change bill, to introduce a mechanism to ensure that people operate in a way that contributes to the achievement of sustainable development.

I move amendment 249.

Alison McInnes: I congratulate Des McNulty on bringing the issue of sustainable development into the framework of the bill. I absolutely support that approach. I welcome the wording of the whole of the proposed new section that Des McNulty’s amendment would introduce, except for subsection (2)(b). My reason for lodging amendment 249B is linked to our agreeing, last week, to amendment 198, in the name of Cathy Peattie, which I supported. Amendment 198 set out climate change duties for public bodies and included a reference to acting sustainably. It will be essential that our public bodies make choices that are sustainable.

Given that we agreed to those duties on public bodies, the inclusion in the bill of a differently worded sustainable development duty on public bodies, as set out in amendment 249, could lead to confusion about which standard public bodies should apply in acting sustainably. We certainly do not want anything to cloud the issue and allow people to argue over how such a duty should be implemented.

It is essential that there is clarity on the fulfilment of duties in relation to climate change. I hope that Des McNulty accepts my amendment to his amendment in the spirit in which it is intended. The intention is to add clarity to his worthwhile amendment to ensure that the legislation is consistent and clear and that the sustainable development duty is workable. I also support Shirley-Anne Somerville’s amendment to the amendment. I will listen to the debate, and if Des McNulty can persuade me that both approaches are necessary, I will not press my amendment.

I move amendment 249B.

Shirley-Anne Somerville: I welcome Des McNulty’s amendment, which replicates a similar amendment that I had been working on with the RSPB and the Stop Climate Chaos Coalition for some time. I am pleased that it will—I hope—become part of the bill. I support Alison McInnes’s amendment to his amendment because, regardless of how I voted on the duties on public bodies last week, I am concerned that we should have a working sustainable development amendment that does not lead to any potential clashes and problems. I am pleased that she has lodged that amendment to clarify the matter.

I have lodged a small amendment to Des McNulty’s amendment to ensure that the advice that ministers receive from any advisory body has regard to sustainable development. It simply ensures that another body, which I do not think is included in Des McNulty’s amendment, is included in the bill.

Stewart Stevenson: We are content for all three amendments in the group to be agreed to. Although we remain unconvinced on the subject of duties on public bodies, if the matter is to be included in the bill, it should be included in a proper and orderly fashion.

Des McNulty: I am not 100 per cent sure that there is a clash between the “relevant public body” aspect of my amendment and the amendment that was agreed to last week. It is clear that ministers will want to examine this suite of provisions and perhaps lodge further amendments to tidy it up. In that context, I am happy at present to accede to the amendments in the names of Alison McInnes and Shirley-Anne Somerville. I am sure that if it becomes necessary to put the “relevant public body” duty back in and tweak another part of the bill, we can consider amendments that are lodged by ministers at that time.

Amendment 249B agreed to.

Amendment 249A moved—[Shirley-Anne Somerville]—and agreed to.

Amendment 249, as amended, agreed to.

18:00

The Convener: There is light at the end of the tunnel—there are only a couple of groups to go. Amendment 280, in my name, is in a group on its own.

The amendment relates to the Government’s carbon assessment tool, which is being developed with the intention of assessing the carbon impact of future Scottish Government budgets. We discussed the issue in our stage 1 inquiry, and in paragraph 56 of our report we noted the possibility that the carbon assessment process could form a statutory part of consideration of expenditure projects. The same argument applies to the budget as a whole.

When the Cabinet Secretary for Finance and Sustainable Growth was asked at a previous committee meeting whether he was open to that opportunity, he said that he was willing to consider it. I lodged amendment 280 to explore whether the Government is ready to make the carbon assessment tool a required part of the Scottish budget process. If the minister indicated open-mindedness to the principle but a disagreement with the proposed method, I would find it interesting. However, given that we are being told that the assessment tool will be ready to apply to the next Scottish budget, it would be a positive step to take to lock it in for the future and ensure
that future Scottish budgets are introduced alongside information that allows Parliament to assess carbon implications.

I move amendment 280.

Des McNulty: I am not unsympathetic to the purpose of the amendment, but I question whether it is an appropriate mechanism to put into climate change legislation or whether it should be part of a protocol of agreement between the Finance Committee and the Cabinet Secretary for Finance and Sustainable Growth. It is a question of the mechanisms involved in putting together the budget. Perhaps the minister will be able to cast some light on that.

Stewart Stevenson: We are content with the principle behind the amendment—members knew that because it is in line with the commitments made by the cabinet secretary. It would certainly add to the policy approval process and the hard actions that will result from our delivery plan that will assist in plotting the path to drive down emissions. Overall, we recognise absolutely the spirit in which the amendment was lodged.

There are several difficulties with the drafting of the amendment, which I will address before I respond to Des McNulty’s point. The amendment refers to “expenditure” whereas budget bills use different terminology, which is “resources”. The amendment also refers to the impact on greenhouse gas emissions, but expenditure does not impact on emissions; it is the activities that expenditure buys that impact on greenhouse gas emissions. Those two flaws in the drafting of the amendment prevent me from supporting its specific formulation today.

Des McNulty asked whether the matter would be best dealt with in a protocol between the cabinet secretary and the Finance Committee. I am not sure that I am in a position to comment on that at this stage, although I see clearly why it might be an alternative proposition.

The Convener: Does the minister accept that a protocol—essentially an agreement between the Government and the Parliament—could be subject to change by future Governments, finance secretaries or those carrying out that function on behalf of future Governments, whereas a legal requirement would bind future Governments?

Stewart Stevenson: Although that is manifestly true, the protocol would be a symmetric arrangement that could also be changed at the behest of the Finance Committee. I can see—albeit without having given the matter huge consideration—that there might be advantages for the two key players in the budget process in having the ability to negotiate, as required, what the protocol should be. A protocol would not be simply a get-out-of-jail-free card for the minister; it is a potentially powerful tool for the Finance Committee to insist on the way in which things are done. I do not wish to take a position on that subject now in front of the committee. If the committee wishes me to consult colleagues further, particularly the cabinet secretary, I will be happy to do so.

I return to the substantive issue before us, which is amendment 280 in the convener’s name. I suggest that, in view of its flaws, it would be most appropriate if it were not pressed today.

The Convener: In light of the debate, I wish to consider further the detail of the options that are being explored. I hope that the minister will have a conversation with the cabinet secretary in advance of the stage 3 deadline so that, if a legislative mechanism is proposed and debated at stage 3, there is time for the Government to take a position on whether some variant of what I am proposing now is acceptable.

Amendment 280, by agreement, withdrawn.

Section 62—Equal opportunities
Amendment 228 not moved.
Section 62 agreed to.
Section 63 agreed to.

Section 64—Subordinate legislation
The Convener: I call amendment 229, in the name of Iain Smith, which was previously debated with amendment 224. Does Iain Smith wish to move the amendment?

Iain Smith: Yes—I am still here.
Amendment 229 moved—[Iain Smith]—and agreed to.
Amendment 186 not moved.

The Convener: Amendment 250 is in the name of Maureen Watt, who has been extremely patient—welcome to the committee, Maureen. The amendment is in a group on its own.

Maureen Watt (North East Scotland) (SNP): Thank you, convener. I am aware that you are at the end of a marathon session, so I will be as brief as possible.

Amendment 250 seeks to improve the scope of the parliamentary scrutiny of the secondary legislation that stems from the broad enabling powers of sections 52 to 59 on waste reduction and recycling. As the bill stands, such secondary legislation would be introduced under the affirmative procedure. The Rural Affairs and Environment Committee considers that a number of the policies in those sections are of such importance that, if they are introduced through
subordinate legislation, they could require close parliamentary scrutiny.

During the part of the afternoon that I have been here, members have been making the same point in relation to a number of other amendments, a prime example relating to section 59, which would allow the introduction of charges for carrier bags. When scrutinising those provisions, members considered that the relevant committees should be afforded the time to take evidence from stakeholders, to report on drafts of the legislation and then to recommend necessary changes to the drafting—as opposed to simply being able to vote for or against a motion under the affirmative procedure. The Rural Affairs and Environment Committee concluded that the secondary legislation that stems from such broad enabling powers should therefore be subject to the so-called super-affirmative procedure. Amendment 250 seeks to ensure that that recommendation is reflected in the bill.

The procedure that the amendment outlines would apply to all instruments made under sections 52 to 59, to which it is currently proposed to apply the affirmative procedure. The specific terms of the amendment are relatively clear, so I do not propose to talk through each feature in turn.

I move amendment 250.

Des McNulty: I agree that the amendment is required, especially in view of—I hesitate to say this—the slightly speculative aspects of the bill. Before any measures are introduced, whether under section 59, section 58 or even some of the earlier sections, it is important that there is an appropriate opportunity for people to be properly consulted. That does not just mean parliamentarians; industry is likely to be affected. I broadly support the proposal in the name of Maureen Watt from the Rural Affairs and Environment Committee.

Elaine Murray: I am a member of the Rural Affairs and Environment Committee. Amendment 250 received cross-party support because of the evidence that we received at stage 1.

I referred to amendment 250 in connection with earlier groups of amendments, and the minister expressed a concern that it might delay the introduction or passage of regulations by about seven months. The problem with the affirmative resolution procedure is that instruments must simply be accepted or rejected, and there is no possibility of amending them. If just one part of a set of regulations created a lot of concern, the Parliament’s only option would be to reject the instrument completely and for the Government to bring in further regulations.

Super-affirmative procedure enables amendment and could speed up the process because, if only a part of a set of regulations was a cause for concern but the general principles were acceptable, it would be possible to amend them and produce an acceptable set of regulations. Is that not the case?

Stewart Stevenson: I should explain that seven months is the minimum likely delay; it could be as much as a year. We are being urged to speed and urgency on the bill and, in those circumstances, it would be inappropriate to have such a delay. We have to balance the need to exercise parliamentary scrutiny with market development, and the amendment covers a huge range of the bill. It might cover such issues as a change in prices for and market acceptability of recyclate and force super-affirmative process on to any secondary legislation that was associated with that. We might require to make emergency changes but be unable to do so because of that procedure. In those circumstances, the lead-in would be very painful and inhibit our ability to take necessary action.

I do not wish to turn away the substantive point that is being made, so we must ask what other alternatives are available to the Parliament. There is always a consultation period in advance of the production of any secondary legislation. It is not without precedent for committees, at that stage, to commission their own inquiries and feed into the consultation process. As the opinion of the Parliament is expressed through the subject committees, it would be perverse of any Government—particularly a minority one—to press on if it knew that the legislation would not be passed. That consultation would deliver the same benefit of enhanced scrutiny without restricting the ability of a Government of whatever complexion to respond rapidly and effectively. It would also not involve a 60-day period, which might be substantially longer in calendar terms—possibly as much as 100 days—depending on how a recess fell.

Amendment 250 is the wrong way to solve a problem that I acknowledge.

Des McNulty: I hear what the minister says about delay and I am sure that we would not want any. Nonetheless, does he accept that sections 58 and 59 represent a special case? They are framework proposals that should be subject to super-affirmative resolution. If the amendment were narrowed to those two sections, would he find it more acceptable than he finds the requirement on the whole run of sections, about which he expresses concern?

Stewart Stevenson: I would certainly find it less unacceptable. That change would respond to the generality and breadth of the proposals in amendment 250, but it would leave open the question of how we respond in circumstances in
which there is a degree of urgency. If we put super-affirmative procedure into primary legislation, the Government’s hands would be tied, to be frank, even in circumstances in which the Parliament urged speed upon it. I come back to the point that the consultation period provides the opportunity for the kind of engagement that I think is being sought.

I encourage Maureen Watt, who is promoting the amendment, not to press it and to consider the point that I am making to the committee. At least, I ask her to restrict its scope so that it would not cover all the sections concerned.

Circumstances such as a collapse in the market for recyclates, which is one issue covered in section 58, could well require a degree of urgency of action. I think that we can get the benefits of enhanced scrutiny by another mechanism. I urge the committee not to put the proposed new provisions into the bill at this stage and to consider further the remarks that I have made.

18:15

Maureen Watt: Given what the minister has said about the need to refine amendment 250 so that it applies only to a couple of sections of the bill, I think that it would be in order for me to withdraw it. However, that is not to say that it will not reappear at stage 3 in another form.

The Convener: Maureen Watt wishes to withdraw amendment 250. Is there any objection to that?

Des McNulty: Yes.

The Convener: The question is, that amendment 250 be agreed to. Are we agreed?

Members: No.

The Convener: There will be a division.

FOR

Gordon, Charlie (Glasgow Cathcart) (Lab)
McInnes, Alison (North East Scotland) (LD)
McNulty, Des (Clydebank and Milngavie) (Lab)
Peattie, Cathy (Falkirk East) (Lab)

AGAINST

Gibson, Rob (Highlands and Islands) (SNP)
Johnstone, Alex (North East Scotland) (Con)
Somerville, Shirley-Anne (Lothians) (SNP)

The Convener: The result of the division is: For 5, Against 3, Abstentions 0.

Amendment 250 agreed to.

Amendment 230 moved—[Cathy Peattie].

The Convener: The question is, that amendment 230 be agreed to. Are we agreed?

Members: No.

The Convener: There will be a division.

FOR

Gordon, Charlie (Glasgow Cathcart) (Lab)
Harvie, Patrick (Glasgow) (Green)
McInnes, Alison (North East Scotland) (LD)
McNulty, Des (Clydebank and Milngavie) (Lab)
Peattie, Cathy (Falkirk East) (Lab)

AGAINST

Gibson, Rob (Highlands and Islands) (SNP)
Johnstone, Alex (North East Scotland) (Con)
Somerville, Shirley-Anne (Lothians) (SNP)

The Convener: The result of the division is: For 5, Against 3, Abstentions 0.

Amendment 231 agreed to.

Amendment 231 moved—[Cathy Peattie].

The Convener: The question is, that amendment 231 be agreed to. Are we agreed?

Members: No.

The Convener: There will be a division.

FOR

Gordon, Charlie (Glasgow Cathcart) (Lab)
McInnes, Alison (North East Scotland) (LD)
Peattie, Cathy (Falkirk East) (Lab)

AGAINST

Gibson, Rob (Highlands and Islands) (SNP)
Johnstone, Alex (North East Scotland) (Con)
Somerville, Shirley-Anne (Lothians) (SNP)

The Convener: The result of the division is: For 5, Against 3, Abstentions 0.

Amendment 231 agreed to.

Section 65, as amended, agreed to.

Schedule 2

MINOR AND CONSEQUENTIAL MODIFICATIONS

The Convener: I call amendment 232, in the name of Iain Smith, which was previously debated with amendment 222. Are you moving or not moving the amendment, Mr Smith?

Iain Smith: In future, I must be careful not to lodge amendments to schedules on minor and consequential modifications, particularly when I am not moving them.

Amendment 232 not moved.
Schedule 2 agreed to.
Section 66 agreed to.

Section 67—Short title and commencement
Amendment 233 moved—[Rob Gibson]—and agreed to.
Amendment 234 moved—[Cathy Peattie].

The Convener: The question is, that amendment 234 be agreed to. Are we agreed?

Members: No.

The Convener: There will be a division.

FOR
Gordon, Charlie (Glasgow Cathcart) (Lab)
Harvie, Patrick (Glasgow) (Green)
McInnes, Alison (North East Scotland) (LD)
McNulty, Des (Clydebank and Milngavie) (Lab)
Peattie, Cathy (Falkirk East) (Lab)

AGAINST
Gibson, Rob (Highlands and Islands) (SNP)
Johnstone, Alex (North East Scotland) (Con)
Somerville, Shirley-Anne (Lothians) (SNP)

The Convener: The result of the division is: For 5, Against 3, Abstentions 0.

Amendment 234 agreed to.

Des McNulty: Can we redo amendment 234? I think there is some confusion.

The Convener: On amendment 234, there were five in favour, three against and no abstentions.

Des McNulty: Did you move it, Cathy? I got a bit confused.

Cathy Peattie: I did move it. I got confused between amendment 234 and amendment 228. I am sorry.

The Convener: Amendment 234 was moved and it has been agreed to.

Amendment 235 moved—[Rob Gibson]—and agreed to.
Section 67, as amended, agreed to.

Long title
Amendment 35 moved—[Stewart Stevenson]—and agreed to.
Amendment 236 not moved.

Long title, as amended, agreed to.

Stewart Stevenson: I just want to express thanks to the committee for its positive engagement during stage 2. The Government will consider the timetables and reporting, and I think that we are likely to conclude that we should try to consolidate and align some of the timelines, without seeking to subvert the intentions of the whole range. We have a bill with a wide range of separately described reporting and timelines, which are worthy of further consideration. I thought that it would be useful to give the committee early indication of our plans, which will probably require a substantial set of amendments. However, our intention is not to subvert the decisions that have been made.

The Convener: Thank you. That concludes our agenda for today.

Meeting closed at 18:21.

67 Short title and commencement

Schedule 1—The Scottish Committee on Climate Change
Schedule 2—Minor and consequential modifications
Amendments to the Bill since the previous version are indicated by sidelining in the right margin. Wherever possible, provisions that were in the Bill as introduced retain the original numbering.

Climate Change (Scotland) Bill
[AS AMENDED AT STAGE 2]

An Act of the Scottish Parliament to set a target for the year 2050, an interim target for the year 2020, and to provide for annual targets, for the reduction of greenhouse gas emissions; to provide about the giving of advice to the Scottish Ministers relating to climate change; to confer power on Ministers to impose climate change duties on public bodies; to make further provision about mitigation of and adaptation to climate change; to make provision about energy efficiency; to make provision about the reduction and recycling of waste; and for connected purposes.

PART 1
EMISSIONS REDUCTION TARGETS

The 2050 target

1 The 2050 target
(1) The Scottish Ministers must ensure that the net Scottish emissions account for the year 2050 is at least 80% lower than the baseline.
(2) In this Act, the target set out in subsection (1) is known as the “2050 target”.

The interim target

2 The interim target
(1) The Scottish Ministers must ensure that the net Scottish emissions account for the year 2020 is at least 34% lower than the baseline.
(2) In this Act, the target set out in subsection (1) is known as the “interim target”.

2A Modifying the interim target
(1) The Scottish Ministers may, by order, modify the percentage figure mentioned in section 2(1) so as to substitute a higher figure for the one for the time being mentioned there.
(2) If an appropriate Community instrument comes into force, the Scottish Ministers must, before the expiry of the appropriate period, lay a draft of a statutory instrument containing an appropriate order before the Scottish Parliament.
(3) An “appropriate order” means an order under subsection (1) modifying the percentage figure mentioned in section 2(1) so as to substitute a figure of at least 42%.
(4) An “appropriate Community instrument” means a Community instrument—

(a) which contains a commitment to reduce greenhouse gas emissions by at least 30% compared to 1990 levels by 2020; and

(b) which amends the Decision of 26 March 2009 of the European Parliament and of the Council on the effort of Member States to reduce their greenhouse gas emissions to meet the Community’s greenhouse gas emission reduction commitments up to 2020 in the manner envisaged in Article 8(2) of the Decision.

(5) The “appropriate period” means the period of 3 months beginning with the day on which the appropriate Community instrument comes into force.

(6) If a draft of an appropriate order is not laid before the expiry of the appropriate period, the Scottish Ministers must lay the draft as soon as reasonably practicable afterwards.

3 Annual targets

(1) The Scottish Ministers must—

(a) for each year in the period 2010-2050, set a target for the maximum amount of the net Scottish emissions account;

(b) ensure that the net Scottish emissions account for each year in that period does not exceed the target set for that year.

(2) The target—

(a) for 2010, must be set at an amount that is less than the estimated net Scottish emissions account for 2009;

(b) for each year in the period 2011-2019, must be set at an amount that is consistent with a reduction over time of the net Scottish emissions account which would allow the interim target to be met;

(c) for each year in the period 2020-2050, must be set at an amount that is at least 3% less than the target for the preceding year.

(3) In this Act—

(a) an “annual target” for any year means the target for the maximum amount of the net Scottish emissions account set for that year in accordance with this section and section 4;

(b) references to an annual target being met are references to the net Scottish emissions account for a year not exceeding the annual target for that year (and cognate expressions are to be construed accordingly).

4 Setting annual targets

(1) The Scottish Ministers must, by order, set the annual targets for each year in the periods mentioned in paragraphs (a) to (g) of subsection (2).

(2) The Scottish Ministers must set the annual targets for each year—

(a) in the period 2010-2022, no later than 1 June 2010;

(b) in the period 2023-2027, no later than 31 October 2011;

(c) in the period 2028-2032, no later than 31 October 2016;
(d) in the period 2033-2037, no later than 31 October 2021;
(e) in the period 2038-2042, no later than 31 October 2026;
(f) in the period 2043-2047, no later than 31 October 2031;
(g) in the period 2048-2050, no later than 31 October 2036.

(3) The Scottish Ministers must, when setting annual targets, have regard—
(a) in relation to each year in the period 2010-2020, to the achievement of the interim target and the 2050 target;
(b) in relation to each year in the period 2021-2050, to the achievement of the 2050 target.

(4) The Scottish Ministers must, when setting annual targets, also have regard to the following matters (the “target-setting criteria”)—
(a) scientific knowledge about climate change;
(b) technology relevant to climate change;
(c) economic circumstances, in particular the likely impact of the target on—
   (i) the Scottish economy;
   (ii) the competitiveness of particular sectors of the Scottish economy;
   (iii) small and medium-sized enterprises;
   (iv) jobs and employment opportunities;
   (d) fiscal circumstances, in particular the likely impact of the target on taxation, public spending and public borrowing;
   (e) social circumstances, in particular the likely impact of the target on those living in poorer or deprived communities;
   (f) the likely impact of the target on those living in remote rural communities and island communities;
   (g) energy policy, in particular the likely impact of the target on energy supplies, the renewable energy sector and the carbon and energy intensity of the Scottish economy;
   (ga) environmental considerations and, in particular, the likely impact of the targets on biodiversity;
   (h) European and international law and policy relating to climate change.

(5) If annual targets for a period are not set by the corresponding date mentioned in paragraphs (a) to (g) of subsection (2), the Scottish Ministers must set the annual targets as soon as reasonably practicable afterwards.

5 Advice before setting annual targets

(1) The Scottish Ministers must, before laying a draft of a statutory instrument containing an order under section 4(1) before the Scottish Parliament, request and publish advice from the relevant body.

(1A) When providing advice under this section, the relevant body must—
(a) express a view as to whether the annual targets are appropriate; and
(b) explain that view by reference to the target-setting criteria.

(2) As soon as reasonably practicable after laying such a draft, the Scottish Ministers must publish a statement setting out in respect of the annual targets set by the order—

(a) the reasons for setting those annual targets at those levels;

(b) the extent to which those targets take account of the target-setting criteria.

(3) If the order under section 4(1) makes provision different from that recommended by the relevant body, the Scottish Ministers must publish a statement setting out the reasons why.

(4) Advice requested under subsection (1) or a statement under subsection (2) or (3) may be published in such manner as the Scottish Ministers consider appropriate.

(5) In this Part, the “relevant body” means—

(a) where no order has been made under section 19(1) designating a person or body as the advisory body, the UK Committee on Climate Change; or

(b) where such an order has been made, the advisory body.

(6) In subsection (5)(a), the “UK Committee on Climate Change” means the Committee on Climate Change established under section 32 of the Climate Change Act 2008 (c.27) (the “2008 Act”).

6 Modifying annual targets etc.

(1) The Scottish Ministers may, by order, modify—

(a) the percentage figure mentioned in section 3(2)(c);

(b) an annual target set by virtue of section 4(1);

(c) any date mentioned in paragraphs (a) to (g) of section 4(2);

(d) the target-setting criteria in section 4(4).

(1A) The Scottish Ministers must, at the same time as laying a draft of a statutory instrument containing an order under subsection (1)(a) before the Scottish Parliament, lay before the Parliament a report explaining why the modification is being proposed.

(1B) The Scottish Ministers must, as soon as reasonably practicable after laying a report before the Scottish Parliament under subsection (1A), and in so far as reasonably practicable, make a statement to the Parliament relating to the report.

(2) The Scottish Ministers may make an order under subsection (1)(a) only if they consider that it is no longer necessary for annual targets to be set by reference to that percentage figure.

(3) The Scottish Ministers may make an order under subsection (1)(b) only if they consider that it is appropriate to do so as a result of—

(a) a modification of the interim target; or

(b) another significant change to the basis on which the annual target was set.

(4) The Scottish Ministers may make an order under subsection (1)(c) or (d) only if they consider it appropriate to do so.

(5) The power in subsection (1)(a) may not be exercised so as to substitute a percentage of less than zero.
(6) The power in subsection (1)(b)—
   (a) may be exercised only before the beginning of the year to which the target relates;
   (b) may not be exercised if the effect of doing so would be that the target for the year
       would be greater than the target for the preceding year.

7 **Advice before modifying annual targets etc.**

   (1) The Scottish Ministers must, before laying a draft of a statutory instrument containing
       an order under section 6(1) before the Scottish Parliament, request advice from the
       relevant body.

   (2) If the order under section 6(1) makes provision different from that recommended by the
       relevant body, the Scottish Ministers must lay before the Scottish Parliament a report
       setting out the reasons why.

   (3) The Scottish Ministers must, as soon as reasonably practicable after laying a report
       before the Scottish Parliament under subsection (2), and in so far as reasonably
       practicable, make a statement to the Parliament relating to the report.

7A **Achievement of annual targets: domestic effort target**

   (1) The Scottish Ministers must ensure that reductions in net Scottish emissions of
       greenhouse gases account for at least 80% of the reduction in the net Scottish emissions
       account in any target year.

   (2) In this Act, the target set out in subsection (1) is known as the “domestic effort target”.

   (3) The Scottish Ministers may, by order, modify the percentage figure mentioned in
       subsection (1) so as to substitute a higher figure for the one for the time being mentioned
       there.

   (4) Before making an order under subsection (3) the Scottish Ministers must request advice
       from the relevant body.

   (5) If the order under subsection (3) makes provision different from that recommended by
       the relevant body, the Scottish Ministers must publish a statement setting out the reasons
       why.

   (6) A statement under subsection (5) may be published in such manner as the Scottish
       Ministers consider appropriate.

30 **Advice on progress**

8 **Progress towards targets**

   (1) The Scottish Ministers must in each year, beginning with the year 2011, request the
       relevant body to prepare a report setting out that body’s views on—

       (a) progress towards achievement of—

           (i) annual targets;

           (ii) the interim target;

           (iii) the 2050 target;

       (b) whether the annual targets, the interim target or the 2050 target are likely to be
           achieved;
(c) any further effort which may be necessary to achieve annual targets, the interim target or the 2050 target.

(2) No later than the end of the second year following a year for which an annual target has been set (a “target year”), the Scottish Ministers must request the relevant body to prepare a report setting out that body’s views on—

(a) whether the annual target for the target year was met;

(aa) whether the domestic effort target was met in that target year;

(b) the ways in which those targets were or were not met;

(c) the action taken by the Scottish Ministers to reduce net Scottish emissions during that year.

(3) The Scottish Ministers must lay a response to the relevant body’s report under this section before the Scottish Parliament as soon as reasonably practicable after they receive that body’s report.

Greenhouse gases

(1) In this Act, a “greenhouse gas” means—

(a) carbon dioxide;

(b) methane;

(c) nitrous oxide;

(d) hydrofluorocarbons;

(e) perfluorocarbons;

(f) sulphur hexafluoride.

(2) The Scottish Ministers may, if they consider it appropriate to do so, by order, modify subsection (1) so as to—

(a) add a gas;

(b) modify the description of a gas.

(3) The power in subsection (2)(a) may be exercised only if it appears to the Scottish Ministers that an agreement or arrangement at European or international level recognises that the gas to be added contributes to climate change.

(4) The Scottish Ministers must, before laying a draft of a statutory instrument containing an order under subsection (2) before the Scottish Parliament, request advice from the relevant body.

(5) If the order makes provision different from that recommended by the relevant body, the Scottish Ministers must publish a statement setting out the reasons why.

(6) A statement under subsection (5) may be published in such manner as the Scottish Ministers consider appropriate.
Baseline

10 The baseline

(1) In this Act, the “baseline” means the aggregate amount of—
   (a) net Scottish emissions of carbon dioxide for 1990; and
   (b) net Scottish emissions of each of the greenhouse gases other than carbon dioxide
       for the year that is the baseline year for that gas.

(2) The baseline years for greenhouse gases other than carbon dioxide are—
   (a) for methane, 1990;
   (b) for nitrous oxide, 1990;
   (c) for hydrofluorocarbons, 1995;
   (d) for perfluorocarbons, 1995;
   (e) for sulphur hexafluoride, 1995.

11 Baselines for additional greenhouse gases

(1) This section applies where the Scottish Ministers have made an order under section
    9(2)(a) adding a greenhouse gas.

(2) In this section, such a gas is referred to as an “additional greenhouse gas”.

(3) The Scottish Ministers may, by order, make provision as to the manner of determining,
    in the case of an additional greenhouse gas, the amount of net Scottish emissions for the
    baseline year.

(4) An order under subsection (3) may in particular—
    (a) designate a year as the baseline year for the additional greenhouse gas;
    (b) provide for the amount of net Scottish emissions of the gas for that year to be
        treated for the purposes of this Act as the amount of net Scottish emissions of that
        gas for that baseline year.

Supplementary

12 The net Scottish emissions account

(1) The net Scottish emissions account means the aggregate amount of net Scottish
    emissions of greenhouse gases—
    (a) reduced by the amount of carbon units credited to the net Scottish emissions
        account for the period in accordance with regulations under subsection (2); and
    (b) increased by the amount of carbon units that, in accordance with such regulations,
        are to be debited from the net Scottish emissions account for the period.

(1A) The net amount of carbon units credited to the net Scottish emissions account for a year
     for which an annual target has been set (a “target year”) must not exceed the allowable
     amount.

(1B) The “allowable amount” is—
(a) the amount equal to the limit, set by virtue of section 18A(1), on the net amount of carbon units that may be credited to net Scottish emissions accounts during the period which includes the target year; or
(b) where a net amount of carbon units has been credited to the net Scottish emissions account for any other target year in that period, the balance (if any) remaining of the amount referred to in paragraph (a).

(1C) In subsections (1A) and (1B), the “net amount of carbon units” has the meaning given by section 18A(3).

(2) The Scottish Ministers may, by regulations, make provision about—
(a) the circumstances in which carbon units may be credited to the net Scottish emissions account for a period;
(b) the circumstances in which such units may be debited from that account for a period;
(c) the manner in which this is to be done.

(3) The regulations must contain provision for ensuring that carbon units that are credited to the net Scottish emissions account for a period cease to be available to offset other greenhouse gas emissions.

12A Restriction on use in 2010-2012 of carbon units purchased by Scottish Ministers
(1) The Scottish Ministers may not, where subsection (2) applies, credit to the net Scottish emissions account for a year in the period 2010-2012 any carbon units purchased by them.
(2) This subsection applies provided the percentage figure mentioned in section 2(1) is 34%.

13 Attribution of emissions to Scotland
For the purposes of section 15(1), emissions of a greenhouse gas are attributable to Scotland if—
(a) they are emitted from sources in Scotland;
(b) they are attributed to Scotland by virtue of an order under section 14(1).

14 Scottish share of emissions from international aviation and international shipping
(1) The Scottish Ministers may, by order, make provision regarding the emissions of greenhouse gases from international aviation and international shipping that are attributable to Scotland.
(2) An order under subsection (1) may make provision—
(a) as to the period or periods (whether past or future) in which emissions of a greenhouse gas are to be taken into account as Scottish emissions of that gas;
(b) as to the manner in which such emissions are to be taken into account in determining Scottish emissions of that gas for the year that is the baseline year for that gas.
(2A) A draft of a statutory instrument containing the first order under subsection (1) must be laid before the Scottish Parliament no later than 1 June 2010.
(2B) If a draft of the first order is not laid by the date mentioned in subsection (2A), the Scottish Ministers must lay the draft as soon as reasonably practicable afterwards.

(3) The Scottish Ministers must, before laying a draft of a statutory instrument containing an order under subsection (1) before the Scottish Parliament, request advice from the relevant body.

(4) If the order makes provision different from that recommended by the relevant body, the Scottish Ministers must publish a statement setting out the reasons why.

(5) A statement under subsection (4) may be published in such manner as the Scottish Ministers consider appropriate.

15 Scottish emissions and removals

(1) In this Act—

“emissions”, in relation to a greenhouse gas, means emissions of that gas into the atmosphere that are attributable to human activity;

“Scottish emissions”, in relation to a greenhouse gas, means emissions of that gas which are attributable to Scotland;

“Scottish removals”, in relation to a greenhouse gas, means removals of that gas from the atmosphere due to land use, land-use change or forestry activities in Scotland;

“the net Scottish emissions” for a period, in relation to a greenhouse gas, means the amount of Scottish emissions of that gas for the period reduced by the amount of Scottish removals of that gas for the period.

(2) The Scottish Ministers may, if they consider it appropriate to do so, by order, modify the definition of Scottish removals in subsection (1).

(3) The amount of Scottish emissions and Scottish removals of a greenhouse gas for a period must, in so far as reasonably practicable, be determined consistently with international carbon reporting practice.

16 Measurement of emissions etc.

(1) For the purposes of this Act, greenhouse gas emissions, reductions of such emissions and removals of greenhouse gases from the atmosphere are measured or calculated in tonnes of carbon dioxide equivalent.

(2) A “tonne of carbon dioxide equivalent” means one metric tonne of carbon dioxide or an amount of any other greenhouse gas with an equivalent global warming potential (calculated consistently with international carbon reporting practice).

17 International carbon reporting practice

In this Act, “international carbon reporting practice” means accepted practice in relation to reporting for the purposes of—

(a) the protocols to the United Nations Framework Convention on Climate Change;

(b) such other agreements or arrangements at European or international level as the Scottish Ministers may, by order, specify.
18 Carbon units and carbon accounting

(1) The Scottish Ministers may, by regulations, make provision for a scheme—
(a) for registering or otherwise keeping track of carbon units;
(b) for establishing and maintaining accounts in which carbon units may be held, and
between which they may be transferred, by the Scottish Ministers.

(2) Regulations under subsection (1) may, in particular, provide for an existing scheme to
be adapted for these purposes.

(3) The regulations may also include provision—
(a) designating a person or body to administer the scheme;
(b) establishing a person or body for that purpose and making such provision in
relation to the appointment of members, staffing, expenditure, procedure and
otherwise of the person or body as the Scottish Ministers consider appropriate;
(c) conferring power on the Scottish Ministers to give guidance or directions to the
person or body administering the scheme;
(d) conferring power on the Scottish Ministers to delegate the performance of any of
the functions conferred on them by the regulations;
(e) requiring the payment by persons using the scheme of such charges as are
reasonably required to cover the reasonable costs incurred in operating the
scheme.

(4) In this Act, a “carbon unit” means a unit of a kind specified in regulations made under
subsection (1) and which represents—
(a) a reduction in an amount of greenhouse gas emissions;
(b) the removal of an amount of greenhouse gas from the atmosphere;
(c) an amount of greenhouse gas emissions allowed under a scheme or arrangement
imposing a limit on such emissions.

18A Limits on use of carbon units

(A1) The Scottish Ministers may only credit to the net Scottish emissions account for a year
in the period 2013-2017 carbon units purchased by them up to a limit of 20% of the
reduction in the amount of the net Scottish emissions account planned for that year.

(1) The Scottish Ministers must, by order, set a limit on the net amount of carbon units that
may be credited to net Scottish emissions accounts during the periods mentioned in
paragraphs (a) to (i) of subsection (2).

(2) The Scottish Ministers must set the limit—
(a) for the period 2010-2012, no later than 1 June 2010;
(c) for the period 2018-2022, no later than 31 December 2016;
(d) for the period 2023-2027, no later than 31 December 2021;
(e) for the period 2028-2032, no later than 31 December 2026;
(f) for the period 2033-2037, no later than 31 December 2031;
(g) for the period 2038-2042, no later than 31 December 2036;
(h) for the period 2043-2047, no later than 31 December 2041;
(i) for the period 2048-2050, no later than 31 December 2046.

(3) The “net amount of carbon units” means C minus D, where—
   “C” is the amount of carbon units credited to net Scottish emissions accounts
during the period in accordance with regulations under section 12(2);
   “D” is the amount of carbon units debited from net Scottish emissions accounts
during the period in accordance with such regulations.

(4) An order under subsection (1) may provide that carbon units of a description specified in
the order do not count towards the limit.

(5) If the limit for a period is not set by the corresponding date mentioned in paragraphs (a)
to (i) of subsection (2), the Scottish Ministers must set the limit as soon as reasonably
practicable afterwards.

18B Modifying limits on use of carbon units etc.

(1) The Scottish Ministers may, by order, modify—
   (a) a limit on the use of carbon units set by virtue of section 18A(1);
   (b) any date mentioned in paragraphs (a) to (i) of section 18A(2).

(2) The Scottish Ministers may make an order under subsection (1)(a) only if they consider
that it is appropriate to do so as a result of—
   (a) a modification of the interim target; or
   (b) another significant change to the basis on which the limit on the use of carbon
      units was set.

(3) The Scottish Ministers may make an order under subsection (1)(b) only if they consider
it appropriate to do so.

(4) An order under subsection (1)(a) may provide that carbon units of a description
specified in the order do not count towards the limit.

18C Advice before setting or modifying limits on use of carbon units etc.

(1) The Scottish Ministers must, before laying a draft of a statutory instrument containing
an order under section 18A(1) or 18B(1) before the Scottish Parliament, request advice
from the relevant body.

(2) If the order under section 18A(1) or 18B(1) makes provision different from that
recommended by the relevant body, the Scottish Ministers must publish a statement
setting out the reasons why.

(3) A statement under subsection (2) may be published in such manner as the Scottish
Ministers consider appropriate.
**PART 2**

**ADVISORY FUNCTIONS**

**19 Meaning of advisory body**

Advisory body

(1) The Scottish Ministers may, by order, designate—

(a) a body established under section 20(1); or

(b) such other public body as they consider appropriate,

to exercise the functions mentioned in subsection (3) (the “advisory functions”).

(2) In this Act, the body designated by virtue of subsection (1) is the “advisory body”.

(3) The advisory functions are—

(a) the function of providing advice, analysis, information and other assistance to the Scottish Ministers in respect of Ministers’ duty under section 2 and functions under sections 5, 7, 8 and 9(4);

(b) the functions conferred on the advisory body by sections 22 to 27; and

(c) such other functions relating to advice on climate change as the Scottish Ministers may confer by an order under subsection (1).

(4) An order under subsection (1) may in particular provide—

(a) for the conferral of functions on the advisory body relating to advice on climate change;

(b) for the information that advice must contain;

(c) for the factors to which the body is to have regard in giving that advice;

(d) for the period within which the body must give that advice;

(e) as to whom that advice is to be given;

(f) for the form and manner in which that advice is to be published and laid before the Scottish Parliament.

(5) In subsection (1)(b), a “public body” means a person or body with functions of a public nature.

**Scottish Committee on Climate Change**

**20 Scottish Committee on Climate Change**

(1) The Scottish Ministers may, by order, establish a body for the purpose of exercising the advisory functions.

(2) The body established by virtue of subsection (1) is to be known as the Scottish Committee on Climate Change (the “Committee”).

(3) Schedule 1 makes further provision about the Committee.

(4) An order under subsection (1) may in particular provide—

(a) for the conferral of functions on the Committee relating to advice on climate change;
(b) in relation to the status, constitution and proceedings of the Committee as the Scottish Ministers consider appropriate;
(c) for the information that the Committee’s advice must contain;
(d) for the factors to which the Committee is to have regard in giving that advice;
(e) for the period within which the Committee must give that advice;
(f) as to whom that advice is to be given;
(g) for the form and manner in which that advice is to be published and laid before the Scottish Parliament.

21 **Application of sections 22 to 27**

(1) Sections 22 to 27 and 45C have effect only from—

(a) the date when an order made by the Scottish Ministers under section 19(1) comes into force; or
(b) such later date or dates as the Scottish Ministers may specify in an order under that section.

(2) When an order under section 19(1)—

(a) bringing section 24 into effect comes into force, subsection (3) of section 8 ceases to have effect;
(b) bringing section 45C into effect comes into force, subsection (4) of section 45B ceases to have effect.

22 **Advice on annual targets etc.**

(1) When requested to do so by the Scottish Ministers, the advisory body must provide the Scottish Ministers with advice as regards—

(a) annual targets Ministers propose to set under section 4;
(b) a modification Ministers propose to make under section 6.

(2) When providing advice under subsection (1)(a), the advisory body must—

(a) express a view as to what annual targets are appropriate; and
(b) explain that view by reference to the target-setting criteria.

(3) When providing advice under subsection (1)(a), the advisory body must also express a view as to—

(a) the extent to which the annual targets should be met—
(i) by taking action to reduce net Scottish emissions;
(ii) by the use of carbon units that in accordance with section 12(1A) and regulations under section 12(2) may be credited to the net Scottish emissions account;
(b) the respective contributions towards meeting the annual targets and the domestic effort target that should be made—
(i) by the traded sector of the Scottish economy;
(ii) by the other sectors of the Scottish economy;
(ba) the respective contributions towards meeting the annual targets that should be made by—

(i) energy efficiency;
(ii) energy generation;
(iii) land use;
(iv) transport.

(4) The advisory body must provide advice under this section within such period as the Scottish Ministers may reasonably request.

(5) In subsection (3)(b)(i), “traded sector” means the sectors of the Scottish economy which are covered by trading schemes within the meaning of section 44 of the 2008 Act.

23 Reporting on progress towards targets

(1) The advisory body must, in each year beginning with the specified year, prepare a report setting out that body’s views on—

(a) progress towards achievement of—

(i) annual targets;
(ii) the interim target;
(iii) the 2050 target;

(b) whether the annual targets, the interim target or the 2050 target are likely to be achieved;

(c) any further effort which may be necessary to achieve annual targets, the interim target or the 2050 target.

(2) In subsection (1), the “specified year” means such year as the Scottish Ministers may, by order, specify.

(3) A report prepared in a relevant year must also set out the advisory body’s views on the matters mentioned in subsection (3C).

(3A) In subsection (3), the “relevant year” means such year as the Scottish Ministers may, by order, designate in accordance with subsection (3B).

(3B) The year which may be designated under subsection (3A) is the first year following a year for which an annual target has been set (a “target year”) or the second year following a target year.

(3C) The matters referred to in subsection (3) are—

(a) whether the annual target for the target year was met;

(aa) whether the domestic effort target was met in that target year;

(b) the ways in which those targets were or were not met;

(c) the action taken by the Scottish Ministers to reduce net Scottish emissions during that year.

(4) The advisory body must lay a report under this section before the Scottish Parliament no later than—

(a) 31 January in the third year following the target year; or
Climate Change (Scotland) Bill
Part 2—Advisory functions

(b) such other date as the Scottish Ministers may, by order, appoint.

24 Scottish Ministers’ response to reports on progress
(1) The Scottish Ministers must lay before the Scottish Parliament a response to a report laid by the advisory body before the Parliament under section 23.

(2) The response to the advisory body’s report must be laid before the Parliament no later than—
   (a) 31 March in the third year following the year for which an annual target has been set; or
   (b) such other date as the Scottish Ministers may, by order, appoint.

25 Duty of advisory body to provide advice or other assistance
When requested to do so by the Scottish Ministers, the advisory body must provide advice, analysis, information or assistance as regards—
   (a) the exercise of the Scottish Ministers’ functions under this Act;
   (b) the exercise of Ministers’ functions in relation to climate change other than under this Act;
   (c) other matters relating to climate change.

26 Guidance to advisory body
(1) The advisory body must have regard to any guidance given by the Scottish Ministers to it in relation to the exercise of its functions under this Act.

(2) The Scottish Ministers may not give the advisory body guidance as to the content of any advice or report.

(3) The power to give guidance under subsection (1) includes power to vary or revoke the guidance.

27 Power to give directions to advisory body
(1) The Scottish Ministers may, if they consider it appropriate to do so, give the advisory body directions as to the exercise of its functions under this Act.

(2) The Scottish Ministers may not direct the advisory body as to the content of any advice or report.

(3) The power to give directions under subsection (1) includes power to vary or revoke the directions.

(4) The advisory body must comply with any directions given under subsection (1).
PART 3
REPORTING DUTIES

28 Reports on annual targets

(1) The Scottish Ministers must lay before the Scottish Parliament a report in respect of each year in the period 2010-2050 for which an annual target has been set (a “target year”).

(2) The report must state whether the annual target for the target year has been met.

(3) If the annual target has not been met, the report must explain why.

(3A) The report must also state whether the domestic effort target has been met in the target year to which the report relates.

(3B) If the domestic effort target has not been met, the report must explain why.

(4) The report must also contain the information mentioned in section 29.

(5) The report under this section must be laid before the Parliament no later than 31 October in the second year after the target year.

29 Reports on annual targets: content

(1) In respect of each greenhouse gas, the report must—
   (a) state the amount of net Scottish emissions for the baseline year;
   (b) state the amount of net Scottish emissions for the target year;
   (c) state whether the amount of net Scottish emissions represents an increase or decrease compared to the equivalent amount for the previous target year;
   (d) identify the methods used to measure or calculate the amount of net Scottish emissions (including in particular any change to those methods).

(2) The report must also set out the aggregate amount for the target year of net Scottish emissions.

(3) The report must also—
   (a) state the amount of the net Scottish emissions account for the target year;
   (aa) state the proportion of the reduction in the net Scottish emissions account which is accounted for by reductions in net Scottish emissions;
   (b) state the total amount of carbon units—
      (i) that have been credited to or debited from the net Scottish emissions account for the target year;
      (ii) that have been purchased in the target year;
      (iii) that have been held and not surrendered in the target year;
   (c) give details of the number and type of those carbon units.

(4) The report must also—
   (a) state the amount of Scottish gross electricity consumption for the target year;
   (b) state the amount of Scottish electricity generation for the target year;
(c) state the average greenhouse gas emissions per megawatt hour of electricity generated in Scotland in the target year;

(d) state the average greenhouse gas emissions per megawatt hour, and the estimated lifetime cumulative emissions, of any new electricity generation capacity greater than 50 megawatts approved in Scotland in the target year.

(4A) The report for each year in the period 2011-2050 must—

(a) state the amount of the net Scottish emissions account for each preceding target year;

(b) state the cumulative amount of the net Scottish emissions account for the target year and all preceding target years.

(5) If the method of measuring or calculating net Scottish emissions changes and that change is such as to require adjustment of an amount for an earlier target year, the report must specify the adjustment required and state the adjusted amount.

(6) An adjustment under subsection (5) must, in so far as reasonably practicable, be made in accordance with international carbon reporting practice.

(6A) If the amount of the net Scottish emissions account for an earlier target year requires to be adjusted, the report must—

(a) explain why the adjustment is required;

(b) specify the adjustment required; and

(c) state the adjusted amount.

(7) The report may contain such other information as the Scottish Ministers consider appropriate and, in particular, may state the amount of Scottish electricity generation from each source for the target year.

30 Reports on proposals and policies for meeting annual targets

(1) As soon as reasonably practicable after making an order under section 4(1) setting annual targets, the Scottish Ministers must lay before the Scottish Parliament a report containing the following information.

(2) The report must, in particular, set out—

(a) the Scottish Ministers’ proposals and policies for meeting the annual targets;

(b) how those proposals and policies are expected to contribute towards the achievement of the interim target, the 2050 target and, in each target year, the domestic effort target;

(c) the timescales over which those proposals and policies are expected to take effect.

(3) The report must also explain how the proposals and policies set out in the report are expected to affect different sectors of the Scottish economy.

(4) The second and each subsequent report under this section—

(a) must contain an assessment of the progress towards implementing proposals and policies set out in earlier reports;

(b) may make such adjustments to those proposals and policies as the Scottish Ministers consider appropriate.
31 Reports on proposals and policies where annual targets not met

(1) This section—
(a) applies if the Scottish Ministers lay a report under section 28 which states that an
annual target has not been met or that the domestic effort target has not been met
in the target year to which the report relates;
(b) does not apply if that report relates to the annual target for 2050.

(2) As soon as reasonably practicable after the report referred to in subsection (1)(a) has
been laid, the Scottish Ministers must lay a report before the Scottish Parliament setting
out proposals and policies to compensate in future years for the excess emissions.

31A Reports on emissions attributable to Scottish consumption of goods and services

(1) The Scottish Ministers must lay before the Scottish Parliament a report in respect of
each year in the period 2010-2050 containing the following information.

(2) The report must, in so far as reasonably practicable, set out the emissions of greenhouse
gases (whether in Scotland or elsewhere) which are produced by or otherwise associated
with the consumption and use of goods and services in Scotland during that year.

(3) The report may also contain such other information as the Scottish Ministers consider
appropriate.

31B Report on progress towards meeting the interim target

(1) The Scottish Ministers must, no later than 31 December 2015, lay before the Scottish
Parliament a report on progress towards meeting the interim target.

(2) The report must, in particular, state the progress that has been made in reducing
emissions and indicate whether this progress is consistent with a reduction over time of
the net Scottish emissions account which would allow the interim target and the 2050
target to be met.

32 Report on the interim target

(1) The Scottish Ministers must lay before the Scottish Parliament a report containing the
following information in respect of the year 2020.

(2) The report must state whether the interim target has been met.

(3) If the interim target has not been met, the report must explain why.

(4) In respect of each greenhouse gas, the report must state the amount of net Scottish
emissions for 2020.

(5) The report must also—
(a) state the amount of the net Scottish emissions account for 2020;
(aa) state the cumulative amount of the net Scottish emissions account for the period
2010-2020;
(b) state the total amount of carbon units—
(i) that have been credited to or debited from the net Scottish emissions
account for 2020;
(ii) that have been purchased in 2020;
(iii) that have been held and not surrendered in 2020;
(c) give details of the number and type of those carbon units.

(6) In subsections (4) and (5), the amount means the amount set out in the report for 2020 made under section 28.

(7) The report may contain such other information as the Scottish Ministers consider appropriate.

(8) The report under this section must be laid before the Parliament no later than 31 October 2022.

33 Report on the 2050 target

(1) The Scottish Ministers must lay before the Scottish Parliament a report containing the following information in respect of the year 2050.

(2) The report must state whether the 2050 target has been met.

(3) If the 2050 target has not been met, the report must explain why.

(4) In respect of each greenhouse gas, the report must state the amount of net Scottish emissions for 2050.

(5) The report must also—
   (a) state the amount of the net Scottish emissions account for 2050;
   (aa) state the cumulative amount of the net Scottish emissions account for the period 2010-2050;
   (b) state the total amount of carbon units—
      (i) that have been credited to or debited from the net Scottish emissions account for 2050;
      (ii) that have been purchased in 2050;
      (iii) that have been held and not surrendered in 2050;
   (c) give details of the number and type of those carbon units.

(6) In subsections (4) and (5), the amount means the amount set out in the report for 2050 made under section 28.

(7) The report may contain such other information as the Scottish Ministers consider appropriate.

(8) The report under this section must be laid before the Parliament no later than 31 October 2052.

34 Reports: provision of further information to the Scottish Parliament

(1) Where the Scottish Ministers lay a report mentioned in subsection (2) before the Scottish Parliament, they must—

   (a) immediately send a copy of the report to the persons who convene and chair such committees of the Scottish Parliament as are for the time being appointed by virtue of standing orders; and
   (b) as soon as reasonably practicable after doing so, and in so far as reasonably practicable, make a statement to the Parliament relating to the report.
(2) Those reports are reports under—
(a) section 28(1) (report on annual target);
(b) section 30(1) (report on proposals and policies for meeting annual targets);
(c) section 31(2) (report on proposals and policies to compensate for excess emissions);
(d) section 32(1) (report on interim target);
(e) section 33(1) (report on 2050 target).

(3) Where the Scottish Ministers lay a report referred to in subsection (2)(a), they must also, as soon as reasonably practicable after doing so, and in so far as reasonably practicable, attend, if invited, the proceedings of any such committees of the Scottish Parliament as are for the time being appointed by virtue of standing orders, for the purposes of giving evidence on the report.

(4) The Scottish Ministers must have regard to any resolution or report of, or of any committee of, the Scottish Parliament made following the laying of a report mentioned in subsection (2) as regards the contents of the report and any future reports.

35 Further provision about reporting duties

(1) The Scottish Ministers may, if they consider it appropriate to do so, by order, make further provision imposing duties on themselves to report to the Scottish Parliament.

(2) An order under subsection (1) may in particular—
(a) provide for the information to be provided under the duties;
(b) provide for the period in relation to which that information is to be provided;
(c) provide for the period within which that information is to be provided.

36 Duties of public bodies relating to climate change

(A1) A public body must, in exercising its functions, act—
(a) in the way best calculated to contribute to the delivery of the targets set in or under Part 1 of this Act;
(b) in the way best calculated to help deliver any programme laid before the Scottish Parliament under section 45;
(c) in a way that it considers is most sustainable.

(A2) In this Part, a “public body” means a Scottish public authority within the meaning of section 3(1)(a) of the Freedom of Information (Scotland) Act 2002 (asp 13).

(1) The Scottish Ministers may, if they consider it appropriate to do so, by order, make further provision relating to the imposition on public bodies of duties relating to climate change.
(1A) The duties imposed by subsection (A1) and any duty imposed by virtue of an order under subsection (1) are referred to in this Act as “climate change duties”.

(2) In this Part, a public body which has climate change duties under subsection (A1) or by virtue of subsection (1) is a “relevant public body”.

(3) An order under subsection (1) may in particular—

(a) impose climate change duties on—
   (i) all public bodies;
   (ii) public bodies of a particular description;
   (iii) individual public bodies;

(b) impose different climate change duties on different public bodies or descriptions of public body;

(c) remove climate change duties.

(4) Before laying a draft of a statutory instrument containing an order under subsection (1) before the Scottish Parliament, the Scottish Ministers must consult, in so far as reasonably practicable, the persons mentioned in subsection (5).

(5) Those persons are—

(a) such associations of local authorities; and

(b) such other persons,

as the Scottish Ministers consider appropriate.

(6) The Scottish Ministers must co-operate with a relevant public body to help that body comply with its climate change duties.

37 Guidance to relevant public bodies

(1) The Scottish Ministers must give guidance to relevant public bodies in relation to climate change duties and those bodies must have regard to such guidance.

(2) Before giving guidance under subsection (1), the Scottish Ministers must consult, in so far as reasonably practicable, the persons mentioned in subsection (3).

(3) Those persons are—

(a) such associations of local authorities; and

(b) such other persons,

as the Scottish Ministers consider appropriate.

(4) The Scottish Ministers may vary or revoke guidance given under this section and where guidance is varied to a substantial extent, subsections (2) and (3) apply.

(5) The Scottish Ministers must publish any guidance given under this section.

38 Reporting on climate change duties

(1) The Scottish Ministers may, by order, make provision—

(a) requiring relevant public bodies to prepare reports on compliance with climate change duties;
(aa) requiring any relevant public body found, following an investigation under section 40, to be failing to comply with its climate change duties, to prepare a report on the actions it is taking to secure future compliance with those duties;

(b) subject to subsection (1A), setting out what information reports must contain;

(c) setting out the form and manner of reports;

(d) setting out the period within which reports must be sent to the Scottish Ministers.

(2) An order under subsection (1) may in particular—

(a) require two or more relevant public bodies to prepare a joint report in relation to compliance with one or more climate change duties; and

(b) require those bodies to co-operate with each other for the purpose of preparing that report.

Monitoring body

39 Appointment of monitoring body

(1) The Scottish Ministers may, by order, designate one or more persons or bodies to monitor whether relevant public bodies are—

(a) complying with climate change duties;

(b) having regard to any guidance given under section 37.

(2) In this Part, a person or body designated under subsection (1) is the “monitoring body”.

Investigations

40 Investigations

(1) The monitoring body may carry out an investigation into—

(a) a relevant public body’s compliance with climate change duties;

(b) whether a relevant public body is having regard to guidance given under section 37.

(2) The monitoring body must carry out an investigation if the Scottish Ministers direct it to do so.

41 Investigations: investigators’ powers

(1) In this section an “investigator” means—

(a) the monitoring body;

(b) a person authorised by the monitoring body for the purpose of carrying out investigations.

(2) An investigator may use the powers set out in subsections (3) to (5) if the investigator considers that it is necessary to do so for the purposes of or in connection with an investigation.

(3) An investigator may, by notice in writing, require any relevant public body to provide any relevant document or relevant information in the possession, or under the control, of the relevant public body.
(4) An investigator may require any person who possesses or controls any document or information referred to in subsection (3) to provide an explanation of the document or information.

(5) An investigator may take copies of, or extracts from, any document or information produced in accordance with subsection (3).

(6) Nothing in this section authorises an investigator to require the disclosure of anything which a person would be entitled to refuse to disclose on grounds of confidentiality in proceedings in the Court of Session.

42 Reporting by monitoring body

(1) The Scottish Ministers may direct the monitoring body to prepare a report relating to—
   (a) the monitoring body’s activities under this Part;
   (b) investigations carried out by the monitoring body;
   (c) its use of resources in carrying out its functions under this Part;
   (d) any other matters the Scottish Ministers may direct.

(2) The report may include information relating to a continuing investigation only if the Scottish Ministers direct that information to be included.

(3) The monitoring body must send the report to the Scottish Ministers.

(4) The Scottish Ministers must lay the report before the Scottish Parliament.

43 Guidance to monitoring body

(1) The monitoring body must have regard to any guidance given by the Scottish Ministers to it in relation to the exercise of its functions under this Part.

(2) Before giving guidance under subsection (1), the Scottish Ministers must consult, in so far as reasonably practicable, the persons mentioned in subsection (3).

(3) Those persons are—
   (a) the monitoring body; and
   (b) such other persons, as the Scottish Ministers consider appropriate.

(4) The Scottish Ministers may vary or revoke guidance given under this section and where guidance is varied to a substantial extent, subsections (2) and (3) apply.

(5) The Scottish Ministers must publish any guidance given under this section.

44 Power to direct monitoring body

(1) The Scottish Ministers may give directions to the monitoring body relating to the exercise of its functions under this Part.

(2) The Scottish Ministers may vary or revoke a direction given under this section.

(3) The monitoring body must comply with a direction given under this section.
PART 5
OTHER CLIMATE CHANGE PROVISIONS

CHAPTER 1
ADAPTATION

Adaptation programmes

45 Programmes for adaptation to climate change

(1) This section applies where the Secretary of State lays a report under section 56 of the 2008 Act (report on impact of climate change) before Parliament.

(2) The Scottish Ministers must lay a programme before the Scottish Parliament—

(b) setting out—

(i) their objectives in relation to adaptation to climate change;

(ii) their proposals and policies for meeting those objectives;

(iia) the arrangements for involving employers, trade unions and other stakeholders in meeting those objectives;

(iib) the mechanisms for ensuring public engagement in meeting those objectives;

(iii) the period within which those proposals and policies will be introduced; and

(c) otherwise addressing the risks identified in the report under section 56 of the 2008 Act.

(3) Where the report laid under section 56 of the 2008 Act is a subsequent report (within the meaning of subsection (3) of that section), the programme must contain an assessment of the progress made towards implementing the objectives, proposals and policies set out in the previous programme.

(4) The Scottish Ministers must lay each programme as soon as reasonably practicable after they receive the copy of the Secretary of State’s report.

45A Reports on progress towards implementation of programmes for adaptation

(1) This section applies where the Scottish Ministers lay a programme under section 45(2) before the Scottish Parliament.

(2) The Scottish Ministers must lay before the Scottish Parliament reports setting out their assessment of the progress made towards implementing the objectives, proposals and policies set out in the programme.

(3) The first report under this section must be laid before the Scottish Parliament no later than the expiry of the period of 12 months beginning with the day on which the programme is laid.

(4) The second and subsequent reports under this section must be laid before the Scottish Parliament no later than the expiry of each subsequent period of 12 months.
45B  Progress towards implementation of programmes for adaptation

(1) This section applies where—

(a) the Scottish Ministers lay a programme under section 45(2) before the Scottish Parliament;

(b) the Secretary of State lays a second or subsequent report under section 56 of the 2008 Act before Parliament.

(2) Where subsection (1)(a) applies, the Scottish Ministers must, before the expiry of the period of 2 years beginning with the day on which the programme is laid, request the relevant body to prepare a report setting out its assessment of the progress made towards implementing the objectives, proposals and policies set out in that programme.

(3) Where subsection (1)(b) applies, the Scottish Ministers must, as soon as reasonably practicable after receiving the copy of the report laid, request the relevant body to prepare a further report setting out its assessment of the progress made towards implementing the objectives, proposals and policies set out in the most recent programme laid by the Scottish Ministers under section 45(2).

(4) The Scottish Ministers must, as soon as reasonably practicable after receiving the relevant body’s report under subsection (2) or, as the case may be, a further report under subsection (3), lay it before the Scottish Parliament.

45C  Reports on programmes for adaptation

(1) This section applies where—

(a) the Scottish Ministers lay a programme under section 45(2) before the Scottish Parliament;

(b) the Secretary of State lays a second or subsequent report under section 56 of the 2008 Act before Parliament.

(2) Where subsection (1)(a) applies, the advisory body must, before the expiry of the period of 2 years beginning with the day on which the programme is laid, prepare a report setting out its assessment of the progress made towards implementing the objectives, proposals and policies set out in that programme.

(3) Where subsection (1)(b) applies, the advisory body must, as soon as reasonably practicable after the report is laid, prepare a further report setting out its assessment of the progress made towards implementing the objectives, proposals and policies set out in the most recent programme laid by the Scottish Ministers under section 45(2).

(4) The advisory body must, as soon as reasonably practicable after preparing a report under subsection (2) or, as the case may be, a further report under subsection (3), lay it before the Scottish Parliament.

Land use strategy

45D  Duty to produce a land use strategy

(1) The Scottish Ministers must, no later than 31 March 2011, lay a land use strategy before the Scottish Parliament.

(2) The strategy must, in particular, set out—
(a) the Scottish Ministers’ objectives in relation to sustainable land use;
(b) their proposals and policies for meeting those objectives; and
(c) the timescales over which those proposals and policies are expected to take effect.

(3) The objectives, proposals and policies referred to in subsection (2) must contribute to—

(a) achievement of the Scottish Ministers’ duties under section 1, 2 or 3(1)(b);
(b) achievement of the Scottish Ministers’ objectives in relation to adaptation to climate change, including those set out in any programme produced by virtue of section 45(2); and
(c) sustainable development.

(4) Before laying the strategy before the Scottish Parliament, the Scottish Ministers must publish a draft strategy and consult with such bodies as they consider appropriate and also with the general public.

(5) The strategy must be accompanied by a report setting out—

(a) the consultation process undertaken in order to comply with subsection (4); and
(b) the ways in which views expressed during that process have been taken account of in finalising the strategy (or stating that no account has been taken of such views).

(6) The Scottish Ministers must, no later than—

(a) five years after laying a strategy before the Scottish Parliament under subsection (1); and
(b) the end of every subsequent period of five years,
lay a revised strategy before the Scottish Parliament; and subsections (2) to (5) apply to a revised strategy as they apply to a strategy laid under subsection (1).

Muirburn

46 Variation of permitted times for making muirburn

After section 23 of the Hill Farming Act 1946 (c.73) (prohibition of muirburn at certain times), insert—

“23A Power to vary permitted times for making muirburn

(1) The Scottish Ministers may, by order, modify section 23 so as to substitute for any of the dates for the time being mentioned in subsection (1), (2) or, as the case may be, (3) of that section such other dates as they consider appropriate as the dates before which or after which it is lawful to make muirburn in any year.

(3) The Scottish Ministers may make an order under subsection (1) only if they consider it necessary or expedient to do so in relation to climate change.

(3A) An order under subsection (1) may not modify any of the dates for the time being mentioned in section 23 if the modification would result in a period during which it is lawful to make muirburn in any year being shorter than the corresponding period which applied immediately before the coming into force of section 46 of the Climate Change (Scotland) Act 2009 (asp 00).

(4) The power conferred by subsection (1) is exercisable by statutory instrument.
(5) No statutory instrument containing an order under subsection (1) may be made unless a draft of the instrument has been laid before, and approved by resolution of, the Scottish Parliament.”.

CHAPTER 2

FORESTRY

47 Power to modify functions of Forestry Commissioners

(1) The Scottish Ministers may, by order, modify the functions of the Forestry Commissioners in or as regards Scotland.

(2) The Scottish Ministers may make an order under subsection (1) only where they consider it necessary or expedient to do so—

(a) in order to comply with their duty under section 1, 2 or 3(1)(b); or

(b) otherwise in relation to climate change.

(3) An order under subsection (1) may in particular include provision enabling the Forestry Commissioners to—

(a) form, or participate in the forming of, a body corporate;

(b) invest in a body corporate;

(c) provide loans;

(d) establish a trust;

(e) act, or appoint a person to act, as—

(i) an officer of a body corporate; or

(ii) a trustee of a trust.

(3A) Any body corporate formed, trust established or person appointed by the Forestry Commissioners by virtue of an order under subsection (1) is a public body or office holder for the purposes of section 1 of the Nature Conservation (Scotland) Act 2004 (asp 6).

CHAPTER 3

ENERGY EFFICIENCY

Promotion of energy efficiency

48 Duty of Scottish Ministers to promote energy efficiency

(1) The Scottish Ministers must prepare and publish a plan for—

(a) promoting energy efficiency; and

(b) improving the energy efficiency of living accommodation, in Scotland.

(2A) The plan must set annual energy efficiency targets and describe how those targets are to be reported on.
(3) The plan prepared under subsection (1) must be published no later than 12 months after the day on which this section comes into force.

(4) The Scottish Ministers—
   (a) may, from time to time; and
   (b) must, before the end of the period mentioned in subsection (5),
       review the plan prepared and published under this section.

(5) The period referred to in subsection (4)(b) is the period of 3 years beginning with the date on which—
   (a) the plan is first published; or
   (b) the plan was last reviewed under subsection (4).

(6) Where, following a review under subsection (4), the Scottish Ministers vary the plan,
    they must, as soon as reasonably practicable after so doing, publish the plan as so varied.

(7) In preparing or varying the plan, the Scottish Ministers must have regard to the contributions which improvements to buildings and changes in building standards can make to the delivery of energy efficiency and to the reduction of greenhouse gas emissions.

(8) In this section—
   “energy efficiency” includes the use of—
   (a) technologies (other than those used for the production of heat) reliant on renewable sources of energy;
   (b) materials the manufacture or use of which produces or involves lower emissions of greenhouse gases than other materials; and
   (c) surplus heat from electricity generation or other industrial processes for district heating or other purposes;
   “fossil fuel” means—
   (a) coal;
   (b) lignite;
   (c) peat;
   (d) natural gas (within the meaning of the Energy Act 1976 (c.76));
   (e) crude liquid petroleum;
   (f) petroleum products (within the meaning of that Act);
   (g) any substance produced directly or indirectly from a substance mentioned in paragraphs (a) to (f);
   “renewable sources” means sources other than fossil fuel and nuclear fuel.

48A Duty of Scottish Ministers to promote renewable heat

(1) The Scottish Ministers must prepare and publish a plan for the promotion of the use of heat produced from renewable sources.
(1A) The plan must, in particular—

(a) set—

(i) targets for the percentage of heat to be produced from renewable sources; and

(ii) in relation to each target, the date by which it should be met; and

(b) describe how those targets are to be reported on.

(2) The plan prepared under subsection (1) must be published no later than 12 months after the day on which this section comes into force.

(3) The Scottish Ministers—

(a) may, from time to time; and

(b) must, before the end of the period mentioned in subsection (4), review the plan prepared and published under this section.

(4) The period referred to in subsection (3)(b) is the period of 2 years beginning with the date on which—

(a) the plan is first published; or

(b) the plan was last reviewed under subsection (3).

(5) Where, following a review under subsection (3), the Scottish Ministers vary the plan, they must, as soon as reasonably practicable after so doing, publish the plan as so varied.

(6) In this section, “renewable sources” has the same meaning as in section 48(8).

49 Laying of plans and reports

(1) The Scottish Ministers must, as soon as reasonably practicable after publishing a plan under section 48(1) or (6) or section 48A(1) or (5), lay it before the Scottish Parliament.

(2) The Scottish Ministers must, before the end of the period mentioned in subsection (3), lay before the Parliament a report on what steps have been taken in implement of the plan.

(3) The period referred to in subsection (2) is the period of 12 months beginning with the date on which—

(a) the plan is first published; or

(b) a report was last laid under subsection (2).

(4) Where the Scottish Ministers lay a plan mentioned in subsection (1) or a report mentioned in subsection (2) before the Parliament, they must, as soon as reasonably practicable after doing so, and in so far as reasonably practicable, make a statement to the Parliament relating to the plan or, as the case may be, report.
Emissions performance standard for new or extended energy generating stations

49A  Energy generating stations: efficiency guidance

(1) The Scottish Ministers must provide or revise existing guidance under section 36 of the Electricity Act 1989 (c.29) setting out the conditions subject to which consent will be granted for the construction of new, or for the extension of existing, energy generating stations of a capacity greater than 50 megawatts.

(2) The guidance required under subsection (1) must set out—
   (a) the maximum greenhouse gas emissions permitted per megawatt hour of energy generated; and
   (b) how heat energy produced from combined heat and power stations is to be included when calculating levels of emissions.

(3) The guidance required under subsection (1) may include provision for different maximum greenhouse gas emissions to be permitted in respect of—
   (a) different dates;
   (b) different technologies.

(4) The Scottish Ministers must comply with subsection (1) no later than 12 months after the day on which this section comes into force.

(5) The Scottish Ministers must, before providing such guidance, request advice from the advisory body regarding the total cumulative emissions budget available for electricity generation in the period 2010-2050 and, in particular—
   (a) an appropriate total lifetime greenhouse gas budget per megawatt of generating capacity;
   (b) the appropriate initial levels of greenhouse gas emissions per megawatt hour of energy generated.

(6) If, in relation to the matters mentioned in subsection (5), the guidance under subsection (1) differs from that which is recommended by the advisory body, the Scottish Ministers must publish a statement setting out the reasons why.

Energy performance of non-domestic buildings

50  Non-domestic buildings: assessment of energy performance and emissions

(1) The Scottish Ministers must, by regulations—
   (a) provide for the assessment of—
      (i) the energy performance of non-domestic buildings;
      (ii) the emission of greenhouse gases produced by or otherwise associated with such buildings or with activities carried out in such buildings;
   (b) require owners of such buildings to take steps, identified by such assessments, to—
      (i) improve the energy performance of such buildings;
      (ii) reduce such emissions.

(2) The regulations may in particular include provision about—
(a) the circumstances in which the regulations apply;
(b) the non-domestic buildings to which the regulations apply;
(c) the persons who may be required to have assessments carried out;
(d) the periods within which such assessments must be carried out;
(e) the procedure and methodology for assessing the energy performance of
buildings;
(f) the procedure and methodology for assessing the greenhouse gas emissions
produced by or otherwise associated with buildings or activities carried out in
buildings;
(g) the persons who may carry out such assessments;
(h) the issuing of certificates following such assessments, including the form, manner
and content of such certificates;
(ha) the form of any recommendations, contained in such certificates, as to the
improvement of the energy performance of buildings and the reduction of
emissions produced by or otherwise associated with buildings or activities carried
out in buildings;
(hb) the manner in which and periods within which persons must take steps to comply
with any recommendations contained in such certificates;
(hc) the registration of such certificates;
(hd) the disclosure of information which is entered in the register;
(i) subject to subsection (3), the enforcement authority in relation to the regulations;
(j) subject to subsection (4), the functions of that authority;
(k) the keeping of information and its production to the enforcement authority;
(l) the enforcement of the duties imposed by the regulations;
(m) offences in relation to failures to comply with requirements of the regulations.

(3) The enforcement authority provided for in the regulations is to be—

(a) a local authority; or
(b) such other person or body as the Scottish Ministers consider appropriate.

(4) The functions of the enforcement authority may include power to levy charges to
recover the reasonable costs incurred by it in exercising its functions under the
regulations.

(5) In this section, “non-domestic building”—

(a) means a building other than a dwelling;
(b) does not include—

(i) any yard, garden, outbuilding or other land or buildings;
(ii) any common areas,
associated with such a dwelling.
50A  **Living accommodation: assessment of energy performance and emissions**

(1) The Scottish Ministers may, by regulations, make provision relating to the assessment and improvement of—

(a) the energy performance of living accommodation;

(b) the emission of greenhouse gases produced by living accommodation.

(2) The regulations may in particular include provision about—

(a) the circumstances in which the regulations apply;

(b) the living accommodation to which the regulations apply;

(c) the persons who may be required to have assessments carried out;

(d) the periods within which such assessments must be carried out;

(e) the procedure and methodology for assessing the energy performance of living accommodation;

(f) the procedure and methodology for assessing the greenhouse gas emissions produced by the living accommodation;

(g) the persons who may carry out such assessments;

(h) the issuing of certificates, following such assessments, including the form, manner and content of such certificates;

(i) subject to subsection (3), the enforcement authority in relation to the regulations;

(j) subject to subsection (4), the functions of that authority;

(k) the keeping of information and its production to the enforcement authority;

(l) the enforcement of the duties imposed by the regulations;

(m) offences in relation to failures to comply with requirements of the regulations.

(3) The enforcement authority provided for in the regulations is to be such person or body as the Scottish Ministers consider appropriate.

(4) The functions of the enforcement authority may include power to levy charges to recover the reasonable costs incurred by it in exercising its functions under the regulations.

---

50B  **Council tax reductions to promote energy efficiency**

(1) The Scottish Ministers must make regulations under section 80 of the Local Government Finance Act 1992 (c.14) to provide that, in respect of a person who—

(a) can demonstrate to a local authority that an energy efficiency improvement has been made, during any qualifying financial year, to a dwelling; and

(b) is liable to pay an amount to that authority in respect of council tax for that dwelling in the next financial year,
the amount that the person is liable to pay for that next financial year shall be reduced (from the amount it would be otherwise than by virtue of this subsection) in accordance with section 50C.

(2) The regulations made by virtue of subsection (1) must further provide that, in respect of a person who—

(a) is liable to pay an amount to a local authority in respect of council tax for a dwelling;

(b) can demonstrate to that local authority that the dwelling meets a reasonable standard of energy efficiency; and

(c) can demonstrate to that local authority that a system using technologies reliant on renewable sources of energy or heat has been installed in or on the dwelling during any qualifying financial year,

the amount that the person is liable to pay for the next financial year must be reduced (from the amount it would be otherwise than by virtue of this subsection) in accordance with section 50C.

(3) Subject to subsection (4)—

(a) any reduction made by virtue of either subsection (1) or (2) is without prejudice to any reduction made by virtue of the other of those subsections, whether those reductions apply in the same financial year or in different financial years; and

(b) any reduction made by virtue of subsection (1) is without prejudice to any further reduction made by virtue of that subsection, whether those reductions apply in the same financial year or in different financial years.

(4) The regulations made by virtue of subsection (1) may specify a maximum number of reductions, or a maximum total reduction, in the amount of council tax payable in respect of any one dwelling in any one financial year.

(5) The regulations made by virtue of subsection (1) must include provision for the sort of evidence that a local authority is to accept as demonstrating that—

(a) an energy efficiency improvement has been made to a dwelling;

(b) a dwelling meets a reasonable standard of energy efficiency,

and shall provide that evidence sufficient to demonstrate that specified energy efficiency improvements, or specified combinations of such improvements, have been made to a dwelling is sufficient to demonstrate that the dwelling meets a reasonable standard of energy efficiency.

(6) A draft of a statutory instrument containing the first regulations under subsection (1) must be laid before the Scottish Parliament no later than 31 December 2009.

(7) In this section—

“cogeneration unit” has the same meaning as in the Electricity and Gas (Carbon Emissions Reduction) Order 2008 (S.I. 2008/188);

“energy efficiency improvement” means a significant improvement to the energy efficiency of a dwelling by means of substantially all of one (and only one) of the following measures—
(a) the provision of insulation in any accessible roof space in the dwelling, including the insulation of any cold water tank and any water supply, overflow and expansion pipes in such a space;

(b) the provision of insulation between the internal and external leaves of cavity walls of the dwelling;

(c) improvements to the energy efficiency of any space or water heating system installed in the dwelling;

(d) the provision of draught proofing to or in the dwelling together with additional means of ventilation for any rooms which would otherwise be inadequately ventilated after such provision;

(e) connection to a cogeneration unit or district heating system;

“qualifying financial year” means the financial year beginning on 1 April 2010 or any subsequent financial year.

(8) The Scottish Ministers may, by regulations, amend subsection (7) by adding to the list of measures in the definition of “energy efficiency improvement”.

50C Amounts of reductions in council tax

(1) For the purposes of regulations made by virtue of section 50B the reduction in council tax is to be—

(a) in the circumstances referred to in subsection (2)(a), £100; and

(b) in the circumstances referred to in subsection (2)(b), £250.

(2) The circumstances are that the local authority assess the relevant cost of the energy efficiency improvement or the installation of technologies reliant on renewable sources of energy or heat, as the case may be, to be—

(a) at least £250 but less than £1,000;

(b) £1,000 or more.

(3) In this section, “relevant cost of energy efficiency improvements” means the amount paid for securing those improvements, minus the amount of any grant received (including a grant made under the Home Energy Efficiency Scheme (Scotland) Regulations 2006 (S.S.I. 2006/570)).

50D Review of provision made by virtue of or under sections 50C and (Amounts of reductions in non-domestic rates)

(1) The Scottish Ministers must, as soon as practicable after 31 March 2012 and annually thereafter, lay before the Scottish Parliament a report on the operation of—

(a) the regulations made by virtue of section 50B; and

(b) section 25B of the Local Government (Scotland) Act 1966 (c.51), (“the 1966 Act”),

including an assessment of whether the reductions in council tax or in non-domestic rates, as the case may be, thereby provided for have contributed effectively to promoting energy efficiency improvements and technologies reliant on renewable sources of energy or heat.
(2) Where the Scottish Ministers conclude in a report made under subsection (1) that the provisions referred to in paragraphs (a) and (b) of that subsection would contribute more effectively to energy efficiency improvements and technologies reliant on renewable sources of energy or heat if—

(a) one or both of the amounts referred to in section 50C(1) or section (Amounts of reductions in non-domestic rates)(1) were greater;

(b) one or both of the amounts referred to in section 50C(2) or section (Amounts of reductions in non-domestic rates)(2) were varied,

they may by regulations increase or, as the case may be, vary the amounts in question.

(3) Where the Scottish Ministers conclude in a report made under subsection (1) that the regulations referred to in that subsection and section 25B of the 1966 Act would contribute more effectively to promoting energy efficiency improvements and technologies reliant on renewable sources of energy if the mechanism prescribed by sections 50C and (Amounts of reductions in non-domestic rates) for calculating the amount of reduction in council tax or non-domestic rates, as the case may be, from the relevant cost of energy efficiency improvements or technologies reliant on renewable sources of energy was different from the mechanism for the time being prescribed, they may, by regulations, amend sections 50C and (Amounts of reductions in non-domestic rates) to prescribe that different mechanism.

Tenement Management Scheme

50E Tenement Management Scheme: definition of “maintenance”

In schedule 1 (Tenement Management Scheme) to the Tenements (Scotland) Act 2004 (asp 11), in the definition of “maintenance” in rule 1.5, after “replacement,” insert “the installation of insulation,”.

Permitted development rights

51A Air source heat pumps and micro wind turbines in domestic properties: permitted development rights

(1) The Scottish Ministers must bring forward an amendment to the Town and Country Planning (General Permitted Development) (Domestic Microgeneration) (Scotland) Amendment Order 2009 (SSI 2009/34).

(2) The amendment required under subsection (1) is to specify the circumstances under which the installation, alteration or replacement of—

(a) air source heat pump microgeneration equipment; or

(b) wind turbine microgeneration equipment,

within the curtilage of a dwellinghouse or building containing a flat is considered a permitted development under the meaning of sections 30 and 31 of the Town and Country Planning (Scotland) Act 1997 (c.8).

(3) An order making the amendment required under subsection (1) must be laid in the Scottish Parliament no later than six months after the day on which this section comes into force.
(4) Before making the amendment required under subsection (1), the Scottish Ministers must consult with organisations which, in the opinion of the Scottish Ministers, have relevant business interests and, in particular, organisations representing—

(a) the energy efficiency industry;
(b) the renewables industry; and
(c) the microgeneration industry.

(5) In this section, “microgeneration” has the meaning given in section 82(6) of the Energy Act 2004 (c.20).

Permitted development rights

51B Microgeneration in non-domestic buildings: permitted development rights

(1) The Scottish Ministers must exercise their powers under sections 30 and 31 of the Town and Country Planning (Scotland) Act 1997 (c.8) so as to make provision of the kind specified in subsection (2).

(2) That provision is provision specifying the circumstances in which the installation, alteration or replacement of microgeneration equipment within the curtilage of a non-domestic building is considered a permitted development within the meaning of those sections of that Act.

(3) The Scottish Ministers must comply with subsection (1) no later than 12 months after the day on which this section comes into force.

(4) Before complying with subsection (1), the Scottish Ministers must consult and seek to reach agreement about the provision to be made by virtue of that subsection with organisations which, in the opinion of the Scottish Ministers, have relevant business interests and, in particular, organisations representing—

(a) the energy efficiency industry;
(b) the renewables industry; and
(c) the microgeneration industry.

(5) In this section—

“microgeneration” has the meaning given in section 82(6) of the Energy Act 2004 (c.20);

“non-domestic building” has the meaning given in section 50(5).

CHAPTER 3A

The Scottish civil estate

51C Energy performance of new buildings procured for the Scottish civil estate

(1) The Scottish Ministers must, in so far as reasonably practicable, ensure that the energy performance of any newly constructed building that becomes part of the civil estate in Scotland falls within the top quartile of energy performance.

(2) For the purposes of subsection (1), a building becomes part of the civil estate if it is procured or constructed by or on behalf of the Scottish Ministers.
Climate Change (Scotland) Bill

Part 5—Other climate change provisions

Chapter 4—Waste reduction and recycling

51D Report on the Scottish civil estate

(1) The Scottish Ministers must, in respect of each financial year beginning with 2010-2011, lay before the Scottish Parliament a report containing an assessment of the progress made in the year towards improving—
   (a) the efficiency; and
   (b) the contribution to sustainability,
   of buildings that are part of the civil estate in Scotland.

(2) If the energy performance of a building mentioned in subsection (3) does not fall within the top quartile of energy performance, the report must state the reasons why the building has become part of the civil estate.

(3) That building is a building—
   (a) to which section 51C applies; and
   (b) which becomes part of the civil estate in the financial year to which the report relates.

(4) The report under this section must be laid before the Parliament no later than 31 October next following the end of the financial year to which the report relates.

51E Scottish civil estate: supplementary

(1) For the purposes of this section and sections 51C and 51D—
   (a) “building” means a building that uses energy for heating or cooling the whole or any part of its interior; and
   (b) a building is part of the civil estate in Scotland if it—
      (i) is used for the purposes of Scottish central government administration; and
      (ii) is of a description of buildings for which the Scottish Ministers have responsibilities in relation to efficiency and sustainability.

(2) The Scottish Ministers may, by order, provide—
   (a) for buildings of a description specified in the order to be treated as being, or as not being, part of the civil estate;
   (b) for uses specified in the order to be treated as being, or as not being, uses for the purposes of Scottish central government administration.

CHAPTER 4

WASTE REDUCTION AND RECYCLING

Waste prevention and management plans

52 Waste prevention and management plans

(1) The Scottish Ministers may, by regulations, require persons of the kinds specified—
   (a) to prepare plans for the prevention, reduction, management, recycling, use and disposal of waste produced by or otherwise associated with their activities;
   (b) to comply with those plans.
(2) The regulations may in particular include provision about—

(a) the circumstances in which plans must be prepared, including when more than one plan must be prepared;

(b) the kinds of waste in relation to which plans must be prepared;

(c) the periods—

(i) to which plans relate;

(ii) within which plans must be prepared;

(d) the content of plans;

(e) subject to section 60—

(i) the enforcement authority in relation to the regulations; and

(ii) the functions of that authority, including the approval by it of plans prepared under the regulations;

(f) the keeping of plans and other information and their production to the enforcement authority;

(g) the enforcement of the duties imposed by the regulations;

(h) offences in relation to failures to comply with requirements of the regulations.

(3) The enforcement authority must have regard to any guidance given by the Scottish Ministers to it in relation to the functions conferred on it by the regulations.

(4) In this Chapter—

"recycling", in relation to any waste, includes recovery and re-use (whether or not the waste is subjected to any process) (and cognate expressions are to be construed accordingly);

"specified" means specified in regulations (and cognate expressions are to be construed accordingly);

"waste" has the meaning given by section 75(2) of the Environmental Protection Act 1990 (c.43) (the “1990 Act”).

Waste data

53 Information on waste

(1) The Scottish Ministers may, by regulations, require persons of the kinds specified to provide SEPA with information on the waste produced by or otherwise associated with such persons’ activities.

(2) The regulations may in particular include provision about—

(a) the circumstances in which information must be provided;

(b) the information required to be provided, including the periods to which the information relates;

(c) the form and manner in which information must be provided;

(d) the periods within which information must be provided;

(e) the functions of SEPA in relation to the regulations;
(f) the keeping of information and its production to SEPA;

(g) the enforcement of the duties imposed by the regulations;

(h) offences in relation to failures to comply with requirements of the regulations.

(3) The power to make regulations under this section is without prejudice to section 34(5) of the 1990 Act and any other enactment to the same effect as that section; and any duty imposed on any person by regulations under this section is without prejudice to any duty to provide information on waste imposed by regulations under that section or by virtue of any other such enactment.

(4) SEPA may give guidance to persons to whom the regulations apply on how to comply with the requirements of the regulations.

(4A) A draft of a statutory instrument containing the first regulations under subsection (1) must be laid before the Scottish Parliament no later than one year after this Act receives Royal Assent.

(5) In this section and in section 60, “SEPA” means the Scottish Environment Protection Agency.

Deposit of recyclable waste etc.

54 Recyclable waste: facilities for deposit etc.

(1) The Scottish Ministers may, by regulations, require—

(a) persons of the kinds specified to provide facilities for the deposit of waste;

(b) authorised persons—

(i) to collect waste deposited by virtue of paragraph (a);

(ii) to ensure, in so far as reasonably practicable, that such waste collected by or transferred to them (whether in accordance with section 34 of the 1990 Act or otherwise) is recycled.

(2) The regulations may in particular include provision about—

(a) the circumstances in which facilities must be provided, including the places at which they must be provided;

(b) the persons for whom facilities must be provided;

(c) the kinds of waste for which facilities must be provided;

(d) the circumstances in which authorised persons must collect waste, including which authorised persons must do so;

(e) the charging by authorised persons for collecting waste, for recycling waste and for otherwise ensuring waste is recycled;

(f) subject to section 60—

(i) the enforcement authority in relation to the regulations; and

(ii) the functions of that authority;

(g) the keeping of records and their production to the enforcement authority;

(h) the enforcement of the duties imposed by the regulations;
Climate Change (Scotland) Bill
Part 5—Other climate change provisions
Chapter 4—Waste reduction and recycling

(i) offences in relation to failures to comply with requirements of the regulations.

(3) The enforcement authority must have regard to any guidance given by the Scottish Ministers to it in relation to the functions conferred on it by the regulations.

(4) The Scottish Ministers may not, by regulations under this section, impose requirements on persons to provide facilities for the deposit of waste in circumstances in relation to which regulations under section 55 may be made.

(5) In this section and in section 55, “authorised person” has the same meaning as in section 34(3) of the 1990 Act.

55 Recyclable waste: facilities for deposit at events etc.

(1) The Scottish Ministers may, by regulations, confer power on local authorities to issue notices requiring—

(a) persons responsible for organising temporary events open to the public to provide facilities for the deposit of waste by persons attending those events;

(b) authorised persons to—

(i) collect waste deposited by virtue of paragraph (a);

(ii) ensure, in so far as reasonably practicable, that such waste collected by or transferred to them (whether in accordance with section 34 of the 1990 Act or otherwise) is recycled.

(2) The regulations may in particular include provision about—

(a) the events in relation to which notices can be issued;

(b) the circumstances in which facilities must be provided, including the places at which they must be provided;

(c) the persons for whom facilities must be provided;

(d) the kinds of waste for which facilities must be provided;

(e) the persons to whom notices can be issued;

(f) the content of notices;

(g) the form of and manner in which notices can be issued, including the times at which notices can be issued;

(h) appeals against notices;

(i) the circumstances in which authorised persons must collect waste, including which authorised persons must do so;

(j) the charging by authorised persons for collecting waste, recycling waste and otherwise ensuring waste is recycled;

(k) subject to section 60—

(i) the enforcement authority in relation to notices; and

(ii) the functions of that authority;

(l) the keeping of records by persons to whom notices are issued and their production to the enforcement authority;

(m) the enforcement of duties imposed by notices;
(n) offences in relation to failures to comply with requirements of notices.

(3) Local authorities must have regard to any guidance given by the Scottish Ministers to them in relation to the functions conferred on them by the regulations.

(4) The enforcement authority must have regard to any guidance given by the Scottish Ministers to it in relation to the functions conferred on it by the regulations.

**Procurement of recyclate**

56 **Procurement of recyclate**

(1) The Scottish Ministers may, by regulations, require persons of the kinds specified to comply with the requirement in subsection (2).

(2) That requirement is to ensure that things procured or constructed by or on behalf of such persons—

(a) comprise of; or

(b) include or contain a certain proportion of, recyclate.

(3) The regulations may in particular include provision about—

(a) the circumstances in which the requirement applies;

(b) the kinds of things in relation to which the requirement applies;

(c) the proportion of recyclate that such things must include or contain;

(d) how such proportions are to be determined;

(e) the circumstances in which a person may apply to the Scottish Ministers to have the requirement disapplied;

(f) subject to section 60—

(i) the enforcement authority in relation to the regulations; and

(ii) the functions of that authority;

(g) the keeping of records and their production to the enforcement authority;

(h) the enforcement of the duties imposed by the regulations;

(i) offences in relation to failures to comply with requirements of the regulations.

(4) The enforcement authority must have regard to any guidance given by the Scottish Ministers to it in relation to the functions conferred on it by the regulations.

(5) Persons to whom the regulations apply must have regard to any guidance given by—

(a) the Scottish Ministers;

(b) the enforcement authority,

to them in relation to the requirements imposed by the regulations.

(6) In this section, “recyclate” means waste that has been recycled.
Reduction of packaging

57 Targets for reduction of packaging etc.

(1) The Scottish Ministers may, by regulations—

(a) set targets—

(i) for the reduction of packaging;

(ii) for the reduction of greenhouse gas emissions produced by the manufacture of or otherwise associated with packaging;

(b) require persons of the kinds specified to comply with those targets.

(2) The regulations may in particular include provision about—

(a) the circumstances in which the requirement in subsection (1)(b) applies;

(b) the kinds of packaging in relation to which targets may be set;

(c) the targets in relation to such packaging (including how targets may be set);

(d) the methods of determining whether targets have been met;

(e) subject to section 60—

(i) the enforcement authority in relation to the regulations; and

(ii) the functions of that authority;

(f) the keeping of records and other information and their production to the enforcement authority (including the periods to which records or information must relate and within which it must be produced to the authority);

(g) the enforcement of the duties imposed by the regulations;

(h) offences in relation to failures to comply with requirements of the regulations.

(3) The enforcement authority must have regard to any guidance given by the Scottish Ministers to it in relation to the functions conferred on it by the regulations.

(4) In this section and in section 58, “packaging” has the meaning given by Article 3 of Directive 94/62/EC of the European Parliament and of the Council on packaging and packaging waste.

Deposit and return

58 Deposit and return schemes

(1) The Scottish Ministers may, by regulations, establish deposit and return schemes.

(2) A “deposit and return scheme” is a scheme under which—

(a) the sale price of articles includes a returnable element (a “deposit”);

(b) persons who return—

(i) such articles;

(ii) the packaging associated with such articles (“returnable packaging”); or

(iii) both such articles and such packaging,

are entitled to be paid a sum equal to that deposit.
(3) Retailers may be required, under a deposit and return scheme, to—

   (a) include a deposit in the price of articles placed on the market by them;

   (aa) accept the return to them of—

      (i) such articles;

      (ii) returnable packaging; or

      (iii) both such articles and such packaging;

   (b) pay a sum equal to the deposit to persons who return to them—

      (i) such articles;

      (ii) returnable packaging; or

      (iii) both such articles and such packaging;

   (ba) return such articles to the producers of them;

   (c) return returnable packaging to the producers of it or of the articles with which it is associated.

(4) Producers may be required, under a deposit and return scheme, to—

   (a) include a deposit in the price of articles placed on the market by them;

   (aa) accept the return to them of—

      (i) such articles;

      (ii) returnable packaging; or

      (iii) both such articles and such packaging;

   (b) pay a sum equal to the deposit to retailers who return to them—

      (i) such articles;

      (ii) returnable packaging; or

      (iii) both such articles and such packaging;

   (c) recycle, or have recycled—

      (i) such articles;

      (ii) returnable packaging; or

      (iii) both such articles and such packaging.

(5) A deposit and return scheme may also provide for a person or body (a “scheme administrator”) to—

   (a) ensure that deposits are included in the price of articles placed on the market;

   (b) accept the return of—

      (i) such articles;

      (ii) returnable packaging; or

      (iii) both such articles and such packaging;

   (c) pay sums equal to deposits to persons who return—

      (i) such articles;
Climate Change (Scotland) Bill
Part 5—Other climate change provisions
Chapter 4—Waste reduction and recycling

(ii) returnable packaging; or
(iii) both such articles and such packaging;

(ca) return such articles to the producers of them;
(d) return returnable packaging to the producers of it or of the articles with which it is associated;
(e) recover sums equal to deposits from such producers;
(f) recycle, or have recycled—
   (i) such articles;
   (ii) returnable packaging; or
   (iii) both such articles and such packaging.

(6) The Scottish Ministers may make regulations under this section only where they consider it necessary or expedient to do so for the purpose of promoting or securing an increase in the recycling of materials.

(7) The regulations may in particular include provision about—

  (a) the persons who are retailers and producers for the purposes of deposit and return schemes;
  (b) the articles to which such schemes apply;
  (c) the deposits to be included in the price of such articles;
  (ca) the inclusion, in the sale price of articles, of a non-returnable element to cover the reasonable costs incurred by retailers, producers or a scheme administrator in administering such schemes;
  (cb) the articles the return of which entitles persons to payment of sums equal to deposits;
  (cc) the methods by which such articles are to be identified;
  (d) the packaging which is returnable packaging for the purposes of such schemes;
  (e) the methods by which returnable packaging is to be identified;
  (f) information on the operation of schemes (including notices on premises where articles are offered for sale and the content of such notices);
  (fa) the places to which articles can be returned;
  (g) the places to which returnable packaging can be returned;
  (h) the registration of retailers and producers to whom schemes apply (including the reasonable fees payable in relation to such registration);
  (ha) the scheme administrator;
  (i) subject to section 60—
      (i) the enforcement authority in relation to the regulations; and
      (ii) the functions of that authority;
  (j) the keeping of records and other information and their production to the enforcement authority;
(k) the enforcement of the duties imposed by the regulations;
(l) offences in relation to failures to comply with requirements of the regulations.

58A Deposit and return schemes: designation of scheme administrator

(1) The Scottish Ministers may, by order, designate—

(a) a body established under section 58B(1); or
(b) such other person or body as they consider appropriate (an “existing body”), as a scheme administrator of a deposit and return scheme established by virtue of section 58.

(2) An order under subsection (1)(b) may, in so far as the Scottish Ministers consider it necessary or expedient to do so, modify the functions of an existing body by—

(a) conferring functions on;
(b) removing functions from; or
(c) otherwise varying the functions of,
the body.

(3) That order may in particular include provision about—

(a) borrowing by the existing body (with the approval of the Scottish Ministers);
(b) the charging by the body, in respect of the exercise of its functions in relation to a deposit and return scheme, of such reasonable amounts as the Scottish Ministers consider appropriate.

(4) In exercising functions in relation to a deposit and return scheme, a scheme administrator must comply with any written directions of a general or specific nature as the Scottish Ministers may from time to time give to it in relation to those functions.

58B Power to establish scheme administrator

(1) The Scottish Ministers may, by order, establish a body to be a scheme administrator of a deposit and return scheme established by virtue of section 58(1).

(2) A body established under subsection (1) is to be a body corporate.

(3) The body may do anything which appears to it—

(a) to be necessary or expedient for the purpose of, or in connection with, the exercise of its functions in relation to a deposit and return scheme;
(b) to be conducive to the exercise of those functions.

(4) In particular, the body may—

(a) enter into contracts;
(b) with the agreement of the Scottish Ministers, borrow money;
(c) charge, in respect of the exercise of its functions in relation to a deposit and return scheme, such reasonable amounts as the Scottish Ministers consider appropriate.

(5) An order under subsection (1) may in particular include provision about—

(a) the status and constitution of the body;
(b) the status of the members and any employees of the body;
(c) the remuneration, allowances and pensions of such members and such employees;
(d) the conferral of functions on the body;
(e) the keeping by the body of accounts and accounting records.

58C Finance of scheme administrator

(1) The Scottish Ministers may, for the purpose of or in connection with the exercise by a scheme administrator of functions in relation to a deposit and return scheme—

(a) pay grants;
(b) make loans,

to the administrator of such amounts as Ministers may determine.

(2) Any such grant or loan may be paid or, as the case may be, made, on such terms and subject to such conditions (including, in the case of a loan, conditions as to repayment) as the Scottish Ministers consider appropriate.

(3) The Scottish Ministers may, from time to time after any grant or loan is paid or, as the case may be, made, vary the terms and conditions on which it was paid or made.

(4) The Scottish Ministers may guarantee, in such manner and on such conditions as they consider appropriate, the discharge of any financial obligation in connection with any sums borrowed by a scheme administrator for the purpose of, or in connection with, the exercise of its functions in relation to a deposit and return scheme.

Carrier bag charges

59 Charges for supply of carrier bags

(1) The Scottish Ministers may, by regulations, require suppliers of goods—

(a) to charge for carrier bags supplied at the place where the goods are supplied for the purpose of enabling the goods to be taken away or delivered;
(b) to apply the net proceeds raised by such charges to the advancement of environmental protection or improvement or to any other purposes that may be reasonably regarded as analogous.

(2) The regulations may in particular include provision about—

(a) the circumstances in which the requirement applies;
(b) the suppliers to whom the requirement applies;
(c) the carrier bags to which the requirement applies;
(d) the minimum amount to be charged for each carrier bag;
(e) how the net proceeds raised by the charge are to be ascertained;
(f) the purposes to which those net proceeds are to be applied;
(g) subject to section 60—

(i) the enforcement authority in relation to the regulations; and
(ii) the functions of that authority;
(h) the keeping of records and their production to the enforcement authority;
(i) the enforcement of the duties imposed by the regulations;
(j) offences in relation to failures to comply with requirements of the regulations.

(3) The enforcement authority must have regard to any guidance given by the Scottish Ministers to it in relation to the functions conferred on it by the regulations.

General provision

60 Enforcement authorities

(1) This section applies to any regulations made under this Chapter other than under section 53.

(2) The enforcement authority provided for in the regulations is to be—
(a) SEPA;
(b) a local authority; or
(c) such other person or body as the Scottish Ministers consider appropriate.

(3) The regulations may provide for the functions of the enforcement authority in relation to the regulations to be exercised by two or more such authorities and about the functions of each such authority.

(4) The regulations may also provide for enforcement authorities to levy charges to recover the reasonable costs incurred by them in exercising their functions under the regulations.

61 Penalties

(1) A person who commits an offence under regulations made under this Part is liable to such penalties, not exceeding those mentioned in subsection (2), as are provided for in the regulations.

(2) Those penalties are—
(a) on summary conviction, a fine not exceeding the statutory maximum;
(b) on conviction on indictment, a fine.

PART 6

GENERAL AND MISCELLANEOUS

61A Sustainable development

(1) The persons mentioned in subsection (2) must, in exercising functions conferred on them by virtue of this Act, take into account the need to do so in a way that contributes to the achievement of sustainable development.

(2) Those persons are—
(a) the Scottish Ministers;
(b) the advisory body.
62 Equal opportunities

(1) The persons mentioned in subsection (2) must exercise their functions under this Act in a manner which encourages equal opportunities and in particular the observance of the equal opportunities requirements.

(2) Those persons are—

(a) the Scottish Ministers;
(b) the advisory body.

(3) In this section, “equal opportunities” and the “equal opportunities requirements” have the same meanings as those expressions have in section L2 of Part 2 of Schedule 5 to the Scotland Act 1998 (c.46).

63 Crown application

(1) This Act and any orders and regulations made under it bind the Crown.

(2) No contravention by the Crown of any provision made by virtue of this Act makes the Crown criminally liable.

(3) But the Court of Session may, on the application of any public body or office-holder having responsibility for enforcing that provision, declare unlawful any act or omission of the Crown which constitutes such a contravention.

(4) Despite subsection (2), any provision made by virtue of this Act applies to persons in the public service of the Crown as it applies to other persons.

64 Subordinate legislation

(1) Any power conferred by this Act on the Scottish Ministers to make orders or regulations is exercisable by statutory instrument.

(2) Any such power—

(a) may be exercised so as to make different provision for different cases or descriptions of case or for different purposes;
(b) includes power to make such consequential, incidental, supplementary, transitory, transitional or saving provision as the Scottish Ministers consider appropriate.

(3) An order or regulations under this Act may modify any enactment (including this Act).

(4) Subject to subsections (5) to (8), no statutory instrument containing an order or regulations under this Act (other than an order under section 67(2)) may be made unless a draft of the instrument has been laid before, and approved by resolution of, the Scottish Parliament.

(5) A statutory instrument containing an order mentioned in subsection (6) or regulations mentioned in subsection (7) is subject to annulment in pursuance of a resolution of the Scottish Parliament.

(6) Those orders are orders under—

(a) section 17(b);
(b) section 38(1);
(c) paragraph 2(2) of schedule 1.

(7) Those regulations are—
(a) the second or subsequent regulations under section 12(2) (other than regulations which make provision altering the amount by which a carbon unit credited or debited to the net Scottish emissions account for a period reduces or, as the case may be, increases the net Scottish emissions account for that period);

(b) the second or subsequent regulations under section 18(1) (other than regulations which make provision specifying a carbon unit of a kind not previously specified in regulations under that section);

(d) regulations under section 58(1) which make provision about one or more of the following matters only—

(i) the deposits mentioned in section 58(7)(c);

(ii) the form and content of notices mentioned in section 58(7)(f);

(iii) setting the registration fees mentioned in section 58(7)(h);

(c) regulations under Chapter 4 of Part 5 which make provision about the matter mentioned in section 60(4) only.

(8) Subsection (5) does not apply to an order or regulations which includes provision modifying an Act or an Act of the Scottish Parliament.

(9) Before laying a draft of any regulations under sections 52 to 59 (other than regulations mentioned in subsection (7)(d) or (e)) before the Scottish Parliament, the Scottish Ministers must—

(a) lay before the Scottish Parliament—

(i) a copy of the proposed regulations; and

(ii) a statement of their reasons for proposing to make the draft regulations;

(b) publicise the proposed draft regulations in such manner as they consider appropriate; and

(c) have regard to—

(i) any representations about the proposed draft regulations;

(ii) any resolution of the Scottish Parliament about the proposed draft regulations; and

(iii) any report by a committee of the Scottish Parliament about the proposed draft regulations,

made during such period as the Scottish Ministers may specify when laying the proposed draft regulations.

(10) The period so specified must—

(a) be no shorter than 60 days; and

(b) include at least 30 days during which the Scottish Parliament is not dissolved or in recess.

(11) When laying a draft of any regulations to which subsection (9) applies before the Scottish Parliament, the Scottish Ministers must also lay a statement giving details of—

(a) any representations, resolution or report falling within paragraph (c) of that subsection; and
(b) the changes (if any) which in the light of any such representations, resolution or report, the Scottish Ministers have made to what was laid under paragraph (a)(i) of that subsection.

65 Interpretation

In this Act—

“additional greenhouse gas” has the meaning given by section 11(2);
“advisory body” has the meaning given by section 19(2);
“advisory functions” has the meaning given by section 19(3);
“annual target” has the meaning given by section 3(3);
“authorised person” has the meaning given by section 54(5);
“baseline” has the meaning given by section 10(1);
“baseline year” means—

(a) in relation to a greenhouse gas mentioned in subsection (2) of section 10, the year mentioned in paragraph (a), (b), (c), (d) or, as the case may be, (e) of that subsection;

(b) in relation to an additional greenhouse gas, any year designated by virtue of section 11(3);
“carbon unit” has the meaning given by section 18(4);
“climate change duties” has the meaning given by section 36(1A);
“Committee” means the Scottish Committee on Climate Change;
“deposit and return scheme” means a scheme established by virtue of section 58(1);
“emissions” has the meaning given by section 15(1);
“energy efficiency” has the meaning given by section 48(8);
“greenhouse gas” has the meaning given by section 9(1);
“interim target” has the meaning given by section 2(2);
“international carbon reporting practice” has the meaning given by section 17;
“local authority” means a council constituted under section 2 of the Local Government etc. (Scotland) Act 1994 (c.39);
“monitoring body” has the meaning given by section 39(2);
“net Scottish emissions” has the meaning given by section 15(1);
“net Scottish emissions account” has the meaning given by section 12(1);
“packaging” has the meaning given by section 57(4);
“public body” (except in Part 4 and section 62) has the meaning given by section 19(5);
“relevant body” has the meaning given by section 5(5);
“relevant public body” has the meaning given by section 36(2);
“recycling” has the meaning given by section 52(4);
“renewable sources” has the meaning given by section 48(8);
“Scottish Committee on Climate Change” has the meaning given by section 20(2);
“Scottish emissions” has the meaning given by section 15(1);
“Scottish removals” has the meaning given by section 15(1);
“SEPA” has the meaning given by section 53(5);
“target year” means a year for which an annual target has been set;
“target-setting criteria” means the matters mentioned in section 4(4)(a) to (h);
“the 1990 Act” means the Environmental Protection Act 1990 (c.43);
“the 2008 Act” means the Climate Change Act 2008 (c.27);
“the 2050 target” has the meaning given by section 1(2);
“UK Committee on Climate Change” has the meaning given by section 5(6);
“waste” has the meaning given by section 52(4).

66 Minor and consequential modifications
Schedule 2 makes minor modifications and modifications consequential on the provisions of this Act.

67 Short title and commencement
(1) This Act may be cited as the Climate Change (Scotland) Act 2009.
(2) This Act (other than this section and sections 22 to 27, 45C and 64) comes into force on such day (in the case of sections 36 to 44, being not later than 18 months after this Act receives Royal Assent) as the Scottish Ministers may, by order, appoint.
(3) Sections 22 to 27 and 45C come into force in accordance with section 21.
(4) Different days may, under subsection (2), be appointed for different purposes.
SCHEDULE 1
(introduced by section 20)

THE SCOTTISH COMMITTEE ON CLIMATE CHANGE

Status

1 (1) The Committee is a body corporate.

(2) The Committee is not to be regarded as a servant or agent of the Crown, nor is it to be regarded as having any status, privilege or immunity of the Crown.

(3) The Committee’s members and employees are not to be regarded as civil servants.

(4) The Committee’s property is not to be regarded as property of, or held on behalf of, the Crown.

Membership of the Committee

2 (1) The Committee is to consist of the following members—

(a) a person to chair the Committee (“the Chair”); and

(b) not fewer than five and not more than eight other members.

(2) The Scottish Ministers may, by order, modify sub-paragraph (1)(b) so as to alter the number of other members of the Committee.

(3) Members of the Committee are appointed by the Scottish Ministers.

(4) In appointing members to the Committee, the Scottish Ministers must have regard to the desirability of the Committee (taken as a whole) having expertise or experience in the following—

(a) business competitiveness;

(b) climate change policy at Scottish, UK and international level (in particular the social impact of such policy);

(c) climate science and other branches of environmental science;

(d) economic analysis and forecasting;

(e) emissions trading;

(f) energy production and supply;

(g) financial investment;

(h) technology development and diffusion.

Period, and conditions, of appointment of members

3 (1) Each member of the Committee is to be appointed for a period not exceeding five years.

(2) A member holds and vacates office in accordance with the terms and conditions of appointment.

(3) A member may resign office as a member of the Committee by giving written notice to the Scottish Ministers.

(4) On ceasing to be a member, a person is eligible to be reappointed for one further period.
Persons not eligible for appointment

4 No person may be appointed as a member of the Committee if that person is, or has at any time during the previous year been, a member of—

(a) the House of Commons;
(b) the Scottish Parliament;
(c) the European Parliament.

Removal of members of Committee

5 (1) Subject to sub-paragraph (3), the Chair may, by giving written notice, remove a member from office if the Chair is satisfied that one of the situations set out in sub-paragraph (2) exists.

(2) Those situations are—

(a) that the member is insolvent;
(b) that the member has been convicted of a criminal offence;
(c) that the member has been absent from meetings of the Committee for a period longer than six months without the permission of the Chair;
(d) that the member is otherwise unable or unfit to discharge the functions of a member or is unsuitable to continue as a member.

(3) The Chair may only remove a member from office with the agreement of the Scottish Ministers.

(4) The Scottish Ministers may, by giving written notice, remove the Chair from office if the Scottish Ministers are satisfied that one of the situations set out in sub-paragraph (2) exists.

(5) For the purposes of sub-paragraph (2)(a), a member is insolvent when—

(a) a voluntary arrangement proposed by the member is approved;
(b) the member is adjudged bankrupt;
(c) the member’s estate is sequestrated;
(d) the member enters into a debt arrangement programme under Part 1 of the Debt Arrangement and Attachment (Scotland) Act 2002 (asp 17) as the debtor;
(e) the member grants a trust deed for creditors.

Remuneration, allowances and pensions of members

6 (1) The Committee must pay its members such remuneration and allowances as the Scottish Ministers may in each case determine.

(2) The Committee may, with the agreement of the Scottish Ministers—

(a) pay (or make arrangements for the payment);
(b) make payments towards the provision;
(c) provide and maintain schemes (whether contributory or not) for the payment,
of such pensions, allowances or gratuities to or in respect of any person who is or has ceased to be a member of the Committee, as the Committee may determine.

(3) The reference in sub-paragraph (2) to pensions, allowances and gratuities includes pensions, allowances and gratuities paid by way of compensation for loss of office.

5

Chief executive and other employees

7 (1) The Committee is to employ a chief executive.

(2) The chief executive is to be appointed by the Committee on such terms and conditions as the Committee may determine.

(3) The appointment of the chief executive and the terms and conditions of that appointment are subject to the agreement of the Scottish Ministers.

(4) The Committee may appoint other employees on such terms and conditions as the Committee may determine.

(5) The Scottish Ministers may give directions to the Committee as regards the appointment of employees under sub-paragraph (4), which may relate in particular to—

(a) the number of appointments;

(b) the terms and conditions of employment.

(6) The Committee must comply with directions given under sub-paragraph (5).

(7) The Committee may, with the agreement of the Scottish Ministers—

(a) pay (or make arrangements for the payment of);

(b) make payments towards the provision of;

(c) provide and maintain schemes (whether contributory or not) for the payment of, such pensions, allowances or gratuities to or in respect of any person who is or has ceased to be an employee of it, as the Committee may determine.

(8) The reference in sub-paragraph (7) to pensions, allowances and gratuities includes pensions, allowances and gratuities paid by way of compensation for loss of office.

Accounts

8 (1) The Committee must—

(a) keep proper accounts and accounting records;

(b) prepare in respect of each financial year a statement of accounts;

(c) send the statement of accounts to the Scottish Ministers.

(2) The Committee must comply with any directions which the Scottish Ministers gives it in relation to the matters mentioned in sub-paragraph (1).

(3) The Scottish Ministers must, as soon as reasonably practicable after receiving the statement of accounts from the Committee—

(a) send the statement of accounts to the Auditor General for Scotland for auditing;

(b) lay the audited statement before the Scottish Parliament.

(4) The Committee must make its audited statement of accounts and its accounting records available so that they may be inspected by any person.
(5) Those documents are to be made available—
   (a) at any reasonable time; and
   (b) without charge.

(6) In this paragraph and paragraph 9, “financial year” means—

   (a) the period beginning with the day the Committee is established and ending with 31 March in the following calendar year;
   (b) each subsequent period of 12 months ending with 31 March.

Reports

9 (1) As soon as practicable after the end of each financial year, the Committee must prepare a report on—
   (a) the discharge of the Committee’s functions during that year;
   (b) the actions that the Committee proposes to take during the following year in pursuance of its functions.

(2) The Committee must—
   (a) send a copy of the report to the Scottish Ministers; and
   (b) publish the report.

(3) The Committee must prepare and publish the report in accordance with any directions which the Scottish Ministers may give.

(4) The Scottish Ministers must as soon as reasonably practicable after receiving the report from the Committee, lay a copy of it before the Scottish Parliament.

(5) The Committee may publish such other reports on matters relevant to its functions as it considers appropriate.

Sub-committees

10 (1) The Committee may establish sub-committees for any purposes relating to its functions.

(2) A sub-committee must comply with any directions given to it by the Committee.

Proceedings

11 (1) Subject to the remaining provisions of this paragraph, the Committee may regulate—
   (a) its own procedure (including any quorum);
   (b) the procedure of any sub-committee (including any quorum).

(2) The Chair must, if present, chair meetings of the Committee or any sub-committee of the Committee.

(3) If the Chair is not available to be present at a meeting of the Committee (or any sub-committee of the Committee), the Chair is to appoint another member to chair the meeting.

(4) The Chair has a casting vote and any person appointed by the Chair under sub-paragraph (3) has a casting vote for the purposes of that appointment.
(5) The validity of any proceedings of the Committee (or any of its sub-committees) is not affected by a vacancy in membership nor by any defect in the appointment of a member.

Delegation of functions

12 (1) The Committee may, subject to sub-paragraph (2), authorise—

(a) any of its members;
(b) any of its sub-committees;
(c) its chief executive;
(d) any other employee,

to exercise such of its functions (and to such extent) as it may determine.

(2) The Committee may not authorise the exercise of the following functions under sub-paragraph (1)—

(a) the approval of annual reports and accounts;
(b) the approval of any budget or other financial plan.

(3) Sub-paragraph (1) does not affect the responsibility of the Committee for the exercise of its functions.

General powers

13 (1) The Committee may do anything which appears to it—

(a) to be necessary or expedient for the purpose of, or in connection with, the exercise of its functions;
(b) to be conducive to the exercise of its functions.

(2) In particular, the Committee may—

(a) enter into contracts;
(b) with the agreement of the Scottish Ministers, borrow money;
(c) with the agreement of the Scottish Ministers, acquire and dispose of land;
(d) obtain advice and assistance from any person who, in the Committee’s opinion, is qualified to give it.

(3) The Committee may pay to any person from whom advice or assistance is obtained such fees, remuneration and allowances as the Committee may, with the agreement of the Scottish Ministers, determine.

SCHEDULE 2
(introduced by section 66)

MINOR AND CONSEQUENTIAL MODIFICATIONS

Hill Farming Act 1946 (c.73)

1 In section 23(1) of the Hill Farming Act 1946 (prohibition of muirburn at certain times), after “section” insert “and to section 23A,”.
Schedule 2—Minor and consequential modifications

Environment Act 1995 (c.25)

2 In section 41(1) of the Environment Act 1995 (power to make schemes imposing charges), after paragraph (e), insert—

“(f) as a means of recovering costs incurred by it in performing functions conferred by regulations under section 53 of the Climate Change (Scotland) Act 2009 (asp 00), SEPA may require the payment to it of such charges as may from time to time be prescribed;”.

Ethical Standards in Public Life etc. (Scotland) Act 2000 (asp 7)

3 In the Ethical Standards in Public Life etc. (Scotland) Act 2000, in schedule 3 (devolved public bodies) at the appropriate place, insert—

“The Scottish Committee on Climate Change”.

Scottish Public Services Ombudsman Act 2002 (asp 11)

4 In the Scottish Public Services Ombudsman Act 2002, in Part 2 of schedule 2 (listed authorities) at the appropriate place, insert—

“The Scottish Committee on Climate Change”.

Freedom of Information (Scotland) Act 2002 (asp 13)

5 In the Freedom of Information (Scotland) Act 2002, in Part 7 of schedule 1 (Scottish public authorities) at the appropriate place, insert—

“The Scottish Committee on Climate Change”.

Public Appointments and Public Bodies etc. (Scotland) Act 2003 (asp 4)

6 In the Public Appointments and Public Bodies etc. (Scotland) Act 2003, in schedule 2 (specified authorities) at the appropriate place in the list of advisory bodies, insert—

“The Scottish Committee on Climate Change”.

Housing (Scotland) Act 2006 (asp 1)

7 In the Housing (Scotland) Act 2006, section 179 (duty of Scottish Ministers to prepare strategy for improving energy efficiency of living accommodation) is repealed.
Climate Change (Scotland) Bill
[AS AMENDED AT STAGE 2]

An Act of the Scottish Parliament to set a target for the year 2050, an interim target for the year 2020, and to provide for annual targets, for the reduction of greenhouse gas emissions; to provide about the giving of advice to the Scottish Ministers relating to climate change; to confer power on Ministers to impose climate change duties on public bodies; to make further provision about mitigation of and adaptation to climate change; to make provision about energy efficiency; to make provision about the reduction and recycling of waste; and for connected purposes.

Introduced by: John Swinney
On: 4 December 2008
Supported by: Stewart Stevenson
Bill type: Executive Bill
These documents relate to the Climate Change (Scotland) Bill as amended at Stage 2 (SP Bill 17A)

CLIMATE CHANGE (SCOTLAND) BILL
[AS AMENDED AT STAGE 2]

REVISED EXPLANATORY NOTES
AND REVISED FINANCIAL MEMORANDUM

CONTENTS

1. As required under Rules 9.7.8A and 9.7.8B of the Parliament’s Standing Orders the following documents are published to accompany the Climate Change (Scotland) Bill (introduced in the Scottish Parliament on 4 December 2008) as amended at Stage 2:

• revised Explanatory Notes; and
• a revised Financial Memorandum.

Text has been added or deleted as necessary to reflect the amendments made to the Bill at Stage 2 and these changes are indicated by sideling in the right margin.
REVISED EXPLANATORY NOTES

INTRODUCTION

2. These Explanatory Notes have been prepared by the Scottish Government in order to assist the reader of the Bill and to help inform debate on it. They do not form part of the Bill and have not been endorsed by the Parliament.

3. The Notes should be read in conjunction with the Bill. They are not, and are not meant to be, a comprehensive description of the Bill. So where a section or schedule, or a part of a section or schedule, does not seem to require any explanation or comment, none is given.

THE BILL

4. Climate change is one of the most serious threats facing Scotland and the world. The most severe consequences include famine, drought and extinction of species. Urgent action is needed by all nations to avoid the most severe climate change.

5. The aim of the Climate Change (Scotland) Bill is to establish a framework to drive greater efforts at reducing Kyoto Protocol greenhouse gas emissions in Scotland. The Bill will create mandatory climate change targets to reduce Scotland’s greenhouse gas emissions. This will signal clearly that the Scottish Government is serious in tackling greenhouse gases and wishes to set a strong example to other countries in the global effort to reduce climate change.

6. The provisions in this Bill will set a long-term target to reduce Scotland’s emissions of Kyoto Protocol greenhouse gases by 80% by the year 2050. This long term target will be supported by a framework of annual targets intended to drive the policies necessary for achieving this target. Many of the policy measures required to meet these targets will not require legislation to implement, but certain climate change mitigation and adaptation policies have been identified which do require legislation and this Bill contains provisions in Part 5 to allow these to be taken forward.

7. The Bill policy areas are separated into five parts.
   - **Part 1** creates the statutory framework for the greenhouse gas emissions reductions in Scotland by setting an interim 34% reduction target for 2020, to rise to 42% if the EU commits to reducing greenhouse gas emissions by at least 30% compared to 1990 levels by 2020, and an 80% reduction target for 2050. To help ensure the delivery of these targets this part of the Bill also requires that the Scottish Ministers set annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050.
   - **Part 2** contains provisions which will allow the Scottish Ministers to establish a Scottish Committee on Climate Change or to designate an existing body to exercise advisory functions.
   - **Part 3** places duties on the Scottish Ministers requiring that they report regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill.
These documents relate to the Climate Change (Scotland) Bill as amended at
Stage 2 (SP Bill 17A)

- **Part 4** places climate change duties on public bodies requiring that they act in the
  way best calculated to deliver the emissions reduction targets included in the Bill. This Part also contains powers to allow the Scottish Ministers, by order, to impose further duties on public bodies in relation to climate change, requirements to issue guidance to those bodies relating to their climate change duties and the power to require that they report upon the discharge of those duties.

- **Part 5 – Chapter 1** requires the Scottish Ministers to lay programmes on adaptation
  to climate change before the Scottish Parliament, and to report on these programmes. It also places a duty on Scottish Ministers to produce a land use strategy and provides for an enabling power for the Scottish Ministers to vary, but not shorten, the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

- **Part 5 – Chapter 2** will allow modification by secondary legislation of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change.

- **Part 5 – Chapter 3** contains a number of provisions relating to energy efficiency.
  - Section 48 – places a duty on the Scottish Ministers to produce an action plan setting out their current and proposed measures to promote the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change towards energy efficiency.
  - Section 48A – places a duty on the Scottish Ministers to prepare and publish a plan for the promotion of the use of heat from renewable sources.
  - Section 49 – places a duty on the Scottish Ministers to report regularly to the Scottish Parliament on the progress of, and the implementation of, the energy efficiency and renewable heat action plans.
  - Section 49A – the provisions in this section place a requirement on the Scottish Ministers to provide or revise existing guidance that sets the conditions subject to which consent will be granted for the construction of new, or the extension of existing, energy generating stations of a capacity greater than 50 megawatts. This section also places requirements regarding the deadline by which this requirement must be complied with and advice which must be sought before the guidance is provided.
  - Section 50 – the provisions in this section require regulations to be made regarding the assessment of the energy performance of existing non-domestic buildings in order to raise awareness of the contribution that those buildings can make to mitigating climate change through reducing energy demand and thereby emissions of greenhouse gases.
  - Section 50A – the provisions in this section enable the Scottish Ministers to make similar regulations in respect of living accommodation.
  - Sections 50B, 50C and 50D – the provisions in these sections detail mechanisms by which the amount of council tax liable on a dwelling may be reduced by a local authority if energy efficiency improvements are made to that dwelling or technologies installed which are reliant of renewable sources.
of energy or heat. Section 50D in particular introduces reporting requirements and permits review of the discount amounts.

- Section 50E amends the definition of maintenance in schedule 1 of the Tenements (Scotland) Act 2004 to include the installation of insulation.

- Sections 51A and 51B – these sections place a duty on the Scottish Ministers to exercise existing powers to make provision by which permitted development rights may be granted for the installation, alteration or replacement of microgeneration equipment in domestic and non-domestic buildings.

- **Part 5 – Chapter 3A** contains provision regarding the procurement and construction of new buildings which become part of the civil estate in Scotland and sets out duties concerning reports which must be made concerning the efficiency and sustainability of those buildings.

- **Part 5 – Chapter 4** contains provisions which will enable the Scottish Ministers to make regulations relating to the acquisition of accurate information about waste and the promotion of waste reduction and recycling by different methods.

**PART 1 – EMISSIONS REDUCTION TARGETS**

8. The provisions set out in Part 1 of the Bill create the statutory framework for the greenhouse gas emissions reductions in Scotland by setting a 34% reduction target for 2020, to rise to 42% in the event of EU agreement to further reduce its greenhouse gas emissions by at least 30% by 2020, and an 80% reduction target for 2050. To help ensure the delivery of these targets the Bill requires that the Scottish Ministers set annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050.

**The 2050 target**

9. Section 1 sets out the 80% target for 2050. Subsection (1) defines the obligation on the Scottish Ministers as reducing the net Scottish emissions account by 80% by 2050 relative to the defined baseline year. The net Scottish emissions account is defined in section 12 of the Bill. For any one year it will consist of the total of Scottish emissions, reduced by the amount of Scottish removals and adjusted to reflect carbon units credited and debited to the account.

**The interim target**

10. Section 2 sets out the interim target for 2020. It will work in the same way as the 2050 target.

**Modifying the interim target**

11. Section 2A sets out the method by which the interim target can be modified. This can only be modified upwards. Subsections (2) and (3) provide that if the European Union commits to reduce greenhouse gas emissions by at least 30% by 2020, then an order modifying the interim target to a figure of at least 42% must be laid before the Scottish Parliament before the expiry of
an appropriate period. Subsections (4) and (5) contain various definitions including what is meant by an appropriate period. Subsection (6) provides that if the order in subsection (2) is not laid in time, then it has to be laid in draft as soon as reasonably practicable afterwards.

**Annual targets**

12. Subsection (1) of section 3 requires that the Scottish Ministers set annual targets for the maximum amount of the net Scottish emissions account for each year in the period 2010-2050 and must ensure that those targets are not exceeded.

13. Subsection (2) establishes criteria that the annual targets must meet. Subsection (2)(a) specifies that the annual target for the year 2010 is an amount which is less than the estimated net Scottish emissions account for 2009. Subsection (2)(b) requires that the targets for each year in the period 2011-2019 must be set so that each is consistent with a reduction that is in line with achieving the interim target. Subsection (2)(c) requires that the targets for each year in the period 2020-2050 must be set so that each is an amount which is at least 3% less than the target for the preceding year.

**Setting annual targets**

14. Section 4 contains a number of conditions which must be met when the Scottish Ministers set annual targets. Subsections (1) and (2) establish that the targets must be set by order and must be set for certain periods by prescribed dates.

15. Subsection (3) imposes a duty on the Scottish Ministers to take account of both the interim 2020 target and the final 2050 target when setting the annual targets up to 2020. After 2020, the Scottish Ministers must consider the 2050 target when setting the annual targets from 2021 onwards.

16. Subsection (4) details a number of scientific, economic, social, environmental and international criteria which must be considered by the Scottish Ministers when setting annual targets. This list is not intended to be the sole list of factors that the Scottish Ministers consider when setting annual targets and additional factors can also be considered.

**Advice before setting annual targets**

17. Section 5 requires the Scottish Ministers to request and publish expert advice before laying an order containing annual targets and to publish a statement explaining why the annual targets are being set at certain levels, and how these annual targets take account of the target-setting criteria described in section 4(4) of the Bill. The expert advice has to include a view as to whether the annual targets are appropriate by reference to the target–setting criteria. If the Scottish Ministers have chosen to set annual targets in a manner which differs from the expert advice provided, they must publish a statement setting out the reason why. Subsection (5) defines “relevant body” for the purposes of the Part, which will be the UK Committee on Climate Change or a Scottish body designated under section 19.
Modifying annual targets

18. Section 6 allows the Scottish Ministers to modify, by order, annual targets, the minimum annual target percentage reduction applying from 2020, dates by which annual targets must be set and target-setting criteria. The annual targets set by order may only be modified if the Scottish Ministers consider it appropriate to do so as a result of a modification of the interim target or there have been significant changes to the basis on which the annual target was set. Subsections (1)(A) and (1)(B) place a requirement on the Scottish Ministers to lay a report before the Parliament at the same time as laying the draft modifying order explaining why the modification is required and to make a statement to the Parliament relating to this report.

19. Subsection (6) further constrains this ability to modify by preventing its use in the year to which a target relates and its use in a way which would result in the target for the year being greater than the target for the preceding year (i.e. allowing emissions to increase between years). An order to modify the 3% minimum reduction in emissions applying from 2020 may be made only where it is no longer considered necessary for that minimum to be achieved, and it can expressly not be used to substitute a percentage of less than zero. An order to modify either the date by which annual targets are to be set, or the target-setting criteria, may be made only where the Scottish Ministers consider it appropriate.

20. Section 7 requires the Scottish Ministers to request expert advice from the relevant body before laying an order for modification under section 6. If this advice is not followed, this provision requires the Scottish Ministers to lay before the Parliament a report explaining why, and to make a statement to the Parliament relating to the report.

Achievement of annual targets: domestic effort target

21. Section 7A places a duty on the Scottish Ministers to ensure that reductions in net Scottish emissions of greenhouse gases make up at least 80% of the reduction in the net Scottish emissions account in any target year – the “domestic effort target”.

22. Subsection (3) enables the Scottish Ministers to modify, by order, this target so as to substitute a higher figure upwards. Subsection (4) requires that advice from the relevant body must be requested by the Scottish Ministers before making any such modification order and subsection (5) requires the Scottish Ministers to publish a statement if they take a different approach to the advice provided.

Progress towards targets

23. Section 8 requires the Scottish Ministers, from 2011, to request that the relevant body prepare a report on its view on the progress towards achievement of annual targets, the interim target and the 2050 target, a view on whether these targets are likely to be achieved and what further effort may be required to meet the targets.

24. Subsection (2) requires that no later than the end of the second year following an annual target, the Scottish Ministers must request the relevant body to prepare a report detailing its
views on whether the domestic effort target was met in that target year, whether the annual target for the target year was met, the ways in which those targets were or were not met and the action taken by the Scottish Ministers to reduce net Scottish emissions during that year. Subsection (3) requires the Scottish Ministers to lay a response to this report before the Scottish Parliament as soon as reasonably practicable after receiving the report.

**Greenhouse gases**

25. Section 9 defines the greenhouse gases targeted by the Bill and allows for this list of gases to be amended, by order, by adding gases or modifying their description. The power to add new greenhouse gases may be exercised only if it appears to the Scottish Ministers that European or international agreements or arrangements recognise the contribution to climate change of a gas. Before laying an order modifying section 9(1), the Scottish Ministers must request advice from the relevant body.

**The baseline**

26. Section 10 defines the baseline years for each greenhouse gas covered by the statutory targets.

**Baseline years for additional greenhouse gases**

27. Section 11 applies in the situation where the list of target gases for the Bill is expanded and a baseline year is required. If a new greenhouse gas is added to the list of target gases for the Bill, subsections (3) and (4) allow the Scottish Ministers to specify by order what the baseline year is to be and how the net Scottish emissions are to be determined for the baseline year for the new gas.

**Net Scottish emissions account**

28. Section 12 defines the net Scottish emissions account as the aggregate of net Scottish emissions, minus any carbon units credited to the account for the period plus any carbon units debited from the account for the period.

29. Subsection (1A) provides that the net Scottish emissions account for a target year may not be credited with an amount of carbon units which exceeds any statutory limit – the “allowable amount”. Subsection (1B) defines the term “allowable amount” as (a) the amount equal to the limit, set by virtue of subsection 1 of section 18A (Limits on use of carbon units), on the net amount of carbon units that may be credited to net Scottish emissions accounts during the period which includes the target year, or (b) where a net amount of carbon units has been credited to the net Scottish emissions account for any other target year in that period, the balance (if any) remaining of the amount referred to in paragraph (a). Subsection (1C) states that the term “net amount of carbon units” has the meaning given in subsection 3 of section 18A.

30. Subsection (2) enables the Scottish Ministers to provide in regulations which carbon units can be credited to and debited from the net Scottish emissions account, and how this can be
These documents relate to the Climate Change (Scotland) Bill as amended at
Stage 2 (SP Bill 17A)

done. Subsection (3) provides that regulations must ensure that, where carbon units are used to reduce the net Scottish emissions account, they are not also used to offset other emissions elsewhere. This would lead to their “double-counting”.

**Restriction on use in 2010-2012 of carbon units purchased by Scottish Ministers**

31. Section 12A places a restriction on the use in 2010-2012 of carbon units purchased by the Scottish Ministers. Subsection (1) prohibits the Scottish Ministers from crediting the net Scottish emissions accounts for the years 2010-2012 with carbon units that they have purchased. Subsection (2) provides that subsection (1) only applies provided the percentage figure mentioned in section 2(1) (the level of the interim target) is 34%.

**Attribution of emissions to Scotland**

32. Section 13 defines which greenhouse gases are attributable to Scotland for the purposes of calculating net Scottish emissions. These are emissions of greenhouse gases emitted from sources in Scotland plus Scotland’s share of emissions from international aviation and international shipping.

**Scottish share of emissions from international aviation and international shipping**

33. Section 14 allows the Scottish Ministers to make provision, by order, for a proportion of emissions from international aviation and international shipping to be attributed to Scotland. A draft of the first order under section 14(1) must be laid before the Scottish Parliament no later than 1 June 2010, failing which as soon as reasonably practicable afterwards. The order under section 14(1) may make provision for the period or periods in which gases are to be regarded as Scottish emissions, and as to the manner in which such emissions are to be taken into account. Before laying such an order, the Scottish Ministers must seek advice from the relevant body and if this advice is not followed, they must publish a statement explaining why they are following a different approach.

**Scottish emissions and removals**

34. Section 15 defines Scottish emissions and Scottish removals of greenhouse gases, and defines the total of these for a period as the net Scottish emissions for that period.

35. Subsection (2) allows the Scottish Ministers to modify the definition of Scottish removals by order. Subsection (3) requires the amount of emissions and removals to be determined, in so far as reasonably practicable, consistently with international carbon reporting practice, defined in section 17.

**Measurement of emissions etc.**

36. Section 16 provides that emissions, emissions reductions and removals are to be measured in tonnes of carbon dioxide equivalent, and defines that term.
International carbon reporting practice

37. Section 17 defines international carbon reporting practice in terms of the protocols to the United Nations Framework Convention on Climate Change, or other European or international arrangements or agreements which the Scottish Ministers specify by order. This power allows the definition to be updated to take account of new international arrangements and agreements.

Carbon units and carbon accounting

38. Section 18 enables the Scottish Ministers to define “carbon unit” in regulations, and provides the Scottish Ministers with the power by regulations, to establish a scheme or use an existing scheme, for the registering and tracking of carbon units and for establishing and maintaining accounts in which carbon units may be held.

Limits on use of carbon credits

39. Section 18A requires the Scottish Ministers to set limits on the net amount of carbon units which may be credited to the net Scottish emissions account for specified periods. Subsection (A1) allows the Scottish Ministers for a year in the period 2013-2017 to only credit carbon units purchased by them up to a limit of 20% of the reduction in the amount of the net Scottish emission account planned for that year.

40. Subsection (2) lists the periods for which limits on the net amount of carbon units must be set and specifies the dates by which those limits must be set. Subsection (3) defines the term “net amount of carbon units” as C minus D, where “C” is the amount of carbon units credited to net Scottish emissions accounts during the period in accordance with regulations under section 12(2), and “D” is the amount debited during this period. Subsection (4) provides that an order may exclude certain specified carbon units from counting towards any limit set, and subsection (5) requires that if the limit for a period is not set by the corresponding deadline, the limit must be set as soon as reasonably practicable afterwards.

Modifying limits on use of carbon units etc.

41. Section 18B enables the Scottish Ministers to modify, by order, any limits which have been set on the amount of carbon units that may be credited to the net Scottish emissions account, and any dates associated with the limits on carbon units.

42. Subsection (2) specifies the specific circumstances when this order may be made – as a result of firstly a modification of the interim target or secondly, another significant change to the basis on which the limit on these use of carbon units was set and the Scottish Ministers consider it appropriate to do so.
Advice before setting or modifying limits on use of carbon units etc.

43. Section 18C requires the Scottish Ministers to request advice from the relevant body (the UK Committee on Climate Change or a Scottish body designated under section 19 of the Bill) before setting or modifying limits on the net amount of carbon units which may be credited to the net Scottish emissions account for specified periods. If provision is made that is different than that recommended by the relevant body, the Scottish Ministers must publish a statement setting out the reasons why.

PART 2 – ADVISORY FUNCTIONS

Advisory body

44. The emissions reduction provisions in the Bill impose duties on the Scottish Ministers, which require them to establish annual emissions reductions targets in secondary legislation. Ministers will be required to seek expert, independent advice in advance of setting or modifying annual targets, adding greenhouse gases to the Bill, or making provision attributing a proportion of greenhouse gases from international aviation and international shipping to Scotland.

45. Subsections (1) and (2) of section 19 give the Scottish Ministers the power to designate a body or person to undertake the advice functions in sections 5, 7, 8 and 9 and the additional advice functions in sections 22 to 27. Thereafter the body or person will be referred to as the advisory body and will take on the role of the UK Committee on Climate Change.

46. Subsection (3) sets out the functions (the “advisory functions”) which the advisory body has.

47. Subsection (4) sets out examples of what may be included in an order under subsection (1), such as the information requirements for the advice. Subsection (5) defines the term “public body” as used in subsection (1).

Scottish Committee on Climate Change

48. Section 20 allows the Scottish Ministers to establish, by order, a body to undertake the advisory functions under the Bill. If established, this body would be known as the Scottish Committee on Climate Change.

49. Subsection (3) gives effect to schedule 1 which sets out details of the constitution and operation of this Committee and subsection (4) identifies the types of further provision which may be included in an order establishing a Scottish Committee on Climate Change.

Application of sections 22 to 27

50. Section 21 makes it clear that the obligations for this body to provide advice to the Scottish Ministers under sections 22-27 and 45C do not apply until the Scottish Ministers designate,
under section 19, a body to exercise advisory functions. Until such an advisory body is
designated, the Scottish Ministers will seek advice from the UK Committee on Climate Change
(which will be the relevant body for the purposes of sections 5 to 9).

Advice on annual targets etc.

51. Section 22 obliges the advisory body to respond to requests by the Scottish Ministers for
advice on proposed annual targets and proposed modifications of annual targets.

52. Subsection (2) requires the body to provide a view on whether a proposal for an annual
target is appropriate, and explain that view.

53. Subsection (3) requires the body to express views on a number of factors relating to annual
targets. Specifically, it should provide a view on the relative merits of taking action to reduce
emissions, compared with the use of carbon units. It should also express a view on the
contributions to annual and domestic effort targets which may be provided by sectors covered by
trading schemes and those not covered by such schemes, and the contributions to annual targets
that may be made by energy efficiency, energy generation, land use and transport.

54. Subsection (4) requires that the body must provide its advice within the period requested
by the Scottish Ministers. Subsection (5) defines the meaning of “traded sector” for subsection
(3)(b)(i). This refers to the definition contained in section 66 of the UK Climate Change Act
2008.

Reporting on progress towards targets

55. Section 23 requires the advisory body to prepare an annual report setting out its views on
the Scottish Ministers’ progress towards meeting the annual targets, the interim target, and the
2050 target. It should also provide views on whether these targets are likely to be achieved and
views on any action considered necessary to achieve these targets. This duty will be switched on
by the Scottish Ministers at an appropriate time after an advisory body has been designated.

56. Subsection (3) requires that the body’s report in a relevant year must express a view on
matters specified in subsection (3C) which are whether the annual target and domestic effort
target for the target year was met, the ways in which those targets were or were not met, and a
view on the action taken by the Scottish Ministers to reduce greenhouse gas emissions during
that year. It also provides in subsection (3A) that the “relevant year” will be such year as the
Scottish Ministers may, by order, designate subject to certain conditions set out in subsection
(3B).

57. Subsection (4) specifies deadlines for laying the reports before the Scottish Parliament.

Scottish Ministers’ response to reports on progress
58. Section 24 obliges the Scottish Ministers to respond to a report provided by the advisory
body under section 23. This response must be laid before the Scottish Parliament no later than
31 March in the third year following the year for which an annual target has been set, or any
other date as the Scottish Ministers may, by order appoint.

**Duty of body to provide advice or other assistance**

59. Section 25 obliges the advisory body to respond to requests for advice, analysis, information
and assistance by the Scottish Ministers in connection with their functions under the Bill, their
other climate change functions, or in relation to climate change generally.

**Guidance to advisory body**

60. Section 26 requires that the advisory body must have regard to any guidance given by the
Scottish Ministers in respect of its functions under the Bill. Subsection (2) provides that the
Scottish Ministers may not give the body guidance on the content of any advice or report.
Subsection (3) permits the Scottish Ministers to vary or revoke any guidance issued.

**Power to give directions to advisory body**

61. Section 27 gives the Scottish Ministers the power to direct the advisory body in terms of its
functions under the Bill. Subsection (2) provides that the Scottish Ministers may not direct the
body on the content of any advice or report and subsection (3) permits the Scottish Ministers the
to vary or revoke the directions. Subsection (4) requires the body to comply with any
directions given.

**PART 3 – REPORTING DUTIES**

62. The Bill requires that the Scottish Ministers report regularly to the Scottish Parliament on
Scotland’s emissions and on the progress being made towards the emissions reduction targets set
in the Bill.

**Reports on annual targets**

63. Section 28 requires the Scottish Ministers to lay annual reports before the Scottish
Parliament in respect of each year from 2010 to 2050. Subsections (2) to (4) specify information
that the annual report must contain. This includes whether the annual target and domestic effort
targets have been met, and if they have not, the report must explain why. Subsection (5) requires
the annual report to be laid before the Scottish Parliament no later than 31 October in the second
year after that to which the annual target discussed in the report relates.

64. Section 29 specifies further requirements for the content of the information contained in
each annual target report. Subsection 3(aa) requires that the report must state the proportion of
the reduction in the net Scottish emissions account which is accounted for by reductions in net
Scottish emissions. Subsection 4 requires the report to include information on electricity
consumption, electricity generation, the average greenhouse gas emissions per megawatt hour of
electricity generated, and the average greenhouse gas emissions per megawatt hour, and the estimated lifetime cumulative emissions, of any new electricity generation capacity greater than 50 megawatts. Subsection 4(A) requires that the report for each year in the period 2011-2050 must state the amount of the net Scottish emissions account for each preceding target year, and the cumulative amount of the net Scottish emissions account for the target year and all preceding target years.

Reports on proposals and policies for meeting annual targets

65. Subsection (1) of section 30 requires the Scottish Ministers to produce a report as soon as reasonably practicable after making an order under section 4 setting annual targets. Subsection (2) requires this report to set out the proposals and policies intended to meet the annual targets, and their timescales, with an explanation of how these are expected to contribute towards the delivery of the interim target, the 2050 target, and in each target year, the domestic effort target.

66. Subsection (3) requires the report to explain how the proposals and policies are expected to affect the different sectors of the Scottish economy and subsection (4) requires the second and each subsequent report to provide an assessment of progress towards implementation of the policies and proposals in earlier reports, and any adjustments to those policies considered appropriate.

Reports on proposals and policies where annual targets not met

67. If the annual report indicates that the annual target or domestic effort target has not been met, section 31 requires the Scottish Ministers to lay a report before the Scottish Parliament, which sets out the proposals and policies to compensate in future years for the excess emissions.

Reports on emissions attributable to Scottish consumption of goods and services

68. Section 31A requires the Scottish Ministers to lay a report before the Scottish Parliament in respect of each year in the period from 2010 -2050 setting out the emissions of greenhouse gases, whether in Scotland or elsewhere, which are produced by or associated with the consumption and use of goods and services in Scotland during that year, in so far as reasonably practicable. The report can also contain other information the Scottish Ministers think appropriate.

Report on progress towards meeting the interim target

69. Section 31B requires the Scottish Ministers to lay before the Scottish Parliament a report on the progress towards meeting the interim target before 31 December 2015.

Report on the interim target

70. Section 32 requires the Scottish Ministers to lay a report before the Scottish Parliament in respect of the interim target, for the year 2020. Subsections (2) to (8) determine what the report must contain and its timescale for laying.
Report on the 2050 target

71. Section 33 requires the Scottish Ministers to lay a report before the Scottish Parliament in respect of the 2050 target. Subsections (2) to (8) determine what the report must contain and its timescale for laying.

Reports: provision of further information to the Scottish Parliament

72. Section 34(1) requires that where the Scottish Ministers lay various reports before the Scottish Parliament relating to annual targets, the interim target and the 2050 target, they must, immediately send a copy of the report to the persons who convene Scottish Parliament committees, and as soon as reasonably practicable, make a statement on the report in the Scottish Parliament. Subsection (2) specifies all the reports which trigger this obligation. Subsection (3) requires that in terms of the report on the annual target, the Scottish Ministers must attend, if invited, Scottish Parliament committees to give evidence on the report. All of these duties apply only as far as is reasonably practicable. Subsection (4) requires Scottish Ministers to have regard to any resolution or report made following the laying of their own report under subsection (2).

Further provision about reporting duties

73. Section 35 permits the Scottish Ministers to impose new duties on themselves, by order, to report to the Scottish Parliament. Subsection (2) sets out further provision which may also be made by such an order.

PART 4 – DUTIES OF PUBLIC BODIES RELATING TO CLIMATE CHANGE

Duties of public bodies relating to climate change

74. Section 36(A1) places specific climate change duties on public bodies to exercise their functions in the way best calculated to achieve delivery of the targets in the Bill, the way best calculated to help deliver any programme laid under section 45 of the Bill (adaptation) and in a way that they consider most sustainable. Subsection (A2) defines the term “public body” and subsection (3) allows the order to impose different duties on different public bodies.

75. Subsection (1) contains powers to allow the Scottish Ministers, by order, to impose further duties on public bodies in relation to climate change (in addition to those specified in subsection (A1)).

76. Subsections (4) and (5) oblige the Scottish Ministers, in so far as reasonably practicable, to consult with such associations of local authorities and such other persons as they consider appropriate before laying an order imposing such duties. Subsection (6) states that the Scottish Ministers must co-operate with the relevant public bodies to help those bodies comply with duties imposed under this section.
Guidance to relevant public bodies

77. Section 37 requires that the Scottish Ministers give guidance to relevant public bodies in relation to climate change duties and those bodies must have regard to such guidance. Subsections (2) and (3) oblige the Scottish Ministers to consult with such associations of local authorities and such other persons as they consider appropriate before creating guidance, in so far as it is reasonably practicable to do so. Subsection (4) allows the Scottish Ministers to vary or revoke this guidance and subsection (5) requires the Scottish Ministers to publish guidance.

Reporting on climate change duties

78. Section 38 enables the Scottish Ministers, by order, to require relevant public bodies to report on how they are complying with a duty imposed under section 36, and to prepare a report on the actions to address future compliance if they are, following an investigation under section 40, found to be failing to comply with their climate change duties. Subsections (1)(b) to (d) enable the Scottish Ministers to set out what must be in the report, its format, and the time by which it must be submitted to them. Where relevant public bodies are working together on a particular duty, the Scottish Ministers may require them to co-operate with each other to prepare a joint report.

Appointment of monitoring body

79. Section 39 enables the Scottish Ministers, by order, to designate one or more persons or bodies to monitor how relevant public bodies are complying with duties imposed under section 36 or how they are having regard to guidance given under section 37. The person or body is referred to as the “monitoring body”.

Investigations

80. Section 40 enables a monitoring body to carry out investigations into how relevant public bodies are complying with duties imposed under section 36, or whether they are having regard to guidance given under section 37. Section 41 defines the powers of investigators in these circumstances; “investigators” may be either the monitoring body or a person authorised by that body.

Reporting by monitoring body

81. Section 42 enables the Scottish Ministers to direct a monitoring body to prepare a report on its activities, use of resources and any other matters. Those reports will not normally mention continuing investigations unless the Scottish Ministers direct this. Subsection (3) requires the monitoring body to submit the report to the Scottish Ministers, and subsection (4) requires the Scottish Ministers to lay the report before the Scottish Parliament.
Guidance to monitoring body

82. Section 43 requires a monitoring body to have regard to any guidance issued by the Scottish Ministers relating to its functions under Part 4 of the Bill. Subsections (2) and (3) oblige the Scottish Ministers to consult with the monitoring body and such other persons as they consider appropriate, in so far as reasonably practicable, before giving guidance.

83. Subsection (4) allows the Scottish Ministers to vary or revoke this guidance and where a variation is substantial, the Scottish Ministers are obliged to consult the persons listed in subsection (3), in accordance with subsection (2), before varying the guidance. Subsection (5) requires the Scottish Ministers to publish any guidance given under this section.

Power to direct monitoring body

84. Section 44 enables the Scottish Ministers to give directions to a monitoring body relating to its functions under Part 4 of the Bill. Subsection (2) allows a direction given under this section to be varied or revoked. Subsection (3) requires the monitoring body to comply with a direction given under this section.

PART 5 – OTHER CLIMATE CHANGE PROVISIONS

Chapter 1 – Adaptation

Programmes for adaptation to climate change

85. Section 45 applies where the Secretary of State lays a report under section 56 of the UK Climate Change Act 2008 before the UK Parliament on the impact of climate change on the United Kingdom. Where such a report is laid under sub-section (2) the Scottish Ministers must lay a programme before the Scottish Parliament. This programme must set out the Scottish Ministers’ objectives, proposals and policies in relation to adaptation to climate change, including the timescales within which the proposals and policies will be introduced and address the risks identified for Scotland in the Secretary of State’s report. It must also outline arrangements to ensure engagement with stakeholders in delivering the programme, specifically with employers and trade unions and what mechanisms will be used to ensure the public is engaged in meeting the objectives. Subsection (3) requires the Scottish Minister’s programme, where it is a subsequent programme, to also contain an assessment of progress towards the previous programme.

86. Section 45A requires the Scottish Ministers to lay before the Scottish Parliament reports setting out their assessment of progress made towards implementing the objectives, proposals and policies set out in the section 45 programme. It also specifies timescales for when such reports have to be laid.

87. Section 45B applies where the Scottish ministers lay an adaptation programme under section 45(2) and requires independent assessments of the progress made towards such a programme. It requires the Scottish Ministers to request the relevant body to prepare a report.
setting out its assessment of the progress made towards implementing the objectives, proposals and policies set out in that programme. Subsection (2) provides that the request has to be made within 2 years of the day on which a programme is laid by the Scottish Ministers before the Scottish Parliament. The assessments will be conducted by the relevant body, currently the UK Climate Change Committee, until such time as a Scottish advisory body is established.

88. Section 45B also applies where the Secretary of State lays a second or subsequent report under section 56 of the UK Climate Change Act 2008. When this occurs, then the Scottish Ministers must request the relevant body to prepare a further report setting out an assessment of the progress made towards implementing the Scottish Ministers’ most recent programme to adapt to climate change. Under the UK Act, subsequent reports of the Secretary of State are due to be laid every five years after the first.

89. Section 45C only comes into effect when an order is made by the Scottish Ministers designating an advisory body. It requires the Scottish Ministers to request the advisory body to produce an assessment of progress made towards their programmes to adapt to climate change with the same timescales as for section 45B.

**Duty to produce a land use strategy**

90. Section 45D requires the Scottish Ministers to produce a land use strategy.

91. Subsection (1) requires that the Scottish Ministers must lay a land use strategy before the Scottish Parliament no later than 31 March 2011. Subsection (2) requires that the strategy sets out objectives in relation to sustainable land use, proposals and policies for meeting those objectives, and timescales over which the policies and proposals are expected to take effect. Subsection (3) states that these objectives, policies and proposals must contribute to achieving climate change targets, the adaptation programme and sustainable development. Subsection (4) and (5) make provisions regarding publishing a draft strategy, the need for consultation and reporting on consultation. Subsection (6) requires Scottish Ministers to revise the land use strategy at least every five years.

**Variation of permitted times for making muirburn**

92. Section 46 of the Bill inserts a new section 23A into the Hill Farming Act 1946 (the “1946 Act”).

93. Subsection (1) of new section 23A enables the Scottish Ministers to make successive orders specifying the dates before or after which it is lawful to make muirburn in any year. Subsection (1) also clarifies the effect of any order made under subsection (1), that is, to substitute for any of the dates specified in section 23(1), (2) or (3) of the 1946 Act, the dates specified in any such order.

94. Subsection (3) of new section 23A provides that the Scottish Ministers may make an order under new section 23A(1) of the 1946 Act only where they consider it necessary or expedient to do so in relation to climate change. Subsection (3A) of new section 23A prevents the order
making power being exercised so as to reduce the length of the muirburn season below that currently provided for under section 23 of the 1946 Act.

95. Subsection (5) of new section 23A of the 1946 Act provides that any statutory instrument containing an order made under subsection (1) of that section is subject to affirmative Parliamentary procedure.

96. Schedule 2 to the Bill provides for a minor amendment of section 23(1) of the 1946 Act, to clarify that section 23 of the 1946 Act is subject to any provision made by order under new section 23A(1) of that Act.

Chapter 2 – Forestry

Power to modify functions of Forestry Commissioners

97. Section 47(1) allows the Scottish Ministers, by order, to modify the functions of the Forestry Commissioners in or as regards Scotland. Subsection (2) provides that such modifications may be made only where the Scottish Ministers consider it necessary or expedient to allow them to comply with their duties under sections 1, 2 or 3(1)(b) of the Bill to reduce greenhouse gas emissions or more generally in relation to climate change.

98. Subsection (3) provides that the order may modify the Forestry Commissioners’ functions to allow them to form or participate in corporate bodies or trusts.

99. Subsection (3A) places the duty in section 1 of the Nature Conservation (Scotland) Act 2004 on any body corporate established or person appointed by the Forestry Commissioners following an order under section 47 of the Bill

100. Section 64 makes more general provision in relation to the power to make an order under section 47, and makes provision as to the Parliamentary procedure for such an order. Subsections (2) and (3) of section 64 provide that an order made by the Scottish Ministers under section 47 may make different provision for different cases or purposes, or make any appropriate consequential, incidental, supplementary, transitory, transitional or saving provision, including modification of any enactment. Section 64(4) provides that an order made under section 47 is subject to affirmative resolution procedure.

Chapter 3 – Energy efficiency

Duty of Scottish Ministers to promote energy efficiency

101. Section 48 requires the Scottish Ministers, within 12 months of the section coming into force, to publish a plan for promoting energy efficiency and improving the energy efficiency of living accommodation in Scotland. Under subsections (4) and (5), Ministers are required to review the plan at least every 3 years. The plan must set annual energy efficiency targets and describe how those targets are to be reported on.
102. Following a review, the Scottish Ministers must in accordance with subsection (6) publish the plan if the review results in changes to the plan.

103. When preparing a plan and when varying it after a review, subsection (7) requires the Scottish Ministers to have regard to the contribution that improvements to buildings and changes in building standards can make to improving overall energy efficiency and lowering carbon emissions in Scotland.

104. “Energy efficiency” is defined in subsection (8) and includes the use of technologies reliant on renewables sources of energy and the use of materials that produce lower greenhouse gas emissions than alternatives. “Fossil fuel” and “renewable sources” are also defined in subsection (8).

Duty of Scottish Ministers to promote renewable heat

105. Section 48A requires Scottish Ministers to prepare and publish a plan for the promotion of the use of heat produced from renewables sources. Subsection (1A) sets out that the plan must set targets and dates by which the targets are to be met. This subsection also requires that Scottish Ministers describe how the targets will be reported on.

106. Subsection (2) requires the Scottish Ministers to publish, within 12 months of the section coming into force, the plan prepared under subsection (1). Under subsections (3) and (4), Ministers are required to review the plan at least every 2 years.

Laying of plans and reports

107. Section 49(1) and section 48A require the Scottish Ministers to lay the initial plan and any subsequent revised plan before the Scottish Parliament as soon as is reasonably practicable after it is published. Subsections (2) and (3) require Ministers to lay a report before the Scottish Parliament on what steps have been taken to implement the plan. The report must be laid within 12 months of the plan being first published and at least annually thereafter. Under subsection (4) Scottish Ministers are required to make a statement to Parliament as soon as reasonably practicable after the plan is laid.

Energy generating stations: efficiency guidance

108. Subsection (1) of section 49A requires the Scottish Ministers to provide or revise existing guidance using the powers they have under section 36 of the Electricity Act 1989, setting out the conditions subject to which consent will be granted for the construction of new, or for the extension of existing, energy generating stations of a capacity greater than 50 megawatts.

109. Subsection (2) requires that the guidance given under subsection (1) must set out the maximum greenhouse gas emission levels for new or extended power stations per megawatt hour of energy generated, specifying how heat produced from combined heat and power stations is to be included when calculating levels of emissions. This approach is often called setting an emissions performance standard, or emissions limit, for power stations.
110. Subsection (3) provides the Scottish Ministers with the power to vary maximum permitted greenhouse gas emissions permitted for different dates or technologies. This approach could be used to implement the emissions performance standard in a phased manner, so that emissions limits could be varied. Different types of power station emit different levels of greenhouse gases and so the section will allow the Scottish Ministers to reflect these differences in setting the guidance.

111. Subsection (4) requires that the revised or new guidance issued to satisfy the duty in subsection (1) be brought forward no later than 12 months after the commencement date of section 49A.

112. Subsection (5) requires the Scottish Ministers to request advice from the advisory body (a body designated under section 19(1)) regarding the total cumulative emissions budget available for electricity generation in the period 2010-2050. This, essentially, is the total amount of greenhouse gas emissions that electricity generation should emit during that period. The advice sought from the advisory body must include its view as to (a) an appropriate total lifetime greenhouse gas budget per megawatt of generating capacity, and (b) appropriate initial levels of greenhouse gas emissions per megawatt hour of energy generated.

113. Subsection (6) stipulates that if the Scottish Ministers make provision in the guidance issued under subsection (1) different from the advice they receive from the advisory body under subsection (5), they must publish a statement setting out the reasons why.

Non-domestic buildings: assessment of energy performance and emissions

114. Section 50 requires Scottish Ministers to make regulations providing for the assessment of (i) the energy performance of non-domestic buildings, and (ii) emissions of greenhouse gases produced or associated with such buildings or with activities carried out in such buildings, and to make regulations requiring owners of such buildings to take steps to improve the energy performance and to reduce emissions.

115. Subsection (2) sets out some of the provisions which may be included in the regulations, including: the kinds of non-domestic buildings covered; persons who are required to obtain assessments; time periods for carrying out assessments; procedures and methodologies for assessing energy performance and emissions; persons who can carry out such assessments; the issuing of certificates following assessment; the form of any recommendations as to the improvement of the energy performance and reduction of emissions; the manner and periods within which steps must be taken with regard to such recommendations; the registration of certificates; the disclosure of information entered in the register; enforcement authorities; the keeping of records; enforcement of the regulations; and offences.

116. Subsection (3) makes provision about the enforcement authority provided for in the regulations and subsection (4) allows the enforcement authority to levy charges to recover reasonable costs incurred by exercising the functions under the regulations.
117. Subsection (5) defines “non-domestic building” as all buildings, other than buildings which are dwellings. Yards, gardens, outbuildings and other land or buildings associated with dwellings, and any common areas so associated, are also excluded from the meaning of “non-domestic building”.

Living accommodation: assessment of energy performance and emissions

118. Section 50A gives Scottish Ministers powers to make regulations providing for the assessment and improvement of (i) the energy performance of living accommodation, and (ii) emissions of greenhouse gases produced by living accommodation.

119. Subsection (2) sets out some of the provisions which may be included in the regulations, including: the kinds of living accommodation covered; persons who are required to obtain assessments; time periods for carrying out assessments; procedures and methodologies for assessing energy performance and emissions; persons who can carry out such assessments; the issuing of certificates following assessment; the registration of certificates; enforcement authorities; the keeping of records; enforcement of the regulations; and offences.

120. Subsection (3) makes provision about the enforcement authority provided for in the regulations and subsection (4) allows the enforcement authority to levy charges to recover reasonable costs incurred in exercising the functions under the regulations.

Council tax reductions to promote energy efficiency

121. Section 50B requires the Scottish Ministers to make regulations under the Local Government Finance Act 1992 (c.14) that reduce council tax liability by prescribed amounts as detailed in Section 50C for those that install energy efficiency measures and/or renewable energy or heat technologies. This would oblige local authorities to reduce council tax liability for those that met the criteria.

122. Subsection (3) ensures that should someone receive a reduction for an energy efficiency improvement, their eligibility to receive a reduction for installing renewable energy or heat technologies is not affected, and vice versa. It also ensures that should someone receive a reduction for an energy efficiency improvement it will not affect their eligibility for a further reduction for a subsequent improvement.

123. Subsections (4), (5) and (6) allow the Scottish Ministers to specify the maximum number and maximum amount of reductions for any one dwelling in any one financial year, require the Scottish Ministers to specify how eligibility for a reduction is demonstrated, and require that a draft statutory instrument containing the initial regulations is laid before the Scottish Parliament by 31 December 2009.

124. “Energy efficiency improvement” is defined in subsection (7) and the measures that would constitute this are listed, to which the Scottish Ministers may add as provided by subsection (8).
These documents relate to the Climate Change (Scotland) Bill as amended at Stage 2 (SP Bill 17A)

Amounts of reductions in council tax

125. Section 50C details the amount of any reduction in council tax as a result of the regulations in Section 50B dependant on the cost of measures and/or technologies installed.

Review of provision made by virtue of or under sections 50C and (Amounts of reductions in non-domestic rates)

126. Section 50D requires the Scottish Ministers to produce a report after 31 March 2012, and then report annually, on the effectiveness of reducing council tax liability for promoting energy efficiency improvements and technologies reliant on renewable energy or heat.

127. Reference is made in subsections (1) and (3) of section 50D to section 25B of the Local Government (Scotland) Act 1966. Reference is also made in the title of section 50D and in subsections (2) and (3) to section (Amounts of reductions in non-domestic rates). These two sections would have been created by amendments 260 and 262 to the Climate Change (Scotland) Bill which were lodged at Stage 2. These amendments related to non-domestic rates but were not ultimately moved at Stage 2, therefore the two new sections detailed in this paragraph and mentioned in section 50D do not exist.

128. Subsection (2) allows the Scottish Ministers, subject to their conclusions in the report made under subsection (1), to increase the amount of any reduction in council tax [and non-domestic rates] and vary the amounts that have to be spent on improvements and technologies to qualify for a reduction.

129. Subsection (3) allows the Scottish Ministers to vary the mechanism by which the amount of any reductions are calculated based on the cost of improvements and technologies if they conclude this will more effectively promote energy efficiency improvements and technologies reliant on renewable sources of energy.

Tenement management scheme: definition of “maintenance”

130. Section 50E amends the definition of maintenance in schedule 1 of the Tenements (Scotland) Act 2004 to include the installation of insulation.

Permitted development rights

131. Sections 51A and 51B are intended to place duties in statute on the Scottish Ministers under planning legislation to bring forward permitted development rights in specified circumstances for the installation of air source heat pump and wind turbine microgeneration equipment in domestic buildings, and permitted development rights for microgeneration in non-domestic buildings.

132. The Town and Country Planning (General Permitted Development) (Domestic Microgeneration) (Scotland) Amendment Order 2009 already extends permitted development rights to the installation of equipment other than those two technologies. The provisions also
place a duty in statute on the Scottish Ministers under planning legislation to bring forward permitted development rights for an unspecified range of microgeneration equipment in non-domestic buildings.

133. The provisions in the Bill indicate the nature and scope of the consultation that will require to be undertaken, and indicate that there are issues that will need to be considered for their potential impacts on the built and natural environment. Where implemented, the provisions would simplify the planning process and provide a cost saving to applicants.

Chapter 3A – The Scottish civil estate

Energy performance of new buildings procured for the Scottish civil estate.

134. Section 51C(1) places a duty on the Scottish Ministers to ensure, in so far as reasonably practicable, that the energy performance of any constructed building that becomes part of the civil estate in Scotland, falls within the top quartile of energy performance.

135. Subsection (2) sets out the criteria that determine the circumstances in which a building becomes part of the civil estate in Scotland.

Report on the Scottish civil estate

136. Section 51D(1) requires the Scottish Ministers, for each financial year beginning with 2010-2011, to lay before the Scottish Parliament a report containing an assessment of the progress made in the year towards improving (a) the efficiency of buildings that are part of the civil estate in Scotland; and (b) the contribution to sustainability of those buildings.

137. If a building whose energy performance does not fall within the top quartile becomes part of the civil estate in the year, subsection (2) requires the report for that year to explain why.

138. Subsection (3) sets out the buildings to which subsection (2) applies.

139. Subsection (4) contains the deadline by which reports under subsection (1) are to be laid before the Scottish Parliament. For example, for the financial year which ends in March 2011, the report must be laid no later than 31 October 2011.

Scottish civil estate: supplementary

140. Section 51E(1) defines the term “building” for the purposes of this section and sections 51C and 51D and sets out what buildings are to be considered as being part of the civil estate in Scotland for these sections.

141. Subsection (2) contains an order making power to allow specific descriptions of buildings to be included in or excluded from the scope of sections 51C and 51D.
Chapter 4 – Waste reduction and recycling

Waste prevention and management plans

142. Section 52 enables the Scottish Ministers to make detailed provision, by regulations, requiring persons specified in such regulations to make waste prevention and management plans, and to comply with them. Some of the detail which may be included in the regulations is specified in subsection (2), but this is without prejudice to the generality of the section. Some essential terms are defined in subsection (4).

143. The effect of regulations made under this section could be, for example, to provide that a builder should draw up plans for how he proposed to reduce waste generated by a building operation by, for example, the re-use of rubble on-site. On a different scale, they might require an office to prepare a plan showing how it will minimise waste – for example by adopting double-sided printing. A person might be required by virtue of subsection (2)(a) to prepare more than one plan, for instance to deal with different types of waste.

144. Subsection (3) ensures that any enforcement authority appointed in relation to this section must have regard to any guidance the Scottish Ministers may give in relation to its functions, which may include the approval of waste prevention and management plans (subsection (2)(e)(ii)). Further provision about enforcement authorities is made by section 60.

145. It is very likely that a system of enforcement, including offences and penalties, would be required to ensure that plans were actually drawn up and complied with, but this will be a matter for regulations. Maximum penalties which may be imposed in any regulations made under this Chapter are specified in section 61.

Information on waste

146. Section 53 enables the Scottish Ministers to make detailed provision, by regulations, requiring the provision of information by persons specified in those regulations about waste associated with their activities to the Scottish Environment Protection Agency (SEPA). Some of the detail which may be included in the regulations is specified in subsection (2), but without prejudice to the generality of the section. “Waste” is a term which has already been defined in section 52(4): this definition matches that of Directive 2006/12/EC on waste.

147. Subsection (3) refers to section 34(5) of the Environmental Protection Act 1990 (the “1990 Act”). This enables the Scottish Ministers to make regulations requiring those who import, produce, carry, keep, treat or dispose of controlled waste to make, retain and furnish documents. The powers have been used to make the Environmental Protection (Duty of Care) Regulations 1991 (the “1991 Regulations”) and the Special Waste Regulations 1996 (the “1996 Regulations”).

---

1 OJ No. L 114, 27.4.2006, p9
2 1990 c.43
3 SI 1991/2839, as amended by SSI 2003/533
These documents relate to the Climate Change (Scotland) Bill as amended at Stage 2 (SP Bill 17A)

Regulations”). These regulations require notes to be prepared when waste covered by them is transferred. Subsection (3) ensures that regulations made under section 53 are not construed as replacing the separate requirements contained in existing regulations.

148. A new subsection, inserted at Stage 2, establishes that the Scottish Ministers must bring forward regulations establishing a scheme to require the provision of data about waste within a year of Royal Assent.

149. It is very likely that a system of enforcement, including offences and penalties, would be required to ensure that information is provided correctly and timeously, but this will be a matter for regulations. Powers to make such provision are contained in subsection (2)(g) and (h).

Recoverable waste: facilities for deposit etc.

150. Section 54 enables the Scottish Ministers to make detailed provision, by regulations, requiring persons specified in those regulations to provide facilities for the deposit of waste, and requiring that waste deposited in such facilities be collected by an authorised person and, as far as practicable, recycled. Some of the detail which may be included in the regulations is specified in subsection (2), but without prejudice to the generality of the section. “Waste” and “recycling” are terms which have already been defined in section 52(4). “Authorised person” is defined in subsection (5) in terms of section 34(3) of the 1990 Act, and includes local authorities and holders of waste management licences.

151. The power this section grants could be used to require offices to have facilities to collect paper for recycling, for example. Such facilities might be no more than a box, but more complex facilities, such as can-crushers, could also be required, as appropriate. This section could not be used to require facilities to be provided at temporary public events, which are covered by section 55 (see section 54(4)). Subsection (2)(b) may be used to restrict the categories of person who must be allowed to use the facilities, such as staff only in an office environment.

152. Subsection (2)(d) may be used to require an authorised person to remove the waste deposited, for example where the person providing the facilities could otherwise encounter difficulties in getting the waste uplifted. If this power were exercised, subsection (2)(e) could be used to set charges to finance this collection, and the recycling of the relevant material.

153. It is very likely that a system of enforcement, including offences and penalties, would be required to ensure that facilities were provided and used properly, but this will be a matter for regulations. Relevant powers are contained in subsection (2)(h) and (i).

Provision of facilities for deposit of recoverable waste at events etc.

154. Section 55 enables the Scottish Ministers to make detailed provision, by regulations, empowering local authorities to issue notices requiring organisers of temporary public events to
provide facilities for the deposit of waste, and requiring that the waste be collected by an authorised person and, as far as practicable, recycled. Subsection (4) of section 54 ensures that events are not subject to requirements, possibly competing, made under both sections.

155. An example of how the power might be used could be a local authority requiring the holder of a music festival to ensure that facilities to collect the kinds of waste to which such a festival might give rise (such as bottles, cans, or plastic cups) are provided for the duration of that festival.

156. Subsection (2)(g) could be used to ensure that notices were issued sufficiently far in advance of the relevant events. Provision for appeals against notices may be made under subsection (2)(h). Subsection (2)(k) to (n) deal with enforcement and provide for the appointment of an enforcement authority, which need not necessarily be the local authority. Further provision on enforcement authorities is made by section 60.

**Procurement of recyclate**

157. Section 56 enables the Scottish Ministers to make detailed provision, by regulations, requiring persons specified in those regulations to ensure that specified things procured or constructed by them include or contain a certain amount or proportion of recyclate. Some of the detail which may be included in the regulations is specified in subsection (3), but without prejudice to the generality of the section. “Recyclate” is defined by subsection (6) in relation to the definition of “recycling” in section 52(4).

158. Subsection (3)(d) could be used to deal with measurement of the proportion of recyclate present in complex items. Subsection (3)(e) could be used to allow the requirement to procure recyclate to be disapplied on application to the Scottish Ministers, for example where this could conflict with Community internal market rules.

159. It is very likely that a system of enforcement, including offences and penalties, would be required to ensure that recyclate was procured in at least the proper proportion, but this will be a matter for regulations.

**Targets for reduction of packaging etc.**

160. Section 57 enables the Scottish Ministers to make detailed provision, by regulations, setting targets for reducing the amount of packaging in use (subsection (1)(a)(i)), or the amount of greenhouse gas emissions associated with packaging (subsection (1)(a)(ii)). Some of the detail which may be included in the regulations is specified in subsection (2), but without prejudice to the generality of the section. “Packaging” is defined by subsection (4) in terms of Directive 94/62/EC on packaging and packaging waste.

161. Subsection (2)(c) would allow targets to be set by a variety of means, for instance by reference to turnover or market share. Subsection (2)(f) could be used to require the production

---

of baseline information about the amount of packaging in circulation, which might then be used to set targets. It is very likely that a system of enforcement, including offences and penalties, would be required to ensure that accurate information was provided and the targets actually met, but this would be a matter for the regulations.

Deposit and return schemes

162. Section 58 enables the Scottish Ministers to make detailed provision, by regulations, setting up deposit and return schemes for packaging associated with specified products, the products themselves, or both, where Ministers are satisfied that it is necessary or expedient to do so in order to promote recycling. Some of the detail which may be included in the regulations is specified in subsections (3), (4) (5) and (7), but without prejudice to the generality of the section. Subsections (4)(c) and (5)(f) would confer power to require that materials returned under such a scheme were “recycled”, using the definition at the beginning of this Chapter, which includes re-use and recovery. Any scheme would have to take account of the waste hierarchy set out in the Waste Framework Directive (2008/98/EC), which prioritises re-use over recycling (narrowly defined), and both over recovery.

163. Subsection (5) would permit regulations to establish an administrative body (called a “scheme administrator”) to act on behalf of relevant producers and retailers in certain respects. This is dealt with in more detail in section 58A. Subsection (7) deals with matters such as mechanisms for identifying articles and/or packaging as falling within a scheme, customer information and specification of the places to which packaging could be returned and the deposit reclaimed. The latter could for example be used to deal with return of packaging to a different retailer selling similar types of product. It also provides for a scheme of “split deposits”, whereby there could be an element added to the price which was not refundable. This could be used to fund the scheme.

164. It is very likely that a system of enforcement, including offences and penalties, would be required to ensure that deposits were actually taken and repaid, and subsection (7)(i) to (l) contain appropriate powers.

Deposit and return schemes: designation of scheme administrator

165. Section 58(A) sets out the detail of the Scottish Ministers’ powers to designate, by order, a scheme administrator. The administrator may be a new or an existing body. If an existing body is chosen, it is highly unlikely that its existing powers and functions will match those required for the administrator. Subsection (2), therefore, allows the Scottish Ministers to alter the functions of an existing body accordingly. In subsection (3) particular mention is made of powers to borrow or charge, which will be necessary to fund the operation of the scheme.

166. Similarly, while it is common for the Scottish Ministers to have powers to direct bodies which have a relationship with Government (SEPA being an obvious example), Ministers do not have such powers over all bodies to whom the functions of scheme administrator might be given. Subsection (4) ensures that such functions may be given, but only in respect of a deposit and return scheme. Thus, should a body which is not currently subject to a power of direction by the Scottish Ministers be given the functions of scheme administrator, the Ministers could direct it

27
only in respect of those functions. Its pre-existing functions which were not subject to a power of direction would remain unaffected.

**Power to establish scheme administrator**

167. Should a new body be established to act as scheme administrator, it will be necessary for the Scottish Ministers to have appropriate powers to give that new body the full range of functions to run a deposit and return scheme. Section 58B gives the Scottish Ministers those powers, which they may exercise by order. Again, specific mention is made of powers to borrow and to charge. Under subsection (2) any body which may be established to be a scheme administrator shall be a body corporate.

168. Subsection (5) gives Ministers explicit powers to make specific arrangements in relation to issues such as status, constitution, accounts and records. Similarly, the Scottish Ministers may make specific rules for the status, remuneration, allowances and pensions of the members and employees who work for the scheme administrator.

**Finance of scheme administrator**

169. Whether a new or existing body undertakes the functions of scheme administrator, it is likely that financial support will be required, at least temporarily, from the Scottish Ministers. Examples of circumstances in which this need for financial support might arise are during the start-up phase, and during the operational phase where there is a mismatch between the timing of receipts (from charges and sale of recyclate, for example) and outgoings. Section 58C gives the Scottish Ministers power to give financial support to the scheme administrator, whether by grant, loan or financial guarantee. The section gives powers to the Ministers to determine the conditions upon which such support shall be given.

**Charges for the supply of carrier bags**

170. Section 59 enables the Scottish Ministers to make detailed provision, by regulations, requiring persons supplying carrier bags to take goods away to charge for those bags, and requiring that the net proceeds of such charges be applied to environmental good causes. Some of the detail which may be included in the regulations is specified in subsection (2), but without prejudice to the generality of the section.

171. Subsection (2)(c) provides a power to specify the carrier bags in respect of which a charge would have to be made. This could be used to exempt certain bags, for example where Ministers were satisfied that they were likely to be re-used rather than quickly becoming waste.

172. The amount of the charge is to be fixed, and may be varied, by regulations. The charge is to be levied, not by central or local government, but by the supplier of the bag to which the regulations may apply. Subsection (2)(a) to (c) provide that the regulations may apply the charge to particular kinds of goods, or bags, or suppliers of goods. Subsection (2)(e) enables regulations to provide a mechanism for the calculation of the net proceeds of the charge.
173. Subsections (1)(b) and (2)(f) would allow Ministers to ensure that the net proceeds were spent on broadly environmental purposes, and to define those purposes in more detail if that was thought necessary (such as specifying that funds raised were to be spent in Scotland). It is very likely that a system of enforcement, including offences and penalties, would be required to ensure that charges were levied, appropriately accounted for, and devoted to appropriate causes, but this would be a matter for the regulations.

Enforcement authorities

174. Section 53 names SEPA as the enforcement authority in respect of waste information. Other provisions in this Chapter enable the Scottish Ministers to specify, by regulations, enforcement authorities in respect of them. Section 60 allows the Scottish Ministers to specify SEPA, a local authority or such other person or body as may be selected. Subsection (3) allows the functions of an enforcement authority to be divided between different specified bodies. Subsection (4) provides that enforcement authorities may charge to recover costs reasonably incurred in connection with their functions. SEPA, however, already has a charging power under section 41(1) of the Environment Act 1995, so charging in respect of its functions under section 53 has been dealt with as a consequential amendment of that section (see schedule 2, paragraph 2).

Penalties

175. Section 61 sets out the maximum penalties for offences created by regulations under any section in Part 5 of the Bill (namely, section 50 in Chapter 3 and sections 52 to 59 in Chapter 4). The statutory maximum for summary cases (those heard without a jury) is currently £10,000, and was set by the Criminal Proceedings etc. (Reform) (Scotland) Act 2007. It may, however, be varied by order by the Scottish Ministers by powers given by the Criminal Procedure (Scotland) Act 1995.

PART 6 – GENERAL AND MISCELLANEOUS

176. Section 61A provides that the persons mentioned in subsection (2) must in exercising functions conferred on them by virtue of this Act, take into account the need to do so in a way that contributes to the achievement of sustainable development.

177. Section 62 requires the Scottish Ministers and the advisory body, when exercising their functions under the Bill, to encourage equal opportunities and the observance of the equal opportunities requirements.

178. Section 63 provides that the Bill applies to the Crown, including to Her Majesty in her private capacity.

---

6 2007 asp 6
7 1995 c. 46
179. Section 64 provides for the procedure for the making of orders and regulations under the Bill. Subsections (2) and (3) provide that such orders and regulations may make different provision for different cases or purposes, or make any appropriate consequential, incidental, supplementary, transitory, transitional or saving provision, including modification of any enactment. Subsections (4) and (5) provide that all orders and regulations made under the Bill, except a commencement order made under section 67, are subject to affirmative resolution procedure except those listed in subsections (6) and (7). The orders and regulations listed in those subsections are subject to negative resolution procedure, unless they modify an Act of Parliament or an Act of the Scottish Parliament (in which case they are subject to affirmative resolution procedure). Subsection (9) places requirements on Scottish Ministers before laying a draft of any regulations under sections 52 to 59 (other than regulations mentioned in subsection (7)(d) or (e)) and subsection (10) defines the period so specified.

180. The exception to the general rule that order and regulations are subject to affirmative procedure are the powers in relation to the matters in Chapter 4, which are the provisions on waste. Unless these are mentioned in subsection (7)(d) or (e) they must be exercised by means of a procedure which requires the discussion of a draft instrument with the Parliament before it is laid.

181. Section 65 brings together defined expressions used in the Bill and either defines them or indicates where in the Bill definitions of them can be found.

182. Section 66 introduces schedule 2, which contains amendments and repeals to other legislation.

183. Section 67 provides that all of the provisions of the Bill, except this section, sections 22 to 27 (powers and duties of advisory body) and section 64 (providing for procedure for orders and regulations), are to come into force on a day set by the Scottish Ministers by order. This section and section 64 come into force on Royal Assent. Sections 22 to 27 come into force in accordance with section 21 (i.e. when an order designating the advisory body is made under section 19). This section also provides for the short title of the Bill.

SCHEDULE 1 – THE SCOTTISH COMMITTEE ON CLIMATE CHANGE

184. Schedule 1 makes provision for the detailed constitution, powers and proceedings of the Scottish Committee on Climate Change which may be established under section 20 of the Bill. The Committee is to consist of a chair and no fewer than five and no more than eight other members. These numbers may be varied by order made by the Scottish Ministers, subject to negative resolution procedure. Members are to be appointed for a period of up to five years. Members are eligible to be reappointed for one further period.

185. In appointing members, the Scottish Ministers are to have regard to the desirability of the Committee (taken as a whole) having expertise or experience in business competitiveness, climate change policy, climate science and other branches of environmental science, economic analysis and forecasting, emissions trading, energy production and supply, financial investment and technology development and diffusion.
186. Schedule 1 provides for the circumstances in which members may be removed, for the disqualification of MPs, MSPs and MEPs from membership, and for remuneration, pensions and allowances.

187. Schedule 1 also provides for the appointment of a Chief Executive of the Committee, with the approval of the Scottish Ministers, and for the appointment of other staff by the Committee. The schedule makes provision for the procedure of the Committee, for the establishment of sub-committees, for its general powers and for the delegation of its functions. The Committee is to be required to keep proper accounts to be audited by the Auditor General for Scotland, and to publish an Annual Report which is to be laid before the Scottish Parliament by the Scottish Ministers.

SCHEDULE 2 – MINOR AND CONSEQUENTIAL MODIFICATIONS

188. Schedule 2 sets out minor and consequential modifications to other legislation required as a result of the Bill.

REVISED FINANCIAL MEMORANDUM

INTRODUCTION

189. This document sets out the financial implications of the Climate Change (Scotland) Bill (as amended at Stage 2). It should be read in conjunction with the Policy Memorandum and the Bill itself. The Policy Memorandum, published separately, explains in detail the policy intentions of the Bill.

190. The main aim of the Climate Change (Scotland) Bill is to establish a challenging long term target which requires the Scottish Ministers to reduce the emission of those greenhouse gases covered by the Kyoto Protocol by 80% by 2050. The Kyoto Protocol greenhouse gases are carbon dioxide, methane, nitrous oxide and the fluoride gases (hydrofluorocarbons, perfluorocarbons and sulphur hexafluoride), collectively referred to as the basket of greenhouse gases. The Bill also contains provisions on topics with a contribution to make to tackling climate change – through mitigation of greenhouse gases or adaptation to the impacts of climate change.

191. The topics in the Climate Change (Scotland) Bill are set out under five significant parts:

- **Part 1** creates the statutory framework for the greenhouse gas emissions reductions in Scotland by setting an interim 34% reduction target for 2020, to rise to 42% once the EU adopts 30% as its target for greenhouse gas emissions reductions for 2020, and an 80% reduction target for 2050. To help ensure the delivery of these targets this part of the Bill also requires that the Scottish Ministers set annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050.
These documents relate to the Climate Change (Scotland) Bill as amended at Stage 2 (SP Bill 17A)

- **Part 2** contains provisions which will allow the Scottish Ministers to establish a Scottish Committee on Climate Change or to designate an existing body to exercise advisory functions.

- **Part 3** places duties on the Scottish Ministers requiring that they report regularly to the Scottish Parliament on Scotland’s emissions, including the emissions attributable to Scottish consumption of goods and services, and on the progress being made towards the emissions reduction targets set in the Bill.

- **Part 4** places climate change duties on public bodies requiring that they act in the most appropriate way to deliver the emissions reduction targets included in the Bill.

- **Part 5 – Chapter 1** requires the Scottish Ministers to lay programmes on adaptation to climate change before the Scottish Parliament, and to report on these programmes. It also places a duty on Scottish Ministers to produce a land use strategy and provides for an enabling power for the Scottish Ministers to vary, but not shorten, the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

- **Part 5 – Chapter 2** will allow modification by secondary legislation of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change.

- **Part 5 – Chapter 3** contains a number of discrete energy efficiency provisions.
  - Section 48 requires the Scottish Ministers to produce an action plan setting out their current and proposed measures to promote and improve the energy efficiency of buildings in Scotland, as well as setting and reporting annually against a target.
  - Section 48A places a duty on the Scottish Ministers to prepare and publish a plan for the promotion of the use of heat from renewables sources.
  - Section 49 places duties on the Scottish Ministers requiring that they report regularly to the Scottish Parliament on progress of the energy efficiency and renewable heat action plans.
  - Section 49A contains a requirement on the Scottish Ministers to provide or revise existing guidance that sets the conditions subject to which consent will be granted for the construction of new or the extension of existing energy generating stations of a capacity greater than 50 megawatts. There are also requirements regarding the deadline by which this requirement must be complied with and advice which must be sought before the guidance is provided.
  - Section 50 contains measures for assessing the energy performance of existing non-domestic buildings in order to raise awareness of the contribution that those buildings can make to mitigating climate change through reducing energy demand and thereby emissions of greenhouse gases.
  - Section 50A contains provisions which permit Scottish Ministers to promote energy efficiency and improve the energy efficiency of living accommodation.
Section 50B contains provisions which require the Scottish Ministers to make regulations which would facilitate local authorities reducing the amount of council tax a person is liable to pay if that person makes an energy efficiency improvement or installs technology reliant on renewable energy or heat in a domestic dwelling.

Section 50C details the amount of any reductions in council tax as a result of the regulations in section 50B dependent on the cost of measures and or technologies installed.

Section 50D requires annual reports to be made by the Scottish Ministers regarding the effectiveness of specific financial incentives towards promoting energy efficiency improvements and technologies reliant on renewable sources of energy or heat. This section also provides Scottish Ministers with the power to vary the amounts and the criteria involved.

Section 50E amends the definition of maintenance in schedule 1 of the Tenements (Scotland) Act 2004 to include the installation of insulation.

Sections 51A and 51B extend permitted development rights to air source heat pumps and domestic turbines, and microgeneration equipment.

Sections 51C, 51D and 51E contain provision regarding the procurement and construction of buildings of new buildings which become part of the civil estate in Scotland and duties concerning reports which must be made concerning the efficiency and sustainability of those buildings.

Part 5 – Chapter 4 contains provisions which will enable the Scottish Ministers to make regulations relating to the acquisition of accurate information about waste and the promotion of waste reduction and recycling by different methods.

PART 1 – EMISSIONS REDUCTION TARGETS

2050 Target

192. Part 1 of the Bill establishes the 2050 emissions reduction target for the basket of greenhouse gases and underpins this long term target with a framework of annual targets. This Bill establishes targets which go beyond the findings of known studies and reports which explore and estimate the potential costs of addressing climate change, globally and in the UK.

193. Estimating costs can be done in two ways. One is to look at the resource costs of measures including the introduction of low carbon technologies and changes in land use, compared with the costs of the business as usual alternative. The second is to use macroeconomic models to explore the system-wide effects of the transition to a low carbon economy. These can be helpful in tracking the dynamic interactions of different factors over time. However these approaches are inevitably complex and their results can be affected by a whole range of assumptions. The studies described below provide a useful starting point for identifying the potential costs to Scotland of delivering emission reductions in 2050 in order to meet the 80% target.
194. The Stern Review on the Economics of Climate Change\(^8\) is considered to be the most comprehensive review carried out to date on the economics of climate change. The Stern Review report states all countries will be affected by climate change and unabated climate change risks raising average temperatures by over 5°C from pre-industrial levels. Based on the assessment of the science carried out by the Intergovernmental Panel on Climate Change on 2001, the Review report states that the dangers of unabated climate change will be an increase in global temperature and that an increase of 2-3 °C will reduce global GDP by between 5% and 20%.

195. By contrast the report estimates the costs of stabilising greenhouse gas concentrations in the atmosphere to avoid such a temperature rise, to be 1% (+/-3%) of global GDP\(^9\). This range assumes that sensible policies are put in place and deliver the induced technological progress required.

196. Stern goes further to indicate that there are also likely to be economic benefits associated with taking action to shift to a low carbon economy and reports that the global market for low carbon technologies could be worth at least $500 billion per annum by 2050 if the world acts on the scale required.

197. A report commissioned by the Department for Business Enterprise and Regulatory Reform (BERR)\(^10\) has estimated the market potential for the low carbon market in Scotland. In 2007, the low carbon market was worth £8.5 billion to the Scottish economy, and accounted for 73,000 jobs. It also estimates that the sector grew by 5.1% in 2007/08, which is more than double the growth rate of the Scottish economy as a whole over that period.

198. The “80% Challenge: Delivering a low-carbon UK” report by the Institute for Public Policy Research, WWF and RSPB\(^11\), published in October 2007, used the same economic model as that used for the UK Impact Assessment for the UK Climate Change Act\(^12\) (refer to paragraph 8), to indicate that an 80% reduction in carbon dioxide emissions, including international aviation and shipping emissions, may cost up to 3% of GDP in 2050. It can be expected that increasing the target to include the other five gases will increase this estimated cost.

199. The Final Impact Assessment for the UK Climate Change Act\(^13\), published in April 2008, indicates that the long term costs to the UK of achieving a 60% reduction in carbon emissions are likely to be in the range 0.3-1.5% of GDP in 2050, depending on the price of fossil fuel and the availability of low-carbon technologies.

---

\(^8\) The Stern Review was published on 20 October 2006 by HM Treasury and was carried out by Sir Nicolas Stern, Head of the UK Government Economic Service and former World Bank Chief Economist. [http://www.hm-treasury.gov.uk/sternreview_index.htm](http://www.hm-treasury.gov.uk/sternreview_index.htm)

\(^9\) World Bank estimates suggest that 1% of global GDP equates to around $650 billion, taking into account both exchange rates and also the purchasing power of each world currency against the dollar, in 2007. [http://www.berr.gov.uk/files/file50253.pdf](http://www.berr.gov.uk/files/file50253.pdf)

200. On 7 October 2008, the expert, independent UK Committee on Climate Change\textsuperscript{14} issued its advice on the level of emissions reductions recommended for the UK. It advised that the UK should aim to reduce emissions of Kyoto Protocol greenhouse gases by at least 80\% by 2050. Based on the Stern Review Report data, the Committee estimates that stabilisation of greenhouse gases at levels of 500-550ppm carbon dioxide equivalent, are between 1\%-2\% of GDP in 2050. This is significant, but is fully consistent with continued growth and development, in contrast with unabated climate change which will eventually pose significant threats to growth. The Committee also stated that the costs to the UK of this level of emissions reductions can be made affordable with appropriate policies and trajectories.

201. The UK Government has agreed with this recommendation and announced on 16 October 2008 that they would seek to amend the target in the UK Climate Change Act to match these recommendations. These amendments to the UK Bill were agreed on 28 October. Meeting an 80\% target is viewed by the Committee as challenging but feasible based on a range of options for reducing emissions including:

- Energy efficiency improvement in buildings and industry (eg. loft and cavity wall insulation, use of more efficient appliances, turning appliances off and using less air conditioning), which will be particularly important for reducing emissions in the period to 2020.
- Decarbonisation of the power sector, starting now and continuing through the 2020s, based on replacing existing conventional fossil fuel fired plant with renewable technologies (e.g. wind and tidal) and carbon capture and storage.
- Transport sector decarbonisation, first through improving fuel efficiency of conventional engines and increased use of sustainable first generation biofuels, with progressive introduction of new technologies such as electric cars, plug in hybrids and hydrogen vehicles, and second generation biofuels.
- Heat sector decarbonisation through increased use of biomass in boilers and combined heat and power, air exchange and ground source heat pumps, and modern electric storage heating.
- Decarbonisation of industry and the energy intensive sector in particular, through the introduction of new technologies such as carbon capture and storage to decarbonise the energy used to produce products such as cement, iron and steel.

2050 target – Costs for the Scottish Government, local authorities, public bodies and Scottish businesses

202. The Scottish Government’s assessment of the potential range and timing of options to deliver an 80\% reduction are tied up with actions at the EU and UK level. The first overview assessment of potential options was published in November 2008\textsuperscript{15} with a focus on measures likely to have a material and lasting impact on emissions in 2050. This is not to downplay the

\textsuperscript{14} The UK Committee on Climate Change is currently operating in shadow form pending its formal establishment under the UK Climate Change Act.

\textsuperscript{15} AEA Energy & Environment, ‘Mitigating against climate change in Scotland: Identification and initial assessment of policy options.’ November 2008
importance of other supporting policy measures such as advice, procurement and training, but recognises the overarching nature of the initial study.

203. The study concludes that options available and currently known could generate an emissions reduction of around 75% based upon our 1990 emissions figure. This percentage includes options about which there is currently considerable uncertainty, so focussing in on the more certain options within this long list, the report concludes that this sub-set of options could potentially deliver around 63% of the total emissions reduction necessary. It is extremely difficult to cost even this sub-set of options but the report further concludes that implementing these measures in 2050 might cost in the region of £1.7 billion (expressed in 2005 prices). This figure is not an assessment of the wider economic costs from implementation nor does it disaggregate the overall cost to show how it falls between producers, consumers or taxpayers. The cost simply relates to the cost of implementing those particular measures in that year.

204. A further study covering the wider economic and societal costs and benefits has also been published. The overall conclusions suggest that reductions in carbon dioxide emissions from a number of policy options may be at the cost of a small reduction in GDP, but it is always important to bear in mind Stern’s conclusions that the “do nothing” option will be far more costly in the long run. The results from this Fraser of Allander study should be seen as early findings illustrating the potential trade-offs across different sectors of the economy rather than a comprehensive answer on the economic cost of meeting our emissions target.

205. The UK Committee on Climate Change cost estimate for delivering the UK Bill target of 80% emissions reduction in 2050, i.e. 1%-2% of GDP, is a close cost comparison available for calculating the cost of delivering the Scottish 2050 emissions reduction target. Estimates for the impact on the UK as a whole are an appropriate proxy for the cost for Scotland as the structure of the Scottish economy is broadly similar to the structure of the UK economy. For example the manufacturing sector represents approximately 14% of the output from the Scottish economy, whereas the corresponding figure for the UK is 14.7%.

206. Chapter 14 of the UK Committee on Climate Change’s first report analysed the economic impacts of the UK Climate Change Act on employment and output in Scotland, Wales and Northern Ireland. It identified the possible implications in each devolved administration as consumers and firms respond to increased production costs and possible competitiveness impacts. In Scotland, sectors at risk are estimated to account for only a small proportion of output and employment, although there is a risk of localised impacts. Sectors at risk account for

---

16 Fraser of Allander Institute and Department of Economics, University of Strathclyde, ‘The impact on the Scottish economy of reducing greenhouse has emissions in Scotland: Illustrative findings from an experimental computable general equilibrium model for Scotland, November 2008

18 Sectors regarded as at risk would have to meet two criteria. Energy costs should be a significant proportion of production costs and/or Gross Value Added (GVA), such that increases in energy costs due to carbon prices would significant impact output prices. Also, products should also be tradable or potentially tradable so that transport costs should not be prohibitive. Sectors at risk have been divided into three categories according to production cost increase:

- **Category 1** cost increase as a % of GVA is greater than 25% (plus aluminium)
- **Category 2** cost increase as a % of GVA between 15% and 25%
- **Category 3** cost increase as a % of GVA between 5% and 15%
less than 1% of GVA and less than 0.5% of employment. Over time, growth in the low carbon sectors should be capable of absorbing any output loss in energy intensive sectors.

207. On this basis, the potential costs of delivering an 80% emissions reduction in Scotland could also be considered to be in the region of 1%-2% of GDP in 2050. Were this cost applicable in 2006, not 2050, then Table 1 shows that the potential Scottish costs would be in the region of £1-£2 billion. Clearly 1-2% of GDP in 2050 will generate a higher figure. These costs will apply across the whole of the Scottish economy – Scottish Government, local authorities, public bodies and Scottish businesses.

208. The cost referred to in paragraph 207 is an estimate based on the preliminary work commissioned by the Scottish Government in identifying how Scotland can meet the 80% emissions reduction target in 2050. This preliminary work represents the first steps in a progressive process and will be built on by the Scottish Government’s Strategic Overview project. The main output of this project, the Climate Change Delivery Plan will be published by the end of June 2009. For the purposes of costing the delivery of the 2050 target at this time, the Scottish Government intends to use the cost information referred to in paragraph 207 i.e. 1-2% of GDP in 2050.

209. Costs in 2050 are not transferrable to earlier years as there will likely be a very different cost profile in between. Emissions reductions to 2050 are unlikely to follow a straight line trajectory. Reductions will occur through the advancement of technology as well as through changing demand and changing behavioural patterns. The introduction of a small number of measures can be expected to result in a step change in Scottish emissions (e.g. new, more carbon-efficient power stations coming on line). Others will lead to a gradual change in emissions (e.g. take up of new vehicle technology) while advances in building efficiencies may be significantly slower to reduce emissions. Each of these changes will impose different costs on different sectors of the economy at different times over the period to 2050. It is not possible to accurately predict when technologies will be introduced or the rates of reductions that will occur from changing behaviours and shifting demand. Overall, with all these factors in play, it is impossible to accurately predict what will happen and when. That is why it is not possible to predict cost profiles during the period of change in the years out to 2050.

210. These costs will be borne by producers and tax payers through higher input prices for goods and public services and by consumers through higher retail prices, leading to lower overall GDP of the order highlighted in the previous paragraph. There is considerable uncertainty about precisely where these costs will fall, and how they will impact on output by sector will depend upon the paths chosen to deliver the emissions reductions.

211. However, in a global context, it should be noted that the cost estimate of taking action to reduce emissions is lower than the cost to society if no action is taken to alleviate climate change – estimated by the Stern Review to be in the order of 5-20% of global GDP.

2020 target – Costs for the Scottish Government, local authorities, public bodies and Scottish businesses

212. Similar difficulties arise with costing the delivery of the 2020 target with any certainty. In addition to steady, year-on-year emissions reductions (e.g. arising from enhanced energy efficiency), some of the more significant emissions reductions will take the form of step changes resulting from, for example, the introduction of new technology. This means that in practice a straight line reduction trajectory is unlikely. For example if carbon capture and storage is
successfully introduced as a mechanism for avoiding emissions of carbon dioxide into the atmosphere, the national reduction trajectory will take the form of series of step changes as the technology is adopted at fossil fuelled power stations.

213. Currently there are not any climate change studies which estimate the costs of reducing emissions by 2020 which could provide a reference point on which to base Scottish costs. As emissions reductions will not occur in a straight line trajectory, taking a proportion of the cost estimated for delivering the 2050 target would not provide a credible cost estimate. The risks and errors with such an approach are too significant.

Annual targets – Costs for the Scottish Government, local authorities, public bodies and Scottish businesses

214. The long term target 2050 target will be underpinned by a series of annual targets, the first of which will be set by order in 2010. The Bill does not specify the methods by which the annual emissions reductions targets are to be delivered. The costs and efficiencies arising as a result of the proposals will depend on a large number of interrelated factors. These include wider economic variables such as macroeconomic conditions and GDP growth, largely exogenous factors such as average winter temperatures and the stability of European energy markets and points more specific to Scotland such as the level at which the annual targets are set, the gradient of the emissions reductions trajectories selected and the costs of the available abatement technologies adopted over the period to 2050. All statutory orders prescribing annual targets will be accompanied by a regulatory impact assessment (RIA) which details the likely cost implications.

215. The Scottish Ministers will be required by the Bill to seek expert, independent advice to identify the most cost effective emissions reductions available when setting annual targets and when identifying the most cost effective way of delivering the post-2020 emissions reduction trajectory required by the Bill.

216. At this time it is not possible to identify what these annual targets will be or how much it will cost to deliver them, at least in part because baseline future emissions are strongly linked to economic activity. As discussed earlier, costs in 2050 are not transferrable to earlier years as there will likely be a very different cost profile in between. This why it is not possible to provide costs for delivering the emissions reductions targets in earlier years.

217. More specifically the Scottish Government expects to be informed on a number of issues by independent advice, which in the first instance is to be obtained from the UK Committee on Climate Change. Under the UK Climate Change Act, the Committee provided advice to the UK Government on 1 December 2008 on the recommended emissions budgets for the first three UK budget periods. The Scottish Government intends to ask the Committee to draw on this advice and advise on the level of annual targets to be set under the Scottish Bill and on the most cost effective abatement methods available to deliver these targets. This advice is not expected to be available until early 2010. Pending this advice it is not possible to quantify the cost of delivering the annual targets to be set under the Bill.
218. In the event of Scotland failing to meet an annual target, the Bill includes powers to address any excess in emissions through the purchase of carbon units. Carbon units represent emissions reductions from recognised sources outside of Scotland. The Bill requires that 80% of the net Scottish emissions account reductions be delivered through emissions reductions in greenhouse gas emissions. It also limits the carbon credits that Scottish Ministers can purchase from 2013 to 2017 to 20% of the required reduction in the net Scottish Emissions Account.

219. Emissions data for Scotland is currently produced by disaggregating UK emissions data. This information is available eighteen to twenty months after the end of a reporting year. Therefore the first year in which these costs might arise for the purchase of units is 2012 in connection with Scotland’s emissions performance in 2010. The cost of purchasing carbon units is determined by the market but is expected to range from at least £15 - £30 per tonne of carbon dioxide equivalent. Should Ministers take up the option to purchase carbon units, the cost can be expected to fall to the Scottish Government from 2012 onwards. It is not possible to estimate at this time exact costs of purchasing carbon credits as this will depend on whether the annual targets are met and if there is any failure, the extent of that failure.

220. The cost of meeting a specific annual or interim target will form part of the overall cost of meeting the 2050 target. For information the cost of any carbon unit purchase represents a transfer of money from Scotland to the country generating a validated carbon unit.

Carbon accounting – Costs for the Scottish Government local authorities, public bodies and Scottish businesses

221. In relation to the net Scottish emissions account, the Bill will allow for the Scottish Ministers to create a scheme, by order, for the tracking of carbon units and establishing and maintaining accounts for holding carbon units. Such a scheme could be administered by the Scottish Government and any costs would be absorbed within existing administration budgets. The potential annual cost of this task is estimated to be £60,000. This cost is based on the employer costs of employing the equivalent of a policy analyst, costed at approximately £60,000 per annum. It is possible that this cost could also be applied in an alternative manner by employing a range of lower grade staff, with employer costs not exceeding this £60,000 estimate.

222. If the Scottish Ministers do create a carbon accounting scheme, these costs will apply to the Scottish Government. There will not be any associated costs for local authorities or Scottish businesses. If the Scottish Ministers require a public body to undertake this activity on their behalf, for example the Scottish Environment Protection Agency, these costs could apply to the public body instead of the Scottish Government.

PART 2 – ADVISORY FUNCTIONS

Advice from the UK Committee on Climate Change Committee

223. The emissions reduction provisions in the Climate Change (Scotland) Bill impose duties on the Scottish Ministers, which among other things, require the Scottish Ministers to establish annual emissions reductions targets in secondary legislation. Ministers will be required to seek expert, independent advice in advance of setting annual targets. It is expected that this advice will be sought from the UK Committee on Climate Change, or corresponding Scottish
Committee, on these annual targets, on the basis of the most cost effective abatement mechanisms for reducing greenhouse gas emissions.

224. If the Bill is approved by Parliament, the first main task for the Scottish Ministers, after it is enacted, will be to set the annual targets for greenhouse gas emissions reductions. These annual targets will be set in batches with the first batch of annual targets expected to cover the period up to and including 2022. Each set of annual targets will be prescribed in orders. All such orders will be accompanied by a fully costed Regulatory Impact Assessment (RIA), detailing the abatement and mitigation policies required to deliver the relevant set of annual targets. The Bill will require the first set of annual targets to be established by June 2010 with subsequent sets established by order at intervals thereafter. This will ensure that a clearly defined statutory reduction pathway is available to guide abatement effort over the short to medium term.

225. The Scottish Ministers intend to seek advice in the short term from the UK Committee on Climate Change. As one of the devolved administrations contributing to the UK target, Scotland has committed to fund this independent, expert Committee and its financial contribution for 2008-09 is £275k, which includes set-up costs and the initial phase of research. Future contributions are expected to be similar although additional funding may be required if the Committee is commissioned to provide advice and the cost of that task is particularly expensive, for example, because the Committee requires to recruit more staff or commission external research in order to develop the advice. Analysis related to the Scottish target and trajectory may at times require extra funding for this reason.

226. If the Scottish Ministers decide to establish a Scottish Committee on Climate Change in the future, for which provision is made in the Bill, the annual costs could be in the region of £2.5m, similar to the current annual cost of running the UK Committee (refer to Table 2). The nature of the advice required and the range of expertise necessary in such a Committee suggests that it would be difficult to save costs by adopting a scaled down operation for Scotland. This would represent a potential increase in costs. There would be little, if any, saving on the core contribution to the UK Committee which advises all 4 administrations on their shared objective of the UK target in the context of a wide-ranging analysis of the UK situation as a whole. There would be a saving in that it would not be necessary to commission any analysis relating to the Scottish target from the UK Committee on Climate Change which might incur extra costs if the task were expensive to carry out. Utilising the expertise of the UK Committee on Climate Change remains the most cost effective option for obtaining advice, currently available to the Scottish Ministers.

**PART 3 – REPORTING DUTIES**

227. The Bill establishes a number of reporting requirements for the Scottish Ministers linked to the greenhouse gas emissions targets. All of these will have a minimal cost impact on the Scottish Government and any costs will be absorbed within existing administration budgets. The potential annual cost of this administration task is estimated to be £17,000 (50% of a policy officer’s employer costs costed at approximately £34,000 per annum).

228. The different reporting requirements are:

- An annual report on greenhouse gas emissions in Scotland;
- A report and statement on proposals and policies designed to meet future annual targets, published as soon as practicable after each set of annual targets are set;
- A report and statement on remedial measures in the event that an annual emissions target is exceeded;
- Reports on policies and proposals for adaptation to climate change (under Part 5, section 45), in response to each UK wide risk assessment issued under the UK Climate Change Act;
- A statement as to whether the 2030 greenhouse gas emissions reduction target has been met;
- A final statement on whether the 2050 greenhouse gas emissions reduction target has been met.

19 Corporate identity costs were only necessary in 2008-09 when the Committee became a statutory body after Royal Assent.
229. The main emissions target provisions do not apply any reporting duties to local authorities or other public bodies.

**PART 4 – DUTIES OF PUBLIC BODIES RELATING TO CLIMATE CHANGE**

**Power to impose duties on public bodies in relation to climate change**

230. The Scottish Ministers anticipate that all sectors of society will play their appropriate part in reducing the emissions of greenhouse gases and therefore contribute to tackling climate change.

231. The Bill requires that public authorities, must in exercising their functions, act in the way best calculated to deliver the targets set by the Bill, help deliver any adaptation programme introduced under section 45 and act in way that it considers most sustainable.

232. Overall these duties can be considered to contribute to delivering the emissions targets contained by the Bill and therefore would not pose an additional cost above that required to meet the annual targets, the 2030 target and the 2050 target. If additional specialist duties for public bodies are introduced through an order, such an order would be accompanied by a fully costed Regulatory Impact Assessment.

*Table 3: Summary of potential costs for Parts 1-4 Emissions Reductions*

PART 5 – OTHER CLIMATE CHANGE PROVISIONS

CHAPTER 1 – ADAPTATION

Programmes for adaptation to climate change

233. Section 45 requires the Scottish Ministers to take specific action where the Secretary of State lays a report before the UK Parliament on the impact of climate change under section 56 of the Climate Change Act 2008.

234. As soon as reasonably practicable following receipt by them of the Secretary of State’s report, the Scottish Ministers must respond by laying a programme before the Scottish Parliament which addresses the adaptation risks identified under section 56 of the UK Act and which sets out the Scottish Ministers’ adaptation objectives and their proposals and policies for meeting these objectives. After the first laying of the report, subsequent reports will require the Scottish Ministers to include within their programmes an assessment of progress under the previous programme.

235. This action will initially be triggered within three years of the in-force date of the relevant section of the UK Act, and thereafter at least once every five years. But the response required will form a considerable part of a policy official’s workload when it is required. Overall it is anticipated that this work will be absorbed within existing administration budgets and will approximate to 50% of a policy analyst’s time during the year in which the duty is triggered. This is cost is estimated as £30,000 based on the employer costs of employing the equivalent of a policy analyst, costed at approximately £60,000 per annum. This cost will only occur for the Scottish Government. It is possible that this cost could also be applied in an alternative manner by employing a range of lower grade staff, with employer costs not exceeding this £30,000 estimate.

Land use strategy

236. A comprehensive land use strategy will provide a means of pulling together, with a focus on climate change, a number of different policies, such as those relating to agriculture, food, forestry, renewable energy, soils, water and conservation.

237. The provisions in Part 5, Chapter 1 of the Bill require Scottish Ministers, following consultation on a draft, to lay a land use strategy before the Scottish Parliament no later than 31 March 2011. The land use strategy is to be revised every five years. The main costs associated with the production of a land use strategy will be administrative and can be expected to be in the region of £300,000. This takes account of staff costs, the central costs of producing and consulting on the strategy and associated tasks such as a Strategic Environmental Assessment which could itself cost in the region of £50,000.
Variation of permitted times for making muirburn

238. Muirburn is a current land management activity, which must adapt to the effects of climate change in order to remain effective. The making of muirburn is the act of controlled burning of vegetation on open muir or moorland. Its use provides fresh food sources on rough grassland or actively managed grouse moors and it manages older vegetation which can be a source of fuel for wildfires.

239. The making of muirburn is regulated by the Hill Farming Act 1946 which provides that muirburn is permitted at prescribed times of the year. In Scotland, climate change has altered climate and seasonal weather patterns and as a result, the ability of muirburn as a land management tool has been, and will in the future be adversely affected.

240. The provisions in Part 5, Chapter 1 of the Bill will give the Scottish Ministers the power to use secondary legislation to set and vary the permitted periods for making muirburn where they consider it necessary in relation to climate change. As muirburn is a current activity, the order-making power is not expected to give rise to additional costs. The administrative costs incurred by the Scottish Government in bringing forward an order are expected to be minimal and will be absorbed within existing administration budgets.

CHAPTER 2 – FORESTRY

Renewable energy development on the national forest estate

241. These provisions will allow the Scottish Ministers to confer functions on Forestry Commissioners in Scotland by secondary legislation, where they consider it necessary or expedient in relation to climate change. The immediate intent is to take forward proposals to allow the Forestry Commission to enter into joint ventures for renewable energy development.

242. Renewable energy development on the National Forest Estate through joint ventures will be revenue generating. Recent studies have shown that there is significant untapped potential for wind and hydro developments on the national forest estate. Annual net income potential might be expected to reach perhaps £10m/yr by 2012 and perhaps £30m/yr by 2020. Initial capital costs to the Forestry Commission will depend on specific joint venture arrangements, but the use of the renewables sites themselves as the Forestry Commission share is preferred. There are further options to fund initial capital from routine land disposal programmes.

243. Additional cash resources will be required by the Forestry Commission Scotland (FCS) initially to establish joint venture arrangements, estimated at £0.5m/yr in 2009/10 and 2010/11. This will be found from FCS’s operational budgets.

244. This proposal will not create additional financial burdens on local authorities or other public bodies, individuals and businesses. As well as helping to mitigate climate change, an enhanced rate of woodland creation will provide economic stimulus to Scotland’s forestry sector.
PART 5, CHAPTER 3 – ENERGY EFFICIENCY

245. Chapter 3 of the Bill aims to improve the energy performance of domestic and non-domestic buildings and improve energy efficiency generally across Scotland.

Section 48 – Duty of Scottish Ministers to promote energy efficiency

246. These provisions will put a duty in statute on the Scottish Ministers to produce a plan for promoting energy efficiency in Scotland. The action plan will provide details of the measures to improve energy efficiency and/or to promote micro-generation across all Scottish Government Directorates and to set annual targets and describe how those targets are to be reported on. This duty is part of current planned activity, is not expected to give rise to additional resources and will be met from within existing Scottish Government administration budgets.

Section 48A – Duty of Scottish Ministers to promote renewable heat

247. These provisions will put a duty in statute on the Scottish Ministers to produce a plan for the promotion of the use of heat produced from renewable sources. The action plan will provide measures to develop, grow and promote the sector in Scotland. Furthermore the provisions will require that the plan must include targets and describe how these targets will be reported upon. Finally when the plan is laid before Parliament, Scottish Ministers must make a statement on the plan. This duty is part of current planned activity, is not expected to give rise to additional resources and will be met from within existing Scottish administration budgets. An estimate of staff resource is in the region of £35,000-£40,000 per year. Other activity is currently funded through a number of existing support programmes – Community and Renewable Energy Scheme, Energy Saving Scotland – Home Renewables and Scottish Biomass Heat Scheme which offer advice and capital grants to support renewable energy installations. Additionally the Renewable Obligation (Scotland) supports combined heat and power plants generated from renewable fuels. It is not envisaged that there will be any costs arising from these provisions for local authorities, individuals or businesses.

248. The Community and Renewable Grant Scheme and the Householder Renewables Initiative aims to bring renewable energy to households and communities across Scotland. Both assist with the installation of a range of renewable technologies, one for households and one for communities. The support includes capital grants and advice which is delivered by a team of development officers based across Scotland. The total budget allocation over the current spending review period is £13.5 million per annum.

249. The Scottish Biomass Heat Scheme is a capital grants scheme targeted at the business sector to help with the costs of installing a biomass heating system and for demonstration of district heating. The budget for the programme is £3.3 million over the financial years, 2009-10 and 2010-2011. This total budget is used for renewable heat.
Section 49A – Energy generating stations: efficiency guidance

250. The policy intention behind section 49A is to reduce emissions from the power generation sector in line with the overall 80% greenhouse gas reduction target of the Bill. To do so will require power stations which emit low levels of CO2.

251. The section does not specify particular types of generating station, and states that the Scottish Ministers may vary the maximum greenhouse gas emissions permitted by different technologies. The section could apply equally to all types of power generation, including wind power, nuclear power, biomass power, combined heat and power, solar power, coal power and gas power.

252. Given that emissions levels are highest from coal and gas-fired stations, it is likely that the greatest reductions in emissions under section 49A would be expected to come from these types of generation. Standard coal-fired plants currently emit around 900g of CO2 per kWh, with supercritical plants around the 700g level. Combined cycle gas turbine plants have an emissions intensity of 350g of CO2 per kWh.

253. To reduce these emissions would require some form of carbon capture and storage technology – technology which has not yet been demonstrated on a commercial scale, making cost estimates difficult. Once fitted with CCS, emissions levels would be expected to fall below 150g of CO2 per kWh, depending on the technology employed.

254. There are a number of costs involved in carbon capture and storage at coal-fired power plants:

- Power plant must be retrofitted with capture equipment
- The capture process must be powered
- A transport system needs to be built
- The CO2 must be stored

255. CCS generating plants incur significantly higher costs than traditional coal- or gas-fired plants due to:

- Increased fuel consumption
- Capital investment in carbon capture equipment
- Capital investment in carbon transportation
- Capital investment in carbon storage
- Increased operational costs due to the above infrastructure and activities

256. In the absence of actual commercial data, there are a number of estimated cost increases to the 2007 cost of coal or gas based electricity after CCS has been retrofitted which have been made:
These documents relate to the Climate Change (Scotland) Bill as amended at Stage 2 (SP Bill 17A)

£9 - £22.9/ MWh  Intergovernmental Panel on Climate Change
£13 - £24/ MWh  UK Treasury Consultation 2006
£20 - £30/ MWh  UK Committee on Climate Change

257. Hence, predicted costs of CCS by 2030 are in the range of:

- €30-45/tonne (assuming a roll-out of 80-120 projects in Europe by 2030)
- €5/tonne (assuming a roll-out of 500-550 projects globally by 2030)

258. The cost of building the first CCS plant could be anywhere between £500m and £1bn, on top of the £1bn cost of a new coal-fired power station. However, it has been estimated that retrofitting CCS at a currently operating power station could cost more than £1.1bn.

259. If Scotland’s three principal coal and gas power stations (Peterhead – 3.1Mt CO2 p.a; Cockenzie – 5Mt CO2 p.a; and Longannet – 9.6Mt p.a in 2006) were to have their emissions limited and required CCS to be fitted, we could therefore expect the retrofit cost to be in the order of £3-4 billion in total (at current estimates).

260. This will depend on market dynamics and how the provisions in section 49A were applied – for example if emissions levels were set at a level above 350g per kWh, then this might lead to gas-fired stations being built to replace coal stations. If emissions levels were set below this then CCS would be required on both coal and gas stations, or else investment would have to take place in alternative means of power generation.

261. At current market prices for carbon, it is recognised that the costs of fitting or retrofitting CCS technology will require public sector support. The UK Government has recently announced its intention to consult on taking powers to impose a levy on fossil fuel energy generators, which would raise funds that could be used to fund demonstration of CCS. The Scottish Ministers do not have any such powers to raise such funds because of the reservations in the Scotland Act 1998. The European Union has also committed to supporting CCS demonstration on 15 power stations across the EU via allocations of allowances under the New Entrants Reserve of its Emissions Trading Scheme, though the mechanism for allocation has not yet been finalised.

262. Operators of new or existing coal or gas power stations that would be required to fit CCS technology under the provisions of section 49A could be expected to pursue this funding in order to make their developments viable. If this funding was insufficient to meet the costs of the provisions of section 49A, then additional public funding might have to be found, or costs passed directly to consumers in the form of higher bills.

Section 50 – Energy performance of non-domestic buildings

263. The aim of improving the energy performance of existing non-domestic buildings is to raise the contribution that the existing non-domestic stock can make to mitigating climate change. Buildings account for over 40% of emissions and there is scope to further reduce these levels. They are to be subject to an assessment of the emissions of greenhouse gases and energy
These documents relate to the Climate Change (Scotland) Bill as amended at Stage 2 (SP Bill 17A)

performance, an enhanced form of energy performance certificate (EPC). The results of the consultation in autumn 2008 has informed the detailed route forward which will require building owners to draw up improvement action plans. These plans will include building work actions for owners to follow which lead to improved energy performance and reduce emissions, and where appropriate could also include alternative measures or operational measures that building users may choose to act on. To deliver this policy, substantive provision is made in eight areas as follows:

1) Extending the scope of enhanced EPCs and action plans to take account of operational ratings as well as asset ratings and also embodied energy/carbon when a robust methodology is available to address the issue of historic and traditional buildings. Varying the lifespan of such assessments/certificates.

2) Requiring owners or their delegated persons to obtain enhanced EPCs (even though they are not selling or renting out their buildings).

3) Requiring owners of non-domestic buildings to formulate action plans for building work arising from the advice on their enhanced EPCs.

4) Requiring building owners to implement their action plan.

5) Setting out the manner and timescale within which building owners have to carry out the recommendations within the certificates.

6) The registration of enhanced EPCs and disclosure of information in the register.

7) Developing appropriate standards for such building work e.g. energy efficient lighting, roof space insulation or sub-metering.

8) Empowering local authorities, or similar public bodies, to check and enforce enhanced EPCs.

264. The costs and savings outlined in this memorandum are those costs and efficiencies that are directly attributable to responsibilities and tasks set out in the energy performance of existing non-domestic buildings part of the Bill. The provisions in the Bill clarify the roles and responsibilities of the Scottish Ministers, local authorities, building owners and other responsible persons and authorities for improving the energy performance of existing non-domestic buildings in Scotland. This will result in reductions in emissions and energy use, which will ultimately lead to the reduction in economic costs to occupiers of non-domestic buildings and in general, the greater good of the population.

265. During early years of implementation, it is scenario 2 that is the closest to how the policy will work (assuming fullest coverage of the non-domestic building stock). Scenario 2 covers all existing non-domestic buildings, requiring an enhanced EPC every 5 years with implementation of cost-effective improvements.

266. As CO₂ reductions fall short there will be a need for mandatory implementation of cost-effective measures, scenario 5 is closest to how the policy will work (again assuming fullest coverage of the non-domestic building stock). Scenario 5 is similar to scenario 2 but requires mandatory implementation of cost-effective improvements.
267. The costs identified are preliminary estimates in the absence of detailed secondary legislation, which cannot be developed until the Bill is enacted and the new responsibilities that will be placed on building owners and the authorities involved, are agreed. All secondary legislation introduced will be accompanied by costed regulatory impact assessments. The menu of provisions in the Bill can be assembled in different ways but for the purpose of this Memorandum the seven different scenarios which were set out in the original Financial Memorandum have been reduced. Of the original seven, Scenarios 2 and 5 remain because they more closely model likely implementation.

268. The total cost depends on a number of factors. The variables that could cause the greatest fluctuation in costs will be the type of buildings covered and the extent to which the enhanced EPCs are applied to the stock.

269. The two applicable scenarios are as follows:

Enhanced EPC on sale or rent for all buildings and all large buildings with additional guidance to promote uptake of recommendations and an increase in the frequency of certification;

Enhanced EPC on sale or rent for all buildings and for all buildings with additional guidance, an increase in the frequency of certification, and compulsory uptake of recommendations;

Improving the energy performance of existing non-domestic buildings

270. Additional costs to the Scottish Government will be incurred as a result of the new Ministerial duties and powers set out in the Bill and are set out below on the basis of the scenario adopted and any financial support.

Table 5: Potential costs for Scottish Government for each energy performance scenario

<table>
<thead>
<tr>
<th>Scenario</th>
<th>One-off Costs - £m</th>
<th>Average Annual Cost - £m pa</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>£0.5</td>
<td>£0.5</td>
</tr>
<tr>
<td>5</td>
<td>£0.6</td>
<td>£12.4</td>
</tr>
</tbody>
</table>

271. The costs have been abstracted from the Partial Regulatory Impact assessment contained within the Consultation Action on Climate Change: Proposals for Improving the Energy Performance of Existing Non-Domestic Buildings\(^\text{20}\). Scenario 2 requires enhanced EPCs to be carried out on buildings for sale or rental and for large buildings but without compulsion to implement the recommendations. The higher cost of Scenario 5 in relation to the other scenario is that enhanced EPCs require to be obtained for all buildings irrespective of sale or rental and size and the recommendations have to be implemented for all buildings.

\(^{20}\) [http://www.scotland.gov.uk/Publications/2008/08/15155233/1](http://www.scotland.gov.uk/Publications/2008/08/15155233/1)
The one-off costs include staff costs to develop secondary legislation, impact assessments and guidance, media campaigns to create public awareness, training and research. The average annual cost includes staff for maintaining the system, support funding for businesses where appropriate and additional research and media campaigns where necessary to alert the public of changes to the system.

**Costs on local authorities**

The Bill will have both cost and resource implications for local authorities. It is difficult to estimate the likely total cost of these new duties. The costs of implementing this will again be dependent on how the menu of provisions in the Bill is assembled in the secondary legislation. The secondary legislation will be accompanied by a costed regulatory impact assessment. The two scenarios below give an indication of potential costs and are likely to include the commissioning of building surveys, calculating energy and carbon performance of buildings, formulating action plans and carrying out building work. One off costs are not anticipated. If local authorities are exempt through relaxation provisions from enhanced EPCs then as building owners they will not bear any costs. If the provisions do apply, then the estimated costs in Table 6 will fall to local authorities. If enforcement responsibilities are given to local authorities, it is expected that a self financing system based on penalty charges will be utilised.

**Table 6: Potential costs for local authorities**

</tbody>
</table>

**Costs on other bodies, individuals and businesses**

Building owners or their delegated persons are likely to incur costs as a result of future secondary legislation brought in under the powers set out in the Bill. The costs of implementing this will be dependent on how the menu of provisions in the Bill is assembled in the secondary legislation. The secondary legislation will be accompanied by a costed regulatory impact assessment. Table 7 outlines the ranges of potential costs, based on scenarios 2 and 5 of the original seven scenarios and are likely to include the commissioning of building surveys, calculating energy and carbon performance of buildings, formulating action plans and carrying out building work. One off costs are not anticipated.

275. Example regulations have been drafted to indicate how the provisions in section 50, Energy performance of non-domestic buildings, of the Climate Change (Scotland) Bill could be implemented. These example regulations:

- are broadly in accordance with the parameters set out under scenario 2 in the public consultation;
- are based on the Bill as introduced to Parliament;
- build on the current system of energy performance certificates;
- most importantly, are for illustrative purposes only and actual regulations will require to be fully developed, supported by research, public consultation, stakeholder engagement and subject to affirmative resolution in Parliament.

276. These example regulations are based on office buildings with a floor area greater than 1000m² and certain improvement measures which are usually cost-effective over a 5 year period.

277. However the detailed work for actual regulations will establish the building types and size and the improvement measures which give the most cost effective wins in terms of both cost and emission savings.

278. Work has commenced on an updated partial RIA for the work covered by example regulations and more detailed costings will be developed as part of this work.

Section 50A – Living accommodation: assessment of energy performance and emissions

279. These provisions permit Ministers to require that houses are assessed for their energy performance and that action is taken to improve their energy performance.

280. These powers sit alongside existing measures and proposals to encourage home owners to improve the energy efficiency of their houses, including the Home Insulation Scheme; a commitment to ensuring the provision of loans; funding available under the Carbon Emissions Reduction Target (CERT) scheme; and the Energy Assistance Package.

281. The cost of implementing secondary legislation made under these provisions will depend on the detail of that secondary legislation and when it is made.

282. Some of the factors that are likely to affect the costs of implementing future secondary legislation are: whether the requirements are created and enforced on a general basis or by targeting particular areas or categories of building or by targeting those who have been offered and have refused voluntary measures; whether different approaches are taken to the requirement to assess and the requirement to improve, for example by making a general requirement to assess but only enforcing improvements in association with programmes of assistance; arrangements to subsidise required works where necessary; and the enforcement authority designated by Ministers. Factors affecting the timing of the use of the powers include the extent to which
owners respond to measures that encourage them to do work voluntarily; and whether the powers can be used in a way that does not prevent CERT funding being available.

283. The secondary legislation will be accompanied by a costed regulatory impact assessment, which will examine the various scenarios produced by combinations of factors such as those described above. As an indication of the context within which these scenarios will be assessed, the total cost of installing loft and cavity wall insulation in all suitable domestic properties is of the order of £1 billion.

Sections 50B and 50C – Energy efficiency discounts – Council tax reductions to promote energy efficiency

284. These provisions will require Ministers to reduce council tax liability for those householders that install energy efficiency measures and/or renewable energy or heat technologies.

285. Council tax liability would be reduced by £100 for those spending £250 to £999 on such measures/technologies and £250 for those spending £1,000 or more. The cost to the Scottish Government will be dependent on the involvement or otherwise of energy suppliers, who may wish to fund the scheme and any contribution from local authorities. There are several scenarios that give rise to a range of potential costs based around the number of dwellings eligible for a reduction in council tax and the relative take-up of each reduction amount.

286. It is not possible at this stage to quantify properly the impact of these proposals as there is a range of information unavailable, such as known capacity to install the efficiency measures, and further work is required, but as an initial estimate and to give an indicative range of costs, we have assumed the number of eligible dwellings to be:

   (a) all chargeable dwellings, of which there are approximately 2.4 million; and
   (b) all chargeable dwellings not receiving a discount – dwellings receiving a discount include second homes, single persons’ discount or Council Tax Benefit (CTB). We estimate there are 818,000 properties not receiving a discount.

287. A sample of well managed discretionary schemes in England and Wales indicates a take up of approximately 1% of eligible dwellings, equivalent to some 18,000 households in Scotland. Assuming an even split of take up of each measure, the likely cost associated with these assumptions is £3.2 million. However, the mandatory nature of this proposal combined with greater marketing, publicity and subsequent demand are likely to increase liabilities, and should take up rise to 1.5%, the associated cost would be £4.7 million, and should it rise, for example, to 5%, the cost would be £19 million.

288. The provision will also likely have cost and resource implications for local authorities. These will come from the need to assess the eligibility of dwellings for the scheme and to determine if energy efficiency improvements and/or installed renewable energy or heat technologies qualify for a reduction.
Section 50D – Review of council tax energy provisions

289. If a scheme, established under sections 50B and 50C, were implemented, arrangements would need to be established, in conjunction with local authorities with regards to both council tax and non-domestic rates for the administration of the proposed scheme and any subsequent reporting requirements. It is difficult to estimate the costs at this stage due to factors such as the final shape of any scheme which may be introduced. It is reasonable to assume that there may be significant costs for data collection by local authorities.

290. There are a number of reporting requirements in the Bill and it is proposed that all opportunities be taken to consolidate reporting requirements to deliver cost efficiencies. This would include identifying if it is possible to include this reporting information with the annual reports which will be produced for the annual greenhouse gas emission targets.

Sections 51A and 51B - Permitted development rights

291. It is intended that the provisions under section 51A would simplify the planning process thereby potentially providing a cost saving to applicants. While it is not possible to cost this provision exactly, a number of benefits are envisaged:

- The elimination of time and monetary costs to applicants of obtaining planning permission – currently a planning application costs approximately £145;
- Increased uptake of renewable sources of power relative to non-renewable sources leading to knock-on effects on carbon savings;
- Stimulation of the market demand for renewable technologies;
- Contribution towards the national target for renewable energy; and
- Wider direct and indirect effects including an anticipated reduction in the work of planning authorities in determining planning applications.

292. In terms of extended permitted development rights, this could provide greater clarity and certainty leading to fewer applications for consideration.

Sections 51C, 51D and 51E – The Scottish civil estate

293. Section 51C introduces a new obligation on Scottish Ministers to ensure, where possible, that the energy performance of any newly constructed building that becomes part of the Scottish civil estate in Scotland, falls within the top quartile of energy performance.

294. This new duty will have a cost attached. The potential cost of delivering this new duty will depend on many variables including the location, size and purpose of the buildings. This cost will be managed as much as possible through the competitive procurement process in order to deliver best value. Where it is not possible to meet this duty for a certain building, for example dealing with a single supplier in a single location, Scottish Ministers will be obliged to report the reason for this under section 51D.
295. Section 51D(1) requires that the Scottish Ministers must, in respect of each financial year beginning with 2010-2011, lay before the Scottish Parliament a report containing an assessment of the progress made in the year towards improving (a) the efficiency and (b) the contribution to sustainability of buildings that are part of the civil estate in Scotland.

296. The Scottish Government currently uses the electronic Property Information Mapping System (ePIMS) managed by the UK Office of Government Commerce. This is a database which contains information about the property that the Scottish Government owns, leases and manages. It contains information about the efficiency and sustainability of these buildings. In this regard, the information that section 51D(1) requires be reported each year is available to the Scottish Ministers and would not incur any additional cost to collect.

297. There will be administrative costs associated with the production of this report. It is estimated that this would amount to 10% of one policy analyst’s employers’ cost annually, which equates to £3,400.

PART 5, CHAPTER 4 – WASTE REDUCTION AND RECYCLING

298. These provisions set out measures aimed at improving waste and recycling in Scotland, to help move Scotland to a “zero waste” society. “Zero waste” is about reducing the unnecessary use of raw materials, sustainable design of products, preventing waste, and recovering value from products and materials when they reach the end of their lives through recycling, composting or energy recovery.

299. The provisions in this part of the Bill establish enabling powers to introduce secondary legislation. The costs and efficiencies arising as a result of the proposals will vary widely according to how and when they are implemented. Consequently it is not possible to provide exact costings for the proposals which will come forward in secondary legislation. All secondary legislation will be accompanied by a Regulatory Impact Assessment and what follows is an indication of possible costs and savings in a range of scenarios.

Costs for the Scottish Government

300. In the case of all the provisions in this part of the Bill, the Scottish Government would incur the costs of making the regulations. These would arise in the ordinary course of the Scottish Government’s business, and it is anticipated that they will be absorbed into the administration budget.

Waste prevention and management plans

301. Depending on the provisions of the regulations, the Scottish Government may also be required to produce plans of its own to prevent and manage waste. The costs of these plans would depend on their complexity, and the range of issues they are intended to address. Since it is envisaged that a plan should be made for each individual relevant project the costs would also depend on the number of relevant projects the Government might undertake.
302. A useful comparator may be the costs assessed for Site Waste Management Plans, which are compulsory in England & Wales under the Site Waste Management Plans Regulations 2008. These are likely to represent the minimum set of parameters Scottish regulations might set for plans. (Plans similar to those which are statutory in England are presently optional in Scotland, and are encouraged by Scottish Planning Policy 10.) These plans apply to all aspects of construction work including preparatory work such as demolition and excavation. They are required for civil engineering projects as well as projects involving the maintenance, alteration and decoration of existing structures. The installation, maintenance or removal of all related services such as electrical, gas, water, sewage and telecommunications are also subject to this requirement.

303. Details of these costs are available in the Department for Food and Rural Affairs (Defra) consultation paper (http://www.defra.gov.uk/environment/waste/topics/construction/index.htm.) which assesses the costs of writing a site waste management plan over a number of project values, from £350 in the case of a project worth £70,000, to £1,600 for a project worth £1,600,000. However, in practice drawing up such a plan can deliver cost efficiencies by reducing waste, and therefore waste costs. At the time the consultation paper was published, these efficiencies were estimated at £210 for a project worth £70,000 to £4,800 for a project worth £1,600,000. At the time, it estimated that a site waste management plan was cost-neutral at a project value of £250,000. Above that figure, the larger the project value, the greater the efficiency. Clearly this is an aspect which may be borne in mind when drawing up any Regulations made under this provision.

304. The consultation paper notes that factors such as ongoing increases in landfill tax could further enhance the potential savings of site waste management plans. Landfill tax is currently escalating by £8/tonne per annum for non-inert waste. As time goes on, therefore, it is likely that the break-even point will reduce.

305. These provisions give the Scottish Ministers powers to require a wider range of waste prevention and management plans than site waste management plans drawn up under the 2008 regulations in England & Wales. Costs will relate to the range of aspects which must be considered, and arise through the necessity to carry out an assessment of wastes arising, identifying how the wastes may be dealt with and preparing the plan. In all cases, it is likely that the preparation of a waste prevention and management plan will lead to efficiencies in waste related costs, through minimisation in particular, but also through identifying opportunities to extract value through reuse and/or recycling, leading to resource savings. The value of these efficiencies is likely to increase owing to the landfill tax escalator, irrespective of resource costs. Envirowise currently estimates waste costs at 4% of turnover (http://www.envirowise.gov.uk/dsur5yhjtw). [Link no longer operates] Addressing more aspects in a waste plan can increase plan costs, while also increasing opportunities for efficiencies.

Waste data returns

306. The Scottish Ministers will be required to make returns on any waste produced, and which was the subject of regulations. A transfer note containing information on the weight, nature and destination of the waste must be prepared under the Environmental Protection (Duty of Care) Regulations 1991. In the case of hazardous waste, more detailed provision is made in
Duties to provide recycling facilities

307. The Scottish Ministers may be subject to a requirement to provide receptacles for material to be recycled. Costs will depend on the type of recycling facilities required, which will be a matter for regulations made under these provisions. However, any regulations are likely to concentrate, at least initially, on materials which are easy to collect and for which there is a ready market, and in this respect the Scottish Ministers already provide receptacles for recycling paper, beverage cans, plastic cups and batteries. It is therefore not anticipated that there would be additional costs arising from this provision.

308. An estimate of the costs involved in the provision of recycling facilities may be found in a consultation carried out by Defra last year on public place recycling (on materials which can occur in litter bins) on a voluntary basis, which can be found at http://www.defra.gov.uk/corporate/consult/recyclebins/consultation.pdf. This suggested a range of one-off costs for England of £1.1 million to £3.3 million, with annual recurring costs thereafter ranging from £0.3 million to £0.9 million. These costs are for a voluntary scheme: any compulsory scheme would be likely to have a wider reach and could cost more.

309. The provision of the bins was estimated to cost between £484 and £600 per bin. These costs are dependent on the nature of the facilities provided and the cost of receptacles varies widely. For example, at the Scottish Government offices at Victoria Quay, Edinburgh, paper collection boxes are provided free as part of the general waste contract, specialised containers for plastic cups each cost £60, can crushers can cost up to £600 individually and those currently in use cost £120 nine years ago.

310. Organisations which provide these facilities are likely to find that they must arrange for the collection and recycling of wastes for which they are not the producers. This will increase costs but also potentially benefit society through the more efficient use of resources, and a reduction in waste disposal by landfill thereby reducing the generation of methane emissions. As an indication of costs, the total waste for the Victoria Quay offices (about 2000 people) in 2007-08 was approximately 260 tonnes (82% paper and card, 4% wood and 3% plastic). Most was collected in a container whose rental was £1.18 a day and whose daily uplift cost £60.60. The majority of this was recycled - 200 tonnes.

311. On the other hand, there are likely to be some off-setting efficiencies. Where recycling facilities are provided it is likely that the organisation providing them will recycle more of its own wastes. This has the effect of reducing disposal costs. Regulations made under these provisions are not likely to come into force before 2010. In 2010 – 2011, the landfill tax will be £48/tonne for non-inert wastes, and is predicted to increase at a rate of £8/tonne every year thereafter. Gate fees at landfill, net of tax, are in the region of £20/tonne at present.

Procurement contracts and recyclate

312. If regulations are established for this provision, the Scottish Ministers would also be subject to their requirements. However, this is unlikely to add any costs. The type of materials
likely to be specified are traded widely therefore must be priced competitively. It is reasonable to assume that the replacement of virgin materials with recycled ones is unlikely to increase costs. Rather than a price barrier, the recycling industry often talks of a “perception” barrier preventing the use of products derived from waste. A requirement that recycled products be used is a means of addressing such a perception barrier.

**Targets for reducing packaging**

313. The Scottish Ministers do not produce packaging therefore are unlikely to be affected by a substantive scheme, except by the costs of making Regulations.

**Deposit and return schemes**

314. Costs arising from these provisions will depend on the detail of the regulations. There are currently operational deposit and return schemes in Scotland which do not result in costs for the Scottish Ministers, for example the AG Barr scheme. At the other end of the scale, all those who contribute to a particular type of packaging entering the Scottish market could be obliged to participate in a scheme which provides for the return and recycling of that packaging. Clearing-house functions may arise from this and the set-up costs would probably have to be met by the Scottish Government (though they may be recovered through charges to users).

315. Both Norway and Denmark, countries with a similar sized population to Scotland’s, operate deposit and return schemes which depend on a central function. Details may be found at [http://www.resirk.no](http://www.resirk.no) and [http://www.dansk-retursystem.dk](http://www.dansk-retursystem.dk) respectively. Some indication of the set up costs may be gleaned from the value of the material assets of these organisations at dates close to set-up. Resirk’s “property, plant and equipment” were worth NKR 3.9m (currently c. £40,000) in 2002 (four years after foundation) and Retursystem’s were worth DKR 14.7m (currently c. £161,000) in 2000, the year of founding. This gives a range of c£40,000 to c£200,000 for value of physical assets at today’s prices. Beyond this, of course, there would be time costs and fees involved in any set-up process, but much of this would be absorbed into the administration budget.

**Carrier bag charges**

316. The only costs, other than those incurred through making the regulations, anticipated for the Scottish Government are those related to publicity campaigns.

317. A Member’s Bill to introduce a levy on plastic bags was introduced in an earlier session of Parliament. The Regulatory Impact Assessment (RIA) for this Bill can be found at [http://www.scottish.parliament.uk/business/committees/environment/papers-05/rap05-28.pdf#page=20](http://www.scottish.parliament.uk/business/committees/environment/papers-05/rap05-28.pdf#page=20). This document contains links to a research report, *Proposed Plastic Bag Levy – Extended Impact Assessment*, which forms the basis for much of its material. The features of the scheme proposed in the Climate Change (Scotland) Bill are somewhat different from this Member’s Bill but much of the information is relevant. For example, the RIA mentions the cost of an education campaign which it estimates at £750,000.
Costs for local authorities

Waste prevention and management plans

318. Local authorities could be required by regulation to make waste prevention and management plans – the costs (£350 - £1,600) and potential efficiencies (£210 - £4,800) attributable to the Scottish Government (detailed in paragraph 303) would potentially apply here also.

319. It is also possible that enforcement duties may fall to local authorities, depending on the nature of the regulations. This could include enforcement powers and duties including the registration of plans, and ensuring that obligated bodies have the necessary plans. The number of obligated bodies would depend on the nature of the plans. However, registration of any single plan is unlikely to take in excess of an hour. Assuming that the average employer cost of a member of staff is £25,000, this would make the cost of registration of any plan unlikely to exceed £15, since a FTE is assumed to work about 2,000 hours a year. Any regulations could provide for registration charge to off-set these administrative costs.

320. Where a report is required for the procurator fiscal with a view to prosecution, this may take three hours of an officer’s time and be equivalent to a cost of £45. Legal officers’ costs could be significantly higher than this, potentially bringing the preparation costs for a case to be in excess of £1,000 - but these are likely to be rare.

Waste data returns

321. Local authorities would be obliged to make returns on any waste produced which was the subject of future regulations. They are already obliged to provide information by the 1991 and 1996 Regulations mentioned above. It is likely that similar information would be required here and the additional costs would be marginal. As local authorities handle significant waste for third parties, information is already provided for this waste and no change is anticipated here.

Duties to provide recycling facilities

322. Local authorities may be expected to provide recycling facilities under the provisions of any regulations brought forward on this matter, and the estimate of £60 - £600 for each receptacle, mentioned in paragraph 309, would apply.

323. The same principle would apply to the enforcement of the provision of recycling facilities. This could apply to local authorities and is particularly likely in the case of the provision of facilities at one-off events. Enforcement is likely to consist of ensuring that facilities are provided, are properly used and that the materials collected are sent for recycling rather than to landfill for disposal. Similarly costs for the officers involved are likely to be in the region of £15 an hour plus travelling time and expenses. In the event of any prosecutions becoming necessary, the costs indicated above would also apply.
These documents relate to the Climate Change (Scotland) Bill as amended at Stage 2 (SP Bill 17A)

Procurement contracts and recyclate

324. Regulations on this would likely apply to local authorities but are unlikely to add costs. The type of materials which may be specified are already traded widely and the replacement of virgin materials with recycled materials is unlikely to increase costs.

325. Depending on the form of the regulations, local authorities may be the enforcing body. This would involve examining invoices, and perhaps also making spot checks. The amount of work involved is unlikely to amount to as much as 1 FTE per local authority, so no more than 32 FTEs would be needed in Scotland as a whole (at an annual cost of about £800,000). In the event of prosecution being necessary the costs outlined earlier could be incurred.

Targets for reducing packaging

326. Costs will be dependent on the eventual form of any regulations and it is possible that local authorities would enforce the targets. As they would apply over Scotland as a whole, this could involve designating “home” or “lead” authorities with a particular connection to main retailers. In these instances particular arrangements would have to be made to support that authority in its work. Local authorities are already responsible for enforcing the Packaging (Essential Requirements) Regulations 2003, which provide that packaging should meet “essential requirements”.

327. Potential costs are unlikely to include visits to retailers and other users of packaging. Instead, the function of enforcing targets may be carried out by examining records, many of which are likely to exist already, such as those relating to materials used, and waste returns. There are approximately 265,000 private sector businesses in Scotland, many of which are small, and either do not produce packaging or are likely to be excluded under a de minimis provision. The Scottish Retail Consortium records 13,805 VAT registered enterprises in Scotland, and the Federation of Small Businesses has a membership of over 19,000, which it believes is over 99% of the relevant businesses in Scotland. It seems likely that a figure of 20,000 could reasonably represent the number of enterprises which put packaging on the market in Scotland. If inspection of a data return is estimated to take one hour, inspection of 20,000 returns would take 20,000 hours, which represents approximately 10 FTEs, on the assumption than a FTE is assumed to work about 2,000 hours a year. The cost of 10 FTEs is approximately 10 x £25,000 = £250,000 per annum.

328. There will be opportunities for efficiencies through creating less packaging. For local authorities in particular this would mean that household waste disposal costs could reduce. For every 1% reduction, savings in landfill tax costs could amount to £144,000 – based on 60% of household waste being disposed of at landfill at a cost of £48/tonne in 2010-2011. This equates to almost 6 FTEs.

Deposit and return schemes

329. It is not anticipated that any variant of a deposit and return scheme, introduced under regulations would have significant costs for local authorities. These proposals are more likely to have a financial benefit for local authorities, by reducing the amount of waste they have to handle. Materials which have a monetary value when handed back are less likely to become litter
These documents relate to the Climate Change (Scotland) Bill as amended at Stage 2 (SP Bill 17A)

– which local authorities have a duty to clear. Experience in Denmark indicates that 85% of bottles are returned via their scheme.

Carrier bag charges

330. Costs may arise for local authorities if regulations apply an enforcement duty. The RIA produced for the Members Bill indicated a potential cost of £3.5 million per annum. It is likely that any eventual Regulations would be aimed at carrier bags generally rather than just plastic bags and this may increase the costs beyond those indicated by the RIA. Enforcing and policing is estimated at £2.5m. Occasional prosecution costs may also arise.

Costs on other bodies, individuals and businesses

Waste prevention and management plans

331. Other bodies, individuals and businesses are likely to be among those whom Regulations made under this part of the bill could require to make waste prevention and management plans. Similar costs (£350 - £1600) and efficiencies (£210 - £4,800) to those outlined in para 302 could apply.

332. The regulations could specify a different enforcement body – for example the Scottish Environment Protection Agency (SEPA). Potential costs are likely to be similar to the £15 per registration described before although there could be economies of scale if this function were carried out by a single national body, which could mean that, overall, fewer individuals need to be employed. Again, it is possible that the regulations would enable SEPA (or any other body charged with enforcement) to recover these costs by charging.

333. Where charges were levied for purposes such as registering plans, this could be a cost for all bodies under a duty to prepare such plans, including the Scottish Government and local authorities.

Waste data returns

334. Other bodies and businesses would be required to make returns on any waste produced, which may be covered by future regulations. As described earlier there are already existing controls for the transfer of waste. It is likely that much the same information would be required and additional costs should therefore be marginal. Householders would not be required to make such returns.

335. While these costs should be marginal, they would be dependent on the detail of regulations - including the complexity of the business, and the frequency with which it generated waste. The regulations could also exempt certain bodies or businesses from providing this information.

336. These provisions are aimed at providing information on the volumes of waste which arise to improve information on overall impacts and help create more effective strategies for waste prevention, minimisation and recovery. It will be necessary to collate this data – and to ensure that it is correctly provided. It is appropriate that such a duty would fall on SEPA. SEPA already
collects data on household waste and makes estimates for commercial and industrial waste. These provisions would improve the accuracy of the information for this duty.

337. However it is to be expected that new enforcement costs will arise as additional activity will be required. It would be reasonable to estimate this as one FTE (\(£25,000\) per annum). The prosecution costs outlined earlier may also occasionally arise.

*Duties to provide recycling facilities*

338. Other bodies, individuals and businesses are likely to be amongst those bodies required through regulations to provide recycling facilities and similar costs to those given in paragraph 309 would apply (\(£60 - £600\) per receptacle).

339. As before, the Scottish Environment Protection Agency (SEPA) could be designated the enforcement body for any regulations made under these provisions. Similar costs and opportunities for efficiencies and cost recovery would apply.

*Procurement contracts and recyclate*

340. Other bodies, businesses etc would be subject to the requirements made by Regulations. However, this is unlikely to add any costs for the reasons explained previously.

341. A national organisation such as SEPA could be the enforcing body for any regulations. Enforcement would include examining invoices and perhaps also making spot checks. The amount of work involved is likely to cost less than is outlined for enforcement costs by local authorities (\(£800,000\) per annum), given that economies of scale would be available. In the event of prosecution being necessary the costs outlined previously could also apply. This would be extremely rare, given that there appears to be little or no cost incentive to avoid the procurement of recyclate.

*Targets for reducing packaging*

342. Another body, possibly SEPA, could oversee the regime established to enforce the targets for packaging reduction. The costs would be similar to those described previously - \(£250,000\) per annum. Obligated bodies and businesses would be required to return forms. As many bodies and businesses, are obliged to provide similar information for the purposes of the existing Producer Responsibility Obligations (Packaging Waste) Regulation 2007, the additional cost is unlikely to be significant.

343. Meeting the target could involve costs. For example, research and development costs for “lightweighting” and for new methods of presenting products involving less packaging. This could involve the purchase of machines for consumers to insert refillable containers. However these costs could be offset by efficiencies elsewhere in areas such as transportation costs and the resulting reduction in shelf space. Additionally less packaging could mean reductions in obligations to recover packaging in terms of the 2007 Regulations - in July 2008 a packaging waste recovery note for paper cost £2 – 3 per tonne, and for aluminium it cost £60 – 70 per tonne ([http://www.letsrecycle.com/prices/prnPrices.jsp](http://www.letsrecycle.com/prices/prnPrices.jsp)). This obligation would not impact on householders.
Deposit and return schemes

344. Any form of deposit and return scheme which may be developed under regulations would be likely to have costs for other bodies and for businesses. This cost could be off-set by an increase in re-use and recycling of the materials collected and lower disposal costs.

345. The extent to which such a scheme would cost or benefit individuals would depend on the extent to which they returned all the materials subject to the scheme. Broadly, a 100% return would be cost neutral – the deposit fee, included in the price, would be recovered. Those persons choosing not to return the materials would be unable to recover the deposit fee thereby discouraging thoughtless disposal.

346. If schemes similar to the existing AG Barr scheme were compulsory for a range of Scottish operators, retailers would incur storage and packaging return costs. However, retailers are already obliged, under the Producer Responsibility Obligations (Packaging Waste) Regulations 2007, to recover a certain amount of glass, steel, aluminium paper/board, plastic and wood, which are principally the materials likely to be targeted for deposit and return schemes. Any deposit and return scheme would supplement, and not replace, these producer responsibility obligations. This could make it easier for retailers to meet the relevant targets, which are expected to increase over time.

347. Producers would be likely to incur a one-off cost of arranging for marking to refer to the deposit. Retailers and producers would also incur the cost of maintaining records and possibly making returns.

348. Regulations could require the designation of a competent authority to inspect returns and ensure a scheme is operated. With more ambitious schemes, such as those operated in Norway and Denmark, there is also a clearing house function. In the case of the Danish scheme, packaging captured by the scheme is registered and marked, to indicate that the deposit fee has been paid. Retailers return the materials and the clearing house issues a payment from the deposit fees. The clearing house collects, or arranges to collect, the materials from the retailers and also arranges for it to be recycled. The clearing house may also carry out the functions of overseeing and enforcing the system.

349. This is clearly a more expensive option. In 2006, the Danish and Norwegian systems cost £17.8m and £17.4m respectively to operate. An estimate of £15-£20 million per annum running costs for a Scottish system handling the same materials (essentially soft drinks packaging) would appear to be reasonable. These costs would have to be recovered through the deposit fees and other possible means, such as sale of recyclate. A similar system could apply to a wider or narrower range of materials, which would affect the costs accordingly.

350. The greater expense of the Danish/Norwegian model could be off-set by the collection and recycling of greater volumes of materials and the subsequent reduction of disposal costs. There could be added benefits through the greater disincentive for littering and fly-tipping and other forms of unauthorised disposal.
351. The Danish experience illustrates an 85% return rate. Dansk Retursystem is empowered to spend any profit on improving the system as it was set up as a non-profit making body. The same principle could be applied in Scotland. Regulations could permit the scheme to spend money on improvements and these could include supporting recycling facilities or the provision of reverse vending machines, which automate the return of the relevant material.

352. However AG Barr’s experience with its current scheme indicates that return rates have dropped from 99% in 1976 to 70% at the beginning in 2007. The firm has recently increased its deposit from 20p to 30p a bottle to address this but it is too early to analyse any results arising from this.

Carrier bag charges

353. The RIA mentions the costs incurred by the Irish Government, which set up a centralised collection service. The set-up costs were approximately €1.5m. This, however, included the costs of an advertising campaign, which would probably be borne by the Scottish Government rather than by other bodies. Ongoing costs are €300,000 (currently c. £240,000) pa, while €12 million (currently c. £9,700,000) a year is raised by the levy. Any scheme the Scottish Government would establish will be subject to set-up and collection costs. It is appreciated that there might be a disproportionate outlay at the beginning of any scheme: for example, the Regulatory Impact Assessment suggests a cost of £1,349,000 for updating tills etc.

354. Costs would arise for the enforcing authority for the regulations. As discussed earlier, this could be local authorities. The Regulatory Impact Assessment referenced in the Member’s Bill estimated that these costs could be £3.5 million per annum. It is likely that any eventual Regulations would be aimed at carrier bags in general, rather than just the plastic ones considered in the Member’s Bill. Although this may increase the costs, a single enforcement body could derive economies of scale and reduce costs. Enforcement and policing was estimated to cost £2.5m.

355. Retailers who issue carrier bags would be subject to a requirement to set a charge and to administer that charge including the potential transfer to good causes approved by the Scottish Ministers. It is expected that any costs would be recoverable from the income realised from charges. The UK Government will levy VAT on the charge, payable to HM Revenue & Customs; this too will be a cost, which will presumably be passed on to the consumer.

356. Users of the carrier bags would pay the charge. The Regulatory Impact Assessment indicated an income of £7.75m on the basis of a charge of 10p per bag. For comparison, in Ireland the income raised from a tax of €0.15, is approximately €12m (£9.7m) a year. If SMEs, charities and promotions were exempted from the charges indicated by the Member’s Bill, the Regulatory Impact Assessment calculated the potential income as £5.43m a year. The proposals included in the Climate Change (Scotland) Bill may have a higher cost as a wider range of bags is under consideration. However this could be off-set by greater efficiencies in waste reduction, litter clear-up, loss of amenity etc. The inclusion of paper bags (as is probable under the present proposals) would result, according to the Regulatory Impact Assessment, in an income of £8.14 million per annum.
357. Consumers can avoid paying this type of charge by using their own bags (though this may mean they have to purchase other items, such as bin-liners). A “bag-for-life” which may be used for carrying shopping instead of the kind of carrier bag likely to be aimed at costs from £1 - £3 and may last indefinitely.

358. Good causes in Scotland would benefit from any profits arising from the system. It is also possible that the Scottish Ministers could provide that only profit arising from the minimum level of charge would be allocated to good causes. If retailers chose to charge more, it is possible that additional profit could be retained by the retailer.

359. The Regulatory Impact Assessment suggested that the changes proposed in the Member’s Bill would cost 300 – 700 jobs in Scotland. This figure would be likely to increase if non-plastic carrier bags were also subject to a charge. However there would be some off-setting such as increased employment in the manufacture and distribution of bags for life.

36 – Paragraph 354, 37 – Paragraphs 353 and 356, 38 – Paragraph 341
Purpose

1. This Memorandum has been prepared by the Scottish Government to assist the Subordinate Legislation Committee in its consideration of the Climate Change (Scotland) Bill. This Memorandum describes provisions in the Bill conferring power to make subordinate legislation which were either introduced to the Bill or amended at Stage 2. The Memorandum supplements the Delegated Powers Memorandum on the Bill as introduced.

2. The contents of this memorandum are entirely the responsibility of the Scottish Government and have not been endorsed by the Scottish Parliament.

3. In deciding whether to adopt negative or affirmative resolution procedure, careful consideration has been given to the degree of parliamentary scrutiny that is felt to be required for the regulations, balancing the need for the appropriate level of scrutiny with the need to avoid using up parliamentary time unnecessarily.

4. During the Stage 2 proceedings, new powers were introduced and a number of the delegated powers were modified. These changes give Parliament a greater role in scrutinising some of the subordinate legislation made under the Bill and respond positively to the comments made by the Parliamentary Committees which scrutinised the Bill. Outlined below are descriptions of the relevant powers which have been added or modified and explanations of and as to why the additions, amendments or alterations have been made and are considered appropriate.
PROVISIONS CONFERRING POWER TO MAKE SUBORDINATE LEGISLATION INTRODUCED OR AMENDED AT STAGE 2

PART 1 – EMISSIONS REDUCTION TARGETS

Section 2A(1) – Modifying the interim target

Power conferred on: the Scottish Ministers
Power exercisable by: order made by statutory instrument

Provision
5. Section 2A was inserted into the Bill during Stage 2. Subsection (1) allows the Scottish Ministers to modify by order the percentage figure mentioned in section 2(1) of the Bill. The percentage figure in section 2(1) of the Bill is 34%, known as “the interim target”. The interim target is expressed in terms of “at least 34%”. The Scottish Ministers are only given the power to modify this figure to substitute a higher percentage figure. There is a requirement in section 2A(2), with details explained in subsections (3) to (6), that if the European Union (EU) brings a Community instrument into force which contains a commitment to reduce greenhouse gas emissions by at least 30% compared to 1990 levels by 2020, the Scottish Ministers must, lay an order before the Scottish Parliament to increase the 34% figure in section 2(1) to at least 42%. Subsection (4) provides that the period within which a draft order in terms of subsection (1) is to be laid is 3 months beginning from the day on which the appropriate Community instrument comes into force. Subsection (5) provides that if the order is not laid before the expiry of that period, then it must be laid as soon as reasonably practicable thereafter.

Reason for taking power
6. On the receipt of particular advice from the relevant or advisory body, or if there have been significant changes to the basis on which the interim target was set, it may be considered necessary to modify the level of the interim target. The power in section 2A(1) allows for this to happen. Section 2A(2) contains a requirement that the Scottish Ministers must lay an order to modify the interim target to make it “at least 42%” if an “appropriate Community instrument” comes into force. This recognises that action at the European Union level has an important influence on certain elements of Scotland’s greenhouse gas emissions. Approximately 40% of Scotland’s greenhouse gas emissions are generated by the “traded sector”, i.e. installations which operate within the EU Emissions Trading Scheme. If the quantity of emissions allowed within that scheme is reduced there is potential for increased emissions savings in Scotland.

Choice of procedure
7. As subsection (1) allows an important percentage set in primary legislation to be modified, it is considered appropriate that affirmative resolution should apply.
Section 6 - Modifying annual targets

**Power conferred on:** Scottish Ministers  
**Power exercisable by:** order made by statutory instrument  
**Parliamentary procedure:** affirmative resolution of the Scottish Parliament

**Provision**

8. Section 6 allows the Scottish Ministers to modify various parts of sections 3 and 4 by order. Subsection (1)(a) enables the Scottish Ministers to modify the percentage figure by which annual targets must reduce year-on-year from 2020. Subsection (2) restricts this power so that the percentage may be modified only if the Scottish Ministers consider that it is no longer necessary to set the targets by reference to that percentage. Subsection (5) further states that the percentage may not be changed to a figure less than zero.

9. Subsection (1)(b) allows the Scottish Ministers to modify an annual target once it has been set by order under section 4. Subsection (3) restricts this power so that an annual target may be changed only as a result of significant changes to the basis on which the annual target was first set.

10. Subsection (1)(c) enables the Scottish Ministers to modify any of the dates set out in section 4 (the dates of the batches of annual targets) and subsection (1)(d) allows modification of the criteria to which the Scottish Ministers must have regard when setting annual targets. Subsection (4) sets out that the Scottish Ministers may only exercise these powers if they consider it appropriate to do so.

11. Subsections (1A) and (1B) were inserted at Stage 2. Subsection (1A) requires the Scottish Ministers, at the same time as laying a draft instrument under any paragraph of subsection (1), to lay before the Scottish Parliament a report explaining why the modification is being proposed. Subsection (1B) requires that Ministers make a statement to the Parliament on this subject as soon as reasonably practicable after the laying the report mentioned in subsection (1A).

12. Subsection (6) allows the Scottish Ministers to exercise the power to modify annual targets set by order only before the beginning of the year to which the target relates. This power may not be used to allow the target to exceed that set for the previous year.

13. Paragraph (a) of subsection (3) was inserted at Stage 2, which in turn moved the content of what is now paragraph (b) from the body of subsection (3) into a separate paragraph. This subsection now specifies that the Scottish Ministers may make an order under subsection (1)(b) only if they consider that it is appropriate to do so as a result of a modification to the interim.

14. Section 7 requires that all of the powers specified in section 6 may only be exercised once the Scottish Ministers have requested advice from the relevant body defined in section 5(5). Subsection (2) was amended at Stage 2 so that, rather than publish a statement, as was the case in the original clause, the Scottish Ministers must lay a report before the Scottish Parliament if the order differs from the recommendation of the relevant body. Section 7(3) was amended in its
entirety at Stage 2. It now requires that Ministers make a statement to the Parliament on relating to the report made under subsection (2) as soon as reasonably practicable after the laying that report mentioned in subsection (2).

**Reason for taking power**

15. The annual targets will be set in advance and are based on a range of criteria. Between the date when an annual target is set and the year to which it relates, circumstances may change significantly which require a re-evaluation of the annual target level. Subsections (1)(a) and (1)(b) allow this re-evaluation to occur. Over time, it may become apparent that annual targets need to be set further, or not as far, in advance. Subsection (1)(c) allows the date by which the annual targets are set to be changed. It is not possible to foresee the full range of criteria which need to be taken into account up until 2050. Additional criteria may become as important as the current list. Subsection (1)(d) allows the criteria to change.

**Choice of procedure**

16. As subsection (1)(a) allows an important percentage set in primary legislation to be modified, it is considered appropriate that affirmative resolution should apply. Subsection (1)(b) allows a change to a previous instrument subject to affirmative resolution, it is therefore considered appropriate that affirmative resolution should apply. As subsections (1)(c) and (1)(d) allow a change in primary legislation, it is considered appropriate that affirmative resolution should apply.

**Section 7A – Achievement of annual targets: domestic effort target**

- **Power conferred on:** the Scottish Ministers
- **Power exercisable by:** order made by statutory instrument
- **Parliamentary procedure:** affirmative resolution of the Scottish Parliament.

**Provision**

17. Section 7A was inserted into the Bill at Stage 2. Subsection (1) requires that the Scottish Ministers must ensure that reductions in net Scottish emissions account for at least 80% of the reduction in the net Scottish emissions account in any target year. Subsection (3) provides that the Scottish Ministers may, by order, modify the percentage figure in subsection (1) but only to substitute a higher figure.

**Reason for taking power**

18. Concerns were expressed by a range of stakeholders that, as introduced, the Climate Change (Scotland) Bill did not place a restriction on the amount of carbon units which could be used to credit the net Scottish emissions account – effectively offsetting quantities of Scottish emissions. As such, it was argued, the Scottish Ministers would, in theory, be able to use carbon units to achieve all of the emissions reductions required by the 2050, interim and annual targets set under the provisions in the Bill. Section 7A seeks to address this concern by requiring that the Scottish Ministers ensure that at least 80% of the reduction in the net Scottish emissions account in any target year is achieved by reductions in net Scottish emissions and not the use of carbon units to credit that account. It may be considered appropriate in the future to seek to ensure that an even greater proportion of the reduction in the net Scottish emissions account in
any year should be achieved by reductions in net Scottish emissions. The power in subsection (3) therefore allows for the domestic effort target to be increased by order.

19. Subsection (4) requires the Scottish Ministers to request advice from the relevant body before making an order. Subsection (5) requires that if the order makes provisions different from those recommended by the relevant body, then the Scottish Ministers must publish a statement setting out the reasons why.

Choice of procedure

20. Subsection (1) sets an important percentage figure in primary legislation. As subsection (3) allows this percentage to be modified to substitute a higher figure, it is considered appropriate that affirmative resolution should apply.

Section 12 - The net Scottish emissions account

Power conferred on: Scottish Ministers
Power exercisable by: regulations made by statutory instrument
Parliamentary procedure: On the first occasion, affirmative resolution of the Scottish Parliament. The second and subsequent regulations will be subject to negative resolution provided the amendments made are simply technical in nature. More detail is provided below.

Provision

21. Subsection (2) of section 12 enables the Scottish Ministers to make provision by regulations about how and in what circumstances carbon units are credited to and debited from the net Scottish emissions account. Subsections (1A), (1B) and (1C) were inserted at Stage 2. Subsection (1A) specifies that the net amount of carbon units which may be credited to the net Scottish emissions account for a target year must not exceed the allowable amount. The terms “allowable amount” and “net amount of carbon units” are defined in subsections (1B) and (1C) respectively.

Reason for taking power

22. Certain businesses in Scotland participate in the European Union Emissions Trading Scheme. It is possible that firms in Scotland may participate in other such trading schemes in the future. If the net Scottish emissions account is to take account of the units traded within such schemes, it will be necessary to define the terms by which this occurs. This power will also enable the Scottish Ministers to create regulations covering the use of carbon units purchased or sold by Ministers themselves outside of specific trading schemes – for example, units generated by the Clean Development and Joint Implementation Mechanisms established under the Kyoto Protocol.

Choice of procedure

23. The initial regulations will set out how and in what circumstances carbon units are credited to and debited from the net Scottish emissions account which will be a key component of the operation of that account. Affirmative resolution procedure is therefore considered
This document relates to the Climate Change (Scotland) Bill as amended at Stage 2
(SP Bill 17A)

appropriate for the initial regulations. Subsequent regulations will likely involve technical amendments which are unlikely to be significant and, therefore, will usually merit negative resolution procedure. If, however, the second or subsequent regulations make provision to alter the amount by which a carbon unit reduces or increases the net Scottish emissions account, affirmative resolution will be required because of the significant effect this could have on the account.

Section 14 - Scottish share of emissions from international aviation and international shipping

Power conferred on: Scottish Ministers
Power exercisable by: order made by statutory instrument
Parliamentary procedure: affirmative resolution of the Scottish Parliament

Provision

24. International aviation and international shipping emissions are generally not directly emitted in a specific country. Subsections (1) and (2) allow the Scottish Ministers to specify by order how certain emissions from international aviation and international shipping are to be regarded as “Scottish emissions”. Subsections (2A) and (2B) were inserted at Stage 2. Subsection (2A) requires that the first order under subsection (1) must be laid before the Scottish Parliament no later than 1 June 2010. Subsection (2B) provides that, if the deadline in subsection (2A) is missed, the Scottish Ministers must lay the draft order as soon as reasonably practicable afterwards. Subsection (3) requires the Scottish Ministers to seek advice from the relevant body defined in section 5(5) prior to making an order. Subsection (4) requires the Scottish Ministers to publish a statement if the advice of the relevant body is not followed.

Reason for taking power

25. As international aviation and international shipping emissions are generally not directly emitted in a specific country, it is necessary to specify how certain amounts of these emissions will be allocated to the Scottish emissions account. This allocation may also need to change over time, particularly if a European or international agreement makes such a change necessary in the future. There is no current international agreement on how to allocate these emissions to states.

Choice of procedure

26. As this is an issue of high interest and could significantly alter the calculation of “Scottish emissions”, and thereby the calculation of the net Scottish emissions account and future annual targets, affirmative resolution procedure is considered appropriate.
Section 18A – Limits on use of carbon units

Power conferred on: Scottish Ministers
Power exercisable by: order made by statutory instrument
Parliamentary procedure: affirmative resolution of the Scottish Parliament

Provision

27. Section 18A was inserted into the Bill at Stage 2. Subsection (1) specifies that the Scottish Ministers must by order set limits on the net amount of carbon units which may be credited to net Scottish emissions accounts during specified periods which are set out in subsection (2). Subsection (2) also contains dates by which the limits on carbon units must be set.

28. Subsection (A1) places a specific restriction on the Scottish Ministers that they may only credit to the net Scottish emissions account for a year in the period 2013-2017 carbon units purchased by them up to a limit of 20% of the reduction in the amount of the net Scottish emissions account planned for that year.

29. Subsection (3) contains a definition of “net amount of carbon units”. Subsection (4) provides that an order under subsection (1) may provide that specified carbon units do not count towards the limit. Subsection (5) provides that if any of the deadlines listed in subsection (2) are missed, the Scottish Ministers must set the relevant limit as soon as reasonably practicable afterwards.

Reason for taking power

30. Concerns were expressed by a range of stakeholders during Stage 1 of the Bill that, as introduced, the Climate Change (Scotland) Bill did not place a restriction on the amount of carbon units which could be used to credit the net Scottish emissions account – effectively offsetting quantities of Scottish emissions. As such, it was argued, the Scottish Ministers would, in theory, be able to use carbon units to achieve all of the emissions reductions required by the 2050, interim and annual targets set under the provisions in the Bill. Section 18A seeks to address this concern by requiring that the Scottish Ministers set limits on the net amount of carbon units which may be credited to net Scottish emissions accounts during specified periods up to and including the year 2050.

Choice of procedure

31. The amount of carbon units which may be credited to net Scottish emissions accounts for any given target year is an important factor in determining the plans and policies which may be implemented to achieve the annual targets. Affirmative resolution procedure is therefore considered appropriate for setting limits on the amounts of carbon units in this section of the Bill.
Section 18B – Modifying limits on use of carbon units

Power conferred on: Scottish Ministers
Power exercisable by: order made by statutory instrument
Parliamentary procedure: affirmative resolution of the Scottish Parliament

Provision

32. Section 18B was inserted into the Bill at Stage 2. Subsection (1)(a) provides that the Scottish Ministers may by order modify a limit on the use of carbon units set by virtue of section 18A(1). Subsection (1)(b) provides that the Scottish Ministers may by order modify any date mentioned in section 18A(2).

33. Subsection (1)(c) provides that the Scottish Ministers may make an order under subsection (1)(a) only if they consider that it is appropriate to do so as a result of a modification of the interim target or another significant change to the basis on which the limit on use of carbon units was set. Subsection (1)(d) sets out that the Scottish Ministers may exercise the power to make an order under subsection (1)(b) only if they consider it appropriate to do so. Subsection (4) provides that an order under subsection (1)(a) may provide that specified carbon units do not count towards the limit.

Reason for taking power

34. There may be circumstances in which limits on carbon units have been set but are subsequently considered to be inappropriate. An example of this would be if the interim target is increased. This would probably have the knock-on effect of requiring certain annual targets to be increased. As a result, the limits set on the use of carbon units for the periods covering those target years may no longer be appropriate. It is therefore necessary for the Scottish Ministers to have the flexibility to modify limits which have been set on the use of carbon units.

35. Scottish emissions are a component part of the UK carbon account, in respect of which the UK Climate Change Act 2008 creates duties on the Secretary of State to reduce. The periods listed in section 18A(2), for which limits on the use of carbon units must be set, are intended to cover the same periods that are covered by the carbon units set under the UK Climate Change Act 2008. This is in recognition of the fact that it may be necessary and appropriate for the Scottish Ministers, when setting limits on the use of carbon units in relation to the Scottish annual targets, to take account of any limit on carbon units that the Secretary of State sets with regard to the UK carbon budgets. Direct compatibility with the UK carbon budgets may not always be necessary or desirable. The power in subsection (1)(b) allows sufficient flexibility for Scotland to move out of synch with the UK carbon accounting cycle should it be decided in the future that this would be desirable.

Choice of procedure

36. The amount of carbon units which may be credited to net Scottish emissions account for any given target year and the periods for which limits on those units may be set at any given time, are important factors in determining the plans and policies which may be implemented to achieve the annual targets. Affirmative resolution procedure is therefore considered appropriate
for modifying the limits on the amounts of carbon units and the dates associated with those limits.

Section 18C – Advice before setting or modifying limits on use of carbon units

37. Section 18C was inserted into the Bill at Stage 2. It does not contain an enabling power but it does contain conditions which must be adhered to by the Scottish Ministers before they seek to exercise their powers under sections 18A(1) and section 18B(1)(a).

38. Subsection (1) requires that the Scottish Ministers must, before laying a draft of a statutory instrument under section 18A(1) or section 18B(1)(a), request advice from the relevant body.

39. If orders under either of those two sections make provision different from that recommended by the relevant body, section 18C(2) requires that the Scottish Ministers must publish a statement setting out the reasons why. Subsection (3) provides that this statement may be published in such manner as the Scottish Ministers consider appropriate.

PART 2 – ADVISORY FUNCTIONS

Section 23(4) – Reporting on progress towards targets

Power conferred on: Scottish Ministers
Power exercisable by: order made by statutory instrument
Parliamentary procedure: affirmative resolution of the Scottish Parliament

Provision

40. Section 23(2) enables the Scottish Ministers to specify the first year for which the advisory body must prepare reports on the progress being made towards the targets established under the Bill. Section 23(4) specifies when the advisory body must lay this report before the Scottish Parliament but also enables the Scottish Ministers to amend this deadline. Section 23(4) was amended at Stage 2 to enable the Scottish Ministers to specify earlier dates as well as later dates, which had been the condition in this subsection when the Bill was introduced to the Scottish Parliament.

Reason for taking power

41. The power to amend the reporting deadline date is intended to provide flexibility should there be a change to the time, for whatever reason, of the availability of the information (such as the disaggregated Scottish emissions data, for example) upon which the advisory body is required to comment.

Choice of procedure

42. Affirmative resolution procedure demonstrates the significance of the reporting and scrutiny framework established by this Bill.
Section 24(2) – Scottish Ministers’ response to reports on progress

Power conferred on: Scottish Ministers
Power exercisable by: order made by statutory instrument
Parliamentary procedure: affirmative resolution of the Scottish Parliament

Provision

43. Section 24(1) requires that the Scottish Ministers respond to the report prepared by the advisory body under section 23. Section 24(2) specifies the date by which this response is to be laid in the Scottish Parliament but also enables the Scottish Ministers to amend this deadline. Section 24(2) was amended at Stage 2 to enable the Scottish Ministers to specify by order earlier dates as well as later dates, which had been the condition in this subsection when the Bill was introduced to the Scottish Parliament.

Reason for taking power

44. The power enabling the Scottish Ministers to amend the response deadline is intended to provide flexibility should the advisory body’s report under section 23 be delayed or be made available earlier than currently expected. In the latter set of circumstances, this would prevent the Scottish Ministers from having a much longer period than intended in the Bill at introduction within which they may respond to the advisory body’s section 23 report.

Choice of procedure

45. Affirmative resolution procedure demonstrates the significance of the reporting and scrutiny framework established by this Bill.

PART 4 – DUTIES OF PUBLIC BODIES RELATING TO CLIMATE CHANGE

Section 36 - Duties of public bodies relating to climate change

Power conferred on: Scottish Ministers
Power exercisable by: order made by statutory instrument
Parliamentary procedure: affirmative resolution of the Scottish Parliament

Provision

46. Section 36 enables the Scottish Ministers to impose duties relating to climate change, by order, on bodies or persons exercising functions of a public nature, referred to as “public bodies” for the purposes of this Bill. Subsection (3) allows the regulations to impose different duties on different public bodies. Subsections (4) and (5) state that the Scottish Ministers must consult with such associations of local authorities and such other persons as they consider appropriate before imposing a duty. Subsection (6) states that the Scottish Ministers must co-operate with the relevant public bodies to help them comply with duties imposed under this section.

47. Subsections (A1) and (A2) were inserted into Section 36 at Stage 2. Subsection (A1) imposes, on the face of the Bill, three climate change duties on public bodies. Subsection (A2) provides that in this Part of the Bill a “public body” means a Scottish public authority within the meaning of section 3(1)(a) of the Freedom of Information (Scotland) Act 2002. The effect of
subsection (A1) is to change the enabling power in section 36(1) to be a power to make further provision relating to the imposition on public bodies of duties relating to climate change. Section 36(1) was therefore amended at Stage 2 to insert the word “further” before the word “provision” in recognition of this.

Reason for taking power

48. Section 36 allows for flexibility in the future to help ensure bodies with functions of a public nature take action on climate change, including reducing emissions or adapting to the effects of climate change.

Choice of procedure

49. As this provision could place a burden on bodies or persons exercising functions of a public nature, affirmative resolution procedure is considered appropriate.

Section 38 – Reporting on climate change duties

Power conferred on: Scottish Ministers
Power exercisable by: order made by statutory instrument
Parliamentary procedure: negative resolution of the Scottish Parliament

Provision

50. Section 38 enables the Scottish Ministers, by order, to require relevant public bodies to report on how they are complying with climate change duties created under section 36. It also enables the Scottish Ministers to set out what reports must include what format they must take and the time by which they must be submitted.

51. At Stage 2, paragraph (aa) was inserted into subsection (1). This paragraph makes clear that the Scottish Ministers may by order make provision requiring any relevant public body found, following an investigation under section 40 of the Bill, to be failing to comply with its climate change duties, to prepare a report on the actions it is taking to secure future compliance with those duties.

52. An amendment was made to paragraph (b) of subsection (1) to insert the condition that any provision made by an order made under subsection (1) as to the information that reports made by relevant public bodies must contain must be subject to subsection (1A). Subsection (1A) would have been created by amendment 209 to the Climate Change (Scotland) Bill which was lodged at Stage 2. This amendment was not ultimately moved at Stage 2, therefore the subsection (1A) mentioned in section 38(1)(b) does not exist.

Reason for taking power

53. The power to require public bodies to report on compliance with climate change duties is intended to ensure that such duties are carried out in an open and transparent fashion.
Choice of procedure

54. Requiring public bodies to report upon climate change duties which they are required to carry out is not considered as significant a burden as the requirement to perform such duties in the first place. Negative resolution procedure is therefore considered appropriate.

PART 5 – OTHER CLIMATE CHANGE PROVISIONS

CHAPTER 1 - ADAPTATION

Section 46 - Variation of permitted times for making muirburn

Power conferred on: Scottish Ministers
Power exercisable by: order made by statutory instrument
Parliamentary procedure: affirmative resolution of the Scottish Parliament

Provision

55. Section 46 inserts a new section 23A into the Hill Farming Act 1946 (“the 1946 Act”). Subsection (1) of new section 23A of the 1946 Act provides the Scottish Ministers with an order-making power to substitute for the dates specified in section 23(1), (2) or (3) of the 1946 Act, such other dates before which, and after which, it is lawful to make muirburn in any year.

56. Subsection (1) of section 23A was amended at Stage 2 to clarify that the order making power may be exercised to modify the dates specified in section 23(1), (2) or (3) of the 1946 Act repeatedly.

57. The original subsection (2) of section 23A was deleted by an amendment at Stage 2, and equivalent text was inserted instead into subsection (1). This text clarifies that any of the dates specified in section 23(1) to (3) of the 1946 Act may be substituted for the dates specified in an order made under section 23A(1) of the 1946 Act.

58. Subsection (3) provides that the Scottish Ministers may make an order under section 23A(1) of the 1946 Act only if they consider it necessary or expedient to do so in relation to climate change.

59. A new subsection (3A) was inserted at Stage 2 after subsection (3). The new subsection clarifies the extent of the Scottish Ministers’ power to modify section 23 of the 1946 Act such that the order-making power may not be exercised so as to reduce the length of the muirburn season below that currently provided for under section 23 of the 1946 Act. The amendment has the effect of maintaining the present length of the muirburn season.

Reason for taking power

60. The permitted times for making muirburn in Scotland have not changed since the 1946 Act came into force. Climate change in Scotland has altered our seasonal weather patterns. Future climate change scenarios suggest that annual temperatures will rise, winters may become wetter and summers generally drier. These climatic changes have impacted, and are likely to continue to impact, on the ability to successfully undertake muirburn. Where effective muirburn
cannot be carried out, there is an increased risk of wildfire from dry or dead vegetation, which can result in the loss of valuable habitats and carbon stored in peat underlying the lands upon which this vegetation is found. The power to vary the dates of the permitted muirburn season will enable muirburn, and those engaged in that activity, to adapt to the effects of climate change by permitting the activity at times of the year which reflect optimal climatic conditions.

Choice of procedure

61. Subsection (5) of new section 23A of the 1946 Act provides that order made under new section 23A(1) of the 1946 Act is subject to affirmative Parliamentary procedure. This allows for greater Parliamentary scrutiny of a draft order which proposes modification of the muirburn season. And as such an order modifies the text of section 23 of the 1946 Act, it is considered appropriate that affirmative, rather than negative, resolution procedure should apply.

CHAPTER 2 - FORESTRY

Section 47 - Power to modify functions of Forestry Commissioners

Power conferred on: Scottish Ministers
Power exercisable by: order made by statutory instrument
Parliamentary procedure: affirmative resolution of the Scottish Parliament

Provision

62. Section 47 confers on the Scottish Ministers the power to modify the functions of the Forestry Commissioners in or as regards Scotland. Subsection (2) provides that this power may be exercised by the Scottish Ministers only where they consider it to be necessary or expedient to do so to comply with their duties under sections 1, 2 or 3(1)(b) of the Bill, or otherwise in relation to climate change. Subsection (3) provides that an order under this section could enable the Forestry Commissioners to form or participate in corporate bodies or trusts. Subsection (4), which was deleted at Stage 2, contained provisions that would have allowed the Forestry Commissioners to delegate their functions to other persons.

Reason for taking power

63. The Forestry Commissioners have the general duty to promote the interests of forestry, the development of afforestation and the production and supply of timber and other forest products. In addition, the Forestry Commissioners have the function of managing land comprising the national forest estate. These functions have benefits in relation to the development of programmes, such as afforestation, which will assist with mitigation of climate change. The effects of climate change will continue to develop in the future. This power will ensure that the Forestry Commissioners can establish, participate in, or facilitate programmes to mitigate climate change without being prevented from doing so because of the limits set out in their current functions and duties which do not allow for them to form or participate in corporate bodies or trusts. The power will allow for flexibility to ensure that the Forestry Commissioners functions and duties can continue to be modified in future to meet the challenges posed by the continuing effects of climate change. Another amendment introduced at Stage 2 provides that any corporate body or trust formed under the powers provided for by Subsection (3) is subject to the biodiversity duty set out in section 1 of the Nature Conservation (Scotland) Act 2004.
Choice of procedure

64. The affirmative resolution procedure is considered appropriate because of the breadth of the power and the fact that it may involve modification of primary legislation.

CHAPTER 3 – ENERGY EFFICIENCY

Section 50 – Non-domestic buildings: assessment of energy performance and emissions

Power conferred on: Scottish Ministers
Power exercisable by: regulations made by statutory instrument

Provision

65. Section 50 requires that the Scottish Ministers make regulations relating to the assessment of the energy performance of and the emission of greenhouse gases from non-domestic buildings. Subsection (1) was amended at Stage 2 to state that the Scottish Ministers “must” make regulations under this section rather than simply that they “may make such regulations, which was the provision in this subsection when the Bill was originally introduced to the Scottish Parliament. Subsection (1)(b) provides that the regulations may extend not only to the greenhouse gases emitted by non-domestic buildings themselves but also to greenhouse gases otherwise associated with such buildings and with the activities carried out in these buildings.

66. At Stage 2 a new subsection was inserted after subsection (1). This new subsection together with the amendment above contains provision that the Scottish Ministers must by regulations require the implementation of recommendations made under subsection (1). The wording of subsection (1) itself has also been slightly amended to enable this new subsection to be introduced.

67. Subsection (2) lists certain things which the regulations may, in particular, provide about. A small amendment was made to paragraph (f) at Stage 2 to clarify that the activities referred to in that paragraph which may be the subject of greenhouse gas assessment are specifically those carried out in buildings. Subsection (2)(h) provides that the regulations made under subsection (1) may make provision about the issuing of certificates following such assessments, including the form, manner and content of such certificates. At Stage 2 four new paragraphs were inserted after subsection (2)(h) to enable regulations to include provision for the form of recommendations contained in such certificates, the manner and periods which persons will be permitted to comply with those recommendations, the setting up of a register for certificates and the disclosure of information in the register.

68. Subsection (3) states that the enforcement authority provided for in the regulations is to be a local authority or such other person or body as the Scottish Ministers consider appropriate. Subsection (4) enables the enforcement authority to levy charges to recover the reasonable costs incurred in exercising its functions under the regulations.
Reason for taking power

69. The aim of the provisions for improving the energy performance of existing non-domestic buildings is to raise the contribution that the existing non-domestic stock can make to mitigating climate change. Buildings account for over 40% of emissions and there is scope to reduce these levels. They are to be subject to an assessment of the emissions of greenhouse gases and energy performance, an enhanced form of energy performance certificate (EPC). The enabling powers in section 50 will allow the creation of the framework necessary for this.

Choice of procedure

70. As this provision may be used to create regulations which could place a significant burden on the owners of non-domestic buildings, affirmative resolution procedure is considered appropriate. When the Bill was introduced to the Scottish Parliament, regulations made to make provision relating to the recovery of costs by the enforcement authority were subject to negative resolution procedure as it was considered that such regulations would be needed to keep such provisions up to date and would involve technical amendments which were unlikely to be significant. However, during Stage 1, the Economy, Energy and Tourism Committee considered that amendments of this kind were of sufficient significance to also merit affirmative resolution procedure. An amendment to section 64 to this effect was made to the Bill at Stage 2.

Section 50A - Living accommodation: assessment of energy performance and emissions

Power conferred on: Scottish Ministers
Power exercisable by: order made by statutory instrument
Parliamentary procedure: affirmative resolution of the Scottish Parliament

Provision

71. Section 50, as amended at Stage 2, enables the Scottish Ministers to make regulations relating to the assessment and improvement of the energy performance and the emission of greenhouse gases from non-domestic buildings, and to require the implementation of recommendations made as part of that assessment.

72. At Stage 2 section 50A was inserted into the Bill, giving the Scottish Ministers powers broadly equivalent to those in section 50 as it was before stage 2, but in relation to living accommodation rather than non-domestic buildings. Subsection (1) of the new section differs from subsection (1) of section 50 by specifying living accommodation and also by referring only to emissions produced by the living accommodation, omitting reference to emissions otherwise associated with the building or activities carried out in the building. It also gives the Scottish Ministers powers to make regulations about improving the energy performance and emissions of living accommodation. Subsection (2) lists certain things which the regulations made under subsection (1) may, in particular, provide about. Subsection (3) states that the enforcement authority provided for in the regulations is to be a person or body that the Scottish Ministers consider appropriate. In this respect, it differs from section 50(3) by making no specific reference, in the case of living accommodation, to the possibility that the local authority could be the enforcement authority. Subsection (4) enables the enforcement authority to levy charges to recover the reasonable costs incurred in exercising its functions under the regulations.
Reason for taking power

73. The aim of the provisions for improving the energy performance of existing domestic buildings is to raise the contribution that the existing domestic stock can make to mitigating climate change. Buildings account for over 40% of emissions and there is scope to reduce these levels. They are to be subject to an assessment of the emissions of greenhouse gases and energy performance, which would be an enhanced and more precise, and therefore fairer, form of energy performance certificate (EPC). The enabling powers in section 50 will allow the creation of the framework necessary for this and for the improvement of energy performance and emissions.

Choice of procedure

74. As this provision may be used to create regulations which could place a significant burden on the owners of domestic buildings, affirmative resolution procedure is considered appropriate.

Section 50B - Council tax reductions to promote energy efficiency

Power conferred on: Scottish Ministers
Power exercisable by: regulations made by statutory instrument
Parliamentary procedure: affirmative resolution of the Scottish Parliament

Provision

75. Section 50B was inserted into the Bill at Stage 2. This section requires that the Scottish Ministers make regulations that would facilitate local authorities to reduce the amount of council tax a person is liable to pay in the following financial year if that person makes an energy efficiency improvement or installs technologies reliant on renewable energy or heat in a domestic dwelling in the current financial year.

76. Subsection (1) places a duty on the Scottish Ministers to make regulations under section 80 of the Local Government Finance Act 1992 to provide that, in respect of a person who satisfies certain conditions set out in paragraphs (a) and (b) of the subsection, the first of which relates to energy efficiency improvements being made to a dwelling, the amount of council tax that the person is to be liable for in the next financial year shall be reduced in accordance with section 50C which was also added to the Bill at Stage 2.

77. Subsection (2) requires that the regulations that the Scottish Ministers must make under subsection (1) must also make similar provision about reducing the council tax which is liable following the installation of technologies reliant on renewable energy or heat in a dwelling.

78. Subsection (3) provides that, subject to subsection (4) any reductions made under either subsection (1) and (2) are without prejudice to reductions made under the other subsection. Subsection (3) also provides that any reduction made under subsection (1) is without prejudice to any further reduction made by virtue of that subsection.

79. Subsection (4) provides that the regulations made by virtue of subsection (1) may specify a maximum number of reductions, or a maximum total reduction, in the amount of council tax payable in respect of any one dwelling in any one financial year.
80. Subsection (5) provides that the regulations made under subsection (1) must make provision regarding the sort of evidence that a local authority is to accept as demonstrating that an energy efficiency improvement has been made to a dwelling and/ or that a dwelling meets a reasonable standard of energy efficiency.

81. Subsection (6) requires that a draft of a statutory instrument containing the first regulations under subsection (1) must be laid before the Scottish Parliament no later than 31 December 2009.

82. Subsection (7) contains definitions of several of the terms used in other parts of 50B and subsection (8) provides that the Scottish Ministers may by regulations, amend subsection (7) to add to the list of measures in the definition of “energy efficiency improvement”.

\textit{Reason for taking power}

83. Under the UK Carbon Emissions Reduction Target scheme, payments are made by energy generators to incentivise householders to make improvements to the energy efficiency of their dwellings and/ or install renewable energy or heat technologies in those dwellings. In England and Wales this money can be made available via local authorities by directly or indirectly reducing the level of council tax payable in respect of particular properties. Section 50B makes provisions for similar incentivisation schemes to be operated in Scotland.

\textit{Choice of procedure}

84. Given that regulations made under section 50B concern varying council tax payable on certain dwellings in specific circumstances and that this has implications for local authorities in Scotland regarding the administration and funding provision of these payments, it is considered that affirmative resolution procedure affords an appropriate level of parliamentary scrutiny.

\textit{Section 50D - Review of provisions made by virtue of or under sections 50C and (Amounts of reductions in non-domestic rates)}

\textbf{Power conferred on:} Scottish Ministers  
\textbf{Power exercisable by:} regulations made by statutory instrument  
\textbf{Parliamentary procedure:} affirmative resolution of the Scottish Parliament

\textit{Provision}

85. Reference is made in subsections (1) and (3) of section 50D to section 25B of the Local Government (Scotland) Act 1966. Reference is also made in the title of section 50D and in subsections (2) and (3) to section (Amounts of reductions in non-domestic rates). These two sections would have been created by amendments 260 and 262 to the Climate Change (Scotland) Bill which were lodged at Stage 2. These amendments related to non-domestic rates but were not ultimately moved at Stage 2, therefore the two new sections detailed in this paragraph and mentioned in section 50D do not exist. This Supplementary Delegated Powers Memorandum provides information only on the powers that are actually available to the Scottish Ministers.

86. Section 50D requires annual reports to be made by the Scottish Ministers regarding the effectiveness of specific financial incentives towards promoting energy efficiency improvements
and technologies reliant on renewable sources of energy or heat, and powers to vary these amounts, and alter the criteria involved.

87. Subsection (1) provides that the Scottish Ministers must, as soon as reasonably practicable after 31 March 2012, and annually thereafter, lay a report before the Scottish Parliament on the operation of regulations made by virtue of section 50B of the Bill, including a assessment of whether reductions which have been made in council tax have contributed effectively towards promoting energy efficiency improvements and technologies reliant on renewable sources of energy or heat.

88. Subsection (2) provides the Scottish Ministers with the power to vary, in specified circumstances, the amount of reduction which may be made to council for the purpose of promoting energy efficiency improvements and technologies reliant on renewable sources of energy or heat.

89. Subsection (3) provides the Scottish Ministers with the power to vary, in specified circumstances, the specified mechanisms for calculating the amount of reduction which may be made to council tax for the purpose of promoting energy efficiency improvements and technologies reliant on renewable sources of energy or heat.

**Reason for taking power**

90. The provision in section 50D is necessary to ensure that the effectiveness of the specified financial incentives towards promoting energy efficiency improvements and technologies reliant on renewable sources of energy or heat is kept under review. The regulation making powers in subsections (2) and (3) are necessary to enable Ministers to take appropriate remedial action should any of the reports made under subsection (1) identify that any of the amounts of reductions in council tax mentioned in that subsection should be increased or otherwise varied or that different mechanisms for calculating those amounts be prescribed.

**Choice of procedure**

91. Given that regulations made under subsections (2) and (3) of section 50D concern varying council tax payable on certain buildings in specific circumstances and that this has implications for local authorities in Scotland regarding the administration of these payments, it is considered that affirmative resolution procedure affords an appropriate level of parliamentary scrutiny.
Section 51A – Air source heat pumps and micro wind turbines in domestic properties: permitted development rights

Power conferred on: Scottish Ministers
Power exercisable by: order made by statutory instrument
Parliamentary procedure: negative resolution of the Scottish Parliament

Provision

92. Subsection (1) of section 51A places a duty on the Scottish Ministers to bring forward an amendment to the Town and Country Planning (General Permitted Development) (Domestic Microgeneration) (Scotland) Amendment Order 2009. Subsection (2) specifies items that the amendment under subsection (1) must contain.

93. Subsection (3) requires that an order making the amendment required in subsection (1) be brought forward no later than six months after the commencement date of this section. The order will be made under section 30 of the Town and Country Planning (Scotland) Act 1997.

94. Subsection (4) contains provision about certain consultation criteria that the Scottish Ministers must comply with before making the amendment under subsection (1).

95. Subsection (5) contains the definition of the term “microgeneration” for the purposes of section 51A.

Reason for taking power

96. Section 51A would place a duty on the Scottish Ministers to take specific action that would provide for the circumstances in which permitted development rights would be granted for the installation, alteration or replacement of air source heat pump and wind turbine microgeneration equipment in domestic properties.

Choice of procedure

97. Orders made under section 30 of the Town and Country Planning (Scotland) Act 1997 are subject to negative resolution procedure.

Section 51B – Microgeneration in non-domestic buildings: permitted development rights

Power conferred on: Scottish Ministers
Power exercisable by: order or regulations made by statutory instrument
Parliamentary procedure: negative resolution of the Scottish Parliament

Provision

98. Subsection (1) of section 51B places a duty on the Scottish Ministers to bring forward an order or regulations under section 30 of the Town and Country Planning (Scotland) Act 1997.

99. Subsection (2) specifies that the order or regulations made under subsection (1) must make provision specifying the circumstances in which the installation, alteration or replacement
of microgeneration within the curtilage of a non-domestic building is considered to be a permitted development within the meaning of sections 30 and 31 of the 1997 Act.

100. Subsection (3) requires that the order or regulations made to satisfy the duty in subsection (1) be brought forward no later than 12 months after the commencement date of this section.

101. Subsection (4) contains provision about certain consultation criteria that the Scottish Ministers must comply with before making the amendment under subsection (1).

102. Subsection (5) contains the definition of the terms “microgeneration” and “non-domestic building” for the purposes of section 51B.

Reason for taking power

103. Section 51B would place a duty on the Scottish Ministers to take specific action that would provide for the circumstances in which permitted development rights would be granted for the installation, alteration or replacement of microgeneration equipment in non-domestic buildings.

Choice of procedure

104. Orders made under section 30 of the Town and Country Planning (Scotland) Act 1997 are subject to negative resolution procedure.

CHAPTER 3A – THE SCOTTISH CIVIL ESTATE

Section 51E – Scottish civil estate: supplementary

Power conferred on: Scottish Ministers
Power exercisable by: order made by statutory instrument
Parliamentary procedure: affirmative resolution of the Scottish Parliament

Provision

105. Sections 51C (Energy performance of new buildings procured for the Scottish civil estate) and 51D (Report on the Scottish civil estate) were inserted into the Bill at Stage 2. Section 51E contains a delegated power related to these two subsections.

106. Section 51E(1) sets out what buildings are to be considered as being part of the civil estate in Scotland for the purposes of sections 51C and 51D.

107. Section 51E(2) contains an order making power to allow specific descriptions of buildings to be included within the scope of sections 51C and 51D if the generic description in subsection (1) is considered not to apply to them. Subsection (2) also provides that descriptions or uses of buildings may be excluded from or included in the scope of sections 51C and 51D.
This document relates to the Climate Change (Scotland) Bill as amended at Stage 2 (SP Bill 17A)

Reason for taking power

108. The wording of subsection (1) of section 51E is drafted so that sections 51C and 51D will cover the buildings used for Scottish central government administration. It may in the future be considered appropriate that subsection (1) should not extend to specific descriptions or uses of buildings or, conversely, that it does not cover particular buildings or uses that it should. The order making power in subsection (2) allows for the scope of subsection (1) to be varied by order to respond to such circumstances.

Choice of procedure

109. Members of the Scottish Parliament are likely to have an interest in which buildings fall within the scope of section 51E and which are therefore covered by sections 51C regarding the procurement or construction of such buildings and section 51D regarding reporting on the efficiency and contribution to sustainability of those buildings. It is considered that affirmative resolution affords the sufficient level of parliamentary scrutiny should the Scottish Ministers seek to use an order under section 51E(2) to alter the scope of section 51E(1).

CHAPTER 4 – WASTE REDUCTION AND RECYCLING

Section 52 - Waste prevention and management plans

<table>
<thead>
<tr>
<th>Power conferred on:</th>
<th>Scottish Ministers</th>
</tr>
</thead>
<tbody>
<tr>
<td>Power exercisable by:</td>
<td>regulations made by statutory instrument</td>
</tr>
<tr>
<td>Parliamentary procedure:</td>
<td>super-affirmative resolution of the Scottish Parliament</td>
</tr>
<tr>
<td></td>
<td>(negative procedure for regulations dealing only with charging by enforcement authority)</td>
</tr>
</tbody>
</table>

Provision

110. Section 52 enables the Scottish Ministers, by regulations, to place a duty on specified persons to prepare waste prevention and management plans. The Scottish Ministers would prescribe in regulations the persons required to prepare a plan (or plans), as well as the matters to be included in a plan. It is intended that the plans can be required for a range of different matters. For example, the regulations might require a plan for an individual construction project. Alternatively, they might require a plan for waste generated by a business on an on-going, day-to-day basis (e.g. office waste). It is intended that these regulations would deal with measures to prevent as well as manage waste.

111. Should the preparation of waste prevention and management plans be made compulsory by regulations under this section of the Bill, a regime will need to be established to ensure that plans are drawn up, that they are sufficiently rigorous, and that they are followed. A body will need to be established, or nominated, to do this. Subsection (2)(e) to (h) and section 60 of the Bill grants powers enabling such a regime to be set up and to establish or nominate a body to operate the regime.

Reason for taking power

112. Minimisation of waste, better use of resources, and careful management of such waste as does arise all impact on climate change. They are also important for other environmental goals,
such as landfill reduction and preservation of amenity. Avoidance of waste can also generate savings for businesses. In view of this range of gains, many businesses already plan for prevention and management of waste. Powers would be taken to ensure that performance across the economy met best standards, and that up-to-date approaches and techniques be adopted.

113. The range of activities encompassed by the plans, and the kind of waste with which they will need to deal, will be strongly influenced by economic activities and market conditions prevailing in future. All of these may change over time. Taking these powers allows a flexible response to prevailing conditions.

Choice of procedure

114. Regulations will provide the detail of any scheme which is to be enforced. At Stage 2 it was considered appropriate, for proper Parliamentary scrutiny, that super-affirmative procedure be adopted. This was thought to be desirable given that regulations are likely to create new offences. The exception would be regulations dealing only with charges by the monitoring and enforcement body (see section 60(4)) which, in terms of section 64(5) and (7)(e), would be made by negative resolution.

Section 53 - Information on waste

Power conferred on: Scottish Ministers
Power exercisable by: regulations made by statutory instrument
Parliamentary procedure: super-affirmative resolution of the Scottish Parliament

Provision

115. Subsection 53(1) enables the Scottish Ministers, by regulations, to require specified persons to provide information to SEPA about the waste that they produce. In terms of an amendment introduced at Stage 2, the first regulations must be made under this section within a year of Royal Assent. Subsection (2) lists certain things which the regulations may, in particular, provide about, including the enforcement of duties imposed by the regulations and related offences for failing to comply with the requirements of the regulations.

Reason for taking power

116. It will be difficult to move to a zero waste society without much better information about the circumstances in which waste arises and its management, treatment and disposal in Scotland. Good, reliable waste data informs policy-makers when they are developing new ways of reducing and managing waste. It informs the private sector when it is seeking to invest in waste infrastructure as part of the move away from landfill, and also when looking to minimise waste, and thus costs. Such information would also help to meet the obligations of the Scottish Ministers under the Waste Statistics Regulation (2150/2002/EC)\(^1\). This establishes a framework for the production of Community statistics on the generation, recovery and disposal of waste. It requires Member States and the European Commission to produce Community statistics on the generation, recovery and disposal of waste. SEPA already collates waste statistics which are

---

\(^1\) OJ No L 332, 9.12.2002, p1
used to meet Scotland’s obligations under the EU Regulation. However, statistics on commercial and industrial waste are based on surveys for which the return rate is low.

117. Taking powers would enable the kind of statistics collected to be determined by developing needs. As an example, and without prejudicing any eventual use of the power, in future it may become possible and desirable to keep statistics relating to the greenhouse-gas-generating potential of waste.

Choice of procedure

118. Regulations will provide the detail of any scheme which is to be enforced. At Stage 2 it was considered appropriate, for proper Parliamentary scrutiny, that super-affirmative procedure be adopted. This was thought to be desirable given that regulations are likely to create new offences.

Section 54 - Recyclable waste: facilities for deposit etc.

Power conferred on: Scottish Ministers
Power exercisable by: regulations made by statutory instrument
Parliamentary procedure: super-affirmative resolution of the Scottish Parliament (negative procedure for regulations dealing only with charging by enforcement authority)

Provision

119. Section 54 enables the Scottish Ministers to make regulations which may require receptacles to be provided by persons of the kinds specified for a broad range of types of waste. It is possible that, for example, supermarkets could be required to provide recycling facilities at or near tills for packaging which customers could use. Offices could be required to provide receptacles in which employees could recycle their own paper, as well as that of the workplace. This would not be a complete innovation: such facilities are already available in places. In practice, the Scottish Ministers would only prescribe types of waste if there was capacity to recycle that waste and a market for the resulting recyclate.

120. Regulations may also be used to require persons with the correct environmental authorisation to collect waste deposited in such facilities and to ensure so far as reasonably practicable that such waste is recycled. Charges payable to such authorised persons may be specified.

121. A monitoring and enforcement regime may be established to ensure that the facilities are provided, and used and operated correctly. Subsection (2)(f) to (i) and section 60 of the Bill grants powers enabling such a regime to be set up and to establish or nominate a body to operate the regime.

Reason for taking power

122. Improved provision of recycling facilities reduces the use of landfill and can also help to mitigate climate change. To improve recycling rates the producers of waste have to be given
better opportunities to recycle, rather than dispose of the waste they produce; and waste has to be separated and kept uncontaminated to make recycling easier, or even physically possible. The provision of receptacles at convenient places, and which keep waste streams separate, achieves both these conditions.

123. The kinds of waste for which receptacles are provided are likely to change over time as recycling markets change or new products are developed. This will in turn affect judgements about the persons who should be required to provide and enabled to use these facilities. For this reason requirements are likely to need to be modified; and this power will permit this to be done.

**Choice of procedure**

124. Regulations will provide the detail of any scheme which is to be enforced. At Stage 2 it was considered appropriate, for proper Parliamentary scrutiny, that super-affirmative procedure be adopted. This was thought to be desirable given that regulations are likely to create new offences. The exception would be regulations dealing only with charges by the monitoring and enforcement body which, in terms of section 64(5) and (7)(e), would be made by negative resolution.

**Section 55 - Recyclable waste: facilities for deposit at events etc.**

<table>
<thead>
<tr>
<th>Power conferred on:</th>
<th>Scottish Ministers</th>
</tr>
</thead>
<tbody>
<tr>
<td>Power exercisable by:</td>
<td>regulations made by statutory instrument</td>
</tr>
<tr>
<td>Parliamentary procedure:</td>
<td>super-affirmative resolution of the Scottish Parliament (negative procedure for regulations dealing only with charging by enforcement authority)</td>
</tr>
</tbody>
</table>

**Provision**

125. Whereas section 54 is most likely to be used to require the provision of receptacles at more-or-less permanent locations, section 55 enables the Scottish Ministers to make regulations which confer power on local authorities to issue notices requiring receptacles to be provided for a broad range of types of waste at various events. The receptacles would be needed only for the duration of the event. This would not be a complete innovation: such facilities have already been made available at particular events. In practice, the Scottish Ministers would only prescribe types of waste if there was capacity to recycle that waste and a market for the resulting recyclate.

126. Those who hold sporting or cultural events could be placed under a duty to provide receptacles in which those attending could leave a range of waste – relevant examples could be plastic cups and programmes. The materials so collected could then be recycled. Regulations may also be used to enable local authorities to require persons with the correct environmental authorisation to collect such waste and to ensure so far as reasonably practicable that waste deposited in such facilities is recycled. Regulations may specify charges payable to such authorised persons.

127. A monitoring and enforcement regime may be established to ensure that facilities are provided, used and operated correctly. Subsections (2)(k) to (n) and section 60 of the Bill grant
powers enabling such a regime to be set up and to establish or nominate a body to operate the
regime.

Reason for taking power

128. As with the kind of receptacles in permanent locations envisaged by section 54, the aim
here is to encourage recycling and thus the more efficient use of resources. The conditions for
higher recycling rates are to be established by maximising collection and by keeping different
types of waste separate for easy recycling. An additional benefit which may be achieved by the
 provision of recycling facilities at events is a reduction in littering.

129. The kinds of waste for which receptacles are provided are likely to change over time as
recycling markets change or new products are developed. This may in turn affect judgements
about which events should be potentially subject to notices. For this reason, requirements are
likely to need to be modified; and this power will permit this to be done.

Choice of procedure

130. Regulations will provide the detail of any scheme which is to be enforced. At Stage 2 it
was considered appropriate, for proper Parliamentary scrutiny, that super-affirmative procedure
be adopted. This was thought to be particularly desirable given that regulations are likely to
create new offences. The exception would be regulations dealing only with charges by the
monitoring and enforcement body which, in terms of section 64(5) and (7)(e), would be made by
negative resolution.

Section 56 - Procurement of recyclate

Power conferred on: Scottish Ministers
Power exercisable by: regulations made by statutory instrument
Parliamentary procedure: super-affirmative resolution of the Scottish Parliament
(negative procedure for regulations dealing only with charging by enforcement authority)

Provision

131. Section 56 gives the Scottish Ministers powers to require specified persons to ensure that
particular things procured or constructed by them contain or include a certain proportion of
recyclate.

132. Arrangements would be required to ensure that these obligations were observed. A body
would have to be set up or nominated to do this. Section 56(3)(f), subject to section 60, contains
provisions allowing such a regime to be developed.

Reason for taking power

133. A great deal of recyclate is already procured by a wide range of businesses and public
bodies, which promotes resource efficiency, reduces the use of landfill and helps mitigate
climate change. It is likely, however, that markets for recyclate, and with them economic
activity in the waste processing sector, could be increased if such procurement were made
compulsory. It would also help to counter the effects of what may be perceived as a stigma attached to recycled products.

134. The kind of recycled materials which should be procured would, however, depend on market conditions prevailing at the time, as would the type of organisation at which the powers would be aimed. Care would also have to be taken, for example, that any materials stipulated should be sufficiently widely available and readily traded to avoid market distortions. Powers therefore need to be flexible enough to allow modification, as envisaged in this section.

Choice of procedure

135. Regulations will provide the detail of any scheme which is to be enforced. At Stage 2 it was considered appropriate, for proper Parliamentary scrutiny, that super-affirmative procedure be adopted. This was thought to be desirable given that regulations are likely to create new offences. The exception would be regulations dealing only with charges by the monitoring and enforcement body which, in terms of section 64(5) and (7)(e), would be made by negative resolution.

Section 57 – Targets for reduction of packaging etc.

Power conferred on: Scottish Ministers
Power exercisable by: regulations made by statutory instrument
Parliamentary procedure: super-affirmative resolution of the Scottish Parliament (negative procedure for regulations dealing only with charging by enforcement authority)

Provision

136. Section 57 enables the Scottish Ministers, by regulations, to set targets to reduce the amount of packaging used and to require specified persons to comply with those targets. Without prejudicing detailed provisions, it would allow Ministers to obtain information about a baseline volume of packaging on the market in Scotland and then set targets on retailers, for example, to reduce that amount year on year. The reduction might be expressed in ways other than absolute amounts: for example, targets could be set with reference to the relationship between volume of packaging put on the market by a retailer and its turnover. The forms of packaging for which targets might be set would be a matter for the regulations and could, obviously, be altered by further regulations.

137. A monitoring and enforcement regime may be established to ensure that information is properly collated and targets met. Subsection (2)(e) to (h) and section 60 of the Bill grants powers enabling such a regime to be set up and to establish or nominate a body to operate the regime.

Reason for taking power

138. There is already legislation regarding packaging, in the form of the Packaging (Essential Requirements) Regulations 2003\(^2\) and the Producer Responsibility Obligations (Packaging

\(^2\) SI 2003/1941
This document relates to the Climate Change (Scotland) Bill as amended at Stage 2
(SP Bill 17A)

Waste) Regulations 2007\(^3\). These respectively set out the required specifications of packaging, and place responsibility on producers to recycle a proportion of waste packaging put on the market by them. Neither of these sets of regulations actually requires that the overall amount of packaging used should be reduced. The proposal in this Bill would complement existing legislation. Baseline information about packaging in circulation is needed before targets can be set, and the system is likely to require future revision in light of changing market conditions.

Choice of procedure

139. Regulations will provide the detail of any targets, to whom they apply, and how they should be enforced. At Stage 2 it was considered appropriate, for proper Parliamentary scrutiny, that super-affirmative procedure be adopted. This was thought to be desirable given that regulations are likely to create new offences. The exception would be regulations dealing only with charges by the monitoring and enforcement body which, in terms of section 64(5) and (7)(c), would be made by negative resolution.

Section 58 – Deposit and return schemes

Power conferred on: Scottish Ministers
Power exercisable by: regulations made by statutory instrument
Parliamentary procedure: super-affirmative resolution of the Scottish Parliament other than where the regulations only make provision relating to one or more of: charging by the enforcement authority, amount of deposits, form and content of notices or registration fees, in which case the procedure is negative resolution of the Scottish Parliament

Provision

140. Section 58 allows the Scottish Ministers to establish deposit and return schemes, which are defined in terms of attaching a returnable element, called a “deposit” to the sale price of an article, which would be payable to the person returning the packaging associated with that item, the item itself, or both the item and the packaging. The section allows the items and/or packaging which would be included in the scheme, and the persons involved, as well as the amount of any deposit, to be defined in regulations. The section as drafted dealt originally only with packaging. Amendments were made at Stage 2 at various places in the section to refer to the articles, the returnable packaging, and to both articles and packaging, allowing any scheme to deal with consumer articles as well as, or even without, their respective packaging.

141. The section also allows for a non-returnable element being included in the price, to defray the expenses of any scheme. This amendment was inserted in section 58(7) at stage 2.

142. The section would permit a range of schemes to be developed, within that basic structure. At its simplest a scheme could merely require Scottish producers to establish their own deposit and return schemes. At the other end of the scale it could require the establishment of a “clearing house” system similar to that operating in Denmark and Norway, whereby relevant items are identified by the clearing house against payment of a fee by whomever puts them on

\(^3\) SI 2007/871
the market. These fees are used to refund those who return the materials. The clearing-house can also take responsibility for recycling the materials collected: this is allowed for by the section.

143. A monitoring and enforcement regime may be established to ensure that materials subject to the requirements have a deposit attached to the sale price of the relevant items and this is properly refunded to those returning them. Monitoring and enforcement powers would be required. Subsection (7)(i) to (l) and section 60 of the Bill grants powers enabling such a regime to be set up and to establish or nominate a body to operate the regime. Section 58(5) contains provision allowing a clearing house of the type described above to carry out these functions. The clearing house, called a “scheme administrator” in an amendment introduced at Stage 2, is dealt with in more detail in the succeeding sections which were similarly introduced at that Stage.

Reason for taking power

144. While the 2007 Regulations described above do require the recycling of certain amounts of packaging this tends to be “back of store”. A deposit and return scheme could increase the return and the recycling of packaging which reaches consumers’ hands. Furthermore, the 2007 Regulations do not affect the consumer items themselves, which might also reasonably be subject to a scheme. For example, a deposit and return scheme could be used to encourage the collection and proper management of waste low-energy light bulbs.

145. Section 58(6) provides that Ministers may only make regulations where they consider this to be necessary or expedient in order to promote or secure an increase in the recycling of materials. Furthermore, by attaching a monetary value to items and packaging it could discourage the careless discarding of these materials – littering and fly-tipping – and reduce the concomitant amenity, and health and safety, problems.

146. A scheme could also encourage manufacturers to develop reusable forms of consumer items and packaging. Those who operate existing deposit and return schemes do so to encourage reuse of materials and thus keep their own costs down. It is likely that the types of product which are suitable for deposit and return schemes will develop along with markets and technology. The level of detail required to establish properly functioning schemes is likely to be best left to subordinate legislation.

Choice of procedure

147. Regulations will provide the detail of any deposit and return schemes. At Stage 2 it was considered appropriate, for proper Parliamentary scrutiny, that super-affirmative procedure be adopted. This was thought to be desirable given that regulations are likely to be complex and, in particular, to create new offences. The exceptions would be regulations dealing only with charges by the monitoring and enforcement body, the amount of the deposits, form and content of information notices for customers, and registration fees which, in terms of section 64(5) and (7)(d) and (e), would be made by negative resolution.
Section 58A - Deposit and return schemes: designation of scheme administrator

**Power conferred on:** Scottish Ministers  
**Power exercisable by:** regulations made by statutory instrument  
**Parliamentary procedure:** affirmative resolution of the Scottish Parliament

**Provision**

148. This section was inserted at Stage 2. Any scheme administrator to which section 58(5) applies needs to be designated by the Scottish Ministers. Subsection (1) of this section allows the Scottish Ministers to do so. It may be either an existing or a new body. Subsection (2) also allows the Scottish Ministers to confer, remove or otherwise vary the scheme administrator’s functions, where the scheme administrator is an existing body. Amongst these functions it mentions in particular, at subsection (3), borrowing and charging in respect of the exercise of its functions. This is necessary to ensure that the scheme administrator’s costs can be covered.

149. Subsection (4) also obliges a scheme administrator to comply with directions the Scottish Ministers may give it. This is common among existing bodies enforcing environmental law, such as SEPA.

**Reason for taking power**

150. The kind of functions envisaged for a scheme administrator – running a clearing-house type of deposit-and-return scheme – are different in nature from the functions of existing bodies in Scotland, and are unlikely all to be available in existing legislation. Not only is it necessary to be able to give a body, whether new or existing, those functions, but it is also necessary to take powers to ensure that Scottish Ministers are able to give any body the necessary functions at all.

**Choice of procedure**

151. An order would provide the detail of to whom the functions of a scheme administrator may be given, and the details of those functions. This would be made by affirmative procedure.

Section 58B - Power to establish scheme administrator

**Power conferred on:** Scottish Ministers  
**Power exercisable by:** regulations made by statutory instrument  
**Parliamentary procedure:** affirmative resolution of the Scottish Parliament

**Provision**

152. This section was inserted at Stage 2. It allows the Scottish Ministers to set up a new body to undertake the functions of a scheme administrator. The detail of the Ministers’ powers in respect of the administrator’s status, constitution, members and employees, functions and accounting is set out in subsection (5). Any such body will be a body corporate. It will have the powers necessary or expedient to carry out the functions of running a clearing-house deposit and return scheme. In particular it may carry out such quasi-commercial functions as entering into contracts, borrowing and charging.
Reason for taking power

153. It is not unlikely that a new body would have to be created to exercise the functions of a scheme administrator, since they are unlike those of any existing body. Detailed powers are therefore necessary to create and establish parameters for a new body, and delineate its functions.

Choice of procedure

154. An order would provide the detail of powers regarding the establishment of a new body to act as scheme administrator. This would be made by affirmative procedure.

Section 59 - Charges for supply of carrier bags

Power conferred on: Scottish Ministers
Power exercisable by: regulations made by statutory instrument
Parliamentary procedure: super-affirmative resolution of the Scottish Parliament (negative procedure for regulations dealing only with charging by enforcement authority)

Provision

155. Section 59 will enable the Scottish Ministers to require suppliers of goods to charge for carrier bags. This may be done by reference to the type of goods sold, the type of supplier, turnover or other factors. The regulations would also define the carrier bags to which the charge applied and specify either the amount to be charged for each bag, or provide for how that amount is to be determined. The regulations would also be able to specify how the net proceeds are to be used, for example to ensure (if necessary) that the proceeds are applied to environmental causes which operate in Scotland.

156. Records will need to be kept about matters such as the number, type and tonnage of carrier bags for which a seller has imposed the charge. Section 59(2)(g) to (l), subject to section 60, enable the Scottish Ministers to appoint a body or bodies to monitor the accuracy of these records, and also to enforce the regulations, including ensuring that the proceeds were actually spent on the required good causes and to impose sanctions for failure to comply with the regulations.

Reason for taking power

157. Voluntary action has already significantly reduced the issue of carrier bags. However, reducing carrier bag use to a minimum may well require the imposition of a charge. Exactly what bags should be subject to such a charge, however, is likely not only to be a matter of detailed exposition, but also to be subject to variables, depending on – for example – life cycle analyses of various kinds of bag at any given time. Changes in the plastic reprocessing market, for example, could significantly affect the assessment of the environmental costs of plastic bags. Consumer shopping habits may change, and be reflected in the pattern of bag use associated with supermarkets on the one hand and boutiques on the other. It is therefore necessary for the power to set charges to be capable of modifying a range of details.
**Choice of procedure**

158. Regulations will provide the detail of any scheme which is to be enforced. At Stage 2 it was considered appropriate, for proper Parliamentary scrutiny, that super-affirmative procedure be adopted. This was thought to be desirable given that regulations are likely to create new offences. The exception would be regulations dealing only with charges by the enforcement body, which, in terms of section 64(5) and (7)(e), would be made by negative resolution.
Subordinate Legislation Committee

35th Report, 2009 (Session 3)

Climate Change (Scotland) Bill as amended at Stage 2

Published by the Scottish Parliament on 24 June 2009
Subordinate Legislation Committee

Remit and membership

Remit:

1. The remit of the Subordinate Legislation Committee is to consider and report on-

   (a) any-

      (i) subordinate legislation laid before the Parliament;

      (ii) Scottish Statutory Instrument not laid before the Parliament but classified as general according to its subject matter,

   and, in particular, to determine whether the attention of the Parliament should be drawn to any of the matters mentioned in Rule 10.3.1;

   (b) proposed powers to make subordinate legislation in particular Bills or other proposed legislation;

   (c) general questions relating to powers to make subordinate legislation; and

   (d) whether any proposed delegated powers in particular Bills or other legislation should be expressed as a power to make subordinate legislation.

   (Standing Orders of the Scottish Parliament, Rule 6.11)

Membership:

Jackson Carlaw
Malcolm Chisholm
Bob Doris
Helen Eadie
Tom McCabe
Ian McKee (Deputy Convener)
Jamie Stone (Convener)
Committee Clerking Team:

Clerk to the Committee
Shelagh McKinlay

Assistant Clerk
Jake Thomas
The Committee reports to the Parliament as follows—

1. At its meeting on 23 June the Subordinate Legislation Committee considered the delegated powers provisions in the Climate Change (Scotland) Bill as amended at Stage 2. The Committee submits this report to the Parliament under Rule 9.7.9 of Standing Orders.

2. The Scottish Government provided the Parliament with a supplementary memorandum on the delegated powers provisions in the Bill (“the supplementary DPM”)\(^1\).

Delegated Powers Provisions

3. The Committee considered all of the powers as set out in the supplementary DPM and is content with sections: 4, 6, 7, 7A, 12, 14, 18A, 18B, 18C, 23(3A) and (4), 24(2), 38, 46, 50A, 51E, 52, 53, 54, 55, 56, 57, 58 and 59.

Section 2A(1) – Modifying the interim target

4. Section 2(1) provides that Ministers must ensure that the net Scottish emissions account for 2020 is at least 34% lower than the baseline figure. This is the “interim target” figure. The new power in section 2A(1) enables the Scottish Ministers to increase the interim target figure by way of an affirmative order. This power may be exercised at any time, or on a number of occasions.

5. **The Committee is content with the delegated power in section 2A of the Bill in principle, which is subject to affirmative resolution procedure.**

6. The remainder of this section requires the Scottish Ministers to make an order substituting a higher figure of at least 42%, if an appropriate Community instrument is made. However, there is no explanation as to the connection between the sort of Community instrument that triggers section 2A(2) and the 42% figure, nor why the Bill is not simply modified if these circumstances arise.

\(^1\) Supplementary Delegated Powers Memorandum
7. The Committee accordingly draws to the attention of the Parliament that no explanation has been given in the supplementary DPM for the relationship between the sort of Community instrument which triggers section 2A(2), and the 42% figure in this section.

Section 36 – Duties of public bodies relating to climate change

8. At Stage 1, the Committee reported that the power under section 36(1) to impose climate change duties on public bodies is extremely wide in its scope, as neither the public bodies which may be subject to climate change duties, nor the duties themselves were defined in the Bill as introduced.

9. The Committee also recommended that this could be mitigated to some extent by provision of a list of public bodies to whom the power is to apply, along with a power to add to the list, subject to affirmative procedure.

10. Section 36 has been amended at Stage 2. It imposes general duties on public bodies relating to climate change (rather than by order), but retaining the power of Scottish Ministers, if they consider it appropriate, to make further provision relating to the imposition on public bodies of duties relating to climate change by affirmative order. Specific duties are imposed by new subsection (A1). Public bodies must exercise their functions in the way best calculated to contribute to the delivery of (a) the targets set in or under Part 1 of the Bill and (b) any programme for adaptation to climate change laid under section 45. Functions are also to be exercised in the manner that bodies consider most sustainable. The power to impose further duties is retained.

11. The Committee’s recommendation in relation to providing a definition of the bodies who will be subject to the duties has been taken on board by the new section 36(A2). This defines a “public body” for the purposes of this Part 4 of the Bill as a Scottish public authority within the meaning of section 3(1)(a) of the Freedom of Information (Scotland) Act 2002.

12. The Committee welcomes this development (that is, more definition of the term “public body” in the Bill). The Committee also notes that in relation to subsection (A2), the Government has lodged an amendment at Stage 3 that would substitute a new definition of “relevant public body” in (7). This would define a “relevant public body” as either a local authority, or a devolved public body within the meaning of section 28(1) and schedule 3 to the Ethical Standards in Public Life etc. (S) Act 2000.

13. As to the concerns which the Committee raised in its Stage 1 Report in relation to the potential width of the powers to impose further duties on bodies, the Government stated in its response to the Committee at Stage 1 that it was never the intention to define “climate change duties” more specifically elsewhere in the Bill. The supplementary DPM, in relation to reasons for taking the powers, offers the further comment that “section 36 allows for flexibility in the future to help ensure bodies with functions of a public nature take action on climate change, including reducing emissions or adapting to the effects of climate change.”
14. The position in the Bill after Stage 2 in relation to the width of the powers has therefore not altered in substance.

15. The Committee accordingly reports that the power in section 36(1) remains potentially extremely wide in scope, in particular as the further climate change duties which may be imposed by order are not clearly defined, but welcomes the provision of a definition of “public body”.

**Section 47 – Power to modify functions of Forestry Commissioners**

16. Section 47 confers on the Scottish Ministers the power to modify the functions of the Forestry Commissioners in or as regards Scotland. Subsection (2) provides that this power may be exercised by the Scottish Ministers only where they consider it to be necessary or expedient to do so to comply with their duties under sections 1, 2 or 3(1)(b) of the Bill, or otherwise in relation to climate change. Subsection (3) provides that an order under this section could enable the Forestry Commissioners to form or participate in corporate bodies or trusts. At introduction subsection (4) contained provisions that would have allowed the Forestry Commissioners to delegate their functions to other persons. However, this was deleted at stage 2. The order is subject to affirmative procedure.

17. In its stage 1 report, the Committee drew attention to the fact that the power to modify the functions of the Forestry Commissioners in or as regards Scotland was very broad in scope and that there was no limitation beyond that it must deliver a climate change purpose.

18. This has not altered – although the Bill does not now permit the delegation of Forestry Commission functions to other bodies. This may have addressed an area of some political controversy as regards future management of the forestry estate on a day to day basis.

19. The terms of the committee’s stage 1 report remain relevant. The Committee therefore draws the Parliament’s attention to the width of this power to modify the functions of the Forestry Commissioners as regards Scotland in relation to climate change purposes while noting that there is no longer power to permit the delegation of functions to other bodies.

**Section 50 – Non-domestic buildings: assessment of energy performance and emissions**

20. At introduction this section allowed the Scottish Ministers to make regulations relating to the assessment of the energy performance of and the emission of greenhouse gases from non-domestic buildings. Subsection (1) as amended at Stage 2 now places a duty on the Scottish Ministers to make regulations under this section.

21. In addition the section has been amended to place a duty on Ministers to make regulations, requiring owners of non-domestic buildings to take steps to improve the energy performance of such buildings and to reduce emissions of greenhouse gases.
22. The Committee draws the Parliament’s attention to there now being a duty to make regulations under section 50(1) rather than there being simply a power available to Ministers to do so. The Committee draws to Parliament’s attention that there is also a duty to make regulations requiring owners to take steps to improve energy performance of non-domestic buildings and reduce emissions from such buildings. The Committee is otherwise content that all of the powers under section 50 are, now, to be exercisable by affirmative procedure. The Committee notes that given the element of discretion afforded to Ministers as to what is provided there may arise a tension as between Ministers duties under the section, and the need for such regulations to be approved by the Parliament before they can be made.

Section 50B - Council tax reductions to promote energy efficiency

23. Section 50B was inserted into the Bill at Stage 2. The supplementary DPM explains that the policy intention is to promote “incentivisation schemes” for energy efficiency improvements through the council tax regime. The Committee considers that it is not clear from the supplementary DPM why it is appropriate to make this provision through a power to make subordinate legislation rather than making direct provision for such schemes.

24. This section places a duty on the Scottish Ministers to make regulations that would facilitate local authorities to reduce the amount of council tax a person is liable to pay in the following financial year if that person makes an energy efficiency improvement or installs technologies reliant on renewable energy or heat in a domestic dwelling in the current financial year.

25. This is a significant new provision. It sets out a duty on Minister to make regulations but as the exercise of the power is subject to affirmative procedure Ministers the Committee observes that Ministers would not be able to fulfil that duty if the Parliament does not approve the Regulations. The exercise of the powers would require council tax reductions, raising significant attendant implications in relation to local authority funding. As this is a policy matter the Committee does not comment on the substance of the power but draws its subject matter to the Parliament’s attention.

26. The Committee draws Parliament’s attention to the new regulation making provision at section 50B and that no justification has been provided in the supplementary DPM as to why it is appropriate to make this provision through subordinate legislation. The Committee notes that Ministers are placed under an obligation to make Regulations but can be prevented from so doing if Parliament does not approve what is laid before it. Given the impact of the power if Parliament considers it acceptable then the Committee considers that the power should be exercisable subject to affirmative procedure.
Section 50D - Review of provisions made by virtue of or under sections 50C and (Amounts of reductions in non-domestic rates)

27. Section 50D was inserted at stage 2 and requires annual reports to be made by the Scottish Ministers regarding the effectiveness of specific financial incentives towards promoting energy efficiency improvements and technologies reliant on renewable sources of energy or heat set out in sections 50B and 50C. Subsections (2) and (3) provide powers to vary these amounts, and alter the criteria involved.

28. Such regulations would enable Ministers to increase, or vary, amounts of reductions in council tax, by significant amounts. This may have significant implications for local authority budgets. The subject matter is a policy matter and as such not for the Committee to review but the Committee considers it should address whether proper justification for the need for subordinate legislation has been provided. It appears from the supplementary DPM that flexibility is required to react to the reports produced so as to ensure that the scheme works effectively as an incentive to promote energy efficiency measures.

29. The Committee draws Parliament’s attention to the new powers in section 50D, with particular reference to the potential financial impact on local authority budgets. Given the significance of the power, the Committee considers that it should be exercisable subject to affirmative procedure.

Section 51A – Air source heat pumps and micro wind turbines in domestic properties: permitted development rights

30. Section 51A was inserted at Stage 2. It places a duty on the Scottish Ministers to exercise powers to amend the General Permitted Development Order so as to specify in what circumstances there will be permitted development rights for the installation, alteration or replacement of air source heat pump and wind turbine microgeneration equipment in domestic properties. While the supplementary DPM explains the intended effect of the section, it does not however provide justification for the duty to exercise the relevant functions to achieve that being required.

31. Rather than providing a new power the committee considers that this places a duty on Ministers to exercise their existing powers. It does however modify that power by imposing new consultation requirements.

32. The Committee draws Parliament’s attention to the duty placed on the Scottish Ministers to exercise their powers under section 30 of the Town and Country Planning (Scotland) Act 1997 to achieve the effect set out in section 51A(2). The Committee is content with the additional consultation requirement imposed by section 51A(4).

Section 51B – Microgeneration in non-domestic buildings: permitted development rights

33. Again, this is a new provision inserted into the Bill at Stage 2. Section 51B places a duty on the Scottish Ministers to exercise existing powers under the 1997
Act to prescribe the circumstances in which permitted development rights would be granted for the installation, alteration or replacement of microgeneration equipment in non-domestic buildings.

34. Orders made under section 30 of the Town and Country Planning (Scotland) Act 1997 are subject to negative resolution procedure.

35. Similar comments apply here to those made in relation to section 51A above. It is understood that there is an intention that the Scottish Ministers should be obliged to make an instrument of the nature set out and covering the matters to which reference is made. An explanation of the nature of the duty is provided in the supplementary DPM, but no analysis of the need for it is set out there.

36. The Committee draws Parliament’s attention to the duty placed on the Scottish Ministers to exercise their powers under sections 30 and 31 of the Town and Country Planning (Scotland) Act 1997 to achieve the effect set out in section 51B(2). The Committee is content with the additional consultation requirement imposed by section 51B(4).

Section 58A - Deposit and return schemes: designation of scheme administrator

37. This is a new section inserted at Stage 2. Any scheme administrator to which section 58(5) applies needs to be designated by the Scottish Ministers. Subsection (1) allows the Scottish Ministers to deal with the designation of a body or person as a ‘scheme administrator’ of a deposit and return scheme, by way of order. It may be either an existing or a new body. Subsection (2) also allows the Scottish Ministers, in making such an order, to confer on, remove or otherwise vary the scheme administrator’s functions. Amongst these functions it mentions in particular, at subsection (3), borrowing and charging in respect of the exercise of its functions. It is stated in the supplementary DPM that this is necessary to ensure that the scheme administrator’s costs can be covered.

38. The Committee notes that aside from being able to designate bodies or persons, provision is made to the effect that an order doing so can modify the functions of an existing body ‘in so far as the Scottish Ministers consider it necessary or expedient to do so’. This power is potentially quite a wide one to the extent that, as indicated, it may be used to modify the functions of an existing body. It can also make provision about borrowing or charging by a body.

39. Given also that an order under section 58A would be setting out details in respect of the persons or bodies to whom the functions of a scheme administrator, and the details of those functions, it is considered that they should be subject to at least affirmative procedure.

40. The Committee draws the Parliament’ attention to this power to the extent that it may be used to modify the functions of existing bodies. The Committee is otherwise satisfied that the process under new section 58A is currently subject to super- affirmative procedure.
Section 58B - Power to establish scheme administrator

41. This is a new section, inserted at Stage 2 which allows the Scottish Ministers to set up a new body to undertake the functions of a scheme administrator by order. The detail of Ministers’ powers in respect of the administrator’s status, constitution, members and employees, functions and accounting is set out in subsection (5).

42. The supplementary DPM indicates that this new power was considered necessary since it is not unlikely that a new body would have to be created to exercise the functions of a scheme administrator, since they are unlike those of any existing body. These detailed powers are necessary to create and establish parameters for a new body, and delineate its functions.

43. The Committee acknowledge that some level of need has been identified for this new power, to establish a scheme administrator of a deposit and return scheme established under section 58, although it notes from the supplementary DPM that there appears to have been an element of speculation as to the extent to which there is an absolute requirement for it.

44. The Committee considers that the powers which that body may have, and what can be provided for within an order under section 58B, are quite widely expressed. However, the requirement that such an order would be subject to super affirmative procedure provides some measure of reassurance in terms of Parliament thereby being fully involved in the process relating to such an order.

45. The Committee draws Parliament’s attention to the breadth of this power, in particular so far as it enables a body established under it ‘to do anything which appears to it to be necessary or expedient for the purposes of, or in connection with, the exercise of its functions in relation to a deposit and return scheme, or conducive to the exercise of those functions’. The Committee is otherwise satisfied that any order made under section 58B is to be made by super-affirmative procedure.
Dear Patrick

CLIMATE CHANGE (SCOTLAND) BILL – DEPOSIT AND RETURN

During the Committee’s discussions of Section 58 at its meeting on 9 June, I agreed to write outlining the circumstances in which the Scottish Ministers would consider exercising the powers to establish deposit and return schemes proposed in that section.

First, I should repeat what my colleague Richard Lochhead told the Rural Affairs & Environment Committee on 4 February. He said, “We will wish to consider the impact on the economy and on the business community of any provisions that we make in the future. Secondary legislation will not be made in the immediate few months from now, so we will have to monitor the economic situation, but I can assure the committee that we will be sensitive to the impact of any provisions on the business community and the economy in general.”

This remains the case. We are clear that now is not the time to be making substantive regulations on these matters. We need to be sure, for example, that markets for recyclate have settled down before we are able to make sensible regulations about deposit and return schemes.

In the mean time, as we have previously indicated, we are keen to see what may be achieved on a voluntary basis. As an example of this, AG Barr recently increased the amount of the deposit on its glass bottles from 20p to 30p, since at the former level the company was seeing a rate of return of only some 70% of bottles. It will be very informative to discover if the increase in the level of deposit brings the return rates the company wishes to see.
More generally, we are very keen to see business engage with the issue of packaging in particular. While the producer responsibility regime currently set out in the GB-wide Producer Responsibility Obligations (Packaging Waste) Regulations 2007 has been very successful at capturing and recycling “back of shop” packaging, it is clear that it has not had much of an impact on the materials that get into the hands of consumers. This must change, since not only are there large carbon benefits to be had from re-using and recycling this material, but consumer packaging is also a significant cause of litter. It is for this reason that petitions PE986 and 1145 support the introduction of deposit and return schemes. As I mentioned at the meeting, there has been genuine progress on this issue, with the introduction of “reverse vending” machines, to which consumers may return packaging. The use of such machines could also be appropriate for used consumer items, such as low-energy light bulbs. Further progress in this respect will be a very significant factor in our decision about whether, and when, to introduce deposit and return schemes.

We are aware that there are a number of issues which must be borne in mind when establishing deposit and return schemes. The effect on existing forms of collection is one that has been raised. Another is the mesh with the producer responsibility regime I have just mentioned. These are quite apart from the mechanics of the schemes themselves, which require consideration of space available, storage, and transport as well as materials involved, their identification and deposit levels. We do not underestimate the complexity of the issues involved. Consequently I am happy to give an assurance that we will work with the interests involved. As Richard Lochhead said on 4 February, “Our approach will be to set up a working group that includes businesses that have strong feelings about the schemes to ensure that we have the right schemes, they are delivered to the right timescales and they are suited to Scottish circumstances.”

I hope this provides assurance that any scheme will be carefully designed. However, I should conclude by observing that we must improve our re-use and recycling rates. Furthermore, the recently revised Waste Framework Directive enjoins extended producer responsibility, and application of the “polluter pays” principle. Merely meeting the targets in the 2007 Regulations is, quite simply, not enough.

I am copying this letter to Maureen Watt MSP, Convener, Rural Affairs & Environment Committee.

STEWART STEVENSON
CLIMATE CHANGE (SCOTLAND) BILL
LETTER FROM THE CHIEF EXECUTIVE OF THE COMMITTEE ON CLIMATE
CHANGE AND OTHER MATTERS

Yesterday I received a letter from the Chief Executive of the Committee on Climate Change responding to a recent request which I made in relation to advice which the Committee will be providing to us on annual targets to 2022. This contains important observations on the appropriate level of the 2020, interim target. I enclose the letter at Annex A and given its importance in respect of the Stage 3 debate of the Bill on Wednesday 24 June, I have copied this letter and the letter from the Chief Executive of the Committee to all MSPs and SPICE.

The letter from the Chief Executive of the Committee comments that, on the basis of current evidence, Scotland should not depart from the approach adopted for the UK, namely the adoption of a target of 34% reduction by 2020, this being increased to 42% in the event of a global deal. The letter further notes that the inclusion of international aviation and shipping in the Scottish targets means that higher cuts will be required in other sectors to meet the targets, thereby making the achievement of Scotland’s targets more difficult than for the UK overall. Accordingly, the Chief Executive considers that an appropriate 2020 target without a global deal could be slightly below 34%.

For information, officials have calculated that the inclusion of international aviation and shipping in the Scottish target makes the 2020 target akin to a 35.5% target if the Scottish Government had not included these sectors.

Separately, you will be aware of the Parliamentary Technical Briefing recently circulated to all MSPs by WWF which suggested a target of more than 40% can be achieved. My
officials advise that this briefing is incorrect on two major points. On the basis of the Delivery Plan, WWF have concluded that the delivery of the non-traded sector measures identified in the Delivery Plan for the Scottish 42% target would deliver over 37% whereas in fact delivery of those measures, where the Scottish Government has competency, would only deliver 36% savings.

Further, WWF advocate the purchase of international credits to cover any shortfall in the delivery of the 40% target. However, the domestic effort provision in clause 7A of the Bill requiring at least 80% of the annual reduction to be domestic abatement means that it would be impossible for the Scottish Government to buy sufficient credits to cover the expected shortfall between the reduction expected through implementation of the measures in the Delivery Plan and the proposed 40% target.

Even assuming 37% from domestic abatement, purchasing the maximum number of credits allowed by the Bill would only deliver a 37.2% reduction, far short of the 40% indicated. Officials have advised WWF of the flaws in their calculations.

Finally, even if the Climate Change Bill did allow for the purchase of international carbon credits to bridge the gap between 36% and 40%, the cumulative cost of purchasing these credits to 2020 (based on €20 or €50 per tonne of CO₂e) would be €300 - €800 million.

The Government believes that the targets as currently set out in the Climate Change Bill are both ambitious and challenging but importantly, as set out in the Delivery Plan published last week, deliverable.

STEWART STEVENSON
Mr Stewart Stevenson  
Minister for Transport, Infrastructure and Climate Change  
The Scottish Government

22 June 2009

Dear Stewart

Thank you for your letter of June 17th informing me of recent developments with your Climate Change Bill and including questions on the 2020 target and the UK Climate Projections.

**2020 target**

We will provide advice to you on the appropriate level of the 2020 target taking into account a range of factors:

- Consistency with the path to meeting the longer term 80% emissions reduction target.
- The international framework
- Opportunities for reducing emissions in Scotland and for the purchase of emissions reductions in the carbon market.

Our recommendation for the UK was that an Interim target of 34% should be adopted until there is a global deal, with a more ambitious target of 42% adopted once a global deal has been reached. We also recommended that the Interim target should be met through domestic emissions reductions, which would prepare for meeting the more ambitious budget mainly through domestic emissions reductions possibly complemented through limited credit purchase.

The evidence that we currently have does not suggest that Scotland should depart from this approach. We will, however, consider whether Scotland has additional low cost options for reducing emissions relative to the UK. If this were to be the case, then there could be an argument either that Scotland should aim to outperform the Interim budget, or set a higher level of ambition in legislation.
The approach adopted in Scotland includes international aviation and shipping. Given that these sectors will not achieve a 34% cut by 2020, a higher required cut in other sectors to meet the economy wide average target. This makes the Scottish approach more ambitious than the UK approach, which requires a 34% cut in sectors excluding international aviation and shipping. I would therefore consider that an appropriate Scottish 2020 target could be set slightly below 34% to account for different treatments of international aviation under UK and Scottish approaches.

**UK Climate Projections**

These projections will be central to our work contributing to development of a UK Climate Change Risk Assessment via our new adaptation sub-committee. We will consider the implication of these projections for Scottish targets as you request. We would not expect, however, that targets should change in light of the new projections. The reason for this is that the projections are based on business as usual scenarios from the IPCC. We have already assessed these scenarios in the context of advising on the UK’s long term target, where we suggested a departure from business as usual. The 80% target is therefore designed to avoid the world as modelled in the UK Climate Projections.

I look forward to hearing from you following the successful passing of the Climate Change (Scotland) Bill.

David Kennedy
Chief Executive, Committee on Climate Change
Climate Change (Scotland) Bill

Marshalled List of Amendments selected for Stage 3

The Bill will be considered in the following order—

Sections 1 to 67  Schedules 1 and 2
Long Title

Amendments marked * are new (including manuscript amendments) or have been altered.

Section 1

Patrick Harvie

6  In section 1, page 1, line 12, leave out <80%> and insert <90%>

Before section 2

Sarah Boyack
Supported by: Des McNulty

94*  Before section 2, insert—

<Setting and modification of interim target>

(1) The Scottish Ministers must ensure that the net Scottish emissions account for the year 2020 is at least 40% lower than the baseline.

(2) In this Act, the target set out in subsection (1) is known as the “interim target”.

(3) The Scottish Ministers may, by order, modify the percentage figure mentioned in subsection (1) so as to substitute—

(a) a figure provided by the relevant body by virtue of subsection (4)(b); or

(b) a higher figure,

for the one for the time being mentioned there.

(4) The Scottish Ministers must, as soon as reasonably practicable after the Bill for this Act receives Royal Assent, request advice from the relevant body as to (having regard to the criteria set out in subsection (5))—

(a) whether the percentage figure for the time being mentioned in subsection (1) is the highest achievable interim target; and

(b) if not, what the highest achievable interim target is.

(5) The criteria referred to in subsection (4) are—

(a) scientific knowledge about climate change;

(b) technology relevant to climate change;

(c) economic circumstances, in particular the likely impact of the target on—
(i) the Scottish economy;
(ii) the competitiveness of particular sectors of the Scottish economy;
(iii) small and medium-sized enterprises;
(iv) jobs and employment opportunities;
(d) fiscal circumstances, in particular the likely impact of the target on taxation, public spending and public borrowing;
(e) social circumstances, in particular the likely impact of the target on those living in poorer or deprived communities;
(f) the likely impact of the target on those living in remote rural communities and island communities;
(g) energy policy, in particular the likely impact of the target on energy supplies, the renewable energy sector and the carbon and energy intensity of the Scottish economy;
(h) environmental considerations and, in particular, the likely impact of the targets on biodiversity;
(i) European and international law and policy relating to climate change.
(6) The Scottish Ministers must publish the advice requested under subsection (4) by 31 December 2009 (or, if the advice is not published by that date, as soon as reasonably practicable afterwards).
(7) Where the relevant body has provided advice of the kind mentioned in subsection (4)(b), the Scottish Ministers must, as soon as reasonably practicable after that advice is published under subsection (6), comply with either of the duties set out in subsection (8).
(8) The duties are—
(a) to lay before the Scottish Parliament a draft of a statutory instrument containing an order under subsection (3) substituting for the percentage figure for the time being mentioned in subsection (1) the figure provided by the relevant body by virtue of subsection (4)(b); or
(b) to make a statement to the Scottish Parliament setting out the reasons why no such order has been laid.
(9) If an appropriate Community instrument comes into force, the Scottish Ministers must, before the expiry of the appropriate period, lay a draft of a statutory instrument containing an appropriate order before the Scottish Parliament.
(10) An “appropriate order” means an order under subsection (3) modifying the percentage figure mentioned in subsection (1) so as to substitute a figure of at least 42%.
(11) An “appropriate Community instrument” means a Community instrument—
(a) which contains a commitment to reduce greenhouse gas emissions by at least 30% compared to 1990 levels by 2020; and
(b) which amends Decision 406/2009/EC of the European Parliament and of the Council of 23 April 2009 on the effort of Member States to reduce their greenhouse gas emissions to meet the Community’s greenhouse gas emission reduction commitments up to 2020 in the manner envisaged in Article 8(2) of the Decision.
(12) The “appropriate period” means the period of 3 months beginning with the day on which the appropriate Community instrument comes into force.

(13) If a draft of an appropriate order is not laid before the expiry of the appropriate period, the Scottish Ministers must lay the draft as soon as reasonably practicable afterwards.

(14) Subsections (9) to (13) cease to apply if a figure higher than 42% is, by virtue of a draft of a statutory instrument of the kind mentioned in subsection (8)(a) having been approved by the Scottish Parliament, the percentage figure for the time being mentioned in subsection (1).

Stewart Stevenson

94A* As an amendment to amendment 94, line 4, leave out <40%> and insert <42%>

Section 2

Patrick Harvie

7 In section 2, page 1, line 17, leave out <34%> and insert <50%>

Alison McInnes

8 In section 2, page 1, line 17, leave out <34%> and insert <42%>

Sarah Boyack

95 Leave out section 2

Section 2A

Patrick Harvie

96 In section 2A, page 1, line 22, leave out subsections (2) to (6)

Stewart Stevenson

97 In section 2A, page 1, line 22, after <instrument> insert <; or

( ) an appropriate Order in Council,

Stewart Stevenson

9 In section 2A, page 2, line 4, leave out <the Decision of 26 March 2009> and insert <Decision 406/2009/EC>

Stewart Stevenson

10 In section 2A, page 2, line 5, after <Council> insert <of 23 April 2009>

Stewart Stevenson

98 In section 2A, page 2, line 7, at end insert—
An “appropriate Order in Council” means an Order in Council under section 30(2) of the Scotland Act 1998 (c.46)—

(a) which modifies Part 2 of schedule 5 to that Act so that—

(i) in Head A, in Section A1, the words “Fiscal, economic and monetary policy”;

(ii) Head D; and

(iii) in Head E, Sections E1, E2 (other than the words from “Rail transport security” to “Railway Heritage Act 1996”), E3 and E4,

cease to have effect; or

(b) which, taken together with other such Orders, so modifies that schedule.

Stewart Stevenson

In section 2A, page 2, line 9, after <instrument> insert <or appropriate Order in Council>

Sarah Boyack

Supported by: Des McNulty

Leave out section 2A

After section 2A

Shirley-Anne Somerville

After section 2A, insert—

<Advice on the interim target

(1) The Scottish Ministers must, as soon as reasonably practicable and, in any event, before laying a draft of a statutory instrument containing the first order under section 4(1) before the Scottish Parliament, request advice from the relevant body on what interim target that body considers is appropriate.

(2) The Scottish Ministers must publish the advice requested under subsection (1) as soon as reasonably practicable after they receive it.

(3) The Scottish Ministers must have regard to that advice and, if they consider it appropriate to do so, lay a draft of a statutory instrument containing an order under section 2A(1) before the Scottish Parliament.

(4) If—

(a) the relevant body recommends that the interim target should be a higher percentage figure than the one for the time being mentioned in section 2(1); and

(b) the Scottish Ministers do not consider that the figure recommended is appropriate, the Scottish Ministers must lay before the Scottish Parliament a report setting out the reasons why.

(5) The Scottish Ministers must, as soon as reasonably practicable after laying a report before the Scottish Parliament under subsection (4), and in so far as reasonably practicable, make a statement to the Parliament relating to the report.>

Patrick Harvie
17 In section 3, page 2, line 25, leave out <3%> and insert <4.5%>

Section 4

Stewart Stevenson
18 In section 4, page 3, line 5, leave out subsection (3)

Shirley-Anne Somerville
102 In section 4, page 3, line 9, at end insert—

<(  ) The Scottish Ministers must, when setting annual targets, have regard to any advice they receive from the relevant body as to the cumulative amount of net Scottish emissions for the period 2010-2050 that is consistent with a reduction over that period of net Scottish emissions accounts which would allow the 2050 target to be met.>
Alison McInnes

103  In section 4, page 3, line 11, at end insert—

<(  ) the objective of not exceeding the fair and safe Scottish emissions budget;>

Alison McInnes

104  In section 4, page 3, line 33, at end insert—

<(  ) In this Act, the “fair and safe Scottish emissions budget” is the aggregate amount of net Scottish emissions for the period 2010-2050 recommended by the relevant body as being consistent with Scotland contributing appropriately to stabilisation of greenhouse gas concentrations in the atmosphere at a level that would prevent dangerous anthropogenic interference with the climate system.>

Section 5

Stewart Stevenson

19  In section 5, page 3, line 36, leave out <and publish>

Stewart Stevenson

20  In section 5, page 3, line 38, leave out subsection (1A) and insert—

<(  ) The request for advice must include requests for the relevant body’s views—

(a) in the case of annual targets proposed for years in the period 2010-2020, as to whether those targets are consistent with a reduction over that period of net Scottish emissions accounts which would allow the interim target and the 2050 target to be met;

(b) in the case of annual targets proposed for years in the period 2021-2050, as to whether those targets are consistent with a reduction over that period of net Scottish emissions accounts which would allow the 2050 target to be met;

(c) in any case, as to what annual targets are appropriate by reference to the target-setting criteria.>

Patrick Harvie

20A  As an amendment to amendment 20, line 11, at end insert—

<(  ) as to the extent to which the annual targets should be met—

(A) by taking action to reduce net Scottish emissions;

(B) by the use of carbon units that in accordance with section 12(1A) and regulations under section 12(2) may be credited to the net Scottish emissions account;

(  ) as to the respective contributions towards meeting the annual targets and the domestic effort target that should be made—

(A) by the traded sector of the Scottish economy;

(B) by the other sectors of the Scottish economy;>
as to the respective contributions towards meeting the annual targets and the domestic effort target that should be made by—
(A) energy efficiency;
(B) energy generation;
(C) land use;
(D) transport;
as to the average greenhouse gas emissions per megawatt hour of electricity generated in Scotland that would be compatible with the delivery of the annual targets for the period to which the advice applies;
as to the level of average greenhouse gas emissions per megawatt hour of electricity generated that should be achieved by new, extended or refurbished generating capacity approved during the period to which the advice applies;
as to what cumulative amount of the net Scottish emissions account for all years between 2010 and 2050 it considers, in the light of current scientific understanding, would comprise an equitable Scottish contribution to a global greenhouse gas emissions budget consistent with the stabilisation of greenhouse gas concentrations in the atmosphere at a level that would prevent dangerous anthropogenic interference with the climate system.

Stewart Stevenson
20AA* As an amendment to amendment 20A, leave out lines 17 to 29

Stewart Stevenson
21 In section 5, page 4, line 1, at end insert—
<( ) The Scottish Ministers must publish the advice requested under subsection (1) as soon as reasonably practicable after they receive it.>

Shirley-Anne Somerville
105 In section 5, page 4, line 1, at end insert—
<( ) The request for advice must also include a request for the relevant body’s views as to the cumulative amount of net Scottish emissions for the period 2010-2050 that is consistent with a reduction over that period of net Scottish emissions accounts which would allow the 2050 target to be met.>

Patrick Harvie
106 In section 5, page 4, line 17, at end insert—
<( ) In this section, “traded sector” means the sectors of the Scottish economy which are covered by trading schemes within the meaning of section 44 of the 2008 Act.>
Section 7A

Stewart Stevenson

22 In section 7A, page 5, line 16, after <must> insert <endeavour to>

Stewart Stevenson

23 In section 7A, page 5, line 19, at end insert—

<(2A) For the purposes of ascertaining whether the domestic effort target has been met, any reduction to the net Scottish emissions account as a result of the crediting to that account of a net amount of European carbon units mentioned in subsection (2B) is to be treated as though it is a reduction in net Scottish emissions.

(2B) In subsection (2A), “European carbon units” means carbon units which are surrendered by participants in—

(a) the European Union Emissions Trading Scheme (“EUETS”); or

(b) such other trading scheme making provision equivalent to the EUETS as the Scottish Ministers may, by order, specify.

(2C) In subsection (2B), “trading scheme” means a trading scheme within the meaning of section 44 of the 2008 Act.>

Stewart Stevenson

24 In section 7A, page 5, line 23, leave out subsection (4) and insert—

<(  ) The Scottish Ministers must, before laying a draft of a statutory instrument containing an order under subsection (3) before the Scottish Parliament, request advice from the relevant body.>

Section 12

Malcolm Chisholm

107* In section 12, page 8, line 17, at end insert—

<(  ) The regulations referred to in subsection (2) must contain provision for ensuring that any carbon units purchased by the Scottish Ministers—

(a) represent a reduction in greenhouse gas emissions (or a removal of greenhouse gas from the atmosphere) that would not otherwise have occurred; and

(b) relate to projects which benefit, and promote sustainable development in, the country in which the reduction in emissions referred to in paragraph (a) is taking place (or in which the activities giving rise to the removal of greenhouse gases referred to in that paragraph are taking place).>

Section 12A

Patrick Harvie

108 In section 12A, page 8, line 19, leave out subsections (1) and (2)
Stewart Stevenson

25 In section 12A, page 8, line 23, at end insert—

<( ) The Scottish Ministers may only credit to the net Scottish emissions account for a year in the period 2013-2017 any carbon units purchased by them up to a limit of 20% of the reduction in the amount of the net Scottish emissions account planned for that year.>

Section 14

Patrick Harvie

109 In section 14, page 8, line 33, leave out from <may> to end of line 38 and insert—

<(a) must make provision for emissions from international aviation and international shipping of—

(i) in the case of the first order under that subsection, each greenhouse gas; and

(ii) in the case of any subsequent order under subsection (1), any gas added to the list of greenhouse gases in section 9(1) since the last such order was made,

> to be taken into account as Scottish emissions of each such gas in the period starting with the 1 January following the order being approved by the Scottish Parliament and ending on 31 December 2050;

(a) may make provision as to any past period in which emissions of a greenhouse gas are to be taken into account as Scottish emissions of that gas;

(ab) may not, once emissions from international aviation and international shipping of a greenhouse gas are, by virtue of a previous order under subsection (1), being taken into account as Scottish emissions of that gas, provide for such emissions to cease to be taken into account as Scottish emissions of that gas;

(b) must, subject to subsection (2ZA), make provision as to the manner in which emissions from international aviation and international shipping of each greenhouse gas are to be taken into account in determining Scottish emissions of that gas—

(i) for the year that is the baseline year for that gas; and

(ii) in the period during which such emissions of that gas are to be taken into account as Scottish emissions of that gas.

(2ZA) Provision made by virtue of subsection (2)(b) must include the use, for each greenhouse gas, of a multiplier which reflects the direct and indirect non-carbon dioxide climate change impacts of emissions at altitude from international aviation.>

Des McNulty

110 In section 14, page 8, line 39, after <(1)> insert <in relation to international aviation>
A draft of a statutory instrument containing the first order under subsection (1) in relation to international shipping must be laid before the Scottish Parliament no later than 1 June 2011.

Stewart Stevenson

146* In section 14, page 9, line 1, after <(2A),> insert <or, as the case may be, subsection (2AA),>

Patrick Harvie

112 In section 14, page 9, line 5, at end insert <(including advice as to an appropriate multiplier for each greenhouse gas for the purposes of subsection (2ZA))>

Section 18A

Stewart Stevenson

26 In section 18A, page 10, line 27, leave out subsection (A1)

Stewart Stevenson

27 In section 18A, page 10, line 34, at end insert—

<(  ) for the period 2013-2017, no later than 31 December 2011;>

Malcolm Chisholm

113 In section 18A, page 11, line 7, leave out subsection (4)

Stewart Stevenson

28 In section 19, page 12, line 14, after <27> insert <and 45C>

Section 22

Stewart Stevenson

29 In section 22, page 13, line 26, leave out from <as> to <view> in line 27 and insert—

<(  ) in the case of annual targets proposed for years in the period 2010-2020, as to whether those targets are consistent with a reduction over that period of net Scottish emissions accounts which would allow the interim target and the 2050 target to be met;>
( ) in the case of annual targets proposed for years in the period 2021-2050, as to whether those targets are consistent with a reduction over that period of net Scottish emissions accounts which would allow the 2050 target to be met;

( ) in any case, as to what annual targets are appropriate>

**Stewart Stevenson**

30 In section 22, page 14, line 6, at end insert—

<\( )\> When providing advice under subsection (1)(a), the advisory body may also express a view as to any other matter that body considers appropriate including, in particular, as to any sectors of the Scottish economy in which there are particular opportunities for contributions to be made towards meeting annual targets through reductions in emissions of greenhouse gases.>

**Shirley-Anne Somerville**

116 In section 22, page 14, line 6, at end insert—

<\( )\> When providing advice under subsection (1)(a), the advisory body must also express a view as to the cumulative amount of net Scottish emissions for the period 2010-2050 that is consistent with a reduction over that period of net Scottish emissions accounts which would allow the 2050 target to be met.>

**Section 29**

**Stewart Stevenson**

31 In section 29, page 17, line 16, leave out <the amount of the net Scottish emissions account for an earlier target year> and insert <an amount mentioned in subsection (3)(a) or subsection (4A)(a) or (b) for an earlier period>

**Section 30**

**Stewart Stevenson**

32* In section 30, page 17, line 27, at end insert—

<\(1A\)\> The Scottish Ministers must, before laying a report under this section before the Scottish Parliament, lay a draft of the report before the Parliament.

\(1B\) The Scottish Ministers may not lay the report before the expiry of the period for Parliamentary consideration.

\(1C\) In subsection \(1B\), the “period for Parliamentary consideration” means the period of 60 days, of which no fewer than 30 must be days on which the Parliament is not dissolved or in recess.

\(1D\) The Scottish Ministers must, before laying the report before the Parliament, have regard to—

\(a\) any representations on the draft report made to them;

\(b\) any resolution relating to the draft report passed by the Parliament; and
(c) any report relating to the draft report published by any committee of the Parliament for the time being appointed by virtue of standing orders.

(1E) The Scottish Ministers must, when laying the report before the Parliament, lay a statement setting out—
   (a) details of any representations, resolutions or reports mentioned in subsection (1D);
   (b) the changes (if any) they have made to the report in response to such representations, resolutions or reports and the reasons for those changes.

(1F) The Scottish Ministers must, as soon as reasonably practicable after laying a report under this section, and in so far as reasonably practicable, make a statement to the Parliament relating to the report.

Stewart Stevenson

33 In section 30, page 17, line 33, at end insert—
   <( ) The report must also set out the Scottish Ministers’ proposals and policies regarding the respective contributions towards meeting the annual targets that should be made by—
   (a) energy efficiency;
   (b) energy generation;
   (c) land use;
   (d) transport.>

After section 31A

Liam McArthur

147* After section 31A, insert—
   <Reports on impact on emissions on exercise of electricity generation related functions
   (1) The Scottish Ministers must lay before the Scottish Parliament a report in respect of each year in the period 2010-2050 containing the following information.
   (2) The report must, in so far as reasonably practicable, set out the impact on net Scottish emissions during that year resulting from the exercise by the Scottish Ministers of the functions conferred on them by virtue of any enactment relating to electricity generation.>

Section 31B

Stewart Stevenson

34 In section 31B, page 18, line 21, after <reducing> insert <net Scottish>

Stewart Stevenson

35 In section 31B, page 18, line 22, leave out <time of the net Scottish emissions account> and insert <the period 2010-2020 of net Scottish emissions accounts>
Section 34

Stewart Stevenson
36 In section 34, page 20, leave out line 3

Stewart Stevenson
37 In section 34, page 20, line 13, leave out subsection (4) and insert—

<(  ) The Scottish Ministers must have regard to—

(a) any resolution passed by the Scottish Parliament;
(b) any report published by any committee of the Parliament for the time being appointed by virtue of standing orders,
relating to the content of any report referred to in subsection (2).>

Section 36

Stewart Stevenson
38 In section 36, page 20, line 27, leave out subsections (A1) and (A2) and insert—

<(A1) A relevant public body must, in so far as reasonably practicable, exercise its functions in a manner which reduces the emissions of greenhouse gases that are attributable to its activities.

(A2) A relevant public body must, in complying with subsection (A1), take into account the need to do so in a way that contributes to the achievement of sustainable development.

(A3) The duty in subsection (A1) applies only in so far as it is consistent with the proper exercise of the relevant public body’s functions.>

Stewart Stevenson

66 In section 50A, page 32, line 28, at end insert—

<( ) In this section, “living accommodation”—

(a) means a dwelling; and

(b) includes—

(i) any building having a total useful floor area of 50m² or more; and

(ii) any common areas, associated with such a dwelling.>

After section 50A

Stewart Stevenson

67 After section 50A, insert—

<Energy efficiency discount schemes

Power of local authorities to establish energy efficiency discount schemes

(1) The Local Government Finance Act 1992 (c.14) is amended as follows.

(2) After section 80 (reduced amounts payable in respect of council tax), insert—
Local authority’s power to reduce amount of tax payable

(1) A local authority may, if it considers it appropriate to do so, establish a scheme for reducing the amounts which persons are liable to pay in respect of council tax where improvements are made to the energy efficiency of chargeable dwellings.

(2) A scheme established under subsection (1) is an “energy efficiency discount scheme”.

(3) An energy efficiency discount scheme may make such provision as the local authority considers appropriate, including, in particular, provision about—

(a) the energy efficiency improvements to which the scheme applies;
(b) the chargeable dwellings to which the scheme applies;
(c) the valuation band or bands in which such dwellings must be listed;
(d) the area or areas to which the scheme applies;
(e) the reduction, which may be made under the scheme, in the amount which persons are liable to pay in respect of council tax;
(f) applications under the scheme.

(4) But, under an energy efficiency discount scheme, the amount which a person is liable to pay in respect of council tax may be reduced only where each of the conditions mentioned in subsection (5) is met (whatever other conditions may require to be met under the scheme).

(5) Those conditions are—

(a) the person is liable to pay council tax in respect of a chargeable dwelling and any day;
(b) the dwelling is situated in an area to which the scheme applies;
(c) improvements are made to the energy efficiency of that dwelling (whether by the person liable to pay or not);
(d) those improvements are made during the same financial year to which the reduction of the amount which the person is liable to pay in respect of council tax relates;
(e) the amount which the person is liable to pay in respect of that year has not already been reduced under the scheme in respect of those improvements;
(f) the amount which any other person is liable to pay in respect of council tax in respect of that dwelling and that year has not been reduced under the scheme in respect of those improvements.

(6) In ascertaining whether the condition in subsection (5)(f) is met, no account is to be taken of any person who is jointly and severally liable, with the person mentioned in subsection (5)(a), to pay council tax in respect of the dwelling.

(7) The local authority may, under an energy efficiency discount scheme, reduce the amount which a person is liable to pay in respect of a dwelling to nil.

(8) In this section—

“energy efficiency” includes the use of—
(a) technologies reliant on sources of energy other than fossil fuel and nuclear fuel;
(b) materials the manufacture or use of which produces or involves lower emissions of greenhouse gases than other materials; and
(c) surplus heat from electricity generation or other industrial sources for district heating or other purposes;

“fossil fuel” means—

(a) coal;
(b) lignite;
(c) peat;
(d) natural gas (within the meaning of the Energy Act 1976 (c.76));
(e) crude liquid petroleum;
(f) petroleum products (within the meaning of that Act);
(g) any substance produced directly or indirectly from a substance mentioned in paragraphs (a) to (f);

“greenhouse gas” has the meaning given by section 9(1) of the Climate Change (Scotland) Act 2009 (asp 00).”.

(3) In schedule 2, after paragraph 21 (effect of reduction of liability to pay council tax under section 13A), insert—

“22 (1) This paragraph applies where a local authority exercises the power under section 80A to establish an energy efficiency discount scheme.
(2) Where, under an energy efficiency discount scheme, the amount which a person is liable to pay in respect of council tax is reduced, any amount in relation to which the reduction applies is to be treated for the purposes of this schedule as subject to a discount equal to the amount of the reduction.”.

Lewis Macdonald

<(  ) In the Local Government Finance Act 1992 (c.14), in Schedule 2, after paragraph 21 (effect of reduction of liability to pay council tax under section 13A), insert—

“22 (1) This paragraph applies where a local authority exercises the power created by regulations under section 80 to establish an energy efficiency discount scheme.

(2) Where, under an energy efficiency discount scheme, the amount which a person is liable to pay in respect of council tax is reduced, any amount in relation to which the reduction applies is to be treated for the purposes of this schedule as subject to a discount equal to the amount of the reduction.”>

Stewart Stevenson

69 Leave out section 50C

Section 50D

Sarah Boyack

130 In section 50D, page 35, line 1, leave out subsections (2) and (3) and insert—

<(  ) Further to a report under subsection (1), the Scottish Ministers may, by regulations, amend section 50C.>

Stewart Stevenson

70 Leave out section 50D

After section 50D

Sarah Boyack

131 After section 50D, insert—

<Non-domestic rates reductions to promote energy efficiency

After section 25A of the Local Government (Scotland) Act 1966 (c.51), insert—>
“25B  Reduction in rates for energy efficiency improvements or installation of technologies reliant on renewable sources of energy or heat

(1) Where a rating authority is satisfied that an energy efficiency improvement has been made during any qualifying financial year to qualifying lands or heritages, the rates payable in respect of those lands and heritages in the next financial year shall be reduced (from the amount they would be otherwise than by virtue of this subsection) in accordance with subsection (4).

(2) Where a rating authority is satisfied that—
   (a) qualifying lands and heritages meet a reasonable standard of energy efficiency; and
   (b) a qualifying technology reliant on renewable sources of energy or heat system has been installed in or on the lands and heritages during any qualifying financial year,

the rates payable for the next financial year shall be reduced (from the amount they would be otherwise than by virtue of this subsection) in accordance with subsection (4).

(3) Subject to subsection (4)—
   (a) any reduction made by virtue of either subsection (1) or (2) is without prejudice to any reduction made by virtue of the other of those subsections, whether those reductions apply in the same financial year, or in different financial years; and
   (b) any reduction made by virtue of subsection (1) is without prejudice to any further reduction made by virtue of that subsection, whether those reductions apply in the same financial year, or in different financial years.

(4) The Scottish Ministers shall by regulations specify—
   (a) an appropriate amount of reduction;
   (b) a maximum number of reductions;
   (c) a maximum total reduction,

in the amount of rates payable in respect of the same lands and heritages in any one financial year.

(5) The Scottish Ministers shall by regulations make provision specifying the sort of evidence that a rating authority is to accept as demonstrating that—
   (a) an energy efficiency improvement has been made to qualifying lands and heritages;
   (b) qualifying lands and heritages meet a reasonable standard of energy efficiency;

and may provide that evidence sufficient to demonstrate that specified energy efficiency improvements, or specified combinations of such improvements, have been made to lands and heritages is sufficient to demonstrate that the lands and heritages meet a reasonable standard of energy efficiency.

(6) A statutory instrument containing regulations made under this section shall be subject to annulment pursuant to a resolution of the Scottish Parliament.

(7) In this section—
“energy efficiency improvement” and “technologies reliant on renewable sources of energy” have the same meanings given by section 50B of the Climate Change (Scotland) Act 2009;

“qualifying financial year” means the financial year beginning on 1 April 2010 or any subsequent financial year;

“qualifying lands and heritages” means such lands and heritages, or such classes of lands and heritages, as are specified in regulations made under this section.”.

Alex Johnstone

132 After section 50D, insert—

<Non-domestic rates: discounts for energy efficiency etc.

In section 153 (power to prescribe amount of non-domestic rate) of the Local Government etc. (Scotland) Act 1994 (c.39), in subsection (3)—

(a) the words “whose rateable value exceeds, and those whose rateable value does not exceed, a prescribed figure” become paragraph (a), and

(b) at the end insert—

“(b) whose energy efficiency and greenhouse gas emissions fall into different categories prescribed for the purpose of this paragraph in rules under subsection (1).

(3A) Regulations under this section may make provision in relation to how lands and heritages are to be determined to fall within a category prescribed for the purpose of subsection (3)(b) in rules under subsection (1).”.

Lewis Macdonald

133 After section 50D, insert—

<Combined heat and power district heating equipment

Rateable value of plant and distribution system associated with combined heat and power plants

(1) The Scottish Ministers must bring forward an amendment to the Valuation for Rating (Plant and Machinery) (Scotland) Regulations 2000 (SSI 2000/58).

(2) The amendment required under subsection (1) must specify the circumstances in which combined heat and power district heating equipment which meets the CHPQA standard does or does not fall within the definition of “lands and heritages” in section 42 of the Lands Valuation (Scotland) Act 1854 (c.91).

(3) Regulations making the amendment required under subsection (1) must be laid before the Scottish Parliament no later than 6 months after the day on which this section comes into force.

(4) Before bringing forward the amendment required under subsection (1), the Scottish Ministers must consult, and seek to reach agreement on the contents of the amendment, with organisations which in the opinion of the Scottish Ministers represent relevant business interests, including, in particular, organisations representing the combined heat and power industry.
In this section, “CHPQA” refers to the Combined Heat and Power Quality Assurance Standard, Issue 1, November 2000 originally published by the Department for the Environment, Transport and the Regions (the “Standard”) (including the later of version Final 1.0 or 2.0 of CHPQA Guidance Notes(c) 0 to 4 (including 2(S), 3(S) and 4(S)), 10 to 28 and 30).

Lewis Macdonald

134 After section 50D, insert—

<Repairing standard

Tenanted housing: inclusion of energy efficiency in the repairing standard

In section 13 (the repairing standard) of the Housing (Scotland) Act 2006 (asp 1)—

(a) in subsection (1)—

(i) the word “and” immediately following paragraph (e) is repealed; and

(ii) after paragraph (f), insert “, and

(g) the house achieves a satisfactory standard of energy efficiency”.

(b) after subsection (5), insert—

“(6) The Scottish Ministers must, by regulations, define what constitutes a satisfactory standard of energy efficiency for the purposes of subsection (1)(g).

(7) In drawing up the regulations under subsection (6), the Scottish Ministers must have regard to any guidance they have issued on the energy efficiency of living accommodation.

(8) The regulations mentioned in subsection (6) must, in particular, include provision about—

(a) the procedure and methodology for assessing the energy performance of the house, and

(b) the minimum energy performance standard that must be achieved in relation to the house.”.

Sarah Boyack

135 After section 50D, insert—

<Climate change burdens

Climate change burdens

After section 46 (health care burdens) of the Title Conditions (Scotland) Act 2003 (asp 9), insert—

“Climate change burdens

46A Climate change burdens

(1) On and after the day on which this section comes into force, it shall be competent to create a real burden in favour of a public body or trust, or of the Scottish Ministers, for the purpose of reducing greenhouse gas emissions; and any such burden shall be known as a “climate change burden”.

24
(2) A climate change burden may only consist of an obligation, in the event of the 
burdened property being developed, for the property to meet specified 
mitigation and adaptation standards.

(3) For the purposes of this section, a “public body” means a body listed in Part I 
or II of the Schedule to the Title Conditions (Scotland) Act 2003 (Conservation 
Bodies) Order 2003 (SSI 2003/453).”.

Section 51A

Stewart Stevenson

71 In section 51A, page 35, line 28, leave out subsection (1) and insert—

<(1) The Scottish Ministers must exercise their functions under sections 30 and 31 of the 
Town and Country Planning (Scotland) Act 1997 (c.8) so as to make provision 
specifying the circumstances in which development of the class mentioned in subsection 
(2) is granted planning permission by virtue of an order under section 30 of that Act.>

Stewart Stevenson

Sarah Boyack
138 After section 51B, insert—

<Annual report on operation of section (Development plans: inclusion of greenhouse gas emissions policies)

(1) The Scottish Ministers must—

(a) not later than one year after the day on which section (Development plans: inclusion of greenhouse gas emissions policies) comes into force; and

(b) annually thereafter,

lay before the Scottish Parliament a report on the operation of the requirement on relevant planning authorities to include policies within development plans under that section, including an assessment of whether those requirements have contributed effectively to the reduction of greenhouse gas emissions from developments.

(2) The fourth and subsequent reports under subsection (1) must include an assessment of the continuing need or otherwise for the requirement on relevant planning authorities to include policies within development plans; and if the requirement is considered by the Scottish Ministers to be no longer necessary, the Scottish Ministers may by order repeal section (Development plans: inclusion of greenhouse gas emissions policies) and this section.>

Stewart Stevenson
138A* As an amendment to amendment 138, line 16, leave out <section (Development plans: inclusion of greenhouse gas emissions policies)> and insert <section 3F of the Town and Country Planning (Scotland) Act 1997>
After section 51B, insert—

Promotion of water conservation and water-use efficiency

Duty of Scottish Water to promote water conservation and water-use efficiency

In section 56(1) of the Water Industry (Scotland) Act 2002 (asp 3), after paragraph (a) insert—

“(aa) requiring it to promote water conservation and water-use efficiency,”.

Section 51C

In section 51C, page 36, line 35, leave out <newly constructed>

In section 51C, page 36, line 38, at end insert—

( ) The Scottish Ministers may, by regulations, provide that the duty under subsection (1) does not apply in respect of specified buildings or categories of buildings.

Section 53

In section 53, page 39, line 12, leave out from <one> to <Assent> in line 13 and insert <12 months after the day on which this section comes into force>

Section 59

Leave out section 59

Before section 61A

Before section 61A, insert—

Public engagement

(1) The Scottish Ministers must prepare and publish a strategy (a “public engagement strategy”) setting out the steps they intend to take to—

(a) inform persons in Scotland about the targets specified by virtue of this Act;

(b) encourage them to contribute to the achievement of those targets.
(2) The public engagement strategy must, in particular, identify actions which persons in Scotland may take to contribute to the achievement of the targets referred to in subsection (1)(a).

(3) The public engagement strategy must be published no later than 31 December 2010.

(4) The Scottish Ministers—
   (a) may, from time to time; and
   (b) must, before the end of the period mentioned in subsection (5), review the strategy.

(5) The period referred to in subsection (4)(b) is the period of 5 years beginning with the date on which—
   (a) the strategy is first published; or
   (b) the strategy was last reviewed under subsection (4).

(6) Where, following a review under subsection (4), the Scottish Ministers vary the public engagement strategy, they must, as soon as reasonably practicable after so doing, publish the strategy as so varied.

(7) A strategy published under subsection (6) must contain an assessment of the progress made towards implementing the steps set out in earlier strategies.

(8) The public engagement strategy may be published in such manner as the Scottish Ministers consider appropriate.

(9) The Scottish Ministers must lay the public engagement strategy before the Scottish Parliament as soon as reasonably practicable after it is published.

Section 62

Cathy Peattie
5 In section 62, page 48, line 7, at end insert—
<( ) public bodies (as defined in section 36(A2))>

Stewart Stevenson
5A As an amendment to amendment 5, leave out line 2 and insert—
<( ) relevant public bodies>

After section 62

Patrick Harvie
141 After section 62, insert—
<Scottish Executive budget: impact on greenhouse gases
(1) The Scottish Ministers must, at the same time as laying before the Scottish Parliament any document setting out draft proposals for the use of resources in any financial year, lay before the Scottish Parliament a document describing the direct and indirect impact on greenhouse gas emissions of the activities to be funded by virtue of the proposals.>
(2) In this section, “use of resources” has the meaning given in section 1(3) of the Public Finance and Accountability (Scotland) Act 2000 (asp 1).

Alison McInnes

142 After section 62, insert—

<Judicial review

(1) In any application for judicial review relating to or arising out of the provisions of this Act, it will be enough for any party to show sufficient interest in order to satisfy the common law tests of title and interest.

(2) “Sufficient interest” is to be interpreted in accordance with the criteria laid out in Article 9 of the Convention on Access to Information, Public Participation in Decision-Making and Access to Justice in Environmental Matters signed at Aarhus on 25 June 1998 (“the Aarhus Convention”).

(3) In relation to the expenses associated with any judicial review proceedings under this Act, the court may impose a cap on, or otherwise regulate, the extent of liability for expenses between the parties; and such applications may be competently made at any stage of the proceedings.

(4) When determining an application made under subsection (3) above, the court is to have regard to the need to remove or reduce financial or other barriers to access to justice, in accordance with the principles laid out in Article 9 of the Aarhus Convention.

(5) In any application for judicial review under this Act, the court may competently consider both the substantive and the procedural legality of the decision, act or omission under review.>

89 After section 64, insert—
Subordinate legislation: pre-laying procedure

(1) This section applies where the Scottish Ministers propose to lay before the Scottish Parliament a draft of a statutory instrument containing the first regulations under section 58 or 59 (other than a draft containing regulations mentioned in section 64(7)(d) or (e) to which section 64(5) applies).

(2) The Scottish Ministers must, before doing so, lay before the Parliament—
   (a) a copy of the proposed regulations; and
   (b) a statement setting out their reasons for proposing to make those regulations.

(3) The Scottish Ministers must, when laying such a copy, specify a period (the “representation period”) during which representations on the proposed regulations may be made to them.

(4) The representation period must be at least 90 days, of which no fewer than 30 must be days on which the Parliament is not dissolved or in recess.

(5) The Scottish Ministers must, as soon as reasonably practicable after laying a copy of the proposed regulations, publicise them in such manner as they consider appropriate.

(6) The Scottish Ministers must, before laying the proposed regulations before the Parliament, have regard to—
   (a) any representations on the proposed regulations made to them;
   (b) any resolution relating to those regulations passed by the Parliament; and
   (c) any report relating to those regulations published by any committee of the Parliament for the time being appointed by virtue of standing orders, before the expiry of the representation period.

(7) The Scottish Ministers must, when laying such proposed regulations, lay a statement setting out—
   (a) details of any representations, resolutions or reports mentioned in subsection (6);
   (b) the changes (if any) they have made to the proposed regulations in response to such representations, resolutions or reports and the reasons for those changes.

(8) In this section, “proposed regulations” means a draft of a statutory instrument to which subsection (1) applies.

Climate Change (Scotland) Bill

Groupings of Amendments for Stage 3

This document provides procedural information which will assist in preparing for and following proceedings on the above Bill. The information provided is as follows:

- the list of groupings (that is, the order in which amendments will be debated). Any procedural points relevant to each group are noted;
- the text of amendments to be debated on the day of Stage 3 consideration, set out in the order in which they will be debated. THIS LIST DOES NOT REPLACE THE MARSHALLED LIST, WHICH SETS OUT THE AMENDMENTS IN THE ORDER IN WHICH THEY WILL BE DISPOSED OF.

Groupings of amendments

Note: The time limits indicated are those set out in the timetabling motion to be considered by the Parliament before the Stage 3 proceedings begin. If that motion is agreed to, debate on the groups above each line must be concluded by the time indicated, although the amendments in those groups may still be moved formally and disposed of later in the proceedings.

Group 1: The 2050 target
6

Group 2: Setting and modification of interim target
94, 94A, 7, 8, 95, 96, 97, 9, 10, 98, 99, 100, 101, 108, 114, 119, 120, 143

Notes on amendments in this group
Amendments 7 and 8 are direct alternatives
Amendment 96 pre-empts amendments 97, 9, 10, 98, 99

Debate to end no later than 45 minutes after proceedings begin

Group 3: Setting annual target – amounts
11, 12, 13, 14, 15, 16, 17, 18

Notes on amendments in this group
Amendment 12 pre-empts amendments 13 and 14

Group 4: Setting annual targets – criteria
102, 103, 104, 105, 116

Group 5: Role of relevant body in relation to annual targets
19, 20, 20A, 20AA, 21, 106, 29, 30
Group 6: Achievement of annual targets – respective contributions of domestic effort target and crediting of carbon units
22, 23, 24, 25, 26, 27, 90

Debate to end no later than 1 hour 40 minutes after proceedings begin

Group 7: Type of carbon units that may be purchased by Scottish Ministers
107, 113

Group 8: Scottish share of emissions from international aviation and international shipping
109, 110, 111, 146, 112

Group 9: Minor amendments and drafting changes
28, 31, 34, 35, 51

Group 10: Parliamentary consideration of reports etc.
32, 33, 36, 37

Group 11: Energy generating stations – efficiency guidance
147, 54

Debate to end no later than 2 hours 30 minutes after proceedings begin

Group 12: Public bodies – climate change duties
38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 52, 5, 5A, 91, 92

Group 13: Application of biodiversity duty
53

Group 14: Contribution of planning and building regulation to reduction of emissions
121, 137, 137A, 137B, 138, 138A

Group 15: Definition of “energy efficiency”
122, 123

Group 16: Assessment of energy performance of buildings
55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66

Debate to end no later than 3 hours 10 minutes after proceedings begin

Group 17: Council tax and non-domestic rates – energy efficiency discounts

Group 18: District heating
133
Group 19: Energy efficiency – modification of repairing standard for tenanted housing
134

Debate to end no later than 4 hours after proceedings begin

Group 20: Climate change burdens
135

Group 21: Permitted development rights – microgeneration equipment
71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 144, 145

Group 22: Promotion of water conservation and water-use efficiency
136

Group 23: Energy performance of Scottish civil estate
139, 140

Group 24: Waste regulations
85, 87, 88, 3, 4, 89

Notes on amendments in this group
Amendment 88 pre-empts amendments 3 and 4
Amendment 3 pre-empts amendment 4

Debate to end no later than 4 hours 50 minutes after proceedings begin

Group 25: Charges for supply of carrier bags
2

Group 26: Public engagement
86

Group 27: Scottish Executive budget – impact on greenhouse gases
141

Group 28: Judicial review
142

Debate to end no later than 5 hours 30 minutes after proceedings begin
Note: (DT) signifies a decision taken at Decision Time.

**Business Motion:** Bruce Crawford, on behalf of the Parliamentary Bureau, moved S3M-4483—That the Parliament agrees—

(a) the following revision to the programme of business for Wednesday 24 June 2009—

delete

2.30 pm Continuation of Stage 3 Proceedings: Climate Change (Scotland) Bill

and insert

1.45 pm Continuation of Stage 3 Proceedings: Climate Change (Scotland) Bill

and (b) the following revision to the programme of business for Thursday 25 June 2009—

after

*followed by* Stage 1 Debate: Arbitration (Scotland) Bill

insert

*followed by* Legislative Consent Motion: Holocaust (Return of Cultural Objects) Bill – UK Legislation

The motion was agreed to.

**Business Motion:** Bruce Crawford, on behalf of the Parliamentary Bureau, moved S3M-4488—That the Parliament agrees that, during Stage 3 of the Climate Change (Scotland) Bill, debate on groups of amendments shall, subject to Rule 9.8.4A, be brought to a conclusion by the time limits indicated, each time limit being calculated from when the Stage begins and excluding any periods when other business is under consideration or when a meeting of the Parliament is suspended (other than a suspension following the first division in the Stage in the morning and afternoon being called) or otherwise not in progress:
Groups 1 and 2: 45 minutes
Groups 3 to 6: 1 hour 40 minutes
Groups 7 to 11: 2 hours 30 minutes
Groups 12 to 16: 3 hours 10 minutes
Groups 17 to 19: 4 hours
Groups 20 to 24: 4 hours 50 minutes
Groups 25 to 28: 5 hours 30 minutes.

The motion was agreed to.

Climate Change (Scotland) Bill - Stage 3: The Bill was considered at Stage 3.

The following amendments were agreed to (by division)—

18(For 79, Against 43, Abstentions 0)
20AA(For 101, Against 18, Abstentions 0)
23(For 60, Against 59, Abstentions 0)
85(For 77, Against 45, Abstentions 0)

The following amendments were disagreed to (by division)—

6(For 2, Against 119, Abstentions 0)
11(For 18, Against 104, Abstentions 0)
12(For 18, Against 103, Abstentions 0)
15(For 19, Against 103, Abstentions 0)
17(For 2, Against 120, Abstentions 0)
107(For 60, Against 61, Abstentions 0)
108(For 3, Against 118, Abstentions 0)
113(For 60, Against 60, Abstentions 0; amendment disagreed to on casting vote)
38(For 60, Against 62, Abstentions 0)
49(For 60, Against 62, Abstentions 0)
2(For 60, Against 62, Abstentions 0)

The following amendments were moved and, with the agreement of the Parliament, withdrawn: 22, 133, 134 and 142.

The following amendments were pre-empted: 3 and 4.

The following amendments were not moved: 7, 8, 96, 101, 105, 110, 111, 146, 40, 41, 42, 43, 44, 45, 46, 47, 48, 126, 127, 128, 129, 130, 131, 137A, 137B, 5A and 91.
Climate Change (Scotland) Bill: The Cabinet Secretary for Finance and Sustainable Growth (John Swinney) moved S3M-4464—That the Parliament agrees that the Climate Change (Scotland) Bill be passed.

After debate, the motion was agreed to (DT).
The Presiding Officer (Alex Fergusson): The next item of business is consideration of business motion S3M-4483, in the name of Bruce Crawford, on behalf of the Parliamentary Bureau, setting out a revised business programme for this week.

Motion moved,

That the Parliament agrees—

(a) the following revision to the programme of business for Wednesday 24 June 2009—

delete

2.30 pm Continuation of Stage 3 Proceedings: Climate Change (Scotland) Bill

and insert

1.45 pm Continuation of Stage 3 Proceedings: Climate Change (Scotland) Bill

and (b) the following revision to the programme of business for Thursday 25 June 2009—

after followed by Stage 1 Debate: Arbitration (Scotland) Bill

insert followed by Legislative Consent Motion: Holocaust (Return of Cultural Objects) Bill – UK Legislation—[Bruce Crawford.]

Motion agreed to.

The Presiding Officer: The next item of business is stage 3 proceedings on the Climate Change (Scotland) Bill. In dealing with amendments, members should have the bill as amended at stage 2—that is, Scottish Parliament bill 17A. They should also have the marshalled list, which was revised yesterday—that is, SP bill 17A-ML revised—and the groupings, which I, as Presiding Officer, have agreed. The division bell will sound and proceedings will be suspended for five minutes for the first division this morning and the first division this afternoon. The period of voting for the first division will be 30 seconds. Thereafter, I will allow a voting period of one minute for the first division after a debate, and 30 seconds for all other divisions.

Section 1—The 2050 target

The Presiding Officer: We start with group 1. Amendment 6, in the name of Patrick Harvie, is the only amendment in the group.

Patrick Harvie (Glasgow) (Green): After working on the Climate Change (Scotland) Bill for so many months, I am gratified that, throughout the process, the debate has been characterised by an almost universal acceptance that our approach to climate change must be science led and based on an acceptance of the urgency of the task that is before us and its importance to the future of human civilisation on our planet.

At stage 2, a number of amendments were debated in committee that specified the trajectory of the emissions cuts that we seek to achieve. That implies a recognition that the end point is not enough, and that we need to think about how many greenhouse gases we emit in the period between now and any target dates; about the relationship between annual targets and long-term targets; and about the points at which those long-term targets should be set.

It is now clear that although we have broad agreement on the principles, we are basing our work on science that is already out of date. We are basing our work on the assumption—which the United Kingdom Government holds, and from which the Scottish Government has not demurred—that the global objective must be to limit climate change to 2°C of warming throughout the world, as that is the generally accepted danger zone and the tipping point beyond which much more unstable change becomes very likely.
To give ourselves any chance of keeping warming to 2°, a debate is needed about the overall level of greenhouse gases in the atmosphere and the amount that we can emit over a period of time. It is clear that the scientific community has already moved beyond the report of the Intergovernmental Panel on Climate Change, which effectively informed the 80 per cent long-term target that the Scottish Government is proposing for 2050. If we are going to include specific targets in the bill, they should be the right targets rather than the wrong ones.

Those who have studied the subject in detail now understand that an 80 per cent target is already out of date and will need to be changed. I suggest, on the basis of evidence from the Tyndall centre, which is the UK’s leading research centre on climate change, that 90 per cent is a more appropriate target at the current time. As the bill makes clear, it will still be necessary to continue to receive advice on the developing science from the UK Committee on Climate Change or from a successor body, and to revise that target as we go along. However, we could just say that in the bill. We could say that we will take whatever target the Committee on Climate Change suggests.

If we are to include a specific target for 2050, we should make it the right one. My suggestion is that a reduction of 90 per cent is a more appropriate target for 2050, and in the debates on future groups, I will argue for other aspects of that trajectory, including a 50 per cent interim target and a more ambitious annual target. If we all accept that the objective is to keep global warming within the 2° danger zone, we should include in the bill numbers that have a credible chance of achieving that objective.

I move amendment 6.

The Minister for Transport, Infrastructure and Climate Change (Stewart Stevenson): Like Patrick Harvie, I acknowledge a degree of satisfaction that there has been universal acceptance of the importance of the climate change agenda, of the need for urgency and of the need for science to lead us. There has also been acknowledgement of the overwhelming contribution that human effects have made to the issue, so it is clear that we open our consideration of this important part of the Climate Change (Scotland) Bill with a broad agreement on principle, as Patrick Harvie said. We do not diverge from the need to contain the rise in temperature to the range 2° to 2.4°, and it is important that we keep hold of that.

Amendment 6 would raise the 2050 target from a reduction in emissions of at least 80 per cent to one of at least 90 per cent. It is identical to an amendment that Robin Harper lodged at stage 2, which only Patrick Harvie supported. There is no great division on the need for us to use expert advice. We need advice from the UK Committee on Climate Change that is specific to Scottish circumstances and which gives us targets that relate specifically to us. It is premature to deviate from the 80 per cent figure, which is founded on the Intergovernmental Panel on Climate Change’s definitive and internationally recognised fourth assessment report. Similarly, the UK Committee on Climate Change has advised that the UK’s 2050 target should be set at 80 per cent.

The 80 per cent target in the bill is, of course, a minimum requirement. The annual target for 2050 will not be set until 2036, which is 27 years from now. I am sure that we can all agree that our understanding of climate change has come a very long way over the past 27 years, and it will undoubtedly continue to grow over the next 27 years. We should not prejudge that future understanding. As it stands, the bill allows for an annual target of 80 per cent to be set for 2050. If we need to increase it, that is rightly a decision for our successors. I ask members not to support amendment 6.

Patrick Harvie: It is clear to me and, to be honest, it is probably clear to members across the political spectrum who have been greatly involved in considering the bill that there is a serious mismatch between the pace at which our scientific knowledge of the subject develops and the pace at which global or even domestic political consensus can move forward.

The minister sets great store by the IPCC’s fourth assessment report. Even the majority of the people who contributed to that report have already acknowledged that its findings are out of date. Its findings were not wrong at the time, but the science and our understanding have moved on, and the task before us is more urgent than it was then understood to be. The minister also sets great store by seeking the advice of the UK Committee on Climate Change. I again express my surprise and disappointment that he has not yet formally sought its advice on any matter in the bill. Despite that, he seems quite happy to interpret its letters according to his own whim.

I will press amendment 6, not in expectation of a sudden conversion, but simply as a marker of the fact that our position is that the science has moved on, that an 80 per cent target is inadequate and that that will be shown to be the case over the coming months and years.

The Presiding Officer: The question is, that amendment 6 be agreed to. Are we agreed?

Members: No.

The Presiding Officer: There will be a division. As this is the first division, there will be a five-minute suspension.
Meeting suspended.

On resuming—

The Presiding Officer: We move now to the division on amendment 6.

The Presiding Officer: The result of the division is: For 2, Against 119, Abstentions 0.

Amendment 6 disagreed to.
Before section 2

The Presiding Officer: We move to group 2. Amendment 94, in the name of Sarah Boyack, is grouped with amendments 94A, 7, 8, 95 to 97, 9, 10, 98 to 101, 108, 114, 119, 120 and 143. I remind members that, if they wish to participate in a debate on a group of amendments, they should press their request-to-speak buttons when I call the grouping. I draw members’ attention to the additional information in the groupings paper on pre-emptions in this group.

Sarah Boyack (Edinburgh Central) (Lab): A week is a long time in politics. Last Monday, John Swinney was adamant, in setting out the delivery plan for the bill’s provisions to my colleague Iain Gray, that the Scottish Government could deliver a target of 34 per cent and no more for emissions reductions by 2020, without a Copenhagen agreement. However, Alex Salmond admitted to members in the chamber last Thursday that the figure was 36 per cent. At both stage 1 and stage 2, Labour members argued for earlier and tougher targets. We said then that we would lodge amendments at stage 3 because we wanted a more ambitious trajectory.

Our reading of the delivery plan is that it is still business as usual in many respects. However, the science says that we must be more ambitious. If we all believe that our bill should be more ambitious and world leading, that must be demonstrated in the bill’s detail. The chief executive of the UK Committee on Climate Change made clear the position when he gave evidence on the bill to the Transport, Infrastructure and Climate Change Committee. He said:

“The preliminary assessment does not reflect specific circumstances in Scotland. That is something that we need to bottom out. We have said clearly in our report that the figure would not be an appropriate basis for target setting, because further work is needed to tailor it to the specific situation in Scotland.”—[Official Report, Transport, Infrastructure and Climate Change Committee, 27 January 2009; c 1399.] The guidance that the UK committee came up with was clearly an initial assessment and does not cover all areas of the Scottish economy, so more work needs to be carried out. The Minister for Transport, Infrastructure and Climate Change agreed with that point when Des McNulty put it to him at stage 2.

The figures cannot be a back-of-an-envelope job. In that respect, I call on the minister to publish the letter that he sent to the Committee on Climate Change only last Wednesday. I think that we are all intrigued about what questions he asked.

We have set out clear criteria in amendment 94, which is important.

Stewart Stevenson: I am entirely happy to publish the letter to which Sarah Boyack referred.

Sarah Boyack: It would have been good to have it before the debate, because we have seen all the other bits of the exchange.

We have said consistently that a tougher interim target will be challenging, but we need it now to drive the change that we need in the early, not later, years. We need the Committee on Climate Change to do a serious piece of work and the Scottish Government to report back to us in Parliament. The bill that we will pass today will provide a range of policy options—many more than were included in the bill as introduced. For example, the council tax provision has the potential to transform attitudes and to deliver carbon reductions. We need to send a clear and honest message to the Copenhagen conference.

When I set the first environment target in the early days of the Parliament, I was told by officials, in true “Yes Minister” style, that it was a bold target. We need to be ambitious today, but we must ensure that we follow through with the policies—that is the critical bit. There should not be a bidding war. I welcome the Government’s shift from its position of last week, but it would be useful to get clarity from the minister on where he now stands, given the letter that he sent out yesterday to MSPs. He was adamant that the transport delivery plan was as much as the Government could do. Indeed, Alex Salmond said last week that the Government could not do more unless Scotland had complete independence. We think that that is an excuse, because we could do much more now with our devolved powers.

It is vital that the Government’s commitment is not a heat-of-the-moment one just to get the Government through today’s debate; it must be followed by radical action in the weeks and months following the passing of the bill. The Stop Climate Chaos Coalition has built up a huge coalition of support. Amendment 94 will help us to drive the change that we need in the early, not late, years. We need to be ambitious today, but we must ensure that we follow through with the policies—that is the critical bit. There should not be a bidding war. I welcome the Government’s shift from its position of last week, but it would be useful to get clarity from the minister on where he now stands, given the letter that he sent out yesterday to MSPs. He was adamant that the transport delivery plan was as much as the Government could do. Indeed, Alex Salmond said last week that the Government could not do more without Scotland having complete independence. We think that that is an excuse, because we could do much more now with our devolved powers.

I move amendment 94.

The Presiding Officer: I call the minister to move amendment 94A.

Stewart Stevenson: I have just been informed that we have already published the letter to which Sarah Boyack referred—it is on the Scottish Government website, with the response from the
Committee on Climate Change. [Interuption.] The First Minister is saying, “Instant action”, which is what he wants from his ministers.

This is an important part of the debate. The implications of the choices that we make during the debate fall on the real world of our futures. The wrong choices will cripple our economy and will mean that we no longer have the financial resources to fight climate change. The debate is therefore not an arid, possibly point-scoring exercise about numbers. The decisions that we make here will shape the bill and the future of Scotland. That is why politicians’ decisions on targets must be based on expert advice whereby scientists, economists and others examine the evidence and make recommendations to which we should have regard.

The UK Committee on Climate Change, our present adviser, is funded by all Governments in the UK, but it is our independent source. The committee has advised the UK Government that a 34 per cent reduction by 2020 is necessary and achievable. A 42 per cent reduction becomes achievable, with considerable difficulty, when—I strongly doubt that it is “if”—the European Union amends its efforts through the EU emission trading scheme to raise the 2020 target to 30 per cent.

For the UK and Scotland, that change is vital to our ambition. Nearly half of all CO₂ that will be booked to the Scottish and UK emissions accounts will come from the trading scheme. We changed the bill at stage 2 to incorporate the 42 per cent target, but we properly made that contingent on EU trading scheme change and provided 34 per cent as the target that we would absolutely commit to now.

Sarah Boyack’s amendment 94 offers us the chance to promote 40 per cent as the target in the bill, with the power to revise that later if expert advice says that we should. We considered that approach at stage 2, but we thought that, in the circumstances, the UK Committee on Climate Change’s 42 per cent figure remained one that we should make contingent.

In my amendment 94A, which I believe and hope the Labour Party will support, we recommend to Parliament that the UK Committee on Climate Change’s 42 per cent figure be used. That is not about outbidding anyone, but about the integrity that comes from using only figures that are based on expert advice. Miss Boyack’s amendment 94 would establish for the first time the ability, based on expert advice, to reduce a target in the bill. Such a power should be very carefully regulated and controlled. We have maintained that that can happen only if there is insufficient EU agreement to increase the level of effort that is required and capable of being put in place.

Miss Boyack said that a week is a long time in politics. Well, we are planning for the very long term. There is a challenge for us all in the period to 2050.

Let me therefore confirm now that this Government will not use any powers to vary the 2020 target by introducing a figure that is lower than expert advice; let me make the commitment now that this Government will not use those powers beyond a single occasion; and let me make the commitment now that this Government will not use the powers at all if the EU raises its 2020 target to at least 30 per cent. We are pleased that a broad if not universal consensus has emerged on this subject.

Finally, I should explain that amendments 9 and 10 seek simply to consolidate the 42 per cent figure and that amendments 97 to 99 seek to strengthen the Government’s commitment. I also support amendment 101 in the name of Shirley-Anne Somerville.

I should also point out that although Patrick Harvie has committed to following expert advice, the 50 per cent figure that is set out in his amendment 7 deviates from that commitment. Similarly, amendment 8, in the name of Alison McInnes, seeks to apply the 42 per cent target at the outset and in advance of expert advice.

I move amendment 94A.

Patrick Harvie: A week is, indeed, a long time in politics; a few weeks are even longer. Sarah Boyack says that the Labour Party argued for tougher targets at stage 2; it is a shame that Labour members did not vote for them. If they had taken the opportunity at stage 2 to vote for the 42 per cent target, we would this morning be discussing a bill that had already been amended in that respect.

Labour members also had the opportunity to vote for a 42 per cent target, full stop, instead of a 42 per cent target with all the caveats, loopholes and get-out clauses that the Labour Party’s amendment 94 would introduce. That is my real concern. The amendment would not only introduce the power to vary or reduce the target, but relegate science to one of nine criteria that should be considered, which include economic competitiveness. I do not think that the Government—this Government, anyway—needs very much encouragement to put the environment second to economic competitiveness.

Agreeing to amendment 94 would merely delay the key vote, which would no longer be on this amendment or on the bill, but on any proposal to reduce the target that ministers might put before
Parliament. I have no doubt that, even within the limits of the commitment that Stewart Stevenson has just made, the Government will be perfectly capable of beefing up its delivery plan just that wee bit with a list of policy measures that it could implement to achieve a 42 per cent reduction—if it had the powers to do so. The UK Committee on Climate Change will say, “Yes, those measures might achieve a 42 per cent reduction,” at which the SNP will turn the whole matter into an argument between London and Edinburgh. In speaking to amendment 94, Sarah Boyack acknowledged that she expects such an excuse to be used. My challenge, therefore, to the Labour Party is this. If the rest of us accept amendment 94 as the best that we will get, even though we need better, will the Labour Party make a commitment to block any attempt by the SNP Government—or a future Labour Government—to reduce the target on the basis that certain powers are not within Scotland’s remit? It is clear that we have the powers to implement various policy measures, including a radical approach to demand-management in transport, energy use and other areas, to achieve the radical cuts that we need. Will the Labour Party make that commitment?

Many of the other amendments in this group would amend sections 2 or 2A, and will become redundant if amendment 94, as amended, is agreed to. However, I draw the chamber’s attention to amendment 108 in my name, which would limit the Government’s opportunity to use international credits in the short term if, in future, the minister does as I fear he wishes and reduces the target to 34 per cent.

**Alison McInnes (North East Scotland) (LD):** I am afraid that I rise to speak with a slight sense of anticlimax, given that amendment 94 and the Government’s amendment 94A, which the Liberal Democrats will very shortly vote for, more or less gazump my amendment 8.

I make it very clear that the Liberal Democrats want the bill to be as strong as is realistically possible and, although I have no doubt that amendment 8 would be the best option in that respect, I can do the maths as well as anyone and I realise that we should get behind amendment 94.

I hope that, finally, we are all agreed that a 34 per cent reduction by 2020 is not enough. After all, the route that we take towards the 2050 target of an 80 per cent reduction on 1990 emissions levels is just as important as reaching that destination. To explain what I mean, I will link my comments to my later amendments on cumulative emissions. Although we can reach the same end via a 34 per cent or 42 per cent target—or indeed any number in between—our impact on the earth’s atmosphere depends very much on our chosen route. Such point-in-time targets are not simply abstract numbers but represent real quantifiable amounts of emissions, and the greater the early action that we take, the better our chance of limiting the damage of climate change.

Early action is vital. A weaker interim target means not only more emissions between now and 2020, but more emissions in every year between 2020 and 2050. As a result, the target will affect not only the next 10 years but the next 40.

I am concerned about the framing of amendment 94. For example, I am by no means encouraged by its reference to 40 per cent as the target “for the time being”; I am not encouraged by its separation of the reference to “a higher figure” from the reference to “a figure provided by the relevant body”.

in referring to any modification of the interim target—a caveat, I might add, that opens the door to lowering the target after today’s figure grabs the headlines; and I am not encouraged by yesterday’s letter from the UK Committee on Climate Change to the minister that suggests that its initial view is that an appropriate target might be “slightly below 34%”. That view appears to be based on limited information and on matters that have not been fully investigated. I trust that, given time, the Committee on Climate Change will come to realise that Scotland can do more. That Scotland must do more is by now, I hope, a given.

We will back the Government’s amendment 94A, which seeks to increase the “for the time being” target to 42 per cent, as that is the figure backed by the science and represents the cut that the evidence says is required. It will be difficult to reach that target, but we must make the effort to do so. I hope that, after today, sense will prevail and that an order weakening the target that we will agree to will not be made. I would oppose any such move, and I am certain that the rest of Scotland would too.

The bill is a signature piece of legislation for the Scottish Parliament. Given that the interim target is a key element of it, we should not be afraid to aim high. We certainly must not be so afraid of failure that we aim at nothing at all.

**Shirley-Anne Somerville (Lothians) (SNP):** The Scottish ministers have committed to seeking the UK Committee on Climate Change’s advice on the most appropriate level for the 2020 interim target, and amendment 101 would make that commitment a statutory requirement. Under its terms, ministers would also have to publish the advice that they receive to ensure that the decision-making process is open and transparent.
At stage 2, we on the Transport, Infrastructure and Climate Change Committee were advised that we should not

“pick a percentage for Scotland but that we should pose to the relevant advisory body the right question—what is the most that we can do to make the bill as strong as it can be? We should make the figure”—[Interruption.] We should make that—[Interruption.]

George Foulkes (Lothians) (Lab): Can you not read your writing?

Members: Oh!
The Presiding Officer: Order.

Shirley-Anne Somerville: Thank you, George.

“We should make the figure that that body provides our target. ... The target is not a subject for political point scoring; our objective in the bill should be the highest level that is consistent with what is achievable.”—[Official Report, Transport, Infrastructure and Climate Change Committee, 26 May 2009; c 1770-1.]

I probably got the words mixed up, because they are not mine, but Des McNulty’s. Perhaps his English is not as good as mine. Regardless of his use of punctuation and grammar, however, I support his point.

Amendment 101 sets out an appropriate way of ensuring that the 2020 interim target is as demanding as possible while still being based on the expert analysis of how it can realistically be delivered. After all, such targets must be challenging but credible.

The bill will lose credibility with the public and, more important, the policies that any future Administration will need to put in place to achieve these targets will struggle to carry their favour if people pick up nothing from the coverage of today’s debate other than an argument over numbers. That is why I am pleased not only to speak to amendment 101 but to support the Government’s amendment 94A, which seeks to ensure that the only numbers that appear in the bill are those that have been mentioned by the UK Committee on Climate Change.

Amendment 101 would complement the Government’s approach and ensure that the UK Committee on Climate Change is given its rightful place in advising on the interim target. This is about the experts advising the politicians on what Scotland can achieve and the politicians listening to and acting on that advice.

Malcolm Chisholm (Edinburgh North and Leith) (Lab): This is the most important debate on the bill; indeed, this has been the key issue throughout the whole process. We all know that cumulative emissions are what matter and that, as a result, early action is crucial.

It looks as if we can show that the Parliament is united around the key issue of the interim target. Of course, there are debates to come about whether it will be modified. I am on the side of the argument that is reluctant to change from 42 per cent. The 34 per cent target was always rather unambitious because the trajectory from 1990, if we had reduced at the rate that we have been reducing, would have led us to a 32 per cent reduction by 2020. We need to be far more ambitious than that. The whole point of a target is to stretch and change behaviour.

Of course we must listen to the expert advice, but the experts will be influenced by the policy options that we are prepared to bring forward. That is why the months that follow are crucial. We must think outside the box and be more ambitious in bringing forward policy changes that will make achievable a target that is far more ambitious than 34 per cent. Even the Government’s delivery plan shows that far more than 34 per cent can be achieved, so let us concentrate our minds after today to ensure that we do not have to change the 42 per cent target in the bill, which we can all welcome today.

Alex Johnstone (North East Scotland) (Con): I am one of those people who are instinctively opposed in a range of policy areas to the setting of targets. Consequently, it is more difficult for me to deal with a bill that is largely centred on the setting of targets, but I accept that the process is necessary.

The danger with the bill was always that, at one point or another, we would get involved in an unseemly bidding war. That happened at the outset when the Government plucked the 80 per cent figure out of the air. Some might have argued that that figure was chosen simply to compete with a lower figure in the south. However, time has moved on and we have all acquiesced around the figure—something we have consolidated through the decisions that we have already taken this morning.

In introducing her amendment, Sarah Boyack made it clear that she has been influenced by the lobbying that has taken place during the passage of the bill. I, too, have been influenced by lobbying. I have been most impressed by the work that the Stop Climate Chaos Coalition has done, but I have also been lobbied by a number of representative bodies that cover public authorities and business interests, who are concerned that we do not set an interim target that stretches too far and causes a negative impact on the Scottish economy at a time when we can ill afford it.

I have to be persuaded that the process that we are about to go through is the correct one. Having read amendment 94, and the amendment to it, amendment 94A, I believe that it can be argued
that taking the step today can be justified. However, I must warn that supporting or acquiescing to the process will consolidate my resolve to stick much more rigidly to the other targets in the bill as approved at stage 2.

Consequently, I will support the Government’s amendment to the amendment and subsequently amendment 94 in the name of Sarah Boyack, but I do so understanding that I will have to continue to justify that course of action to a range of interests in Scotland who are concerned that we do not set an unachievable target for 2020.

Jack McConnell (Motherwell and Wishaw) (Lab): Like Malcolm Chisholm, I believe that the issue that we are discussing is the key one that we will consider today. I want to make a brief case for having the most ambitious targets possible. We should be guided by science and listen to expert advice, but expert advice can be contradictory. If we had listened to all the expert advice back in early 2002, in my first months as First Minister, we would not have set the high targets that were set for renewable energy. If we had not set those targets, we would not have met them and the Government that is in place today would not have had the opportunity to set even more ambitious targets for industry to meet and public authorities to comply with.

In the area of climate change, perhaps above all others, the setting of ambitious targets forces people in industry, public authorities and experts to consider how they can be met. As Malcolm Chisholm said, targets can shape behaviour and effect change. We are talking about a future that most of us in the Parliament will not be here to see, but which the Parliament will change fundamentally. We need to ensure that the future is not just cleaner, greener and safer, but more sustainable. By setting ambitious targets today, we will set out our stall as a Parliament. People throughout Scotland and elsewhere will follow us if we give that lead.

Expert opinion is important and scientific advice can guide us, but ultimately the political decisions that we make as a Parliament are far more important. Today, we should set a lead for Scotland.

10:00

Des McNulty (Clydebank and Milngavie) (Lab): The context in which we are debating the matter is the SNP’s manifesto commitment to set a 3 per cent year-by-year target, which was abandoned. We should remember that. The other context is that, in considering the bill, we managed to bring forward the date of the interim target from 2030, which was the original date, to 2020, so we have made significant progress in pegging back what was lost when the SNP shifted its position.

I am pleased that the various parties, in making their contributions, have accepted the position that I put forward at stage 2, which is that it is difficult for us as politicians to select a particular number without having an up-to-date and focused consideration by an expert committee—in this case, the UK Committee on Climate Change. To me, it makes logical sense to go back to the UK committee and ask it not just for an assessment of the global conditions but for an assessment of Scotland’s potential—what Scotland can do to take forward its climate change contribution—and the policies that we need to put in place to push the target up. We can boost the target only by taking policy actions to deliver it. What we say does not make a lot of difference. It is what we do, fundamentally, that makes a difference.

Patrick Harvie is right. When the Committee on Climate Change comes back, there will be a debate in the chamber about the figure that it puts forward, but there will also be a debate about the policies that are needed to take action forward. We must prepare for that debate. If the answer is that if we just do what we are doing we can achieve percentage X, I do not think that we will simply accept percentage X. We will have a debate about the policies and how we can take that argument forward.

I do not see the logic of the SNP’s position. Having said that 34 per cent is the maximum that is possible, it is now putting forward a case for 42 per cent. To me, however, the important thing is that there is a scientific mechanism.

The Cabinet Secretary for Finance and Sustainable Growth (John Swinney): Let me explain the logic of the Government’s position to Mr McNulty. What the Government is setting out is exactly what we set out at stage 2—that we can achieve 42 per cent if we get the necessary support that we all hope for from the EU discussions later this year. What we propose today, with Mr Stevenson’s clarifying amendment 94A, is to put a scientific target of 42 per cent in the bill. That can be realised if the agreement that we all hope for at the EU level is delivered.

Des McNulty: I do not think that the issue is purely about what is delivered in the EU commitment. The issue is about what we can deliver here in Scotland. We believe that more than 34 per cent can be delivered and that referring to the UK Committee on Climate Change for a considered view on what can be achieved is the right approach. On the basis of the expert advice, we will come back to the chamber and decide how to go forward. I support Sarah Boyack’s amendment 94.
**Stewart Stevenson**: Patrick Harvie said that he would open with the science, but he then appeared to ask us to disregard the science and the expert opinion on the 34 per cent and 42 per cent targets.

Of course we have to ask for the advice of the UK Committee on Climate Change in relation to Scotland’s particular circumstances.

Alison McInnes said that the bill is the Parliament’s signature piece of legislation. I am happy to agree with her and I suspect that there will be no dissent from that view.

Shirley-Anne Somerville must read Des McNulty’s words more carefully.

Malcolm Chisholm made an important point. Of course we will be influenced by policy options that are presented, particularly on the subject of cumulative emissions. That is right and proper. It is also proper that the Government be challenged to bring forward policy options to address where the bill should take us after it has been enacted. However, we accept that, as Malcolm Chisholm pointed out, within our delivery programme we can go beyond 34 per cent, and the 36 per cent figure that has been used is an option. Further policy options will allow us to go forward.

Alex Johnstone made an important point about continuing engagement. This is not the end of the process; if it is anything, it is the end of the beginning.

Jack McConnell made good points. Given his involvement in the matter, I was surprised that he did not take the opportunity to say that part of what we are doing is making a moral case on behalf of nations that will be more adversely affected by climate change than Scotland will be, such as those in sub-Saharan Africa, in particular. There is a moral as well as a practical imperative to what we are doing.

Amendment 94A agreed to.

Amendment 94, as amended, agreed to.

**Section 2—The interim target**

Amendment 7 not moved.

Amendment 8 not moved.

Amendment 95 moved—[Sarah Boyack]—and agreed to.

**Section 2A—Modifying the interim target**

The Presiding Officer: I remind members that if amendment 96 is agreed to, amendments 97, 9, 10, 98 and 99 will be pre-empted.

Amendment 96 not moved.

Amendments 97, 9, 10, 98 and 99 moved—[Stewart Stevenson]—and agreed to.

Amendment 100 moved—[Sarah Boyack]—and agreed to.

After section 2A

**Section 3—Annual targets**

The Presiding Officer: Group 3 is on the setting of annual targets. Amendment 11, in the name of Alison McInnes, is grouped with amendments 12 to 18. I draw members’ attention to the additional information on pre-emptions in the group, which is in the groupings paper.

Alison McInnes: I will speak to amendment 11 and to amendments 12 and 15, in the name of Patrick Harvie, because I would have lodged such amendments if he had not beaten me to it.

I have a question for members. When is 3 per cent not 3 per cent? Perhaps that is not the most challenging riddle. We all know the answer: when it is inconvenient for the SNP.

Mr Swinney said that the Government was “committed to an 80 per cent reduction in our emissions by 2050. That target is equivalent to a reduction of 3 per cent each year.”—[Official Report, 21 June 2007; c 1039.]

I hesitate to challenge the mathematics of Scotland’s Cabinet Secretary for Finance and Sustainable Growth, but I must do so. An 80 per cent reduction by 2050 is equivalent to 3 per cent annual reductions if and only if the 80 per cent target is met by making annual reductions of 3 per cent.

I will explain, and I must again talk about cumulative emissions. Let us imagine two trajectories towards the 80 per cent target: in one, the interim target is 34 per cent, and 3 per cent annual reductions kick in after 2020; in the other, the interim target is 42 per cent and the 3 per cent annual reductions happen from the outset. Those trajectories are not equivalent. The start and end points are the same, but the bit in the middle—the important bit—is far from the same. On the first trajectory, we emit nearly 1,500 million tonnes of CO₂ equivalent. On the second, we emit just more than 1,300 million tonnes. The difference is about 142 million tonnes of CO₂ equivalent, or nearly three times the total emissions for Scotland in 2006. The two trajectories are not equivalent.

That is why it is vital that we take early action. We need 3 per cent annual reductions now. SNP members have just voted for a 42 per cent interim target. Now they have the chance to show us that that was not just political manoeuvring. Let them show us that they intend to achieve the target.
Annual emissions reductions of 3 per cent will enable us to reach the 42 per cent reduction target by 2020. If the SNP is serious about that goal, I am confident that amendment 11 will gain support. If the SNP is not serious about the goal, Scotland will soon know it.

I move amendment 11.

Patrick Harvie: Alison McInnes made a good job of explaining something that is easier to explain in a graph than in a speech. The question that we must ask ourselves is not simply about point-in-time targets. Such targets are part of the issue, but if we are to determine what impact we are having on the climate we must also think about the trajectory and overall greenhouse gas emissions over the course of that trajectory.

The question is then very clear. We have stiffened the task and steepened the trajectory by bringing the interim target forward from 2030 to 2020 and raising it—albeit that during the coming months we must wait to see whether the Government wants to reduce it again. If by passing the bill the Parliament is defining a more ambitious trajectory, the annual targets must automatically be made stronger.

On first reading, amendments 15 and 17, in my name, and amendment 11, in the name of Alison McInnes, might seem slightly confusing, if only because some of them follow on from amendments that we debated earlier. Members are presented with a series of options. We can consider the 3 per cent annual target, to which the SNP committed in its manifesto and in Government for a while—although not for long enough to include it in the bill. The Labour Party has criticised the SNP for dropping its commitment to 3 per cent annual reductions. Let us now commit to ensuring that such reductions are made, rather than simply accepting that the target has been dropped.

We have an opportunity to raise the annual target to 4.5 per cent. I have argued that that is necessary for a more ambitious trajectory. The Parliament rejected amendment 6, which would have set the 2050 target at 90 per cent, so it might well also reject a 4.5 per cent annual target.

We also have an opportunity to ensure that the 3 per cent target is brought forward, so that we do not have to wait until 2020 before it comes into effect. Members who are not convinced that we can achieve 3 per cent in the first couple of years can support amendment 12, which would remove section 3(2)(b).

We have supported a steeper and more ambitious trajectory. We will fail to achieve that trajectory unless we improve the annual targets. I urge members to be as bold as they can be.

Stewart Stevenson: The amendments in my name in group 3 are concerned with correcting drafting anomalies and inconsistencies that have crept into the bill as a result of amendments at stage 2. Section 18A introduced the concept of periods of individual net Scottish emissions accounts, rather than an overall net Scottish emissions account that would have covered the entire period from 2010 to 2030. The approach more accurately reflected the concepts that are enshrined in the bill.

Amendment 13 will amend section 3(2)(b) to refer to multiple net Scottish emissions accounts, rather than to a single account. Amendment 14 will extend the scope of an amendment that Des McNulty made at stage 2, so that the annual targets for 2011 to 2019 are set at amounts that are consistent with achieving the 2050 target as well as the interim target. Amendment 16 will apply to the annual targets for 2020 to 2050 requirements that are similar to those that section 3(2)(b) applies to the targets for 2011 to 2019.

Amendment 18 will delete section 4(3). I am not seeking to remove the important provision that the Scottish ministers “must … have regard” to annual targets. The amendments that were agreed to at stage 2, and the amendments that have been lodged at stage 3 in relation to section 3(2) of the bill will require that annual targets be set at amounts that are consistent over time and which will allow the interim target and the 2050 target to be met.

10:15

The duty is now stronger than the duty that was in the bill as originally introduced. The requirement in section 4(3) is that, when setting annual targets, ministers “must … have regard” to the interim target and the 2050 target. However, the duty in section 4(3) has now been superseded. The subsection is therefore unnecessary, and amendment 18 seeks to delete it.

I will now consider the group 3 amendments lodged by Alison McInnes and Patrick Harvie—which I note were not supported in the Transport, Infrastructure and Climate Change Committee.

The effect of Alison McInnes’s amendment 11 would be that the annual target for 2010 was “at least 3%” lower than the estimated emissions for 2009. In a similar way, Patrick Harvie’s amendment 17 would include the figure of “4.5%”. As I explained to the Transport, Infrastructure and Climate Change Committee at stage 2, accelerating our annual reductions, from the current average of approximately 1.2 per cent to a figure of 3 per cent or more, is simply not immediately possible. I whole-heartedly agree that we have to build towards the level of annual...
reductions suggested as soon as possible, but we cannot make it happen overnight.

I will welcome any and all reasonable suggestions as to how we can achieve the reductions in emissions as quickly as possible. We published our climate change delivery plan last week; I have yet to see the plans of the Scottish Green Party or the Liberal Democrats. We will continue to draw on the expert advice of the UK Committee on Climate Change, which will be valuable as we set our annual targets at challenging but realistic levels, designed to meet both the interim and the long-term targets that are set out in the bill.

I am sorry that I will be unable to support amendments 11, 12, 15 and 17.

Alison McInnes: I simply repeat that early and sustained action is the sensible way forward. The path that we choose in order to move towards the end point will be important. If we do not go for 3 per cent from the outset, we will face a much harder struggle further down the line.

When the Transport, Infrastructure and Climate Change Committee was taking evidence on the bill, many representations were made to us about giving a clear message to industry and to our partners in Scotland. Certainty is needed if investment is to flow. That investment, and the green jobs that would be created, would be of great benefit to Scotland at this time. I therefore hope that members will support amendment 11.

The Deputy Presiding Officer (Alasdair Morgan): The question is, that amendment 11 be agreed to. Are we agreed?

Members: No.

The Deputy Presiding Officer: There will be a division.

The Deputy Presiding Officer: The result of the division is: For 79, Against 43, Abstentions 0.

Amendment 18 agreed to.

The Deputy Presiding Officer: Group 4 is on setting annual targets—criteria. Amendment 102, in the name of Shirley-Anne Somerville, is grouped with amendments 103 to 105 and 116.

Shirley-Anne Somerville: During the passage of the bill, we have heard a lot about the need to take early action to tackle climate change. We have already taken such action by agreeing to certain amendments this morning. However, we must also consider the total amount of greenhouse gas emissions that we will produce between now and 2050.

I very much welcomed the amendment that was lodged by Cathy Peattie at stage 2 to place a duty on ministers to report on cumulative emissions. As a result, the bill contained—for the first time—a duty on cumulative emissions. The amendment picked up on a great deal of evidence that the committee heard on the need to take cumulative emissions into account.

I am keen for the bill to be even more ambitious, and I want to build on Cathy Peattie’s good work. That is why I have lodged amendments 102, 105 and 116, which will oblige the Scottish ministers to request and consider advice from the UK Committee on Climate Change on what the cumulative amount of net Scottish emissions should be for Scotland for the duration of the effect of the bill. The Scottish ministers should be obliged to request such information each time they set annual targets, so that we can obtain advice at the earliest opportunity.

Of course, it will not be enough simply to request advice; ministers will have to act on it. The amendments cover that point too. Once available, that information will prove to be a significant factor in determining the level of future annual targets, and will focus the minds of future Administrations on their obligations for the years right up until 2050.

The amendments in the name of Alison McInnes are along the same lines and, indeed, take us a step further. They are a welcome addition to the amendments in my name, and I urge the chamber to support them as well.

I move amendment 102.

Alison McInnes: I will support the amendments in the name of Shirley-Anne Somerville. They are a good start, but I hope that the chamber will also agree to amendments 103 and 104, in my name, which further define and enhance the role that a cumulative emissions budget would play.

I reassure the chamber that the amendments are not overly prescriptive. They do not set an arbitrary budget. They call for the best scientific evidence that is available to direct the Government with regard to what an appropriate total would be. Already this morning, there has been much emphasis on the idea of using the best scientific evidence that is available. In doing so, we will strengthen the fundamental target-setting role of the bill and move from a basis of doing what we need to do.

Unfortunately, because of the way in which the groupings of amendments have worked out, I feel as though I am repeating myself when I address the chamber this morning. However, as I have already said, when we set targets, it is impossible to examine the interim target, the annual targets and the cumulative targets in isolation; they are all, ultimately, stepping stones and tools along the course to the 80 per cent target—we cannot have one without the others. That is especially the case when we consider the question of cumulative emissions. I cannot emphasise enough that, for
the bill to be truly effective, we cannot be totally reliant on point-in-time targets; we must ensure that we know how much damaging greenhouse gas it is safe for Scotland to emit. We already know the critical concentration of atmospheric greenhouse gases beyond which there will necessarily be significant and damaging climate change events. We also know how much more emissions there can be in total before we reach that figure, which means that we can calculate a fair share for Scotland. I welcome the fact that Shirley-Anne Somerville has come to that view as well.

I cannot put it more simply than this: if we do not calculate an overall emissions budget based entirely on science and not on the addition of point-in-time targets, we simply cannot know whether those targets are right and we cannot know whether our annual targets will have the desired impact.

Stewart Stevenson: The amendments in the names of Shirley-Anne Somerville and Alison McInnes are concerned with Scotland’s cumulative emissions over the period from 2010 to 2050. I recognise the widespread desire for the bill to acknowledge the issue of Scotland’s cumulative emissions. I believe that the amendments in the name of Shirley-Anne Somerville provide a way for cumulative emissions to be incorporated in the bill in a way that is sufficiently flexible not to interfere with the emissions reduction trajectory that will be published in line with the batches of annual targets that ministers must set. I am therefore content to accept amendments 102, 105 and 116.

We have considered the amendments in the name of Alison McInnes. Although, from a technical point of view, we would have preferred some aspects of the amendments to be drafted differently—there might be some small practical difficulties with them—they basically express policy positions that we wish to pursue, so we are happy to commend them to the chamber as well.

Shirley-Anne Somerville: This is an important section. It ensures that we approach our early action with an eye to 2050 in a way that ensures that we do not emit more than our fair share in the years to come. As Alison McInnes has said, the section ties the two parts of our efforts together. It ensures that, when we set our annual targets, we focus on our cumulative and total emissions up to 2050. I urge the chamber to support all the amendments in the group.

Amendment 102 agreed to.

Amendments 103 and 104 moved—[Alison McInnes]—and agreed to.

Section 5—Advice before setting annual targets

The Deputy Presiding Officer: Group 5 is on the role of the relevant body in relation to annual targets. Amendment 19, in the name of the minister, is grouped with amendments 20, 20A, 20AA, 21, 106, 29 and 30.

10:30

Stewart Stevenson: Amendments 19 to 21 and 29 are necessary as a consequence of the amendments that require annual targets to be set at amounts that are consistent with achieving the interim and 2050 targets. That is necessary as a result of changes that were made at stage 2—and, perhaps, at stage 3—to section 3(2).

Amendments 19 to 21 amend section 5 to require that the Scottish ministers ask the relevant body for appropriate advice in that respect and publish it after they receive it.

Amendment 29 has a similar effect, in that it places a corresponding duty on the advisory body to provide that advice, as opposed to the duty on the Scottish ministers to ask for it.

On amendment 30, at stage 2, Des McNulty inserted paragraph (ba) into section 22(3) of the bill. The effect of the new paragraph is to require the advisory body, when providing advice under section 22(1)(a), to express its view about the respective contributions towards meeting the annual targets that should be made by energy efficiency, energy generation, land use and transport.

At stage 2, I indicated that I was broadly content with the proposal, and that remains the case. There is, however, a risk that paragraphs (a), (b) and (ba) of section 22(3) could be read as limiting the total extent of the areas about which the advisory body can give advice. Clearly, that is not meant to be the case, so amendment 30 seeks to insert a paragraph after paragraph (ba) that makes it clear that the advisory body has the freedom to express its views on any area in which it considers that there are particular opportunities to reduce the emission of greenhouse gases.

The Scottish ministers are comfortable with the first three paragraphs that amendment 20A, in the name of Patrick Harvie, proposes, as they simply cover the same subject matter areas as section 22, which sets out the things on which the advisory body must express a view. However, we have a difficulty with the last three proposed paragraphs. Two of them would in effect require ministers to seek advice from the relevant body on an emissions performance standard for electricity generating stations in Scotland that could be
different from any equivalent standard in England and Wales.

As I explained to the Transport, Infrastructure and Climate Change Committee at stage 2, the Government has not ruled out the introduction of an emissions performance standard for new electricity generating stations. However, that would need to be done in line with the UK approach to the development of carbon capture and storage technology. The UK Government is currently consulting on a CCS levy, which could be used to fund the substantial investment that will be necessary from the public sector. That levy will require new UK legislation, but spending it will be a devolved process. The Scottish Parliament will have its opportunity to give its consent to that in the autumn, when there will be an opportunity to discuss the matter in detail.

I intend to say more on this subject when we debate amendment 54 in group 15 but, for the reasons that I have outlined, the two paragraphs on electricity generation in amendment 20A are unnecessary, given the on-going work on the emissions performance standard.

The language that is used in the paragraph about cumulative emissions budgets is inconsistent with the language that is used about cumulative emissions elsewhere in the bill, and we should exercise caution in that regard.

Amendment 20A is also flawed in that it places a duty on the Scottish ministers to ask the relevant body for advice on cumulative emissions but places no equivalent duty on the body to provide that advice.

As I stated at the outset, we have no difficulty with the first three proposed paragraphs of amendment 20A. Accordingly, I have lodged amendment 20AA, which will allow those paragraphs into the bill while excluding the ones that create difficulties. If members are willing to agree amendment 20AA, ministers will be happy to support amendment 20A. If not, we cannot do so.

Amendment 106, in the name of Patrick Harvie, imports the definition of trading schemes from section 44 of the UK Climate Change Act 2008 and applies it as a definition of the traded sector in amendment 20A. Similar provision is already included in section 22(5) of the bill, and it also appears in the equivalent advice provisions in the UK act. Therefore, the Government is content to accept amendment 106.

I move amendment 19.

Patrick Harvie: I am grateful that the minister accepts amendment 106, but I was rather hoping that he would accept the rest of amendment 20A. Amendment 20A has multiple purposes—it tries to achieve three things. First, it deals with an issue of the language in provisions that originate from the Government and from a Labour amendment at stage 2, and which relate to advice on the respective contributions from energy efficiency, energy generation, land use and transport. There is a risk that those provisions would not come into play until a Scottish advisory body was established. The Stop Climate Chaos Coalition has argued that that part of amendment 20A is necessary to avoid a loophole, so I am glad that the minister accepts it.

The minister argues that the language in the final paragraph in amendment 20A, which is on cumulative emissions, is different from that in the rest of the bill. I welcome amendment 104, in the name of Alison McInnes, which has been agreed to and which uses the same language. The amendment in my name talks about stabilising “greenhouse gas concentrations in the atmosphere at a level that would prevent dangerous anthropogenic interference with the climate system.”

I argue that that is complementary language and that that paragraph of amendment 20A is compatible with amendments that have already been agreed to.

On electricity generation and emissions performance, there is probably broad agreement that an emissions performance standard is required. I welcome the fact that work is happening on that at UK level. However, we should be able to contemplate agreeing to amendment 20A ahead of that work progressing. It certainly cannot be argued that the amendment is not competent or not within devolved powers, as it would simply mean that the Government would seek advice on “the average greenhouse gas emissions per megawatt hour of electricity generated in Scotland that would be compatible with” the targets that the Parliament will agree to in passing the bill.

Stewart Stevenson emphasised carbon capture and storage, but that should be put into context. The Government has a great reliance on and trust in the idea that carbon capture and storage will be developed and will be technically achievable and commercially viable. I hope that the Government is right about that, but I do not know that it is. The risk exists that new coal-fired power stations will be up and running before carbon capture and storage is operational, or in the absence of carbon capture and storage. In that context, I argue that that aspect of amendment 20A is desirable, as it would help to ensure that the Government focused its mind on the emissions per megawatt hour of electricity that is generated in Scotland. I ask members to support amendment 20A, but to resist amendment 20AA.
The Deputy Presiding Officer: I call the minister to wind up. Does the minister wish to wind up? It is not compulsory.

Stewart Stevenson: The minister was so enthralled by the debate that he was continuing to listen, in the expectation that Mr Harvie had more to say.

Everything has been said. I encourage members to support amendment 19 and, when we come to it, amendment 20AA.

Amendment 19 agreed to.

Amendment 20 moved—[Stewart Stevenson].

Amendment 20A moved—[Patrick Harvie].

Amendment 20AA moved—[Stewart Stevenson].

The Deputy Presiding Officer: The question is, that amendment 20AA be agreed to. Are we agreed?

Members: No.

The Deputy Presiding Officer: There will be a division.

**The Deputy Presiding Officer:** The result of the division is: For 101, Against 18, Abstentions 0.

**Amendment 20A, as amended, agreed to.**

**Amendment 20, as amended, agreed to.**

**Amendment 21 moved—[Stewart Stevenson]—and agreed to.**

**Amendment 105 not moved.**

**Amendment 106 moved—[Patrick Harvie]—and agreed to.**

**Section 7A—Achievement of annual targets: domestic effort target**

**The Deputy Presiding Officer:** Group 6 is on the achievement of annual targets. Amendment 22, in the name of the minister, is grouped with amendments 23 to 27 and 90.

**Stewart Stevenson:** I will move amendment 22, but I intend later to seek permission to withdraw it, because we do not intend to proceed with it. I will move it only to allow the debate to proceed.

Amendments 22 to 24 and 90 relate to the domestic effort target that was added to the bill at stage 2 in section 7A. Ministers have gone on record many times to state that our preference is to reduce emissions from sources in Scotland rather than to purchase offset credits. Money that is spent on international credits is money that is not spent on investing in Scotland. However, as Sir Nicholas Stern emphasised in his report “The Economics of Climate Change”, global carbon markets are a key component of attempts to curb rising global emissions. Members will appreciate that the use of carbon units to offset excess emissions will be necessary, within statutory restrictions, at certain points up to 2050.

In response to a recommendation in the Transport, Infrastructure and Climate Change Committee’s stage 1 report, the Government introduced amendments to the bill that set limits on the total amount of carbon units that ministers may credit to the net Scottish emissions account. However, those limits do not apply to carbon units that are derived from the European Union emission trading scheme, for good reasons, concerning how that scheme works. More than 40 per cent, or perhaps as much as half, of Scotland’s emissions fall within the traded sector and therefore are affected by carbon markets such as that created by the EU scheme. The fundamental problem with the domestic effort target in section 7A is that it makes no distinction between carbon units that the Scottish ministers use and the units that Scottish companies use in the scheme.

Amendments 22 and 23 offer alternative ways of addressing the problem. The important point is that the 2050, interim and annual targets are achieved in the first place. Placing disproportionate emphasis on a flawed domestic effort target could risk those targets being missed.

The Government’s preference is for amendment 23, which is the best way of fixing the issue. The carbon units that are surrendered by Scottish installations within the EU emission trading scheme would fall within the 20 per cent allowance that the domestic effort target gives the Scottish ministers for using carbon units. The challenge is that we do not use those units—individual installations such as power stations throughout Scotland do so. The Scottish ministers will simply carry out the accounting in relation to the EU ETS, ensuring that its operation in Scotland is not ignored when calculating progress towards the targets that are set in the bill. If Scottish installations bought a large number of units in one year—which is understandable practice, as there is a finite number of credits within the scheme as a whole—the domestic effort target would almost certainly be breached and the Scottish ministers simply could not do anything about it. It is therefore vital that the power companies ensure that they make a strong contribution to delivering on their obligations.

10:45

The importance of carbon reduction not interfering with the EU ETS is also recognised by the expert Committee on Climate Change. In its advice to the UK Government that was published last December, the committee recommended that any restriction on the use of carbon units should not extend to units generated within the EU.

We have already voted to raise the 2020 target to 42 per cent. In lobbying for that, WWF Scotland indicated that the purchasing of carbon units could cover any shortfall. As it stands, the domestic effort provision in section 7A means that it would be impossible for the Scottish Government to buy sufficient credits to cover the shortfall between the expected reduction and the interim target.

There will be times when buying carbon units is the most cost-effective way of ensuring that Scotland’s climate change targets are achieved,
but forcing ministers to take unnecessarily expensive measures to tackle emissions would, in effect, be a new tax on the people of Scotland.

Amendment 23 will avoid that problem by removing EU ETS credits from the restriction on the use of carbon units inherent within the domestic effort target. The domestic effort target is intended to encourage ministers to focus on reducing emissions in Scotland. It would be perverse if it acted to prevent all the other targets in the bill from being met.

I should also highlight that section 7A contains a flaw, as it refers to the Scottish ministers “making an order”. The power is subject to the affirmative procedure, so advice should be sought before ministers lay a draft, rather than make an order. Amendment 24 will correct that drafting flaw by referring instead to the Scottish ministers “laying a draft of a statutory instrument containing an order”.

As regards domestic effort, amendment 90 simply adds the term “domestic effort target” to those listed in section 65, “Interpretation”.

Amendments 25 and 26 are tidying-up amendments, which move section 18A(A1) into section 12A. Essentially, the distinction is that section 18A as a whole is about all limits on carbon units for multiyear periods, while section 18A(A1) is about capping at 20 per cent the amount of carbon units that may comprise the reductions in individual years. Section 12A, which was introduced by one of Des McNulty’s amendments at stage 2, does essentially the same thing as section 18A(A1), so it makes sense to move section 18A(A1) into section 12A.

When section 18A was amended at stage 2 to insert subsection (A1), Des McNulty also deleted section 18A(2)(b), which would have required the Scottish ministers to set a limit on the net amount of carbon units that may be credited to the net emissions account during the period 2013 to 2017. Mr McNulty might have thought that section 18A(2)(b) was unnecessary on the basis that new section 18A(A1) would define the total amount of carbon units that may be used, as would be the case if section 18A(2)(b) had not been deleted. That weakens the bill, which we do not think is what Mr McNulty intended.

In addition—I am coming to a conclusion, Presiding Officer—given that the years 2010 to 2012 are covered in section 18A, as are all the years from 2018 to 2050, it could be inconsistent and confusing for ministers not to set a limit on the total amount of carbon units that they may use in respect of the period 2013 to 2017. Amendment 27 seeks to correct that anomaly.

We will listen carefully to the debate on this complex and technical group of amendments and we will see where we get to.

I move amendment 22.

Des McNulty: As Mr Stevenson said, we introduced section 7A into the bill at stage 2. It is a significant section, because it sets out the framework within which the domestic effort target is established. We established clear parameters around what can and cannot be done through buying international credits. That was very much at the forefront of Stop Climate Chaos’s consideration and the consideration of groups that are particularly interested in international development issues, in which I have a long-standing involvement and interest.

It seems strangely paradoxical that in order to boost the targets here, we could end up boosting emissions in other countries, which is not where we want to be. I want to focus Scotland’s attention on reducing emissions here. We will have to use some international credits, but we should set clear limits on how and parameters within which that can be done.

I am content to accept the minister’s amendments 24 to 27 and 90, which are tidying-up amendments. I heard the minister say that he did not want to pursue amendment 22. Seeking to introduce the words “endeavour to” into section 7A(1) seems an obvious attempt to dilute what that section is trying to do. I hope that the minister accepts that the use of the word “must” is the right mechanism.

There is a debate to be had about how we deal with European carbon units, but we are not at the stage where we have to accept amendment 23. Stop Climate Chaos’s view is that amendment 23 would dilute significantly the intention and purpose of section 7A. I therefore ask members to reject amendment 23, but to accept the other amendments in the group that are going to be pursued.

Stewart Stevenson: We have to be careful about the use of the word “must”, because it limits the ability to do things on occasion. However, that is a drafting issue.
Amendment 23 remains vital. The power companies have engaged significantly in the debate, so we know that they are very much up for it. However, we have to be careful not to allow ourselves to be hostages to the traded sector, which in Scotland—and for that matter the UK—accounts for 40 to 50 per cent of total emissions. Amendment 23 is necessary at this stage. We cannot postpone the discussion, although we will have a discussion in the autumn on a legislative consent motion. That is the proper time to visit the matter in the context of what we know is happening. If we do not pass amendment 23, we will be unable to make amendments, except by primary legislation, in the light of what happens at UK level. This is one policy area where we can barely put a cigarette paper between UK and Scottish ambitions, although there is difference in the detail. Therefore, we will work closely with the UK Administration on this subject.

I have said all that I have to say. I seek Parliament’s leave to withdraw amendment 22.

Amendment 22, by agreement, withdrawn.

The Deputy Presiding Officer: The question is, that amendment 23 be agreed to. Are we agreed?

Members: No.

The Deputy Presiding Officer: There will be a division.

The Deputy Presiding Officer: The result of the division is: For 60, Against 59, Abstentions 0.

Amendment 23 agreed to.

Amendment 24 moved—[Stewart Stevenson]—and agreed to.

Section 12—The net Scottish emissions account

The Deputy Presiding Officer: Group 7 is on the type of carbon units that may be purchased by the Scottish ministers. Amendment 107, in the name of Malcolm Chisholm, is grouped with amendment 113.

Malcolm Chisholm: As Des McNulty said in the debate on group 6, carbon credits should be used to meet the emissions reduction targets in the bill only as a last resort. Our first priority must be to reduce our own emissions and take our fair share of the global effort that is required to avoid dangerous climate change.

As was also said in the debate on the previous group, the Scottish Government cannot interfere with carbon credits that installations in Scotland purchase under the EU emission trading scheme, but it can ensure that any carbon units that it buys are truly additional and contribute to sustainable development in the countries where they arose.

Two major concerns have been levelled at the use of carbon credits under Kyoto mechanisms—whether the clean development mechanism or the joint implementation mechanism. The first concern is about additionality. Academic research from Stanford University has shown that between one third and two thirds of all clean development mechanism offsets represent not real emissions cuts but activities that would have taken place anyway.

The second concern relates to sustainable development. The Stern report goes into great detail on some of the problems in implementing the clean development mechanism. It says that the mechanism is

"in its current form … making only a small difference to investment in long-lived energy and transport infrastructure … While a substantial international flow of funds is being generated through"

the clean development mechanism,

"it falls significantly short of the scale and nature of incentives required to reduce future emissions in developing countries."

According to the World Bank, only 10 per cent of CDM projects by volume in the 15 months to March this year involved energy efficiency, fuel switch, biomass or other renewables activities, which Stern says are critical to the long-term reduction of greenhouse gas emissions.

I would like the Government to give a commitment to take on board those concerns. If the Government has doubts about the credits that it should buy, it can refer to the Gold Standard Foundation, which is an international non-profit organisation that operates a certification scheme for gold-standard carbon credits.

Amendment 113 would delete section 18A(4), which allows ministers arbitrarily to designate some categories of credits as not counting against the limit on the Government purchase of credits. In effect, that would make the Government’s power to purchase credits unlimited. We recognise and welcome the Government’s stated intent to keep the purchase of credits to a minimum, but we call on it to accept that the bill must support that aim and not create loopholes that would allow future Governments to reject that commitment and indulge in the excessive purchasing of credits, at the cost of action in Scotland.

Section 18A(4) appears to be a giant loophole, but I look forward to any explanation that the minister has for it. In particular, I look for a commitment in relation to amendment 107.

I move amendment 107.

Des McNulty: I hoped to speak after the minister had given some of the assurances that Malcolm Chisholm has sought, but I will reinforce the points that he made. Section 18A(4) could be a large loophole. I am sure that the minister does not want that impression to continue, as he said that a cigarette paper should not be able to pass the points that he made. Section 18A(4) could be a large loophole. I am sure that the minister does not want that impression to continue, as he said that a cigarette paper should not be able to pass through the parties or between the Scottish Government and the UK Government on these issues.

I raised at stage 2 a similar issue to that which amendment 107 addresses. At that time, the minister gave assurances about how he would proceed. It would help if he repeated those assurances and went a bit further than he did at stage 2 to inform the Parliament about the
approach that the Scottish Government wishes to take.

11:00

Stewart Stevenson: I respect absolutely the principle that underpins amendment 107. Broadly, I think that members in the Parliament do not differ on the policy objectives that they wish to pursue. However, the amendment is unnecessary, because ministers can act at their own hand on the matter. Also, the amendment has a flaw that makes it impossible to agree to.

I will explain the flaw. Paragraph (a) in amendment 107 would mean that ministers could credit the net Scottish emissions account with carbon units that represented

“a reduction in greenhouse gas emissions (or a removal of greenhouse gas from the atmosphere) that would not otherwise have occurred”.

I appreciate that Malcolm Chisholm has sought to address issues that we identified at stage 2 when the Transport, Infrastructure and Climate Change Committee discussed an amendment from Des McNulty. However, amendment 107 would prevent the Scottish ministers from using one of the most fundamental carbon units that is available under the Kyoto mechanisms—the assigned amount unit.

Paragraph (b) in amendment 107 would create a specific sustainability duty in relation to the origin of carbon units. However, such a duty is made unnecessary by the duty in section 61A, which was created by a combination of Labour, Liberal Democrat and Government amendments at stage 2. Section 61A says that, in exercising the functions that the bill confers on them, the Scottish ministers have a duty to

“take into account the need to do so in a way that contributes to the achievement of sustainable development.”

That will apply to the crediting of carbon units to the net Scottish emissions account.

I recognise absolutely that Malcolm Chisholm does not come lightly or early to the issue. His reference to the Gold Standard Foundation is important. That is a measure of what we should be looking at. I hope that he is reassured about sustainability and that he acknowledges the drafting problems that I described in amendment 107 that would affect ministers’ ability to use assigned amount units to credit the net Scottish emissions account. I hope that he is satisfied with my assurances and that he will seek leave to withdraw the amendment on that basis. If he says in closing that there were gaps in what I have said, I might be able to shed further light.

Amendment 113 would delete section 18A(4), which allows specified units to be excluded from counting towards any limit that the Scottish ministers are required to set on the quantity of carbon units that may be credited to the net Scottish emissions account in given periods. Having the ability to exclude some types of carbon units from counting towards the section 18A limits is extremely important. In practice, it is intended to prevent carbon units that are used by installations that participate in emission trading schemes such as the EU emission trading scheme from counting towards section 18A limits. Carbon trading is one way in which the international community expects to reduce emissions. The joint effort that has been put into the EU ETS and the joint commitment to it throughout Europe will lead to early reductions in the most polluting sectors throughout Europe. That is important.

The traded sector in Scotland accounts for more than 40 per cent of our emissions. Even though the Scottish ministers do not participate directly in the EU scheme, they cannot ignore it. We are simply the accountants to the scheme. Of course, our approach is entirely consistent with that of the UK Government in the carbon accounting regulations that it has made under the UK Climate Change Act 2008. In the advice to the UK Government that it published in December, the Committee on Climate Change recommended that any restriction should not extend to units such as those from the EU. If section 18A(4) were deleted, EU units would take up most of the carbon units that we would be allowed to credit to the account and in some years would even breach that amount. That would create very serious difficulties and, of course, run counter to the advice of the expert Committee on Climate Change. Given Parliament’s future scrutiny of the regulations and the problems that are inherent in amendment 113, I ask Malcolm Chisholm not to move it.

Malcolm Chisholm: The wording of amendment 107 refers to the Scottish ministers purchasing units rather than just accounting for them. The more substantive point relates to the assigned amount units to which the minister
referred. It was somewhat disingenuous of him to say that they are an allowance and not a reduction. The fact that they are made available results from a reduction somewhere else in the world. I understand his point, but he did not tell the whole story.

As I indicated in my opening speech, we are talking not only about assigned amount units but about emission reduction units under Kyoto joint implementation projects, certified emission reductions from the clean development mechanism, and renewable units under Kyoto on the basis of land use change and forestry. I am slightly reassured by the minister’s remarks on sustainable development, but I am not totally persuaded by the case that he made.

The minister said that amendment 113 was a way of revisiting the last debate. Given that he won the vote by 60 to 59, it is worth testing the Parliament again, just in case any member happened to be having coffee or in the toilet at the time of the vote. I understand his reasoning, but not deleting section 18A(4) has the potential to create a dangerous loophole. I will press my amendments in the group.

The Deputy Presiding Officer: The question is, that amendment 107 be agreed to. Are we agreed?

Members: No.

The Deputy Presiding Officer: There will be a division.

Amendment 108 disagreed to.

Amendment 25 moved—[Stewart Stevenson]—and agreed to.

Section 14—Scottish share of emissions from international aviation and international shipping

The Deputy Presiding Officer: Group 8 is on Scottish share of emissions from international aviation and international shipping. Amendment 109, in the name of Patrick Harvie, is grouped with amendments 110, 111, 146 and 112.

Patrick Harvie: During stage 1, the committee heard clear evidence—albeit that there was a range of views, there was broad agreement on the principle—that aviation and shipping emissions should be included in the bill. It was also agreed that aviation emissions have a disproportionate impact on climate change.

The inclusion of aviation and shipping emissions was one of the earliest demands that the non-governmental organisation community made in lobbying on the bill. Indeed, early in the process, the Government agreed with campaigners that that was an area for inclusion. The committee was pleased to welcome that. We also welcomed the assurance that aviation and shipping emissions would be included not only at some point in the system that we are putting in place, but at the outset.

However, as it stands, the drafting of the bill says that ministers “may ... make provision” to include aviation and shipping emissions. My amendment 109 seeks to change the word “may” to “must”. It would ensure that ministers “must make provision for emissions from international aviation and international shipping”.

It also seeks to ensure that ministers can take account of “any gas added to the list of greenhouse gases” some time down the line and that they cannot reverse their decision. In other words, amendment 109 would ensure that ministers cannot introduce a subsequent order to remove the counting of aviation and shipping emissions in climate change targets.

I turn to the additional impact of aviation emissions. It is clear that, although this is a developing area of science—just as the whole subject of climate change is—emissions at altitude have a disproportionate and substantial impact on the causes of climate change. It has been argued that a multiplier should therefore be applied before aviation emissions are counted for the purpose of the target.

Towards the end of amendment 109, I seek to require that the provision “must include the use, for each greenhouse gas, of a multiplier which reflects the direct and indirect non-carbon dioxide climate change impacts of emissions at altitude from international aviation” on climate change.

Amendment 112 raises the issue of a multiplier in respect of the advice that ministers must request from the advisory body—at present the UK Committee on Climate Change. That committee has expressed its view and the UK Government also has a view. Given that those views will develop over time, it is important that ministers are required to seek advice on the most appropriate multiplier that should apply.

At times, aviation can come in for a bit too much stick. I recognise that it is only one element of a much broader agenda. We need to reduce our dependence on aviation, just as we need to reduce our road traffic levels, energy demands and waste. In that context, aviation emissions should not be exempt on the basis that they represent only a small proportion of overall emissions. If aviation emissions are to be included in the bill, we should include all of their impact. If we do that, perhaps in coming years we will read fewer stories in the newspapers about the Scottish Government flying its advisers round the world to tell it how to reduce emissions.

I move amendment 109.

Des McNulty: Amendments 110 and 111 are probing amendments. I am interested in how ministers respond to the different problems that
are associated with measures on aviation emissions and shipping emissions.

When the committee considered the bill, it was recognised that there is a fairly well-established methodology for identifying aviation emissions, albeit that there are outstanding issues to do with the multiplier, but that there are much greater difficulties in quantifying shipping emissions. That is largely due to the fact that whereas aviation emissions can be based on fuelling—there is refuelling every time there is a flight—ships do not need to be fuelled for every voyage. It is therefore much harder to identify shipping emissions.

I want to ensure that the difficulties in bringing forward provisions on shipping emissions that result from those emissions not being easy to quantify do not delay the process of establishing aviation emissions. I am keen to ensure that if ministers have any doubt whatever about the possibility of treating emissions as a package that includes aviation and shipping emissions, we should separate them at this point so that aviation can at least be dealt with and a further year can be allowed for shipping if that should prove to be necessary. The purpose of my proposals is to ensure that ministers have identified the problems in dealing with what the bill requires and that they have set themselves an appropriate timetable that ensures that we can deal with aviation and shipping as quickly as possible.

Stewart Stevenson: Mr McNulty’s amendments 110 and 111 are not necessary, but I would have no objection to his pressing them. There is certainly merit in what he says. A range of difficulties is associated with shipping compared with aviation. Indeed, there is a range of difficulties with shipping on a broad range of emissions, not simply greenhouse gas emissions. Shipping must still reduce the sulphur in its fuel, which has certain effects, and it must still do work on particulates, which are still being emitted from burning shipping fuel. Mr McNulty is therefore perfectly correct to give us the opportunity to consider the issue.

We must ensure that aviation plays a significant part. I was interested to hear Patrick Harvie say that we sometimes overfocus on aviation. That is true, but it is important that every sector shows that it is making progress. I do not think that aviation has so far taken the demonstrable steps forward that we might wish for. I assure members that the Government is absolutely committed to moving rapidly on aviation and that when we understand how to resolve some of the difficulties associated with shipping, we will move on them as well.

There is a drafting issue with respect to Des McNulty’s amendment 111, which my amendment 146 seeks to correct. It would insert a reference to the other date of 1 June 2011, which it is important to do.

We are happy to agree to Patrick Harvie’s amendments in the group. Amendment 109 seeks to include various criteria that the Scottish ministers must comply with when they make orders to specify the emissions from international aviation and international shipping that are to be attributable to Scotland for the purposes of the targets in the bill. The amendment simply puts on a statutory footing actions that the Scottish ministers intended to take anyway. On that basis, I am comfortable with amendment 109 and am willing to support it.

Amendment 112, which is linked to amendment 109, requires the Scottish ministers to request advice from the relevant body on the appropriate multiplier for each greenhouse gas prior to bringing forward an order to include Scotland’s share of international aviation emissions within Scottish emissions. That relates to the matter of radiative forcing, which is of particular interest to Patrick Harvie and is of interest to me, too. We have committed to seeking advice on the multiplier, so the principle behind the amendment causes me no problems. I am therefore content to support it.

Des McNulty: I want to be clear about the minister’s analysis. I have offered an opportunity through amendments 110 and 111 for the minister to guarantee that the current timetable in the bill will allow him to deal with aviation and shipping. If he is not confident that he can do that adequately, it would be better to agree to those amendments. That would give us the assurance that aviation at least could be dealt with within the timescale and that dealing with shipping could follow.

Stewart Stevenson: We are content that the current provisions give us sufficient time to make an initial judgment. Of course there will be changes as information emerges over the years, particularly about maritime transport—I think that there is a move from using a number of quite heavily contaminating fuels; I am thinking of M30, M40 and the less-contaminating M120—but we are in a position at which we can take initial steps. Indeed, it is important that we take early initial steps. That is a thread running through the bill.

Patrick Harvie: To save time, I say simply that I welcome the minister’s comments in agreeing to support the amendments in my name in the group.

Amendment 109 agreed to.

Amendments 110, 111 and 146 not moved.

Amendment 112 moved—[Patrick Harvie]—and agreed to.
Section 18A—Limits on use of carbon units

Amendments 26 and 27 moved—[Stewart Stevenson]—and agreed to.

Amendment 113 moved—[Malcolm Chisholm].

The Deputy Presiding Officer (Trish Godman): The question is, that amendment 113 be agreed to. Are we agreed?

Members: No.

The Deputy Presiding Officer: There will be a division.

The Deputy Presiding Officer: The result of the division is: For 60, Against 60, Abstentions 0.
I use my casting vote against amendment 113. Amendment 113 disagreed to.

Section 19—Meaning of advisory body
Amendment 114 moved—[Sarah Boyack]—and agreed to.

The Deputy Presiding Officer: Group 9 is on minor amendments and drafting changes. Amendment 28, in the name of the minister, is grouped with amendments 31, 34, 35 and 51.

Stewart Stevenson: All the amendments in the group are for minor drafting purposes. They are designed to tidy up a number of provisions that were amended at stage 2, and principally address matters of consistency of language and structure. Given their technical nature, I do not propose to say any more about them, unless any member wishes to intervene; I would be happy to provide further details if any member does so.

I move amendment 28.

Amendment 28 agreed to.

Section 22—Advice on annual targets etc
Amendments 29 and 30 moved—[Stewart Stevenson]—and agreed to.

Amendment 116 moved—[Shirley-Anne Somerville]—and agreed to.

Section 29—Reports on annual targets: content
Amendment 31 moved—[Stewart Stevenson]—and agreed to.

Section 30—Reports on proposals and policies for meeting annual targets
The Deputy Presiding Officer: Group 10 is on parliamentary consideration of reports. Amendment 32, in the name of the minister, is grouped with amendments 33, 36 and 37.

Stewart Stevenson: Amendment 32, which is the main amendment in the group, introduces a national planning framework format to some of the reporting that the bill requires. That is in line with the commitment that I made to Alison McInnes in the stage 1 debate.

At stage 2, Des McNulty raised concerns on going through an NPF-style scrutiny period each year for reporting under the bill. I agree that that would probably be unhelpful and cumbersome. That is why amendment 32 applies specifically to the report that ministers must make on proposals and policies to achieve annual targets. Unlike other reports that the Parliament requires, it is not simply a presentation of data, so a 60-day period for parliamentary scrutiny shall be of benefit.

Members will note that amendment 36 is consequential on amendment 32 and seeks to delete the reference in section 34 to proposals and policies for achieving annual targets. That is because section 34 is concerned with the scrutiny of reports after they have been laid in Parliament. Proposed new subsections (1E) and (1F) that amendment 32 would insert into section 30 contain provisions relating to the scrutiny of the final report on proposals and policies for meeting annual targets once that report is laid in Parliament. Because that provision is made in amendment 32, the post-laying scrutiny provision in section 34 is unnecessary in respect of the report on proposals and policies.

Amendment 33 adds a new requirement for the report on proposals and policies to report the respective contributions that energy efficiency, energy generation, land use and transport should make towards achieving the targets. That fulfils another commitment that I made to Alison McInnes at stage 2.

Amendment 37 seeks to clarify some ambiguity in the wording of section 34(4) surrounding reports, which are made by committees, and resolutions, which are made by the Parliament.

I move amendment 32.

Alison McInnes: I am pleased that the minister lodged amendment 33, which implements provisions that I first proposed at stage 2. I welcomed his commitment at stage 2 to come back with altered language on sectoral targets. As the minister knows, I believe passionately that, for the bill to encourage genuine behavioural shift, it is vital that we specify that emissions reductions must happen across all aspects of Scotland’s economy. I am confident that, by putting the requirement into law, we will set the ball rolling on encouraging innovation across our economy.

I am pleased that the minister has introduced the NPF-style review process for reports on proposed policies that are aimed at meeting annual targets. As the minister acknowledged, Patrick Harvie and I proposed that approach in a slightly broader form at stage 2. I am a little disappointed that the process could not cover all the reporting duties, but I am pleased that it is being brought into section 30. I am sure not only that it will encourage members to develop an active interest and expertise in such matters, but that the requirement on the Government to take heed of representations that are made during the process will bring valuable input into policies on achieving targets. As the targets get harder as the years go on, the process will prove invaluable in helping to ensure that we achieve the targets that we have set.

Amendment 32 agreed to.
Amendment 33 moved—[Stewart Stevenson]—and agreed to.

After section 31A

The Deputy Presiding Officer: Group 11 is on energy generating stations—efficiency guidance. Amendment 147, in the name of Liam McArthur, is grouped with amendment 54.

11:30

Liam McArthur (Orkney) (LD): Every speaker in the debate so far has referred to the importance of addressing climate change and the challenge that we face. Therefore, it is not surprising that all parties in the Parliament agreed that the bill should be passed without undue delay. In the circumstances, that was the right decision, but it has created difficulties for the Parliament, particularly the lead committee—the Transport, Infrastructure and Climate Change Committee—although ministers and their officials have not escaped unscathed.

The amendments in this group provide ample evidence of those difficulties. At stage 2, I successfully moved an amendment that required the Scottish ministers to use their consenting powers under the Electricity Act 1989 to set emissions limits for new and extended electricity generating plants. Liberal Democrat colleagues at Westminster—notably Charles Kennedy—have taken a lead on that issue, with firm support from the Scottish National Party and other parties. There was some question at that stage about the legal competence of the measure that the committee supported and, despite subsequent efforts, no agreement could be reached that did not risk leaving the bill open to further scrutiny by the Privy Council, which all parties were keen to avoid.

Late in the day, concerns were also raised about the impact that section 49A might have on Longannet’s chances of successfully bidding for the pilot carbon capture and storage competition that the UK Government is running. All parties in the Parliament want Longannet to win that competition, so I am happy to accept amendment 54 in the minister’s name. However, it is important that proper focus be brought to bear on the impact that emissions from electricity generation have. No one can dispute the significant contribution that they make to our overall emissions. Therefore, the more we can do to bring down emissions from generation, the greater the likelihood that we will achieve and possibly exceed the overall reduction targets that we set. Emissions performance standards will have a role to play in that.

Amendment 147 in my name brings proper focus to that and requires the Scottish ministers to lay before the Parliament annually a report that outlines the impact of their actions on net Scottish emissions resulting from electricity generation. It falls short of what might have been achievable had more time been available, but it provides a useful and important basis on which to keep the issue under review from 2010 onwards.

I am grateful to the Presiding Officer for allowing amendment 147 as a manuscript amendment.

I move amendment 147.

Stewart Stevenson: I thank Liam McArthur for his assistance in this regard. We never had a policy difference; we merely foresaw a difficulty with the drafting. I am glad that, in amendments 147 in his name and amendment 54 in mine, we have something in front of us that will take us forward and resolve the issue.

Under amendment 147, the Scottish ministers will have to report on the impact that the exercise of their electricity generation functions has on net Scottish emissions. Liam McArthur’s amendment will give members a strong assurance of an enduring legislative requirement for ministers to justify their actions on electricity generation. Given our clear commitment to the decarbonisation of electricity generation by 2030, as set out in the climate change delivery plan, the Government will be more than happy to make such reports.

However, as Liam McArthur accepted, we have to delete section 49A from the bill. It is a serious matter when there is a risk that a bill will breach legislative competence. As Liam McArthur said, the Privy Council could come into play and significantly delay the bill. That would be embarrassing, risk undermining our reputation as leaders on climate change and take us into uncharted legal territory. That is not a risk worth taking, and Liam McArthur has been clear about that.

As I outlined to committee members at stage 2, the Government has not ruled out introducing an emissions performance standard for new electricity generating stations. As my colleague Jim Mather informed the Parliament last week in his reply to parliamentary question S3W-24912, we will consider, in line with the UK approach, the development of an emissions performance standard in line with the development of carbon capture and storage technology.

The key issue at present, as I said at stage 2, is timing. To decarbonise by 2030, CCS will need to be retrofitted in the 2020s and demonstrated in the 2010s, so the next decade will be crucial in making CCS a technical and commercial reality. That will require substantial investment from the public sector. That is why the UK Government is
currently consulting on a CCS levy—which will require new UK legislation—which will be spent by this Parliament. We will seek the Parliament’s consent on the issue in the autumn, so the Scottish Parliament has a clear reassurance that it can revisit the subject later this year. Decarbonising electricity generation by 2030 must remain our overarching objective.

I have given some clear commitments to Parliament today. Under amendment 147, in the name of Liam McArthur, ministers will be subject to a new reporting duty. That should give clear assurance that emissions reduction from electricity generation will take place in keeping with the bill.

Alex Johnstone: At stage 2, I voted against the amendment that inserted section 49A largely because of the concerns that the minister has just set out. However, as Liam McArthur mentioned, section 49A includes a significant area of policy that enjoys a broad level of support in the south, in the House of Commons. Consequently, I was somewhat concerned to find myself required to oppose section 49A on grounds that were not policy related. Therefore, I am very pleased that Liam McArthur lodged amendment 147, which will ensure that the issue is included in the bill. That allows me to support both amendment 147 and amendment 54, which will delete section 49A from the bill.

Des McNulty: At stage 2, Labour members of the Transport, Infrastructure and Climate Change Committee supported—on policy grounds—the amendment that inserted section 49A. However, we understand the legislative competence issues that have led to the requirement for amendment 54, which will delete that section. We will support amendment 147, in the name of Liam McArthur, which will achieve some of what he intended to achieve through section 49A. We continue to believe that new fossil fuel stations should be introduced only on the basis that they incorporate carbon capture and storage, as would have been required under section 49A. Although amendment 147 perhaps falls short by comparison with section 49A, we hope that we will have the opportunity to discuss the issue further. On that basis, we will support amendment 147 and amendment 54.

Liam McArthur: I welcome the minister’s comments on the importance of, and the potential future role for, emissions performance standards. We will certainly press him on that matter and continue to scrutinise developments up to 2020. I am also grateful for the supportive comments of Alex Johnstone and Des McNulty.

Amendment 147 agreed to.

Section 31B—Report on progress towards meeting the interim target
Amendments 34 and 35 moved—[Stewart Stevenson]—and agreed to.

Section 34—Reports: provision of further information to the Scottish Parliament
Amendments 36 and 37 moved—[Stewart Stevenson]—and agreed to.

Section 36—Duties of public bodies relating to climate change
The Deputy Presiding Officer: Group 12 is on public bodies—climate change duties. Amendment 38, in the name of the minister, is grouped with amendments 39 to 49, 52, 5, 5A, 91 and 92.

Stewart Stevenson: At stage 2, Cathy Peattie successfully proposed amendments that included within the bill a duty on public bodies “to contribute to the delivery of the targets set in or under Part 1”.

Although I did not agree that such an approach was necessary, I accepted the general principle behind what is now section 36(A1) of the bill. However, while I accept the general principle, I believe that a number of amendments are needed to improve how section 36 works and to take proper account of the amendments that were made at stage 2.

In particular, section 36(A1) is not specific about what will be expected of public bodies to fulfil the duties that it places on them. As members will know from the briefing note that the Convention of Scottish Local Authorities has circulated, it has concerns about that aspect of the duties as they currently stand. Amendment 38 will place on public bodies a duty to reduce greenhouse gas emissions in so far as that is consistent with the exercise of the relevant public body’s functions. The language that is proposed in amendment 38 seeks to make it much clearer what is expected from public bodies.

In the proposed new subsection (A2) that amendment 38 will insert into section 36, the sustainable development duty will apply only to public bodies’ actions to reduce their emissions. That will ensure that the duty does not cut across other functions that such bodies might have and other sustainability duties to which they might be subject. That will help to avoid the confusion of conflicting and competing sustainability duties on public bodies.

Let me reassure members about duties that relate to adaptation to the effects of climate change. Although a wide spectrum of Scotland’s public bodies can, and should, take action to reduce their emissions, taking action to adapt to
the effects of climate change tends to be more of a specialist activity. For that reason, it is felt that adaptation duties on public bodies are best suited to secondary legislation. That will allow a more targeted, and therefore more effective, approach to be taken. The Scottish Government intends to introduce carefully considered regulations and guidance, which will also allow the flexibility to improve directions as our approach to adapting to climate change continues to improve. I am content to confirm that I consider that it is important that an adaptation duty be introduced as swiftly as possible once the bill receives royal assent. We anticipate that that will be within about a year.

Another point to make is that, under the provision that was inserted by Cathy Peattie’s stage 2 amendment, the climate change duties apply to all the persons and bodies that are listed in schedule 1 to the Freedom of Information (Scotland) Act 2002. Unfortunately, that is unnecessarily wide, as it refers to individuals as well as organisations. Therefore, I propose that we use a different reference source for the list of relevant public bodies: the list of devolved public bodies in schedule 3 to the Ethical Standards in Public Life etc (Scotland) Act 2000. I believe that that will cover all the significant public bodies that should be covered. That will be achieved by amendment 49, which will mean that local authorities will also be included in the definition of “relevant public body”.

Amendments 39, 43 to 48, 91 and 92 are consequential on amendment 49.

A significant issue with section 36 as it stands is that it would require public bodies to comply with the new duties when exercising any functions and to do so in the most sustainable manner. That duty would not be restricted to duties under the bill but would apply to those bodies when they carry out any function, even those functions that have no obvious connection to climate change. That could have the effect of causing significant confusion because many public bodies—including the Scottish Environment Protection Agency, Scottish Natural Heritage and local authorities—already have sustainable development duties under other legislation. I do not believe that that was Ms Peattie’s intention, which is why I propose to replace the current duties in sections 36(A1) and 36(A2) with better-defined duties. In fact, the proposed duties in amendment 38 could be said to go further than the duty that was inserted at stage 2 because they would require bodies to act in a manner which reduces the emissions of greenhouse gases rather than simply to “contribute to the delivery of the targets” that are placed on ministers under the bill.

Amendment 41 is consequential on amendment 38.

For the sake of completeness, amendments 40 and 42 will simply tidy up the drafting of section 36.

On amendment 5, in the name of Cathy Peattie, and my amendment 5A, I agree that the more focused list of public bodies that, if amendment 38 is agreed to, will be covered by section 36 should be subject to the equal opportunities duty in section 62. Given the wide range of bodies and persons that are covered by the Freedom of Information (Scotland) Act 2002, there is a difficulty with amendment 5 as lodged, which means that I cannot accept it. Amendment 5A, in my name, which is in a sense consequential on amendment 49, will have the effect of applying the section 62 duty to those relevant public bodies that will be covered by section 36 if amendment 49 is agreed to. If amendment 5A is agreed to, I will be happy to support amendment 5.

At stage 2, John Park lodged amendments on procurement but, after discussion, his principal amendment was not moved because of technical drafting problems that were identified. Amendment 52 deals with that issue and will impose a requirement that will apply when public bodies have to prepare a report on how they are complying with climate change duties. That report must contain information about how the procurement policies and procurement activities of public bodies “have contributed to compliance with climate change duties.”

I move amendment 38.

11:45

Cathy Peattie (Falkirk East) (Lab): I oppose amendments 38 and 43 to 49. Public bodies should have nothing to fear from the duty that was agreed to at stage 2. Many are already implementing a wide range of climate change measures, and I congratulate them on setting an example to which all public bodies should aspire; the duty exists to ensure that they do.

The current duty is not onerous. It incorporates reducing greenhouse gas emissions, adaptation and sustainable development. It specifies that public bodies must “contribute to the delivery of the targets” in the bill and must “help deliver” adaptation programmes. It also makes it clear that they can decide what is appropriate for their area.

The minister appeared to agree with that when he promised to work with whatever decision the
I, too, think that councils and other public bodies are up for this.

Why lodge amendment 38? It will weaken the public body duty that was agreed to at stage 2. It completely removes adaptations, requires public bodies merely to cut greenhouse gas emissions attributable to their activities, and links sustainable development only to weak greenhouse gas emissions cuts and not to overall functions.

Councils’ stated fears about people taking cases to court are not borne out by similar legislative provisions, which have not led to a significant number of cases. I am sure that the Scottish legal system is robust enough to deal with them and, in any event, amendment 38 would not prevent anyone from trying. That being so, why diminish the perfectly good provisions that have been agreed to?

Amendment 43 is linked to other amendments, including amendment 49. The bill, as agreed to at stage 2, defines public bodies according to the Freedom of Information (Scotland) Act 2002. Amendment 49 limits the definition of public bodies to the definition in the Ethical Standards in Public Life etc (Scotland) Act 2000, which is not as wide as the FOI act and does not include the Scottish ministers. Crucially, the FOI act definition is likely to be broadened to cover, for example, private prisons and other organisations that deliver public services. Amendment 49 is minimalist in ambition. We need action, and we need it urgently.

Amendment 5 ensures that equal opportunities requirements in the bill apply to public bodies as well as to ministers and advisory bodies.

John Park (Mid Scotland and Fife) (Lab): I want to make a brief contribution on amendment 52. I appreciate that the minister took on board the spirit of my proposal at stage 2 and has tidied up the technical aspects.

It is important to recognise the role of the public sector not just in procurement policy but in procurement activity. The public sector plays an important role in driving behaviour—and, we hope, will provide an exemplar to the private sector. The bill provides an opportunity to promote and publicise the good work that is taking place throughout not only the public sector but the private sector. I hope that we will consider the key roles played by workers, particularly those who are involved in trade union workplace environmental activity. A key role is played by the trade unions in driving the behaviour of trade union members and workers—not just in the workplace but the behaviour that they take back to their homes.

The environmental objectives that are being pursued by the trade union movement are a worthy contribution to the wider climate change challenge that we face. In the past, we have seen health and safety representatives make workplaces safer and learning representatives make workplaces smarter.

Stewart Stevenson: I agree with much of what Mr Park is saying, and we are working closely with the Scottish Trades Union Congress on many of those issues.

John Park: I thank the minister. I believe that environmental representatives in the workplace will make workplaces greener.

Alison McInnes: The Liberal Democrats will oppose the changes to what was agreed at stage 2. If we are to achieve the necessary cultural changes, everyone needs to be involved, and the whole of the public sector needs to contribute to achieving the targets that we spoke about earlier. We all need to set off from the starting line at the same time. As it stands, the net is cast as widely as possible. I suggest that we should resist amendments that narrow the definitions and, disappointingly, remove adaptations altogether.

Patrick Harvie: I support Cathy Peattie’s position on the group of amendments and express some disappointment with COSLA’s position in its briefing paper. If that position is based on fear that council decisions could be challenged on the assertion that an alternative approach could be made on the ground of reducing carbon emissions, it seems an implicit acceptance that many council decisions need to be challenged on the basis that alternative approaches should have been considered. I would have hoped that our local government sector would have been more up for this challenge than it appears to be according to the contents of its briefing.

As I said, I support Cathy Peattie’s position on this group. Throughout the passage of the bill, she has consistently argued for clear and ambitious public sector duties. I urge her to move her amendments and I look forward to supporting them.

The Deputy Presiding Officer: Does the minister wish to respond?

Stewart Stevenson: I think that the debate has been put, Presiding Officer.

The Deputy Presiding Officer: The question is, that amendment 38 be agreed to. Are we agreed?

Members: No.

The Deputy Presiding Officer: There will be a division.

The Deputy Presiding Officer: The result of the division is: For 60, Against 62, Abstentions 0.

Amendment 49 disagreed to.

Section 38—Reporting on climate change duties

Amendments 51 and 52 moved—[Stewart Stevenson]—and agreed to.
Section 45D—Duty to produce a land use strategy

Amendment 119 moved—[Sarah Boyack]—and agreed to.

Section 47—Power to modify functions of Forestry Commissioners

Amendment 120 moved—[Sarah Boyack]—and agreed to.

The Deputy Presiding Officer: Group 13 is on application of biodiversity duty. Amendment 53, in the name of the minister, is the only amendment in the group.

Stewart Stevenson: Amendment 53, in my name, amends section 47(3A), as inserted at stage 2 by amendment 221, in the name of Jim Hume. On closer reading of subsection (3A), I believe that it goes further than Mr Hume intended. Applying the duty to individuals opens them to the risk of their being directly liable for breach of biodiversity duty rather than, or as well as, the joint venture company or trust itself. In deleting the reference to the “person appointed”, amendment 53 removes that risk while leaving intact, we believe, Mr Hume’s intention at stage 2.

I move amendment 53.

Jim Hume (South of Scotland) (LD): I am happy to accept that amendment to my stage 2 amendment, as it sharpens it up.

Amendment 53 agreed to.

Section 48—Duty of Scottish Ministers to promote energy efficiency

The Deputy Presiding Officer: Group 14 is on the contribution of planning and building regulations to reduction of emissions. Amendment 121, in the name of Sarah Boyack, is grouped with amendments 137, 137A, 137B, 138 and 138A.

Sarah Boyack: It is fair to say that we are all marked by our experience before we arrive in the Parliament. I own up to being a former town planner, which is a dangerous thing to admit in any public organisation, but it makes me determined to use our building and planning process to tackle the challenge of climate change effectively.

I am convinced that we are not currently taking many opportunities that we need to take. All the amendments in group 14 are about enabling the planning system to look to the future, plan intelligently and future proof our new buildings so that they take on the challenge of climate change, particularly in relation to reducing emissions.

We can all be proud of the fact that the Scottish Parliament has ratcheted up the standards that are required for new buildings. The intention of Scottish planning policy 6, which was passed two years ago, was to incentivise all developers to build homes and buildings that were more efficient and more reliant on locally sourced heat and energy. We adapted the Merton rule for our purposes in Scotland, but we now need to do more to push ahead on that agenda.

All our new developments and buildings should incorporate low-carbon designs and technologies. Each building will bring its own opportunities, but also its own challenges. We can see from the way in which the code for sustainable buildings is beginning to transform the building industry in England that setting a level playing field and ensuring that there is clarity for developers does work.

Amendment 121 requires the Scottish Government’s energy efficiency plan to give details of how ministers intend to ensure that all new buildings avoid a specified and rising proportion of the projected greenhouse gas emissions from their use, calculated on the basis of designs for specific building, through the installation and operation of low and zero-carbon generating technologies. New buildings will have to meet the building standards that are set by the Government of the day. If they do better than those standards, there is the incentive that they will not have to produce as many on-site renewables and zero-carbon technologies.

12:00

Amendment 121 would mean that new developments must take account of those issues. In committee, the minister objected to the terms of my stage 2 amendment. Now that I have re-examined the issue from first principles and considered the code for sustainable building that is employed in the rest of the UK, I want to push the point because it is entirely possible to predict buildings’ notional impact when they are built. That is no guarantee of how buildings are used. There is nothing to prevent people who have fantastically efficient boilers from putting them on full and leaving the windows open, but that does not mean to say that the builder installed the best technology. How we use our buildings must obviously be part of the agenda, but it is possible to predict their notional impact.

SPP 6 sought to deliver houses that were cheaper to heat and power in financial and carbon terms. Another key objective was to promote decentralised renewable energy networks. The Department of Trade and Industry estimated that between 30 and 40 per cent of locally sourced heat and power could come from such networks. We are nowhere near that yet, but SPP 6 is beginning to incentivise people to move in that
direction. Aberdeen is a good example of where that is beginning to happen. We must deliver on the potential that exists, and development plans are the key.

The Royal Town Planning Institute has signalled its commitment to play a part in reducing carbon emissions. It advocates that regional and local plans and policies should be climate change proofed to ensure that they are updated, and amendment 137 would ensure that all local plans are updated. The minister is unhappy about the fact that amendment 137A refers specifically to strategic development plans but, as a former strategic planner, I am afraid that I must debate the point with him. There might be a different way of phrasing it, but the principle needs to be in the structure plans. The structure plans set the framework for local planners to follow, and there is a role for them to play in regional community heat provision.

Amendment 138 is crucial as it provides for a review process. When SPP 6 was put in place, a criticism that was made was that neither local authorities nor the Government showed enough leadership or pushed it enough. We need to get the momentum going again.

I believe that, taken together, my amendments represent a good package that would ensure that, at least for new developments, we could be confident that a good process was in place that developers across the country could work with, that was clear to them and that met local circumstances. My amendments would allow ministers to review progress in the future and identify what more needs to be done. That is crucial given that we are discussing a moving target.

Finally, I thank the minister for his gracious lodging of amendment 138A, which probably makes amendment 138B appropriate for supplementary guidance, which in turn would not be universal in their cover over the country can operate perfectly well without the requirements of the strategic plans, it is hard to see why those councils that are subject to them need additional requirements.

The detail of amendment 137 may be more appropriate for supplementary guidance, which in due course can form a statutory element of the development plan when ministers approve the first strategic plans and planning authorities adopt the first local development plans.

We accept all amendments in this group apart from amendments 137A and 137B, which we think are unnecessary and bureaucratic and, in any event, would not be universal in their cover over councils.

Sarah Boyack: It is helpful to get the minister’s clarification of the Government’s view. It is important that, even in a concise and visionary plan, we can indicate support for low-carbon technologies and strategic developments that relate to local provision. I welcome the fact that the minister will bring along supplementary guidance. I have been careful not to be specific in the bill about types of technologies because I do not think that would be appropriate. New zero-carbon technologies that none of us has heard of will probably be available in four years’ time.
The issue is about a principle being established in plans and not detailed requirements on developers, who must be left to choose the right kind of zero or low-carbon technologies for their own developments—I very much agree with the minister in that respect. However, if we do not have the planning policies in place in every development plan, they will not happen. As an ex-planner, I know that guidance from central Government is crucial. I therefore hope that, if we agree to my amendments in this group, the Government will bring forward guidance.

One of the concerns that informed my lodging of the amendments is that the recasting of planning policy guidance, which in many ways is admirable, will potentially water down what was in SPP 6, which would be a great mistake. Local authorities such as the City of Edinburgh Council and Midlothian Council, which have already started down that track, have begun to make a difference to the standards of new buildings. I therefore hope that what I propose will go into statute and make a difference in all our new developments.

Amendment 121 agreed to.

The Deputy Presiding Officer: Group 15 is on definition of energy efficiency. Amendment 122, in the name of Des McNulty, is grouped with amendment 123.

Des McNulty: Section 48(8)(b) refers to "materials the manufacture or use of which produces or involves lower emissions of greenhouse gases than other materials". It struck me that there might be a restriction in the use of the term "materials" that excludes or does not explicitly include equipment that could contribute to reducing emissions of greenhouse gases. It therefore seemed to me to be appropriate to seek to introduce the term "equipment" into section 48(8)(b), which would allow a broader use of technologies than those referred to in section 48(8)(a), which refers to "technologies … reliant on renewable sources of energy".

There are other technologies that may not be reliant on particular sources of energy to deliver energy efficiency. For the sake of completeness, I therefore lodged amendments 122 and 123.

If the minister can satisfy me that "materials" is sufficient and includes equipment, I will not press amendment 122, but it seems to me that there is no harm in making explicit reference to equipment by including the phrase "and equipment" in section 48(8)(b).

I move amendment 122.

Stewart Stevenson: Amendments 122 and 123 simply seek to make explicit what we believe is already implicit. They are not necessary but it will not cause any harm if they are agreed to.

Amendment 122 agreed to.

Amendment 123 moved—[Des McNulty]—and agreed to.

Section 49A—Energy generating stations: efficiency guidance

Amendment 54 moved—[Stewart Stevenson]—and agreed to.

Section 50—Non-domestic buildings: assessment of energy performance and emissions

The Deputy Presiding Officer: Group 16 is on assessment of energy performance of buildings. Amendment 55, in the name of the minister, is grouped with amendments 56 to 66.

Stewart Stevenson: The wording of sections 50 and 50A, which cover the energy performance of, respectively, non-domestic buildings and living accommodation, should mirror each other as clearly and closely as possible, and amendments 55 and 56 seek to amend section 50 to achieve that very aim.

On amendment 57, although at stage 2 I welcomed in principle amendment 226, in the name of Liam McArthur, I was unable to support it because of a technical drafting flaw. Amendment 57 seeks to correct that flaw and to place a duty on the Scottish ministers to publish 12 months after the day on which section 50 comes into force a report on measures to reduce non-domestic building emissions and the manner of and the timescales for introducing such measures.

Amendments 58 to 66 are technical amendments that seek to modify section 50 to make the provisions on energy efficiency for living accommodation equivalent to those for non-domestic buildings. I will be able to provide further explanation if members so require.

Taken together, the Government amendments in this group seek to ensure that powers to require improvements in energy performance and reductions in emissions are consistent across all buildings and to allow ministers, subject to proper parliamentary scrutiny, to recognise the differences in ownership and character between living accommodation and non-domestic buildings.

I move amendment 55.

Iain Smith (North East Fife) (LD): I welcome the amendments to section 50A, which was introduced as a result of a stage 2 amendment in my name, lodged on behalf of the Economy, Energy and Tourism Committee. The amendment was intended to ensure that provisions on the
assessment of energy performance of and emissions from buildings applied—or, at least, could apply—to living accommodation. Although regulations relating to living accommodation and non-domestic buildings need not be identical, at least the power to introduce them will exist.

The measure is absolutely vital, given that by 2050 85 per cent of Scotland’s population will be living in buildings that exist at the moment and will therefore not be subject to any stronger building regulations that might be introduced in future. We need to take action to ensure that those buildings are taken into account and that we do all we can to improve the energy performance of all buildings, not just new ones.

The minister, rightly, says that this group of amendments seeks to bring section 50A into line with section 50. Given that my amendment at stage 2 reflected the wording of section 50 in the bill as introduced, I welcome the fact that the amendments will bring section 50 and section 50A into line following amendments made to section 50 at stage 2.

Liam McArthur: At stage 2, there was general cross-party agreement on the importance of tackling energy efficiency in non-domestic buildings. Indeed, in the Government’s consultation, 80 per cent of respondents agreed that current policies and support would not deliver significant carbon emissions reductions. At that stage, the minister took very welcome steps to introduce a power requiring building owners to make the energy improvements specified in energy performance certificates. In lodging amendments that sought to clarify the timetable for such action, I was seeking not least to deliver on our aspiration to create many thousands of green-collar jobs by providing transparency, clarity and a timetable to allow industry to build up the products, materials and skills needed to deliver the bill’s measures.

In that light, I very much welcome amendment 57 and confirm that we accept all the amendments in the group.

Des McNulty: At stage 2, Labour supported the introduction of section 50A and the amendments that were lodged by Iain Smith and Liam McArthur. I pick up the minister’s invitation and ask him for further explanation of two amendments about which we have specific concerns. On amendment 59, we wonder why the minister wishes to remove the word “improvement”, and we are concerned that amendment 66 could exclude certain types of dwelling. If the minister can shed any light on the reason for those amendments, it would help members to understand them and decide whether they agree with the minister’s approach.

12:15

Stewart Stevenson: Amendment 66 simply ensures that we have a definition of “living accommodation”. There is a de minimis approach in relation to size, which is not likely to affect anything else. The amendment was drafted to cover tenements in particular, where there are specific difficulties, and other dwellings that have common areas. The definition is certainly not intended to exclude anything. It actually has the opposite effect and ensures that nothing that should be included is in fact excluded.

On amendment 59, improvement is a different issue that is dealt with elsewhere. The important thing at this stage is to make the assessment. Obviously, improvements require to be made once the assessment has been done. Amendment 59 simply ensures that we have things in the proper places.

Amendment 55 agreed to.

Amendments 56 to 57 moved—[Stewart Stevenson]—and agreed to.

Section 50A—Living accommodation: assessment of energy performance and emissions

Amendments 58 to 66 moved—[Stewart Stevenson]—and agreed to.

The Deputy Presiding Officer: I have no wish to move on to group 17 now as I do not wish to split the group between the morning and afternoon sessions. I therefore suspend the meeting until 1.45 pm.

12:17

Meeting suspended until 13:45.

13:45

On resuming—

The Presiding Officer (Alex Fergusson): Good afternoon. The first item of business this afternoon is the continuation of stage 3 proceedings on the Climate Change (Scotland) Bill. I remind members that they should have in front of them the bill as amended at stage 2; the marshalled list, which was revised yesterday; and the groupings, which I agreed.

As was the case this morning, the division bell will sound and proceedings will be suspended for five minutes for the first division of the afternoon, and the period of voting for that division will be 30 seconds. Thereafter, I will allow one minute for the first division after a debate. All other divisions will last 30 seconds.
After section 50A

The Presiding Officer: We continue where we left off. Group 17 is on council tax and non-domestic rates. Amendment 67, in the name of the minister, is grouped with amendments 67A to 67D, 67F, 67E, 125, 125A, 125B, 126, 68, 127 to 129, 69, 130, 70, 131, 132 and 93.

Stewart Stevenson: We accept amendments 67A to 67E, in the name of Lewis Macdonald. If amendments 125A and 125B, in my name, are agreed to, I will also be able to accept amendment 125, in his name. On non-domestic rates, I wish to accept amendment 132, in the name of Alex Johnstone.

I acknowledge the very valuable contribution of Sarah Boyack, whose determination placed a mechanism for incentivising energy efficiency and microgeneration in the text of the bill at stage 2. The Government amendments on council tax should be seen as largely complementary to that. They articulate, in robust and sound drafting, the principles that she has articulated.

We accept the principles of sections 50B and 50D, but a number of gaps and errors make them technically unworkable. I am happy to discuss those in detail during the debate on this group, if members require me to do so. Any remaining differences are only about how best to achieve the aims.

The Government's preferred approach is illustrated by amendment 67, combined with the changes that Mr Macdonald proposes. Overall, there are three issues where we can now reach consensus: a minimum level of council tax rebate; a mandatory element to the schemes; and arrangements for reporting on progress.

There are a number of other advantages to the Government's approach. It gives local authorities the flexibility to design energy efficiency discount schemes in a way that is best suited to the particular issues and challenges that affect their areas. The challenges that face a city council, such as the City of Edinburgh, might well be very different from those that face a council in a more rural area. Local authorities may begin to apply the measures on commencement; they do not have to wait for ministers to make regulations. By providing a broad definition of energy efficiency, new section 80A of the Local Government Finance Act 1992, which amendment 67 inserts, will allow future developments to be included in an energy efficiency discount scheme without the need for further legislation. For those reasons, I will move the amendments in my name and support those in the name of Mr Macdonald.

This is a difficult area of law, and action taken in one area can often have an unintentional, adverse impact elsewhere. That is the case with the provisions that Sarah Boyack's amendments inserted in the bill at stage 2, and with her stage 3 amendments, a number of which also relate to non-domestic rates. I will give some examples. Section 50B reduces the amount of council tax that a person is liable to pay in the following financial year. A similar weakness arises in relation to non-domestic rates. I fear that, because of the time lag, home owners might be put off making home energy improvements if they are considering moving home. Our proposal would reduce council tax liability in the same year in which an improvement is made. That makes the incentive potentially more attractive, as the rebate is enjoyed immediately. More important, it should help to encourage the quicker implementation of energy efficiency measures, which can only be a good thing.

The Scottish Government envisages that the rebate will be funded through successful partnerships between local authorities and energy suppliers, as is the case in England and Wales. However, without the flexibility that amendment 67 offers, combined with Lewis Macdonald's amendments, unmanaged demand from people in well-insulated properties might conflict with other locally led schemes to promote the uptake of energy efficiency measures. That could have a knock-on effect on council tax revenue. In the current economic situation, we do not think that it would be right to add unduly to such pressures on local authorities.

Furthermore, many businesses would not see any benefit from amendment 131, on non-domestic rates—on which we have identified some technical issues—as they are already exempt from paying rates through the various rates relief schemes. Amendment 132, on the other hand, would give the Scottish ministers the power to make regulations in respect of reductions in non-domestic rates for properties that fall into different categories and bands on the basis of their energy efficiency and greenhouse gas emissions.

Let me summarise. I recommend that members agree to amendments 67, 67F and 68 to 70, which will remove sections 50B to 50D. I also commend to members amendments 67A to 67E and 125, in the name of Mr Macdonald, along with the Government's amendments 125A and 125B. Finally, I endorse amendment 132, in the name of Mr Johnstone, and I ask members to do likewise. In consequence, I must ask members to reject amendments 126 to 131, if they are moved, as they are unnecessary in the light of the other amendments in the group.

I move amendment 67.

Lewis Macdonald (Aberdeen Central) (Lab): In the hierarchy of actions that we can take to reduce carbon emissions, action on energy
efficiency must always come first. Council tax discounts offer a significant incentive for householders to improve the energy efficiency of their homes.

As the minister has graciously acknowledged, we are discussing the amendments in group 17 as a direct result of Sarah Boyack’s vision and persistence in pursuing the matter, and her success in building a broad coalition of support behind her member’s bill proposals on energy efficiency and microgeneration, which is an important part of the same approach.

As the minister has acknowledged, the Transport, Infrastructure and Climate Change Committee approved that approach at stage 2. I welcome the fact that ministers have moved to support action on energy efficiency in the terms that we have heard. My amendments are designed to ensure that the scheme that the minister introduces achieves the desired results, and I welcome Mr Stevenson’s support for them. Without such amendments, the minister’s proposals would have allowed discount schemes that supported energy efficiency improvements, but they would not have guaranteed access to the benefits of such schemes across Scotland. If Parliament agrees to my amendments, that access will be guaranteed. Any householder who wishes to make energy efficiency improvements will enjoy access to a council tax discount. There will be no risk of a householder’s council not having such a scheme, or of its not applying it to the local area or to the valuation band of the house in question.

The message that such discounts are available right across Scotland is a clear and positive one. Of course, a national approach implies a national commitment, and I am glad that ministers have endorsed such an approach throughout Scotland. It is true to say that the bill must provide a framework for the energy companies so that they can invest in improving the energy efficiency of Scottish housing through the carbon emissions reduction target scheme, and we would expect central and local government fully to endorse and support that approach.

Amendment 125 provides for a review of the effectiveness of discount schemes, and it does so on an all-Scotland basis, so that any changes that are made will be consistent in all 32 local authority areas. I am happy to accept the minister’s amendments to amendment 125, as well as Alex Johnstone’s amendment 132. I urge members to support those amendments.

I move amendment 67A.

Sarah Boyack: In my view, the amendments in this group are probably the most important practical policy provisions that we will discuss today, from the point of view of their power to transform people’s attitudes to energy and their capacity to start making a difference on the huge amount of energy and heat that is wasted in this country. Somebody said earlier that 80 per cent of the buildings that will exist in 2050 have already been built. Our challenge is to encourage householders to make their houses more energy efficient.

Energy efficiency measures are incredibly cost effective and are the cheapest and best way to start to tackle climate change. However, people do not routinely put such measures into their houses, because they think that it is a hassle, they do not know how to get advice on them, they do not know a supplier and they do not know where to start. Even simple measures such as loft insulation or cavity wall insulation need to be put in place. For example, we could install cavity wall insulation in about 700,000 houses in Scotland, but we are not doing so, because we cannot put the pressure on and do not have the mechanisms to let people get on with it.

Last year, the Energy Saving Trust published research in England and Wales and then in Scotland that demonstrated that a one-off council tax reduction is an incredibly effective way in which to draw people’s attention and persuade them to act. Thousands of businesses have properties that could be changed. A reduction in council tax and business rates would mean that people could save on their bills—that is crucial, given that fuel prices for domestic properties have gone up by about 50 per cent over the past five years—and play their part in saving the planet. The message is really simple.

As colleagues have said, I have worked for five years now to bring these measures to the chamber. I thank everybody; I have previously thanked colleagues in the Parliament and the members of my steering group. I am delighted with where we have got to today. I would have loved it if the minister had sat down and talked to me about the measures months ago, but the Government had a they-shall-not-pass policy on council tax. However, I give the minister credit, because he has been incredibly helpful in the past week or so in ensuring that we have something in the bill that will work, which is my top priority. It is not the scheme that I wanted, but it is a good place to start. I listened to the minister’s officials last week and I do not want to impose a scheme that they do not like and which they could not make work.

The proposed measures will bring in CERT money. A sum of £50 is a good start and is enough to catch the attention. The review mechanism will be included, if we vote for all Lewis Macdonald’s amendments in the group.
Crucially, I want to ensure that the scheme cannot be a cherry-picking one that would mean that people could get money off their council tax only if they lived in particular local authority areas or certain streets. The scheme must be implemented across the country.

The minister has given a commitment that there will be guidance from the Scottish Government. That will be crucial in helping local authorities and in ensuring that they do not have too many burdens. In addition, with regard to the money for energy efficiency in the budget that we passed this year, I hope that the proposed provisions will allow us to draw in additional money from the private sector through CERT, which would make the £15 million that we supported earlier this year go much further. There will be another discussion about the issue next year, but I hope that the scheme gets up and running, that we begin to see a difference and that we can tackle not just climate change but fuel poverty, which afflicts almost 25 per cent of households in Scotland—that is a national disgrace and a national shame. The proposed measures will not fix that issue tonight or tomorrow, but they will put in place a mechanism that will let councils work with the power companies and individuals to make a difference.

I hope, too, that the Parliament will support the measures in Alex Johnstone’s amendment 132, on non-domestic rates. The Tories have been supportive of my member’s bill proposal throughout, for which I give them credit. It is probably appropriate that amendment 132 has fewer faults than my amendments in the group—that is the benefit of lodging a smaller amendment. I know that the business community is seized of the need to undertake energy efficiency measures. There is much support for the measures from big companies such as Tesco and groups such as the Scottish Property Federation.

I hope that we can all move forward today on the measures. The test will be next year, when we assess how far we have gone. I will not move my amendments in this group—amendments 126 to 131—but I will support the amendments in the group in the names of Lewis Macdonald, Alex Johnstone and Stewart Stevenson, which take us a lot further forward.

**Alex Johnstone:** I said earlier that I do not like the whole business of setting targets, because I have gone through that painful experience previously. It is far more practical to set out measures that will assist individuals, whether they are householders or business owners, to achieve the targets. That is why, in my view, chapter 3 contains some of the most significant provisions in the bill.

I pay tribute to Sarah Boyack for the work that she has done on promoting the energy efficiency aspects of the bill. I was not sure how long that has taken, but I heard her say in her speech that she has been working on those provisions for five years. At an early stage in that process, I took the opportunity to support in principle what she was trying to achieve.

14:00
The issue became the subject of intense debate at stage 2, when various members presented a number of slightly different proposals to introduce into the bill council tax discounts for people who take energy efficiency measures. At that stage, we obtained the Government’s agreement in principle to move forward on the issue and, pending the publication of Government amendments at stage 3, I decided to withdraw or not move my own amendments. I am therefore pleased to support not only amendment 67 but amendments 67A to 67F, in the names of Lewis Macdonald and the minister.

However, one issue that was not finalised at stage 2 was the inclusion of the non-domestic rateable sector in the broad provision. As a result, I have lodged amendment 132, which mirrors an amendment that I lodged but did not move at stage 2.

Once again, I commend Sarah Boyack for her work on this matter. However, I seek the Parliament’s support for amendment 132, which I have attempted to keep as simple as possible and which seeks to allow the Government to introduce a scheme, the detail of which will be fleshed out under the affirmative procedure. I hope that we will agree to that measure later.

**Liam McArthur:** In recognising Sarah Boyack’s contribution, the minister has set the tone for comments on this group of amendments. I certainly associate myself with his comments and with those made by Lewis Macdonald and Alex Johnstone. Although the manifestos of the various parties set out proposals in this area, the cross-party approach that was taken on the issue was very much a priority for Sarah Boyack, with expertise and support brought in from outwith the Parliament.

Earlier, I mentioned the pressures and difficulties created by the timetable for scrutiny of the bill. Given how long Sarah Boyack has been working on these proposals, it is perhaps unfortunate that even at stage 3 we are still trying to piece together a workable solution. However, as Lewis Macdonald and Alex Johnstone have pointed out, we have found a workable solution that covers both domestic and non-domestic incentive schemes.

In seeking to amend the Government’s amendment, amendments 67A to 67E, in the
name of Lewis Macdonald, seek to enshrine in the bill a national dimension to the proposed programme, and I welcome the minister’s support for the important approach that they set out.

Amendment 132, in the name of Alex Johnstone, certainly enjoys the benefits of brevity and simplicity. With the reporting requirements that amendment 125 seeks to introduce, the provisions will ensure that we are able to respond if, where and when necessary.

This part of the bill will have a very direct impact on the situation and as parliamentarians we will be able to support it with some confidence in our constituencies.

The Presiding Officer: I call the minister to wind up on amendment 67. You can have three minutes, minister.

Stewart Stevenson: Taking members’ advice about brevity and simplicity and given the unanimity and shared sense of purpose in the chamber, which I have to say bodes well for the whole climate change agenda, I may not need all that time, Presiding Officer.

However, I wish to make a couple of remarks. First, I again acknowledge Sarah Boyack’s efforts on this issue and thank her for reciprocating in her comments about the efforts that we have made in recent weeks. It is also worth revisiting her very important point that, although the proposal is part of the climate change agenda, it contributes to other policy areas, in particular our efforts to tackle fuel poverty. We have always recognised that improving the energy efficiency of people’s houses and reducing people’s energy bills plays to another agenda, and that is another important reason for moving in a direction that now appears to have secured unanimity in the chamber.

Lewis Macdonald: Likewise, I will be brief and simply acknowledge the chamber’s strong—indeed, unanimous—view that we have reached this point as a result of Sarah Boyack’s commitment and latterly the willingness of all parties to find a common route to ensure that progress was made in this area.

The critical question now is how the measure will be delivered and how we ensure that, in putting the schemes in place, local authorities have the full support not only of the private sector partners that deliver energy and have committed to improve energy efficiency but of every level of Government. On that basis, the Parliament has taken a significant step forward.

Amendment 67A agreed to.

Amendments 67B, 67C and 67D moved—[Lewis Macdonald]—and agreed to.

Amendment 67F moved—[Stewart Stevenson]—and agreed to.

Amendment 67, as amended, agreed to.

Amendment 125 moved—[Lewis Macdonald].

Amendments 125A and 125B moved—[Stewart Stevenson]—and agreed to.

Amendment 125, as amended, agreed to.

Section 50B—Council tax reductions to promote energy efficiency

Amendment 68 moved—[Stewart Stevenson]—and agreed to.

Amendment 69 moved—[Stewart Stevenson]—and agreed to.

Section 50C—Amounts of reductions in council tax

Amendments 127 to 129 not moved.

Amendment 70 moved—[Stewart Stevenson]—and agreed to.

After section 50D

Amendment 131 not moved.

Amendment 132 moved—[Alex Johnstone]—and agreed to.

The Presiding Officer: Group 18 is on district heating. Amendment 133, in the name of Lewis Macdonald, is the only amendment in the group.

Lewis Macdonald: Back in 2002, Aberdeen City Council established the Aberdeen Heat and Power Company Ltd to deliver the benefits of combined heat and power to people’s homes. Three successful schemes have been established, including those at Seaton and Stockethill in my constituency, and they supply 850 homes in high-rise buildings, half of which are for sheltered housing. The direct benefits are better heated homes, locally sourced electricity and lower bills.

If CHP schemes are established more widely, the potential prize will be that we significantly reduce carbon emissions while also tackling fuel poverty. That is why Labour wants more CHP schemes to be established in more towns and cities to supply cheaper and more sustainable heat and power to more homes. Indeed, I suspect
that those objectives are shared by members throughout the chamber.

To achieve those ends, amendment 133 requires ministers to amend the relevant regulations to remove the burden of non-domestic rates from the distribution pipes and risers in combined heat and power schemes. The Mansfield judgment in England confirmed that business rates there should not be paid on the distribution element of residential CHP schemes. To deliver the same benefit in Scotland requires action by ministers, and that is what the amendment seeks.

The required change to the regulations will exempt distribution pipes from the point where they leave the plant to the hydraulic interface unit at which they enter individual homes. Where a scheme includes non-residential as well as residential properties, the exemption will apply from the point where distribution pipes that serve only homes leave the mains pipe that serves both categories. Such changes would bring a reduction in householders’ bills. For pensioners and low-income households, a saving of £1 a week or even a fortnight can make a difference and help people to avoid fuel poverty.

The changes would not only help householders but reduce the capital costs of developing new or extending existing CHP schemes. That is the prize. If we want more widespread development of district heating schemes, much more will need to be done. However, if members agree to amendment 133, or if the minister makes the changes that I propose in another way, we will make a useful start.

I move amendment 133.

Stewart Stevenson: Our objective is to ensure that people throughout Scotland can share in the benefits that residents of Seaton and Stockethill in Aberdeen have enjoyed from combined heat and power. In the early 2000s the Labour-led Administration in Aberdeen took a lead, which is a shining example that should inform others.

The job of ministers and the Parliament is to dismantle barriers to the wider adoption of such measures. Lewis Macdonald said that a pensioner might save £1 per week; I prefer to think of that saving as £52 per year, which gives a sense of the significant sum that can be saved—as is the case with the winter fuel allowance, which comes in a lump sum. The approach that Lewis Macdonald proposed would be a significant intervention.

I have the power to introduce legislation to achieve the objective behind amendment 133. We intend to do so in any event, to ensure that we harmonise the valuation treatment of CHP plants north and south of the border. There are specific difficulties with amendment 133. We have residual concerns about European state aid rules, but we think that we can overcome those difficulties through secondary legislation. The construction of amendment 133 is such that I have difficulty in supporting it, but I commit to using the powers that we have to address the problem of risers and connecting pipes in multistorey buildings, which has been the biggest issue. The objective is to end up in the position that exists south of the border and to ensure that the Aberdeen models can be adopted elsewhere.

Lewis Macdonald: I am pleased to hear that assurance. When does the minister anticipate introducing the secondary legislation to which he referred?

Stewart Stevenson: We have given preliminary thought to how we might do that. The member’s question is reasonable, but I am not in a position to give him the absolute assurance that he seeks. However, I would be surprised if we were not able to do it within, perhaps, 12 to 18 months. I want to make rapid progress and ensure that we pick up the issue and run with it.

Lewis Macdonald: I am pleased by the minister’s assurances about the substance of what he intends to do. I had hoped that he might be able to give an assurance in relation to the forthcoming financial year, but I take what he said to mean that he will make efforts to introduce secondary legislation as quickly as he can do.

Stewart Stevenson: I am happy to acknowledge that in the terms that the member used.

Lewis Macdonald: That is helpful. Given the minister’s comment and what I took to be a backstop assurance that the regulations will be changed within 18 months, thereby achieving the objective of amendment 133, I will not press the amendment.

Amendment 133, by agreement, withdrawn.
sector still has the worst levels of energy inefficiency of any form of housing tenure. According to the key findings of the Scottish house condition survey, a rented property in the private sector is four times as likely to be rated as poor for energy efficiency as the average home. Ten per cent of private sector tenants, whether in city-centre tenements or in homes in rural areas, live in severe fuel poverty, as compared with 4 per cent of tenants in the social rented sector. Amendment 134 seeks to press ministers to achieve the target of bringing the private rented sector up to the same standard that is achieved in other sectors.

The guidance that is issued by ministers on the energy efficiency of social rented housing—the Scottish housing quality standard—requires providers to achieve a national home energy rating of at least 5 out of 10 by 2015. Amendment 134 would extend that requirement to cover private landlords.

The minister said at stage 2 that consultation on these issues will take place as part of work on the proposed housing bill, and I welcome that. I hope that he can reaffirm that intention today. However, beyond that general commitment, I would specifically like to hear whether ministers will consult on the application of the Scottish housing quality standard to the private rented sector, on the same timetable as applies to the social rented sector. That is partly because I would like to find out about any difficulties that might arise, but also because I would like to hear an indication of the Government's intentions for overcoming any such difficulties.

As was the case with amendment 133, I would be interested in hearing when consultation will begin. Will it be accompanied by a regulatory impact assessment to consider the costs and benefits in terms of carbon as well as cash?

Finally, following our discussions at stage 2, I would welcome an assurance from the minister that his approach to consulting on energy efficiency measures as consequential improvements to existing buildings, of whatever size, will be the same as his approach to improvements in the private rented sector. Will the minister assure us that steps will be taken in the next few months?

I move amendment 134.

Stewart Stevenson: I will start by briefly reverting to our discussion on amendment 133. I knew that we had started work on combined heat and power; I am now told that we should be ready by 1 April 2010. For some reason, my notes did not say that, as they should have done, but I hope that I have now put some flesh on what I said to Lewis Macdonald earlier.

By making energy efficiency part of the repairing standard that private landlords are already required to meet, amendment 134 aims to ensure that private landlords take action to improve the energy efficiency of the houses that they let. We absolutely understand the intention behind Lewis Macdonald's proposal. As he said, he has engaged with these serious issues over an embarrassingly long period with SCARF—a body with which members from the north-east continue to engage in order to ensure that their constituents receive the benefits.

As with many other issues that have arisen at this stage of the bill's progress, further scrutiny and consultation would likely be required—especially in relation to scale, impact and cost. Lewis Macdonald referred to any regulatory impact assessment were the Government to consult, and I take what he said as an acknowledgement that we need to tackle these key issues.

Our consultation on minimum energy efficiency standards in the private rented sector will be launched in early autumn. Depending on the outcome, we plan to introduce measures in the proposed housing bill in 2010. We will consult on setting the minimum standard at the same level as the existing standard required for energy efficiency in the social rented sector. Thereafter, we will consider further enhancements to the standard.

The consultation will be accompanied by a partial regulatory impact assessment, which will examine the cost impact of the proposal, as well as examining potential carbon savings, potentially lower fuel bills, and the impact on the Government’s fuel poverty targets.

I hope that that addresses the points that the member raised and convinces him of the seriousness with which we are treating his proposal and the eagerness with which we seek to pursue it.

Lewis Macdonald: I am encouraged by the assurances that the minister has given and by the timetable that he has set. I take it from his comments that that timetable would apply to the range of areas on which he gave assurances at stage 2.

Stewart Stevenson: That is correct.

Lewis Macdonald: I welcome that clarification, particularly with regard to consequential improvements.

Clearly, this is an important issue in terms of social justice as well as energy efficiency. The consultation will enable the necessary steps to be taken in short order to improve the energy efficiency of homes. On that basis, I seek leave to withdraw the amendment.

Amendment 134, by agreement, withdrawn.
The Presiding Officer: Amendment 135, in the name of Sarah Boyack, is in a group on its own.

Sarah Boyack: At stage 2, I moved an amendment that aimed to enable the best use to be made of our buildings and land assets in relation to climate change objectives. The minister agreed with the aims behind that amendment but politely suggested that it needed to be reworked. I am grateful to the committee clerks for their assistance in the drafting of amendment 135 and to the minister’s officials for their advice about how to get the amendment right.

The climate change burden will be applicable under the Title Conditions (Scotland) Act 2003. It will enable public bodies, at their discretion, to add heightened mitigation or adaptation performance standards to the title deeds of built and land assets that they wish to sell and which could be developed in the future by a purchaser. Those standards will be applied in advance, before the land is put up for sale, so that developers will be able to take the burden into account when paying for the land in question.

The amendment seeks to introduce an enabling mechanism that a public body can use if it wishes to do so. That mechanism will be available to any public body or agency in Scotland, such as local authorities, the Scottish Environment Protection Agency and Scottish Water, and it will enable local authorities to exercise leadership and send a clear signal about expectations to people who want to develop land or buildings.

We are talking about a great deal of land. Public bodies have a keen interest in selling their land, and they often negotiate and set conditions when they do so. The provisions in amendment 135 will enable them to take an up-front approach in relation to climate change, and will mean that someone who is buying the land will know exactly what the burden is when they negotiate the price. Clearly, a local authority or public body will use this mechanism only when it fits its objectives.

The provision builds on the current legal framework in the Title Conditions (Scotland) Act 2003. It builds on those burdens, but it will be a new type of burden. The closest comparator is probably the economic development burden in section 45 of the 2003 act, which enables a burden to be established for the purpose of promoting economic development. The new burden will be wider than that in terms of who can exercise it, and it will be exercised in relation to climate change. I hope that colleagues will support the amendment.

I move amendment 135.

Stewart Stevenson: The amendment seeks to create a new type of real burden that relates to climate change. As I indicated at stage 2, we support the general principle behind the amendment. Public bodies and others should be able to ensure that, when they sell property on for development, that development is taken forward in line with high environmental standards. Although, arguably, the planning system already guarantees minimum standards for new developments, and higher standards will, of course, impact on the price that public bodies receive for the sale, amendment 135 simply provides an additional option for public bodies and others to consider. I am, therefore, content to support it.

Amendment 135 agreed to.

Section 51A—Air source heat pumps and micro wind turbines in domestic properties: permitted development rights

The Presiding Officer: Group 21 is on permitted development rights. Amendment 71, in the name of the minister, is grouped with amendments 72 to 84, 144 and 145.

Stewart Stevenson: We will accept the amendments in Sarah Boyack’s name in this group and, therefore, we hope that Parliament will accept all of ours as well.

The effect of amendments 144 and 145, in the name of Sarah Boyack, will be to require the Scottish ministers to introduce any further permitted development rights for microgeneration equipment in domestic property within six months of the bill receiving royal assent. Members will wish to note that research on the issue has recently been let to contractors, who will engage with a wide range of stakeholders during the summer and then report to officials on that. I believe that the first meeting on the subject will take place tomorrow. That research will assist in equipping the Scottish Government with a detailed understanding of the potential impacts of micro wind turbines and air source heat pumps in domestic properties.

In proposing amendments 71 to 77, which are in my name, I support the intention behind Ms Boyack’s stage 2 amendment that introduced section 51A, but I seek to clarify the procedures by which the objectives should be brought forward and the domestic properties to which permitted development should apply. Amendment 71 will ensure that the wording of section 51A more clearly makes provision on specifying the circumstances for the introduction of permitted development rights under planning legislation. Amendment 72 seeks to achieve clarity about procedure and intention. Amendments 73, 74 and 76 are simply consequential amendments. Amendment 75 relates to an issue of drafting practice—convention says that we use the numeral “6” rather than the word “six”. Amendment 77 strengthens the scope of consultation.
Amendment 78 is the first of a group of seven amendments to section 51B that relate to the issue of permitted development rights for microgeneration in non-domestic buildings. As I said, amendments 71 and 72 relate to the way in which the Scottish ministers will introduce any changes to permitted development rights for microgeneration in domestic properties, and it is important to ensure that the same procedures apply to non-domestic properties. Amendment 78 will ensure that the bill states that the Scottish ministers must exercise their functions, rather than their powers, under planning legislation. That will align section 51B with section 51A and secure Liam McArthur’s intentions, which I support, in advancing the amendment that introduced section 51B at stage 2. Amendment 82 seeks to strengthen that provision to ensure that persons who are representative of the energy efficiency, renewables or microgeneration industries, and other persons, may be consulted.

I move amendment 71.

Sarah Boyack: The reason why the sections that now have the heading “Permitted development rights” were accepted at stage 2 was because of a general feeling in the committee that we need to get going on producing a credible statutory instrument to provide rules on permitted development rights. The Government produced a draft statutory instrument, but it was flawed in relation to mini wind turbines, as it included a bizarre condition that there could be permitted development only if a building was 100m away from the next property. That would have ruled out many wind turbines not only in urban Scotland but in rural Scotland, too.

I am glad that we are debating the issue. COSLA’s briefing raises concerns about the potential adverse physical impact of microgeneration in buildings. It is appropriate that we address those concerns head on. Permitted development rights will not apply automatically to listed buildings or in conservation areas. We all expect that when a statutory instrument comes before us after due consultation, there will be a mechanism that will focus particularly on the noise issue. There is a requirement on the industry to ensure that its equipment is certified properly and that householders and their neighbours can rely on that certification to be absolutely accurate. However, we must get going on giving householders the opportunity to use the right form of equipment if it can help to provide energy for their houses and if it is appropriate—that must be their call.

Microgeneration is part of decarbonising our energy system and part of delivering a more decentralised energy supply network throughout Scotland. As a representative of a city that has tremendous heritage, I think that the qualification that permitted development rights will not apply automatically to listed buildings or in conservation areas is important. In some areas, it would not be appropriate to have modern technology. However, that must be the call of the local authority and it must be done intelligently. We should be able to get to that point with the new statutory instrument.

14:30

The feed-in tariff that will be coming soon will help to promote these technologies, but there is unnecessary red tape. The amendments in my name are intended to ensure that the intention behind my stage 2 amendment is delivered in practice. When we read the bill as amended at stage 2, it appeared that the amendment might not have helped to speed up the minister. I hope that the amendments that I have lodged for stage 3 will do that and I am grateful to the minister for accepting them.

We are all keen to get going on this issue. It is not about requiring people to use these technologies; it is about ensuring that the technologies can be used where people think that they will make a difference to their property. That is the key point. It might not be the biggest change that we make in tackling climate change, but it is important nonetheless.

Liam McArthur: At stage 2, there were divisions on this issue between the political parties that are represented on the committee. Given what the minister has said, those divisions seem to have disappeared and we now have a consensus on the role that permitted developments can play in the domestic and non-domestic sectors.

The amendment at stage 2 addressed flaws in what was being proposed for the domestic sector. A stage 2 amendment in my name acted as a catalyst for pressing ahead with permitted development in the non-domestic sector. I accept what the minister said at that stage about having to treat certain aspects of the two sectors differently.

As Sarah Boyack said, the statutory instruments that will now follow will have to be considered further, because we have to allay fears that there will be a complete free-for-all. She identified the issue of noise; undoubtedly others will arise and they will have to be tackled.

On the Government’s green jobs objectives, providing a degree of clarity about what is expected will allow companies in the sector to invest in the skills, equipment and expertise that will allow these devices to be rolled out throughout the country, where appropriate and where the desire for them exists.
I welcome the amendments in the name of the minister, which improve aspects of consultation and tighten up the wording that was approved as a result of amendments at stage 2.

The Presiding Officer: I call the minister to wind up.

Stewart Stevenson: I think that everything has been said, Presiding Officer.

Amendment 71 agreed to.

Amendments 72 to 77 moved—[Stewart Stevenson]—and agreed to.

Section 51B—Microgeneration in non-domestic buildings: permitted development rights

Amendments 78 to 84 moved—[Stewart Stevenson]—and agreed to.

After section 51B

Amendment 137 moved—[Sarah Boyack].

Amendments 137A and 137B not moved.

Amendment 137 agreed to.

Amendment 138 moved—[Sarah Boyack].

Amendment 138A moved—[Stewart Stevenson]—and agreed to.

Amendment 138, as amended, agreed to.

The Presiding Officer: Group 22 is on promotion of water conservation and water-use efficiency. Amendment 136, in the name of Des McNulty, is the only amendment in the group.

Des McNulty: If this were a climate change bill in practically any other country in the world, I am pretty sure that water conservation and water-use efficiency would be high up the agenda. It is perhaps testament to Scotland’s rather damp climate—except for Clydebank, of course, where it never rains at all—that water conservation and water-use efficiency have not figured on our agenda so far. However, for a number of reasons, I believe that that is an oversight.

One reason is that Scottish Water is our biggest electricity consumer, so any improvements that it makes in water conservation or water-use efficiency will contribute significantly to overall energy efficiency. Individually, we are water consumers. If we can reduce our water consumption and eliminate wasteful water consumption or use non-treated water rather than treated water when appropriate, all of that will improve Scotland’s energy performance.

We should examine more systematically what we can do to improve our water-use efficiency. That opens up an agenda that it might be appropriate to consider in relation to another vehicle. If I had had time to think about the issue in advance, I would have produced a more elaborate amendment—I gave the minister a draft of one. However, I am content to have in the bill a duty that gives the Scottish ministers the right to encourage Scottish Water—in the politest possible way—to improve its performance on water conservation and water-use efficiency.

I hope that when regulations on energy efficiency or targets are made under the bill in due course, we will consider how to deal with wasteful water use or encourage more efficient use of water. In so doing, we will bring ourselves into line with what other countries seek to do. If one argument in favour of the bill is that it will produce green jobs, addressing our immediate needs and those of other people to improve how water is used could provide future employment for the country. We could also export our skills in that.

There are many arguments in favour of looking at water conservation and water-use efficiency. I am pleased to move the amendment and to highlight the issues in the bill.

I move amendment 136.

Stewart Stevenson: Amendment 136 will amend section 56(1) of the Water Industry (Scotland) Act 2002 to place a duty on the Scottish ministers to direct Scottish Water to promote water conservation and water-use efficiency. That is entirely consistent with the wider expectations that part 4 of the bill places on Scottish Water as a public body.

Members recognise that, as Des McNulty said, water conservation and water-use efficiency could contribute to the achievement of the targets that the bill sets. That is why we have directed Scottish Water to reduce leakage in its networks. Much is going on through the saving water in Scotland network.

Amendment 136 complements existing activities. Mr McNulty made his point politely and I will convey it in those polite terms to Scottish Water. I am happy to support the amendment.

Amendment 136 agreed to.

Section 51C—Energy performance of new buildings procured for the Scottish civil estate

The Presiding Officer: Group 23 is on the energy performance of the Scottish civil estate. Amendment 139, in the name of Cathy Peattie, is grouped with amendment 140.

Cathy Peattie: If the amendments are agreed to, older properties will not be automatically ignored and ministers will have to justify exceptions. Amendment 139 extends the requirement on the Government to procure
buildings that fall within the top quartile of energy performance to all buildings that become part of the Scottish civil estate, including buildings that are not newly built. At present, the bill requires no significant increase in standards over those that apply universally under building regulations. The amendment will provide a welcome boost to the non-domestic retrofit industry, which section 51C will not currently achieve.

A recent report found that emissions from Scottish Government buildings increased by 2.5 per cent last year. Amendment 139 will help us to rectify that problem and to show genuine leadership in reducing the 17 per cent of emissions that come from non-domestic buildings.

The accompanying amendment—amendment 140—will allow the Scottish Government to specify in regulations exemptions from the requirement to procure buildings that are in the top quartile of energy performance. That might apply when the Scottish Government had made a previous policy decision to relocate Government offices to a location where no building in the top quartile is available and where the cost of retrofitting would be unreasonable.

I move amendment 139.

Stewart Stevenson: I am content to support amendments 139 and 140. Amendment 139 extends the requirement for any building that the Scottish civil estate acquires to fall into the top quartile of energy performance to pre-existing buildings. Where it is not reasonably practicable to do that, there is the additional reporting duty under section 51B(2) to explain the reason for acquiring the building. One example would be the Scottish Government acquiring premises in a rural location where no building in the top quartile is available and where the cost of retrofitting would be unreasonable.

I move amendment 139.

Cathy Peattie: I am happy with the minister’s response.

Amendment 139 agreed to.

Amendment 140 moved—[Cathy Peattie]—and agreed to.

Section 53—Information on waste

The Presiding Officer: Group 24 is on waste regulations. Amendment 85, in the name of the minister, is grouped with amendments 87, 88, 3, 4 and 89.

Stewart Stevenson: I thought that my speech notes on this group were missing, but I have found them, Deputy Presiding Officer—Presiding Officer—[Interruption.] It has been a long day.

The Presiding Officer: I quite understand, minister.

Stewart Stevenson: I appreciate the sentiment behind Mr McNulty’s amendments, which would scale back the extent of super-affirmative procedure in chapter 4, part 5. I agree that that procedure is not appropriate for a number of the waste provisions in the bill; amendments 3 and 4 recognise that. The Scottish Government’s amendments—87, 88 and 89—seek to remove most of the waste provisions from super-affirmative procedure, as do Mr McNulty’s amendments. Affirmative procedure will remain the default.

I acknowledge readily the importance of the Parliament being able to consider thoroughly the significant provisions on deposit-and-return schemes and charging for carrier bags. It is clear that they have generated most of the debate. In recognition, we propose that the representation period be 90, not 60, days. Members will appreciate that that gives the Parliament an even greater opportunity to consider draft schemes, obtain evidence and craft proposals.

The Government amendments in the group differ from those of Mr McNulty in seeking to apply the super-affirmative procedure to only the first exercise of the powers under section 58 on deposit-and-return schemes and those under section 59 on charges for carrier bags. On its initial agreement to the use of those powers, the Parliament will have established the principle of using those schemes.

We do not propose any other substantive change to the amendment that the Rural Affairs and Environment Committee lodged at stage 2. In lodging the amendments in the group, we also took the opportunity to deal with some minor drafting problems. I do not propose to go into detail, but I am happy to answer questions on the subject.

I am grateful to Mr McNulty for his focus on these matters. However, in light of the reassurance that Scottish Government amendments 87 to 89 give—including that of addressing his intentions—I ask him not to move his amendments.

Amendment 85 aims to correct a drafting issue in section 53(4A). The matter is a simple one: an act cannot receive royal assent. The amendment is a simple and technical drafting correction.

I move amendment 85.

Des McNulty: Deputy Presiding Officer—I am sorry, Presiding Officer—I am following the same track of thought as Mr Stevenson—

The Presiding Officer: If you wait for just a few seconds, Mr McNulty, you will be right. The
Deputy Presiding Officer is taking over from me in the chair.

Des McNulty: Naturally I am pleased that the minister has taken on board the point that I raised at stage 2 about the need for the super-affirmative procedure to be protected in respect of sections 58 and 59. The fact that he has introduced a super-super-affirmative procedure with a period of 90 days is welcome, but that is perhaps testament to the fact that the sections that are referred to, particularly section 59, should not be in the bill. The fact that ministers are so embarrassed about the proposition that they want to have a procedural back-stop makes the fundamental issue clearer. I will return to that when we consider the next group of amendments.

As the minister said, amendments 87 to 89 do what I sought to do with amendments 3 and 4: they provide more of a back-stop. Therefore, I am happy not to press my amendments in favour of the minister’s proposals.

The minister said that amendment 85 aims to correct a minor drafting error. It appears to us that a timetabling issue is involved, and as far as we can see no case has been made for the amendment. We are therefore inclined to oppose it unless the minister can make a case for it. Obviously, we will listen to what he has to say about it and about what he is trying to do. If he can make a decent case, we are open to persuasion.

14:45

Alex Johnstone: I will speak briefly to the amendments in the group and to section 58, which is on deposit-and-return schemes. At stage 2, I proposed that the section be removed from the bill, but I subsequently withdrew my amendment. I believe, of course, that deposit-and-return schemes have a great deal to contribute to waste reduction, but fears that people in the industry expressed to me—that such schemes may be counterproductive or have unforeseen effects—caused a great deal of lobbying and concern. I therefore welcome the amendments and the fact that the super-affirmative procedure will give Parliament the opportunity to ensure that any such scheme will be open to full public and parliamentary scrutiny. I hope that, as a result, we will avoid some of the pitfalls that the industry is concerned about.

Stewart Stevenson: I will address the point that Mr McNulty raised. Section 53(4A), which was introduced at stage 2, states:

“A draft of a statutory instrument containing the first regulations under subsection (1) must be laid before the Scottish Parliament no later than one year after this Act receives Royal Assent.”

In drafting terms there is no act, so that language cannot be used. That is simply what I seek to address.

Malcolm Chisholm: Why did the minister not lodge an amendment to replace “Act” with “Bill”? He has used the drafting error to introduce a completely new timescale. The section may come into force in goodness knows how many years’ time; it depends on the Government.

Stewart Stevenson: I am entirely happy that we move forward with the subject at best speed and introduce the instrument a reasonable time after the section comes into force.

The Deputy Presiding Officer (Alasdair Morgan): The question is, that amendment 85 be agreed to. Are we agreed?

Members: No.

The Deputy Presiding Officer: There will be a division. I suspend proceedings for five minutes.

14:48

Meeting suspended.

14:53

On resuming—

The Deputy Presiding Officer: We move to the division on amendment 85.

The Deputy Presiding Officer: The result of the division is: For 77, Against 45, Abstentions 0. Amendment 85 agreed to.

**Section 59—Charges for supply of carrier bags**

The Deputy Presiding Officer: Group 25 is on charges for the supply of carrier bags. Amendment 2, in the name of Des McNulty, is the only amendment in the group.

Des McNulty: At stage 2, an amendment similar to amendment 2 was defeated on the casting vote of the committee convener. The argument against the inclusion of what is proposed in section 59 remains as strong as it was when the then Environment and Rural Development Committee unanimously rejected the Environmental Levy on Plastic Bags (Scotland) Bill, which Mike Pringle introduced in the previous parliamentary session.

The minister will perhaps argue that section 59 is an enabling measure that could apply not just to plastic bags but to all carrier bags, but he will be well aware—following his meeting with representatives of Scotland’s highly successful packaging industry—that its practical impact would be to increase, by 35,000 tonnes, the annual weight of materials used for packaging. That will happen if single-use plastic bags are replaced by other forms of packaging, including paper bags and multiple-use plastic or plasticised bags. As well as that additional weight of materials contributing to increased CO2 emissions, we should also take into account the 200,000m3 of additional waste per annum—a substantial increase in avoidable waste going to landfill or to other methods of waste disposal in Scotland—and the extra 600,000 pallet journeys that would result. Those extra journeys and additional pieces of material that would need to be produced and disposed of are significant carbon-using mechanisms, so it is incredibly difficult to see how...
the measure would contribute to tackling climate change. In fact, the overwhelming evidence is that it would detract from tackling climate change.

As I said in the earlier discussion on the super-super-affirmative procedure, the fall-back position that the Government has adopted simply emphasises the fact that the proposal would adversely affect emissions by the amounts that I have been able to quantify. The proposal was previously tested and rejected by the Parliament.

Jeremy Purvis (Tweeddale, Ettrick and Lauderdale) (LD): In the area that I represent, one town—Selkirk—is now a plastic-bag-free town and another is fast on the way because of the support of the community and of local retailers. Is the member saying that my constituents are wrong to move ahead in that direction?

Des McNulty: No, I am saying absolutely the reverse. When I was a councillor, I represented a ward that at that time included Glasgow’s landfill centre, so my then constituents were very concerned about the amount of waste that was deposited needlessly. People do not want the amount of waste to increase as a result of a flawed measure that is introduced by the Scottish Parliament. The reality is that a charge on bags is the wrong way to reduce the use of plastic bags.

Over the past 18 months, huge success has been achieved by voluntary schemes—precisely of the kind that Mr Purvis mentioned—that have been introduced throughout Scotland. If we can reduce demand voluntarily, why do we need to introduce legislation that, in climate change terms, will make things worse and will not address the problems that people in Mr Purvis’s town are presumably concerned about?

The way forward is to have a sensible, rational and science-driven approach. We should take account of the voluntary action that people are already taking. We should not impose an undue burden and a significant disadvantage on a successful Scottish industry. We should not contaminate a climate change bill with measures that will actually contribute to increased emissions.

I move amendment 2.

Mike Pringle (Edinburgh South) (LD): I listened to Des McNulty’s speech with interest, but he simply repeated all the claims that the plastic bags industry has promulgated over the past few years since I introduced my bill. The truth of the matter is that the SNP should be congratulated on including section 59, which is an enabling provision. I agree with Des McNulty that huge advances have been made over the past 18 months or two years in reducing the number of plastic bags.

Karen Gillon (Clydesdale) (Lab): If the member feels so strongly about the issue, why did he not seek to reintroduce his bill after engaging in the further consultation that the then Environment and Rural Development Committee asked for?

15:00

Mike Pringle: The simple answer is that I was pragmatic. The fact was that, at that time, the Parliament would not have passed the bill. There seemed little point in reintroducing the bill when the Parliament did not think that the proposal was the right way forward. The right way forward, then and now, is to reduce the number of plastic bags—as has happened over the past 18 months.

Des McNulty is right: there has been a huge reduction in the number of plastic bags. However, if that reduction does not continue and section 59 remains, the SNP Government—or a future Government of Scotland—can say, “We haven’t gone far enough; there hasn’t been enough of a reduction.” We need only consider the example of countries all over the world that have gone down the route of charging. Ireland is a good example. In Ireland, there was a massive reduction in plastic bags and a huge increase in recycling. That is one of the reasons why my bill would have been successful. I congratulate the SNP and urge the Parliament to keep section 59 in the bill.

Alex Johnstone: On the day the bill was published, I read through it and found much that I thought positive, which I have gone on to support and perhaps improve, but when I reached section 59 I thought, “That’s cheeky,” because something the Parliament had previously considered and rejected had been stuck in the Climate Change (Scotland) Bill. I have felt a degree of hostility towards it ever since.

Much of what has been said so far in this brief debate is positive, and I agree with much of Des McNulty’s position. Since Mike Pringle introduced his bill and it was discussed in Parliament and the greater community, this is the one area in which ordinary individuals have been able to do the most to reduce the amount of waste the country produces.

Anyone who goes to a supermarket will see that many people are now using reusable bags, trying to reduce the number of bags they use and doing all they can to reduce packaging. Whatever the motivation for that, it is an example of how everyone is working voluntarily to try to reduce the amount of waste that society produces.

There is ample evidence that people in this country are already doing their bit and are working hard to ensure that we reduce waste. I believe that the carrot is always better than the stick. Evidence presented by none other than Jeremy Purvis tells
us that there are two towns in the Borders that are almost completely carrier bag free. That is an example of how the voluntary principle can work most effectively, and it is why section 59 is unnecessary.

Patrick Harvie: I spoke against an amendment to remove section 59 at stage 2 and I speak against one again now. At stage 2, and again today, some members have—accidentally or not—confused the proposal in the bill with the bill that was considered by Parliament. They are not the same. Mike Pringle’s bill concerned plastic bags, but section 59 concerns a much broader approach, which is to carrier bags. Alex Johnstone commented a couple of moments ago about towns in the Borders that might be carrier bag free. I am sure that they are not carrier bag free. People still carry things in bags. Carrier bags include all forms of bag, not just plastic ones.

The mix-up between carrier bags and plastic bags is not the only area of confusion. There have been other confused arguments. Des McNulty seems to be unclear whether he is saying that this is the wrong objective or the wrong way of achieving the objective. His argument about the environmental impact of additional pallet journeys and the impact of other types of bags suggest that reducing the use of disposable or single-use bags is the wrong objective, but he went on to say that what he is really saying is that a charge is the wrong way of achieving the objective. We must argue one way or the other: either this is the right thing to do but it is being done in the wrong way, or it is the wrong thing to do and we should not be trying to reduce single-use bags at all. Des McNulty needs to be clearer about that.

Voluntary measures have been taken, although they have been patchy. Some people take the issue seriously, others do not.

Johann Lamont (Glasgow Pollok) (Lab): When Patrick Harvie talks about carrier bags, does he mean single-use bags? He seems to be arguing that there is a broader definition of carrier bag, but if that is the case the need to exclude the provision of carrier bags is not so pressing because it is not an issue about the environment.

Patrick Harvie: When I say carrier bags I mean all forms of carrier bag. Section 59 does not discuss excluding the provision of carrier bags; it gives the Government the opportunity to make proposals, which the Parliament will scrutinise in detail. Different approaches may be taken to different types of bag. It is a straightforward point that the Government has that opportunity.

There are some good arguments about the environmental impacts of different types of bag; some completely spurious arguments have also been advanced, such as the idea that reusing bags will become some sort of public health menace because of their not being hygienic. The only way to quantify the impact of a proposal is to wait and see the detail of it. Deleting section 59, as Des McNulty proposes, would prohibit the Government from making detailed proposals, which the Parliament could examine on their merits, separating the good arguments from the spurious arguments and making a judgment. The Parliament should reject amendment 2 and retain section 59.

Stewart Stevenson: Amendment 2 aims to remove the proposed power for the Scottish ministers to require charges for carrier bags. A similar amendment was moved, and defeated, in committee.

Des McNulty’s argument appears to have two elements. First, a similar proposal was debated in relation to Mike Pringle’s Environmental Levy on Plastic Bags (Scotland) Bill, which was not supported by the Environment and Rural Development Committee. Secondly, a charge on plastic bags would have a negative effect on emissions because of substitution by paper bags etcetera. I direct Mr McNulty to section 59(2)(c), which states that ministers may specify “the carrier bags to which the requirement applies”.

There is flexibility to respond to circumstances were we to do what the Welsh Assembly Government is doing—the Labour minister, Jane Davidson, an excellent minister, albeit of another political persuasion, is moving to implement such a provision in Wales.

We are addressing the issue of carrier bags in general, not merely plastic bags. We rely on independent research from AEA Technology, which shows that a measure such as the one that we are proposing would save 5,000 tonnes of waste a year. That is not a huge saving, but it is a real saving and it relates to a waste stream that is a genuine problem, as any examination of rural fences, urban trees and motorway verges would undoubtedly demonstrate.

The Parliament’s work has been examined by the UK Government, which included a power to require charges for single-use bags in its Climate Change Act 2008. The provision in our bill is more carbon-friendly even than the one in the UK act, as ours could require charges for fabric bags for life, as well as for paper and plastic bags. The power is there to be used for that purpose.

In the meantime, the Scottish supermarket summit last year pioneered an agreement that was later extended across the whole of the UK: that the use of bags by retailers would, as at the end of last month, be reduced by 50 per cent compared with the 2006 baseline. We expect the results next month, but the indications are—as Jeremy Purvis
and other members have mentioned—that there has been a considerable decrease in use. It is open to debate whether such an agreement would have been arrived at without the prospect of legislation, pour encourager les autres.

If voluntary work by retailers—which Alex Johnstone rightly praised in the stage 1 debate—delivers results, we will not need to use the powers in section 59. We need them, however, in case voluntary measures fail to achieve the results that we have agreed on with the retailers.

Given that we are not in fact repeating work that was done in session 2, but building on its conclusions, and given that the powers in section 59 could bring real improvements, I invite Mr McNulty to withdraw amendment 2.

Des McNulty: It is certainly not my intention that the Government should not introduce legislation on this matter. It is perfectly open to the Government to do so. In fact, it would have been much better if the Government had introduced a bill on carrier bags, on packaging or whatever, constructing a bill in whatever way it found to be appropriate. Then, we could have considered the evidence in detail and the Government would have had to advance a thoroughly well-worked-through proposition on which we could have consulted widely. The problem is that the measure was tacked on to a bill about climate change, and the Government has not addressed that.

Stewart Stevenson: Is the member equally uncomfortable that the UK Government’s Climate Change Act 2008 contains provisions on carrier bags?

Des McNulty: Actually, I believe in devolution. If there are good arguments for taking a different approach in Scotland, we should do so. The arguments must be made in this Parliament. Many of them were tested during the passage of Mike Pringle’s Environmental Levy on Plastic Bags (Scotland) Bill and found wanting. When it came to the vote, Mr Pringle’s proposition did not even get the support of his own party colleagues. If we implement section 59, the risk is that a bill such as Mike Pringle’s will come in through the back door, and without the support of adequate evidence.

Ministers consulted on waste issues relatively recently. Of seven propositions, the least popular with the public was the one to do with carrier bags. That is evidence. The figures that I gave about the increased emissions consequences of the proposal are evidence, too. Patrick Harvie is extremely fond of quoting numbers and science when it suits him and extremely reluctant to accept them when they do not. He cannot pick and choose. Tonnes of carbon emissions would be produced as a consequence of implementing section 59. I see that I have annoyed Patrick Harvie.

Patrick Harvie: I would be grateful for a clear explanation. How on earth does Des McNulty expect us to accept that the impact of the proposal can be quantified in the way the industry suggests when we do not know the detail of what the charges will be, or of how, when or to what they will be applied?

Des McNulty: If we do not know what the proposal is, what it will do or how it will work, why should we vote it?

The Deputy Presiding Officer: The question is, that amendment 2 be agreed to. Are we agreed?

Members: No.

The Deputy Presiding Officer: There will be a division.

### Amendment 2 disagreed to.

The Deputy Presiding Officer: Group 26 is on public engagement. Amendment 86, in the name of Brian Adam, is the only amendment in the group.

**Brian Adam (Aberdeen North) (SNP):** Amendment 86 will create an obligation on the Scottish ministers to produce a new strategy on public engagement. I feel that it is extremely important to ensure that we fully engage people in the process of tackling climate change, in which we, as legislators, have had the opportunity to engage today and over the past few months.

The voluntary sector has made considerable efforts to persuade the Government and, indeed, all members to produce the bill that is likely to be passed at 5 o’clock. However, after 5 o’clock, it will be a question of delivery, which will be at the hands of not just ministers and public bodies but all of us. We must provide a mechanism whereby the public can engage in the strategy for delivering the bill’s provisions. There is no doubt that the eco-congregation movement was extremely active in trying to persuade the Government and the rest of us to support a public engagement route. I was pleased to lodge an amendment on the subject at stage 2, and I am delighted to have lodged a stage 3 amendment that will allow public engagement to take place.

I know that communities of interest wish to be involved in helping to deliver the bill’s provisions, but that will not happen just because we pass a law: it will happen because people will make it happen. A public engagement strategy must be part and parcel of that.

15:15

The public engagement measure will have to be kept up to date, which is why I have included a requirement to review it at least once every five years. If not just MSPs but all the people of Scotland work together, we can make a real difference in tackling climate change. We have heard that the bill is world-leading legislation, but it would be even better if the delivery were world leading, because there will be an impact not just...
on us and our communities but well beyond Scotland’s shores.

I commend amendment 86 to members. I hope that we can allow people such as those in the eco-congregation movement and other communities of interest to engage in delivering this important legislation.

I move amendment 86.

Des McNulty: I hope that I am more successful in supporting amendment 86 than I was in moving the previous amendment. However, I have taken the precaution of allying myself with the Government’s chief whip, which no doubt will assist me greatly in the process.

The minister will be aware that public engagement has been a constant theme of my speeches on climate change from the first debate that we had on the issue following the election in 2007. I am delighted that it has now been accepted that a public engagement strategy will be part of the bill and an important aspect of how its measures will be delivered. Brian Adam is right: we can impose all the duties that we want on ministers and public bodies and we can create targets and so on, but it will be the people of Scotland who deliver differences in climate change emissions. Unless we engage effectively with them and help them to achieve their potential for contributing to the climate change agenda by collective and shared effort, we are unlikely to succeed, whatever target we set ourselves.

There have already been good examples of organisations and groups taking the climate change agenda forward: Brian Adam referred to eco-congregations in that regard, I was fortunate to host a members’ business debate on eco-congregations last year and I have been fortunate to meet many eco-congregations across Scotland. Superb work is going on in church communities and excellent work is going on in schools throughout Scotland. Young people seem much more personally engaged in ecological activity and eco-awareness than do people of my age. Perhaps we must learn from our sons, daughters and grandchildren how to take that agenda forward. It really is the case that every little bit helps, but people acting together sensibly can do a lot. Many of the things that they can do are effective not just ecologically but economically, because they are ways of saving or avoiding wasting money.

Amendment 86 is important. I am pleased that there will be a public engagement strategy and that it will be regularly refreshed. I am also pleased about the Church of Scotland’s role in bringing the strategy to the chamber. I warmly support amendment 86.

Stewart Stevenson: I am happy to support amendment 86. To achieve the targets that are set out in the bill, the Government will need to encourage everyone to contribute to reducing greenhouse gas emissions. We will achieve that only if people are fully engaged in tackling climate change and if they understand which of their own actions can contribute to reducing emissions. A public engagement strategy will help to raise awareness and engage people in taking direct action to reduce emissions.

In the past few weeks, I spent two and a half hours speaking on climate change to people of Buchan presbytery in my constituency, who are very much engaged in the eco-congregation initiative that the faith communities have introduced, and who impressed on me the importance of this amendment.

Robin Harper (Lothians) (Green): The minister will be aware that 90 per cent of Scotland’s primary schools are now eco-schools and that more than half of them have got their green flag. However, progress has been rather slower in the secondary sector. Would the minister be amenable to considering whether extra resources could be found for that sector?

Stewart Stevenson: The member makes the very general point that we need to engage widely with communities. In the past six months or so, I spoke in this very chamber to an international gathering of senior school students, who had some terrific ideas, and I know of very good examples of initiatives in secondary schools throughout Scotland that complement the progress that is being made in primary schools. That is an example of the engagement that we need right across our communities. The eco-congregations have taken the lead on promoting this amendment, but its applicability stretches far beyond that community to the whole community of Scotland.

Brian Adam: I am very pleased with the general support for amendment 86. I know that groups outwith the chamber are waiting anxiously for the bill to be passed so that they can get involved in delivering its provisions.

Amendment 86 agreed to.

Section 62—Equal opportunities

Amendment 5 moved—[Cathy Peattie].
Amendment 5A not moved.
Amendment 5 agreed to.

After section 62

The Deputy Presiding Officer: Group 27 is on the Scottish Executive budget—impact on
greenhouse gases. Amendment 141, in the name of Patrick Harvie, is the only amendment in the group.

**Patrick Harvie:** In 2007, I proposed that the Cabinet Secretary for Finance and Sustainable Growth introduce a carbon assessment tool for the Scottish budget that would look at the direct and indirect impact of Scottish Government spending decisions on climate change, suggesting that such a move would recognise that the Scottish public sector in the broadest sense is a significant part of the economy and has a significant role in reducing climate change emissions.

The Scottish Government agreed to the suggestion and is now developing a carbon assessment tool; indeed, my colleagues on the Transport, Infrastructure and Climate Change Committee were grateful to receive an update on its progress. As I have recognised from the start, the concept is complex and innovative and we simply cannot take something off the shelf, set it up and get it running straightaway. However, the Scottish Government seems confident that the carbon assessment mechanism will be available for use in the 2010-11 budget.

As a result, during the passage of the Climate Change (Scotland) Bill and at other times over the past year when the cabinet secretary has appeared before our committee, I have asked whether the Government would be open to the idea of a legislative requirement for a carbon assessment of the budget. Such a measure might seem a bit technical and obscure beside the bill’s headline measures on interim and annual targets, but I believe that making an effective and robust carbon assessment of the Scottish budget a requirement for every future Government could be every bit as significant as the emissions reduction targets.

Although the minister saw the principle behind my stage 2 amendment on this matter, he rejected some of the wording and terms that I used. I have attempted to take on board those comments in amendment 141, which seeks to require the Scottish Government, at the same time as laying a draft budget before Parliament, to lay before Parliament

“a document describing the direct and indirect impact on greenhouse gas emissions of the activities to be funded”.

I hope that the ministers find the amendment acceptable. If not, I would be grateful to know what other mechanism they intend to use to lock in this requirement. Indeed, I hope that they agree that such a requirement should be locked in. Their work on a carbon assessment tool is valuable and welcome, but it will be worth very little if a future Government reverses the measure.

I move amendment 141.

**George Foulkes:** The minister and particularly the cabinet secretary will be aware that I have asked a number of questions about the travel arrangements of ministers. If we are to urge everyone else in the country not to create carbon emissions and to get out of their cars and walk—

**Members:** Do you?

**George Foulkes:** I have walked from my flat to the Parliament on many occasions. [Interruption.]

**The Deputy Presiding Officer:** Order.

**George Foulkes:** I have asked about the First Minister. He does not even walk from St Andrew’s house to here. He takes the car every time. That is not setting an example. People say that he is busy and has lots to do, but we should set an example. How can we expect other people to change their habits and lifestyles if we do not set an example? That example should be set by the Scottish ministers, and principally the First Minister.

I compliment Stewart Stevenson on regularly using public transport.

**Patrick Harvie:** On a point of order, Presiding Officer. I ask for your guidance. Is the member required to make a speech that is relevant to the amendment that is under debate, or is an utterly irrelevant speech in order?

**The Deputy Presiding Officer:** It is my judgment that the member is in order in terms of addressing the amendment. Otherwise, I would have stopped him.

**George Foulkes:** I knew that, Presiding Officer. You are a very wise Presiding Officer.

**The Deputy Presiding Officer:** I would, however, urge the member not to stretch my patience too much.

**George Foulkes:** I will not. I think that I have made my point.

**Stewart Stevenson:** It is clear to all of us that every action that we take as human beings has an effect. The very exhalation of one breath of air has a carbon impact. Would that some members fell in with what has been an exceptionally positive and consensual approach to the bill. I am afraid that although I graciously accept Mr Foulkes’s praise for the 400 miles that I have so far walked as a minister—it felt much further—we must return to the substance of amendment 141.

Patrick Harvie used a phrase with which I am happy to associate myself. He said that competence exists within the Government. Mr Foulkes might care to take tent of Patrick Harvie’s phrase.

I am pleased to say to Patrick Harvie that, this time, we can accept the wording of his
The Deputy Presiding Officer: Group 28 is on judicial review. Amendment 142, in the name of Alison McInnes, is the only amendment in the group.

Amendment 141 agreed to.

The Deputy Presiding Officer: Group 28 is on judicial review. Amendment 142, in the name of Alison McInnes, is the only amendment in the group.

Alison McInnes: The Aarhus convention, which was developed under the auspices of the United Nations, sets out three strands: access to information, public participation and access to justice. Amendment 142 addresses the third strand.

The convention says that access to judicial review on environmental matters—such as will arise from the bill—should be available to the interested public. In Scotland there is uncertainty about the standing of environmental interests. That is not the case in England. Moreover, as far as I can see, in Scotland there is no established provision to limit the financial risks that are associated with pursuing a case, whereas the English courts have established the use of protective costs orders.

When I lodged a similar amendment at stage 2, the minister said that it was unnecessary, because the issues were either covered by Scots law or under active consideration by the Lord President of the Court of Session. The minister said that clarity on the rules of standing was unnecessary. However, when similar circumstances arose regarding the Land Reform (Scotland) Bill, the Parliament, the courts, and the then Scottish Executive took the opposite view and chose actively to clarify rules of standing with respect to non-governmental organisations, in line with Aarhus. Clarity is needed regarding the Climate Change (Scotland) Bill, too.

I am aware that the Lord President is considering protective costs orders, with a view to determining whether changes to court rules are necessary. I did not press my amendment at stage 2, because I had secured a commitment from the minister that he would discuss the matter with the Lord President, so I will be interested to hear what the minister has to say.

I move amendment 142.

Stewart Stevenson: I had a conversation on the matter with the Lord President on Monday. He is reviewing the position on protective costs orders in general. Of course, changes to court rules would not just relate to the bill but would have much broader applicability. The Lord President wants to have the benefit of the report of Lord Gill's review of civil justice before he makes a decision. I took it from my conversation with him that he understands the importance of the issue.

Lord Gill's report is expected shortly. It would be wrong of us to pre-empt the Lord President's consideration by legislating on protective costs orders at this stage. The Lord President's engagement on the matter is an important indication that it is being taken seriously.

Amendment 142 is identical to an amendment that the member lodged at stage 2. Subsections (1) and (2) of the new section that amendment 142 would introduce deal with title and interest and would apply a test from the Aarhus convention. No evidence from past cases in the environmental field suggests that the Court of Session would not take a suitably wide approach to title and interest in cases that fell within the scope of the convention. Therefore, there is no need for those subsections.

Subsection (5) concerns the scope of judicial review proceedings. Again, we cannot see that it would usefully add to Scots law. Over a long period, the Court of Session has shown itself to be flexible in developing its judicial review jurisdiction and I am not aware of a reason why we need to innovate by statute in the field of judicial reviews that concern matters arising under the bill.

The outcome of Lord Gill's review will be relevant in relation not just to subsections (3) and
(4) but to other provisions in amendment 142. Even if the Government accepted the need for the provisions—we do not—we would prefer not to legislate in a piecemeal fashion. I hope that Alison McInnes accepts that my conversation with the Lord President about amendment 142 shows that matters are in hand and that she agrees that the amendment is unnecessary. I urge her to seek to withdraw amendment 142.

Alison McInnes: I thank the minister for his full response to my query, and for his reassurances. I am heartened that the Lord President is actively considering the issue, and I therefore seek leave to withdraw amendment 142.

Amendment 142, by agreement, withdrawn.

Section 64—Subordinate legislation
Amendment 87 moved—[Stewart Stevenson]—and agreed to.

The Deputy Presiding Officer: I remind members that, if amendment 88 is agreed to, amendments 3 and 4 will be pre-empted.

Amendment 88 moved—[Stewart Stevenson]—and agreed to.

After section 64
Amendment 89 moved—[Stewart Stevenson]—and agreed to.

Section 65—Interpretation
Amendment 90 moved—[Stewart Stevenson]—and agreed to.

Amendment 143 moved—[Sarah Boyack]—and agreed to.

Amendment 91 not moved.

Section 67—Short title and commencement
Amendment 144 moved—[Sarah Boyack]—and agreed to.

Amendment 92 moved—[Stewart Stevenson]—and agreed to.

Amendment 145 moved—[Sarah Boyack]—and agreed to.

Long Title
Amendment 93 moved—[Stewart Stevenson]—and agreed to.

The Deputy Presiding Officer: That ends our consideration of amendments.
in extraordinary detail, as was demonstrated today by his handling of the debate in the chamber.

I cannot reflect on where we have come from and the achievements that have been made in the consideration of the bill without talking of the body of opinion that has existed outwith the Parliament and the way in which Parliament has engaged with it in considering the issues that are at stake.

Many of the non-governmental organisations with whom we have been familiar over the 10 short years of this Parliament have worked together under the Stop Climate Chaos banner to send to Parliament and the people of this country a coherent and co-ordinated message that we should consider and, frankly, be inspired by. As a consequence of the commitment and the contribution that has been made by the individuals in those organisations, working hand in hand with members of the public in Scotland—some of whom have come to Parliament to witness a truly historic day, and whom Stewart Stevenson and I had the pleasure of meeting at lunch time—a tremendous range of opinions and ideas has been marshalled, with the result that we can rightly and justifiably claim that the Scottish Parliament will today pass world-leading legislation on climate change that can set an example to others. That partnership between the people and Parliament has worked to an extraordinarily successful extent.

For the purposes of rule 9.11 of the standing orders, I am required at the outset to advise the Parliament that, having been informed of the purport of the Climate Change (Scotland) Bill, Her Majesty has consented to place her prerogative orders, I am required at the outset to advise the Parliament that, having been informed of the purport of the Climate Change (Scotland) Bill, Her Majesty has consented to place her prerogative and interests in so far as they are affected by the bill at the disposal of the Parliament for the purposes of the bill. Members might want to reflect on that issue in conversation with Her Majesty on Friday evening.

As has been correctly expressed throughout the debate, climate change affects all the peoples of our planet. None of us in the Parliament has suggested, at any stage in our consideration of the bill, that we in Scotland have nothing to contribute to the solution to the problem. Despite the fact that we are a relatively small contributor in the grand scheme of things, in terms of emissions, we have all accepted that we have a duty to make a contribution to that process at this stage.

At 5 o’clock today, we will approve the bill, which will set an example to others and give direction to the nations of the world that will meet in Copenhagen in December to negotiate a post-Kyoto protocol climate change agreement. Those discussions will be significant in setting the pace of tackling climate change through a new global agreement to accelerate emissions reductions across our planet.

We will have made a contribution to that debate by the manner in which we, as a country, have considered the issues, with our NGOs and members of the public informing and leading debate, and Parliament considering and reflecting on what we can do to deliver on those aspirations. Without a doubt, we must now focus on the contents of the delivery plan to achieve the targets on climate change that are implicit in the bill. That plan, which was published by the Government last week, sets out the transformational measures that are required to move Scotland on to the correct pathway to a low-carbon economy that will deliver our long-term emissions reduction targets.

Those measures include massive increases in green energy; the wholesale adoption of electric vehicles that are powered by green energy; major improvements in energy efficiency and reductions in demand; and significant increases in forestry cover. They will focus our thinking and deliver on the significant commitments that we have made today to an 80 per cent reduction in emissions by 2050 and a 42 per cent reduction by 2020, subject to agreements at European Union level. Those are the directions in which the Parliament now sets off to ensure that we deliver on our commitments to achieve the targets.

We will do that in a variety of ways. We will do it by taking the adaptation and transformational measures to which I referred. We will ensure that, when we make our financial choices and set out the budget provisions—which Patrick Harvie raised a few moments ago in his amendment on the budget—we set a range of priorities throughout Government that are utterly consistent with the achievement of the objectives in the bill. The bill cannot relate to only one area of Government policy; it must relate to every area of Government policy. Crucially, the debate is not only about Government and the actions over which we have direct control; it is about motivating, enthusing, encouraging and, at times, requiring other organisations to make a contribution.

In the debate so far, the Government has set out an approach that is designed to combine all those attributes and to ensure that we lead by example, that we set a clear agenda and that we motivate and encourage others to make their contribution. During the earlier debate in which Mr Adam and Mr McNulty were involved, the role of eco-congregations and the wider question of public engagement was raised. That is central to the achievement of all our ambitions. The Government cannot do everything on its own, although it will give the greatest priority to ensuring that we are successful. Today, Parliament sets an example to the people of Scotland on what we must all do in our lives to make our contribution to tackling climate change. As we embark on the Parliament’s
10th anniversary celebrations, we can be justifiably proud of the achievement that the bill enshrines.

I move,

That the Parliament agrees that the Climate Change (Scotland) Bill be passed.

15:47

Sarah Boyack (Edinburgh Central) (Lab):
Almost every day, we hear reports of new scientific evidence that warns us of the potential negative impacts of unchecked climate change and, crucially, of the changes that are already taking place in our world. Climate change is no longer an issue that exclusively interests environmentalists; it has become a factor for businesses, the education system and government at every level. As was demonstrated at lunch time today, more and more of our constituents are concerned about the issue. The challenge is to move away from business as usual to a low-carbon society. Each debate on the issue that we have had in Parliament has set down a new marker on members’ knowledge of and commitment to the issue. Over time, more and more members have been drawn into the debates and into the thinking that is needed to underpin the required policy development.

As John Swinney said, three committees took up the task of scrutinising the bill and engaging with the many witnesses and organisations who presented a range of evidence and views that we had to take into account. That involved a huge amount of work by members, witnesses, clerks and Scottish Government officials, all of whom should be thanked for their sterling work. In particular, we should thank the clerks and Government officials who helped us at stage 3. We are all aware that there was a lot of burning of midnight oil. Perhaps we will avoid that in the future, but it was completely necessary for the bill.

I associate myself with John Swinney’s remarks about the handling of the process by his deputy minister Stewart Stevenson. I have been in charge of difficult bills and I realise that the present one was particularly difficult. I suspect that, as a minority Government, the Administration faced a new set of challenges in getting the bill through in one piece and in a way that is legislatively competent. Members can see the bits of the bill to which they contributed and, even more important, people outside the Parliament feel that they helped to construct it. As part of the democratic process, as we hit the Parliament’s 10-year anniversary, that is a significant achievement. It sets the bar for future bills, as well as for implementation of this one.

Labour members have been particularly proud that the United Kingdom Government has genuinely led the way in trying to get other countries to sign up to ever more radical measures to address climate change. EU countries have been crucial in leading the way across the globe. The election of Barack Obama signalled that the United States wanted to play a much more constructive part in tackling climate change globally and trying to ensure that we do not have a humanitarian disaster and economic catastrophe—which will come if we do not avert dangerous climate change. There is a mood around the world that we want to do more. We have debated the impact on developing countries if we fail, given that even minimal rises in sea level or increases in temperature could make parts of the world simply uninhabitable.

Although we produce a relatively small part of the emissions in our world, the debates that we have had on the bill have demonstrated our desire for Scotland to play its full part not just in reducing our emissions but in participating in the wider global debate. I agree with John Swinney that our bill has been strengthened immeasurably by the process of democratic debate and discussion, which is a good thing.

I am sure that we will hear lots of warm speeches today, but the challenge is what we do next to implement the bill, particularly considering the substantial amendments to which we agreed at stage 2 and stage 3. Labour members are committed to the bill. We do not think that the devolution settlement limits us in taking groundbreaking action; we see the bill as a big opportunity to go further. Our challenge is to develop action on climate change that goes with the grain of our principles of social justice and economic fairness. That is why we were so keen to see sustainable development built into the bill.

I hope that ministers will seize the day, having voted for our interim target—and having decided to go further. I noted John Swinney’s comments when he intervened on Des McNulty. I very much hope that the 42 per cent target, which he said was seen as absolutely doable if we sign up to the deal at Copenhagen, can be realised. I hope that we can also consider carefully amendment 94, which we agreed to today. It is a fallback amendment; we will absolutely go to 42 per cent if a deal is reached at Copenhagen, but our amendment provides the opportunity to look at how much further we can go than our initial advice from the Committee on Climate Change suggested, should that not happen. We have all signed up to that now, so the challenge is where we go next.

We are in a recession and we have to build our way out of it using low-carbon technologies, redesigning our public services, looking at the carbon-counting commitment that John Swinney...
will bring forward in next year’s budget and looking at how we redesign our public services to avoid dangerous greenhouse gas emissions. The Royal Society of Edinburgh warned us that, given that we are in a recession, we should not assume that any decrease in emissions has happened as a result of the good things that we are doing in the Parliament; it might have happened because of the recession. Secondly, as we clamber out of recession, there is a danger that the trends that we saw before the recession will pick up again. There is a real warning for us to look at the detail and to work harder on emission reductions.

There are many things in the bill of which Labour members in particular feel proud. They include earlier action targets; making the most of our employment opportunities and public procurement targets; looking hard at the contribution of domestic action, with clear limits on international carbon credits; duties for public bodies, which we have strengthened today; and a public engagement strategy, to which every member is signed up 110 per cent—let us see what we can do to take that further, given the emotion, energy and commitment around the bill. There were specific amendments on the land use strategy and sectoral work—on key sectors in which we have to do better, such as energy efficiency, production of energy, and transport.

The work that we have done on energy efficiency is something of which we can all be proud, although the real challenge is making it happen. We have all debated the promise, made in 2002, for the early action energy efficiency strategy. Now it is in the bill. It really must happen and we must all sign up to what comes from that.

Regulations on domestic renewables will come into force more quickly. I am delighted that we agreed to a commitment on planning, which will mean that with all new housing and buildings we will be able to seize the day by taking the opportunities that come from low-carbon buildings and technologies and looking at how we decentralise our energy networks and go for decarbonised energy.

The bill contains a huge amount that is fantastic. Every one of us is under a huge obligation. I have noticed that more members from across the parties have engaged in the debates. The challenge lies in ensuring that they remain engaged. The three committees that were involved and the colleagues who lodged stage 2 amendments must stay on track.

The Government has a key challenge of leadership. We have made a complex bill more complex—that was the clear will of Parliament. Stewart Stevenson’s burden was to guide us through that. We need to consider a revised delivery plan, how the bill will work, the annual targets that we have set and the parliamentary mechanisms—the accountability mechanisms—about which I remember John Swinney was enthusiastic when he introduced the bill at stage 1.

The bill contains a lot for everyone. The Parliament needs to assert its role in holding the Government to account and to do that constructively with ministers. Labour members will not just vote to pass the bill, but commit themselves to remaining enthusiastic about it and to working hard to ensure that its implementation is delivered.

15:56

Alex Johnstone (North East Scotland) (Con):
This is indeed a great day—it is always a great day when a bill completes its passage through Parliament. The bill has presented to the Government, to Parliament and to individuals in Parliament one of the biggest challenges that we have had to deal with.

I repeat the congratulations and thanks to all those who contributed to the process. I offer the most thanks to the committee clerks, some of whom worked extremely hard to assist in drafting amendments at late hours, which was above and beyond the call of duty. I am eternally grateful for that.

The nature of the bill will probably not dawn on us fully for many years. I am confident that we have produced a good piece of legislation, but its effects might not be truly felt as late as 2050, when we will know whether we have achieved what we set out to do.

My objective during the passage of the bill has perhaps annoyed some people. Some in Parliament are keen to take up the lobbying and encouragement from a range of organisations, including our NGOs, but one of our greatest achievements in the Parliament has been managing to keep competing interests and diverse groups on side and in line with the bill’s objectives. If one or two people—perhaps even those in the public gallery—are still disappointed at how I or others in the Parliament voted at stage 2 or 3, I say that that was largely to do with the fact that we must serve competing interests and keep them on board with the process. It would not have served us at all to have allowed anybody to become detached from the process. Every party—including the Conservatives—has been keen to keep the process together.

As I have said before, when I have come across people who might instinctively support my party and who have grave doubts about the nature of climate change or the requirement to deal with it, the position that I have taken has allowed me to argue the case for the bill and against such
arguments, rather than find myself incapable of so doing.

As a result, we have made good progress. We made unanimous progress on a range of issues and we found common ground on the handful of issues on which we could not agree distinctly at the outset.

The process has at times been entertaining and I have enjoyed elements of it. Late in the debate on amendments this afternoon, I almost thought that Stewart Stevenson would turn into one of the Proclaimers, because he claimed that he had walked 500 miles and that he would walk—

The Minister for Transport, Infrastructure and Climate Change (Stewart Stevenson): Four hundred.

Alex Johnstone: Okay—400 miles. I presumed that he was to be the man who walked 1,000 miles to deliver the bill.

I apologise to anyone who was involved that, unfortunately, I could not attend the lobby event today that Stop Climate Chaos Scotland organised, but I will describe an entertaining moment at an earlier event on the lawns beside the Parliament. I managed to get myself photographed beside two people in fancy dress; one was dressed as a panda and the other as an orang-utan. Amazingly—though perhaps unsurprisingly—the photograph found its way into the Holyrood magazine caption competition. It is a measure of how far the Conservative party in Scotland has come that no one entered a caption in which the words “three rare species” appeared.

There has been a great deal of debate today on the nature and specifics of the bill. It is an ambitious bill and it is world-leading legislation. However, we started out on a controversial note in deciding to support the 42 per cent target for 2020, and not the 34 per cent target. For me, that was perhaps the most difficult point of the day. I accepted the figure, as did the Conservative party, in good faith and on the information that the Government brought forward to defend its original decision. We have done the right thing, but I will have to defend the decision in the weeks and months to come. If we proceed properly and appropriately, I believe that the figures are achievable. Indeed, much of what we did following that decision will serve the purpose of taking us towards that target.

Achievability must be what the bill is about. As I said this morning, I find target setting instinctively difficult—it is not an approach that I like to take—but it is inevitable in a bill of this nature that target setting is a key provision. The figures that we agreed on during stage 3 amendments give us the opportunity to make progress against the targets.

Another significant decision that we took today was to reinforce the practical measures in the bill to deliver the change that we want. I refer in particular to green council tax discounts. The Conservatives want our power companies, councils and the Scottish Government to work together to make Scotland greener. Until now, Scotland has been losing out on green council tax rebates that, south of the border, range between £50 and £125. An estimated 1.8 million Scottish homes could benefit from such a scheme. Power companies such as British Gas already contribute to the cost in England. We think that it is not fair that Scotland should lose out. We believe that these moves will encourage more households and businesses to go greener. That would mean lower bills for the consumer and help to cut greenhouse gas emissions. I am delighted that our amendment that was agreed to today will extend the possibility of green discounts to businesses across Scotland. In addition to making Scotland greener, once again the Scottish Conservatives have been shown to be a party with creative plans on how to reduce and reform the council tax.

People will look back on today as a milestone in the process of averting climate change. I hope that the decisions that we have made today will go down as the right ones in the long term.

16:03

Alison McInnes (North East Scotland) (LD): Although passing the bill has been a long process, all too often over the past few weeks it has also seemed like a hectic rush. That may be a typical experience—I do not know—as I said in the stage 1 debate, this is the first substantive bill that I have led on for our group since I was elected to the Parliament.

At this point, it is rightly traditional to pass on my thanks to those who helped me over the course of the bill. I thank whole-heartedly the committee clerks whose endless work and late nights made the complexity understandable and the process smooth. I must also thank the thousands of people who responded to the initial consultation last year and the many lobbyists who have contacted me since that time. Their thoughts, insights and arguments were an invaluable help.

Most important, I thank the hundreds of my constituents who wrote asking me to help make the bill a world beater. I say to them that I tried my hardest to strengthen the bill. Their letters, e-mails and telephone calls provided me with the encouragement of knowing that my position on the bill was the right one.

Another stage 3 tradition dictates that I welcome the constructive nature of the proceedings, the excellence of the bill that we are passing and the
positive impact that it will have. I hope that members will forgive me for saying that I cannot be quite as fulsome in that regard as I may have wished to be. Two months ago, I told members that it was a privilege to have the opportunity to work on the bill—and it was. I also said that I wanted to be proud of the bill. I am proud of many parts of it. Parts of it will make good things happen and stand us in good stead for the future. We have agreed on the inclusion of a cumulative emissions budget, which is a huge step in ensuring that our emissions reduction targets are properly based on the science of what is needed; that will truly make a difference. After much campaigning, sectoral targets have been included. They will help to ensure that every part of Scotland’s economy will play its role in reducing emissions. We have committed to including emissions from aviation and shipping in the emissions accounts from the outset. That truly sets an example for the world to follow. The Government has also adopted our proposal to introduce an iterative process for analysing, questioning and working to improve the proposals that it will put forward on policies that will, I hope, meet the targets that have been set. I will always be proud of having played a part in making those things law.

I am not, sadly, totally satisfied with everything that we will agree to today. We have all echoed the same words from the start. We have said that the bill is the most important bill that the Parliament will pass and that we must show real ambition. So far, we have heard quite a lot of self-congratulation; I fear that I am about to dampen the celebrations a little. [Interruption.] I hear the groans.

Party lines should have been set aside in considering the bill. We should have united in pushing for far-reaching targets and worked for consensus right from the start. I have been genuinely disappointed that that has not happened. A little analysis of what we got on the journey is necessary. We got broken manifesto commitments from the Scottish National Party. We then got its ambition not to set the world an example, but to imitate what had already been done at Westminster. Finally, when the SNP was in danger of being left behind, there was a belated understanding that there was a true desire in Scotland for us to take action that will make a difference.

I am sorry that Labour prevaricated a lot. That was followed by what seemed to be a sudden rush to get in on the act. It seems that the ambition was to get headlines, not to get early action. There was a desperate late scramble to try to make up for missed opportunities at stage 2.

The word “disinterested” probably best describes the Tories’ approach. There was not much sign of David Cameron’s vote blue, go green delusions. I am sorry; I meant to say aspirations.

Despite the strengthening of annual targets that our agreement to introduce a cumulative budget will bring, I remain sceptical about the showpiece amendment that we agreed to earlier, which will put the interim target at 42 per cent with strings attached. I want it to stay at 42 per cent, but I fear that it might not do so much past the end of the year. Over the next six months, it is our responsibility to make the case that Scotland can achieve that target—that our emissions can be 42 per cent lower than the baseline by 2020. We must aim high.

As Sarah Boyack said, the bill is not the solution; rather, it is an opportunity for us to take the initiative and show that Scotland can lead the way. We can make it work and we can make a difference.

16:08

Shirley-Anne Somerville (Lothians) (SNP): This is a definitive moment for the Scottish Parliament. This is the day on which we set Scotland on a path to create a greener, more sustainable economy for the future. The danger of climate change has taken political centre stage today and, given the number of reporting requirements in the bill, it will rightly continue to do so. Indeed, those reporting requirements will mean that the minister and the Transport, Infrastructure and Climate Change Committee will see quite a lot of each other over the coming years.

Climate change is not only an environmental issue; it raises an important moral question that cuts to the heart of every political decision that we make. Should we blindly continue to support unsustainable lifestyles, regardless of their impact on the poorest people on our planet, or should we take action to create a more just and fair society, recognising our global responsibilities? The bill signals the strong intention of the Scottish Government—and, more important, that of the Scottish Parliament—to ensure that we take the latter path.

Des McNulty (Clydebank and Milngavie) (Lab): What the member says is important, but the substantive difference between Labour and the SNP is that the SNP lodged amendments to water down domestic efforts and make it easier to push our responsibilities on to the international community. We need to work together on that in a constructive way to ensure that what the member says is what we do.

Shirley-Anne Somerville: I fully agree that we need to work together. I am therefore disappointed that a Labour amendment to give ministers power to decrease a target, rather than continuously
upgrade it, was considered today for the first time. I am pleased that the amendment was agreed to as amended, which puts the matter back in the hands of the experts.

The bill, if passed, will put Scotland at the forefront of the global effort to tackle the clear and present danger of climate change. It will commit successive Scottish Governments to reducing emissions by 80 per cent over 40 years. It will also require annual targets, beginning next year, and robust annual reporting to ensure that every Scottish Government, regardless of its colour, is far more accountable for its actions.

It is not only the end point, but how we get there that is important. That is why I am very pleased that members agreed to the amendments that I moved today to ensure that cumulative emissions are taken into account. I am also pleased that another of my amendments was accepted at stage 2, to report on the emissions from consumption. The bill is believed to be the first in the world to include a measure of the effects of importing consumer goods that are produced in other countries. That measure will ensure that we are aware of Scotland’s true carbon footprint and take responsibility for emissions that are produced abroad as well as those that are a result of our actions at home. I pay tribute to WWF Scotland for its assistance in drafting that amendment.

The Climate Change (Scotland) Bill as it now stands has come a long way since its promising beginnings. I welcome the tireless efforts of everyone involved, particularly the NGOs, led by the Stop Climate Chaos Coalition, and the many concerned individuals who wrote or spoke to me over the past few months and at lunch time today—they kept up their lobbying right until the last minute. All that input undoubtedly helped to make the bill as strong as it can be.

All of us who have been interested in the bill realise that its passage is not the end of the process, but the beginning. Politicians, the NGOs and their members must now get out to sell the bill and, more important, the policies that are required to achieve its targets, to the Scottish public. We must remember, as other members have already said, that the bill itself does not tackle climate change. What we do with it is what counts and I am afraid that, if we take the tack that Alison McInnes has done, we will not sell the bill, will fail in the policies and will lose the people.

The bill fulfils one other important function: it shows that Scotland and its Parliament can pass world-leading legislation. For the sake of people in Scotland and, more important, further afield, let us hope that when the rest of the world meets in Copenhagen at the end of the year it is listening to the debate and examining the efforts that we have made today.

16:12

Cathy Peattie (Falkirk East) (Lab): There can be no doubt that the bill is one of the most important pieces of legislation that the Scottish Parliament will ever pass. Not only does it define what Scotland can do to address the challenge of climate change—reduce emissions, build a green economy and adapt to change—it contributes to global action against climate change and allows us to set an example and raise the bar for climate change legislation. We have worked hard to incorporate many strands of policy and action into the bill to ensure that we encourage the best use of technology, the best practice in our public bodies and the best development of working practices and to ensure that we promote sustainable travel for work and leisure, public participation and awareness raising.

Scotland can be proud of the bill. I thank the clerks for their hard work. They must have used candles to stay up late at night to make sense of our amendments. I congratulate all those who have campaigned and lobbied for a strong Climate Change (Scotland) Bill. The Stop Climate Chaos Coalition has been fantastic. I also thank everyone who is present at the debate, everyone who has written, everyone who is working to change the way that we live and everyone who is doing what they can to contribute to a more sustainable use of our planet.

I am proud to have played a part in the bill, but the process does not end here; it is only the beginning of a new stage in our work to address climate change. The Copenhagen protocol has been published ahead of the forthcoming climate change talks. Reducing emissions will require a transition to an economy that is based on more sustainable production and consumption and the promotion of sustainable lifestyles. That must be underpinned by a just transition for the workforce, which is central to achieving an agreement that is based on the active participation of all stakeholders. Anything else would simply repeat the mistakes of the past. Economic reconstruction should not neglect industries and communities. I hope that the United Kingdom negotiators will reflect the widespread support among trade unions and other civic organisations for a just transition clause.

Of course, it is easy to be cynical about what people are trying to do to tackle climate change. People say to me, “Well, actually, it’s not a problem, so you’re talking nonsense.” Others choose not to think about the implication of not tackling climate change. Some people think, “Well, it’s just too big, so we can do absolutely nothing.” We have a real job to do to win hearts and minds in communities across Scotland and, indeed, across the world.
The idea that 2050 is too far into the future to think about is nonsense. Forty years is not a long time, looking back. This is my ruby wedding anniversary—I do not want presents or drinks. On this day, 40 years ago, I married as a teenager. I had no idea then what would happen in 2009. Indeed, apart from nuclear weapons, I was not interested in the possibility that anything might destroy our world. I might not be here in 2049, but I hope that my children and grandchildren—I am getting emotional now—will be, and I care about the world that they will inherit.

Let us pass the bill so that we can get on with the task of making this world a better place, both now and in the future.

16:16

Patrick Harvie (Glasgow) (Green): What can I say to Cathy Peattie, other than “Congratulations”?

John Swinney began his remarks by offering thanks to those who have well earned them, and it would be wrong for me to begin in any other way. I thank my fellow members of the Transport, Infrastructure and Climate Change Committee as well as other members from outwith the committee who have engaged constructively throughout the process. I thank our witnesses and our colleagues in the Scottish Parliament information centre. In particular, I thank our team of clerks, who have, perhaps more than any of us, earned a fabulous summer recess after the work that they have put in.

I also thank the NGO community, especially the Stop Climate Chaos Coalition—which was misreported today as the “Save Climate Change Coalition” by a newspaper sub-editor who does not seem to get it—for the wider pressure that has been applied. That pressure has come not just from campaign groups and activists but from people in the private sector—for example, Scottish and Southern Energy’s chief executive, Ian Marchant—and from others in faith organisations. Without that overwhelming pressure from outside Parliament, we would not have made the progress that has been made during the bill’s passage over the past few months.

Alex Johnstone spoke of those who might have grave doubts about the nature of climate change, but another criticism that might be made, which I do not direct at any particular party, is that many people out there might have even graver doubts about the nature of party politics. Despite the progress that has been made with the bill, the victory belongs to the outside campaigners. Perhaps the degree of posturing that has taken place—on all sides—is understandable and is a natural shortcoming of party politics, but we should think carefully about how, and whether, we might avoid that in future.

Despite those shortcomings, Scotland has shown itself, in passing the bill, to be not just environmentalist but rationalist and internationalist. We have recognised our responsibility for the unequal impact of the choices that we make not only on people here at home—as Cathy Peattie argued, we need a just transition—but also on people around the world. Des McNulty was right to remind us that we could, and should, have done better in that regard.

Sarah Boyack asked where we go from here. Again, my message is primarily to the campaigners and activists. Their work will continue to be vital if we are to turn the commitments that we have made into a reality. As I said to Des McNulty earlier, the headline target in the bill—the 42 per cent interim target—is a vote delayed rather than a vote that we have taken today. Some of the language used in the climate change delivery plan, in ministerial correspondence in recent days and in speeches today makes me fear that we will end up debating which powers are reserved and which are devolved, and arguing that we need reserved powers in order to reach the 42 per cent target. That is an argument that I do not intend to try to settle in this debate, but it will be settled in Parliament. To every one of the tens of thousands of people in Scotland who have lobbied us, who have argued with us and who have pressured us to do better, I say, “Keep going,” because if party politics shows itself to be wanting, we will have achieved very little by passing the bill.

Targets alone are not enough. They are necessary, but not sufficient. They will not be achieved without a radical shift in policy on transport, housing, land use, food and energy. An energy issue that has not come up in today’s debate is infrastructure. Pretty much every member who gets it on climate change recognises the need, for example, for upgrades to the grid, such as the controversial Beauly to Denny transmission line. Yet where is the leadership when people raise aesthetic objections? It is clear that the renewables demanded by the delivery plan will not be connected to the grid without that kind of upgrade. As we await the result of the public local inquiry on the Beauly to Denny line, all of us who argue for radical targets in the bill should be showing leadership on that issue.

We do not yet know the detail of all of the policy shifts that will be required over the next 40 years. It is as though people in the late 1960s drafted a bill setting targets for delivery today. They could not have anticipated the social, technological and economic changes that have taken place, and nor can we anticipate all the changes that will take
place, although we know that they will be more radical than any Government can imagine.

If party politics is found wanting at any stage in the coming decades, it is possible that only more radical approaches, such as those being prepared by people who are getting ready to take direct action on some of the most polluting activities—coal extraction, new coal-fired power stations and new road building—will prompt future politicians to take the radical steps that will be necessary to turn the targets in the bill from numbers on a page into reality.

16:23

Rob Gibson (Highlands and Islands) (SNP): The Climate Change (Scotland) Bill is a victory for the people of Scotland and the wider world. In the many and varied ways that we have agreed through the bill process, it will curb greenhouse gases and mitigate the effects of and help us adapt to climate change.

Unlike Patrick Harvie, I believe that the political parties in the Parliament have grown in stature as the bill has developed. He could not be believed by any of us when he said on Monday:

“This week will be crucial to Scotland’s future reputation, and if the SNP has to be dragged kicking and screaming to 40%, then so be it.”

Such intemperate language sounds like it comes from someone who is speaking from the outside, looking in. It is those of us who are inside who took the decisions today.

Patrick Harvie: Will Rob Gibson take an intervention?

Rob Gibson: We have heard from the member already.

The mainstream of climate change beliefs will be dealt with in the committee to which I belong and that Patrick Harvie convenes. Weekly—I suggest—for the months and years ahead, we will consider the secondary legislation to create the delivery of the ambitious climate change plans that we have agreed to today.

Some of the intemperate language was not needed, but it spurred us on to ensure that we have a stronger bill. It was due to the negotiations between the parties over the issues concerned that we have achieved the bill.

I have played my own part in helping to strengthen our adaptation rules and laws and to provide for specific Scottish scientific advice on our peat bogs and native pine woods, for example, which is part of the process of examining the impact of climate change. I am delighted that the Royal Society for the Protection of Birds has helped us to work towards that possibility.

I have taken a considerable interest in ensuring that there is a firm foundation for the HEET plan—on home energy efficiency targets—which is one of the most ambitious areas of delivery. The target of reaching 11 per cent of our renewable heat needs by 2020 marks a huge leap from where we are at present, and I believe that, thanks to the work done by Scottish Renewables and others, there is now a feeling that the industry is set to invest in Scotland and take up the challenges of creating renewable heat, using machinery such as boilers, and that the sort of green jobs that should flow from our statement of commitment today will be created.

Scotland has a huge potential in this context. We can meet our needs for renewable energy from the tides, the waves and the wind. The UK targets for climate change rely on our delivering that energy, and the same applies to our commitment and contribution for Europe. The scope of the discussions that we have had today and the opportunities that we have grasped in the Parliament, mainly by a consensual approach and in debates that have by and large strengthened the bill enormously, have allowed us to deliver within a short time one of the best bills on climate change that has been passed in the world. There were doubters that we could complete the bill by the summer; those doubts have been allayed. I do not believe that the bill is “staggeringly weak”; I believe that it will be one of the best pieces of legislation that this Parliament passes.

16:27

Patricia Ferguson (Glasgow Maryhill) (Lab): It is a privilege to speak in this debate. Like others, I am delighted that Scotland will have robust climate change legislation following today’s deliberations.

Not being a member of the lead committee can make it difficult for someone with an interest in a bill to follow its progress closely. On this occasion, I am particularly indebted to my colleagues on the Transport, Infrastructure and Climate Change Committee for keeping me and other members informed. I am also indebted to the many constituents of mine who have kept in touch with me along the way and who have ensured that I have known exactly what has been happening with the bill.

None of us is immune from the effects of climate change, and I am sure that we have all encountered problems in our own constituencies that have been caused wholly or in part by climate change. The bill seems to strike just about the right balance between carrot and stick measures. It will require us to continue to monitor and debate the situation as we go forward with secondary legislation. I am pleased that the bill contains such a rigorous measure of reporting.
On emissions, the bill allows us to say to those who are meeting later in the year in Copenhagen to discuss climate change that they should be ambitious, particularly as technology is changing constantly. If they are not ambitious, they will fall behind.

I was very much struck by a discussion between the minister and my colleague Sarah Boyack about how the climate change agenda feeds into so many others. I have an example of that from my constituency. Allied Vehicles constructs and makes electric cars. To me, those cars are for the future, yet they are also for today, as the company employs 300 people in construction work in an area of relatively high unemployment. The agenda is important and meets with many of our other objectives.

The Malawians call it chilala—warming earth. No matter what we call it, the effects of climate change are felt most by people in the developing world, by those who are most vulnerable and by those who are least able to recover from them. In this country, we each produce on average about 9.4 tonnes of emissions per annum. The average Malawian produces only about 0.1 tonnes per annum. Yet it is our friends in Malawi who feel the effects of our actions first and most deeply.

Those of us who have visited Malawi will have sampled chambo, the country’s most popular fish dish. Because the watercourses are drying up, catches of chambo reduced from 2,000 metric tonnes in 1993 to 200 metric tonnes in 2003. At the same time, it is generally accepted that the yearly pattern of wind and rain in Malawi is changing. Most crucially, it is no longer consistent, which means that planting times cannot be synchronised with the weather. It is no wonder that Malawians think that the weather is muddled. They are right—it is.

In Yemen, where there is no permanent river system, the Government is considering moving the capital city, because it foresees that it will not be able to sustain the population’s water supply in a few years’ time. In Burkina Faso, rainfall has fallen to between 400mm and 500mm a year, which represents a decline of almost 20 per cent. In many other parts of the world, local communities are taking action to adapt their lives and their communities to meet the challenges of climate change. Villagers in Bangladesh are moving their buildings—they are building up the height of the local schools so that they can survive heavier rainfall and provide shelter for entire villages if homes are lost to flooding.

We must not lose sight of the fact that such activity is necessary because of our actions. I am interested to know how the Government plans to assist in that regard. In my opinion, that should not be done at the expense of other international development work. We could end up in the same situation as those countries if we are not vigilant; we must use the situation that they are in as a warning to us.

When the Parliament was created, Donald Dewar said that devolution was not an event but a means to an end, and that end was social justice. For that reason, because climate change is a social justice issue, I am delighted to support the bill.

16:32

Malcolm Chisholm (Edinburgh North and Leith) (Lab): I am sure that, when they got up this morning, many of the people who have been involved with the bill for several months—if not, in some cases, years—were tempted to think that it was the beginning of the end, but of course we all know that it is merely the end of the beginning. Recognition of that fact is more crucial to our work on climate change than it is to our work on any other issue that faces us. Tomorrow we must recommit ourselves to delivering on the targets that we have included in the bill during today’s historic proceedings, but perhaps for one evening we can take some satisfaction from delivering what is certainly the most important bill of the parliamentary session.

Like others, I want to thank a number of people. I thank my constituents, hundreds of whom have shown how important an issue climate change is to them by writing to or contacting me about the bill. I also thank the Stop Climate Chaos Coalition, whose members have not only serviced the cross-party group in the Scottish Parliament on climate change—of which Shirley-Anne Somerville and I are co-conveners—but more importantly driven many of the developments in the bill through their energetic and unceasing engagement with MSPs on the big issues that we have discussed today. I know that they are slightly disappointed that some of the amendments that they supported have not been agreed to, but I am sure that they will take some satisfaction from the fact that, in many ways, the bill is stronger as a result of their efforts.

We must also give credit to two other extremely important groups. Credit is due to the Government, which we should remember was the first Government in the world to go for an 80 per cent target, which was the ideal starting point for debates on the bill. In addition—without being too self-congratulatory—we must give credit to the Parliament. It is invidious to mention too many people, but I would like to single out Des McNulty, who managed to get the domestic effort target into the bill. When it was first introduced, the bill did not contain such a target. We should also thank many people for the development of the interim target, including Sarah Boyack, who lodged an
amendment on the subject. Clearly, individuals in other parties, too, were instrumental in bringing about those developments.

The big debates today have been around domestic effort and the interim target. It struck me during the debate and previously that both targets are heavily influenced by emissions trading and that debates on both have been heavily influenced by our understanding of that trading. It was slightly disappointing that there was not more about that crucial issue in the documents that accompany the bill. Perhaps we still have to address that deficiency, because debate on the interim target will clearly continue.

The headline today is that we are united on the 42 per cent interim target—and we should take some satisfaction from that—but the focus tomorrow will be on delivery. We know from the delivery plan that reductions of 36 to 37 per cent are in train, but we must look for more because the point of a target is to stretch and change behaviour. I have just looked at the crucial table in the climate change delivery plan that shows what the targets will mean sector by sector. It struck me that the difference between 34 per cent and 42 per cent in the heat sector is the difference between a reduction of 42 per cent and one of 46 per cent by 2020, which is not an enormous or unachievable difference. In transport, the table shows that the difference is between 24 per cent and 33 per cent, which is a bigger difference but, again, not unachievable.

Somebody at a lobby in Parliament today said to me that he welcomed the announcement by the Minister for Transport, Infrastructure and Climate Change of the target of 10 per cent of all journeys to be made by bicycle by 2020 but that it had not been included in the delivery plan. Perhaps the minister can comment on that. We can do more, which is the message that we need to focus on in the weeks and months ahead.

I am delighted, as I think is everyone in the Parliament, about the amendment on public engagement—amendment 86—being passed. The Government and Parliament alone cannot achieve what the bill seeks, although we must continue to show leadership. Communities and individuals throughout Scotland will do the work in partnership with us. Let us therefore go forward together across the party divides and in partnership with the people.

16:37

Liam McArthur (Orkney) (LD): I raise a glass of bubbly in honour of Cathy Peattie’s ruby anniversary—well done.

At times like these, there is a risk that we lapse into hyperbole in a bid to capture the significance of the task that we are undertaking. Nevertheless, I believe that, in the challenge that we face in addressing climate change and bringing into a more sustainable balance the use to which we put the world’s resources, it is difficult to overstate the bill’s importance and what we seek to achieve through the measures that we are putting in place.

I warmly congratulate Stewart Stevenson on how he has piloted this signature bill through Parliament. I acknowledge the remarks by the Cabinet Secretary for Finance and Sustainable Growth about the bill’s scale and complexity. As I highlighted earlier today, difficulties arose because of the pace with which we elected to consider the bill but, given the imperative for radical early action, that approach was entirely justified.

The speed of the bill’s passage perhaps caught some members by surprise. After what I thought was an entertaining contribution to the debate this afternoon, we clearly could have benefited from hearing more from Alex Johnstone. Sadly, his monastic silence for long periods contrasted with the example of Shirley-Anne Somerville and Rob Gibson, who seemed more seized of the need to improve and strengthen their own Government’s bill.

The bill has been improved and strengthened in many important areas. Like Alison McInnes, I am proud of the role that Liberal Democrats have played in that, but I fully acknowledge that it has very much been a cross-party endeavour, including Alex Johnstone, but one that drew heavily on the expertise of external campaigning organisations and, indeed, the prompting of our constituents. Many members have rightly pointed to the importance of the public’s engagement with the debate that we have had. Parliamentary and committee staff, too, rose superbly to the challenge.

At the risk of eliciting groans from the cabinet secretary, I remain concerned that the bill remains a missed opportunity.

John Swinney: No.

Liam McArthur: There we go—no disappointment there.

For all the rhetoric about the bill being world leading, it can still be found wanting in a number of key respects. The lack of scientifically credible interim annual and sectoral targets means that, while the bill will make some improvements to the current situation, it ultimately risks falling short of fulfilling its potential. The Government is correct to set the target of 80 per cent for 2050—I acknowledge the comments that Malcolm Chisholm made in that regard—even though it is difficult to sustain the assertion that the target is now world leading, because it mirrors the figure set at UK level.
John Swinney: Liam McArthur is in danger of being contaminated by the Liberal Democrats’ doom and gloom. Perhaps if he casts his mind back he will remember that this Government’s proposal for an 80 per cent emissions reduction target was ridiculed by some. Now the UK Government has increased its own target to match an ambition that this Administration has had from day one.

Liam McArthur: I certainly echo the sentiments of Malcolm Chisholm, who conceded that very point in a non-partisan way, but the cabinet secretary’s comments illustrate the point that setting a simple 42 per cent target would provide a more unambiguous benchmark than what has been agreed today.

During the stage 1 debate, I welcomed ministers’ announcement that they were bringing forward the date of the interim target from 2030 to 2020. Stewart Stevenson triumphantly flourished the rabbit that he had just produced from his top hat, but the suspicion remained that all was not what it seemed. So it transpired: although the new interim date was ambitious, the emissions reduction target of 34 per cent was not.

Since that debate, there has been ample opportunity to put some backbone into the bill. For example, the Liberal Democrats have made strenuous efforts to get Parliament to commit to a scientifically credible interim target of 42 per cent. Unfortunately, the Government, supported by both Labour and the Tories, opposed such a move; indeed, in an attempt to outmanoeuvre the Government, Labour simply succeeded in priming the trapdoor through which ministers have gleefully escaped.

In his letter to all party leaders, Scottish and Southern Energy chief executive Ian Marchant said:

“If the 2050 target is 80% cut from the 1990 baseline, then by the halfway point, 2020, the cuts must be more than half way. That means at least 40% with no ifs or buts or politically-motivated caveats”.

He went on to add:

“With its rich natural resources, Scotland shouldn’t just be waiting for the pack, but leading it.”

Ambition has also been lacking in year-on-year targets, with the explicit commitment in the SNP manifesto dumped. The Stop Climate Chaos Coalition has urged the First Minister to honour his commitment to a 3 per cent annual target, while the World Development Movement criticised the decision not to do so as “incredibly disappointing”.

Such shortcomings are not insignificant, but the bill will still achieve much if we can ensure that it is implemented effectively. For example, it will lead to real improvements in the energy efficiency of domestic and non-domestic buildings and put in place important provisions on local and business tax incentives and permitted development rights. I am proud of the role that I have played in these areas and put on record my thanks to the Association for the Conservation of Energy, Friends of the Earth Scotland and the Stop Climate Chaos Coalition. Finally, I should add that the bill’s provisions on cumulative emissions have been greatly improved by the amendments that have been agreed to, due in no small part to my colleague Alison McInnes.

This is a signature bill for the Parliament; it is the most important that it will pass in this session—and perhaps the most important that it has passed so far. It falls short of what it might have been, but it will nevertheless have a significant impact in helping Scotland to play its part in tackling the challenge of climate change not just for us but, as Patricia Ferguson rightly said, for the many people in developing countries who will bear the brunt of climate change in the first instance. In passing, I note that, according to recent evidence, my own constituency might be in the front line in this country.

I thank everyone who has contributed to the scrutiny process and, again, I congratulate the minister on securing the bill’s successful passage. Notwithstanding our reservations, I commit the Liberal Democrats to ensuring that the legislation delivers in the weeks, months and years ahead.

16:43

Nanette Mline (North East Scotland) (Con):

Today’s long and well-fought battle will, at decision time, result in the passing of an extremely important piece of legislation that, following on from the UK Climate Change Act 2008, should ensure that our small island punches well above its weight in the battle against the global warming that threatens our planet’s future, and should set an example for others to follow.

We face an unprecedented environmental challenge and, although we in Scotland might get off relatively lightly, other countries, particularly in the poorest and most heavily populated parts of the world, face devastation unless we can achieve a significant and early reduction in the volume of greenhouse gases emitted from our terrestrial activities.

I have not been involved in the bill’s committee stages, so as an onlooker I feel well placed to acknowledge and pay tribute to the very hard work of the many people inside and outwith the Parliament who in a relatively short time have put in a tremendous amount of effort to ensure that the Climate Change (Scotland) Bill is as robust as possible, with challenging targets and duties
placed on ministers and others to ensure that every effort is put into achieving them.

It is a complex and technical bill, and it has been dealt with with commendable thoroughness and competence by all concerned. However, although I fully understand the need to have the legislation in place as early as possible, to my mind three weeks was not long enough for stages 2 and 3 of such a complex and far-reaching bill. The flurry of stage 3 amendments at the last minute made the final stages of the parliamentary process considerably more stressful for members and staff than they might have been.

The stakes are high and the challenges are awesome. If they are to be met, all of us, in every community, institution and business and in our homes, will have to make a determined effort to reduce our individual contributions to atmospheric pollution by carbon dioxide and other greenhouse gases. John Swinney and Brian Adam were right to highlight the need for public engagement in the delivery of the bill’s objectives, and I am glad that the Parliament has acknowledged that.

I am sure that significant efforts will be made in Scotland and the rest of the United Kingdom to meet the targets that are set for us, but I worry about some of the bigger players in the world whose impact on climate change is on a much bigger scale than ours but whose efforts to offset it are smaller. At least we are setting an example and beginning to move in the right direction.

Much of the focus in recent days has been on part 1 of the bill and the emissions reduction targets within it. We have been happy all along to support the target to reduce emissions by 80 per cent by 2050 and the recently amended interim target of 42 per cent by 2020. That is an ambitious target but, as Scottish and Southern Energy stated in its stage 3 briefing to us, it demonstrates the leadership to which Scotland rightly aspires. It should deliver greater competitive advantage for investment and economic opportunities in a low-carbon economy, with the jobs that that will create. It should also help Scotland to lead the way in securing the necessary policy actions elsewhere in the UK and the European Union.

With ambitious targets in place, it is clear that progress towards achieving them must be carefully monitored. We fully support the duties to be placed on ministers to make regular reports to the Parliament. That will give members the opportunity to question them effectively and openly and to hold them to account for meeting the targets. Although we prefer carrots rather than sticks to encourage businesses, public sector bodies and individuals to make the necessary changes to their behaviour in the interests of climate change mitigation, we accept that public bodies should have regard to the guidance that they will receive from ministers.

Finally, I will deal with a couple of aspects of part 5 of the bill that concerned my party. Following the Government’s decision to drop the forestry leasing proposals, we are pleased that the bill now requires ministers to lay a land use strategy before the Parliament by March 2011. Given the desire for significantly more woodland in Scotland and other competing land uses such as the food production that is so important for our food security, the increasing need for sustainable flood risk management and the need for land for industrial and housing development, it is extremely important that Scotland has a proper plan to use its land in the most appropriate and sustainable way.

On the Conservative benches, we are keen to encourage and improve energy efficiency, so we are pleased that the Parliament has approved the various amendments that will allow energy efficient improvements to dwellings and non-domestic properties. I join other members in commending Sarah Boyack for her immense contribution in that regard over the years. As a north-east MSP, I am also extremely pleased with the minister’s stated commitment to extend the combined heat and power schemes that a number of Aberdeen residents enjoy and his intention that that will be done from April next year.

I could say a great deal more about the detail of this groundbreaking legislation, but I conclude by welcoming the many measures that will help us to make progress in the battle to reduce and mitigate the effects of climate change. There are those who will not be happy with the progress that we have made, but the bill is a major step in the right direction and we will be happy to support it at decision time.

16:49

Des McNulty (Clydebank and Milngavie) (Lab): Like other members, I begin by expressing my particular thanks to the clerks. I probably caused them more late nights and problems than anyone else did at stages 1 and 2, although I probably did not quite do so at stage 3. I am conscious that giving the clerks more work had consequences not only for my fellow committee members but for members of the bill team, so I apologise to them for all the work that I caused them.

Collectively, we have substantially improved the bill. It will be interesting to compare the amended bill that we pass with the bill that was introduced, because that will provide a measure of how far we have come and how much we have added to and
adapted the bill, thereby substantially improving it, as I think members of all parties accept.

Our collective improvement of the bill is a great tribute to the Parliament’s committee system and how it differs from the Westminster system. Bills in the Scottish Parliament go to a specialist committee, whose members have a background and an interest in the committee’s work and build up an area of expertise. I am not saying that we are all experts, but in the context that I have described ministers cannot bring committees information and not expect to be asked difficult questions from time to time—and very difficult questions a fair part of the time.

The collective approach to improving the bill is also a tribute to the Government, given that the make-up of the Transport, Infrastructure and Climate Change Committee is such that the Government party is numerically weak. There are more Labour than SNP members on the committee. That not only presented the Government with problems, which Mr Stevenson and his SNP colleagues dealt with well, but placed a responsibility on Labour members, to which I hope that we responded by being constructive.

The process that the committee went through was all about persuasion. I say to Liam McArthur and Alison McInnes that to some extent their problem was that they did not successfully persuade us about matters that they chose to pursue. They might need to reflect on that. We all need to focus on our ability to persuade people on issues that we want to pursue. I did not persuade people to agree to all the changes that I or my party colleagues wanted to make to the bill, but we made significant changes, not by saying, “We are right and you are wrong,” but by saying, “How can we take this forward in a way that improves the bill?”

It is not just about improving the bill. As Malcolm Chisholm said, passing the bill is not the end of the process but the beginning of implementation. The setting of a target is meaningful only if we also set policy priorities that are consistent with the objectives in the bill. I thought that Mr Swinney’s comments jarred a bit in one area. He seems to regard the 42 per cent target as “34 per cent if the Europeans give in”. I do not think that that is where we have got to. The Parliament is not asking the Government to say that 34 per cent is as far as we can go. What Parliament is asking—and what Scotland wants—is for the Government to consider what additional, cost-effective measures can be brought in and what policy proposals must be reviewed so that we can move towards a higher target.

If David Kennedy is asked whether the bill’s 2020 target is inappropriate, as he was asked last week, he is likely to reply, “Well, 34 per cent is fine.” However, if we ask him what additional action we can take to drive up that target, I think that we will get a different answer. The onus is on the Government to come up with policy proposals that can drive up Scotland’s potential to achieve emissions reductions. The question that we want the UK Committee on Climate Change to answer is, “What is Scotland’s potential and how do we achieve it?”

The bill is a good one. It might not be as good as it could be and some aspects of it might have been improved, but it will provide a solid foundation. We must drive the process forward in real terms, by engaging people and acting in a way that will deliver the objectives that we have set out.

16:54

The Minister for Transport, Infrastructure and Climate Change (Stewart Stevenson): I thank John Swinney for the name check in his opening remarks in the debate. I also thank members around the chamber for their warm words. The contributions of a large number of parliamentarians can be seen in the bill, and those parliamentarians have been informed by widespread action and lobbying from outside the chamber.

The bill is complex, and I quite enjoy engaging with complex bills. Quite early in my business career, I was told that when a person did a job well, their reward was that they got to do it again; but I hope that the cabinet secretary does not have anything immediately in mind in that regard. We shall see.

Alex Johnstone congratulated the clerks to the Transport, Infrastructure and Climate Change Committee, and I would like to congratulate the bill team, whose efforts on occasions could only be described as heroic. The team responded to ministers but, in addition, and through the process of engagement that we have sought to create, they responded to members of other political parties, and tried to support them. The process has been a model for how the Parliament can work. It is very much how we, as a minority Government, would wish to go about our business, now and in the future.

We ended up with a substantial area of common ground, and we now have a substantial set of proposals to which we can compare our views with satisfaction. Alex Johnstone tried to compare himself with an orang-utan; I have agreed with his wife that I will ensure that, at least in circumference, that comparison will not be true.

Cathy Peattie made a particular contribution by being here on her ruby wedding anniversary. I am only three weeks—no, four weeks, no, five
weeks—away from mine. [Laughter.] But with Gavin Brown, I am waiting to see whether the most important delivery of the day has happened. He has been on tenterhooks, waiting to find out whether his next child has been delivered today. We have drawn people in from all the airts; we have created a priority for this bill, and people have respected that.

Patrick Harvie raised questions in relation to devolved and reserved matters. However, on this particular subject, there is common purpose between the United Kingdom Administration and ourselves. That is not least because we have to be part of the UK’s efforts. Our success will be part of its success.

Patrick Harvie also talked about direct action. I counsel him, very severely, that we have to behave responsibly, and that we have to take the people of Scotland with us. We must turn this legislation—[Interruption.]

The Presiding Officer (Alex Fergusson): Order. There is an awful lot of background noise and I would prefer less of it.

Stewart Stevenson: We must turn this legislation into real action.

Patricia Ferguson referred to Allied Vehicles in her constituency. Within the past week, I was delighted to drive one of its electric vehicles. It is interesting to note that battery technology is probably the technology that is not yet up to the mark. A lot of work will be done on that. In Scotland, we have biotech industries and some electrical engineers, and that will probably help. Patricia Ferguson also mentioned Malawi—a topic that brings home the whole idea of social justice that is at the heart of what we are trying to do.

Today has largely been a day in which we have looked inwards. However, we must now look outwards towards Scotland’s comity, to countries around the world, and to the United Nations conference in Copenhagen in December. Most of all, we must look outwards to the poor and disadvantaged in Africa, India, China, Brazil and other countries all round the world.

The bill is not an economic bill, although it will have economic effects. It is not legislation to gather dust on the shelves of hundreds of lawyers; it is a moral step we take that will be important for the world.

When I had dinner with Ian Marchant a couple of weeks ago at the business delivery group, he gave me a copy of Douglas Adams’s “The Hitchhiker’s Guide to the Galaxy”. Ford Prefect had come from another world to look at the earth, and he was working on an entry in the guide that said that the earth was “harmless”. After vigorous research, he converted that assessment to “mostly harmless”. Through this bill, let us turn the earth and humans’ efforts on earth into something that is mostly harmless. Let us also remember that the answer to everything in the hitchhiker’s guide to the galaxy is one that is relevant to today. The answer was 42.
Climate Change (Scotland) Bill

Schedule 1—The Scottish Committee on Climate Change
Schedule 2—Minor and consequential modifications
Climate Change (Scotland) Bill

[AS PASSED]

An Act of the Scottish Parliament to set a target for the year 2050, an interim target for the year 2020, and to provide for annual targets, for the reduction of greenhouse gas emissions; to provide about the giving of advice to the Scottish Ministers relating to climate change; to confer power on Ministers to impose climate change duties on public bodies; to make further provision about mitigation of and adaptation to climate change; to make provision about energy efficiency, including provision enabling council tax discounts; to make provision about the reduction and recycling of waste; and for connected purposes.

PART 1

EMISSIONS REDUCTION TARGETS

The 2050 target

1 The 2050 target

(1) The Scottish Ministers must ensure that the net Scottish emissions account for the year 2050 is at least 80% lower than the baseline.

(2) In this Act, the target set out in subsection (1) is known as the “2050 target”.

The interim target

A2 Setting and modification of interim target

(1) The Scottish Ministers must ensure that the net Scottish emissions account for the year 2020 is at least 42% lower than the baseline.

(2) In this Act, the target set out in subsection (1) is known as the “interim target”.

(3) The Scottish Ministers may, by order, modify the percentage figure mentioned in subsection (1) so as to substitute—

(a) a figure provided by the relevant body by virtue of subsection (4)(b); or

(b) a higher figure,

for the one for the time being mentioned there.

(4) The Scottish Ministers must, as soon as reasonably practicable after the Bill for this Act receives Royal Assent, request advice from the relevant body as to (having regard to the criteria set out in subsection (5))—
(a) whether the percentage figure for the time being mentioned in subsection (1) is the highest achievable interim target; and
(b) if not, what the highest achievable interim target is.

(5) The criteria referred to in subsection (4) are—
   (a) scientific knowledge about climate change;
   (b) technology relevant to climate change;
   (c) economic circumstances, in particular the likely impact of the target on—
      (i) the Scottish economy;
      (ii) the competitiveness of particular sectors of the Scottish economy;
      (iii) small and medium-sized enterprises;
      (iv) jobs and employment opportunities;
   (d) fiscal circumstances, in particular the likely impact of the target on taxation, public spending and public borrowing;
   (e) social circumstances, in particular the likely impact of the target on those living in poorer or deprived communities;
   (f) the likely impact of the target on those living in remote rural communities and island communities;
   (g) energy policy, in particular the likely impact of the target on energy supplies, the renewable energy sector and the carbon and energy intensity of the Scottish economy;
   (h) environmental considerations and, in particular, the likely impact of the targets on biodiversity;
   (i) European and international law and policy relating to climate change.

(6) The Scottish Ministers must publish the advice requested under subsection (4) by 31 December 2009 (or, if the advice is not published by that date, as soon as reasonably practicable afterwards).

(7) Where the relevant body has provided advice of the kind mentioned in subsection (4)(b), the Scottish Ministers must, as soon as reasonably practicable after that advice is published under subsection (6), comply with either of the duties set out in subsection (8).

(8) The duties are—
   (a) to lay before the Scottish Parliament a draft of a statutory instrument containing an order under subsection (3) substituting for the percentage figure for the time being mentioned in subsection (1) the figure provided by the relevant body by virtue of subsection (4)(b); or
   (b) to make a statement to the Scottish Parliament setting out the reasons why no such order has been laid.

(9) If an appropriate Community instrument comes into force, the Scottish Ministers must, before the expiry of the appropriate period, lay a draft of a statutory instrument containing an appropriate order before the Scottish Parliament.

(10) An “appropriate order” means an order under subsection (3) modifying the percentage figure mentioned in subsection (1) so as to substitute a figure of at least 42%.
(11) An “appropriate Community instrument” means a Community instrument—

(a) which contains a commitment to reduce greenhouse gas emissions by at least 30% compared to 1990 levels by 2020; and

(b) which amends Decision 406/2009/EC of the European Parliament and of the Council of 23 April 2009 on the effort of Member States to reduce their greenhouse gas emissions to meet the Community’s greenhouse gas emission reduction commitments up to 2020 in the manner envisaged in Article 8(2) of the Decision.

(12) The “appropriate period” means the period of 3 months beginning with the day on which the appropriate Community instrument comes into force.

(13) If a draft of an appropriate order is not laid before the expiry of the appropriate period, the Scottish Ministers must lay the draft as soon as reasonably practicable afterwards.

(14) Subsections (9) to (13) cease to apply if a figure higher than 42% is, by virtue of a draft of a statutory instrument of the kind mentioned in subsection (8)(a) having been approved by the Scottish Parliament, the percentage figure for the time being mentioned in subsection (1).

### Annual targets

3 **Annual targets**

(1) The Scottish Ministers must—

(a) for each year in the period 2010-2050, set a target for the maximum amount of the net Scottish emissions account;

(b) ensure that the net Scottish emissions account for each year in that period does not exceed the target set for that year.

(2) The target—

(a) for 2010, must be set at an amount that is less than the estimated net Scottish emissions account for 2009;

(b) for each year in the period 2011-2019, must be set at an amount that is consistent with a reduction over that period of net Scottish emissions accounts which would allow the interim target and the 2050 target to be met;

(c) for each year in the period 2020-2050, must be set at an amount that is—

(i) consistent with a reduction over that period of net Scottish emissions accounts which would allow the 2050 target to be met; and

(ii) at least 3% less than the target for the preceding year.

(3) In this Act—

(a) an “annual target” for any year means the target for the maximum amount of the net Scottish emissions account set for that year in accordance with this section and section 4;

(b) references to an annual target being met are references to the net Scottish emissions account for a year not exceeding the annual target for that year (and cognate expressions are to be construed accordingly).
4 Setting annual targets

(1) The Scottish Ministers must, by order, set the annual targets for each year in the periods mentioned in paragraphs (a) to (g) of subsection (2).

(2) The Scottish Ministers must set the annual targets for each year—

(a) in the period 2010-2022, no later than 1 June 2010;
(b) in the period 2023-2027, no later than 31 October 2011;
(c) in the period 2028-2032, no later than 31 October 2016;
(d) in the period 2033-2037, no later than 31 October 2021;
(e) in the period 2038-2042, no later than 31 October 2026;
(f) in the period 2043-2047, no later than 31 October 2031;
(g) in the period 2048-2050, no later than 31 October 2036.

(3A) The Scottish Ministers must, when setting annual targets, have regard to any advice they receive from the relevant body as to the cumulative amount of net Scottish emissions for the period 2010-2050 that is consistent with a reduction over that period of net Scottish emissions accounts which would allow the 2050 target to be met.

(4) The Scottish Ministers must, when setting annual targets, also have regard to the following matters (the “target-setting criteria”)—

(aa) the objective of not exceeding the fair and safe Scottish emissions budget;
(a) scientific knowledge about climate change;
(b) technology relevant to climate change;
(c) economic circumstances, in particular the likely impact of the target on—
   (i) the Scottish economy;
   (ii) the competitiveness of particular sectors of the Scottish economy;
   (iii) small and medium-sized enterprises;
   (iv) jobs and employment opportunities;
(d) fiscal circumstances, in particular the likely impact of the target on taxation, public spending and public borrowing;
(e) social circumstances, in particular the likely impact of the target on those living in poorer or deprived communities;
(f) the likely impact of the target on those living in remote rural communities and island communities;
(g) energy policy, in particular the likely impact of the target on energy supplies, the renewable energy sector and the carbon and energy intensity of the Scottish economy;
(ga) environmental considerations and, in particular, the likely impact of the targets on biodiversity;
(h) European and international law and policy relating to climate change.

(5) If annual targets for a period are not set by the corresponding date mentioned in paragraphs (a) to (g) of subsection (2), the Scottish Ministers must set the annual targets as soon as reasonably practicable afterwards.
In this Act, the “fair and safe Scottish emissions budget” is the aggregate amount of net Scottish emissions for the period 2010-2050 recommended by the relevant body as being consistent with Scotland contributing appropriately to stabilisation of greenhouse gas concentrations in the atmosphere at a level that would prevent dangerous anthropogenic interference with the climate system.

5 Advice before setting annual targets

(1) The Scottish Ministers must, before laying a draft of a statutory instrument containing an order under section 4(1) before the Scottish Parliament, request advice from the relevant body.

(1A) The request for advice must include requests for the relevant body’s views—

(a) in the case of annual targets proposed for years in the period 2010-2020, as to whether those targets are consistent with a reduction over that period of net Scottish emissions accounts which would allow the interim target and the 2050 target to be met;

(b) in the case of annual targets proposed for years in the period 2021-2050, as to whether those targets are consistent with a reduction over that period of net Scottish emissions accounts which would allow the 2050 target to be met;

(c) in any case—

(i) as to what annual targets are appropriate by reference to the target-setting criteria;

(ii) as to the extent to which the annual targets should be met—

(A) by taking action to reduce net Scottish emissions;

(B) by the use of carbon units that in accordance with section 12(1A) and regulations under section 12(2) may be credited to the net Scottish emissions account;

(iii) as to the respective contributions towards meeting the annual targets and the domestic effort target that should be made—

(A) by the traded sector of the Scottish economy;

(B) by the other sectors of the Scottish economy;

(iv) as to the respective contributions towards meeting the annual targets and the domestic effort target that should be made by—

(A) energy efficiency;

(B) energy generation;

(C) land use;

(D) transport.

(1B) The Scottish Ministers must publish the advice requested under subsection (1) as soon as reasonably practicable after they receive it.

(2) As soon as reasonably practicable after laying such a draft, the Scottish Ministers must publish a statement setting out in respect of the annual targets set by the order—

(a) the reasons for setting those annual targets at those levels;

(b) the extent to which those targets take account of the target-setting criteria.
If the order under section 4(1) makes provision different from that recommended by the relevant body, the Scottish Ministers must publish a statement setting out the reasons why.

Advice requested under subsection (1) or a statement under subsection (2) or (3) may be published in such manner as the Scottish Ministers consider appropriate.

In this Part, the “relevant body” means—

(a) where no order has been made under section 19(1) designating a person or body as the advisory body, the UK Committee on Climate Change; or
(b) where such an order has been made, the advisory body.

In subsection (5)(a), the “UK Committee on Climate Change” means the Committee on Climate Change established under section 32 of the Climate Change Act 2008 (c.27) (the “2008 Act”).

In this section, “traded sector” means the sectors of the Scottish economy which are covered by trading schemes within the meaning of section 44 of the 2008 Act.

Modifying annual targets etc.

The Scottish Ministers may, by order, modify—

(a) the percentage figure mentioned in section 3(2)(c);
(b) an annual target set by virtue of section 4(1);
(c) any date mentioned in paragraphs (a) to (g) of section 4(2);
(d) the target-setting criteria in section 4(4).

The Scottish Ministers must, at the same time as laying a draft of a statutory instrument containing an order under subsection (1)(a) before the Scottish Parliament, lay before the Parliament a report explaining why the modification is being proposed.

The Scottish Ministers must, as soon as reasonably practicable after laying a report before the Scottish Parliament under subsection (1A), and in so far as reasonably practicable, make a statement to the Parliament relating to the report.

The Scottish Ministers may make an order under subsection (1)(a) only if they consider that it is no longer necessary for annual targets to be set by reference to that percentage figure.

The Scottish Ministers may make an order under subsection (1)(b) only if they consider that it is appropriate to do so as a result of—

(a) a modification of the interim target; or
(b) another significant change to the basis on which the annual target was set.

The Scottish Ministers may make an order under subsection (1)(c) or (d) only if they consider it appropriate to do so.

The power in subsection (1)(a) may not be exercised so as to substitute a percentage of less than zero.

The power in subsection (1)(b)—

(a) may be exercised only before the beginning of the year to which the target relates;
(b) may not be exercised if the effect of doing so would be that the target for the year would be greater than the target for the preceding year.
7  **Advice before modifying annual targets etc.**

(1) The Scottish Ministers must, before laying a draft of a statutory instrument containing an order under section 6(1) before the Scottish Parliament, request advice from the relevant body.

(2) If the order under section 6(1) makes provision different from that recommended by the relevant body, the Scottish Ministers must lay before the Scottish Parliament a report setting out the reasons why.

(3) The Scottish Ministers must, as soon as reasonably practicable after laying a report before the Scottish Parliament under subsection (2), and in so far as reasonably practicable, make a statement to the Parliament relating to the report.

7A  **Achievement of annual targets: domestic effort target**

(1) The Scottish Ministers must ensure that reductions in net Scottish emissions of greenhouse gases account for at least 80% of the reduction in the net Scottish emissions account in any target year.

(2) In this Act, the target set out in subsection (1) is known as the “domestic effort target”.

(2A) For the purposes of ascertaining whether the domestic effort target has been met, any reduction to the net Scottish emissions account as a result of the crediting to that account of a net amount of European carbon units mentioned in subsection (2B) is to be treated as though it is a reduction in net Scottish emissions.

(2B) In subsection (2A), “European carbon units” means carbon units which are surrendered by participants in—

(a) the European Union Emissions Trading Scheme (“EUETS”); or

(b) such other trading scheme making provision equivalent to the EUETS as the Scottish Ministers may, by order, specify.

(2C) In subsection (2B), “trading scheme” means a trading scheme within the meaning of section 44 of the 2008 Act.

(3) The Scottish Ministers may, by order, modify the percentage figure mentioned in subsection (1) so as to substitute a higher figure for the one for the time being mentioned there.

(4) The Scottish Ministers must, before laying a draft of a statutory instrument containing an order under subsection (3) before the Scottish Parliament, request advice from the relevant body.

(5) If the order under subsection (3) makes provision different from that recommended by the relevant body, the Scottish Ministers must publish a statement setting out the reasons why.

(6) A statement under subsection (5) may be published in such manner as the Scottish Ministers consider appropriate.

---

8  **Progress towards targets**

(1) The Scottish Ministers must in each year, beginning with the year 2011, request the relevant body to prepare a report setting out that body’s views on—
Climate Change (Scotland) Bill

Part 1—Emissions reduction targets

(a) progress towards achievement of—
   (i) annual targets;
   (ii) the interim target;
   (iii) the 2050 target;
(b) whether the annual targets, the interim target or the 2050 target are likely to be achieved;
(c) any further effort which may be necessary to achieve annual targets, the interim target or the 2050 target.

(2) No later than the end of the second year following a year for which an annual target has been set (a “target year”), the Scottish Ministers must request the relevant body to prepare a report setting out that body’s views on—
(a) whether the annual target for the target year was met;
(b) the ways in which those targets were or were not met;
(c) the action taken by the Scottish Ministers to reduce net Scottish emissions during that year.

(3) The Scottish Ministers must lay a response to the relevant body’s report under this section before the Scottish Parliament as soon as reasonably practicable after they receive that body’s report.

Greenhouse gases

(1) In this Act, a “greenhouse gas” means—
   (a) carbon dioxide;
   (b) methane;
   (c) nitrous oxide;
   (d) hydrofluorocarbons;
   (e) perfluorocarbons;
   (f) sulphur hexafluoride.

(2) The Scottish Ministers may, if they consider it appropriate to do so, by order, modify subsection (1) so as to—
(a) add a gas;
(b) modify the description of a gas.

(3) The power in subsection (2)(a) may be exercised only if it appears to the Scottish Ministers that an agreement or arrangement at European or international level recognises that the gas to be added contributes to climate change.

(4) The Scottish Ministers must, before laying a draft of a statutory instrument containing an order under subsection (2) before the Scottish Parliament, request advice from the relevant body.
(5) If the order makes provision different from that recommended by the relevant body, the Scottish Ministers must publish a statement setting out the reasons why.

(6) A statement under subsection (5) may be published in such manner as the Scottish Ministers consider appropriate.

**Baseline**

10 **The baseline**

(1) In this Act, the “baseline” means the aggregate amount of—
   
   (a) net Scottish emissions of carbon dioxide for 1990; and
   
   (b) net Scottish emissions of each of the greenhouse gases other than carbon dioxide for the year that is the baseline year for that gas.

(2) The baseline years for greenhouse gases other than carbon dioxide are—
   
   (a) for methane, 1990;
   
   (b) for nitrous oxide, 1990;
   
   (c) for hydrofluorocarbons, 1995;
   
   (d) for perfluorocarbons, 1995;
   
   (e) for sulphur hexafluoride, 1995.

11 **Baselines for additional greenhouses gases**

(1) This section applies where the Scottish Ministers have made an order under section 9(2)(a) adding a greenhouse gas.

(2) In this section, such a gas is referred to as an “additional greenhouse gas”.

(3) The Scottish Ministers may, by order, make provision as to the manner of determining, in the case of an additional greenhouse gas, the amount of net Scottish emissions for the baseline year.

(4) An order under subsection (3) may in particular—
   
   (a) designate a year as the baseline year for the additional greenhouse gas;
   
   (b) provide for the amount of net Scottish emissions of the gas for that year to be treated for the purposes of this Act as the amount of net Scottish emissions of that gas for that baseline year.

**Supplementary**

12 **The net Scottish emissions account**

(1) The net Scottish emissions account means the aggregate amount of net Scottish emissions of greenhouse gases—
   
   (a) reduced by the amount of carbon units credited to the net Scottish emissions account for the period in accordance with regulations under subsection (2);
   
   (b) increased by the amount of carbon units that, in accordance with such regulations, are to be debited from the net Scottish emissions account for the period.
(1A) The net amount of carbon units credited to the net Scottish emissions account for a year for which an annual target has been set (a “target year”) must not exceed the allowable amount.

(1B) The “allowable amount” is—

(a) the amount equal to the limit, set by virtue of section 18A(1), on the net amount of carbon units that may be credited to net Scottish emissions accounts during the period which includes the target year; or

(b) where a net amount of carbon units has been credited to the net Scottish emissions account for any other target year in that period, the balance (if any) remaining of the amount referred to in paragraph (a).

(1C) In subsections (1A) and (1B), the “net amount of carbon units” has the meaning given by section 18A(3).

(2) The Scottish Ministers may, by regulations, make provision about—

(a) the circumstances in which carbon units may be credited to the net Scottish emissions account for a period;

(b) the circumstances in which such units may be debited from that account for a period;

(c) the manner in which this is to be done.

(3) The regulations must contain provision for ensuring that carbon units that are credited to the net Scottish emissions account for a period cease to be available to offset other greenhouse gas emissions.

12A Restriction on use in 2010-2012 of carbon units purchased by Scottish Ministers

(1) The Scottish Ministers may not, where subsection (2) applies, credit to the net Scottish emissions account for a year in the period 2010-2012 any carbon units purchased by them.

(2) This subsection applies provided the percentage figure mentioned in section 2(1) is 34%.

(3) The Scottish Ministers may only credit to the net Scottish emissions account for a year in the period 2013-2017 any carbon units purchased by them up to a limit of 20% of the reduction in the amount of the net Scottish emissions account planned for that year.

13 Attribution of emissions to Scotland

For the purposes of section 15(1), emissions of a greenhouse gas are attributable to Scotland if—

(a) they are emitted from sources in Scotland;

(b) they are attributed to Scotland by virtue of an order under section 14(1).

14 Scottish share of emissions from international aviation and international shipping

(1) The Scottish Ministers may, by order, make provision regarding the emissions of greenhouse gases from international aviation and international shipping that are attributable to Scotland.

(2) An order under subsection (1)—
(a) must make provision for emissions from international aviation and international shipping of—

(i) in the case of the first order under that subsection, each greenhouse gas; and

(ii) in the case of any subsequent order under subsection (1), any gas added to the list of greenhouse gases in section 9(1) since the last such order was made,

to be taken into account as Scottish emissions of each such gas in the period starting with the 1 January following the order being approved by the Scottish Parliament and ending on 31 December 2050;

(aa) may make provision as to any past period in which emissions of a greenhouse gas are to be taken into account as Scottish emissions of that gas;

(ab) may not, once emissions from international aviation and international shipping of a greenhouse gas are, by virtue of a previous order under subsection (1), being taken into account as Scottish emissions of that gas, provide for such emissions to cease to be taken into account as Scottish emissions of that gas;

(b) must, subject to subsection (2ZA), make provision as to the manner in which emissions from international aviation and international shipping of each greenhouse gas are to be taken into account in determining Scottish emissions of that gas—

(i) for the year that is the baseline year for that gas; and

(ii) in the period during which such emissions of that gas are to be taken into account as Scottish emissions of that gas.

(2ZA) Provision made by virtue of subsection (2)(b) must include the use, for each greenhouse gas, of a multiplier which reflects the direct and indirect non-carbon dioxide climate change impacts of emissions at altitude from international aviation.

(2A) A draft of a statutory instrument containing the first order under subsection (1) must be laid before the Scottish Parliament no later than 1 June 2010.

(2B) If a draft of the first order is not laid by the date mentioned in subsection (2A), the Scottish Ministers must lay the draft as soon as reasonably practicable afterwards.

(3) The Scottish Ministers must, before laying a draft of a statutory instrument containing an order under subsection (1) before the Scottish Parliament, request advice from the relevant body (including advice as to an appropriate multiplier for each greenhouse gas for the purposes of subsection (2ZA)).

(4) If the order makes provision different from that recommended by the relevant body, the Scottish Ministers must publish a statement setting out the reasons why.

(5) A statement under subsection (4) may be published in such manner as the Scottish Ministers consider appropriate.
“Scottish emissions”, in relation to a greenhouse gas, means emissions of that gas which are attributable to Scotland;
“Scottish removals”, in relation to a greenhouse gas, means removals of that gas from the atmosphere due to land use, land-use change or forestry activities in Scotland;
“the net Scottish emissions” for a period, in relation to a greenhouse gas, means the amount of Scottish emissions of that gas for the period reduced by the amount of Scottish removals of that gas for the period.

(2) The Scottish Ministers may, if they consider it appropriate to do so, by order, modify the definition of Scottish removals in subsection (1).

(3) The amount of Scottish emissions and Scottish removals of a greenhouse gas for a period must, in so far as reasonably practicable, be determined consistently with international carbon reporting practice.

16 Measurement of emissions etc.

(1) For the purposes of this Act, greenhouse gas emissions, reductions of such emissions and removals of greenhouse gases from the atmosphere are measured or calculated in tonnes of carbon dioxide equivalent.

(2) A “tonne of carbon dioxide equivalent” means one metric tonne of carbon dioxide or an amount of any other greenhouse gas with an equivalent global warming potential (calculated consistently with international carbon reporting practice).

17 International carbon reporting practice

In this Act, “international carbon reporting practice” means accepted practice in relation to reporting for the purposes of—

(a) the protocols to the United Nations Framework Convention on Climate Change;

(b) such other agreements or arrangements at European or international level as the Scottish Ministers may, by order, specify.

18 Carbon units and carbon accounting

(1) The Scottish Ministers may, by regulations, make provision for a scheme—

(a) for registering or otherwise keeping track of carbon units;

(b) for establishing and maintaining accounts in which carbon units may be held, and between which they may be transferred, by the Scottish Ministers.

(2) Regulations under subsection (1) may, in particular, provide for an existing scheme to be adapted for these purposes.

(3) The regulations may also include provision—

(a) designating a person or body to administer the scheme;

(b) establishing a person or body for that purpose and making such provision in relation to the appointment of members, staffing, expenditure, procedure and otherwise of the person or body as the Scottish Ministers consider appropriate;

(c) conferring power on the Scottish Ministers to give guidance or directions to the person or body administering the scheme;
(d) conferring power on the Scottish Ministers to delegate the performance of any of the functions conferred on them by the regulations;

(e) requiring the payment by persons using the scheme of such charges as are reasonably required to cover the reasonable costs incurred in operating the scheme.

(4) In this Act, a “carbon unit” means a unit of a kind specified in regulations made under subsection (1) and which represents—

(a) a reduction in an amount of greenhouse gas emissions;

(b) the removal of an amount of greenhouse gas from the atmosphere;

(c) an amount of greenhouse gas emissions allowed under a scheme or arrangement imposing a limit on such emissions.

18A Limits on use of carbon units

(1) The Scottish Ministers must, by order, set a limit on the net amount of carbon units that may be credited to net Scottish emissions accounts during the periods mentioned in paragraphs (a) to (i) of subsection (2).

(2) The Scottish Ministers must set the limit—

(a) for the period 2010-2012, no later than 1 June 2010;

(b) for the period 2013-2017, no later than 31 December 2011;

(c) for the period 2018-2022, no later than 31 December 2016;

(d) for the period 2023-2027, no later than 31 December 2021;

(e) for the period 2028-2032, no later than 31 December 2026;

(f) for the period 2033-2037, no later than 31 December 2031;

(g) for the period 2038-2042, no later than 31 December 2036;

(h) for the period 2043-2047, no later than 31 December 2041;

(i) for the period 2048-2050, no later than 31 December 2046.

(3) The “net amount of carbon units” means C minus D, where—

“C” is the amount of carbon units credited to net Scottish emissions accounts during the period in accordance with regulations under section 12(2);

“D” is the amount of carbon units debited from net Scottish emissions accounts during the period in accordance with such regulations.

(4) An order under subsection (1) may provide that carbon units of a description specified in the order do not count towards the limit.

(5) If the limit for a period is not set by the corresponding date mentioned in paragraphs (a) to (i) of subsection (2), the Scottish Ministers must set the limit as soon as reasonably practicable afterwards.

18B Modifying limits on use of carbon units etc.

(1) The Scottish Ministers may, by order, modify—

(a) a limit on the use of carbon units set by virtue of section 18A(1);
(b) any date mentioned in paragraphs (a) to (i) of section 18A(2).

(2) The Scottish Ministers may make an order under subsection (1)(a) only if they consider that it is appropriate to do so as a result of—

(a) a modification of the interim target; or

(b) another significant change to the basis on which the limit on the use of carbon units was set.

(3) The Scottish Ministers may make an order under subsection (1)(b) only if they consider it appropriate to do so.

(4) An order under subsection (1)(a) may provide that carbon units of a description specified in the order do not count towards the limit.

18C Advice before setting or modifying limits on use of carbon units etc.

(1) The Scottish Ministers must, before laying a draft of a statutory instrument containing an order under section 18A(1) or 18B(1) before the Scottish Parliament, request advice from the relevant body.

(2) If the order under section 18A(1) or 18B(1) makes provision different from that recommended by the relevant body, the Scottish Ministers must publish a statement setting out the reasons why.

(3) A statement under subsection (2) may be published in such manner as the Scottish Ministers consider appropriate.

PART 2

ADVISORY FUNCTIONS

Advisory body

19 Meaning of advisory body

(1) The Scottish Ministers may, by order, designate—

(a) a body established under section 20(1); or

(b) such other public body as they consider appropriate,

to exercise the functions mentioned in subsection (3) (the “advisory functions”).

(2) In this Act, the body designated by virtue of subsection (1) is the “advisory body”.

(3) The advisory functions are—

(a) the function of providing advice, analysis, information and other assistance to the Scottish Ministers in respect of Ministers’ duty under section A2(1) and functions under sections 5, 7, 8 and 9(4);

(b) the functions conferred on the advisory body by sections 22 to 27 and 45C; and

(c) such other functions relating to advice on climate change as the Scottish Ministers may confer by an order under subsection (1).

(4) An order under subsection (1) may in particular provide—

(a) for the conferral of functions on the advisory body relating to advice on climate change;
Part 2—Advisory functions

(5) In subsection (1)(b), a “public body” means a person or body with functions of a public nature.

20 Scottish Committee on Climate Change

(1) The Scottish Ministers may, by order, establish a body for the purpose of exercising the advisory functions.

(2) The body established by virtue of subsection (1) is to be known as the Scottish Committee on Climate Change (the “Committee”).

(3) Schedule 1 makes further provision about the Committee.

(4) An order under subsection (1) may in particular provide—

(a) for the conferral of functions on the Committee relating to advice on climate change;

(b) in relation to the status, constitution and proceedings of the Committee as the Scottish Ministers consider appropriate;

(c) for the information that the Committee’s advice must contain;

(d) for the factors to which the Committee is to have regard in giving that advice;

(e) for the period within which the Committee must give that advice;

(f) as to whom that advice is to be given;

(g) for the form and manner in which that advice is to be published and laid before the Scottish Parliament.

21 Application of sections 22 to 27

(1) Sections 22 to 27 and 45C have effect only from—

(a) the date when an order made by the Scottish Ministers under section 19(1) comes into force; or

(b) such later date or dates as the Scottish Ministers may specify in an order under that section.

(2) When an order under section 19(1)—

(a) bringing section 24 into effect comes into force, subsection (3) of section 8 ceases to have effect;

(b) bringing section 45C into effect comes into force, subsection (4) of section 45B ceases to have effect.
Advice on annual targets etc.

(1) When requested to do so by the Scottish Ministers, the advisory body must provide the Scottish Ministers with advice as regards—

(a) annual targets Ministers propose to set under section 4;
(b) a modification Ministers propose to make under section 6.

(2) When providing advice under subsection (1)(a), the advisory body must express a view—

(a) in the case of annual targets proposed for years in the period 2010-2020, as to whether those targets are consistent with a reduction over that period of net Scottish emissions accounts which would allow the interim target and the 2050 target to be met;
(b) in the case of annual targets proposed for years in the period 2021-2050, as to whether those targets are consistent with a reduction over that period of net Scottish emissions accounts which would allow the 2050 target to be met;
(c) in any case, as to what annual targets are appropriate by reference to the target-setting criteria.

(3) When providing advice under subsection (1)(a), the advisory body must also express a view as to—

(a) the extent to which the annual targets should be met—

(i) by taking action to reduce net Scottish emissions;
(ii) by the use of carbon units that in accordance with section 12(1A) and regulations under section 12(2) may be credited to the net Scottish emissions account;

(b) the respective contributions towards meeting the annual targets and the domestic effort target that should be made—

(i) by the traded sector of the Scottish economy;
(ii) by the other sectors of the Scottish economy;

(ba) the respective contributions towards meeting the annual targets that should be made by—

(i) energy efficiency;
(ii) energy generation;
(iii) land use;
(iv) transport.

(3A) When providing advice under subsection (1)(a), the advisory body may also express a view as to any other matter that body considers appropriate including, in particular, as to any sectors of the Scottish economy in which there are particular opportunities for contributions to be made towards meeting annual targets through reductions in emissions of greenhouse gases.

(3B) When providing advice under subsection (1)(a), the advisory body must also express a view as to the cumulative amount of net Scottish emissions for the period 2010-2050 that is consistent with a reduction over that period of net Scottish emissions accounts which would allow the 2050 target to be met.
(4) The advisory body must provide advice under this section within such period as the Scottish Ministers may reasonably request.

(5) In subsection (3)(b)(i), “traded sector” means the sectors of the Scottish economy which are covered by trading schemes within the meaning of section 44 of the 2008 Act.

### 23 Reporting on progress towards targets

(1) The advisory body must, in each year beginning with the specified year, prepare a report setting out that body’s views on—

(a) progress towards achievement of—

(i) annual targets;

(ii) the interim target;

(iii) the 2050 target;

(b) whether the annual targets, the interim target or the 2050 target are likely to be achieved;

(c) any further effort which may be necessary to achieve annual targets, the interim target or the 2050 target.

(2) In subsection (1), the “specified year” means such year as the Scottish Ministers may, by order, specify.

(3) A report prepared in a relevant year must also set out the advisory body’s views on the matters mentioned in subsection (3C).

(3A) In subsection (3), the “relevant year” means such year as the Scottish Ministers may, by order, designate in accordance with subsection (3B).

(3B) The year which may be designated under subsection (3A) is the first year following a year for which an annual target has been set (a “target year”) or the second year following a target year.

(3C) The matters referred to in subsection (3) are—

(a) whether the annual target for the target year was met;

(aa) whether the domestic effort target was met in that target year;

(b) the ways in which those targets were or were not met;

(c) the action taken by the Scottish Ministers to reduce net Scottish emissions during that year.

(4) The advisory body must lay a report under this section before the Scottish Parliament no later than—

(a) 31 January in the third year following the target year; or

(b) such other date as the Scottish Ministers may, by order, appoint.

### 24 Scottish Ministers’ response to reports on progress

(1) The Scottish Ministers must lay before the Scottish Parliament a response to a report laid by the advisory body before the Parliament under section 23.

(2) The response to the advisory body’s report must be laid before the Parliament no later than—
(a) 31 March in the third year following the year for which an annual target has been set; or
(b) such other date as the Scottish Ministers may, by order, appoint.

25 **Duty of advisory body to provide advice or other assistance**

When requested to do so by the Scottish Ministers, the advisory body must provide advice, analysis, information or assistance as regards—

(a) the exercise of the Scottish Ministers’ functions under this Act;
(b) the exercise of Ministers’ functions in relation to climate change other than under this Act;
(c) other matters relating to climate change.

26 **Guidance to advisory body**

(1) The advisory body must have regard to any guidance given by the Scottish Ministers to it in relation to the exercise of its functions under this Act.

(2) The Scottish Ministers may not give the advisory body guidance as to the content of any advice or report.

(3) The power to give guidance under subsection (1) includes power to vary or revoke the guidance.

27 **Power to give directions to advisory body**

(1) The Scottish Ministers may, if they consider it appropriate to do so, give the advisory body directions as to the exercise of its functions under this Act.

(2) The Scottish Ministers may not direct the advisory body as to the content of any advice or report.

(3) The power to give directions under subsection (1) includes power to vary or revoke the directions.

(4) The advisory body must comply with any directions given under subsection (1).

**PART 3**

**REPORTING DUTIES**

28 **Reports on annual targets**

(1) The Scottish Ministers must lay before the Scottish Parliament a report in respect of each year in the period 2010-2050 for which an annual target has been set (a “target year”).

(2) The report must state whether the annual target for the target year has been met.

(3) If the annual target has not been met, the report must explain why.

(3A) The report must also state whether the domestic effort target has been met in the target year to which the report relates.

(3B) If the domestic effort target has not been met, the report must explain why.
(4) The report must also contain the information mentioned in section 29.

(5) The report under this section must be laid before the Parliament no later than 31 October in the second year after the target year.

29 Reports on annual targets: content

(1) In respect of each greenhouse gas, the report must—
(a) state the amount of net Scottish emissions for the baseline year;
(b) state the amount of net Scottish emissions for the target year;
(c) state whether the amount of net Scottish emissions represents an increase or decrease compared to the equivalent amount for the previous target year;
(d) identify the methods used to measure or calculate the amount of net Scottish emissions (including in particular any change to those methods).

(2) The report must also set out the aggregate amount for the target year of net Scottish emissions.

(3) The report must also—
(a) state the amount of the net Scottish emissions account for the target year;
(aa) state the proportion of the reduction in the net Scottish emissions account which is accounted for by reductions in net Scottish emissions;
(b) state the total amount of carbon units—
(i) that have been credited to or debited from the net Scottish emissions account for the target year;
(ii) that have been purchased in the target year;
(iii) that have been held and not surrendered in the target year;
(c) give details of the number and type of those carbon units.

(4) The report must also—
(a) state the amount of Scottish gross electricity consumption for the target year;
(b) state the amount of Scottish electricity generation for the target year;
(c) state the average greenhouse gas emissions per megawatt hour of electricity generated in Scotland in the target year;
(d) state the average greenhouse gas emissions per megawatt hour, and the estimated lifetime cumulative emissions, of any new electricity generation capacity greater than 50 megawatts approved in Scotland in the target year.

(4A) The report for each year in the period 2011-2050 must—
(a) state the amount of the net Scottish emissions account for each preceding target year;
(b) state the cumulative amount of the net Scottish emissions account for the target year and all preceding target years.

(5) If the method of measuring or calculating net Scottish emissions changes and that change is such as to require adjustment of an amount for an earlier target year, the report must specify the adjustment required and state the adjusted amount.
(6) An adjustment under subsection (5) must, in so far as reasonably practicable, be made in accordance with international carbon reporting practice.

(6A) If an amount mentioned in subsection (3)(a) or subsection (4A)(a) or (b) for an earlier period requires to be adjusted, the report must—

(a) explain why the adjustment is required;
(b) specify the adjustment required; and
(c) state the adjusted amount.

(7) The report may contain such other information as the Scottish Ministers consider appropriate and, in particular, may state the amount of Scottish electricity generation from each source for the target year.

30 Reports on proposals and policies for meeting annual targets

(1) As soon as reasonably practicable after making an order under section 4(1) setting annual targets, the Scottish Ministers must lay before the Scottish Parliament a report containing the following information.

(1A) The Scottish Ministers must, before laying a report under this section before the Scottish Parliament, lay a draft of the report before the Parliament.

(1B) The Scottish Ministers may not lay the report before the expiry of the period for Parliamentary consideration.

(1C) In subsection (1B), the “period for Parliamentary consideration” means the period of 60 days, of which no fewer than 30 must be days on which the Parliament is not dissolved or in recess.

(1D) The Scottish Ministers must, before laying the report before the Parliament, have regard to—

(a) any representations on the draft report made to them;
(b) any resolution relating to the draft report passed by the Parliament; and
(c) any report relating to the draft report published by any committee of the Parliament for the time being appointed by virtue of standing orders.

(1E) The Scottish Ministers must, when laying the report before the Parliament, lay a statement setting out—

(a) details of any representations, resolutions or reports mentioned in subsection (1D);
(b) the changes (if any) they have made to the report in response to such representations, resolutions or reports and the reasons for those changes.

(1F) The Scottish Ministers must, as soon as reasonably practicable after laying a report under this section, and in so far as reasonably practicable, make a statement to the Parliament relating to the report.

(2) The report must, in particular, set out—

(a) the Scottish Ministers’ proposals and policies for meeting the annual targets;
(b) how those proposals and policies are expected to contribute towards the achievement of the interim target, the 2050 target and, in each target year, the domestic effort target;
(c) the timescales over which those proposals and policies are expected to take effect.
(2A) The report must also set out the Scottish Ministers’ proposals and policies regarding the respective contributions towards meeting the annual targets that should be made by—
(a) energy efficiency;
(b) energy generation;
(c) land use;
(d) transport.

(3) The report must also explain how the proposals and policies set out in the report are expected to affect different sectors of the Scottish economy.

(4) The second and each subsequent report under this section—
(a) must contain an assessment of the progress towards implementing proposals and policies set out in earlier reports;
(b) may make such adjustments to those proposals and policies as the Scottish Ministers consider appropriate.

31 Reports on proposals and policies where annual targets not met

(1) This section—
(a) applies if the Scottish Ministers lay a report under section 28 which states that an annual target has not been met or that the domestic effort target has not been met in the target year to which the report relates;
(b) does not apply if that report relates to the annual target for 2050.

(2) As soon as reasonably practicable after the report referred to in subsection (1)(a) has been laid, the Scottish Ministers must lay a report before the Scottish Parliament setting out proposals and policies to compensate in future years for the excess emissions.

31A Reports on emissions attributable to Scottish consumption of goods and services

(1) The Scottish Ministers must lay before the Scottish Parliament a report in respect of each year in the period 2010-2050 containing the following information.

(2) The report must, in so far as reasonably practicable, set out the emissions of greenhouse gases (whether in Scotland or elsewhere) which are produced by or otherwise associated with the consumption and use of goods and services in Scotland during that year.

(3) The report may also contain such other information as the Scottish Ministers consider appropriate.

31AA Reports on impact on emissions of exercise of electricity generation related functions

(1) The Scottish Ministers must lay before the Scottish Parliament a report in respect of each year in the period 2010-2050 containing the following information.

(2) The report must, in so far as reasonably practicable, set out the impact on net Scottish emissions during that year resulting from the exercise by the Scottish Ministers of the functions conferred on them by virtue of any enactment relating to electricity generation.
31B Report on progress towards meeting the interim target

(1) The Scottish Ministers must, no later than 31 December 2015, lay before the Scottish Parliament a report on progress towards meeting the interim target.

(2) The report must, in particular, state the progress that has been made in reducing net Scottish emissions and indicate whether this progress is consistent with a reduction over the period 2010-2020 of net Scottish emissions accounts which would allow the interim target and the 2050 target to be met.

32 Report on the interim target

(1) The Scottish Ministers must lay before the Scottish Parliament a report containing the following information in respect of the year 2020.

(2) The report must state whether the interim target has been met.

(3) If the interim target has not been met, the report must explain why.

(4) In respect of each greenhouse gas, the report must state the amount of net Scottish emissions for 2020.

(5) The report must also—
   (a) state the amount of the net Scottish emissions account for 2020;
   (aa) state the cumulative amount of the net Scottish emissions account for the period 2010-2020;
   (b) state the total amount of carbon units—
      (i) that have been credited to or debited from the net Scottish emissions account for 2020;
      (ii) that have been purchased in 2020;
      (iii) that have been held and not surrendered in 2020;
   (c) give details of the number and type of those carbon units.

(6) In subsections (4) and (5), the amount means the amount set out in the report for 2020 made under section 28.

(7) The report may contain such other information as the Scottish Ministers consider appropriate.

(8) The report under this section must be laid before the Parliament no later than 31 October 2022.

33 Report on the 2050 target

(1) The Scottish Ministers must lay before the Scottish Parliament a report containing the following information in respect of the year 2050.

(2) The report must state whether the 2050 target has been met.

(3) If the 2050 target has not been met, the report must explain why.

(4) In respect of each greenhouse gas, the report must state the amount of net Scottish emissions for 2050.

(5) The report must also—
   (a) state the amount of the net Scottish emissions account for 2050;
(aa) state the cumulative amount of the net Scottish emissions account for the period 2010-2050;

(b) state the total amount of carbon units—

   (i) that have been credited to or debited from the net Scottish emissions account for 2050;

   (ii) that have been purchased in 2050;

   (iii) that have been held and not surrendered in 2050;

(c) give details of the number and type of those carbon units.

(6) In subsections (4) and (5), the amount means the amount set out in the report for 2050 made under section 28.

(7) The report may contain such other information as the Scottish Ministers consider appropriate.

(8) The report under this section must be laid before the Parliament no later than 31 October 2052.

---

34 Reports: provision of further information to the Scottish Parliament

(1) Where the Scottish Ministers lay a report mentioned in subsection (2) before the Scottish Parliament, they must—

   (a) immediately send a copy of the report to the persons who convene and chair such committees of the Scottish Parliament as are for the time being appointed by virtue of standing orders; and

   (b) as soon as reasonably practicable after doing so, and in so far as reasonably practicable, make a statement to the Parliament relating to the report.

(2) Those reports are reports under—

   (a) section 28(1) (report on annual target);

   (c) section 31(2) (report on proposals and policies to compensate for excess emissions);

   (d) section 32(1) (report on interim target);

   (e) section 33(1) (report on 2050 target).

(3) Where the Scottish Ministers lay a report referred to in subsection (2)(a), they must also, as soon as reasonably practicable after doing so, and in so far as reasonably practicable, attend, if invited, the proceedings of any such committees of the Scottish Parliament as are for the time being appointed by virtue of standing orders, for the purposes of giving evidence on the report.

(4) The Scottish Ministers must have regard to—

   (a) any resolution passed by the Scottish Parliament;

   (b) any report published by any committee of the Parliament for the time being appointed by virtue of standing orders, relating to the content of any report referred to in subsection (2).
35 Further provision about reporting duties

(1) The Scottish Ministers may, if they consider it appropriate to do so, by order, make further provision imposing duties on themselves to report to the Scottish Parliament.

(2) An order under subsection (1) may in particular—

(a) provide for the information to be provided under the duties;

(b) provide for the period in relation to which that information is to be provided;

(c) provide for the period within which that information is to be provided.

PART 4
DUTIES OF PUBLIC BODIES RELATING TO CLIMATE CHANGE

36 Duties of public bodies relating to climate change

(A1) A public body must, in exercising its functions, act—

(a) in the way best calculated to contribute to the delivery of the targets set in or under Part 1 of this Act;

(b) in the way best calculated to help deliver any programme laid before the Scottish Parliament under section 45;

(c) in a way that it considers is most sustainable.

(A2) In this Part, a “public body” means a Scottish public authority within the meaning of section 3(1)(a) of the Freedom of Information (Scotland) Act 2002 (asp 13).

(1) The Scottish Ministers may, if they consider it appropriate to do so, by order, make further provision relating to the imposition on relevant public bodies of duties relating to climate change.

(1A) The duties imposed by subsection (A1) and any duty imposed by virtue of an order under subsection (1) are referred to in this Act as “climate change duties”.

(2) In this Part, a public body which has climate change duties under subsection (A1) or by virtue of subsection (1) is a “relevant public body”.

(3) An order under subsection (1) may in particular—

(a) impose climate change duties on—

(i) all public bodies;

(ii) public bodies of a particular description;

(iii) individual public bodies;

(b) impose different climate change duties on different public bodies or descriptions of public body;

(c) remove climate change duties.

(4) Before laying a draft of a statutory instrument containing an order under subsection (1) before the Scottish Parliament, the Scottish Ministers must consult, in so far as reasonably practicable, the persons mentioned in subsection (5).

(5) Those persons are—

(a) such associations of local authorities; and
(b) such other persons,
as the Scottish Ministers consider appropriate.

(6) The Scottish Ministers must co-operate with a relevant public body to help that body comply with its climate change duties.

37 Guidance to relevant public bodies

(1) The Scottish Ministers must give guidance to relevant public bodies in relation to climate change duties and those bodies must have regard to such guidance.

(2) Before giving guidance under subsection (1), the Scottish Ministers must consult, in so far as reasonably practicable, the persons mentioned in subsection (3).

(3) Those persons are—

(a) such associations of local authorities; and
(b) such other persons,
as the Scottish Ministers consider appropriate.

(4) The Scottish Ministers may vary or revoke guidance given under this section and where guidance is varied to a substantial extent, subsections (2) and (3) apply.

(5) The Scottish Ministers must publish any guidance given under this section.

38 Reporting on climate change duties

(1) The Scottish Ministers may, by order, make provision—

(a) requiring relevant public bodies to prepare reports on compliance with climate change duties;

(aa) requiring any relevant public body found, following an investigation under section 40, to be failing to comply with its climate change duties, to prepare a report on the actions it has taken, is taking or intends to take to secure future compliance with those duties;

(b) subject to subsection (1A), setting out what information reports must contain;

(c) setting out the form and manner of reports;

(d) setting out the period within which reports must be sent to the Scottish Ministers.

(1A) A report required by virtue of subsection (1)(a) must, in particular, contain information relating to how—

(a) procurement policies of relevant public bodies; and

(b) procurement activity by relevant public bodies,
have contributed to compliance with climate change duties.

(2) An order under subsection (1) may in particular—

(a) require two or more relevant public bodies to prepare a joint report in relation to compliance with one or more climate change duties; and

(b) require those bodies to co-operate with each other for the purpose of preparing that report.
Climate Change (Scotland) Bill

Part 4—Duties of public bodies relating to climate change

Monitoring body

39 Appointment of monitoring body
(1) The Scottish Ministers may, by order, designate one or more persons or bodies to monitor whether relevant public bodies are—
   (a) complying with climate change duties;
   (b) having regard to any guidance given under section 37.
(2) In this Part, a person or body designated under subsection (1) is the “monitoring body”.

Investigations

40 Investigations
(1) The monitoring body may carry out an investigation into—
   (a) a relevant public body’s compliance with climate change duties;
   (b) whether a relevant public body is having regard to guidance given under section 37.
(2) The monitoring body must carry out an investigation if the Scottish Ministers direct it to do so.

41 Investigations: investigators’ powers
(1) In this section an “investigator” means—
   (a) the monitoring body;
   (b) a person authorised by the monitoring body for the purpose of carrying out investigations.
(2) An investigator may use the powers set out in subsections (3) to (5) if the investigator considers that it is necessary to do so for the purposes of or in connection with an investigation.
(3) An investigator may, by notice in writing, require any relevant public body to provide any relevant document or relevant information in the possession, or under the control, of the relevant public body.
(4) An investigator may require any person who possesses or controls any document or information referred to in subsection (3) to provide an explanation of the document or information.
(5) An investigator may take copies of, or extracts from, any document or information produced in accordance with subsection (3).
(6) Nothing in this section authorises an investigator to require the disclosure of anything which a person would be entitled to refuse to disclose on grounds of confidentiality in proceedings in the Court of Session.

42 Reporting by monitoring body
(1) The Scottish Ministers may direct the monitoring body to prepare a report relating to—
   (a) the monitoring body’s activities under this Part;
(b) investigations carried out by the monitoring body;
(c) its use of resources in carrying out its functions under this Part;
(d) any other matters the Scottish Ministers may direct.

(2) The report may include information relating to a continuing investigation only if the Scottish Ministers direct that information to be included.

(3) The monitoring body must send the report to the Scottish Ministers.

(4) The Scottish Ministers must lay the report before the Scottish Parliament.

43 Guidance to monitoring body

(1) The monitoring body must have regard to any guidance given by the Scottish Ministers to it in relation to the exercise of its functions under this Part.

(2) Before giving guidance under subsection (1), the Scottish Ministers must consult, in so far as reasonably practicable, the persons mentioned in subsection (3).

(3) Those persons are—

(a) the monitoring body; and

(b) such other persons,
as the Scottish Ministers consider appropriate.

(4) The Scottish Ministers may vary or revoke guidance given under this section and where guidance is varied to a substantial extent, subsections (2) and (3) apply.

(5) The Scottish Ministers must publish any guidance given under this section.

44 Power to direct monitoring body

(1) The Scottish Ministers may give directions to the monitoring body relating to the exercise of its functions under this Part.

(2) The Scottish Ministers may vary or revoke a direction given under this section.

(3) The monitoring body must comply with a direction given under this section.

PART 5
OTHER CLIMATE CHANGE PROVISIONS

CHAPTER 1
ADAPTATION

Adaptation programmes

45 Programmes for adaptation to climate change

(1) This section applies where the Secretary of State lays a report under section 56 of the 2008 Act (report on impact of climate change) before Parliament.

(2) The Scottish Ministers must lay a programme before the Scottish Parliament—

(b) setting out—
(i) their objectives in relation to adaptation to climate change;
(ii) their proposals and policies for meeting those objectives;
(iia) the arrangements for involving employers, trade unions and other stakeholders in meeting those objectives;
(iib) the mechanisms for ensuring public engagement in meeting those objectives;
(iii) the period within which those proposals and policies will be introduced;
and
(c) otherwise addressing the risks identified in the report under section 56 of the 2008 Act.

(3) Where the report laid under section 56 of the 2008 Act is a subsequent report (within the meaning of subsection (3) of that section), the programme must contain an assessment of the progress made towards implementing the objectives, proposals and policies set out in the previous programme.

(4) The Scottish Ministers must lay each programme as soon as reasonably practicable after they receive the copy of the Secretary of State’s report.

45A Reports on progress towards implementation of programmes for adaptation

(1) This section applies where the Scottish Ministers lay a programme under section 45(2) before the Scottish Parliament.

(2) The Scottish Ministers must lay before the Scottish Parliament reports setting out their assessment of the progress made towards implementing the objectives, proposals and policies set out in the programme.

(3) The first report under this section must be laid before the Scottish Parliament no later than the expiry of the period of 12 months beginning with the day on which the programme is laid.

(4) The second and subsequent reports under this section must be laid before the Scottish Parliament no later than the expiry of each subsequent period of 12 months.

45B Progress towards implementation of programmes for adaptation

(1) This section applies where—

(a) the Scottish Ministers lay a programme under section 45(2) before the Scottish Parliament;

(b) the Secretary of State lays a second or subsequent report under section 56 of the 2008 Act before Parliament.

(2) Where subsection (1)(a) applies, the Scottish Ministers must, before the expiry of the period of 2 years beginning with the day on which the programme is laid, request the relevant body to prepare a report setting out its assessment of the progress made towards implementing the objectives, proposals and policies set out in that programme.
(3) Where subsection (1)(b) applies, the Scottish Ministers must, as soon as reasonably practicable after they receive the copy of the report laid, request the relevant body to prepare a further report setting out its assessment of the progress made towards implementing the objectives, proposals and policies set out in the most recent programme laid by the Scottish Ministers under section 45(2).

(4) The Scottish Ministers must, as soon as reasonably practicable after they receive the relevant body’s report under subsection (2) or, as the case may be, further report under subsection (3), lay it before the Scottish Parliament.

### 45C Reports on programmes for adaptation

(1) This section applies where—

   (a) the Scottish Ministers lay a programme under section 45(2) before the Scottish Parliament;

   (b) the Secretary of State lays a second or subsequent report under section 56 of the 2008 Act before Parliament.

(2) Where subsection (1)(a) applies, the advisory body must, before the expiry of the period of 2 years beginning with the day on which the programme is laid, prepare a report setting out its assessment of the progress made towards implementing the objectives, proposals and policies set out in that programme.

(3) Where subsection (1)(b) applies, the advisory body must, as soon as reasonably practicable after the report is laid, prepare a further report setting out its assessment of the progress made towards implementing the objectives, proposals and policies set out in the most recent programme laid by the Scottish Ministers under section 45(2).

(4) The advisory body must, as soon as reasonably practicable after preparing a report under subsection (2) or, as the case may be, a further report under subsection (3), lay it before the Scottish Parliament.

### Land use strategy

### 45D Duty to produce a land use strategy

(1) The Scottish Ministers must, no later than 31 March 2011, lay a land use strategy before the Scottish Parliament.

(2) The strategy must, in particular, set out—

   (a) the Scottish Ministers’ objectives in relation to sustainable land use;

   (b) their proposals and policies for meeting those objectives; and

   (c) the timescales over which those proposals and policies are expected to take effect.

(3) The objectives, proposals and policies referred to in subsection (2) must contribute to—

   (a) achievement of the Scottish Ministers’ duties under section 1, A2(1) or 3(1)(b); and

   (b) achievement of the Scottish Ministers’ objectives in relation to adaptation to climate change, including those set out in any programme produced by virtue of section 45(2); and

   (c) sustainable development.
(4) Before laying the strategy before the Scottish Parliament, the Scottish Ministers must publish a draft strategy and consult with such bodies as they consider appropriate and also with the general public.

(5) The strategy must be accompanied by a report setting out—

(a) the consultation process undertaken in order to comply with subsection (4); and

(b) the ways in which views expressed during that process have been taken account of in finalising the strategy (or stating that no account has been taken of such views).

(6) The Scottish Ministers must, no later than—

(a) five years after laying a strategy before the Scottish Parliament under subsection (1); and

(b) the end of every subsequent period of five years,

lay a revised strategy before the Scottish Parliament; and subsections (2) to (5) apply to a revised strategy as they apply to a strategy laid under subsection (1).

**Muirburn**

**46 Variation of permitted times for making muirburn**

After section 23 of the Hill Farming Act 1946 (c.73) (prohibition of muirburn at certain times), insert—

“23A Power to vary permitted times for making muirburn

(1) The Scottish Ministers may, by order, modify section 23 so as to substitute for any of the dates for the time being mentioned in subsection (1), (2) or, as the case may be, (3) of that section such other dates as they consider appropriate as the dates before which or after which it is lawful to make muirburn in any year.

(3) The Scottish Ministers may make an order under subsection (1) only if they consider it necessary or expedient to do so in relation to climate change.

(3A) An order under subsection (1) may not modify any of the dates for the time being mentioned in section 23 if the modification would result in a period during which it is lawful to make muirburn in any year being shorter than the corresponding period which applied immediately before the coming into force of section 46 of the Climate Change (Scotland) Act 2009 (asp 00).

(4) The power conferred by subsection (1) is exercisable by statutory instrument.

(5) No statutory instrument containing an order under subsection (1) may be made unless a draft of the instrument has been laid before, and approved by resolution of, the Scottish Parliament.”.

**CHAPTER 2**

**FORESTRY**

**47 Power to modify functions of Forestry Commissioners**

(1) The Scottish Ministers may, by order, modify the functions of the Forestry Commissioners in or as regards Scotland.
(2) The Scottish Ministers may make an order under subsection (1) only where they consider it necessary or expedient to do so—

(a) in order to comply with their duty under section 1, A2(1) or 3(1)(b); or

(b) otherwise in relation to climate change.

(3) An order under subsection (1) may in particular include provision enabling the Forestry Commissioners to—

(a) form, or participate in the forming of, a body corporate;

(b) invest in a body corporate;

(c) provide loans;

(d) establish a trust;

(e) act, or appoint a person to act, as—

(i) an officer of a body corporate; or

(ii) a trustee of a trust.

(3A) Any body corporate formed or trust established by the Forestry Commissioners by virtue of an order under subsection (1) is a public body or office holder for the purposes of section 1 of the Nature Conservation (Scotland) Act 2004 (asp 6).

CHAPTER 3
ENERGY EFFICIENCY
Promotion of energy efficiency

48 Duty of Scottish Ministers to promote energy efficiency

(1) The Scottish Ministers must prepare and publish a plan for—

(a) promoting energy efficiency; and

(b) improving the energy efficiency of living accommodation, in Scotland.

(2A) The plan must set annual energy efficiency targets and describe how those targets are to be reported on.

(2AA) The plan must also include details of how the Scottish Ministers intend to update planning and building regulations to ensure that all new buildings avoid a specified and rising proportion of the projected greenhouse gas emissions from their use, calculated on the basis of the approved design and plans for the specific building, through the installation and operation of low and zero-carbon generating technologies.

(3) The plan prepared under subsection (1) must be published no later than 12 months after the day on which this section comes into force.

(4) The Scottish Ministers—

(a) may, from time to time; and

(b) must, before the end of the period mentioned in subsection (5), review the plan prepared and published under this section.
(5) The period referred to in subsection (4)(b) is the period of 3 years beginning with the date on which—
   (a) the plan is first published; or
   (b) the plan was last reviewed under subsection (4).

(6) Where, following a review under subsection (4), the Scottish Ministers vary the plan, they must, as soon as reasonably practicable after so doing, publish the plan as so varied.

(7) In preparing or varying the plan, the Scottish Ministers must have regard to the contributions which improvements to buildings and changes in building standards can make to the delivery of energy efficiency and to the reduction of greenhouse gas emissions.

(8) In this section—
   “energy efficiency” includes the use of—
   (a) technologies (other than those used for the production of heat) reliant on renewable sources of energy;
   (b) materials and equipment the manufacture or use of which produces or involves lower emissions of greenhouse gases than other materials and equipment; and
   (c) surplus heat from electricity generation or other industrial processes for district heating or other purposes;

   “fossil fuel” means—
   (a) coal;
   (b) lignite;
   (c) peat;
   (d) natural gas (within the meaning of the Energy Act 1976 (c.76));
   (e) crude liquid petroleum;
   (f) petroleum products (within the meaning of that Act);
   (g) any substance produced directly or indirectly from a substance mentioned in paragraphs (a) to (f);

   “renewable sources” means sources other than fossil fuel and nuclear fuel.

Promotion of renewable heat

48A Duty of Scottish Ministers to promote renewable heat

(1) The Scottish Ministers must prepare and publish a plan for the promotion of the use of heat produced from renewable sources.

(1A) The plan must, in particular—
   (a) set—
      (i) targets for the percentage of heat to be produced from renewable sources; and
      (ii) in relation to each target, the date by which it should be met; and
(b) describe how those targets are to be reported on.

(2) The plan prepared under subsection (1) must be published no later than 12 months after the day on which this section comes into force.

(3) The Scottish Ministers—

(a) may, from time to time; and

(b) must, before the end of the period mentioned in subsection (4), review the plan prepared and published under this section.

(4) The period referred to in subsection (3)(b) is the period of 2 years beginning with the date on which—

(a) the plan is first published; or

(b) the plan was last reviewed under subsection (3).

(5) Where, following a review under subsection (3), the Scottish Ministers vary the plan, they must, as soon as reasonably practicable after so doing, publish the plan as so varied.

(6) In this section, “renewable sources” has the same meaning as in section 48(8).

49 Laying of plans and reports

(1) The Scottish Ministers must, as soon as reasonably practicable after publishing a plan under section 48(1) or (6) or section 48A(1) or (5), lay it before the Scottish Parliament.

(2) The Scottish Ministers must, before the end of the period mentioned in subsection (3), lay before the Parliament a report on what steps have been taken in implement of the plan.

(3) The period referred to in subsection (2) is the period of 12 months beginning with the date on which—

(a) the plan is first published; or

(b) a report was last laid under subsection (2).

(4) Where the Scottish Ministers lay a plan mentioned in subsection (1) or a report mentioned in subsection (2) before the Parliament, they must, as soon as reasonably practicable after doing so, and in so far as reasonably practicable, make a statement to the Parliament relating to the plan or, as the case may be, report.

Energy performance of non-domestic buildings

50 Non-domestic buildings: assessment of energy performance and emissions

(1) The Scottish Ministers must, by regulations—

(a) provide for the assessment of—

(i) the energy performance of non-domestic buildings;

(ii) the emission of greenhouse gases produced by or otherwise associated with such buildings or with activities carried out in such buildings;

(b) require owners of such buildings to take steps, identified by such assessments, to—
(i) improve the energy performance of such buildings;
(ii) reduce such emissions.

(2) The regulations may in particular include provision about—
(a) the circumstances in which the regulations apply;
(b) the non-domestic buildings to which the regulations apply;
(c) the persons who may be required to have assessments carried out;
(d) the periods within which such assessments must be carried out;
(e) the procedure and methodology for assessing the energy performance of buildings;
(f) the procedure and methodology for assessing the greenhouse gas emissions produced by or otherwise associated with buildings or activities carried out in buildings;
(g) the persons who may carry out such assessments;
(h) the issuing of certificates following such assessments, including the form, manner and content of such certificates;
(ha) the form of any recommendations, contained in such certificates, as to the improvement of the energy performance of buildings and the reduction of emissions produced by or otherwise associated with buildings or activities carried out in buildings;
(hb) the manner in which and periods within which persons must take steps to comply with any recommendations contained in such certificates;
(hc) the registration of such certificates;
(hd) the disclosure of information which is entered in the register;
(i) subject to subsection (3), the enforcement authority in relation to the regulations;
(j) subject to subsection (4), the functions of that authority;
(k) the keeping of information and its production to the enforcement authority;
(l) the enforcement of the duties imposed by the regulations;
(m) offences in relation to failures to comply with requirements of the regulations.

(3) The enforcement authority provided for in the regulations is to be such person or body as the Scottish Ministers consider appropriate.

(3A) The regulations may provide for the functions of the enforcement authority to be exercised by two or more such authorities and about the functions of each such authority.

(4) The functions of the enforcement authority may include power to levy charges to recover the reasonable costs incurred by it in exercising its functions under the regulations.

(4A) The Scottish Ministers must, no later than 12 months after the day on which this section comes into force, publish a report setting out—
(a) what measures they intend to take to reduce emissions from non-domestic buildings; and
(b) when they intend to make provision as mentioned in paragraphs (ha) and (hb) of subsection (2).

(5) In this section, “non-domestic building”—

(a) means a building other than a dwelling;

(b) does not include—

(i) any yard, garden, outbuilding or other land or buildings;

(ii) any common areas, associated with such a dwelling.

Energy performance of living accommodation

50A Living accommodation: assessment of energy performance and emissions

(1) The Scottish Ministers must, by regulations—

(a) provide for the assessment of—

(i) the energy performance of living accommodation;

(ii) the emission of greenhouse gases produced by or otherwise associated with such accommodation;

(b) require owners of such accommodation to take steps, identified by such assessments, to—

(i) improve the energy performance of such accommodation;

(ii) reduce such emissions.

(2) The regulations may in particular include provision about—

(a) the circumstances in which the regulations apply;

(b) the living accommodation to which the regulations apply;

(c) the persons who may be required to have assessments carried out;

(d) the periods within which such assessments must be carried out;

(e) the procedure and methodology for assessing the energy performance of living accommodation;

(f) the procedure and methodology for assessing the greenhouse gas emissions produced by or otherwise associated with living accommodation;

(g) the persons who may carry out such assessments;

(h) the issuing of certificates, following such assessments, including the form, manner and content of such certificates;

(ha) the form of any recommendations, contained in such certificates, as to the improvement of the energy performance of, and the reduction of emissions produced by or otherwise associated with, living accommodation;

(hb) the manner in which and periods within which persons must take steps to comply with any recommendations contained in such certificates;

(hc) the registration of such certificates;
(hd) the disclosure of information which is entered in the register;
(i) subject to subsection (3), the enforcement authority in relation to the regulations;
(j) subject to subsection (4), the functions of that authority;
(k) the keeping of information and its production to the enforcement authority;
(l) the enforcement of the duties imposed by the regulations;
(m) offences in relation to failures to comply with requirements of the regulations.

(3) The enforcement authority provided for in the regulations is to be such person or body as the Scottish Ministers consider appropriate.

(3A) The regulations may provide for the functions of the enforcement authority to be exercised by two or more such authorities and about the functions of each such authority.

(4) The functions of the enforcement authority may include power to levy charges to recover the reasonable costs incurred by it in exercising its functions under the regulations.

(5) The Scottish Ministers must, no later than 12 months after the day on which this section comes into force, publish a report setting out—
   (a) what measures they intend to take to reduce emissions from living accommodation; and
   (b) when they intend to make provision as mentioned in paragraphs (ha) and (hb) of subsection (2).

(6) In this section, “living accommodation”—
   (a) means a dwelling; and
   (b) includes—
      (i) any building having a total useful floor area of 50m² or more; and
      (ii) any common areas, associated with such a dwelling.

Energy efficiency discount schemes

50AA Duty of local authorities to establish energy efficiency discount schemes

(1) The Local Government Finance Act 1992 (c.14) is amended as follows.

(2) After section 80 (reduced amounts payable in respect of council tax), insert—

“80A Local authority’s power to reduce amount of tax payable

(1) A local authority must establish a scheme for reducing the amounts which persons are liable to pay in respect of council tax where improvements are made to the energy efficiency of chargeable dwellings.

(2) A scheme established under subsection (1) is an “energy efficiency discount scheme”.

(3) An energy efficiency discount scheme may make such provision as the local authority considers appropriate, including, in particular, provision about—
(a) the energy efficiency improvements to which the scheme applies;
(b) the chargeable dwellings to which the scheme applies;
(c) the reduction, which may be made under the scheme, in the amount which persons are liable to pay in respect of council tax;
(d) applications under the scheme.

(4) But, under an energy efficiency discount scheme, the amount which a person is liable to pay in respect of council tax may be reduced only where each of the conditions mentioned in subsection (5) is met (whatever other conditions may require to be met under the scheme).

(5) Those conditions are—
(a) the person is liable to pay council tax in respect of a chargeable dwelling and any day;
(b) improvements are made to the energy efficiency of that dwelling (whether by the person liable to pay or not);
(c) those improvements are made during the same financial year to which the reduction of the amount which the person is liable to pay in respect of council tax relates;
(d) the amount which the person is liable to pay in respect of that year has not already been reduced under the scheme in respect of those improvements;
(e) the amount which any other person is liable to pay in respect of council tax in respect of that dwelling and that year has not been reduced under the scheme in respect of those improvements.

(6) In ascertaining whether the condition in subsection (5)(f) is met, no account is to be taken of any person who is jointly and severally liable, with the person mentioned in subsection (5)(a), to pay council tax in respect of the dwelling.

(6A) The minimum reduction which may be provided for under an energy efficiency discount scheme must be—
(a) where the amount which the person is liable to pay in respect of council tax is £50 or more, no less than £50;
(b) where the amount which the person is liable to pay in respect of council tax is less than £50, an amount equal to that person’s liability.

(7) The local authority may, under an energy efficiency discount scheme, reduce the amount which a person is liable to pay in respect of a dwelling to nil.

(8) In this section—
“energy efficiency” includes the use of—
(a) technologies reliant on sources of energy other than fossil fuel and nuclear fuel;
(b) materials the manufacture or use of which produces or involves lower emissions of greenhouse gases than other materials; and
(c) surplus heat from electricity generation or other industrial sources for district heating or other purposes;
“fossil fuel” means—
(a) coal;
(b) lignite;
(c) peat;
(d) natural gas (within the meaning of the Energy Act 1976 (c.76));
(e) crude liquid petroleum;
(f) petroleum products (within the meaning of that Act);
(g) any substance produced directly or indirectly from a substance
mentioned in paragraphs (a) to (f);

“greenhouse gas” has the meaning given by section 9(1) of the Climate
Change (Scotland) Act 2009 (asp 00).”.

(3) In schedule 2, after paragraph 21 (effect of reduction of liability to pay council tax under
section 13A), insert—

“22 (1) This paragraph applies where a local authority establishes an energy efficiency
discount scheme under section 80A.

(2) Where, under an energy efficiency discount scheme, the amount which a
person is liable to pay in respect of council tax is reduced, any amount in
relation to which the reduction applies is to be treated for the purposes of this
schedule as subject to a discount equal to the amount of the reduction.”.

50AB Review of energy efficiency discount schemes

(1) The Scottish Ministers must, as soon as practicable after 31 March 2012 and annually
thereafter, lay before the Scottish Parliament a report on the operation of energy
efficiency discount schemes established under section 80A of the Local Government
Finance Act 1992 (c.14), which must include an assessment of whether the reductions
thereby provided for have contributed effectively to promoting energy efficiency.

(2) The Scottish Ministers may, if they consider it appropriate, by order amend section 80A
of the Local Government Finance Act 1992 for the purpose of improving the
contribution of energy efficiency discount schemes to promoting energy efficiency.

50DA Non-domestic rates: discounts for energy efficiency etc.

In section 153 (power to prescribe amount of non-domestic rate) of the Local
Government etc. (Scotland) Act 1994 (c.39), in subsection (3)—

(a) the words “whose rateable value exceeds, and those whose rateable value does not
exceed, a prescribed figure” become paragraph (a), and

(b) at the end insert—

“(b) whose energy efficiency and greenhouse gas emissions fall into different
categories prescribed for the purpose of this paragraph in rules under
subsection (1).

(3A) Regulations under this section may make provision in relation to how lands
and heritages are to be determined to fall within a category prescribed for the
purpose of subsection (3)(b) in rules under subsection (1).”.
Climate change burdens

50DB Climate change burdens

After section 46 (health care burdens) of the Title Conditions (Scotland) Act 2003 (asp 9), insert—

“Climate change burdens

46A Climate change burdens

(1) On and after the day on which this section comes into force, it shall be competent to create a real burden in favour of a public body or trust, or of the Scottish Ministers, for the purpose of reducing greenhouse gas emissions; and any such burden shall be known as a “climate change burden”.

(2) A climate change burden may only consist of an obligation, in the event of the burdened property being developed, for the property to meet specified mitigation and adaptation standards.

(3) For the purposes of this section, a “public body” means a body listed in Part I or II of the Schedule to the Title Conditions (Scotland) Act 2003 (Conservation Bodies) Order 2003 (SSI 2003/453).”

Tenement Management Scheme

50E Tenement Management Scheme: definition of “maintenance”

In schedule 1 (Tenement Management Scheme) to the Tenements (Scotland) Act 2004 (asp 11), in the definition of “maintenance” in rule 1.5, after “replacement,” insert “the installation of insulation,”.

Permitted development rights

51A Air source heat pumps and micro wind turbines in domestic properties: permitted development rights

(1) The Scottish Ministers must exercise their functions under sections 30 and 31 of the Town and Country Planning (Scotland) Act 1997 (c.8) so as to make provision specifying the circumstances in which development of the class mentioned in subsection (2) is granted planning permission by virtue of an order under section 30 of that Act.

(2) That class is the installation, alteration or replacement, within the curtilage of a dwellinghouse or building containing one or more flats, of—

(a) air source heat pump microgeneration equipment; or

(b) wind turbine microgeneration equipment.

(3) The Scottish Ministers must comply with subsection (1) no later than 6 months after the day on which this section comes into force.

(4) Before complying with subsection (1), the Scottish Ministers must consult—

(a) such persons appearing to them to represent the producers and suppliers of the equipment mentioned in paragraphs (a) and (b) of subsection (2); and

(b) such other persons as the Scottish Ministers consider appropriate.
(5) In this section, “microgeneration” has the meaning given in section 82(6) of the Energy Act 2004 (c.20).

51B Microgeneration in non-domestic buildings: permitted development rights

(1) The Scottish Ministers must exercise their functions under sections 30 and 31 of the Town and Country Planning (Scotland) Act 1997 (c.8) so as to make provision specifying the circumstances in which development of the class mentioned in subsection (2) is granted planning permission by virtue of an order under section 30 of that Act.

(2) That class is the installation, alteration or replacement, within the curtilage of a non-domestic building, of microgeneration equipment.

(3) The Scottish Ministers must comply with subsection (1) no later than 12 months after the day on which this section comes into force.

(4) Before complying with subsection (1), the Scottish Ministers must consult—

(a) such persons appearing to them to represent the producers and suppliers of the equipment mentioned in subsection (2); and

(b) such other persons as the Scottish Ministers consider appropriate.

(5) In this section—

“microgeneration” has the same meaning as in section 51A(5);

“non-domestic building” has the same meaning as in section 50(5).

Development plans

51BA Development plans: inclusion of greenhouse gas emissions policies

After section 3E of the Town and Country Planning (Scotland) Act 1997 (c.8) insert—

“3F Greenhouse gas emissions policies

A planning authority, in any local development plan prepared by them, must include policies requiring all developments in the local development plan area to be designed so as to ensure that all new buildings avoid a specified and rising proportion of the projected greenhouse gas emissions from their use, calculated on the basis of the approved design and plans for the specific development, through the installation and operation of low and zero-carbon generating technologies.”.

51BB Annual report on operation of section 51BA

(1) The Scottish Ministers must—

(a) not later than one year after the day on which section 51BA comes into force; and

(b) annually thereafter,

lay before the Scottish Parliament a report on the operation of the requirement on relevant planning authorities to include policies within development plans under that section, including an assessment of whether those requirements have contributed effectively to the reduction of greenhouse gas emissions from developments.
(2) The fourth and subsequent reports under subsection (1) must include an assessment of the continuing need or otherwise for the requirement on relevant planning authorities to include policies within development plans; and if the requirement is considered by the Scottish Ministers to be no longer necessary, the Scottish Ministers may, by order, repeal section 3F of the Town and Country Planning (Scotland) Act 1997 and this section.

Promotion of water conservation and water-use efficiency

51BC Duty of Scottish Water to promote water conservation and water-use efficiency
In section 56(1) of the Water Industry (Scotland) Act 2002 (asp 3), after paragraph (a) insert—

“(aa) requiring it to promote water conservation and water-use efficiency,”.

CHAPTER 3A
THE SCOTTISH CIVIL ESTATE

51C Energy performance of buildings procured for the Scottish civil estate
(1) The Scottish Ministers must, in so far as reasonably practicable, ensure that the energy performance of any building that becomes part of the civil estate in Scotland falls within the top quartile of energy performance.
(2) For the purposes of subsection (1), a building becomes part of the civil estate if it is procured or constructed by or on behalf of the Scottish Ministers.
(3) The Scottish Ministers may, by regulations, provide that the duty under subsection (1) does not apply in respect of specified buildings or categories of buildings.

51D Report on the Scottish civil estate
(1) The Scottish Ministers must, in respect of each financial year beginning with 2010-2011, lay before the Scottish Parliament a report containing an assessment of the progress made in the year towards improving—

(a) the efficiency; and
(b) the contribution to sustainability,
of buildings that are part of the civil estate in Scotland.
(2) If the energy performance of a building mentioned in subsection (3) does not fall within the top quartile of energy performance, the report must state the reasons why the building has become part of the civil estate.
(3) That building is a building—

(a) to which section 51C applies; and
(b) which becomes part of the civil estate in the financial year to which the report relates.
(4) The report under this section must be laid before the Parliament no later than 31 October next following the end of the financial year to which the report relates.
51E Scottish civil estate: supplementary

(1) For the purposes of this section and sections 51C and 51D—
   (a) “building” means a building that uses energy for heating or cooling the whole or any part of its interior; and
   (b) a building is part of the civil estate in Scotland if it—
      (i) is used for the purposes of Scottish central government administration; and
      (ii) is of a description of buildings for which the Scottish Ministers have responsibilities in relation to efficiency and sustainability.

(2) The Scottish Ministers may, by order, provide—
   (a) for buildings of a description specified in the order to be treated as being, or as not being, part of the civil estate;
   (b) for uses specified in the order to be treated as being, or as not being, uses for the purposes of Scottish central government administration.

CHAPTER 4

WASTE REDUCTION AND RECYCLING

Waste prevention and management plans

52 Waste prevention and management plans

(1) The Scottish Ministers may, by regulations, require persons of the kinds specified—
   (a) to prepare plans for the prevention, reduction, management, recycling, use and disposal of waste produced by or otherwise associated with their activities;
   (b) to comply with those plans.

(2) The regulations may in particular include provision about—
   (a) the circumstances in which plans must be prepared, including when more than one plan must be prepared;
   (b) the kinds of waste in relation to which plans must be prepared;
   (c) the periods—
      (i) to which plans relate;
      (ii) within which plans must be prepared;
   (d) the content of plans;
   (e) subject to section 60—
      (i) the enforcement authority in relation to the regulations; and
      (ii) the functions of that authority, including the approval by it of plans prepared under the regulations;
   (f) the keeping of plans and other information and their production to the enforcement authority;
   (g) the enforcement of the duties imposed by the regulations;
   (h) offences in relation to failures to comply with requirements of the regulations.
Climate Change (Scotland) Bill
Part 5—Other climate change provisions
Chapter 4—Waste reduction and recycling

(3) The enforcement authority must have regard to any guidance given by the Scottish Ministers to it in relation to the functions conferred on it by the regulations.

(4) In this Chapter—

“recycling”, in relation to any waste, includes recovery and re-use (whether or not the waste is subjected to any process) (and cognate expressions are to be construed accordingly);

“specified” means specified in regulations (and cogitate expressions are to be construed accordingly);

“waste” has the meaning given by section 75(2) of the Environmental Protection Act 1990 (c.43) (the “1990 Act”).

Waste data

53 Information on waste

(1) The Scottish Ministers may, by regulations, require persons of the kinds specified to provide SEPA with information on the waste produced by or otherwise associated with such persons’ activities.

(2) The regulations may in particular include provision about—

(a) the circumstances in which information must be provided;

(b) the information required to be provided, including the periods to which the information relates;

(c) the form and manner in which information must be provided;

(d) the periods within which information must be provided;

(e) the functions of SEPA in relation to the regulations;

(f) the keeping of information and its production to SEPA;

(g) the enforcement of the duties imposed by the regulations;

(h) offences in relation to failures to comply with requirements of the regulations.

(3) The power to make regulations under this section is without prejudice to section 34(5) of the 1990 Act and any other enactment to the same effect as that section; and any duty imposed on any person by regulations under this section is without prejudice to any duty to provide information on waste imposed by regulations under that section or by virtue of any other such enactment.

(4) SEPA may give guidance to persons to whom the regulations apply on how to comply with the requirements of the regulations.

(4A) A draft of a statutory instrument containing the first regulations under subsection (1) must be laid before the Scottish Parliament no later than 12 months after the day on which this section comes into force.

(5) In this section and in section 60, “SEPA” means the Scottish Environment Protection Agency.
54 Recyclable waste: facilities for deposit etc.

(1) The Scottish Ministers may, by regulations, require—

(a) persons of the kinds specified to provide facilities for the deposit of waste;

(b) authorised persons—

(i) to collect waste deposited by virtue of paragraph (a);

(ii) to ensure, in so far as reasonably practicable, that such waste collected by
or transferred to them (whether in accordance with section 34 of the 1990
Act or otherwise) is recycled.

(2) The regulations may in particular include provision about—

(a) the circumstances in which facilities must be provided, including the places at
which they must be provided;

(b) the persons for whom facilities must be provided;

(c) the kinds of waste for which facilities must be provided;

(d) the circumstances in which authorised persons must collect waste, including
which authorised persons must do so;

(e) the charging by authorised persons for collecting waste, for recycling waste and
for otherwise ensuring waste is recycled;

(f) subject to section 60—

(i) the enforcement authority in relation to the regulations; and

(ii) the functions of that authority;

(g) the keeping of records and their production to the enforcement authority;

(h) the enforcement of the duties imposed by the regulations;

(i) offences in relation to failures to comply with requirements of the regulations.

(3) The enforcement authority must have regard to any guidance given by the Scottish
Ministers to it in relation to the functions conferred on it by the regulations.

(4) The Scottish Ministers may not, by regulations under this section, impose requirements
on persons to provide facilities for the deposit of waste in circumstances in relation to
which regulations under section 55 may be made.

(5) In this section and in section 55, “authorised person” has the same meaning as in section
34(3) of the 1990 Act.

55 Recyclable waste: facilities for deposit at events etc.

(1) The Scottish Ministers may, by regulations, confer power on local authorities to issue
notices requiring—

(a) persons responsible for organising temporary events open to the public to provide
facilities for the deposit of waste by persons attending those events;

(b) authorised persons to—

(i) collect waste deposited by virtue of paragraph (a);
(ii) ensure, in so far as reasonably practicable, that such waste collected by or transferred to them (whether in accordance with section 34 of the 1990 Act or otherwise) is recycled.

(2) The regulations may in particular include provision about—

(a) the events in relation to which notices can be issued;

(b) the circumstances in which facilities must be provided, including the places at which they must be provided;

(c) the persons for whom facilities must be provided;

(d) the kinds of waste for which facilities must be provided;

(e) the persons to whom notices can be issued;

(f) the content of notices;

(g) the form of and manner in which notices can be issued, including the times at which notices can be issued;

(h) appeals against notices;

(i) the circumstances in which authorised persons must collect waste, including which authorised persons must do so;

(j) the charging by authorised persons for collecting waste, recycling waste and otherwise ensuring waste is recycled;

(k) subject to section 60—

(i) the enforcement authority in relation to notices; and

(ii) the functions of that authority;

(l) the keeping of records by persons to whom notices are issued and their production to the enforcement authority;

(m) the enforcement of duties imposed by notices;

(n) offences in relation to failures to comply with requirements of notices.

(3) Local authorities must have regard to any guidance given by the Scottish Ministers to them in relation to the functions conferred on them by the regulations.

(4) The enforcement authority must have regard to any guidance given by the Scottish Ministers to it in relation to the functions conferred on it by the regulations.

**Procurement of recyclate**

(1) The Scottish Ministers may, by regulations, require persons of the kinds specified to comply with the requirement in subsection (2).

(2) That requirement is to ensure that things procured or constructed by or on behalf of such persons—

(a) comprise of; or

(b) include or contain a certain proportion of, recyclate.
(3) The regulations may in particular include provision about—

(a) the circumstances in which the requirement applies;
(b) the kinds of things in relation to which the requirement applies;
(c) the proportion of recyclate that such things must include or contain;
(d) how such proportions are to be determined;
(e) the circumstances in which a person may apply to the Scottish Ministers to have the requirement disapplied;
(f) subject to section 60—
   (i) the enforcement authority in relation to the regulations; and
   (ii) the functions of that authority;
(g) the keeping of records and their production to the enforcement authority;
(h) the enforcement of the duties imposed by the regulations;
(i) offences in relation to failures to comply with requirements of the regulations.

(4) The enforcement authority must have regard to any guidance given by the Scottish Ministers to it in relation to the functions conferred on it by the regulations.

(5) Persons to whom the regulations apply must have regard to any guidance given by—

(a) the Scottish Ministers;
(b) the enforcement authority,
to them in relation to the requirements imposed by the regulations.

(6) In this section, “recyclate” means waste that has been recycled.

Reduction of packaging

57 Targets for reduction of packaging etc.

(1) The Scottish Ministers may, by regulations—

(a) set targets—
   (i) for the reduction of packaging;
   (ii) for the reduction of greenhouse gas emissions produced by the manufacture of or otherwise associated with packaging;

(b) require persons of the kinds specified to comply with those targets.

(2) The regulations may in particular include provision about—

(a) the circumstances in which the requirement in subsection (1)(b) applies;
(b) the kinds of packaging in relation to which targets may be set;
(c) the targets in relation to such packaging (including how targets may be set);
(d) the methods of determining whether targets have been met;
(e) subject to section 60—
   (i) the enforcement authority in relation to the regulations; and
Part 5—Other climate change provisions

Chapter 4—Waste reduction and recycling

(ii) the functions of that authority;

(f) the keeping of records and other information and their production to the
enforcement authority (including the periods to which records or information must
relate and within which it must be produced to the authority);

(g) the enforcement of the duties imposed by the regulations;

(h) offences in relation to failures to comply with requirements of the regulations.

(3) The enforcement authority must have regard to any guidance given by the Scottish
Ministers to it in relation to the functions conferred on it by the regulations.

(4) In this section and in section 58, “packaging” has the meaning given by Article 3 of
packaging waste.

Deposit and return

58 Deposit and return schemes

(1) The Scottish Ministers may, by regulations, establish deposit and return schemes.

(2) A “deposit and return scheme” is a scheme under which—

(a) the sale price of articles includes a returnable element (a “deposit”);

(b) persons who return—

(i) such articles;

(ii) the packaging associated with such articles (“returnable packaging”); or

(iii) both such articles and such packaging,

are entitled to be paid a sum equal to that deposit.

(3) Retailers may be required, under a deposit and return scheme, to—

(a) include a deposit in the price of articles placed on the market by them;

(aa) accept the return to them of—

(i) such articles;

(ii) returnable packaging; or

(iii) both such articles and such packaging;

(b) pay a sum equal to the deposit to persons who return to them—

(i) such articles;

(ii) returnable packaging; or

(iii) both such articles and such packaging;

(ba) return such articles to the producers of them;

(c) return returnable packaging to the producers of it or of the articles with which it is
associated.

(4) Producers may be required, under a deposit and return scheme, to—

(a) include a deposit in the price of articles placed on the market by them;
(aa) accept the return to them of—
   (i) such articles;
   (ii) returnable packaging; or
   (iii) both such articles and such packaging;

(b) pay a sum equal to the deposit to retailers who return to them—
   (i) such articles;
   (ii) returnable packaging; or
   (iii) both such articles and such packaging;

(c) recycle, or have recycled—
   (i) such articles;
   (ii) returnable packaging; or
   (iii) both such articles and such packaging.

(5) A deposit and return scheme may also provide for a person or body (a “scheme administrator”) to—

(a) ensure that deposits are included in the price of articles placed on the market;
(b) accept the return of—
   (i) such articles;
   (ii) returnable packaging; or
   (iii) both such articles and such packaging;

(c) pay sums equal to deposits to persons who return—
   (i) such articles;
   (ii) returnable packaging; or
   (iii) both such articles and such packaging;

(ca) return such articles to the producers of them;
(d) return returnable packaging to the producers of it or of the articles with which it is associated;
(e) recover sums equal to deposits from such producers;
(f) recycle, or have recycled—
   (i) such articles;
   (ii) returnable packaging; or
   (iii) both such articles and such packaging.

(6) The Scottish Ministers may make regulations under this section only where they consider it necessary or expedient to do so for the purpose of promoting or securing an increase in the recycling of materials.

(7) The regulations may in particular include provision about—

(a) the persons who are retailers and producers for the purposes of deposit and return schemes;
(b) the articles to which such schemes apply;
(c) the deposits to be included in the price of such articles;
(ca) the inclusion, in the sale price of articles, of a non-returnable element to cover the reasonable costs incurred by retailers, producers or a scheme administrator in administering such schemes;
(cb) the articles the return of which entitles persons to payment of sums equal to deposits;
(cc) the methods by which such articles are to be identified;
(d) the packaging which is returnable packaging for the purposes of such schemes;
(e) the methods by which returnable packaging is to be identified;
(f) information on the operation of schemes (including notices on premises where articles are offered for sale and the content of such notices);
(fa) the places to which articles can be returned;
(g) the places to which returnable packaging can be returned;
(h) the registration of retailers and producers to whom schemes apply (including the reasonable fees payable in relation to such registration);
(ha) the scheme administrator;
(i) subject to section 60—
   (i) the enforcement authority in relation to the regulations; and
   (ii) the functions of that authority;
(j) the keeping of records and other information and their production to the enforcement authority;
(k) the enforcement of the duties imposed by the regulations;
(l) offences in relation to failures to comply with requirements of the regulations.

58A Deposit and return schemes: designation of scheme administrator

(1) The Scottish Ministers may, by order, designate—
   (a) a body established under section 58B(1); or
   (b) such other person or body as they consider appropriate (an “existing body”),
as a scheme administrator of a deposit and return scheme established by virtue of section 58.

(2) An order under subsection (1)(b) may, in so far as the Scottish Ministers consider it necessary or expedient to do so, modify the functions of an existing body by—
   (a) conferring functions on;
   (b) removing functions from; or
   (c) otherwise varying the functions of,
the body.

(3) That order may in particular include provision about—
(a) borrowing by the existing body (with the approval of the Scottish Ministers);
(b) the charging by the body, in respect of the exercise of its functions in relation to a
   deposit and return scheme, of such reasonable amounts as the Scottish Ministers
   consider appropriate.

(4) In exercising functions in relation to a deposit and return scheme, a scheme
   administrator must comply with any written directions of a general or specific nature as
   the Scottish Ministers may from time to time give to it in relation to those functions.

58B Power to establish scheme administrator

(1) The Scottish Ministers may, by order, establish a body to be a scheme administrator of a
   deposit and return scheme established by virtue of section 58(1).

(2) A body established under subsection (1) is to be a body corporate.

(3) The body may do anything which appears to it—
   (a) to be necessary or expedient for the purpose of, or in connection with, the exercise
       of its functions in relation to a deposit and return scheme;
   (b) to be conducive to the exercise of those functions.

(4) In particular, the body may—
   (a) enter into contracts;
   (b) with the agreement of the Scottish Ministers, borrow money;
   (c) charge, in respect of the exercise of its functions in relation to a deposit and return
       scheme, such reasonable amounts as the Scottish Ministers consider appropriate.

(5) An order under subsection (1) may in particular include provision about—
   (a) the status and constitution of the body;
   (b) the status of the members and any employees of the body;
   (c) the remuneration, allowances and pensions of such members and such employees;
   (d) the conferral of functions on the body;
   (e) the keeping by the body of accounts and accounting records.

58C Finance of scheme administrator

(1) The Scottish Ministers may, for the purpose of or in connection with the exercise by a
   scheme administrator of functions in relation to a deposit and return scheme—
   (a) pay grants;
   (b) make loans,
   to the administrator of such amounts as Ministers may determine.

(2) Any such grant or loan may be paid or, as the case may be, made, on such terms and
   subject to such conditions (including, in the case of a loan, conditions as to repayment)
   as the Scottish Ministers consider appropriate.

(3) The Scottish Ministers may, from time to time after any grant or loan is paid or, as the
   case may be, made, vary the terms and conditions on which it was paid or made.
(4) The Scottish Ministers may guarantee, in such manner and on such conditions as they consider appropriate, the discharge of any financial obligation in connection with any sums borrowed by a scheme administrator for the purpose of, or in connection with, the exercise of its functions in relation to a deposit and return scheme.

**Carrier bag charges**

### 59 Charges for supply of carrier bags

(1) The Scottish Ministers may, by regulations, require suppliers of goods—

- (a) to charge for carrier bags supplied at the place where the goods are supplied for the purpose of enabling the goods to be taken away or delivered;
- (b) to apply the net proceeds raised by such charges to the advancement of environmental protection or improvement or to any other purposes that may be reasonably regarded as analogous.

(2) The regulations may in particular include provision about—

- (a) the circumstances in which the requirement applies;
- (b) the suppliers to whom the requirement applies;
- (c) the carrier bags to which the requirement applies;
- (d) the minimum amount to be charged for each carrier bag;
- (e) how the net proceeds raised by the charge are to be ascertained;
- (f) the purposes to which those net proceeds are to be applied;
- (g) subject to section 60—
  - (i) the enforcement authority in relation to the regulations; and
  - (ii) the functions of that authority;
- (h) the keeping of records and their production to the enforcement authority;
- (i) the enforcement of the duties imposed by the regulations;
- (j) offences in relation to failures to comply with requirements of the regulations.

(3) The enforcement authority must have regard to any guidance given by the Scottish Ministers to it in relation to the functions conferred on it by the regulations.

### 60 Enforcement authorities

(1) This section applies to any regulations made under this Chapter other than under section 53.

(2) The enforcement authority provided for in the regulations is to be—

- (a) SEPA;
- (b) a local authority; or
- (c) such other person or body as the Scottish Ministers consider appropriate.
(3) The regulations may provide for the functions of the enforcement authority in relation to the regulations to be exercised by two or more such authorities and about the functions of each such authority.

(4) The regulations may also provide for enforcement authorities to levy charges to recover the reasonable costs incurred by them in exercising their functions under the regulations.

61 Penalties

(1) A person who commits an offence under regulations made under this Part is liable to such penalties, not exceeding those mentioned in subsection (2), as are provided for in the regulations.

(2) Those penalties are—
   (a) on summary conviction, a fine not exceeding the statutory maximum;
   (b) on conviction on indictment, a fine.

PART 6
GENERAL AND MISCELLANEOUS

61ZA Public engagement

(1) The Scottish Ministers must prepare and publish a strategy (a “public engagement strategy”) setting out the steps they intend to take to—
   (a) inform persons in Scotland about the targets specified by virtue of this Act;
   (b) encourage them to contribute to the achievement of those targets.

(2) The public engagement strategy must, in particular, identify actions which persons in Scotland may take to contribute to the achievement of the targets referred to in subsection (1)(a).

(3) The public engagement strategy must be published no later than 31 December 2010.

(4) The Scottish Ministers—
   (a) may, from time to time; and
   (b) must, before the end of the period mentioned in subsection (5), review the strategy.

(5) The period referred to in subsection (4)(b) is the period of 5 years beginning with the date on which—
   (a) the strategy is first published; or
   (b) the strategy was last reviewed under subsection (4).

(6) Where, following a review under subsection (4), the Scottish Ministers vary the public engagement strategy, they must, as soon as reasonably practicable after so doing, publish the strategy as so varied.

(7) A strategy published under subsection (6) must contain an assessment of the progress made towards implementing the steps set out in earlier strategies.
(8) The public engagement strategy may be published in such manner as the Scottish Ministers consider appropriate.

(9) The Scottish Ministers must lay the public engagement strategy before the Scottish Parliament as soon as reasonably practicable after it is published.

61A Sustainable development

(1) The persons mentioned in subsection (2) must, in exercising functions conferred on them by virtue of this Act, take into account the need to do so in a way that contributes to the achievement of sustainable development.

(2) Those persons are—

(a) the Scottish Ministers;

(b) the advisory body.

62 Equal opportunities

(1) The persons mentioned in subsection (2) must exercise their functions under this Act in a manner which encourages equal opportunities and in particular the observance of the equal opportunities requirements.

(2) Those persons are—

(a) the Scottish Ministers;

(b) the advisory body;

(c) public bodies (as defined in section 36(A2)).

(3) In this section, “equal opportunities” and the “equal opportunities requirements” have the same meanings as those expressions have in section L2 of Part 2 of Schedule 5 to the Scotland Act 1998 (c.46).

62A Scottish Executive budget: impact on greenhouse gases

(1) The Scottish Ministers must, at the same time as laying before the Scottish Parliament any document setting out draft proposals for the use of resources in any financial year, lay before the Scottish Parliament a document describing the direct and indirect impact on greenhouse gas emissions of the activities to be funded by virtue of the proposals.

(2) In this section, “use of resources” has the meaning given in section 1(3) of the Public Finance and Accountability (Scotland) Act 2000 (asp 1).

63 Crown application

(1) This Act and any orders and regulations made under it bind the Crown.

(2) No contravention by the Crown of any provision made by virtue of this Act makes the Crown criminally liable.

(3) But the Court of Session may, on the application of any public body or office-holder having responsibility for enforcing that provision, declare unlawful any act or omission of the Crown which constitutes such a contravention.

(4) Despite subsection (2), any provision made by virtue of this Act applies to persons in the public service of the Crown as it applies to other persons.
Subordinate legislation

(1) Any power conferred by this Act on the Scottish Ministers to make orders or regulations is exercisable by statutory instrument.

(2) Any such power—

(a) may be exercised so as to make different provision for different cases or descriptions of case or for different purposes;

(b) includes power to make such consequential, incidental, supplementary, transitory, transitional or saving provision as the Scottish Ministers consider appropriate.

(3) An order or regulations under this Act may modify any enactment (including this Act).

(4) Subject to subsections (5) to (8) and to section 64A, no statutory instrument containing an order or regulations under this Act (other than an order under section 67(2)) may be made unless a draft of the instrument has been laid before, and approved by resolution of, the Scottish Parliament.

(5) A statutory instrument containing an order mentioned in subsection (6) or regulations mentioned in subsection (7) is subject to annulment in pursuance of a resolution of the Scottish Parliament.

(6) Those orders are orders under—

(a) section 17(b);

(b) section 38(1);

(c) paragraph 2(2) of schedule 1.

(7) Those regulations are—

(a) the second or subsequent regulations under section 12(2) (other than regulations which make provision altering the amount by which a carbon unit credited or debited to the net Scottish emissions account for a period reduces or, as the case may be, increases the net Scottish emissions account for that period);

(b) the second or subsequent regulations under section 18(1) (other than regulations which make provision specifying a carbon unit of a kind not previously specified in regulations under that section);

(d) regulations under section 58(1) which make provision about one or more of the following matters only—

(i) the deposits mentioned in section 58(7)(c);

(ii) the form and content of notices mentioned in section 58(7)(f);

(iii) setting the registration fees mentioned in section 58(7)(h);

(c) regulations under Chapter 4 of Part 5 which make provision about the matter mentioned in section 60(4) only.

(8) Subsection (5) does not apply to an order or regulations which includes provision modifying an Act or an Act of the Scottish Parliament.
64A **Subordinate legislation: pre-laying procedure**

(1) This section applies where the Scottish Ministers propose to lay before the Scottish Parliament a draft of a statutory instrument containing the first regulations under section 58 or 59 (other than a draft containing regulations mentioned in section 64(7)(d) or (e) to which section 64(5) applies).

(2) The Scottish Ministers must, before doing so, lay before the Parliament—

   (a) a copy of the proposed regulations; and
   
   (b) a statement setting out their reasons for proposing to make those regulations.

(3) The Scottish Ministers must, when laying such a copy, specify a period (the “representation period”) during which representations on the proposed regulations may be made to them.

(4) The representation period must be at least 90 days, of which no fewer than 30 must be days on which the Parliament is not dissolved or in recess.

(5) The Scottish Ministers must, as soon as reasonably practicable after laying a copy of the proposed regulations, publicise them in such manner as they consider appropriate.

(6) The Scottish Ministers must, before laying the proposed regulations before the Parliament, have regard to—

   (a) any representations on the proposed regulations made to them;
   
   (b) any resolution relating to those regulations passed by the Parliament; and
   
   (c) any report relating to those regulations published by any committee of the Parliament for the time being appointed by virtue of standing orders, before the expiry of the representation period.

(7) The Scottish Ministers must, when laying such proposed regulations, lay a statement setting out—

   (a) details of any representations, resolutions or reports mentioned in subsection (6);
   
   (b) the changes (if any) they have made to the proposed regulations in response to such representations, resolutions or reports and the reasons for those changes.

(8) In this section, “proposed regulations” means a draft of a statutory instrument to which subsection (1) applies.

65 **Interpretation**

In this Act—

   “additional greenhouse gas” has the meaning given by section 11(2);

   “advisory body” has the meaning given by section 19(2);

   “advisory functions” has the meaning given by section 19(3);

   “annual target” has the meaning given by section 3(3);

   “authorised person” has the meaning given by section 54(5);

   “baseline” has the meaning given by section 10(1);

   “baseline year” means—
(a) in relation to a greenhouse gas mentioned in subsection (2) of section 10, the year mentioned in paragraph (a), (b), (c), (d) or, as the case may be, (e) of that subsection;

(b) in relation to an additional greenhouse gas, any year designated by virtue of section 11(3);

“carbon unit” has the meaning given by section 18(4);

“climate change duties” has the meaning given by section 36(1A);

“Committee” means the Scottish Committee on Climate Change;

“deposit and return scheme” means a scheme established by virtue of section 58(1);

“domestic effort target” has the meaning given by section 7A(2);

“emissions” has the meaning given by section 15(1);

“energy efficiency” has the meaning given by section 48(8);

“greenhouse gas” has the meaning given by section 9(1);

“interim target” has the meaning given by section A2(2);

“international carbon reporting practice” has the meaning given by section 17;

“local authority” means a council constituted under section 2 of the Local Government etc. (Scotland) Act 1994 (c.39);

“monitoring body” has the meaning given by section 39(2);

“net Scottish emissions” has the meaning given by section 15(1);

“net Scottish emissions account” has the meaning given by section 12(1);

“packaging” has the meaning given by section 57(4);

“public body” (except in Part 4 and section 62) has the meaning given by section 19(5);

“relevant body” has the meaning given by section 5(5);

“relevant public body” has the meaning given by section 36(2);

“recycling” has the meaning given by section 52(4);

“renewable sources” has the meaning given by section 48(8);

“Scottish Committee on Climate Change” has the meaning given by section 20(2);

“Scottish emissions” has the meaning given by section 15(1);

“Scottish removals” has the meaning given by section 15(1);

“SEPA” has the meaning given by section 53(5);

“target year” means a year for which an annual target has been set;

“target-setting criteria” means the matters mentioned in section 4(4)(a) to (h);

“the 1990 Act” means the Environmental Protection Act 1990 (c.43);

“the 2008 Act” means the Climate Change Act 2008 (c.27);

“the 2050 target” has the meaning given by section 1(2);

“UK Committee on Climate Change” has the meaning given by section 5(6);
“waste” has the meaning given by section 52(4).

66 Minor and consequential modifications

Schedule 2 makes minor modifications and modifications consequential on the provisions of this Act.

57 Short title and commencement

(1) This Act may be cited as the Climate Change (Scotland) Act 2009.

(2) This Act (other than this section and sections 22 to 27, 45C, 51A and 64) comes into force on such day (in the case of sections 36 to 44, being not later than 18 months after the day on which the Bill for this Act receives Royal Assent) as the Scottish Ministers may, by order, appoint.

(3) Sections 22 to 27 and 45C come into force in accordance with section 21.

(3A) Section 51A comes into force on the day after the Bill for this Act receives Royal Assent.

(4) Different days may, under subsection (2), be appointed for different purposes.
SCHEDULE 1
(introduced by section 20)

THE SCOTTISH COMMITTEE ON CLIMATE CHANGE

Status

1 (1) The Committee is a body corporate.
(2) The Committee is not to be regarded as a servant or agent of the Crown, nor is it to be regarded as having any status, privilege or immunity of the Crown.
(3) The Committee’s members and employees are not to be regarded as civil servants.
(4) The Committee’s property is not to be regarded as property of, or held on behalf of, the Crown.

Membership of the Committee

2 (1) The Committee is to consist of the following members—
(a) a person to chair the Committee (“the Chair”); and
(b) not fewer than five and not more than eight other members.
(2) The Scottish Ministers may, by order, modify sub-paragraph (1)(b) so as to alter the number of other members of the Committee.
(3) Members of the Committee are appointed by the Scottish Ministers.
(4) In appointing members to the Committee, the Scottish Ministers must have regard to the desirability of the Committee (taken as a whole) having expertise or experience in the following—
(a) business competitiveness;
(b) climate change policy at Scottish, UK and international level (in particular the social impact of such policy);
(c) climate science and other branches of environmental science;
(d) economic analysis and forecasting;
(e) emissions trading;
(f) energy production and supply;
(g) financial investment;
(h) technology development and diffusion.

Period, and conditions, of appointment of members

3 (1) Each member of the Committee is to be appointed for a period not exceeding five years.
(2) A member holds and vacates office in accordance with the terms and conditions of appointment.
(3) A member may resign office as a member of the Committee by giving written notice to the Scottish Ministers.
(4) On ceasing to be a member, a person is eligible to be reappointed for one further period.
Persons not eligible for appointment

4 No person may be appointed as a member of the Committee if that person is, or has at any time during the previous year been, a member of—

(a) the House of Commons;
(b) the Scottish Parliament;
(c) the European Parliament.

Removal of members of Committee

5 (1) Subject to sub-paragraph (3), the Chair may, by giving written notice, remove a member from office if the Chair is satisfied that one of the situations set out in sub-paragraph (2) exists.

(2) Those situations are—

(a) that the member is insolvent;
(b) that the member has been convicted of a criminal offence;
(c) that the member has been absent from meetings of the Committee for a period longer than six months without the permission of the Chair;
(d) that the member is otherwise unable or unfit to discharge the functions of a member or is unsuitable to continue as a member.

(3) The Chair may only remove a member from office with the agreement of the Scottish Ministers.

(4) The Scottish Ministers may, by giving written notice, remove the Chair from office if the Scottish Ministers are satisfied that one of the situations set out in sub-paragraph (2) exists.

(5) For the purposes of sub-paragraph (2)(a), a member is insolvent when—

(a) a voluntary arrangement proposed by the member is approved;
(b) the member is adjudged bankrupt;
(c) the member’s estate is sequestrated;
(d) the member enters into a debt arrangement programme under Part 1 of the Debt Arrangement and Attachment (Scotland) Act 2002 (asp 17) as the debtor;
(e) the member grants a trust deed for creditors.

Remuneration, allowances and pensions of members

6 (1) The Committee must pay its members such remuneration and allowances as the Scottish Ministers may in each case determine.

(2) The Committee may, with the agreement of the Scottish Ministers—

(a) pay (or make arrangements for the payment);
(b) make payments towards the provision;
(c) provide and maintain schemes (whether contributory or not) for the payment,
of such pensions, allowances or gratuities to or in respect of any person who is or has ceased to be a member of the Committee, as the Committee may determine.

(3) The reference in sub-paragraph (2) to pensions, allowances and gratuities includes pensions, allowances and gratuities paid by way of compensation for loss of office.

Chief executive and other employees

7 (1) The Committee is to employ a chief executive.

(2) The chief executive is to be appointed by the Committee on such terms and conditions as the Committee may determine.

(3) The appointment of the chief executive and the terms and conditions of that appointment are subject to the agreement of the Scottish Ministers.

(4) The Committee may appoint other employees on such terms and conditions as the Committee may determine.

(5) The Scottish Ministers may give directions to the Committee as regards the appointment of employees under sub-paragraph (4), which may relate in particular to—

(a) the number of appointments;

(b) the terms and conditions of employment.

(6) The Committee must comply with directions given under sub-paragraph (5).

(7) The Committee may, with the agreement of the Scottish Ministers—

(a) pay (or make arrangements for the payment of);

(b) make payments towards the provision of;

(c) provide and maintain schemes (whether contributory or not) for the payment of, such pensions, allowances or gratuities to or in respect of any person who is or has ceased to be an employee of it, as the Committee may determine.

(8) The reference in sub-paragraph (7) to pensions, allowances and gratuities includes pensions, allowances and gratuities paid by way of compensation for loss of office.

Accounts

8 (1) The Committee must—

(a) keep proper accounts and accounting records;

(b) prepare in respect of each financial year a statement of accounts;

(c) send the statement of accounts to the Scottish Ministers.

(2) The Committee must comply with any directions which the Scottish Ministers gives it in relation to the matters mentioned in sub-paragraph (1).

(3) The Scottish Ministers must, as soon as reasonably practicable after receiving the statement of accounts from the Committee—

(a) send the statement of accounts to the Auditor General for Scotland for auditing;

(b) lay the audited statement before the Scottish Parliament.

(4) The Committee must make its audited statement of accounts and its accounting records available so that they may be inspected by any person.
(5) Those documents are to be made available—
(a) at any reasonable time; and
(b) without charge.

(6) In this paragraph and paragraph 9, “financial year” means—
(a) the period beginning with the day the Committee is established and ending with 31 March in the following calendar year;
(b) each subsequent period of 12 months ending with 31 March.

Reports
9 (1) As soon as practicable after the end of each financial year, the Committee must prepare a report on—
(a) the discharge of the Committee’s functions during that year;
(b) the actions that the Committee proposes to take during the following year in pursuance of its functions.

(2) The Committee must—
(a) send a copy of the report to the Scottish Ministers; and
(b) publish the report.

(3) The Committee must prepare and publish the report in accordance with any directions which the Scottish Ministers may give.

(4) The Scottish Ministers must as soon as reasonably practicable after receiving the report from the Committee, lay a copy of it before the Scottish Parliament.

(5) The Committee may publish such other reports on matters relevant to its functions as it considers appropriate.

Sub-committees
10 (1) The Committee may establish sub-committees for any purposes relating to its functions.

(2) A sub-committee must comply with any directions given to it by the Committee.

Proceedings
11 (1) Subject to the remaining provisions of this paragraph, the Committee may regulate—
(a) its own procedure (including any quorum);
(b) the procedure of any sub-committee (including any quorum).

(2) The Chair must, if present, chair meetings of the Committee or any sub-committee of the Committee.

(3) If the Chair is not available to be present at a meeting of the Committee (or any sub-committee of the Committee), the Chair is to appoint another member to chair the meeting.

(4) The Chair has a casting vote and any person appointed by the Chair under sub-paragraph (3) has a casting vote for the purposes of that appointment.
(5) The validity of any proceedings of the Committee (or any of its sub-committees) is not affected by a vacancy in membership nor by any defect in the appointment of a member.

**Delegation of functions**

12 (1) The Committee may, subject to sub-paragraph (2), authorise—

(a) any of its members;
(b) any of its sub-committees;
(c) its chief executive;
(d) any other employee,

to exercise such of its functions (and to such extent) as it may determine.

(2) The Committee may not authorise the exercise of the following functions under sub-paragraph (1)—

(a) the approval of annual reports and accounts;
(b) the approval of any budget or other financial plan.

(3) Sub-paragraph (1) does not affect the responsibility of the Committee for the exercise of its functions.

**General powers**

13 (1) The Committee may do anything which appears to it—

(a) to be necessary or expedient for the purpose of, or in connection with, the exercise of its functions;
(b) to be conducive to the exercise of its functions.

(2) In particular, the Committee may—

(a) enter into contracts;
(b) with the agreement of the Scottish Ministers, borrow money;
(c) with the agreement of the Scottish Ministers, acquire and dispose of land;
(d) obtain advice and assistance from any person who, in the Committee’s opinion, is qualified to give it.

(3) The Committee may pay to any person from whom advice or assistance is obtained such fees, remuneration and allowances as the Committee may, with the agreement of the Scottish Ministers, determine.

**SCHEDULE 2**

(introduced by section 66)

**MINOR AND CONSEQUENTIAL MODIFICATIONS**

_Hill Farming Act 1946 (c.73)_

1 In section 23(1) of the Hill Farming Act 1946 (prohibition of muirburn at certain times), after “section” insert “and to section 23A,”.
Environment Act 1995 (c.25)

2 In section 41(1) of the Environment Act 1995 (power to make schemes imposing charges), after paragraph (e), insert—

“(f) as a means of recovering costs incurred by it in performing functions conferred by regulations under section 53 of the Climate Change (Scotland) Act 2009 (asp 00), SEPA may require the payment to it of such charges as may from time to time be prescribed;”.

Ethical Standards in Public Life etc. (Scotland) Act 2000 (asp 7)

3 In the Ethical Standards in Public Life etc. (Scotland) Act 2000, in schedule 3 (devolved public bodies) at the appropriate place, insert—

“The Scottish Committee on Climate Change”.

Scottish Public Services Ombudsman Act 2002 (asp 11)

4 In the Scottish Public Services Ombudsman Act 2002, in Part 2 of schedule 2 (listed authorities) at the appropriate place, insert—

“The Scottish Committee on Climate Change”.

Freedom of Information (Scotland) Act 2002 (asp 13)

5 In the Freedom of Information (Scotland) Act 2002, in Part 7 of schedule 1 (Scottish public authorities) at the appropriate place, insert—

“The Scottish Committee on Climate Change”.

Public Appointments and Public Bodies etc. (Scotland) Act 2003 (asp 4)

6 In the Public Appointments and Public Bodies etc. (Scotland) Act 2003, in schedule 2 (specified authorities) at the appropriate place in the list of advisory bodies, insert—

“The Scottish Committee on Climate Change”.

Housing (Scotland) Act 2006 (asp 1)

7 In the Housing (Scotland) Act 2006, section 179 (duty of Scottish Ministers to prepare strategy for improving energy efficiency of living accommodation) is repealed.
Climate Change (Scotland) Bill
[AS PASSED]

An Act of the Scottish Parliament to set a target for the year 2050, an interim target for the year 2020, and to provide for annual targets, for the reduction of greenhouse gas emissions; to provide about the giving of advice to the Scottish Ministers relating to climate change; to confer power on Ministers to impose climate change duties on public bodies; to make further provision about mitigation of and adaptation to climate change; to make provision about energy efficiency, including provision enabling council tax discounts; to make provision about the reduction and recycling of waste; and for connected purposes.

Introduced by: John Swinney
On: 4 December 2008
Supported by: Stewart Stevenson
Bill type: Executive Bill
