Given limitations on public finance and current problems with private sector investment, it is of special importance that both STAG and SEA procedures should take account of the need to compare the costs and benefits of major transport projects with the costs and benefits of alternative uses for similar, or reduced, levels of funding. On the evidence of the Eddington and Stern Reports as developed by the UK Climate Change Committee, there is a distinct possibility that structural change in funding strategy (backed by regulatory and fiscal change) could offer higher and earlier benefits for the economy, climate change and society than the programme outlined in STPR as published in December, 2008.

Finalised STPR and related Economic and Environmental Reports

The Association urges adoption of the following changes:-

- A diversion of funding from major road projects to lesser rail, road and other public transport schemes offering greater corridor and area benefits in phased packages
- A funding shift to promote energy efficiency, energy conservation and alternative fuels
- Enlarged funding for rail electrification in Scotland and Anglo-Scottish route development both to, and beyond, 2016
- Enlarged funding for Regional Transport Partnerships (RTPs) and local councils earmarked for local public transport, travel plans, access and active travel
- Introduction of borrowing for major transport schemes against specified income streams (allowing higher investment in sustainable transport than might otherwise be the case)
SUMMARY : UK Climate Change Report & AEA Reports to Scottish Government

Global Economic, Energy & Climate Change Issues

Major financial problems are deepening a global recession likely to last beyond 2010. A few contract-ready schemes in the transport capital programme are being accelerated but at the cost of slowing later spend. It is not feasible to accelerate major projects not yet ready for contract but the UK Committee on Climate Change has also questioned the concept of scheme acceleration unless they support steeper cuts in fossil fuel use by, and beyond, 2020. In December 2008, the First Annual Report of the Committee concluded that a strong economy requires faster action to develop energy conservation and to move away from fossil fuels. Continuing on a ‘business as usual’ basis would worsen economic prospects. In Scotland, the AEA Reports to the Scottish Government in October 2008 examined energy requirements in total, and by sector, to 2020 and evaluated longer-term options for emissions cuts to 2050. The reports concluded that, as part of an improving economy, energy consumption in Scotland would fall by some 5% between 2005 and 2020 with emissions down some 15%. Looking to 2050, absolute cuts in emissions of between 63% and 75% were expected depending on actual prices and policies adopted. This was seen as close to the 80% target with further work required on the best reduction trajectory.

The UK Committee concluded that the large majority of 80% cuts should come from action within the UK (rather than by emissions trading facilitating cuts in other countries). It called for a steepened target (excluding international transport) of 42% on 1990 levels by 2020 (equal to 31% cuts on 2005 levels – a much larger cut than the 15% in the AEA Scottish Report). Transport is seen as the sector where it is hardest to deliver cuts. The Scottish reports expect a 15% rise in energy use in transport between 2005 and 2020. Growth in movement would be higher but higher efficiency in energy use and shifts to alternative fuels would help to reduce the rise in emissions from transport. Beyond 2020, AEA considers that absolute cuts in transport emissions may prove possible due to greater shifts to alternative energy sources and further advances in the efficient use of energy.

Aided by stronger EU regulations to cut vehicle emissions and more rapid shifts to electric power, the UK Committee recommends deeper cuts in surface transport emissions by 2020 as part of steeper overall UK cuts by 2020. The Committee recognises that their 2020 targets exclude international aviation and shipping but stresses the urgency for international agreement on action affecting these sectors, especially aviation.

None of the Reports claim special expertise in transport. The AEA reports take the view that rising car ownership will lead to significant further growth in road traffic but this is at odds with the evidence of structural change in movement patterns showing stable car use, but strong growth in rail, over the past five years. The UK Report also ignores the evidence that soft and smarter measures can cut car use by 10% to 20%. Further research and shifts in behaviour may indicate greater and earlier scope for emissions reductions in the transport sector. Without such changes, targets will be harder to hit and the economy less strong.

The AEA Reports see a decoupling of energy use from economic growth. Improved efficiency in energy use, notably in housing and other buildings, is a major feature – which also moderates the challenge of meeting the Scottish target of generating 50% of Scottish electricity from renewables by 2020. AEA also point to prospects for life-extension at Scotland’s two nuclear power stations plus future use of carbon capture and storage at fossil fuel generating plants. The revised National Planning Framework favours a major coal-fired power station at Hunterston with provision for future carbon capture technology. In contrast UK policy contains reservations on any early viability for carbon capture and explicitly favours an expansion of nuclear build to increase the power and heat available while also aiding targets for emission reduction.
On behalf of the Scottish Building Federation (SBF), I welcome the opportunity to respond to the Scottish Parliament Transport, Infrastructure and Climate Change Committee’s call for views concerning the proposed Climate Change (Scotland) Bill.

Background

Scotland’s construction industry is crucial to the health of the Scottish economy both as a driver of economic growth and a provider of well paid skilled jobs. Recent statistics show that construction contributes over £13 billion to the Scottish economy, more than tourism and whisky combined.

A recent SBF survey of the sector revealed that, as a result of the current economic downturn, around 20,000 Scottish construction jobs were lost in 2008, representing a significant loss in capacity and skills form the industry. SBF’s expectation is that 2009 will be a similarly challenging year for the construction sector.

Our Response

The Scottish construction industry is fully aware that it has a major part to play in ensuring that the built environment makes a significant contribution in combating the effects of climate change. Overall, building use is responsible for around 50% of total CO2 emissions in the UK, with around 30% coming from homes, and 20% from commercial buildings. We also recognize that measures to reduce construction waste and increase recycling require to be maintained and increased.

With respect to the construction of new buildings, SBF were part of the expert panel that considered the issue of building standards and produced the Report “A Low Carbon Building Standards Strategy For Scotland” (Published December 2007), which recommended measures to improve energy performance of houses and buildings, with a view to reducing carbon dioxide and other emissions. The work streams identified within this report require to be progressed in close consultation with the construction industry to ensure the outcomes are realistic and ultimately positive in terms of climate change. We repeat our offer of assistance and a willingness to be involved in this process.

In considering the current economic environment, and the importance to the wider Scottish economy of retaining an active and dynamic construction industry, SBF strongly believes that the Climate Change (Scotland) Bill offers important opportunities to improve significantly the energy performance of our existing building stock. Our view is that a detailed policy focused on achieving this goal could also assist in retaining industry capacity, as well as equipping workers in the building sector with valuable green construction skills.

An important prerequisite for achieving these goals will be to ensure that all buildings are properly assessed in order to determine their existing energy performance, thereby ensuring that any future retrofit programme is targeted in the most cost-effective way possible.

SBF believe that in order to meet the targets set by the Scottish Government an assessment of energy performance will be required for all types of building to ensure that priorities can be set, which recognize the funding constraints, whether these be in the public or private sector. Failure to carry out a comprehensive assessment of energy performance and establish a priority plan may result in the headline objectives of the Bill being difficult, if not impossible, to meet.

Other Matters That Require Consideration:

- Realistic and achievable stepped targets to ensure progressive improvements to achieve the ultimate objectives.
- Consideration of other factors, i.e. the economic climate.
- Sufficient advance warning of changes in regulations.
- Clear and easily accessed grant funding, potentially for both householders and the construction sector.
In summary, we would therefore urge Members of the Scottish Parliament to consider how the Bill might be reformulated in a way that recognises the vital contribution improvements to the existing built environment can make towards meeting the dual objectives of ensuring a significant reduction in CO2 from Scottish buildings and helping the Scottish construction industry to retain capacity and further enhance skills.
SCIAF welcomes the presentation of the Climate Change (Scotland) Bill before the Scottish Parliament and is pleased to submit written evidence to the Transport Infrastructure and Climate Change Committee. SCIAF supports local communities in over 20 countries in Africa, Asia and Latin America, helping thousands of families to combat the negative effects that climate change is already having on their day to day lives. SCIAF has also undertaken policy and campaigns work on climate change in Scotland and at an international level since 2007; independently, as a member of Stop Climate Chaos Scotland, and as part of extensive international networks. Consequently we are well-placed to bring the voice of poor and vulnerable communities overseas to a legislative process that will not only affect those living in Scotland but communities worldwide.

As a member of Stop Climate Chaos Scotland (SCCS) we endorse its priorities (see below) and its full submission. Where appropriate, we will ask you to refer to its submission which reflects SCIAF’s views on particular topics. The Stop Climate Chaos Coalition Scotland priorities for the Climate Change (Scotland) Bill are that it must:

1. Set out a framework that will achieve at least an 80% reduction in greenhouse gas emissions by 2050.
2. Establish in statute annual emission reductions of at least 3% year-on-year from the start, not just from 2020, compatible with a fair and safe cumulative budget identified by the advisory body (see 4).
3. Include all emissions in the framework and targets set out in the Bill, including those from international aviation and shipping, from the very start.
4. Establish a Scottish advisory body, a Scottish Climate Change Commission, in the primary legislation to support delivery of the Bill when it is enacted.
5. Ensure that at least 80% of the effort to cut emissions takes place in Scotland.
6. Establish duties on all public bodies to reduce greenhouse gas emissions in line with the national target.
7. Set in place robust, transparent reporting measures so the Scottish Parliament is well informed on progress in meeting targets and Government is held to account.
8. Ensure that strong enforcement measures are set in place in statute.
9. Ensure Scotland counts all its emissions and reports on those produced by products and services we consume as well as emissions produced domestically.
10. Be explicit that sustainable development is core to the purpose and delivery of the statute in relation to mitigation and adaptation.

Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

For a full response, please also refer to the SCCS submission.

SCIAF welcomes the long-term greenhouse gas emissions reduction target of at least 80% by 2050 based on 1990 levels outlined in the Bill, which we feel represents a strong commitment to doing Scotland’s fair share to tackle climate change.

However, further to the evidence submitted by SCCS, we must stress the importance of committing Scotland to a greenhouse gas emissions reduction trajectory that ensures early action and makes a fair contribution to the global effort needed to prevent dangerous climate change.
Early action is essential because people living in developing countries are already feeling the effects of climate change. The UN estimates that between 2000 and 2004, 262 million people were affected by climate related disasters each year. 98% of these people were from developing countries. Should global temperatures continue to rise, many more will be affected. Indeed it is crucial for poor and vulnerable communities worldwide that the global surface temperature is not permitted to rise beyond what the UN has called a ‘tipping point’ — the temperature at which ‘the risk of large-scale human development setbacks and irreversible ecological catastrophes will increase sharply’. The IPCC has identified this potential tipping point as a rise of 2°C above pre-industrial levels, however at the most recent UNFCCC Conference of Parties in Poznan in December 2008, the Alliance of Small Island States (AOSIS), pointing to new scientific evidence, stated that their future survival depended on rises in global surface temperatures staying below 1.5°C.

It is therefore essential that Scotland commit itself to early action and retain the ability (and be willing) to revise the current commitment to a reduction in greenhouse gas emissions of at least 80% by 2050 upwards in line with changing climate science. Ensuring early action also means committing to annual targets of at least 3% greenhouse gas emissions reductions per annum from 2010 onwards and amending the interim target from 50% reduction in greenhouse gas emissions by 2030 to 50% reduction in greenhouse gas emissions reduction by 2020 (based on 1990 levels).

By setting the interim target for 50% by 2020, we would not only be committing ourselves to early action but setting a leading example which would be immediately comparable with UK and EU targets, both of which have 2020 rather than 2030 targets.

Further, by setting the interim target at 50% by 2020, we would automatically meet the UK’s share of the EU’s 2020 target should it be revised upwards in light of a global deal on climate change being reached at the UNFCCC Conference of Parties in Copenhagen in December 2009. The current EU deal commits member states to a collective reduction in greenhouse gas emissions of 20% by 2020 and if a global deal is reached this figure will be increased to 30% by 2020 (based on 1990 levels). Because the EU greenhouse gas emissions reductions commitment is based on the principle of effort sharing, economies with a high GDP per capita such as the UK are expected to reduce their greenhouse gas emissions by more than those member states with a lower GDP per capita. The UK Committee on Climate Change has therefore recommended that the UK as a whole should commit to reducing its greenhouse gas emissions by 34% by 2020, or 42% by 2020 (based on 1990 levels) should a global deal be reached. It is widely recognised that Scotland is well-placed to cut its greenhouse gas emissions by more than the UK average. Consequently, by setting the interim target at 50% by 2020, Scottish legislation is likely to be consistent with the UK’s share of any revised EU target.

Q2 The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

What are your views on the setting of targets in batches from 2010 to 2022?

For a full response, please refer to the SCCS submission.

Q3 The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?
SCIAF recommends the adoption of annual emissions reductions targets of at least 3% year on year from 2010, to ensure that Scotland commits itself to early action on climate change. This is also in keeping with current scientific evidence and would keep us on track for the 2050 target.

A study for the IPPR by Paul Baer and Michael Mastrandrea which looked at global emissions reductions found that, in order to have a 74-91% chance of keeping the temperature increase to 2°C, global emissions must contract by 5% each year from 2010 onwards. A 2006 report by the Tyndall centre looked at the UK and found that, if it was to do its fair share of stabilising atmospheric carbon emissions at 450ppmv by 2050—a level which still carries a 50% chance of exceeding 2 degrees—this would require decarbonisation of 9-13% per annum.

When the science is suggesting annual cuts of 5-13%, 3% must be seen as a bare minimum. Annual targets of at least 3% are also in keeping with the SNP’s manifesto promise of ‘mandatory carbon reduction targets of 3% per annum’.

Annual targets of at least 3% commencing from 2010 onwards must be included in primary legislation for the Climate Change (Scotland) Bill to ensure it is a truly world leading piece of legislation that commits Scotland to doing its fair share to tackle climate change.

Q.4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

SCIAF, like SCCS, believes that the vast majority of greenhouse gas emissions reductions should come from Scottish sources, and not be ‘bought in’ from other countries. In addition to the reasons outlined in the SCCS submission, SCIAF believes that the majority of greenhouse gas emissions reductions should come from Scotland because:

- The use of carbon credits might detract from domestic reduction effort. The unrestricted availability of international credits may create an incentive for administrations to emphasise short term, quick and easy fixes abroad, instead of focusing on the longer term changes that are necessary in Scotland. Whilst this may reduce emissions in the short term the danger is that, by putting off difficult decisions, it stores up problems for the longer term.

- Overuse of international credits would risk sending mixed messages and engendering cynicism amongst the general public as the government could be perceived as ‘buying its way out’ of its responsibilities. This could be damaging domestically, whilst also putting Scotland’s international leadership credentials on this issue to the test.
One of the major obstacles to securing a global deal at the UNFCCC Conference of Parties in Copenhagen this year is the lack of trust present between developed and developing countries. Failure to make firm emissions reduction pledges and the over-reliance on international credits and trading schemes by developed countries has engendered scepticism amongst developing countries. A Bill that limited the proportion of emissions reductions bought in from elsewhere would make Scotland amongst the first industrialised nations to demonstrate its commitment to make deep cuts at home. In doing so Scotland would be at the forefront of generating greater trust and confidence among developing nations, which is desperately need to ensure we have any chance of securing a sufficiently ambitious global deal at Copenhagen.

Our historical responsibility for climate change. The UK has a particular responsibility for climate change being, in 1830, the first country to emit more CO2 a year than the current sustainable level – something we have continued to do till today. In 2005, just one of Scotland’s power stations, Longannet on the River Forth, emitted ten times more CO2 than Malawi produces in a year, and more CO2 than ten sub-Saharan African countries combined. Scotland must address this historical responsibility for climate change by ensuring that the majority of greenhouse gas emissions reductions come from domestic sources.

SCIAF does not wish to rule out the use of international carbon credits altogether, however a limit must be placed on the amount of international credits that can be used to prevent Scotland from becoming over-reliant on international credits as a means of making up for annual shortfalls in domestic greenhouse gas emissions reductions.

Further, should international credits be used by the Scottish Government, they should adhere to international best practice. The following principles must apply to international credits used by the Scottish Government:

- Full transparency: annual reports on emissions reductions must show actual emissions from Scotland and net emissions after credits are taken into account.
- Ownership by developing countries and affected peoples: the methods by which international credits are generated must have the free, prior and informed consent of the host country government and of local communities affected by the project.
- Genuine social and environmental benefits: international credits must promote sustainable development and be additional to existing mitigation efforts.

Q5 The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

For a full response, please refer to the SCCS submission.
Q6 The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government’s approach to obtaining independent, expert advice on climate change?

For a full response, please refer to the SCCS submission.

Q7 The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

For a full response, please refer to the SCCS submission.

Q8 The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

For a full response, please refer to the SCCS submission.

Q9 The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on this proposal?

For a full response, please refer to the SCCS submission.

Q10 Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are your views on this proposal?

For a full response, please refer to the SCCS submission.

Q11 The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?
Q12 The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?

For a full response, please refer to the SCCS submission.

Q13 The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government’s thinking in this area.

What are your views on this approach?

For a full response, please refer to the SCCS submission.

Q14 The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

What are your views on this proposal?

For a full response, please refer to the SCCS submission.

Q15 The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas:

- Waste prevention and management plans;
- Waste data;
- Deposit of recyclable waste;
- Procurement of recyclate;
- Reduction of packaging;
- Deposit and return schemes;
- Charges for carrier bags.

What are your views on these proposals?

For a full response, please refer to the SCCS submission.

Q16 What are your views on the adequacy of the Scottish Government’s consultation in advance of publishing the Bill?

For a full response, please refer to the SCCS submission.

Q17 Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government out on the consultation proposals?

For a full response, please refer to the SCCS submission.
Q18 Does the Bill raise any equalities issues you would wish to highlight?

For a full response, please also refer to the SCCS submission.

Climate change is fundamentally a matter of international equity. Climate change has a disproportionate effect on poor and vulnerable communities, those who have done the least to cause it. It is also very likely that climate change will widen inequalities between the developed and the developing world further as well as compounding existing social inequalities within developing countries.

Indeed, we are already witnessing the disproportionate effect climate change is having on women living in developing countries, particularly those living in rural areas. Women are responsible for up to 75% of household food production in developing countries. Increased droughts and water scarcity stand to make this role even more time-consuming. This not only makes their day-to-day lives more difficult, it risks reducing the amount of time they have to spend on other activities, such as paid employment or education. Consequently, climate change is contributing to the further entrenchment of gender-based inequalities in the developing world.

Further, poor and vulnerable people are less able to adapt to and manage the impacts of climate change that have occurred and will continue to occur over the coming decades. There is consensus from international bodies (from the IPCC to the UNDP) and from people on the ground that adaptation is essential, and that insufficient adaptation has consequences for social justice, respect of human rights and global inequalities. However, the countries where adaptation is most urgently needed are least able to provide it. They lack the necessary finance, the necessary infrastructure and often the relevant information. In countries with extremely tight budgets, finding money for adaptation may mean taking money away from basic social services such as health and education.

By contrast, developed nations—including Scotland—have the financial means to fund adaptation and have the moral responsibility to do so. Given Scotland’s historical responsibility for greenhouse gas emissions, we should provide compensation to those most vulnerable to the impacts of climate change. Indeed, the Climate Change (Scotland) Bill provides a unique opportunity here for the Scottish Government to redress these inequalities by playing a role in providing resources to fund adaptation in developing countries.

Even relatively modest sums of funding provided could have a real impact in practical terms on the ground – as has already been proved by the impact that Scottish Government development aid has had.

It would also have a symbolic importance that would far outweigh its practical benefits. Obtaining sufficient, secure, additional and accessible financing for mitigation, adaptation and technology transfer is key to obtaining a global deal on Climate change at the UNFCCC Conference of Parties in Copenhagen in December 2009. The current lack of financing has become an important excuse for inaction at the negotiations. Scotland, by providing some funding for adaptation, could play an important role in breaking this deadlock.
Consequently, the Scottish Government should make some funding available that will allow communities in developing countries to adapt and respond to the climate change that is already impacting upon their lives. As a matter of principle this funding must be in addition to, and not be drawn from, the development aid budget, with a fixed, predictable amount made available year-on-year. Across the world we are seeing increasing levels of funding for developing countries to adapt to the effects of climate change, but this often comes from existing aid budgets. Since developed industrialised countries have, by and large, caused climate change, the ‘polluter pays’ principle means they should be obligated to pay for such adaptation measures as a matter of course. This must not ‘eat into’ existing development aid budgets which were set up before climate change and its effects became apparent.

The provision of secure, accessible and additional funding for adaptation is essential to ensure that Scotland does its fair share to address the inequalities that have already resulted from climate change.

(For more detailed answer on how to include funding for adaptation please see the response to question 20)

Q19 Do you have any comments on the impact of the Bill on sustainable development?

For a full response, please also refer to the SCCS submission.

We agree with SCCS that sustainable development should be an underpinning principle of the bill, and we would therefore like to see a sustainable development duty included in the Bill in Part 6 and also see ‘sustainable development’ referenced in the Bill’s long title. This would ensure that the bill remains focused throughout on promoting positive and sustainable development both in Scotland and in the developing world. It would also acknowledge the truly global nature of climate change and recognise the impact that the Climate Change (Scotland) Bill could have on communities across the globe.

Further we also believe that it is essential that the Climate Change (Scotland) Bill should place a duty on the Scottish Government to ensure that any mitigation and adaptation efforts contribute to the furthering of sustainable development; and ensure the avoidance of negative social and environmental impacts on poor and vulnerable communities worldwide. This, for example, would guard against a reliance on first-generation biofuels to meet annual greenhouse gas emissions reductions commitments in the transport sector because of the damaging effects they can have on rural communities and food security in the developing world.

Q20 Do you have any other comments on the Bill?

For a full response, please also refer to the SCCS submission.

(Please also see SCIAF’s response to Question 18)

In recognition of the urgent need for adaptation funding in the developed world, we propose that the Scottish government make a relatively modest sum of money available to help developing countries adapt to climate change that is already happening. As a matter of principle this must be in addition to, and not be drawn from, the development aid budget, with a fixed, predictable amount made available year-on-year from direct government funding.
In addition to its predictable core funding, such a fund could be topped up from innovative sources. One such suggestion is a ‘climate fund’ mechanism, replenished in part through fines (or missed incentive payments) levied against Government Departments and publicly-funded bodies that have failed to meet relevant climate emissions targets. Such a fund, if designed well, could incentivise public bodies to meet their emissions reductions targets, mobilise additional investment to meet emissions reductions targets and adaptation projects within Scotland, and result in additional funds being available for adaptation overseas.

WRITTEN SUBMISSION FROM SCOTTISH ENVIRONMENT LINK

The Scottish Environment LINK (LINK) Climate Change Task Force welcomes the opportunity to provide written evidence on the Climate Change (Scotland) Bill. Established in 1987, LINK is the forum for Scotland’s voluntary environment organisations - 32 member bodies representing a broad spectrum of environmental interests with the common goal of contributing to a more environmentally sustainable society. LINK provides a forum and network for its member organisations, enabling informed debate, and assisting co-operation within the voluntary environmental sector. LINK assists communication between member bodies, government and its agencies and other sectors within civic society. Acting at local, national and international levels, LINK aims to ensure that the environment is fully recognised in the development of policy and legislation affecting Scotland.

The LINK Climate Change Task Force works closely with the Stop Climate Chaos Coalition (SCCS) and supports the top ten priorities for the Bill identified by SCCS. The coalition members include environment and development NGOs, faith groups, trade unions, community councils, student societies, women’s organisations, a mental health charity, and many others. In Scotland, the members have a combined supporter base of over 1.5 million people.

The LINK Climate Change Task Force supports the following ten Stop Climate Chaos Coalition Scotland priorities for the Climate Change (Scotland) Bill. The Bill must:

1. Set out a framework that will achieve at least an 80% reduction in greenhouse gas emissions by 2050.
2. Establish in statute annual emission reductions of at least 3% year-on-year from the start, not just from 2020, compatible with a fair and safe cumulative budget identified by the advisory body (see 4).
3. Include emissions from all sectors in the framework and targets set out in the Bill, including those from international aviation and shipping, from the very start.
4. Establish a Scottish advisory body, a Scottish Climate Change Commission, in the primary legislation to support delivery of the Bill when it is enacted.
5. Ensure that at least 80% of the effort to cut emissions takes place in Scotland.
6. Establish duties on all public bodies to reduce greenhouse gas emissions in line with the national target.
7. Set in place robust, transparent reporting measures so the Scottish Parliament is well informed on progress in meeting targets and Government is held to account on mitigation and adaptation.
8. Ensure that strong enforcement measures are set in place in statute.
9. Ensure Scotland counts all its emissions and reports on those produced by products and services we consume as well as emissions produced domestically.
10. Be explicit that sustainable development is core to the purpose and delivery of the statute in relation to mitigation and adaptation.

LINK member bodies believe that Scotland needs urgent action on climate change and have been calling for greenhouse gas reductions to be delivered in a sustainable manner and for adaptation measures to be put in place to help secure our natural and cultural heritage. We are using our environmental experience and strong membership base in helping to address climate change, but we need the Government to provide the lead to ensure policies and decision-making go in the right direction to reduce greenhouse gas emissions.

Further information outlining LINK’s view on climate change is available in the document - Time to Act on Climate Change

3 http://www.scotlink.org/pdf/LINKClimateStatementSept08.pdf
1. Reducing greenhouse gas emissions

Climate change is the greatest threat facing our environment and humankind and it requires immediate and sustained reductions in greenhouse gas emissions to avoid disastrous consequences. Research predicts that without urgent action, climate change could cause the extinction of up to one million species worldwide by 2050, which is more than a third of land-based species. Numerous devastating climate change impacts on biodiversity and ecosystems are identified in the various reports from the IPCC.

The Millennium Ecosystem Assessment\(^4\) states that, if significant global adverse changes to ecosystems are to be avoided, efforts should be made to limit the increase in global mean surface temperature to less than 2°C above pre-industrial levels and to limit the rate of change to less than 0.2°C per decade.

Currently, the best scientific advice points to the need for greenhouse gas reductions in developed countries of at least 80% by 2050. This would give us a reasonable likelihood of staying below a 2°C increase in global temperature, which is considered the maximum manageable level if we are to avert the worst effects of climate change.

**We consider that early emissions reduction of at least 3% per annum is necessary and achievable in a sustainable manner.** To delay makes the cuts required in future so great and rapid that it may be too difficult to achieve without severe social, economic and environmental consequences.

We want to see this reflected in the Scottish Climate Change Bill with strong statutory long-term and annual targets to deliver the necessary greenhouse gas reductions in order to avoid dangerous levels of climate change.

2. A sustainable approach

**LINK considers it essential that a strong sustainability duty is included in the Bill.** Sustainable development means recognising environmental limits while considering the environment, social issues and the economy together. This is the only way to really tackle climate change and ensure our actions do not add to the challenges brought about by climate change. Our use of energy for homes and businesses, travel, our consumption of goods and food and our use of the land and sea are all major sources of greenhouse gas emissions. Reducing these emissions needs to be set within a legislative framework that encourages a sustainable approach. This means delivering energy demand reduction and efficiency, along with renewables without environmental harm; reducing waste and encouraging recycling. It means greater support for walking, cycling and public transport rather than expanding airports and roads. It also means finding ways to manage our land to provide multiple public benefits, including attractive landscapes and natural habitats, improved local economies and quality of life.

A sustainable approach will also avoid environmental conflict when considering the most appropriate ways to reduce greenhouse gas emissions or adapting to climate change. Present and future generations depend on a healthy environment and there is no point seeking opportunistic ways of addressing climate change which threaten biodiversity, landscapes or our cultural heritage. Indeed, our natural environment if managed sustainably can often help in cutting emissions and providing the means to deal with a changing climate.

The Ministerial Foreword to the consultation document recognises the need for sustainability to be at the heart of all policies, including climate change but this is not reflected in the legislative proposals. We think that it is vital that such a strong legislative framework document should include a clear steer that climate change should be tackled in a sustainable manner.

----

3. Adaptation

LINK welcomes the Bill’s proposals for Government to produce reports on Adaptation. We are already seeing changes in our natural environment on land and at sea, with many of Scotland’s most iconic species and habitats showing particular vulnerability. The right adaptation measures are vital to ensure the conservation of Scotland’s biodiversity, and to address the threats to ecosystem structure and function. In our built heritage, our historic buildings are facing extremes of weather not previously experienced in their lifetimes. Coordinated action across all sectors is required to help make our environment resilient, bearing in mind that much of it is already in a damaged and deteriorating state.

In order to deliver the right response in Scotland it is important that decision-makers have the right information on the impacts of climate change relevant to the particular Scottish circumstances. We therefore would like to see the Bill require the Scottish Government to produce their own climate change impact assessment with support from the relevant advisory body, rather than rely entirely on a UK impacts report.

It is also important that the Bill provides for independent public scrutiny of the Scottish Government’s progress in implementing its adaptation policies and programmes. We therefore recommend that the Scottish Climate Change Bill should require the production of a Scottish adaptation programme at least every three years, which includes:

- an assessment of the current and future predicted impact of climate change in Scotland
- the objectives of the Scottish Government in relation to adaptation to climate change
- the Scottish Government’s proposals, policies and timescales for meeting those objectives

and should provide for:

- an independent assessment, at least every two years, of progress towards implementing the objectives, proposals and policies set out in the adaptation strategy
- annual reporting to the Scottish Parliament of achievements and revisions to the strategy

4. Muirburn

LINK supports the Bill’s enabling powers for Ministers to vary muirburn times. This is a measure which is required as part of our adaptation response to the impacts of a changing climate. Many moorland ground-nesting birds have already shown a response to climate change by breeding earlier in the season and it is important therefore for Ministers to be able to adjust the times at which muirburn is permitted in order to avoid harming wildlife. Key stakeholders of the Moorland Forum, a consortium of organisations with an interest in moorland management issues have responded to a Scottish Government request for an agreed position and provided a statement in support of the Bill’s proposals.

5. Forestry

In principle, LINK welcomes the fresh look at how the Forestry Commission Scotland (FCS) can deliver for climate change but we are particularly concerned that the plans proposed in the Bill are controversial, not fully explained or costed and as such, they represent a distraction from the important climate change priorities in the Bill.

Creating new woodlands contributes to carbon sequestration as does restoring damaged woodlands, but the benefits of this are relatively small and scientifically challenging to confirm compared to carbon mitigation from reductions in our use of fossil fuels. The National Forest Estate whilst having a role to play in carbon sequestration also has a vital role in adaptation yet this was not considered in the FCS proposals. Much of the public concern voiced over the Bill’s forestry proposals was a reflection of support for the multiple benefits of our forests including environmental and recreational values which could be undermined if carbon became the primary driver for the National Forest Estate.

Please see http://www.scotlink.org/pdf/LINKWTFWrittenEvidenceRAECommitteeForestryProposalsCCScotBill3Feb2009.pdf for detailed LINK evidence to the Rural Affairs and Environment Committee on the Forestry provisions in the Claimed Change (Scotland) Bill.
It is LINK’s view that these proposals require more considered thought and discussion. As a result, we are unhappy with the wide reaching enabling powers in Section 47, sub sections 1, 2 and 4 being included in the Bill. Rather we would like to see any specific powers that may be identified, legislated for in future, after they have been properly explored and consulted upon. We do however welcome the inclusion of Subsection 3,a), b), c) and d) (i) which allows the FCS to enter into joint ventures which could include renewable energy projects, because these proposals are specific and directly relevant to the Bill’s aims.

LINK also considers it important to recognise that land use as a whole, including agriculture, forestry, and nature conservation are all important for climate change mitigation and adaptation. We believe that Scotland should have a sustainable land use strategy to deliver a holistic, integrated approach to land use which addresses climate change and delivers multiple public benefits.

6. Energy Efficiency

LINK welcomes the recognition the Bill gives to the role energy efficiency will play in driving down emissions and closing a future energy gap. However, there are a number of key areas where this section could be improved. Firstly, the Bill should refer to ‘improving’ rather than ‘promoting’ energy efficiency wherever possible. This language is used in the Housing (Scotland) Act 2006, section 179 (duty of Scottish Ministers to prepare strategy for improving the energy efficiency of living accommodation) and should be adopted in defining the aims of this Bill with regard to energy efficiency.

There has been considerable delay (some six years) in the provision of a long promised Energy Efficiency Action Plan and the Bill should not prevent its earliest possible publication. The Plan should include targets on energy efficiency, and progress should be reported in terms of reduced energy demand, reduced emissions, and increase in microrenewables as part of the Annual Report set out in Part 3 – Reporting Duties.

The following member organisations have agreed this statement:

Friends of the Earth Scotland
The John Muir Trust
National Trust for Scotland
Plantlife Scotland
Ramblers’ Association Scotland
RSPB Scotland

Scottish Environment LINK is the forum for Scotland’s voluntary environment organisations - 32 member bodies representing a spectrum of environmental and associated cultural heritage interests with the common goal of contributing to a more environmentally sustainable society. LINK provides a forum and network for its members; and assists communication between members, government and civic society. Further information on LINK is available at www.scotlink.org

Scottish Environment LINK is a Scottish Company limited by guarantee without a share capital under Company No. SC250899 and a Scottish Charity No. SC000296.
WRITTEN SUBMISSION FROM SCOTTISH ENVIRONMENT PROTECTION AGENCY

Introduction

SEPA’s main role is to protect the environment and human health. We do this by controlling activities that can cause harmful pollution and by monitoring the quality of Scotland’s air, land and water working to enable those we regulate to comply with the legislation as well as delivering a number of services such as flood warning and environmental business advice.

SEPA welcomes the Climate Change (Scotland) Bill and the strong framework it contains to address climate change in Scotland. SEPA feels that there are areas where further provisions are necessary to help Scotland achieve its targets. On balance, SEPA believes putting in place provisions for these measures now would further assist us on the pathway of reducing emissions towards the 80% target as well as protect Scotland’s environment and communities.

Flooding and floods management is clearly a key issue, and a major part of SEPA’s activity. However given the parallel development of the Floods Risk Management (Scotland) Bill, we have not commented further in this evidence.

Key messages

We need early action where possible and a Bill to support this.

To set a clear pathway for reductions of Scottish emissions and the move towards a low carbon economy, international credits must be a purely supplementary measure to firm domestic action.

Parallel reporting on consumption emissions and communication activity on end user demand is needed to provide an overall picture of our climate change impacts.

We need to measure and monitor Scottish emissions closely- existing systems are unlikely to be sufficient to meet changing demands.

We need statutory duties on local authorities, government departments and the wider public sector to consider the carbon impact of their decision making and procurement activities. We need provisions for regulators and planning authorities to take account of carbon impacts.

We need to greatly improve our utilisation of waste heat and underpin renewable heat and waste heat policy with firm and supportive action.

The Climate Change Bill should recognise the importance of Scotland’s carbon rich soils, and the need for their effective management. Scotland is in a unique position with a large amount of carbon in peatlands that need to be protected and managed sustainably.

Response to Call for Views

Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

SEPA welcomes the 2050 target of 80% emissions reduction and the setting of an interim target of 50% by 2030. SEPA feels that an interim target sends clear signals to business and will set us on the pathway to the 2050 targets.
There has been discussion since the Bill’s publication on the need for an earlier target, possibly for 2020, in order to strengthen these signals. SEPA notes that Scotland will be part of the UK 2020 target of at least 26%. This target is achievable based on the UK Committee on Climate Change’s recommendations set out in its recent report. The report further recommends a 34% interim target (and 42% intended target if international agreement on a global treaty is reached) going beyond the commitment in the UK Climate Change Act of at least 26% in 2020. SEPA understands that the UK government, after having consulted with devolved administrations, will respond to the UK Committee’s advice shortly.

Scottish Government’s technical note on Climate Change Scotland Bill: Greenhouse Gas (GHG) Emissions, Annual Reduction and Targets notes that Scottish Ministers will be informed by the advice of the UK Committee on Climate Change before setting the levels of annual targets.

In addition to this, if Scotland reduces its share of emissions in line with the UK target and then continues on an annual 3% reduction to 2030, SEPA believes we would be well on the way to performing beyond the current interim target of 50%.

In summary, the picture on target setting continues to develop, and SEPA is not in a position to comment on the detailed trajectories at this stage, other than to re-iterate that a balance must be struck between early, sustained action, and economic and feasibility considerations.

Q2 The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

What are your views on the setting of targets in batches from 2010 to 2022?

SEPA supports the setting of targets in batches. Given the length of the first batch, it is important that not only are the targets credible but also crucial that they are as stretching as possible to avoid possible carbon lock in.

Q3 The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

SEPA notes that there are lead-in times for policies enacted now, but also that there are available measures that could set us on a strong downwards trajectory pathway before 2020. We recognise 3% reduction in the first years may not be attainable, but we need to make sure we don’t carry on “business as usual” up to 2020. SEPA is concerned that reductions that could be made prior to 2020 may not occur without strong action.

In line with this, we need to recognise the purpose of the Bill is to reduce the concentration of greenhouse gases in the atmosphere and that earlier action makes this battle a lot easier in the long term. The sooner we start moving towards a low carbon economy and implementing measures that are making a sizeable contribution to emission reductions, the easier it will be to achieve the 2030 and 2050 targets.

Scottish Government’s technical note highlights a scenario up to 2020 that continues on the same pattern as we have done since 1990, rather than increasing the emissions reduction pathway. It is worth stating that such an approach, whilst not being proposed, approximates to only 1% annual reductions, and is completely inadequate.

1 http://www.theccc.org.uk/reports/ Building a Low Carbon Economy – the UK’s contribution to tackling climate change
Emissions reductions since 1990 have not always been attributable to mitigation measures and so to continue on this same pathway could be considered “business as usual”. For example, the decline of the manufacturing industry in Scotland has seen a decrease in Scotland’s emissions but not necessarily global emissions.

Q.4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

The net Scottish emissions account is an ideal concept to use as a point of reference against which the target for reducing greenhouse gases can be measured. SEPA welcomes the establishment of a carbon account for the tracking of carbon units and maintaining a database. SEPA has experience in this area as the body that enforces and administrates the EU Emissions Trading Scheme (EU ETS).

As detailed in SEPA’s Bill Consultation response\(^3\), SEPA believes that there should be limits on credits used by Scottish Government in meeting Scottish targets. SEPA recognises that it would be in contravention with the EU ETS to set a limit that applies to the traded sector before they have purchased international credits and therefore the limit should apply to the net Scottish emissions as a whole after the traded sector have been added to the Scottish emissions account.

International credits used for the net Scottish emissions account should be purely supplementary and applying limits is therefore a necessity. SEPA proposes a limit of one fifth of emissions reductions to ensure that efforts are focused in Scotland. This would strengthen the transition to a low carbon economy and energy efficiency measures and encourage investment in mitigation measures in Scotland.

Q5 The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

SEPA feels this is an accurate view of production emissions for the purpose of the target. However as Scotland’s influence goes far wider than the boundaries outlined as the definition of Scottish emissions, we would like to see provisions in the Bill for parallel reporting on consumption emissions. An end user inventory could illustrate the influence that Scotland’s domestic demand and imports has on international emissions. This could be made up of heat, electricity, transport, goods and services.

This would not only help with communication but also look at the influence that Scotland has on global emissions, for example, by looking at the impact of the steel we import has on emissions, the impact of the plastic goods we import and therefore provide at least an estimate of our influence on emissions globally. A key delivery challenge for this is to ensure the availability of acceptable data at an appropriate level from other countries.

\(^3\) http://www.scotland.gov.uk/Resource/Doc/259367/0077144.pdf SEPA’s response to the Consultation on proposals for a Scottish Climate Change Bill
Q6 The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government’s approach to obtaining independent, expert advice on climate change?

SEPA supports Scottish Government’s approach to obtaining independent, expert, advice on climate change.

SEPA also believes that there may be merit in exploring the potential for a body to undertake a wide ranging review of the impact of regulations and policies on climate change policy. A ‘Scottish Climate Change Regulatory Review Commission’ could actively invite submissions from stakeholders to identify inadequate, contradictory or outdated provisions. Such approaches have been used across a wide range of policy areas and have the advantage of allowing a transparent, consultative and considered approach. SEPA has in mind the sorts of processes used for the Hampton, Macrory and Davidson reviews (better regulation), the Crerar review of scrutiny, and so on.

Q7 The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

Reporting is clearly a key element of the policy cycle, as good performance reporting drives better performance and more timely intervention where required.

Many of the reporting requirements that SEPA called for in its response to the consultation have been incorporated, however, climate change science with a particular focus on Scotland (for example emissions for peat systems), could also be reported.

In the original Bill consultation there were three levels of duties proposed: advisory, monitoring and reporting/evaluation. However, direct monitoring no longer appears to be addressed on the face of the Bill. SEPA is also concerned about the lack of integration between monitoring from local authorities, the Scottish Government, SEPA and other reporting agencies. It is not clear that current climate change monitoring and reporting frameworks do in fact provide the necessary framework within which policy consequences can be explored.

In SEPA’s view, therefore, there is need to establish a more detailed, faster and more accurate picture of emissions of climate gases within Scotland in order to assist with planning, and meet increased demands for scrutiny. SEPA believes that this will need to involve both increased physical monitoring and assessment of some gases (e.g. nitrous oxides) and an increased capacity to assemble, verify and publish data.

This approach would also contribute to a more detailed understanding of the progress towards the targets and impacts of policies and other mitigation measures on greenhouse gas emissions. As a result this would lead to more robust and detailed reporting.

SEPA would be happy to respond further on the responsible body for this duty. In our response to the Bill consultation, SEPA put itself forward as the appropriate body for such a task. This was on the basis that, SEPA has carried out similar roles in measuring, assembling, verifying and publishing data, for example Waste Data, Scottish Pollutant Release Inventory (SPRI) and the EU ETS. However, clearly a debate is needed as to which body is best placed to carry out this task- from SEPA’s perspective it is difficult to see an alternative body that could logically carry out the task.
SEPA recommends the inclusion of provisions in the Bill to improve the measuring and estimation of emissions, verification and publishing of data, and a power for Scottish Ministers to require other organisations to cooperate with the central measuring/monitoring body.

**Q8** The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

**What are your views on this proposal?**

**Statutory Provisions**

SEPA fully supports the proposals in Part 4 and feels that statutory duties on the public sector (including central government directorates) should be part of the way forward in tackling climate change in Scotland. In particular SEPA feels that the duty should be placed on public bodies now, as part of the Bill, with statutory guidance on the meaning of the duty to be developed in due course.

Not only should the public sector lead by example but also the extensive influence that the public sector has on emissions via its own decision making should be recognised. Analogous voluntary agreements in the private sector and voluntary commitment in the public sector have been shown to deliver little more than business as usual in many cases.

**Taking account of the carbon impact**

As recognised above the public sector and government have a huge influence through their decision making on carbon emissions in Scotland (often referred to as indirect emissions). We are very much at the beginning when it comes to taking account of the carbon impact of policy decisions but there are some good examples of where progress is being made in this area. As our knowledge and skills develop in this area, provisions in the Bill requiring public bodies to take account of carbon impact in their procurement, policy and regulatory decisions would set us firmly on the pathway for reducing emissions and setting up a low carbon infrastructure to which we can build upon.

In addition, SEPA considers that there might be merit within the limits of devolved powers in placing a duty on regulators (including possibly SEPA, SNH, HSE, FSA, Marine Scotland, local authority regulatory services, Audit Scotland, CAA, Water Industry Commission and OFGEM) to consider carbon impact as part of their statutory duties. With regard to SEPA’s own regulatory functions, further provisions could be added to part 5, to amend the Environment Act 1995, to require SEPA to take account of climate change for all its regulatory decisions. Clear, consistent guidance on how to approach this would be needed and could be developed by the regulatory bodies in partnership with the Scottish Government.

Just as importantly, SEPA considers there should be specific duties on planning authorities and community planning partnerships to ensure that they consider greenhouse gas emissions in planning and policy decisions. The initial step in the majority of developments and redesigns is a planning application. Continually reducing emissions will be best achieved by adequately considering emissions at this stage. SEPA is already working with Scottish Government and the other responsible authorities under the requirements of Strategic Environmental Assessment (SEA) to improve the consideration of greenhouse gases at this stage in the process.

**Q9** The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

**What are your views on this proposal?**
SEPA note that there could be more pieces of legislation in addition to permitted times for muirburn that may require amendments in order to allow for adaptation to climate change impacts. A provision in the Bill recognising that as we develop our understanding and knowledge of climate change impacts we may need to amend other legislation would be useful.

Also, provisions could be included to amend the Water Environment and Water Service (WEWS) Act so that it is a statutory requirement to consider and report on adaptation under the WEWS Act, e.g. Wetlands Strategy and River Basin Management Planning (RBMP) in terms of adaptation.

SEPA feels that the section on adaptation should make a specific reference to sustainable development so that social, economic and environmental factors are all considered.

Q10 Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are your views on this proposal?

SEPA has no specific comments to make on the muirburn proposals. However, as elaborated below, SEPA notes the vital importance of effective management of Scotland’s soil carbon resource in mitigating climate change.

SEPA’s view is that land management practices should aim for positive carbon impacts (or at least carbon neutral) and should aim to improve the resilience of Scottish soils in this respect.

Q11 The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

SEPA responded to the separate consultation on forestry provisions in the Climate Change Scotland Bill and our key points on the consultation on forestry provisions were:

- It is important that the provisions ultimately lead to helping Scotland achieve its climate change targets through a net reduction in carbon emissions.
- Renewable energy developments and woodland creation cannot be successful in isolation. Scotland must integrate a variety of mechanisms including: minimising woodland removal, conserving forest carbon stocks by low impact silvicultural systems, identifying core networks/areas to maintain biodiversity, establish energy crops, woodland creation and environmental protection through processes.
- In considering the consultation, SEPA would have welcomed more detail on the proposals and possible implications. For example, the consultation mentions remedying weaknesses in existing forestry legislation – it would be useful to have these weaknesses fully laid out in the consultation.
- Without an overall quantified carbon assessment of the proposals, SEPA has found it difficult to judge the merits of the proposals, and therefore restricted its comments to identifying issues for clarification/resolution.
- With the underlying objective being to help achieve the emissions reduction target in the Scottish Climate Change Bill, we would encourage conditions on the lease so that operators are required to take account of carbon impact.

Q12 The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?

It appears that the Bill could be unintentionally weakening Energy Efficiency legislation. The Climate Change Bill repeals terminology in the Housing Act 2006 to improve energy efficiency whereas the Climate Change Bill looks to promote energy efficiency.

SEPA would also like to draw the committee’s attention to SEPA’s response\(^5\) to the Economy, Energy and Tourism Committee’s call for evidence on determining and delivering Scotland’s Energy future. SEPA noted that measures to address energy demand for existing building stock will need to be addressed. Also, we are still seeing major public developments (hospital and schools etc) basing decisions on building costs (now) rather than future costs of carbon, resulting in the wrong boiler type or heating system and inadequate energy efficiency standards. The cost of carbon must be incorporated into the design, planning and decision stage of building projects. SEPA would like to see the provisions in Section 48, 49 and 50 reflect this need.

Q13 The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government’s thinking in this area.

What are your views on this approach?

Xxxxxxxxxxx no answer xxxxxxxxxxxxx

Q14 The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

What are your views on this proposal?

Key messages:

- Promotion and support could extend to the promotion of waste heat from fossil fuels use (working with the UK Government where appropriate).
- There is need to go further than ‘promote’ and to explore opportunities for improved coordination between key actors, use of the planning system and application of best practice standards to underpin the direction of the draft framework for the development and deployment of renewables in Scotland\(^6\) (includes Scottish Action Plan on renewable heat) and SEPA’s Thermal Treatment guidelines\(^7\).

\(^{7}\) [http://www.sepa.org.uk/about_us/sepa_boards/the_agency_board/agendas_and_papers/10_february_2009.aspx](http://www.sepa.org.uk/about_us/sepa_boards/the_agency_board/agendas_and_papers/10_february_2009.aspx) SEPA’s Thermal Treatment Guidelines approved by the Agency Board 10\(^\text{th}\) February 2009. Papers for the meeting page 67 to 110. [Link no longer operates]
Waste heat

SEPA welcomes the provisions that Scottish Ministers must take steps to promote the use of heat from renewable sources. Promotion and support could also be expanded to cover the use of waste heat produced by fossil fuel power stations and other industrial processes. SEPA also highlighted this issue in its response to the Economy, Energy and Tourism committee’s call for evidence for determining and delivering Scotland’s Energy Future. SEPA explained that Scotland requires a huge and sustained increase in its ability to utilise heat from renewable sources as well as waste heat from industry, power supply and thermal treatment.

Legislation to underpin waste heat and use of renewable heat policy

Scotland’s Renewable Heat Strategy: Recommendations to Ministers recognises that there are particular opportunities in Scotland because of the extent of areas off the gas grid, and the existence of clusters of potential heat demand and existing waste heat or potential renewable heat sources.

SEPA’s Thermal Treatment of waste guidelines set out the approach that SEPA will take in planning responses to, and licensing of, waste treatment facilities. The thermal treatment guidelines note that the location of thermal treatment facilities needs to consider the future use of waste heat, as an integrated network of facilities will ensure energy from waste is recovered efficiently.

“SEPA recognises that Scotland does not yet have mature or extensive heat-use networks. However, there are immediate opportunities for reliable and extensive heat use by co-locating thermal treatment plants with existing energy and heat intensive industries, or near to public developments such as leisure complexes and shopping centres. Another alternative is to develop facilities in areas with the potential for the co-development of heat-using industries. Low grade heat could be a driver for the development of eco-industrial parks, with a focus on waste treatment, reprocessing and manufacturing using waste materials, renewable energy production and local food production.”

Regulators, government and the renewables sector need to work more closely together to ensure the development and application of best practice industry standards and methods of working. Scottish Ministers and Planning Authorities (working with the UK Government where appropriate) have a central role in putting in place mechanisms to increase the use of waste heat and renewable heat sources. Scottish Ministers will need to interact with the Planning System to take steps to increase the use of heat from renewable sources and the utilisation of waste heat.

Q15 The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas:
Waste prevention and management plans;
Waste data;
Deposit of recyclable waste;
Procurement of recyclate;
Reduction of packaging;
Deposit and return schemes;
Charges for carrier bags.

What are your views on these proposals?

With reference to the objectives of the Climate Change Bill, SEPA believes that there must be concrete evidence that the waste provisions provide an overall carbon benefit. SEPA would therefore advocate that a full life cycle assessment and carbon impact assessment is carried out in detail before the implementation of each waste provision to ensure they contribute positively towards the overall 80% emissions reduction target.

SEPA gave oral evidence at the Rural Affairs and Environment Committee on 4th February and also submitted a consultation response\(^9\) in October 2008 to the consultation paper on potential legislative measures to implement zero waste.

Further to this, Section 58 of the Climate Change Bill as could expand so that it covers products as well as packaging in deposit return schemes.

A simple but effective example of the benefits of a more flexible approach would be energy efficient light bulbs (one could list many other products that are potentially problematic from an environmental resource and carbon impact perspective e.g. mobile phones and batteries). Energy efficient light bulbs will hit the waste stream in their millions in a few years and therefore provisions for an incentive to the public could help recover their metal, glass and plastic content as well as keep their mercury content, albeit low, out of landfills and energy from waste systems.

SEPA suggest the following approach to widen this potentially useful instrument:

- Make the powers general to any products and inclusive of packaging.
- Ensure the powers can be used for full or partial refund schemes. This will enable either, a full refund on return approach, or a partial refund and part subsidy for recovery approach, which for some potentially hazardous household wastes may be necessary. This is not an uncommon approach to deposit refund schemes. Care would be necessary to ensure retailers cannot pocket part of the deposit. A central clearing house approach would avoid this.

There are clear opportunities to ‘close the loop’ in terms of ensuring that a waste material can be used as the input fuel or raw material for other processes, either within the same overall manufacturing process, or as a valuable raw material for another organisation. This can be achieved one of two routes: (1) within a tiered, proportionate regulatory system that reflects the risks associate with a particular waste or end-use, or, (2) where a case can be made to show that the use of waste materials is no worse than the non-waste equivalent for the environment and human health, as a new product or raw material.

Dealing specifically with the second route, SEPA is relatively unique within the UK as it has provided publicly available guidance on the definition of waste since 2006. Our sister agencies in other parts of the UK are working on their own guidance at the moment but have still not published anything. We supplemented SEPA guidance with specific guidance on the recovery of waste oils in 2007 and it is a piece of guidance around which we have had some success:

- A drilling waste management company recovers waste oil from offshore drilling mud so that it is no longer a waste when it is sent for reuse offshore.
- Working with the Quarry Products Association, SEPA published guidance on the recovery and re-use of road planings as a non-waste. This has reduced the costs and bureaucracy for civil engineering contractors and aims to encourage an approach that ‘closes the loop’ on up to 500,000 tonnes of road planings per year.
- We reached a successful end-of-waste conclusion for a company manufacturing biodiesel from used cooking oil and animal rendering wastes. Smaller biodiesel manufacturers are likely to benefit from a change in legislation in 2006 (i.e. an exemption from the requirement to hold a waste treatment licence) to allow small scale manufacturing under certain conditions.
- We are currently working with the Scotch Whisky Association on a framework document which looks at the reuse of outputs from distilleries in a range of activities, including their use as fuels, animal feed and soil conditioner.
- We are working in partnership with the Civil Engineering Contractors Association to develop guidance on the end-of-waste for clean soils from Greenfield sites.
- We are working with Scottish Power and ScotAsh to consider end-of-waste cases for the uses of the various waste ash streams from coal burning power stations.
- Working with the Quarry Products Association to see whether we can, on the basis of an end-of-waste case, allow the use of recovered waste oils as fuel in roadstone coating plants without requiring compliance with the EU Waste Incineration Directive.

---

\(^9\) http://www.sepa.org.uk/about_us/consultations/sepa_responses_200.aspx SEPA’s response in October 2008 to the consultation paper on potential legislative measures to implement zero waste. [Link no longer operates]
Q16 What are your views on the adequacy of the Scottish Government’s consultation in advance of publishing the Bill?

The 12 week consultation period provided ample opportunity for SEPA to consider the proposals for a Scottish Climate Change Bill. SEPA organised several internal seminars to discuss the proposal and SEPA’s response was also considered by the SEPA Board in April 2008.

Q17 Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government out on the consultation proposals?

In our response to the Strategic Environmental Assessment Environmental Report consultation, SEPA welcomed the undertaking of a Strategic Environmental Assessment on the Scottish Climate Change Bill consultation and considered it to be a very comprehensive document that covers the issues in considerable detail and, importantly, identifies a comprehensive range of SEA mitigation measures.

In its original comments, SEPA recommended that a simplified report was prepared to support the introduction of the Climate Change Scotland Bill to Parliament which clearly sets out the key findings and SEA mitigation measures. SEPA noted that this would help inform decision making on the Bill as it progresses through Parliament; such a note was published on 23rd December 2008.

Q18 Does the Bill raise any equalities issues you would wish to highlight?

No comment.

Q19 Do you have any comments on the impact of the Bill on sustainable development?

SEPA believes that, taken as a whole, the provisions and policies to meet the targets should make a strong contribution to sustainable development. The advisory mechanisms established via the UK Committee have, as part of their definition, a requirement to take account of economic, social and environmental issues.

However, the same does not appear to be the case for adaptation measures. Adaptation measures should consider the social and economic impacts as well as the environmental impacts and there may be a case to re-examine section 45 of the Bill.

Q20 Do you have any other comments on the Bill?

SEPA sees the Bill as setting the framework (Part 1 -3) but also facilitating the move towards the ambitious targets required. Part 4 tackles the huge amount of emissions influenced by the public sector and Part 5 could therefore possibly expand to include provisions for mitigation measures in other more carbon intensive sectors.

There are further key areas that Part 5 of the Climate Change Scotland Bill could address.

The transport and agricultural sectors make key contributions to emissions. To reduce emissions from vehicles, there is a need to promote sustainable transport and take into account the carbon impact of new transport infrastructure decisions.

In agriculture, this could particularly look at mitigation measures for methane and nitrous oxide and the need to protect carbon content of soils.

A paper published by National Grid in January 2009, The Potential for Renewable Gas in the UK, noted substantial opportunities from biogas. One of the two main biogas processes is anaerobic digestion. SEPA wishes to see a major drive to stimulate appropriate sectoral and on-farm anaerobic digestion utilising both farm wastes and other sources of waste biomass. This could provide a significant contribution to a decentralised micro-generation energy system as well as diversification for the agricultural sector.
Scotland’s per capita water consumption is increasing in contrast to consumption patterns for other developed countries. Supporting measures to require and/or enable more effort to reduce water demand and improve water efficiency across all sectors would help reverse recent trends for increasing energy consumption associated with the supply of clean water and disposal of wastewater.

SEPA has initiated a discussion with Scottish Water concerning future energy use, recognising the importance of this issue to mitigating climate change. It is clear that existing regulatory needs and drivers will drive increased energy use in water and sewerage management in future, which are incompatible with climate change targets. It is SEPA’s view that radical solutions will be needed in future to avoid this materialising.

The Climate Change Bill should recognise the importance of Scotland’s carbon rich soils, and the need for their effective management. Scotland is in a unique position with a large amount of carbon in peatlands that needs to be protected and managed sustainably. Given the significance of carbon stores to Scotland’s carbon budget (our present carbon “store” is estimated as equivalent 200 yrs of present emissions)\(^\text{10}\) it seems reasonable for Scotland to legislate to protect these stores.

Given the sheer scale of the potential greenhouse gas emissions from land, there seems to be a gap in the range of powers and duties on public bodies to ensure effective management and protection.

Scottish public bodies already have a duty to further the conservation of biodiversity under the Nature Conservation (Scotland) Act 2004 and this would seem to allow Scottish Government to require the sustainable management of peatland via further guidance.

There is an opportunity in the Climate Change Bill Part 5 to emphasise the importance of the carbon stores by including provisions that ensure public bodies consider carbon explicitly when carrying out their duties in protecting Scotland’s soils.

Another way forward may be the inclusion of a duty on Scottish Ministers to issue a national carbon strategy for both peatlands and Scottish soils. The Bill could also include provisions for a statutory consultee in the planning process for soil carbon issues, and provision to enable a body to be given regulatory powers if necessary to ensure effective, sustainable management of soil/peatlands carbon.

\(^{10}\) Bradley et al. (2005) stated that Scotland’s soils contain an estimated 2196 million tonnes of soil carbon, to a depth of 100 cm, compared to a total of 4566 million tonnes for the whole of the UK.
On behalf of the Scottish Food and Drink Federation (SFDF), I would like to thank you for the opportunity to contribute to this consultation process.

In our view, a successful food and drink manufacturing industry is a vital component of a healthy Scottish economy, not least because it generates annual sales of £7.57 billion and exports worth £3.57 billion. It also provides employment for around 50,000 people, that is, one in five of the total Scottish manufacturing workforce.

Achieving Sustainable Economic Growth

We share the Scottish Government’s view that achieving sustainable economic growth should be our key priority. However, underinvestment in Scotland’s infrastructure over a number of years has, to an extent, acted as a brake on the business growth rate. Therefore, SFDF is of the view that Government has a crucial role to play in ensuring the physical infrastructure put in place across Scotland – including the electricity network - is fit for purpose and has sufficient capacity to meet the needs of a growing industry.

Renewable Energy Framework: Addressing Both Sides of the Equation

In recent years increasing energy costs, concerns over the impact of climate change and the nature of Scotland’s climate and geography have combined to give impetus to energy efficiency programmes and promotion of the generation of energy from renewable sources.

Therefore, we welcome the Scottish Government’s desire to develop a renewable energy framework and its ambition to increase the relative contribution of energy generated from renewable sources as part of Scotland’s overall energy mix. However, this is only one side of the equation.

On the other side of the equation – the macro side - an electricity network that is fit for purpose and has sufficient capacity across the whole of Scotland to supply the needs of growing businesses is crucial to the long-term success of our industry.

Therefore, the grid, grid connectivity, funding and planning all need to be addressed as a matter of urgency by the Scottish Government when developing a renewable energy framework if new sources of energy generation are to be harnessed and made accessible across the country.

Infrastructure: An Energy Network that is Fit for Purpose

As already stated SFDF is of the view that it is the role of Government to ensure that a physical infrastructure is put in place that is fit for purpose, has sufficient capacity to meet the needs of industry and facilitates growth.

The reality is, however, that Scotland has an ageing, limited capacity, grid-distributed electricity network which is geographically centralised. The characteristics of this network include weak, low voltage 11kV networks, often supplying small communities and farms or extra urban areas. Conversely, all areas are transmitted by high voltage 33kVA wooden pole transmission lines and >132kVA pylon lines which attract commercially restrictive connection and reinforcement charges.

In recent years this situation has literally applied a brake to business growth in a number of instances due to insufficient capacity in network sub-stations to supply additional power for companies seeking to extend their premises or increase production to meet growing demand.

To date, the only way to resolve this situation has been for companies to pay to upgrade the local network / sub station, adding significantly to business costs and impacting on competitiveness. Indeed, even where companies have been in a position to invest in their own on-site renewable energy generation, the perishable nature of many food and drink products means there is generally still a requirement to connect such projects into the grid in order to guarantee continuity of supply.

Note: The Scottish Food and Drink Federation has also made a submission in respect of waste. This has been published on the Scottish Parliament Rural Affairs and Environment Committee web site. Click here.
Therefore, when developing a renewable energy framework, this situation where the electricity network is developed and upgraded in such a piecemeal fashion cannot be allowed to persist. The Scottish Government needs to take a more strategic approach to development of the network and must ensure the grid, grid connectivity; funding and planning issues are all addressed as a matter of urgency.

The Transition to a Low Carbon Economy: The Contribution of Renewables

The Scottish Government’s aspiration of making the transition to a low carbon economy will not and cannot be achieved through the development of a renewable energy framework alone.

Reducing carbon emissions through the use of renewable energy must be taken in conjunction with a range of activities, including promotion and delivery of improved resource efficiency. In recognition of this, the food and drink manufacturing industry has already taken significant steps towards maximising their energy efficiency through our Five-fold Environmental Ambitions (FEA), which include a commitment to achieving a 20% reduction in CO2 emissions by 2010.

More generally, by analysing power usage, companies can develop a better understanding of where and how power is being used and thereby target savings through efficiency improvements. While this can be used to inform capital expenditure decisions, in today’s uncertain economic climate some companies may require a greater degree of support (advice and funds) from government to make the required investment to cover such initiatives.

With this in mind, SFDF recently secured agreement of all the main business support programmes to provide food and drink manufacturing companies in Scotland with access to a coordinated programme of support and advice. This coordinated programme of support is a significant benefit for our members in the food and drink manufacturing industry as it will assist them in delivering progress towards achieving our FEA.

SFDF would encourage the Scottish Government to promote the delivery of coordinated support and advice to companies and make additional funds available to companies to invest in efficiency savings.

Conclusions

Addressing the range of interrelated energy issues should be high on the Scottish Government’s list of priorities in seeking to develop a renewable energy framework which meets the needs of our industry and contributes to the achievement of sustainable economic growth.

The Scottish Government’s approach needs to strike the right balance between economic, social and environmental factors, in order to secure improvements and progress without damaging the underlying competitiveness of industry in Scotland. It also needs to be more strategic in approach and take into account the grid, grid connectivity, funding and planning in developing a renewable energy framework if new sources of energy generation are to be harnessed and made accessible across the country.

I trust our comments will be taken into consideration, however, if you require further input please do not hesitate to contact me.
The Food and Drink Manufacturing Industry

The Scottish Food and Drink Federation (SFDF) represents the food and drink manufacturing industry in Scotland. The food and drink manufacturing industry in Scotland has a gross output of around £7.57 billion and exports worth £3.57 billion.

SFDF is a devolved division of the Food and Drink Federation (FDF), the voice of the UK food and drink manufacturing industry.

As the largest manufacturing sector in the UK, food and drink manufacturers employ over 500,000 people and have a combined annual turnover of £70bn. UK food and drink exports in 2005 were almost £10bn.

The following Associations are members of the Food and Drink Federation:

ABIM  Association of Bakery Ingredient Manufacturers
ACFM  Association of Cereal Food Manufacturers
BCA   British Coffee Association
BCCCA Biscuit, Cake, Chocolate and Confectionery Association
BOBMA British Oats and Barley Millers Association
BSIA  British Starch Industry Association
CIMA  Cereal Ingredient Manufacturers’ Association
EMMA  European Malt Product Manufacturers’ Association
FA    Food Association
FOB   Federation of Bakers
FPA   Food Processors’ Association
GPA   General Products Association
IDFA  Infant and Dietetic Foods Association
MSA   Margarine and Spreads Association
NACM  National Association of Cider Makers
SB    Sugar Bureau
SIBA  Society of Independent Brewers
SMA   Salt Manufacturers’ Association
SNACMA Snack, Nut and Crisp Manufacturers’ Association
SPA   Soya Protein Association
SSA   Seasoning and Spice Association
UKAMBY UK Association of Manufacturers of Bakers’ Yeast
UKTA  UK Tea Association

Within FDF there are the following sector organisations:

FF    Frozen Food Group
LDT   Lifestyle and Dietary Trends Group
MG    Meat Group
ORG   Organic Food and Drink Manufacturers’ Group
SG    Seafood Group
VEG   Vegetarian and Meat Free Industry Group
YOG   Yoghurt and Chilled Dessert
SNH views climate change as the most serious threat over coming decades to Scotland’s natural heritage. In addition to its environmental consequences, climate change is likely to have major social and economic implications for people in Scotland and elsewhere. SNH aims to understand the effects of climate change on the natural heritage, and to help deliver the contribution that the natural heritage can make in limiting it and adapting to it.

The impact of climate change on Scotland’s natural heritage is likely to be profound, causing very significant changes to our ecosystems and landscapes within a timescale measured in decades. Current indications are that by the 2080s Scotland will be warmer, especially in summer, with snowless winters in some parts; winters may become wetter and summers generally drier. The range of many species and habitats may shift northwards, or up hillsides. However many species and habitats may simply be unable to keep pace with the rates of climatic change, and some species may become extinct.

The most obvious changes in Scotland may be to coastal, marine and freshwater ecosystems. As sea levels rise, saltmarsh and machair habitats will be lost where man-made defences or natural topography prevent them moving inland. In the seas around Scotland there have already been shifts in ranges in algal, plankton and fish abundance. Rivers may become more affected by low flows in summer and by flash floods in winter washing out spawning beds for salmon. Wetlands may dry out in summer allowing woody species to colonise or causing peat to erode with consequences for greenhouse gas emissions.

Flexibility is likely to be key to making sure that infrastructure and land use are resilient to future climate, weather patterns and weather events. The natural heritage has an important role to play by making sure that ecosystems retain sufficient integrity so that they continue to provide essential services, such as flood mitigation, productive land capacity and water supply.

SNH is currently developing a policy statement and action plan on Climate Change and the Natural Heritage. A summary of the draft policy statement is annexed, which describes the main expected impacts of climate change on the natural heritage.

SNH’s key contributions in responding to climate change will be:

• helping to understand and publicise the effects and consequences of climate change for the natural heritage;
• advising on infrastructure and land management practices which help to mitigate climate change;
• guiding adaptation so that nature can, as far as possible, adapt to a changing climate and so that people can make best use of natural processes in preparing for climate change;
• promoting action by organisations and individuals by setting an example in the management of SNH’s own operations, and through our wider environmental education work

Climate change should not only be considered ‘a problem of the future’. Its effects are already beginning to be evident in Scotland. Documented effects include:

• increasing average annual temperatures;
• increasing peak day temperatures (the 24-hour maximum);
• increasing length of the growing season;
• increasing sea surface temperatures;
• rising sea levels from thermal expansion of the oceans as well as melting glaciers and ice sheets;
• acidification of seas from increased carbon dioxide absorption.

We therefore strongly support the proposals for the Climate Change (Scotland) Bill.

---

Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

We welcome the 2050 target. As discussed in the policy memorandum associated with the Bill, this is based on the desire to avoid dangerous climate change. However, ‘avoiding dangerous climate change’ is not mentioned in the Bill itself. In contrast, the UK Act (Section 6, 3a) requires that the advice that ministers receive on targets is to be based on developments since June 2000, the date of the Royal Commission on Environmental Pollution report Energy – The Changing Climate, which is referenced in the UK Act. We recommend a similar clause be included in the Scottish Bill, to provide a firm foundation if there should be any need to vary targets in future. The reference to ‘avoiding dangerous climate change’ need not be quantified, as understanding of the thresholds is likely to develop with scientific knowledge.

The target to reduce emissions by 50% in 2030 should be tightened. The overall effect of interim targets should be to achieve marked early reductions in emissions to follow an overall emission reduction pathway like the lower curve in Figure 1 (as discussed in the consultation paper on the proposed Bill during 2008). This approach is consistent with scientific advice that what is most important is the total change cumulative emissions over the period – represented by the area under the curve.

Faster early reduction will help avoid the need for major annual reductions in later years. The Bill proposals for an interim target of 50% in 2030 only amount broadly to achieving a linear pathway between now and 2050. We recommend that a further interim target for 2020 be introduced, set in the light of the recommendations of the UK Climate Change Committee. In our response to the consultation on the Bill we recommended reductions of at least 40% by 2020. If such a target were set, it would put Scotland on track to achieve a 2030 target of 55-60%.

It should be borne in mind that some of Scotland’s emissions may be difficult or impossible to avoid, for example those arising from historical disturbance of peaty soils, including drainage, dehydration and erosion, for example by tree felling and draining certain peaty soils to plant forest. This legacy – arising from earlier land management decisions - could remain as a significant ‘hard core’ of emissions by 2050. Further work is required to establish in detail the nature and amount of such emissions. However, their existence means that emissions from other sectors will have to be reduced by much more than 80% in order to meet an 80% target overall.

An intended overall percentage reduction of only 3% in each of the final years of the period up to 2050 will require a much higher proportionate reduction in ‘controllable’ emissions.

![Figure 1. Illustration of the effect on total emissions over time of different emissions reduction trajectories](source: Consultation proposals for a Scottish Climate Change Bill, Jan 2008, Fig 6)
The targets should avoid relying on uncertain technological advances to secure rapid reductions later on. Where reliance is placed on technological advances (e.g. on carbon capture and storage, nuclear fusion, wave power, hydrogen economy), firm policy frameworks should be put in place, including regulatory controls and expected timescales, to make sure that such technologies are operational by specific dates.

Otherwise there is a risk of lock-in to existing forms of high-carbon infrastructure. In particular we have recently commented that there should be a moratorium on new coal power plant until such time as a firm timescale can be set to implement carbon capture and storage requirements. We think that imposing a requirement for carbon capture readiness – meaning only that there is space on site and that general feasibility studies have been undertaken – is insufficient.

In contrast, there are many practical measures that can be taken now using existing technologies (such as energy management, combined heat and power, electric vehicles, and renewable energy development), and more effective use of measures to help change behaviour and lifestyles. Interim targets should reflect the availability in the short term of these many practical measures.

Finally, we note that Scotland could be a role model for the international community in delivering these challenging targets.

Q2 The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive

What are views on the setting of targets in batches from 2010 to 2022?

We support this approach provided the targets are compatible with the first three 5-yearly budgets recommended by the UK Climate Change Committee (2008-2012, 2013-2017 and 2018-2022). For the reasons set out above, we believe that the annual emissions reductions sought in this period should be higher than the annual emissions reductions sought in the last decade leading up to 2050.

Part 5 of the Bill is limited in scope, covering only selected aspects of forestry, energy efficiency and waste. To give effect to the targets or budgets we suggest that the Scottish Government produce a new Scottish Climate Change Programme, initially covering 2009-2022. The programme should cover all major sectors over which the Scottish Government has direct control, especially:

- Heat;
- Transport;
- Renewable electricity;
- Land use and land use change (including forestry and agriculture).

It should also cover areas that are important to achieving emission reductions in Scotland but are administered by the UK Government or the EU (e.g. emissions trading, product standards).

It would be helpful to develop ‘energy hierarchies’ for energy use in buildings and transport, similar to the well-established ‘waste hierarchy’. These, for example, would give priority to demand management and avoiding energy use, followed by energy efficiency, renewable generation, low-carbon generation, through to higher emission generation as the least desirable. Emissions should be quantified on a life cycle basis. The less that is achieved at the top of the hierarchy, the more infrastructure may be needed to deliver solutions further down the hierarchy, with a likely consequence that there will be more conflicts with the natural heritage and other environmental factors.

Q3 The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.
What are your views on this approach or any possible alternative approaches?

As discussed above, we favour emission reductions that lead to steeper reductions in the early years. We note that the provisions of the Scottish Bill are considerably less demanding over the period to 2020 than those of the UK Act which requires a minimum of 26% emissions reduction by 2020. We hope that the recommendations of the UK Climate Change Committee for 2020, for an ‘interim target’ of 34% and an ‘intended target’ of 42%, can be reflected in the final Bill.

Q4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

We agree with the principle that the Bill should ensure that action to reduce emissions is strongly weighted to domestic effort. We note that the UK Act contains a clause that limits the amount of carbon credits that can be purchased, and that the UK Climate Change Committee recommends limiting this to 10% for the ‘interim target’, so that 90% of the reductions are achieved through domestic effort or elsewhere in the EU.

Q5 The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

We agree with this definition, which is consistent with international reporting obligations. However, we recommend that the Bill also provides for reporting of emissions based on consumption of goods and services in Scotland. This issue was discussed in the consultation paper on the Bill. There is a risk that emissions associated with Scottish manufacturing might fall but only as a result of our importing similar goods from other countries, with the result that global emissions due to Scottish people might increase while Scotland satisfactorily meets its internal emissions targets. Scottish Government should keep itself well informed on such patterns of consumption so that mechanisms and policy measures can be designed to avoid this risk. Tracking emissions based on consumption is consistent with the adoption of ecological footprint as an indicator in the National Performance Framework, so most of the relevant data and information should be readily available.

Q6 The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government’s approach to obtaining independent, expert advice on climate change?

---

1 The ‘interim target’ of a 34% reduction by 2020 assumes that the EU target to reduce emissions from the EU by 20% in 2020 remains in force. The UK CCC set a more ambitious ‘intended target’ of a 42% reduction by 2020 to apply if the EU adopts a 30% target for 2020, as they have stated depending on post-Kyoto international agreements.
We agree with the approach to rely on the UK Climate Change Committee until such time as there is a demonstrable need for a dedicated Scottish Committee or equivalent body. It may be important to make sure that the UK Committee is resourced so that it is able to present its advice so that it is directly relevant to Scotland (e.g. relevant legal, regulatory, policy and governance context). If there is a need to establish a Scottish Climate Change Committee, it should either be founded as an extension of the UK Committee, or required to work closely with the UK Committee, adding supplementary advice as needed. The composition of any such body should reflect understanding of the impacts of climate change on the natural heritage, and also social aspects of climate change, including both the social impacts of climate change and issues such as facilitating behaviour change.

Q7 The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland's emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

We agree with the proposals. Improvements are required in both the timing and content of the Scottish inventory of greenhouse gas emissions. There is currently a lag of approximately 2 years between production of the UK emissions accounts and disaggregated accounts for the devolved administrations. On the content, we have found major presentational differences in various inventories and reports, for example the treatment of emissions associated with land management and energy sectors, which makes it difficult to compare like with like. It is important that the inventories and reporting of emissions of greenhouse gases inform policy decisions in Scotland. We welcome the development of the Carbon Impact Assessment methodology by the Scottish Government, which should help to remove these discrepancies and achieve better alignment and reporting across economic sectors, relating financial spending and greenhouse gas emissions.

Q8 The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

We welcome these proposals and would be content with any reasonable duties imposed, that is, consistent with the degree of action required to reduce emissions, adapt to the impacts of climate change and making sure that ecosystems retain sufficient integrity so that they continue to provide essential services. As indicated in our opening remarks, we aim to lead by example.

Q9 The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on this proposal?

We strongly support this. As indicated in our introductory remarks and answer to Q1 climate change is already happening and we need to adapt to a changing climate in the future. This means making sure that infrastructure and long term decisions about land management and land use are resilient to future climate, weather patterns and weather events. The natural heritage has an important role to play by making sure that ecosystems retain sufficient integrity so that they continue to provide essential services, such as flood mitigation, productive land capacity and water supply. This requires that approaches to adaptation allow the natural heritage to adapt to changing climate so that it can continue to support the ecosystem functions that help society to adapt. Further details on our approach and recommendations on adapting to climate change may be found in our policy statement and Action Plan on Climate Change and Natural Heritage.

We welcome the Scottish Government’s progress on developing a Climate Change Adaptation Framework and have assisted its development. We understand that after 2012
this will become the reporting and action framework required by the Bill following the first UK Climate Change Risk Assessment, expected in 2011 under the UK Act. We recommend that the Scottish Adaptation Framework should form part of the Scottish Climate Change Programme as suggested in our response to Question 2, so that the Climate Change Programme contains both mitigation and adaptation strategies.

We recommend that the timing of the requirement to report is tightened from “as soon as reasonably practicable” after the UK Risk Assessment to specify a number of months. We welcome the proposals for 5-yearly reporting: a good comprehensive report every 5 years is likely to be of more value than a less detailed but more frequent analysis. It is important that this process stimulates the action required and this aspect of the Bill may need to be subject to similar independent monitoring and scrutiny arrangements that prevail for emission reductions.

Q10 Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are views on this proposal?

We support this. Fire has been part of upland environments for many thousands of years. It occurs naturally as a result of lightning strikes and it is probably also one of the most useful, and oldest, land management tools. Each year, less than 5% of moorland is burnt for agricultural, nature conservation and sport interests to enable the provision of fresh food sources on rough grassland or managed moorland for livestock, game and wildlife, and the management of older vegetation, which can act as a source of fuel for wildfires. However, it is a powerful tool, which needs to be used with skill and understanding if it is not to do more harm than good. If not undertaken at an appropriate time, or according to good practice, muirburn can exacerbate erosion on some slopes and soils, damage peat-forming vegetation such as sphagnum mosses reducing the ability of the bog to sequester carbon, result in fire spreading to the underlying peat leading to severe erosion, cause displacement or death to wildlife, especially birds and reptiles and recolonisation rates. The Muirburn Code sets out the constraints to limit the potential damage to risk of damage to agricultural, forestry, game, biodiversity, landscape, and archaeological assets. Consequently, we recommend that there is a requirement for Ministers to consult with relevant authorities, including SNH, before varying the permitted times during which muirburn may be made. Consideration of changes to the dates of the muirburn season should not be in isolation, on the basis of one possible driver of change. In some cases it may be difficult to disentangle changes attributed to climate change from other factors including land management. Decisions would also need to take into account the extent to which restricting muirburn season would reduce the amount of muirburn undertaken. This may have detrimental impacts on some habitats, including Natura and Biodiversity Action Plan habitats that are maintained by rotational muirburn.

Q11 The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

We support the work that FCS does, and in particular we welcome the way that forest management has developed into a multi-use, public-benefit process over the last 20 years. We strongly support multi-benefit forestry and would regard moves to single benefit forestry, even for carbon sequestration, as a potentially retrograde step. The development of joint ventures for renewable energy projects would be covered by existing safeguards in the planning process, and could be compatible with the delivery of multiple benefits. Some of the income from renewable partnerships could be earmarked to secure continued management of the national forest estate for multiple benefits. We would support this.

The outcomes associated with the proposals to lease-off some forest areas are less predictable. It is possible that management for the natural heritage could be perceived as
being less important in areas leased off. The lease-off could lead to less income for the remaining areas of the national forest estate and therefore fewer resources to support management for natural heritage benefits in those areas. This could lead to a weakened and 'de-commercialised' FCS, less able to lead by example and influence the private sector to undertake positive management for the natural heritage.

Establishing some firm principles to guide any leasing arrangements could reduce the likelihood of such undesirable outcomes:

• In the details of the lease and the use of any income, specify that the income should be spent in producing a balanced range of public benefits, not just carbon sequestration. The range of benefits should reflect the priorities, needs and outcomes sought in the areas that are being leased out.

• Require that the lease should be subject to formal review, for example through forest plans, every 10 years or so. It is extremely difficult to set the details of a lease for a period of 75 years which will cover all future options. For example, 75 years ago the most important use of timber from forestry was for pit-props, and decisions at that time could not have foreseen the management required for recent conservation issues or some of the difficulties associated with that, such as capercaillie leks and deer fences. Therefore, the terms of lease should provide for flexibility to require changed management for changing circumstances.

Q12 TO 16 (energy efficiency, waste, adequacy of consultation)

No comment.

Q17 Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government on the consultation proposals?

We are satisfied with the SEA process conducted by the Scottish Government, and its responses to the comments made by the consultation authorities. Consideration of the Screening Report commenced during pre-consultation stages of the proposals, with a report published in August 2007 and a determination in September 2007. A Scoping Report was published in September 2007, and the Environmental Report accompanied the consultation paper on proposals to introduce a climate change bill in January 2008, with comments invited in April 2008. A revised Environmental Report was published on the Scottish Government website on 4 December 2008, with clear responses to all of the comments made by the consultation authorities and relevant changes to the Bill (as introduced). We consider that the SEA has been a constructive process, adding value to the policy development.

Q18 Does the Bill raise any equalities issues you would wish to highlight?

No comment.

Q19 Do you have any comments on the impact of the Bill on sustainable development?

Despite our strong concerns about climate change and its impacts on Scotland’s natural heritage, we would be concerned if efforts to address it have the effect of narrowing down perspectives on sustainable development away from the broad suite of goals set out in the Scottish Sustainable Development Strategy and in Scottish Government’s 2007 Spending Review, to become overly focused on the single issue of carbon reduction.
Sustainable development has many angles, which are captured very broadly within the five strategic objectives of Government. Measures to address climate change will have to be designed sensitively, and with supporting policies and programmes, if they are to avoid making achieving these five broad objectives more difficult. Higher energy prices without improvements in energy efficiency could lead to greater levels of fuel poverty. Some approaches to restricting car use could make remote communities more fragile. Higher energy costs could affect costs for business. The Stern Review and the UK Climate Change Committee both emphasise the need for integrated policy interventions to reduce the likelihood of adverse outcomes, and both emphasise the long-term costs of failing to make early reductions in emissions: these are issues to be considered and designed around, rather than barriers to taking action on climate change.

We believe the need is to think in terms of what a sustainable low-carbon society that is well adapted to our changing climate will be like in 2020 and 2050, and actively steer Scotland’s development towards that vision. Decisions on major infrastructure will be crucial, as they may set a pattern for decades ahead. That is what is needed if the aspiration of Scottish Ministers is to be fulfilled that Scotland should be a leading nation in dealing with the issue of climate change.

Q20 Do you have any other comments on the Bill?

No comment.
DRAFT POLICY STATEMENT SUMMARY

There is now a scientific consensus that the planet is warming and that the degree of recent changes can be explained only by the effect of human activities. The impact on Scotland's natural heritage is likely to be profound, causing very significant changes to our ecosystems and landscapes within a timescale measured in decades. This statement sets out SNH's perspective on climate change and our role in responding to it.

SNH views climate change as the most serious threat over coming decades to Scotland's natural heritage. In addition to its environmental consequences, climate change is likely to have major social and economic implications for people in Scotland and elsewhere. SNH aims to understand the effects of climate change on the natural heritage, and to help deliver the contribution that the natural heritage can make in limiting it and adapting to it.

Increasing amounts of greenhouse gases in the atmosphere are leading to increasing global average air and surface temperatures, widespread melting of snow and ice, and rising sea levels. The climate is becoming more chaotic with more frequent and more extreme weather events, such as heat waves, heavy rainfall, drought, and high winds. The severity of these problems in particular places will depend on a variety of local factors. Current indications are that by the 2080s Scotland will be warmer, especially in summer, with snowless winters in some parts; winters may become wetter and summers generally drier. The range of many species and habitats may shift northwards, or up hillsides. However many species and habitats may simply be unable to keep pace with the rates of climatic change, and some species may become extinct.

There will always be a substantial amount of natural variability, giving rise to a wide range of weather events and weather patterns over months to years. Flexibility is likely to be key to making sure that infrastructure and land use are resilient to future climate and weather conditions. The natural heritage has an important role to play by making sure that ecosystems retain sufficient integrity so that they continue to provide essential services, such as flood mitigation, productive land capacity and water supply.

Our key contributions will be:

1) Helping to understand and publicise the effects and consequences of climate change for the natural heritage.

There are huge uncertainties over the likely effects of climate change on Scotland's natural heritage, or of how these changes can be influenced or managed. We aim to invest in research to improve that understanding, so as to enable our effort on adaptation to be well targeted.

2) Advising on infrastructure and land management practices which help to mitigate climate change.

We strongly support the need for major global reductions in greenhouse gas emissions in order to avoid a dangerous level of climate change – taken as a 2°C warming - beyond which there is potential for severe disruption of global ecosystems.

A wide range of measures is required, including energy efficiency, the use of renewable sources of energy, more sustainable modes of transport, and encouraging walking and cycling. In advising on such infrastructure, SNH will take into account its benefits in mitigating climate change and enabling adaptation to the impacts of climate change alongside the need to protect the natural heritage. We will advise on how Scotland’s rich renewable energy resource can be harnessed with least impact on the natural heritage.

We will encourage land management which protects the carbon stored in peatlands and other organic soils. These soils represent a very significant carbon reservoir, which if released into the atmosphere would be equivalent to around 170 years of greenhouse gas emissions from Scotland at current rates. We will also support the creation of new woodland with a view to carbon storage where it does not conflict with natural heritage interests.
3) Guiding adaptation so that nature can, as far as possible, adapt to a changing climate and so that people can make best use of natural processes in preparing for climate change.

We will support action to help both society and nature adapt to the effects of climate change. Climate change places new importance on considering the interdependence between species, habitats, and associated natural processes, and the benefits or services that people receive from these. SNH seeks to maintain the resilience of ecosystems so that they continue to provide the services that support human life as well as biodiversity. Restoring natural processes in freshwater systems can help in abating flood risks, and managed coastal realignment can allow natural habitats to provide protection against sea-level rise. Reducing other pressures on ecosystems, e.g. from pollution or habitat attrition, and maintaining diversity, will help nature to be more resilient to climate change.

As the climate changes, many species will need to be able to disperse into new areas where the climate remains suitable – usually northwards or upwards. Improving the connectivity between habitats through ecological networks can help species disperse into new areas. Protected sites will remain important for biodiversity conservation because characteristics such as greater habitat diversity and natural processes will continue to favour high biodiversity. They will also provide source populations and colonising habitat for dispersing species. For species that are unable to disperse, but still have suitable habitat within Scotland, their survival may be assisted by translocations but these can be high risk and costly and are a last resort. We will take a risk-based approach to eradication of invasive non-native species, taking account of both potential benefits and costs of action. For a few species, the effects of climate change may simply result in no suitable climate space in the UK and consequently their extinction.

4) Promoting action by organisations and individuals by setting an example in the management of SNH’s own operations, and through our wider environmental education work.

We will set an example in the management of our own operations. We aim to reduce our greenhouse gas emissions by at least 4% per year. We will work closely with Government and other public bodies to develop good practice and high standards in carbon reduction which can be applied elsewhere within the public sector. We will also review our operations to ensure that our offices, properties and visitor facilities on nature reserves are well prepared to withstand the effects and added risks associated with climate change. We apply sustainability criteria within our procurement processes, relating to energy and resource use, waste minimisation, recycling, and biodiversity impacts. We will encourage others to reduce their emissions too, and to take action to adapt to climate change, through our general environmental education work and by attaching conditions to the grants we give to other organisations.

These four roles will guide SNH’s work in responding to climate change. Our Climate Change Action Plan sets out in some detail the actions we intend to take over the next five years.
The SQA welcomes the invitation from the Scottish Parliament’s Transport, Infrastructure and Climate Change Committee to comment on the draft Climate Change (Scotland) Bill. We have reviewed the draft and are supportive of the Government’s intentions. We support the decision of the Government to seek independent, expert advice on climate change.

We are not qualified to comment on specific and detailed proposals in this important area. We would however make comments on the following specific questions.

**Duties of Public Bodies Relating to Climate Change**

By imposing duties on all public bodies and by giving appropriate guidance this will ensure a fair and even reporting structure across the public sector.

**Energy Efficiency**

By implementing improved energy efficiency of Scottish buildings and introducing measures to encourage population behavioural change, the Bill will go a long way towards meeting its overall emission reduction targets.

With Scotland’s excellent wind and water resource, the establishment of power generated from these and other natural renewable resources will contribute greatly to Scotland’s overall energy efficiency.

**Waste Reduction and Recycling**

A large proportion of the Scottish population participate, through their Local Authorities, in local domestic recycling schemes. This should make the introduction of further waste reduction and recycling measures, both domestically and in the commercial sector, more readily acceptable.
Scottish Renewables welcomes the opportunity to provide written evidence on the Stage 1 scrutiny of the proposed Climate Change (Scotland) Bill which is one of the most significant pieces of legislation ever considered by the Scottish Parliament. Scottish Renewables is Scotland’s leading green energy trade body. We represent over 240 organisations involved in renewable energy in Scotland and include many environmental NGOs in our wider associate membership. Further information on our work and membership can be found on our website – www.scottishrenewables.com

Scottish Renewables believes that the harnessing of renewable energy sources in a sustainable manner provides a unique opportunity to not only tackle climate change but to provide economic benefits to Scotland. The setting of statutory targets to reduce emissions is vital if we are to send the right signals to industry and wider society that significant changes are required to establish a low carbon economy.

However the setting of statutory targets on their own will not deliver the kind of changes needed unless accompanied by strong action that can be scrutinised by the Scottish Parliament. This is why we are proposing a robust supporting framework to accompany the Bill which will involve aligning the consideration of the financial Budget Bill and the financial spending review to the delivery of climate targets.

If Scottish Renewables can be of any further assistance to the Committee, we will be happy to provide further written or oral evidence in support of our statements.

Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

Interim point targets will be useful in providing milestones on the way to delivering the 2050 goal, but the primary focus should be on the delivery of the target for the individual carbon budget cycle. The Bill should allow for subordinate legislation to adjust the level and year of any interim targets including the 2050 target. However this provision should only be included if there is an accompanying statutory purpose of the Bill to contribute towards a stabilisation of global average temperature levels at no more than 2 degrees celsius beyond pre-industrial levels. This important aim was adopted by the EU in 1996 and has been repeatedly reaffirmed including at the 2007 G8 conference. It is important that the purpose of the target is explicit on the face of the Bill, allowing flexibility to revise approaches and targets to deliver Scotland’s contribution to the global challenge in the decades ahead. Any proposed change in target levels should be supported by strong scientific consensus analysed and reported on through the UK Climate Change Committee and/or relevant Scottish body.

Q2 The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

What are your views on the setting of targets in batches from 2010 to 2022?

The setting of annual targets within batches over a 12 year period is feasible provided the targets are compatible with the first three 5-yearly budgets recommended by the UK Climate Change Committee. The danger in early batches failing to deliver, would result in disproportionate pressures to reduce carbon emissions in a shorter period of time.
The electoral cycle of the Scottish Parliament is likely to provide an ultimate form of scrutiny for governments but detailed scrutiny of the carbon budget must take place in parliament aligned with the carbon assessment of the spending review and annual Scottish Budget Bill.

Q3 The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

The requirement to meet at least 3% annual carbon emissions in the period to 2020 appears to be questionable. There is insufficient explanation as to why the period up to 2020 is aspirational rather than mandatory in setting annualised carbon cuts. The perception is that annual carbon emission cuts of 3% is unlikely. If the Government does not have the confidence that annual cuts of 3% are achievable, then this should be identified and explained now, with a clear understanding that in certain future years the carbon emissions cuts will be considerably greater than 3%.

Q4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

International trading in carbon has a role to play in providing flexibility but could undermine the need to act now in Scotland to reduce emissions across all sectors and to capitalise on domestic renewable resources. There are issues regarding the credibility and regulation of international credits that need to be resolved before they can play a significant role. If they are to be used in the future a strict limit should be imposed and we would support a limit of at least 80-90% of carbon emission reductions being achieved through domestic effort or elsewhere in the EU.

Q5 The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

Scottish Renewables supports the inclusion of a Scottish share of international aviation and shipping. The reality that Scotland is part of an ‘island nations’ and dependent upon air and sea transportation for its people’s travel and exchange of goods cannot be under-estimated. However, there are issues surrounding, for example, the arrival of imports at a Scottish port or airport for onward delivery to a destination outside Scotland (or in the case of goods passing through say from Stranraer to the Cumbrian border) and whether there will be sufficiently robust systems to record the end user of a carbon commodity.
Q6 The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government’s approach to obtaining independent, expert advice on climate change?

There is a growing body of opinion that the UK Climate Change Committee may not have the resources and/or stretch to provide detailed advice on Scotland-only carbon emissions and the consequences of climate change. Scottish Renewables would support an independent Scottish body, which will work closely with the UK Climate Change Committee and other public bodies such as Audit Scotland, and may incorporate the role of the Sustainable Development Commission in Scotland. With increasing concerns about the need to secure carbon cuts in the first few years of the Bill’s passing, a stronger focus on what is happening and what corrective action should be applied, is more likely to be forthcoming in a dedicated Scottish body.

Q7 The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

The recent experience of minority government in Scotland has resulted in a shift of the balance of power in favour of the Parliament over the governing executive. This is a welcome development and in the current climate suggests that parliamentary scrutiny of carbon emissions cuts would be robust.

However, there is no guarantee that the current political situation will continue any time into the future and there are concerns that majority government can lead to parliamentary committees being less able to openly question the performance of the governing parties.

With this in mind, Scottish Renewables supports the reporting duties as stated in the Bill, but believes that the carbon assessment of individual budget lines in the spending review needs to also be comprehensively undertaken to enable scrutiny from parliamentary committees. There needs to be a form of legislative commitment in the Bill to this approach otherwise a meaningful way of assessing how government spending is directly supporting the delivery of targets will be opaque.

Q8 The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?
Approximately one-third of the Scottish Government’s revenue is transferred to local government and a similar significant proportion funds the National Health Service in Scotland. The Local Government Concordat clearly shows that the Scottish Government has a strong belief that Scottish local authorities have their own responsibilities and priorities to decide upon. However, the difficulties in committing local authorities to delivering Scottish Government policies within the Single Outcome Agreement process, together with Community Planning arrangements having less binding obligations on a local authority area, would suggest that local government will require early direction on their key role in cutting carbon emissions. Whilst some local authorities have made clear and significant progress in both the delivery of policies and services with due cognisance to the impact of climate change, there are too many local authorities who appear to be dragging their feet with the complaint that they are insufficiently resourced to transform their services without additional government funding.

The Scottish Government and COSLA need to work together and urgently on changing this culture and if significant change has not come about within the next 3 years, early implementation of a duty on local authorities and/or other public bodies should be considered.

As much as this might appear as using a ‘stick’, there are ‘carrot’ incentives which the government could consider to encourage a more positive approach to combating climate change including incentives to reduce energy bills and establish locally owned or community owned Energy Service Companies.

Q9 The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on this proposal?

Scottish Renewables broadly welcomes this approach and the experience of the past twelve months in consultation on such matters has been constructive.

Q10 Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are your views on this proposal?

Scottish Renewables does not have a view on this provision.

Q11 The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

The Commission owns and manages a very large estate which is likely to include a significant number of sites suitable for generation of electricity from hydropower and wind. Whilst the Commission has in-house project development expertise it may prove commercially sensible to work in partnership with other players in the renewables industry to realise any potential, especially where it is desirable to promote rapid deployment.
However we believe that the energy generation by any such joint venture should be limited ‘to generate power from wind, hydro and micro power’ and that there is no suggestion that the Forestry Commission would form joint ventures to develop bioenergy projects of any scale. If bioenergy Joint Ventures were proposed, these may allow a situation to arise where Forestry Enterprise Services is effectively selling timber to itself. Real or perceived, serious market distortion in the wood fuel market may arise.

Q12 The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change. 

What are your views on this proposal?

Scottish Renewables is pleased to see that the issue of energy efficiency is included in the Bill, however, we are disappointed that an Energy Efficiency and Microgeneration Action Plan is long over-due. The action plan needs to set out what the current energy demand is and what it needs to be in order to reduce carbon emissions. Setting this out will clearly help industry and the general public to appreciate the scale of the challenge which we face.

Q13 The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government’s thinking in this area.

What are your views on this approach?

Scottish Renewables would support moves incorporated into the Bill to require minimum energy efficiency standards to be met within the public and private sectors in Scotland. However, all avenues should be explored, such as using fiscal incentives to reward energy efficiency and/or microgeneration.

The Scottish Government should progress the extension of General Permitted Development rights for air source heat pumps and wind turbine technologies as a matter of urgency, as well as turn its attention towards solutions for tenemental properties.

Q14 The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

What are your views on this proposal?

In our response to the Scottish Government’s consultation on the draft Renewable Energy Framework, Scottish Renewables set out a rationale of action which would further the promotion and deployment of renewable energy in Scotland.

Whilst we welcome the attention paid to renewable heat in the Bill and the recognition of urgent action in this area there is perhaps a missed opportunity to consider electricity and transport as well. Determined action needs to take place on all three fronts and would be keen to see the Bill promote this with clear, measurable actions from the Scottish Government (see following paragraph for an example).

In terms of the specific wording of the Bill, it could be more detailed by specifying the role of heat in domestic and commercial/industrial sectors and expectations of how each sector will reduce its carbon emissions over a period of time and indicating the powers that Ministers may implement to assist in that transition.
Q15 The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas: Waste prevention and management plans;

Waste data;
Deposit of recyclable waste;
Procurement of recyclate;
Reduction of packaging;
Deposit and return schemes;
Charges for carrier bags.

What are your views on these proposals?

Scottish Renewables is broadly supportive of these measures.

Q16 What are your views on the adequacy of the Scottish Government’s consultation in advance of publishing the Bill?

Scottish Renewables welcomes the opportunity to put forward the views of its members on both proposed legislation and policy development on specific measures. The consultation process for the Bill has been constructive and encouraging.

Q17 Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government out on the consultation proposals?

No specific comment at this stage.

Q18 Does the Bill raise any equalities issues you would wish to highlight?

No specific comment at this stage.

Q19 Do you have any comments on the impact of the Bill on sustainable development?

The Bill should have a positive impact on sustainable development as it will reduce emissions and also provide impetus to investment in a low carbon economy.

Q20 Do you have any other comments on the Bill?

The Bill contains highly commendable aspirations as a piece of enabling legislation, however it is the detail of the implementing legislation that will be more important and we look forward to seeing this. The Bill’s efficacy will be whether secondary legislation and government action will achieve the targets which are core of this legislation. There is considerable debate about what to do in the event that targets are not achieved. It is difficult to see how financial penalties against a government would be feasible, however, this legislation is not being enacted in isolation: international, European and UK obligations may come to bear on the performance of the devolved administration in Scotland.

Furthermore, the general purpose of the Bill should be to accelerate government action and delivery in the short term as well as the setting of targets for the long term. This means that areas such as carbon accounting of government action through the Scottish Budget, infrastructure planning, action on renewable energy and energy efficiency, building regulations and such like, are inter-related in making the Bill effective in practice. If the Bill is successful in truly facilitating the climate change proofing of Scottish public policy, then it will achieved far more than other initiatives aimed at mainstreaming core values and principles in Scottish life.
In the time since the Scottish Government was formed in 2007, amid a blaze of expectation for a Scottish Climate Change Bill and the subsequent ‘sustainable’ economic growth strategy, circumstances have changed. The UK Climate Change Act is now in place. Recession has hit most of the developed world and its implications for developing countries have barely featured on our horizon. The progress of the Climate Change (Scotland) Bill through its stages of parliamentary scrutiny may provide an opportunity to look again at how we approach ‘sustainability’ within our economic strategy. Even with the challenges of tackling climate change, Scotland has a strong competitive advantage to develop a low carbon economy, with economic benefits which are in balance with our natural environment and social concerns.
The Scottish Rural Property and Business Association (SRPBA) welcomes the opportunity to provide comments on the Climate Change (Scotland) Bill to the Transport, Infrastructure and Climate Change Committee. The SRPBA represents land managers and rural businesses across Scotland with wide ranging interests including agriculture, forestry, moorland management and tourism. We acknowledge that climate change is a global issue and that ultimately all countries in the world must make a firm commitment to tackling the problem. However, some developing nations are continuing to produce phenomenal amounts of greenhouse gases without due regard to the consequences of their actions. The SRPBA believes that Scotland is capable of leading the way as an exemplar of how to be a clean, green nation. We see Scotland as potentially acting as a model to other countries of how to act effectively in tackling climate change.

The SRPBA recognises that the rural sector is a contributor to greenhouse gas emissions but we believe it also has considerable potential to help mitigate against climate change caused by human activity. It is important for the competitiveness of the rural sector that disproportionate or inappropriate mitigation measures, which result from pressures to reach targets set out in this Bill, do not have an adverse impact on the business activities of our members beyond that which might be considered reasonable to help address areas of significant climate impact. We strongly support measures that enable land managers to contribute positively to carbon sequestration and the development of renewable energy, particularly where these measures can contribute to sustainable rural development and economic growth. The SRPBA was particularly encouraged by research carried out by Scottish Agricultural College (SAC) economists last year who found that farming and forestry could make up to a 25% cut in greenhouse gas emissions by 2020 at very little cost, indeed, some options could actually save land managers money. We are strongly supportive of such win-win situations.

Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

The SRPBA recognises the seriousness of the threats posed by climate change at both a national and a global scale. At a national scale, Scotland has been experiencing rising temperatures and more frequent winter storms in recent years which have impacted on the Scottish population, the environment and the economy. At a global scale it has been predicted that climate change will lead to sea level rises, it will have regional effects on crop productivity (it could cause famine in some areas and it could alter the range of agricultural pests), it will potentially increase diseases in some areas and it may also change the composition and range of many ecosystems.

Scientists have warned that climate change is likely to result in sudden and dramatic changes to some of the major geophysical elements of the Earth if global average temperatures continue to rise as a result of the predicted increase in emissions of greenhouse gases. They have identified nine different ways in which the earth could be suddenly tipped into a potentially dangerous state that could last for many centuries, for example, melting of the Greenland ice sheet could result in the shut down of the North Atlantic thermohaline circulation causing dramatic cooling in North West Europe (Lenton and Schellnhuber, 2007). Therefore, the SRPBA is fully aware of the need to act now to tackle greenhouse gas emissions in order to prevent these ‘tipping points’ being reached.

Consequently, we agree that Scotland must take large steps to reduce greenhouse gas emissions. We consider the targets set in this Bill challenging but necessary if Scotland is to make a significant contribution to tackling climate change. Therefore, we agree with setting a 50% reduction target for 2030 and an 80% reduction target for 2050. We believe that the implementation of the Bill will have to be accompanied by a good communications strategy as the 80% target is so challenging that it may put some land managers off trying as it may be perceived as being unachievable.
Q2 The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

What are your views on the setting of targets in batches from 2010 to 2022?

The SRPBA believes that it is imperative that a balance is found between setting emissions targets sufficiently far into the future but not so far that they become meaningless. We think that significant changes in emissions are likely to occur in steps rather than a gradual reduction over time. For example, large scale renewable energy projects may be allowed to proceed after several years going through the planning process. This may be the case with offshore wind and tidal/wave power. The SRPBA thinks that setting annual targets in batches will help focus government priorities within defined timescales. If this was not the case then successive governments might well put off making hard decisions on the basis that the target timescale is far into the future. Setting annual targets in batches will also help drive research and development into renewable technologies within defined timescales.

The SRPBA is encouraged to see in section 4.4 of the Bill that Scottish Ministers must, when setting annual targets, also have regard for a number of other criteria. We are particularly encouraged to see economic circumstances (Scottish economy, competitiveness of particular sectors of the Scottish economy and small and medium-sized enterprises) and the likely impact of the target on those living in remote and rural communities included in the list of criteria.

Q3 The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

Prior to 2020, the Scottish Ministers will be expected to set annual targets which build towards delivering emissions reductions of at least 3% each year. Cuts of 3% year on year are not statutorily provided for in the Bill until 2020. This signifies that the Scottish Government does not think that a 3% year on year target could be met before 2020. The Scottish Government has calculated that if emissions continued to reduce at 1.23% per year (the average fall between 1990 and 2006) until 2020, then an annual average reduction of 3.95% would be necessary after 2020 to achieve an 80% reduction by 2050. Therefore, the year on year reduction in greenhouse gas emissions after 2020 is closer to 4% than 3% (the percentage quoted in the Bill). The SRPBA believes that it is necessary for the Scottish Government to take action sooner rather than later based on the Stern Review conclusion that to carry on with business as usual would have ‘catastrophic’ financial consequences in the future. The SRPBA suggests that if a target of 3% year on year emissions reductions is not achievable before 2020, then perhaps a lower target of 2% each year should be set. We think that it is not acceptable to carry on for 10 years without having any specific targets in place. It is imperative that progress towards the 50% reduction target by 2030 and the 80% reduction target by 2050 is not compromised.

Q4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?
On the whole, the SRPBA is supportive of the concept of “net Scottish emissions account” outlined in the Bill. We are encouraged that the Bill allows the Scottish Ministers to modify the definition of Scottish removals to take account of potential additional types of removal which may be recognised in the future (Section 15.2).

However, we do have reservations about the provisions made for shipping and aviation outlined in the Bill. Section 14 states that “The Scottish Ministers may, by order, make provision regarding the emissions of greenhouse gases from international aviation and international shipping that are attributable to Scotland”. We acknowledge that aside from scientific issues, international aviation and shipping are difficult problems both politically and methodologically. This is because there has never previously been a need to attribute these greenhouse gas sources to a particular country and the difficulty of attempting this has resulted in international policy agreements such as the Kyoto Protocol ignoring the issue. However, the SRPBA believes that these are important and growing sectors which must be factored into mitigation policies. Therefore we believe that the wording of the Bill should be changed from “Scottish Minister may” to “Scottish Ministers must” take into account international aviation and shipping attributable to Scotland when calculating the net Scottish emissions account.

The SRPBA believes it is important that measures to balance the “net Scottish emissions account” in relation to reduction targets by carbon trading should not be pursued to the detriment of mitigation measures in Scotland. Consequently, there should be a limit on the number of carbon units which Scotland can purchase. We think that Scotland should be encouraged to generate and sell carbon units rather than buy and use them.

Q5 The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

The SRPBA agrees with the definition of Scottish emissions given in the Bill but we feel that emissions from international aviation and shipping attributable to Scotland must also be included in the total.

Q6 The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government's approach to obtaining independent, expert advice on climate change?

The SRPBA believes that Scotland should establish a Climate Change Commission, not a Committee, in order to signify it is not controlled directly by the Scottish Government but is an independent think-tank. We feel that the UK Committee does not have sufficient expertise about what is happening in Scotland or about Scottish structures to give independent expert advice to Scotland on climate change. However, the SRPBA envisages that the UK Committee could provide additional useful advice to the Scottish Climate Change Commission.

Q7 The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?
The SRPBA believes that the reporting process is crucial. Targets set in statute focus the minds of administrations by applying a degree of political, legal and moral pressure, even if financial or legal sanctions are not involved. We recognise that the issue of sanctions for not reaching targets is complicated because the government could end up fining itself.

The SRPBA is supportive of the reporting mechanisms outlined in the Bill which require Scottish Ministers to: (1) lay an annual report before the Parliament giving details of Scotland’s emissions, (2) lay a report before the Parliament setting out proposals and policies for meeting current and future annual emissions targets, (3) if the net Scottish emissions account exceeds an emissions target they must lay a report setting out the proposals and policies by which they intend to compensate for the excess emissions and (4) final statements for 2030 and 2050.

Q8 The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

The SRPBA agrees that the Scottish Government must be able to impose duties on public bodies in relation to climate change, issue guidance to those bodies and require that they report upon the discharge of those duties. We feel that without clear defined duties, public bodies may fail to take appropriate action which might place them out of step with the government. Therefore, we are supportive of the proposals outlined.

Q9 The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on this proposal?

The SRPBA believes that if the Scottish Government is to produce a report about how Scotland can adapt to climate change it must avoid the use of buzz words and phrases as found in the “Adapting our ways: Managing Scotland’s Climate Risk” consultation paper.

Q10 Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are your views on this proposal?

No clear indication is given about whether Scottish Ministers will be inclined to make the muirburn season begin earlier/later or finish earlier/later and whether the season will be longer or shorter and the SRPBA cannot support such an open ended proposal. If the burning season was shortened this would inevitably result in a reduction in burning leading to an increased risk of unplanned fire in the summer months fuelled by larger quantities of old, dry vegetation remaining on the hill. Consequently, carbon storage within the peat would be threatened and this is at odds with the Scottish Government’s desire to mitigate against climate change.
Based on current understanding of climate change and its effect on moorland there appears to be no strong evidence that the current dates for muirburn need to be varied. The SRPBA maintains that issues associated with changing weather patterns and concerns over controlling fires in difficult conditions or burning when the ground is too dry can be addressed though stricter adherence to The Muirburn Code. The SRPBA supports the view that not enough is known about how long-term trends in climate will affect muirburn and therefore we are not convinced that, at this stage, additional powers for Ministers are required. It is also difficult to see how changes in permitted dates on a Scotland wide basis would be appropriate given there is so much local variation in terms of weather conditions, fauna, vegetation and many other site-specific or environmental factors.

Q11 The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

- The SRPBA is supportive of joint ventures and believes that they represent an excellent opportunity for FCS to participate more fully in reducing greenhouse gas emissions in Scotland. The money raised from joint ventures would be invested in future tree planting to achieve the government’s other target of 25% woodland cover by 2050. They would create new jobs which would come at an appropriate time given the current economic climate. FCS can provide land and management expertise while the other partner(s) can contribute their experience in overseeing renewable energy projects. Therefore, successful joint ventures are achievable.

- The leasing proposal is much more controversial. So little detail is given about the proposal that it is difficult to either support or reject it as it stands. We do not agree with the leasing proposal outlined in the consultation paper for a number of reasons:
  o It is understood that the most productive areas of forestry would be leased and therefore where will the money come from to fund the environmental, recreational, educational and research work currently carried out by FCS?
  o FCS has a long tradition of supporting processing industries by guaranteeing supplies and thus maintaining timber flows to the timber industry. It is not clear how this could be assured with a commercial operator.
  o We have reservations about one company leasing such a large proportion of forestry in Scotland. This could create an imbalance in the timber market and potentially cause problems for the timber trade.
  o There is no guarantee that the money raised from leasing would be put back into the forestry sector.
  o Any lease arrangement that attempts to ensure that the public’s interest in the national forest estate is retained is likely to be very complex, possibly not 100% effective in the long run and very expensive overall.
  o A 75 year lease does not relate to rotation length and this may lead to the demand for a lease roll over or sale of land.

- The SRPBA has concerns about the proposed not-for profit trust competing head on with the private sector for afforestation sites. The trust could initially have a very large sum of money to play with depending on how the rent will be paid. It has not been clarified whether the rent would be paid upfront in a lump sum or if it will be paid annually. If the former is the case, this could represent a problem to other growers in Scotland. We also object to the transfer of the landlord’s interest in leased national forest estate land to a not-for profit trust. Overall control must be maintained by Scottish Ministers to ensure all activities and their impacts remain in the national interest and are accountable to the Scottish people through parliament.
• We suggest that planting by the private sector would increase to meet government targets of 10,000ha/yr if changes were made to the Single Farm Payment. There are costs and risks involved with planting trees on bare land whereas one can let that land remain bare and receive money for doing so in the form of a Single Farm Payment. Reform of these rules would remove one barrier to increasing planting.

• Additionally, the SRDP needs to be simplified to make money more readily accessible to growers. Private owners and investors have not lost their appetite for planting, as demonstrated by the large oversubscription to the Ayrshire locational premia under the old SFGS. In short, if the incentive is present, the private sector will provide the forests.

Q12 The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?

The SRPBA welcomes the production of such an action plan but it must be designed to take account of old rural properties, recognising that they are very difficult to make thermally efficient. We would particularly support an action plan that identifies support and incentives available for upgrading Scotland’s housing stock.

Q13 The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government's thinking in this area.

What are your views on this approach?

The SRPBA is supportive of owners of non-domestic buildings receiving guidance to improve energy efficiency. However, we do not agree that owners should be legally required to develop a programme of cost-effective improvements to reduce emissions and improve energy efficiency unless financial assistance is made available.

Q14 The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

What are your views on this proposal?

The SRPBA agrees that measures should be put in place to incentivise the production of heat from renewable sources. We promote the use of woodfuel as a carbon neutral fuel which is more environmentally sustainable than fossil fuels. We recognise that woodfuel heat systems are more effective when they are located close to a wood supply, otherwise carbon emissions will be incurred during transport. Therefore, we encourage the use of local woodfuel supplies where this is possible.

However, the SRPBA believes that there seems to be a bias in the Bill by singling out renewable heat and not mentioning renewable electricity and transport. Emphasis needs to be placed across all three sectors in order to meet the ambitious 2050 target.
Q15 The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas:

- Waste prevention and management plans;
- Waste data;
- Deposit of recyclable waste;
- Procurement of recyclate;
- Reduction of packaging;
- Deposit and return schemes;
- Charges for carrier bags.

What are your views on these proposals?

The SRPBA considers all of these areas vital to achieving the emissions reduction targets set in this Bill. We believe that the Scottish Government should make funds available to Local Authorities and/or private enterprises to capture and utilise methane from existing landfill sites and to build and operate anaerobic digestion plants or incineration plants to produce energy from food waste, fallen stock and other non-recyclable waste. Funds should also be made available to encourage the setting up of local ventures to deal with recycled materials including glass, plastic, electrical and other wastes. Incentives often prove more effective than regulation but enabling regulation should remain an option.

Q16 What are your views on the adequacy of the Scottish Government's consultation in advance of publishing the Bill?

The consultation was adequate.

Q17 Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government out on the consultation proposals?

No.

Q18 Does the Bill raise any equalities issues you would wish to highlight?

No.

Q19 Do you have any comments on the impact of the Bill on sustainable development?

The SRPBA believes it is important that the measures to combat climate change in Scotland are proportionate to the impact they have on a global scale. While we acknowledge the importance of reducing Scotland’s greenhouse gas emissions, we must stress that it is also necessary to ensure that Scotland’s business competitiveness is not compromised disproportionately. It is essential that fragile economic activities are not adversely affected in the quest for greenhouse gas emission reductions, particularly in rural areas. The SRPBA believes it is imperative that efforts to reach reduction targets are backed up by support and initiatives which focus on the economic opportunities presented by climate change, rather than focusing on regulation.

Q20 Do you have any other comments on the Bill?

No.

References
INTRODUCTION

Scottish and Southern Energy welcomes the opportunity to comment on the proposed Scottish Climate Change Bill. SSE is headquartered in Perth, is Scotland’s largest company and employs over 17,000 people. SSE’s core purpose is to provide the energy people need in a reliable and sustainable way; it has set out an investment plan to 2013 of over £3 billion in renewables with much of that investment intended to be in Scotland, representing a timely boost for the Scottish economy. By 2013 SSE intends to have doubled its renewable energy portfolio in the UK and Ireland to 4000MW, maintaining and extending its current lead as the biggest renewable energy generator in the UK, and has set a sector-leading target of reducing the carbon intensity of its entire power generating portfolio by 50% by 2020. By reducing exposure to increasingly volatile prices for fossil fuels in international markets for energy, Scotland should enjoy a long-term benefit from more indigenous energy produced from renewable sources.

This piece of legislation is of the utmost importance and it is vital for the economy and the wellbeing of the people that we get it right. We strongly support the 80 per cent target by 2050 - but long-term targets are no substitute for short-term action.

DELIVERY

Debate on targets must not be a substitute for, or distraction from, adopting accompanying policy delivery actions. The Ministerial foreword to the initial bill consultation document contained ambitious commentary on the issues: now it is time to translate that commentary into DELIVERY, to ensure that ambitions are realised. It is imperative that Scotland puts in place the accompanying actions and policies to achieve the targets and that the legislation drives specific actions by industry, organisations, individuals and government at all levels.

ACCOUNTABILITY

It is also important that government action to meet targets is closely monitored and that Ministers are genuinely and transparently accountable to parliament on an annual basis for progress. They should be required to demonstrate the progress made in the relevant areas of public policy - such as in renewables, planning, energy efficiency, transport, housing and transmission infrastructure for example - to ensure we don’t do too little, too late. Although some early measures may take time to deliver the output of emission reduction, action plans should specify when emissions are expected to be reduced in each sector as a result of the action taken so that appropriate assessment and accountability can take place.

CLIMATE CHANGE: A PRIORITY ACROSS GOVERNMENT

The question of where climate change sits in a hierarchy of priorities for government agencies and departments is also a crucial question – one which does not appear to be specifically answered. This may be an issue for the duties, aims and objectives of SNH and SEPA, but equally, prioritisation cuts across all government departments and agencies as well as local government, their local plans and approach to developments. According to the Ministerial foreword when the Bill was introduced ‘Climate change will change the world we live in. As a society we are at the cusp choosing which world we will pass to our children: a greener, sustainable economy, or a world where mass deaths from droughts, famines and storms and extinction of species is the norm.’ All of Scotland’s environmental legislation, including duties which govern the agencies on a statutory basis, needs to reflect this.
Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

SSE supports both as minimum targets.

Q2 The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

What are your views on the setting of targets in batches from 2010 to 2022?

In principle SSE has no objection to the grouping of annual targets into batches, as long as the batches are framed within timescales that are consistent with political cycles so that no government will ever be able to revert to the 'not in my term of office' syndrome. The original proposal to set budgets over 4 or 5 year periods makes more sense than a budget to 2022 from 2010. In addition, annual scrutiny of progress towards targets would naturally be referenced at 3% minimum. However, to set one budget for 12 years may allow far too much leeway to project action into the future instead of the early action that is required. The targets and budgets should of course, be aligned with UK and International targets

Q3 The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

The targets and framework should be set consistent with international, European and UK commitments, and on a per capita basis, to be aligned with the scientific recommendation of what is needed to keep global average temperature increase to below 2 degrees Centigrade. Early action is needed and it should be possible, if not obligatory, for the government to set the direction and expectation that we must reduce emissions early, regularly and urgently.

Q.4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

SSE believes that the Scottish Government should encourage action to be taken which aims to achieve the majority of carbon reduction from Scottish source emissions. SSE also believes that trading has an important role to play in tackling global climate change and should not be artificially restricted. However, measuring the effort undertaken in trading schemes can be complicated and for the EU ETS will differ depending on what allocation methodology is used - increasingly the EU will be moving from allocation to a fully auctioned system.

(Where emissions are grandfathered or benchmarked, the effort undertaken by an installation can be calculated by comparing actual emissions against allocated allowances in the same time period. Where allowances are auctioned effort can only be measured in aggregate by comparing the total number of allowances issued in the auction against actual emissions) For this reason it is more important that the Scottish Government creates the right policy framework to ensure that significant action is taken across all sectors, than that effort is expended on complicated formulae for calculating and monitoring the impact of national and international emissions trading schemes. SSE favours a mechanism in the Bill that will oblige government to deliver 80% of the pollution reduction from Scotland. The UK Climate Change Committee has recommended a set of figures up to 2020 that specifies domestic, traded and credit purchase. This amounts to a 34% cut predominantly through domestic emissions reduction, and 42% total through domestic emissions reduction and credit purchase. SSE would support the adoption of this model for the purposes of both consistency and effectiveness.
Q5 The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

The term ‘attributable’ as a definition may be problematic to assess precisely, but in general a ‘rule of thumb’ approach may be better than attempting to achieve perfection. However, it should be noted that rather than cut emissions over the last 18 years, most of the substantial cuts have simply been exported – for example in closing steelworks and then importing the same product from overseas. It is still Scottish demand that is causing the emissions made elsewhere, and therefore this is an important factor in assessing pollution caused by people in Scotland.

Q6 The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government’s approach to obtaining independent, expert advice on climate change?

SSE agrees with this approach. Additional advice to the Scottish Parliament will be needed when it scrutinises government action, and we would suggest that additional effort needs to be considered, perhaps with the joint efforts of both the Scottish Sustainable Development Commission and Audit Scotland.

Q7 The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

SSE would broadly agree with the arrangements for scrutiny, but it is vital that the parliament plays a scrutiny role across portfolios similar to the way it operates in relation to the Budget process. Action is needed in every sector. Reporting and Scrutiny will need to do the same. Indeed, assessing the carbon budgets in relation to the finance budgets in a conjoined manner would help the process greatly. Ministers must be accountable for their actions. The process of parliamentary scrutiny enables the successes or failures of political action to be felt keenly in the political arena. With financial or legal sanctions on Ministers being generally difficult to impose as a form of punishment for failure, the key driver for failure or success is Ministerial credibility. Parliamentary committees also reflect a diversity of political parties and would be relatively independent. Ministers would present a report on their ACTIONS and the IMPACT of those actions, as well as reporting the quantified emission levels.

Q8 The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

All public bodies should be given a general duty to have regard to the targets when carrying out any of their public functions and this could be done on the face of the Bill. For example, Local Authorities, SEPA and SNH should have a duty to have regard to the targets when considering low or zero carbon and supporting infrastructure proposals. Given the scale and influence of the public sector in Scotland, SSE also agrees that there should be enabling powers incorporated into the Bill which can be brought forward as secondary legislation at a future date. Local authorities and the private sector may benefit from the universal application of policy measures and setting expectations as early as possible. Many of the potential requirements on local authorities for example, could include: a duty to meet specific targets and a duty to consider climate change impacts through all public procurement and planning. Carbon budgets could be set by the same teams that set cash budgets across all sorts of public and private bodies. This will ingrain the concepts. Best Value guidance ought to incorporate climate impact criteria, so that procurement helps deliver cuts in emissions. Although ‘sustainable development’ is reflected to some degree, specifying emissions is likely to be more effective, reflecting a priority and be more easily quantifiable.
Q9 The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on this proposal?

SSE broadly supports this approach.

Q10 Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are your views on this proposal?

No specific view.

Q11 The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

SSE broadly agrees with the proposal subject to some conditions. As stated previously, all of Scotland's agencies and public bodies should play their part in delivering action on climate change. In principle, the possibility of private and public ventures making maximum use of Scotland's forest estate to deliver renewable energy solutions should be advanced. Concerns over the long term stewardship of Scotland's forest resources have been raised by a number of stakeholders since the launch of the consultation. Some of these concerns, where appropriate, could be addressed through the framing of leases, contracts and management conditions. SSE would readily participate in discussions with other stakeholders to ensure that the twin objectives of sustainable use and management of forestry resources and the delivery of renewable energy solutions are delivered.

Q12 The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?

An action plan on energy efficiency is long-awaited, and welcome. The action plan should also set out emission saving targets through energy efficiency and assessed as part of the scrutiny process. Rapid delivery of insulation and energy efficiency measures is vital. SSE supports an area-based approach to rolling out a nation-wide programme of energy efficiency and insulation measures. We were delighted to see cross-party support for this approach in the recent vote in parliament which “calls on the Scottish Government to consider a comprehensive and fully funded Scotland-wide scheme on this scale to provide energy audits, insulation provision and financial support for micro-renewables where appropriate.” SSE also supports the energy assistance package proposed by the Fuel Poverty Forum.

Q13 The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government's thinking in this area.

What are your views on this approach?
SSE would support moves incorporated into the bill to require minimum energy efficiency standards to be met within the public and private sectors in Scotland. Given that existing homes will still constitute two thirds of the total housing stock by 2050, a major focus of public policy change should be in improving the fabric and performance of building stock. All avenues should be explored, such as using local and national tax incentives to reward energy efficiency or microgeneration. Just as the local government finance deal has delivered an incentive for local authorities to freeze council tax levels, similar conditions on funding allocations to local authorities could be considered. Measures to incentivise local authorities to deliver emission reductions and specific climate-friendly actions such as through procurement strategies, renewable energy development plans and energy efficiency initiatives. Business rates in respect of renewable energy developments such as wind farms could be payable directly to the local authority in which the wind farm is located for example. Permitted development rights could be incorporated in the bill to enable easier installation of low-carbon and renewable devices on buildings.

Q14 The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

What are your views on this proposal?

SSE broadly supports the Scottish Government’s nominal target of 11% renewable heat by 2020. This is clearly a challenging target but given the 14% target at the UK level we should perhaps revise this upwards to ensure consistency across the country and ensure Scotland is playing its part. It will require significant developments in energy efficiency as well as in renewable heat technology deployment. Whilst we acknowledge that the bulk of heat use is in the domestic sector, there is significant potential renewable heat deployment in the industrial and commercial sectors and this should be given sufficient weight in policy development. The economies of scale are greater in industrial and commercial uses of heat and there may also be greater potential for closed loop waste to energy systems in these sectors. We also note that the carbon intensity of heating fuels is higher in these sectors, thus delivering better carbon savings per pound of investment in renewable alternatives An incomplete appreciation of GSHP capability may also lead to an underestimate of its potential contribution. It should be noted that the GSHP industry has ambitions to install 100,000 installations per annum across the UK. GSHPs are also a viable option for community based district heating schemes and this should be suitably incorporated into government action planning. Cooling needs to be considered alongside heat, for both mitigation and adaptation reasons. We would challenge the recent assertion in the Scottish Government's renewables pilot that appears to back Air Source Heat Pumps, not GSHP. We believe the reference data and costs associated with GSHP used in the pilot is out of date and does not incorporate significant gains in cost and output efficiencies and its highly effective application in specific circumstances. We recommend the government revisits this. The UK RES consultation suggests that 7.3million UK homes will be required to install solar thermal technology by 2020, to contribute to a 14% renewable heat target. Although capital costs are high and payback periods long, SSE believe that mass installation of this proven, easily installed technology will be necessary in order to meet any renewable heat target. The scale of the renewable heat target must not be underestimated. It is imperative that all sources of renewable heat are considered and deployed where best suited. If Scotland is to meet its target, then it must ensure that the conditions ensure that all renewable heat technologies can flourish. The cost of this challenge should not be undervalued. The Enviros report used as a foundation to BERR’s UK RES consultation estimates the cost to overcoming the barriers to achieve 10.5% renewable heat is nearly £8billion; on a population share, Scotland’s share would be £700million. Above all else, Government and stakeholders must develop a strategy for mass deployment on this scale in order to succeed.

Q15 The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas:

Waste prevention and management plans;
Deposit of recyclable waste;
Procurement of recylcate;
Reduction of packaging;
Deposit and return schemes;
Charges for carrier bags.

What are your views on these proposals?
Broadly supportive of these measures.

**Q16** What are your views on the adequacy of the Scottish Government's consultation in advance of publishing the Bill?

Generally positive, there appears to have been significant effort deployed at engaging with stakeholders and the wider public.

**Q17** Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government out on the consultation proposals?

No specific comment at this stage.

**Q18** Does the Bill raise any equalities issues you would wish to highlight?

No specific comment at this stage.

**Q19** Do you have any comments on the impact of the Bill on sustainable development?

The Bill should have a positive impact on sustainable development as it will reduce emissions and also provide impetus to investment in a low carbon economy.

**Q20** Do you have any other comments on the Bill?

The overall purpose of the Bill should be to accelerate government action and delivery in the short term as well as the setting of targets for the long term. This means that areas such as renewable energy planning, upgrading of the electricity transmission system, the National Planning Framework, the Marine Bill and the formation of Marine Scotland, a Heat and Energy Efficiency action plan, etc are all crucial components and factors that will determine the effectiveness of the Climate Change Bill. This leads to the conclusion that the scrutiny of the bill must also focus on the effectiveness of these delivery mechanisms and associated action plans, and emission reductions across the different sectors for it to be meaningful.
Scottish Water Response to the Call for Views on the Climate Change (Scotland) Bill by the Scottish Parliament Transport, Infrastructure and Climate Change Committee

Introduction

We welcome the opportunity to provide evidence to the Committee on the proposed Climate Change (Scotland) Bill. During 2008 Scottish Water issued a detailed response to the consultation on earlier proposals for this bill setting out some of the challenges for the water industry in addressing climate change.

We are pleased to see additions to the current bill that take account of the need for adaptation. We believe that it is useful and necessary for both adaptation and mitigation to be considered together within the bill. The Flooding Bill promotes multi-agency approaches and surface water management planning and is an example of the sort of partnership approach across wider aspects of climate change adaptation – the requirement to produce a programme must be seen in the context of partnership.

General Statement

We are fully supportive of the aims and ethos of the bill. We understand the scientific basis on which the targets are decided and also the moral responsibility for developed nations to demonstrate leadership on this issue. Our vision is that Scottish Water always demonstrates responsibility in delivering its duties.

The water industry is at the forefront of climate change. We depend on a healthy environment for reliable, good quality water to treat and supply to customers. Further, we act to protect the aquatic environment by treating and safely returning society’s wastewaters without causing flooding or pollution. A changing climate challenges the provision of these services.

In respect of carbon it must be recognised that the water industry is an energy intense sector. The challenge of meeting public health and aquatic environmental quality imperatives has seen a step change in technology in recent years with the advent of tertiary wastewater treatments, membrane technologies and UV disinfection.

Rising Energy Demand

It is estimated that the £4bn we will invest between 2002 and 2010 to meet service, health and aquatic environmental imperatives will increase energy demand by 2.5% per annum. However, backtracking on quality is not an option. We need a good quality environment and we are a critical service supporting a healthy Scotland.

Legislators in Scotland and Europe collectively need to recognise that future quality enhancement must be balanced by holistic assessment of the net benefit or cost. Local enhancement must be considered in the context of the global impact from potential emissions increase.

There is a need for a full review of legislation written in a “pre-carbon” era to identify unintended carbon consequences from EU, UK and Scottish Law. Full carbon assessment should be demanded of all new legislation. Implementation of legislation must consider the wider impact and whether there are policy mechanisms etc by which carbon can be mitigated.

A Scottish Water Climate Change Strategy

Our strategy commits us to be proactive on behalf of customers, to seek to understand the impacts and secure service in a changing climate and to contribute appropriately to carbon mitigation by reducing our energy demand, becoming more efficient and generating renewable energy.

On adaptation we have taken steps to identify the work that will be required to properly assess the risk and respond appropriately. Our intention is that prior to physical investment we will work in partnership with others to understand the service risk, the timeframe over which impacts may be felt, and the response necessary to secure service. This will ensure we commit expenditure as efficiently as possible.
On mitigation, Scottish Water is committed to carbon management and to the production of annual footprint reports of operational activities. Our current footprint is circa 470,000 tonnes CO₂ equivalents. We have been a leading influence on the development of carbon assessment tools in the water industry, in particular to examine emissions associated with investment planning.

We are presently exploring tools that will support the assessment of the “whole life” carbon impact associated with investment planning. This may help ensure that future decisions properly accommodate the need to report, manage and reduce carbon.

We generate up to 5% of our electricity demand from renewables (predominantly hydro), and have assessed our capacity to increase this as part of our mitigation measures. We are currently developing a 'Carbon Attainment Plan' that seeks to identify the contribution that each part of Scottish Water needs to make towards managing carbon – making carbon part of ‘business as usual’.

**Specific Points**

**The 2050, and interim 2030 carbon targets**

We recognise the scientific basis on which the 80% reduction is predicated, and agree that a trajectory to achieve 80% by 2050 requires a challenging interim target. To do otherwise risks back loading action on emissions reduction, increases the risk of failure to achieve the target and allows a greater net emissions over the period. For this reason, it is sensible and right to introduce an interim target that would allow all sectors to begin planning their carbon management approaches.

We believe that a genuine multi-agency approach is required to agree and secure the necessary actions and funding to deliver emissions reduction cost effectively across all sectors of the economy. To do this will require significantly increased focus on the carbon abatement costs across the economy in order that attention may be focussed on areas where there is greatest opportunity and efficiency.

**Annual Targets and Carbon Budgeting**

The setting of annual targets that are appropriately scoped and costed presents a significant challenge to Scottish Ministers. This builds on the issue raised above, namely that greater clarity is required on the ability of the Scottish economy to make emissions reductions that will both contribute meaningfully to the long term goals, and do so in a manner that is both cost effective and equitable.

During our earlier consultation response, we expressed the view that clear budget periods over 5 years, with sufficient lead time would be necessary, and that a degree of flexibility in balancing budgets is required. This is because our industry has extremely long lived assets, 8 year objective setting periods and 4 year regulatory investment plans. We need sufficient sight of budgets and the implications for Scottish Water in order to make appropriate plans. The ability to vary targets annually, along with the significant work required on cost effectiveness brings a degree of uncertainty to the process.

Annual targets offer a useful profile within a budget period, but we believe it is more important to produce longer term budgets that will cost-effectively drive the right opportunities and contribute to the overall trajectory of emission reduction.

**Public Sector Duty**

The public sector is a diverse range of organisations with differing carbon impacts and reduction opportunities. It is imperative that we consider (1) emissions associated with a public body in delivering its duties, and (2) emissions from third parties that are ‘caused’ by the public body – the public body’s unintended impact on carbon in the wider economy through policy, legislation, planning decisions etc.

With respect to the operational emissions of a public body, an appropriate duty would require organisations to report carbon performance regularly, and develop carbon management plans that demonstrate how carbon is being ‘mainstreamed’ throughout its operational practices. Such a plan may be submitted for approval by the sponsor unit which would itself have a duty to mainstream carbon thinking across its remit. Periodic review of progress against the plan may then follow.
It is unrealistic to expect all public bodies to default to the same trajectory as the proposed targets. This is because each body will have a different mitigation capacity. The key focus must be on cost-effective reduction to ensure that tax and water charge payers get value for money for carbon abatement.

With respect to the carbon consequences of legislation, policy or decisions made by public bodies we believe there should be a duty to consider how, in the course of its activities, seemingly unrelated policies or decisions may drive unintended carbon consequences elsewhere in the economy.

Carbon management is interconnected with all parts of the economy and a multi-agency approach with government, regulators, authorities, NDPBs etc, to take account of the degree to which their decisions impact carbon emissions.

We believe that building the right carbon management tools to encompass whole life costing of carbon will allow us to see the most cost effective means by which carbon could be reduced. Added to which, proper evaluation of the capacity and cost efficiency of investment in renewables across public sector and cost efficiency will enable the identification of suitable carbon mitigation goals.

Adaptation

We are pleased to note the provisions for laying a programme for adaptation before Parliament. We believe that only through multi-agency partnerships particularly those associated with critical national infrastructure will we successfully integrate policy and action towards securing a well adapted Scotland. We are committed to continuing to work with Government and stakeholders toward achieving this.

Waste Management

Through our waste management facilities in our non-core business “Scottish Water Horizons” we have significant green waste composting and recycling capacity that we are looking to expand. We believe that there is scope to streamline the regulation surrounding such activities to promote sector expansion and the inclusion of carbon beneficial activities such as Combined Heat and Power units.
This is the response of SIMPAC LTD to the 20 questions you have requested views upon as follows:-

Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

A1 The baseline against which these targets are being measured is either 1990 or 1995. Are these baseline numbers already available and if so where can they be found? That is critical for measurement purposes and the public must be told of them.

These targets are unrealistic and unattainable, without a huge ongoing tax burden on the people of Scotland and it would require a ridiculous and impossible commitment from politicians who will all be out of politics long before the final deadline in 2050. We have not and will NOT meet our meagre Kyoto Protocol targets which were at least realistic and attainable had we made a concerted effort so to do. No smug kudos for saying "we've done our bit" if the majority of the world ignores their part. Africa, Asia, and India represent more than 50% of the world's population and they will not allow us to stifle their economic revolutions. Furthermore it is naive of us to expect them to do so.

No other country has undertaken such a target as Scotland has proposed and whilst it might massage egos to think that we will be the leader in this field, all it will do is further denude the country of manufacturing industry, make Scotland uncompetitive, and create no appreciable difference to the alleged 2 degree rise in temperature which some experts THINK might be the extent of climate change over the next 100 years.

One part of this Bill (see section 15 below) will INEVITABLY INCREASE CO2 AND METHANE EMISSIONS yet it is included in a Bill to REDUCE such emissions. This is by no stretch of the imagination clarity of thinking, by introducing a Bill which in part will INCREASE the problems it is intended to solve.

Q2 The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

A2 This is nothing more than a cop out. The lack of attaining the Kyoto targets should attest to that. A 12 year target with internal batching of say every 3 or 4 years with the Parliamentarians and/or Government changing every 4 years looks like a recipe for "blaming the previous administration politics" to me. If you are truly serious set annual targets and have the infrastructure in place to measure the effect against these targets so that within 2 months of the end of a year we, the public who would have to finance the reductions in emissions can truly judge their effectiveness. That gives the public a running total for the 12 years and your efforts can be measured against that and the voters can vote accordingly. Furthermore if other countries don't comply then we should not be boxed into set targets which the majority of the world's population is ignoring.

Q3 The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

A3 Refer back to answer 1. This is a totally unrealistic approach, wonderful in conceptual pie in the sky thinking, but unattainable. It is impossible to plan more than the length of one Parliamentary term as unforeseen circumstances WILL occur, just as today, we have the credit crisis which is making a mockery of attempts to increase consumption whilst reducing emissions.
This is simply posturing and should be kept out of the Bill so that we are not internationally ridiculed.

Q4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland...

A4 You can massage figures as much as you wish, buy or sell carbon units as much as you want but the reality is it won’t make the any significant difference to the level of emissions in the world. We represent about 0.07% of the world’s population. China and India represent together 37%. China has, for the past 3 years and for the next 2, been building and commissioning at least 2 new coal fired power stations every week. The Chinese public want heating in the winters and air-conditioning in the summer – we in the West have it, why shouldn’t they? The people of India, who are industrially presently well behind China, dream of their electric washing machines and their petrol driven Tata motor cars rather than walking to work, and they all want to have running water and hygienic toilets. Power generation gives them all of these Western conveniences and the consequent greenhouse gas emissions from power stations are the least of their Government’s concerns, however much they posture about their green credentials when talking to the West. Rightly, their Governments are more concerned about avoiding revolution and reducing hunger, poverty and disease, all of which will be helped enormously by industrialisation and employment.

Q5 The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

A5 This seems reasonable

Q6 The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

A6 The key to this question is “independent, expert advice”. Let’s ensure we understand the facts and not the current hype of the type of the now totally rejected Al Gore form of political misinformation. It would seem reasonable to accept truly independent expert advice; save that this is a politically motivated Bill and the UK Parliament has little influence from the SNP which is the party in power in Scotland. However, if the Holyrood view is to accept the UK Committee independent expert advice, then we in Scotland should submit the independent advice we have already paid for in the question of charging for carrier bags which produced a unanimous conclusion in 2006 that the unintended consequences of charging for carrier bags would produce a negative effect on the transport used annually, the further destruction of the infrastructure in Scotland and an increase in waste findings leading to an increase in greenhouse gas emissions from such increased waste arisings. Sadly we are merely shadowing the Westminster Bill in this area and we have already rejected this section for Scotland. It has no place in this Bill.
Q7 The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

A7 Define regularly please. Annually would be a good definition. The public and voters need to be kept informed of the efficiency of Government.

Q8 The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

A8 Please no more public sector jobs with attendant pension costs.

Q9 The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

A9 It would be good to know about what has actually happened rather than fanciful projections based on computer models based on hype. See A1 above on unattainable targets.

Q10 Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

A10 I understand there is a tourism connection in ensuring the regeneration of moorland, and if so please consult the relevant tourism authority and the owners of the moorland so burnt.

Q11 The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

A11 Not competent to answer this.

Q12 The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

A12 About time. Start with all publicly owned buildings which are a disgrace – automatic movement detectors for lights in all Government and Local authority buildings and set the heating at a constant 65 degrees with no exceptions.

Q13 The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government's thinking in this area.

A13 Good.
Q14 The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

A14 I have no problem with this section. However, do all the sums, add up all the renewable resource power available in the next 30 years and we still will have people dying from the cold, the lights turned off and industry handcuffed unless we introduce an element of nuclear power. My children and grandchildren will be stymied from providing themselves with a decent lifestyle. Nuclear power we CAN, WILL and MUST learn to deal with if Scotland is to be a force in the decades remaining of this century and beyond.

Q15 The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas:

- Waste prevention and management plans;
- Waste data;
- Deposit of recyclable waste;
- Procurement of recyclate;
- Reduction of packaging;
- Deposit and return schemes;
- Charges for carrier bags.

A15 I do not think that unregulated powers of this nature should be sneaked through as part of a Climate Change Bill or any other Bill. This give enormous power to the Government of all flavours going forward, which allows the introduction of law in any of the areas mentioned WITHOUT FURTHER CONSULATION OR EXAMINATION BY THE PUBLIC. The Environment Minister says these may well not be used, and are a backstop. This kind of legislation has NO PART in a democratic society and should be excluded in its entirety.

Charges for carrier bags: - Why this appears anywhere in this Bill and particularly under waste reduction remains a travesty of our democratic process. The Scottish Parliament has already in 2004 – 2006 spend an estimated £2,000,000 of taxpayers money investigating a proposed Environmental Levy on Plastic Bags Bill and unanimously rejected that Bill for very clear unambiguous reasons that to do so would create substitution of lightweight plastic bags by heavier bulkier and more inefficient carriers which was clearly and quantifiably proved to be counterproductive in reducing waste. Whilst Section 59 is all encompassing and non specific as to the material from which the carrier bags are manufactured, there is no doubt that measures already undertaken to reduce the number of bags used (as endorsed by all four UK environment Ministers) has inevitably increased the weight of product used, the bulk of the product used and defeat the very intention of the measure suggested.

There have already been two long and costly “consultations” undertaken by Parliament on this issue. The first when examining the proposed Levy Bill elicited over 1100 responses, over 1000 of which specifically said “no” to a levy on plastic bags. The second, on the Implementation of Zero Waste proposals, stated that “the proposal relating to single-use carrier bags only received support from a minority of respondents”. Both indicated clear majority opposition to the idea of having to pay for carrier bags. It is therefore undemocratic to include such a measure when the issue has already twice been consulted upon, and unanimously rejected by Parliament.

Furthermore, all of the major UK retailers have already signed up to a voluntary code of conduct in 2007, instigated and endorsed by the Carrier Bag Consortium (www.carrierbagtax.com), which required retailers to reduce the ENVIRONMENTAL IMPACT of carrier bags by the end of December 2008 by 25%. This has not yet been
officially reported upon (WRAP have however indicated that the target has been exceeded) but the retailers involved have now undertaken with the UK Government to reduce the NUMBERS of carrier bags by 50% from the base line in mid 2006, by the summer of 2009.

You will all have seen and understood the retailer campaigns being run, including being asked if you need a bag, to bring back the previously used bag, to pay for a carrier bag, to buy alternative products, jute, cotton, nylon, bags for life, woven polypropylene and nonwoven polypropylene, and the occasional switch to paper from plastic in non food applications.

All of these campaigns are been promoted as being “better for environment” and more “ecologically friendly” so why did the Scottish Parliament unanimously reject that in 2006?

The answer is a combination of many reasons which are listed below and expanded in further detail for your understanding. Be aware that it is only the lightweight polyethylene (plastic) supermarket carrier bag that is actually being targeted under this section 59 of the proposed Bill as it is the one which is most in use throughout the UK, and no other type of bag has shown any reduction with all the substitute products having increased availability and use.

Accordingly, a reduction of 50% (as prescribed by the agreement mentioned above) in the number of carrier bags will probably

1. Increase the weight of bags used in Scotland from 10,610 tonnes to 38,343 tonnes per annum
2. Increase the bulk and cubic capacity of bags used in Scotland from 27,660 cubic meters to 232,476 cubic meters per annum of product.
3. Increase the weight of transit packaging from 704 tonnes to 4,100 tonnes per annum
4. Increase the number of lorries - full (unlikely to be full) 20 ft lorry loads from 3,457 to 29,059 per annum
5. Increase the number of full pallets moving around our country from 76,064 to 639,306 per annum
6. Increase the amount of carcinogenic exhaust fumes from vehicles as a result
7. Increase the traffic congestion in our cities, towns and countryside as a result
8. Increase the incidence of road kill of our animals and probably humans
9. Contravene the Kyoto principle, the Bali agreement, the Poznam agreement, EU, UK and the Scottish targets set for Carbon Dioxide, Methane and other greenhouse gas reductions, by increasing their emissions.

This is a much increased and greater environmental cost than that which was estimated in 2006 as the substitute products for the lightweight carrier bags being replaced which are all being sold in today’s retail market are far heavier, bulkier and incidentally more expensive than was anticipated in 2006.

These are more accurate figures from those which the Environment and Rural Development Committee (ERDC) reviewed in 2006, as we now know what substitute products have been introduced, and when this potential disaster was understood by them, they had the foresight to understand the damage to the environment that they were being asked to make into law. Thankfully they intelligently voted unanimously against this ill conceived idea. Further consequences not able to be quantified by me, inevitably include more exhaust fumes, more traffic congestion, more road damage, more wildlife and probably human road kill as well.
Sadly the damage does not end there. In that significantly fewer lightweight supermarket carrier bags are available, the public will be forced to replace their re-use which, according to WRAP pre the introduction of the Code of Conduct, stood at between 74 and 80 %, with alternative truly single use products. These are likely to be an increased use of plastic black bin bags, pedal bin and swing bin liners, nappy bags, dog dirt bags, and food, freezer and sandwich bags to carry lunches and sandwiches to work, all of which will negate any perceived benefit from the introduction of charges to reduce lightweight plastic carrier bags.

Detailed analysis of the calculations based on actual weights of products currently available and, estimated usage based on information obtained in the market place, are attached as Appendix A, Appendix B, Appendix C. They show clearly the position as it was for Scotland alone in 2006/7 and as it is likely to be in mid 2009 with the products currently available. Back up sheets show the product analysis with weights and the packaging and bulk calculations for all products. To really frighten yourselves, multiply all figures by 13 to arrive at the UK damage which will be inflicted on our Environment.

Do not be misled by either the tacit mildly reluctant acceptance by the retailers of this required reduction in number of bags or that they are anything other than ecstatic and enthusiastic about these plans to reduce free carrier bags. Please take time to understand the following,

1. The retailers reduce their costs by reducing the number of bags they give away “free”. In the UK when there is a 50% reduction in number, that is tantamount to Government handing them extra net profit annually of £100,000,000
2. Should they charge 5p for the remaining lightweight bags (as M & S do) they will save another £50 - £120 million per annum , less what they generously give of the public's money to charity after deducting the costs of the bags, an administration cost, and the VAT remitted to the Treasury. The ever suffering public believes all their 5p is going to charity, and it most certainly is not.
3. They now sell many different types of alternative bags, jute, cotton, heavyweight plastic, woven and non woven polypropylene and nylon bags, all making significant profit for the retailers
4. They are seen to be “generous” giving the “net proceeds to charity”. It’s the PUBLIC’S money they are donating without any contribution from them.
5. They are perceived to be “doing good for the environment” when, if you understand this submission, they are actually damaging it.

This remains a shrewd commercial decision rather than a studied philanthropic one for the retailers.

These are some of the quantifiable DIRECT environmental costs which will occur by simply reducing the number of lightweight supermarket bags in circulation. The unquantifiable, but inevitable, increased damage from points 6 – 10 above, will be hugely significant.

There are further INDIRECT costs to the environment as well. In Eire, when they introduced a €15 cent plastax (now increased to €24 cents per bag) in 2002, the whole retail experience changed. No plastic bag was exempt from the tax other than small bags under approximately 250 x 375 mm. As a consequence, there was, and remains a visual and almost universal change from plastic to paper bags in the non food retailers. Boots, Mothercare, Next, Topshop, Evans, Miss Selfridge, M & S, Topman, Burton, Debenhams, to name but a few, all changed from plastic to paper in Eire only, whilst retaining plastic in their UK operations. Furthermore, in Eire, many of the paper bags had to be laminated with polypropylene (another plastic) to stop them disintegrating when wet and avoiding ink transfer onto clothes when carried. Yet another unintended consequence of the tax was therefore using more plastic than saving.
In the Irish food supermarkets the whole retail presentation of food altered with all fruits, vegetables, pies, bakery products and deli products changing from being sold loose, to being sold in collation packs, so that they were not contaminated by being placed in the dirty, reusable non-plastic substitute carrier bags inevitably soiled by milk spills, dirt absorbed from the pavement, soap residues and other unsavory unhygienic contaminants (this is a public health hazard waiting to happen).

You simply cannot buy loose fruit or vegetables in an Irish supermarket – they are all now prepackaged in plastic trays and plastic clam shells, wrapped inevitably in shrink film. To give you some indication of the crass stupidity of this decision, 4 bananas in an Irish supermarket are now presented on a plastic tray, covered in shrink film with two paper adhesive labels attached thereto, one showing country of origin and the other the price. The weight of all that packaging is equal to 7 times the weight of a UK supermarket check out carrier bag and 16 times the weight of a fruit and vegetable carrier we use at present. The packaging consisted of 4 different base materials which rendered the waste very difficult to recycle. These changes WILL inevitably happen in the UK if the public increasingly do not have free carrier bags supplied at the checkout.

Factually in Eire the weight of plastic film used annually increased by more than the weight of film saved as the public bought heavier bin bags and garbage bags to compensate for the lack of carrier bags used to contain their waste rubbish.

The Irish turn a blind eye to these massive hidden waste increases, please do not make the same mistake by ignoring these inevitable consequences for Scotland.

Recently, the Environment and Rural Development department announced a £5 million fund availability over a two year period for “improving material recovery facilities and to develop a home market for plastics reprocessing, and inform us that they will be working to significantly increase public awareness of waste issues, including reprocessing carrier bags.” Whilst I am truly encouraged that Parliament is at least making some attempt to address the plastics issue, the inclusion of plastic carrier bags under this funding is totally unnecessary and compounds a glaring lack of knowledge of facilities already available within Scotland.

May I respectfully remind you of the statement from John Langlands, the MD of British Polythene Industries, a major Scottish Plc, at the evidence taking on the failed attempt to levy a charge on plastic bags in 2005, whose recorded response to the Environment Committee, including Mr. Lochhead the current Environment Minister, on October 26th 2005 was as follows: “We are the largest recycler of polythene film in the UK and probably in Europe—we recycle about 75,000 tonnes of polythene film a year. If you can get it to us by whatever means, we can recycle it. The stuff that we cannot turn into refuse sacks or building film we turn into Plaswood, which we use to manufacture park benches and signs, for which we have won awards and which we sell to Scottish local authorities. That is a good use of recycled products and something that must be encouraged and developed in the community.”

This Scottish facility, in Dumfries, for recycling plastic film and carrier bags is and has been in place for over two decades. Why don't local authorities use it? Also the TIC committee should be educating these local authorities in an understanding of what is needed to instigate a collection service from the public which delivers what you seek without a penny of your £5 million allocation. Save the fund for hard plastics, ABS, PET, PP, PS and PVC, all of which are far more prevalent, both in tonnage and in bulk, in our waste stream than polythene film. It would be a very brave, and some will say stupid, businessman who, in these difficult times, would invest today in recycling plastics or paper with such uneconomic price levels for these products coupled with surplus raw material already available worldwide.
Plastic is environmentally easily and economically recycled, using less resource than any of the substitute products both initially and on recycling, and Parliament should be encouraging continued use of lightweight bags rather than reducing their use which leads to further damage to the environment from substitute products.

The Government should be far more proactively encouraging the public to reuse their lightweight plastic carrier bags where hygienically possible, and to recycle them in the plethora of disposal units now visible in the forecourts of most major supermarkets. It should demand and encourage Local Authorities to instigate a collection from householders of plastic carrier bags. It should provide educational literature for schools aimed at encouraging the intelligent use, reuse and recycling mantra on plastic bag use, and not demonising them.

The carrier bag industry, more specifically the plastic carrier bag industry, is under attack from all sides

1. The UK Customs and Excise impose import duties on imports ranging from 3% to 25%
2. The EU has imposed additional anti-dumping duty on plastic bags ranging from 5% to 29%
3. Towns and villages attempt to force a ban plastic bags which is legally unenforceable, as confirmed by Jane Kennedy, the UK’s Environment Minister (Hansard Monday 19 January 2009)
4. Government in Westminster regards them as evil with the Prime Minister stating that he “wants to get rid of plastic bags”
5. Government in Scotland specifically includes them in their Zero Waste initiative and again specifies them in the draft Climate Change (Scotland) Bill
6. A two year campaign, voluntarily undertaken by all the major retailers to reduce the ENVIRONMENTAL IMPACT of carrier bags by 25% then subsequently changed to 25% in NUMBER of carrier bags without consulting the parties involved.
7. A further extension to that policy to reduce the NUMBER of carrier bags by 50% from the 2006 base level (around 1 billion carrier bags in Scotland) by summer of 2009.

All aimed at reducing what you must think is a massive part of our household waste findings.

The reality is that household waste arisings in Scotland amount to some 3,500,000 tonnes annually, of which, in 2006, ALL plastic carrier bags accounted for less than 8,500 tonnes per annum. At that time, paper and card based household waste accounted for 850,000 tonnes and with the demise of a paper maker in Fife that claimed to recycle over 100,000 tonnes per annum, that figure is actually around 950,000 tonnes of paper waste per annum. The voluntary scheme mentioned in point 6 above has (as agreed by WRAP) been met and exceeded, therefore reducing the tonnage of plastic to less than 6,400 tonnes per annum.

This now represents less than 0.2% of waste arisings and why should time and energy be wasted on such an insignificant percentage of waste when there is close to a million tonne mountain of paper waste and other identifiable component groups like food requiring more immediate action.

Furthermore, the reduction by 50% of the NUMBER of carrier bags used in Scotland, will have consequences which will hugely damage the environment of our country as
the public are forced, by ill conceived Government policy, to reduce the number of lightweight bags in use only to substitute them with heavier reusable bags made from paper, jute, cotton, woven and non-woven polypropylene. This is not just a possibility – it has and continues to be happening right now. If even half of the surviving 50% of the carriers remain lightweight supermarket carriers then these unintended consequences are already damaging our environment.

Do not close your mind to these consequences and understand that they ARE ALREADY HAPPENING, and as a result, the Kyoto protocol, the Bali agreement, the EU targets for carbon dioxide and methane gas reductions all will be significantly more difficult to achieve as this new mountain of waste, enough to cover the pitch at Hampden to a depth of 30 meters every year, will generate significant increases in both these greenhouse gases and more if the landfill physical conditions are met.

In terms of transport here are some facts: One 20 ft container will hold approximately:-

1. 1,700,000 lightweight plastic supermarket bags or
2. 300,000 heavyweight plastic “bags for life” or
3. 70,000 equivalent strength paper carrier bags or
4. 45,000 woven polypropylene plastic carrier bags or
5. 35,000 non woven polypropylene plastic carrier bags or
6. 22,000 jute carrier bags (with laminated plastic lining) or
7. 30,000 cotton carrier bags

Please relate these numbers to storage, transport and disposal logistics.

Serious awareness should also be understood about the “down weighting” which continues unabated in all forms of packaging and manufacturing today: the substitution of glass bottles by plastic bottles: the change from cardboard collation packs to plastic packs, the lightening of motor cars, and all forms of public transport by changing from steel bodywork, bumpers and interior fittings to plastic panels: shrink film and plastic vacuum packs replacing cardboard cartons; plastic pallets replacing wooden ones: paint pots changing from steel to plastic; fruit and vegetable transit packaging to avoid damage and extending food shelf life changing from paper and cardboard to plastic; paper carriers changing to plastic carriers; soup tins changing to plastic cartons and pouches; metal pipes changed to plastic, wooden and metal windows changed to plastic, are just a few of the changes seen recently.

Why? – simply to reduce packaging waste, reduce overall weight for transport considerations and increase energy efficiency, preserve products from spoiling and transit damage, increase shelf life, reduce theft, increase efficiency and preserving resources - all of these are achieved by down weighting and all are achieved by changing from various materials to plastic. What this section of the draft Bill will do is increase the weight and bulk of the product and in many cases increase the complexity and variety of materials used, rendering them more difficult to recycle – clearly going against all that is happening in the market place to use less of the world’s resources and become more efficient. The Courtauld Commitment, a voluntary agreement, launched in 2005, between WRAP and the major grocery retailers has as one of its aims, that the signatories must seek ways to reduce the weight of packaging. This Bill will be doing exactly the opposite.

Do not be taken in or take decisions under the mistaken belief, that we will save any oil as a result of this projected change. Polyethylene (plastic) bags are manufactured from by products, naphtha and ethylene, resulting from the distillation of oil and gas into fuel. Accordingly, for as long as we drive cars, use buses, trains, aircraft and bikes or switch on an electric light, these by products will be produced and if not used in the manufacture of plastics, it would be flared off into the atmosphere.
Our overview of the targets set by the draft Bill is that they are commendable but probably unrealistic and therefore unachievable and accordingly are likely to concentrate efforts in the wrong direction. We should be encouraging solutions to deal with the possible 2 degree warming estimated to occur within the next 100 years, for example bringing more current unproductive cold agricultural land into producing additional food and revenues. Continue to seek alternative energy solutions by all means, but do not ignore the opportunities which such warming will bring.

There will be an enormous cost to the people of Scotland (and to the rest of the World) in the cause to reduce emissions, in the perhaps mistaken belief that in so doing, we will address the problem of climate change. I do not profess to be an expert in this field, but I would recommend that every member of the Committee, in order to gain a comprehensive alternative view to that which is currently in vogue on this issue, reads the following books on the subject of Climate Change, which will undoubtedly change their perspective of what they are attempting to achieve.

1. The Skeptical Environmentalist by Bjorn Lomborg published in 2001
2. Cool It by Bjorn Lomborg as an update published in 2007
3. An Appeal to Reason by Nigel Lawson, former Chancellor of the Exchequer

Lomborg, a Danish statistician regarded by Time magazine as one of the 100 most influential persons on Earth, comprehensively and with unchallenged statistical facts, destroys Al Gore’s “An Inconvenient Truth” analysis of the problem, and whilst Lomborg does not deny that there is a slight warming of the earth, he provides historical evidence suggesting that this is a natural, perfectly normal, repeating cycle. These three books explode the many myths associated with the current hysteria on climate change and that we are responsible for it. Lomborg’s view is that the cost of fighting climate change cannot be justified by the likely benefit, and that there are more pressing problems for the world to address. He proves, for example, that many more people die from winter cold than would perish in future from summer heat waves, and that climate change will, therefore, save more lives than it costs. He also proves that the reduction in numbers of polar bears is caused by humans killing them and has nothing whatsoever to do with global warming.

This draft Climate Change Bill has many sensible and very demanding targets for the country to meet. However there is no justification for the continuing attack on the ubiquitous plastic carrier bag as such a move will only make those targets much more difficult to meet.

Contrary therefore to what is proposed in the draft Bill, Parliament should avoid the stigma of introducing a Bill which increases environmental damage and produces even more carbon dioxide and methane gases, by not only encouraging the use of lightweight plastic bags, but also their sensible re-use and highlighting their recycling properties, for the simple reason that they are clearly the most efficient environmentally friendly product currently available for transporting retail purchases home.

Q16 What are your views on the adequacy of the Scottish Government’s consultation in advance of publishing the Bill?

A16 The ONLY product specifically mentioned in the whole of this bill is “carrier bags”. No request for either attendance at the evidence giving was made to anyone in the manufacture, import, distribution or business of supplying plastic carrier bags was sought and no request for information from this section of business has been made. In that 95% of the carrier bags in 2006 were agreed by Government to be made from plastic, it is surely remiss of both the TICC and REA committees to proceed to
comment upon laws which will materially affect these businesses and their employees. The consultation in this specific regard has been totally inadequate.

Q17 Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government out on the consultation proposals?

A18 I have no knowledge of when this was commissioned or what the Assessment concluded.

Q18 Does the Bill raise any equalities issues you would wish to highlight?

A18 Equalities? Irrelevant for Climate Change save that the public may be forced to buy carrier bags which would discriminate against the poor.

Q19 Do you have any comments on the impact of the Bill on sustainable development?

A19 If we don’t embrace new nuclear power stations then our beautiful countryside and our inshore waters will be smothered by wind farms, hydro electric dams and wave power generators. The tourist industry, so important for Scotland, will die.

Q20 Do you have any other comments on the Bill?

A21 Remove section 59 in its entirety. It will

1. Increase Transport throughout Scotland
2. Damage the Infrastructure throughout Scotland
3. Have a damaging effect on the Climate Change Bill by increasing greenhouse gas emissions.

Isn’t that exactly what the Transport, Infrastructure and Climate Change committee are to report upon?

If you don’t recommend removal of this section you will be passing a Bill which includes a section which runs contrary to all the other sections and will merely undermine all other efforts to address the perceived issue.

Simpac Ltd
Spiersbridge Avenue
Glasgow G46 8NL.
We regret that we have not had the time to produce a detailed response to the Bill, but would briefly make the following points.

[a] We are a member of Stop Climate Chaos Scotland, and support their ten top Bill priorities, at

[b] Spokes made a detailed submission to the consultation prior to the Bill. As far as we can see, none of the points in that submission have found their way into the Bill, and therefore we reiterate those concerns. That submission may be found at

[c] With regard to both (a) and (b) above, a primary concern is that emission reductions of at least 3% annually should be achieved from the start, and not from a date well in the future.

[d] The mechanisms by which emissions reductions can and will be achieved both in the short term and the long term must be an urgent priority, and we are not clear how far the Bill will achieve that, rather than just setting abstract targets.

[e] In particular, there must be mechanisms to ensure that short-term 'quick wins' are acted on urgently. To expand somewhat on this point, in the light of our own recent experience...

The value of 'quick wins' (at the same time as moving as urgently as possible towards a non-carbon-powered more electric future) was emphasised by Lord Adair Turner, head of the UK Advisory Committee on Climate Change in his recent lecture at Edinburgh University's McEwan Hall. In particular, in terms of quick wins, he referred to (a) a rapid programme to insulate all domestic properties in Scotland and (b) immediate investment in making our towns and cities walk and cycle-friendly.

Regrettably, and remarkably in this context, the Scottish Government, which professes 'Sustainable' economic growth, took a diametrically opposed stance in the recent 2009/10 Scottish Budget - rejecting a 10-year all-Scotland street-by-street house insulation programme; and ignoring (not even assessing) the evidence-based all-party recommendation of the Transport, Environment and Climate Change Committee to increase the present (miserable) level of investment in walking and cycling infrastructure. Funding clearly was available for such quick wins, given that trunk road spending is increased by over £150m as compared to 2008/09, whilst walking and cycling investment is frozen at (in total) far, far below even the levels of the increase in trunk road spending. Clearly, it is just a question of priorities, and the government's priorities in terms of Climate Change quick-wins are quite topsy-turvy.

As the Bill stands, it is difficult to see how it would persuade the government to adopt any quick wins at all - particularly given that the 3% annual reductions will not come into force until over a decade into future.
WRITTEN SUBMISSION FROM STOP CLIMATE CHAOS SCOTLAND

Below is the Stop Climate Chaos Scotland (SCCS) response to the Transport, Infrastructure and Climate Change Committee’s Call for Views on the Climate Change (Scotland) Bill. SCCS is a coalition of more than 30 organisations campaigning on climate change. SCCS members include environment and development NGOs, faith groups, trade unions, community councils, student societies, women’s organisations, a mental health charity, and many others. In Scotland, those members have a combined supporter base of over 1.5 million people.

This document represents the areas of broad consensus in the coalition, and does not necessarily represent the detailed policy positions of all members. For the more detailed positions of individual members, please refer to their individual consultation responses.

Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050. What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

SCCS welcomes the long-term reduction target of at least 80% by 2050, and fully supports the requirement that this target is based on the basket of six Kyoto greenhouse gases. This is the minimum reduction required by Scotland, and the rest of the developed word, if it is to make a fair contribution to preventing dangerous climate change.

However, not only is this end target critical but so too is the emission reduction path taken to reach this goal. Scotland must meet its target of at least 80% via a trajectory that constrains total cumulative emissions over the period to 2050 to a fair share of a safe global budget. Any interim target should be on at least such a trajectory. SCCS would like to see an ambitious interim target of 50% reduction by 2020.

The proposed interim target of a 50% emissions reduction by 2030 does not ensure we will cut our emissions at the necessary rate to help prevent dangerous climate change. Indeed, initial calculations indicate that simply aiming for the 2030 target would result in approximately 200 million more tonnes of CO₂ equivalent being emitted into the atmosphere by 2050 than would be the case if the trajectory resulting from emissions reductions of 3% a year were followed, as promised in the SNP election manifesto.

SCCS would like to see the interim target revised so that a 50% emissions reduction must be achieved by 2020 rather than 2030. Not only does this place the target on a more desirable trajectory, it also places the Scottish interim target in line with other UK, European and international targets – all of which have 2020 targets rather than 2030 targets. Scotland is well placed to deliver this more ambitious target because of the opportunities we have in terms of producing renewable energy. There will also be economic benefits for Scotland in early investment in green technologies as we can build up expertise and a skilled workforce ahead of other countries. The earlier target will also give investors confidence to invest in renewable and carbon-reducing technologies, as the demand for these technologies will be ensured.

- Set out a framework that will achieve at least an 80% reduction in greenhouse gas emissions by 2050.

Q2 The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive. What are your views on the setting of targets in batches from 2010 to 2022?

SCCS believes that the Climate Change (Scotland) Bill must set in place annual emission reductions of at least 3% year on year, right from the start. Only annual targets will guarantee that the necessary minimum will be done.

Without an annual statutory target of at least 3% per year, the risk of inaction in early years and the subsequent delays in making significant early progress towards the 80% cut are significantly increased. If action is delayed, the effect will be to increase the concentrations of greenhouse gases in the atmosphere towards dangerous levels. Recent scientific evidence gives greater urgency to immediate emissions...
reduction as it describes a rapid acceleration in the rate of growth of atmospheric CO₂ concentrations from 1.3% per year to 3.3% per year and a decline in the efficiency of the world’s natural carbon sinks.

The costs resulting from delaying meaningful climate change action have been repeatedly shown to dwarf the immediate costs of reducing our emissions. The UK Climate Change Committee and others have echoed the conclusions of the Stern Review that first set out the economic imperative of early action. If we do not immediately make reductions of at least 3%, we will be required to make much steeper cuts in the future that will challenge our economy and society.

Globally, emissions must peak and begin a rapid decline in the next few years. This means that developed nations must be actively reducing their emissions now. Scotland’s leadership on climate change is dependent on committing to immediate emissions reductions of at least 3% per year. While targets of at least 3% per year should be the primary aim of the Bill, climate science is increasingly suggesting the need for increasingly ambitious targets. In light of this, and in order to account for the latest scientific evidence, SCCS supports the Bill’s intention of setting annual targets in multi-year batches.

However, when setting multi-year batches of annual targets a number of criteria should be adhered to:

1. A minimum 3% annual target between 2010 and 2050 should be maintained. Therefore, any annual targets proposed would have to be over and above 3%.
2. Consideration of a fair and safe cumulative budget must be included in the factors to which Ministers and the advisory body must have account when setting multi-year batches of annual targets.
3. Consideration towards meeting an interim target of 50% by 2020 must be included in the factors to which Ministers and the advisory body must have account when setting batches of annual targets.

We also have concern about the current periods and timelines outlined in the Bill. In particular setting the first set of annual targets by June 2010 – halfway through the first annual target - seems to build in an excuse to either miss or set a weak annual target for 2010.

- Establish in statute annual emission reductions of at least 3% year-on-year from the start, not just from 2020, compatible with a fair and safe cumulative budget identified by the advisory body.

Q3 The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

SCCS believes that the current requirement in the Bill - which simply states that Scotland’s emissions must be less than the previous year between 2010 and 2019 and then from 2020 until 2050 they must be reduced by at least 3% - is inadequate. Cuts of at least 3% a year need to be in place right from the start. The resulting framework fails to incentivise the necessary immediate emissions reductions, does little to encourage the large-scale investment required to kick-start the transition to a low carbon economy, and ultimately undermines any interim target.

If the Bill sets in place immediate annual emission reductions of at least 3%, there will be greater certainty of what the minimum annual target from 2010-2050 will be, right from the time the Bill is implemented. Consideration of a fair and safe cumulative budget must be taken into account when Ministers and the advisory body set annual targets.

Scotland could have the strongest climate legislation in the world, but without annual emission reductions of at least 3%, the Climate Change (Scotland) Bill cannot hope to fulfil the Scottish Government’s ambition of “setting an example to the rest of the world of how a developed nation can become greener sustainably.”

---

4 Ministerial foreword to Consultation on Proposals for a Scottish Climate Change Bill
it is the blueprint for other nations following in our wake, then it is even more important it addresses the urgency rather than delaying the shift to a low carbon economy into the future.
Q.4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

SCCS believes that the key objective of the Scottish Climate Change Bill must be to reduce Scotland’s emissions by at least 80% by 2050.

The unlimited access to overseas credits allowed by the Climate Change Bill undermines Scotland’s leadership on climate change, increases the risk of dangerous climate change and would mean that Scotland misses the opportunity to develop a low carbon economy.

SCCS proposes that at least 80% of the effort to cut emissions in any given year should take place in Scotland. In its latest report, the IPCC concluded that in order to tackle climate change the developed world must reduce its emissions by at least 80%.5

If we do not limit access to carbon credits we may not succeed in sufficiently reducing our domestic emissions, become over-reliant on an immature carbon market and not incentivise investment in carbon abatement technologies here. Taking action in Scotland to reduce our emissions will place us at the forefront of the low carbon economy and help to ensure we fulfil Scotland’s considerable renewables potential.

In order to achieve this we must address the role of the EU Emissions Trading Scheme (ETS) in both reducing emissions in Scotland and the rate of reduction it compels. The ETS captures almost 50% of Scotland’s emissions, the majority of which originate from the power sector. As it currently operates, the ETS allows for all the emissions reductions it requires to be met outside of Scotland, both from within the EU and, very substantially, from the developing world.

Over-reliance on the EU ETS sector builds two fundamental weaknesses into the Climate Change (Scotland) Bill. Firstly, the level of cuts that will be required under the ETS over the next decade will be wholly inadequate to match the Scottish Government’s ambition of at least an 80% cut in emissions by 2050. The current annual rate of reduction currently prescribed by the ETS is only 1.74% a year between now and 2020. This is particularly inadequate as the ETS includes areas of the economy which most climate analysts (including Lord Stern, Lord Turner and the IPCC) identify as critical to achieving a low-carbon economy. Indeed the power sector, a key part of the ETS, needs to be almost zero carbon by 20306. In this context, it is critical that Scotland takes domestic action designed to supplement the reductions achieved through the EU ETS. Requiring a minimum level of domestic effort to meet the Climate Change Bill targets will provide a framework to drive the necessary supplementary reductions.

Secondly, in addition to setting an inadequate emissions reduction trajectory, the ETS also allows for almost 50% of Scotland’s emissions to be reduced overseas, either in Europe or, through its link to the Kyoto Protocol’s Clean Development Mechanism7, across the developing world. A minimum level of domestic effort is needed to correct for this and place the balance of emission reductions firmly within Scotland.

SCCS’s proposal that the Bill requires a minimum level of domestic effort does not limit the legal access the ETS sector has to external carbon credits, it simply establishes that of the total volume of emissions reduced in any one year at least 80% occurs in Scotland. In effect, the minimum level of domestic effort presents a

5 Indeed the UK Committee on Climate Change recently stated that, “the majority of 80% will in the long term need to be achieved via domestic action”. ‘Building a low-carbon economy – The UK’s contribution to tackling climate change’, First Report of the Committee on Climate Change, December 2008, TSO pxi

6 The First Report of the Committee on Climate Change says “Any feasible path to a 80% reduction by 2050 will require the almost total decarbonisation of electricity generation by 2030”, ‘Building a low-carbon economy – The UK’s contribution to tackling climate change’, December 2008, TSO p198.

7 The Clean Development Mechanism (CDM) allows developed countries to offset their own emissions through emissions abatement projects in developing countries. There is concern that many of these projects do not offer emissions reductions that are genuinely ‘additional’ to what the developing country had already committed to, and that therefore they cannot be guaranteed to offset emissions from developed nations.
powerful incentive to develop and implement policies designed to tackle our power sector or other sectors outside the ETS such as transport.

A Scottish Climate Change Bill, which limited the proportion of emission reductions bought in from elsewhere, would make Scotland an industrialised nation that has demonstrated its willingness and ability to make deep cuts at home. In so doing, Scotland would be at the forefront of generating greater trust and confidence amongst developing countries, which is desperately needed in advance of the international talks in Copenhagen in December 2009. It would also have the added benefits of:

- Ensuring the Scottish Climate Change Bill meets its overall objectives of at least an 80% reduction in Scotland’s greenhouse gas emissions and guide Scotland to a low carbon economy;
- Capitalising on the economic benefits of early investment in green technology; and
- Encouraging an equitable global solution to climate change.

SCCS also believes that there needs to be absolute transparency in reporting what level of reductions has been achieved through purchasing international credits. The annual reporting of progress towards emissions reduction targets must clearly show both actual emissions reductions from Scotland, as well as the net emissions reductions after credits are taken into account.

- Ensure that at least 80% of the effort to cut emissions takes place in Scotland.

Standards

Any international credits bought by the Scottish Government must at least meet the requirements set out under the Gold Standard8. The Gold Standard is the most widely endorsed quality standard for designing and implementing carbon offset projects. The Gold Standard’s main purpose is to ensure that projects are both reducing emissions and fostering sustainable development. According to members of the SCCS coalition, the Gold Standard best reflects the objectives of the Kyoto Protocol.

Q5 The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

International aviation and shipping

SCCS fully supports the inclusion of Scotland’s share of emissions from international aviation and shipping in the definition of ‘Scottish emissions’, along with those emissions from sources in Scotland.

However, emissions from international aviation and shipping must be included in the Climate Change Bill from the very start. Although the Cabinet Secretary announced that the “Government has taken the bold decision to include emissions from international aviation and shipping within its targets”9 the Bill as presented to the Scottish Parliament does not include these emissions. As it currently stands, the Bill says that Scottish Ministers may by order make provisions regarding emissions from international aviation and shipping and that before doing this they must ask for advice from the ‘relevant body’. Despite reassurances from civil servants in their evidence to the Committee, this falls short of including emissions from both international aviation and shipping from the outset and does not guarantee that they will be included in the immediate future.

Aviation is a significant and rapidly-growing source of greenhouse gas emissions, and urgent action is required to put it on a more sustainable path. It is one of the fastest-growing sources of greenhouse gas emissions in the UK. Between 1990 and 2006, Scottish CO2e emissions from aviation have risen by approximately 185%. In recent years, emissions have been growing at over 10% a year. If we choose to ignore the emissions from international aviation and shipping, our calculations suggest that we will in effect make less than a 70% reduction by 2050, well short of the minimum needed of 80%.

8 http://www.cdmgoldstandard.org/about_goldstandard.php?id=11
The Scottish Climate Change Bill needs to account for the total sum of emissions Scotland is responsible for producing. Excluding a particular sector undermines the intention of the legislation and threatens the credibility of the Bill. As a matter of principle, it is important that the Bill includes emissions from international aviation and shipping. We are responsible for these emissions and cannot simply put off acknowledging that responsibility until some time in the future. This is especially true given that, as the Cabinet Secretary pointed out, “Scotland benefits greatly from international trade and travel,” and therefore, “it is right to take responsibility for the Scottish share of these emissions”\(^\text{10}\).

If the inclusion of these emissions is delayed until some unconfirmed date in the future, it introduces a potential disruptive element into the emissions reduction trajectory. With limited warning, Scotland’s emissions would need to be reduced at a greater rate than had been planned for and without the necessary investment plans in place. Accounting for Scotland’s full emissions responsibility from the outset ensures there is a long-term projection of the total emissions reduction needed, this is a prerequisite for investment in a low carbon economy.

Emissions from both domestic and international aviation for Scotland are currently reported on as part of the UK Greenhouse Gas inventory. This methodology follows the most robust and accurate approach recommended by the IPCC. The data is provided by the Civil Aviation Authority and sets out details of each individual flight, including airport origin, destination, fuel type, plane type and engine type.\(^\text{11}\)

SCCS proposes that the Bill should be amended to allow for the methodology used to account for emissions from aviation and shipping to be revised in the future so that it continues to follow international best practice. This would mean emissions from international aviation and shipping were included from the outset and the Bill would recognise, as is the case elsewhere, that there must be scope to keep in step with international reporting methods.

- **Include emissions from all sectors in the framework and targets set out in the Bill, including those from international aviation and shipping, from the very start.**

### Consumption

SCCS would also like to see parallel reporting on those emissions that result from consumption in Scotland. Our consumption of goods and resources generates further emissions that are not counted under a production based reporting system. The Scottish Government have committed to reporting on Scotland’s ecological footprint annually as one of the National Performance Indicators, this means that it would be relatively straightforward to present an account of Scotland’s CO\(_2\)eq footprint. SCCS would like to see such an account reported on at least every year along with the production-based emissions account the following reasons:

- **Global responsibility:** climate change is the response to a global change in the atmospheric concentration of greenhouse gases. Scotland’s shift towards a service-based economy means it is increasingly important that we account for this burden shift of greenhouse gas emissions to other countries.

- **Policy levers:** both production- and consumption-based reporting methods have their strengths in ensuring Scotland is able to target its policy levers to address climate change. Importantly, consumption-based reporting helps to identify the drivers behind changes in the worldwide impact of emissions from Scotland’s consumption patterns. It also allows for a much more subtle understanding of the critical drivers and behaviours behind Scotland’s emissions.

- **Visible indicator:** consumption-based reporting can provide a valuable footprint-based representation of our contribution to climate change. The footprint description provides a powerful communication tool, allowing for an immediate and intuitive appreciation of our global contribution to climate change, empowering consumers to make choices that reduce Scotland’s consumption emissions.

- **Individual responsibility:** we all have an important role to play in reducing Scotland’s greenhouse emissions. Consumption-based reporting provides the disaggregated description of Scotland’s emissions that highlights the contribution the individual can make to a national target, both in behaviour and consumer activity.

\(^{10}\) Consultation response from Scottish Government: [http://www.scotland.qov.uk/Publications/2008/10/response](http://www.scotland.qov.uk/Publications/2008/10/response)

\(^{11}\) Greenhouse gas emissions data from international aviation and shipping for Scotland can be found here. [http://www.airquality.co.uk/archive/reports/cat07/0811180855_International_aviation_and_shipping1990-2006_final_v5.xls](http://www.airquality.co.uk/archive/reports/cat07/0811180855_International_aviation_and_shipping1990-2006_final_v5.xls)
Data availability: the data needed to provide a consumption-based report of Scotland’s emissions are available now and are being used to deliver the Scottish Government supported Local Footprints Project\textsuperscript{12}. The necessary data are available at both a Scotland and local authority level.

\textsuperscript{12} See \url{http://www.sustainable-scotland.net/page.asp?pg=25} for more information about the Footprint project.
• Ensure Scotland counts all its emissions and reports on those produced by products and services we consume as well as emissions produced domestically.

Q6 The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government’s approach to obtaining independent, expert advice on climate change?

SCCS believes that Scotland needs a distinctive body to support delivery of the Climate Change (Scotland) Bill from the moment it is implemented. Although that body would work constructively with the UK Climate Change Committee, there are so many crucial differences between the Scottish and UK contexts that a separate Scottish body is essential. Indeed, the Chair and Chief Executive of the UK Committee on Climate Change have both indicated in response to questioning that they may not be able to support Scotland in these different approaches and areas.

The legislative framework that Scotland will be working within is different from the rest of the UK, e.g. Scotland is committed to emissions reduction through annual targets. The policy context is completely different with much that affects climate change emissions and adaptation devolved, and whether in housing, transport, energy or education the priorities and approaches may be different from the rest of the UK.

The organisations that will be expected to deliver under the legislation are distinctively Scottish, whether in local government (which operates under a completely different structure and funding arrangement in Scotland), agencies or other public bodies. The cultural, educational, legal, social and geographical context is different. The tools and measures to support the implementation and delivery to the targets under the climate legislation will need to be tailored to Scotland.

SCCS further believes that the body should be a Scottish Climate Change Commission (not Committee, so as not to be confused with the Climate Change Committee in Scottish Parliament).

While the Scottish Government will be responsible for delivery of the targets within the Scottish Climate Change legislation, the Scottish Parliament should be responsible for auditing progress and ensuring delivery. Scotland’s Parliament should be able to seek advice from an independent, arms-length body which can support it in ensuring that the targets and plans implemented deliver the requirements of the Climate Change legislation.

A Scottish Climate Change Commission is needed to provide that advice and support; advising Parliament on the global scientific picture; supporting them in the review of delivery or even plans in order to reach targets; monitoring progress in Scotland; and putting activity in Scotland into international context. Such a Commission could provide Scottish Government with advice and support, but as a body that is ‘owned’ by the Scottish Parliament rather than the Government it would remain independent from Government and therefore not compromised by being too close to Government.

• Establish a Scottish advisory body, a Scottish Climate Change Commission, in the primary legislation to support delivery of the Bill when it is enacted.

Q7 The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

The Bill sets out a framework of annual, interim and long-term targets to ensure that Scotland achieves at least an 80% reduction in greenhouse gases by 2050.
In order to be absolutely sure that Scottish Governments, from now until 2050, deliver the targets on time and by the amount that is necessary to make our contribution to avoiding dangerous climate change, the reporting mechanisms and processes set out in the legislation must be tough and meaningful. These will be critical to holding Government to account and ensuring that any failures to deliver are addressed.

Parliamentary process

In line with the Cabinet Secretary’s commitment to make the process tough enough that any Minister in the future would rather go to the dentist and have all his/her teeth pulled out, than come to the Scottish Parliament and tell them he/she has failed, the following process is proposed:

1. Annually, the First Minister (as the Minister with an overview of all departments) should be required to make a statement in the Chamber in front of the whole Parliament. This statement will be on progress in the last year (i.e. have Government met the targets) and set out the plans for the coming year.
2. The full annual report to accompany this statement should be placed in the Scottish Parliament Information Centre (SPICe). It should be accompanied by an annual report response from the Scottish Climate Change Commission (see SCCS Briefing 4), which gives a global snapshot and independent commentary on how Scottish Government has performed and advice for plans for the next year. It could also be accompanied by an audit of the numbers Government set out13.
3. With these documents available to inform the Parliament, there should be a 6-8 week process of scrutiny undertaken by the Audit Committee (as a mandatory committee) on what has been achieved, any failings and particular areas needing investigation to inform the next year’s plans. Evidence should be invited from external sources, including the Scottish Climate Change Commission and secondary Committees (for example in relation to transport or local government) could also be appointed.
4. The Audit Committee should then produce a short report, with recommendations, which would form the basis of an informed debate in Parliament. At the end of this debate, there would be a vote on the recommendations and, potentially, the Government’s proposals for the following year could be amended if deemed necessary to achieve the right cuts.

This process would ensure that there is adequate information and support provided to the Scottish Parliament to allow informed and meaningful scrutiny of the progress on achieving targets. With the Scottish Parliament empowered to undertake strong scrutiny, it would mean that the Government is held to account through a strong, robust process which is transparent and accountable.

The sanctions that would be placed on Government for a failure to achieve targets would be political.

Public bodies reporting

We call for a general duty on public bodies (see 8) and therefore propose that public bodies should report annually on progress on measures to tackle climate change. This could be reinforced by the relevant Parliamentary committee calling in a selection of annual reports each year for scrutiny. In addition, innovative ways of involving local communities directly should be explored. Local accountability might be strengthened by local hearings. For example, an annual schools gathering where students could question appropriate Councillors and officials on the report.

On public bodies, the Bill leaves too much to secondary legislation which may be implemented at some point in the future. In our view, this will unnecessarily delay urgent action by these bodies to cut greenhouse gas emissions.

Cross-sectoral scrutiny

The current proposals state that there will be an annual statement to Parliament. The need for cross-sectoral scrutiny is acknowledged by a proposal to meet with the Convener’s Group in the Scottish Parliament.

---

13 Done by Audit Scotland
The intention of this proposal is good, however, SCCS does not consider the Convener’s Group to be the appropriate forum for this discussion. We are concerned that the Convener’s Group does not meet in public (therefore lacks transparency and accountability) and is not currently constituted in a suitable manner to support the scrutiny of such an important piece of legislation. Instead, a process led by the Audit Committee (which is mandatory) would offer a formal process that is transparent and accountable in line with the Consultative Steering Group principles.

If the government are to be held to account to an appropriate standard of assessment, transparency and expertise, SCCS believes it is essential that the Scottish Parliament Committee system be utilised, in conjunction with the Scottish Climate Change Commission and a meeting of the full Parliament, as outlined above.

Q8 The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

SCCS supports the proposal to place climate change duties on public bodies. However, this should be in the Bill as primary legislation and enacted now, not at a possible date in the future.

While some local authorities are innovative and ambitious in their emission reduction plans, existing guidance and voluntary measures are not enough to ensure that all public bodies play their part in tackling climate change. If they were, serious action would already be happening.

SCCS believes it is critical to give all public bodies climate change duties that will ensure they all take the necessary action to contribute towards delivery of national targets for emissions reduction. Public bodies will only be able to contribute to climate change targets if these targets are included in their procurement and commissioning practices and this needs to be reflected in the Scottish Government’s procurement regulations and guidance.

It will be impossible for the Scottish Government to deliver its emission reduction targets without the active support of and lead from the public sector. At UK level, the need for a similar duty on public bodies to help deliver the Climate Change Act was not included and a need for it has been identified14. Climate change duties introduced from the start mean that everyone is on a level playing field, and how they deliver those duties can be made appropriate for each organisation and local authority area.

If there are no duties laid out at the start, Scottish Government may have to be more prescriptive in order to ensure action is taken, through policies and regulation. A general duty across the public sector would be fairer and more flexible.

When consulted on this issue, the majority of Local Authorities responded positively to the proposed duties.

The statute as drafted would just serve to delay implementation and require consulting these bodies all over again on the same question, which they have just responded positively to, thereby delaying investment and planning towards delivery towards the national goal.

The Carbon Reduction Commitment, being introduced in 2010, will apply to large public bodies but will not set even those, let alone all public bodies, on a path to reducing greenhouse gas emissions in line with national targets. A public body duty will cover the full range of activities carried out by the body, including the extremely important one of procurement, which can be a very effective lever outside the public sector. In relation to Local Authorities, it could help fulfill outcomes in many Single Outcome Agreements, such as emission reduction or footprint reduction. It would also further the intentions of the Scottish Climate Change Declaration (SCCD). This was always intended to pave the way for action on climate change, not be the whole answer. A duty would underpin the commitments under the SCCD.

The Bill must establish a duty on public bodies to consider the impact of climate change in all their decisions and to pursue, in a manner based on sustainable development principles, reductions in carbon emissions in line with national targets. The duty would also apply to adaptation work. This should be implemented immediately so the public sector is involved in delivery right from the start.

SCCS also believes that all public bodies should be required to report annually on the specific measures they have taken to tackle climate change (see 7). Furthermore, all public bodies should be required to seek to negotiate a workplace environmental agreement with their recognised trade unions.

- Establish duties on all public bodies to reduce greenhouse gas emissions in line with the national target.

Q9 The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on this proposal?

SCCS supports the requirement for Scottish Ministers to lay before Parliament an adaptation programme for Scotland, following publication of a UK report on the impact of climate change.

However, SCCS does not believe that such a programme as detailed in the Bill will be adequate in dealing with Scotland’s adaptation needs.

SCCS believes that Scottish Ministers should be required to produce their own climate change impact assessment as well as reporting annually to Parliament on programmes of sustainable adaptation action. The Bill should therefore ensure that:

- Climate change impacts, consistent with UK reporting, are identified for Scotland’s particular circumstances. This will assist public bodies in carrying out adaptation work under their general climate change duties.
- Scottish Ministers seek independent assessments of progress made towards implementing the adaptation programme, from the UK Committee on Climate Change and any Scottish advisory body established with functions relating to climate change.
- Sustainable adaptation is secured across all sectors, safeguarding the future of Scotland’s communities, biodiversity and ecosystems.
- Scotland supports adaptation work to address the impacts of climate change on vulnerable communities and ecosystems in developing countries. Any support must be additional to existing overseas development assistance.

SCCS believes that the Bill should require the production of a Scottish adaptation programme, at least every three years, which should include:

- an assessment of the current and future predicted impact of climate change in Scotland;
- the objectives of the Scottish Government in relation to adaptation to climate change;
- the Scottish Government’s proposals, policies and timescales for meeting those objectives; and
- key indicators by which to measure progress.

and should provide for:

- an independent assessment, at least every two years, of progress towards implementing the objectives, proposals and polices set out in the adaptation strategy; and
- annual reporting to the Scottish Parliament of achievements and revisions to the strategy.

Even with immediate and significant cuts in our emissions, the changes we are already committed to will have an impact on Scotland’s communities and wildlife. Wildlife that is already stressed will be ill-equipped to cope with climate change. We need increased investment in protected areas, on land and at sea, and more environmentally friendly management of the wider countryside to secure healthy populations. Adequate resources and effort must be directed at improving the resilience of Scotland’s wildlife in the face of climate change.
An annual reporting requirement on adaptation, and a requirement to develop a set of indicators to measure progress would assist in measuring success and highlighting areas where more research or resource is required.

- Be explicit that sustainable development is core to the purpose and delivery of the statute in relation to mitigation and adaptation.

Q10 Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are your views on this proposal?

We would highlight that the proposed clause is an enabling clause giving Ministers the power to make changes should they consider it ‘necessary or expedient to do so in relation to climate change’.

Given that the impacts of climate change are already evident in the habitats associated with muirburn we support these provisions, which would give Scottish Ministers powers similar to those in England and Wales to take account of these changes and vary permitted time for making muirburn as appropriate.

We would add that we also support the idea of making provision through a licensing system for out of season burning, to allow flexibility of approach. To provide the necessary safeguards for the natural heritage from out-of-season burning, we consider that a licensing system should be put in place and it seems to us most appropriate that such a system is administered by Scottish Natural Heritage as the Scottish Government’s advisors on nature conservation.

Such a licensing system would, as mentioned, enable a flexible approach whilst a change in the unlicensed dates would reflect the needs of a changing climate and bring Scotland into line with England and Wales. We would welcome amendments to the draft Climate Change (Scotland) Bill to enable such a licensing system to be established at the same time as any changes in the permitted times for making muirburn.

Q11 The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

SCCS is concerned that the forestry provisions are distracting from discussion of the overall aims and objectives of the Climate Change (Scotland) Bill, the urgency of reducing our emissions and how we propose to meet the targets. These provisions were introduced late in the day, meaning that there has not been appropriate consultation on the details of this.

SCCS supports the idea of Forestry Commission Scotland being able to participate in environmentally appropriate joint ventures to address climate change. However, without adequate legislative scrutiny, we do not believe that the Climate Change (Scotland) Bill is the appropriate place for the Government to propose new forestry provisions and enabling powers – such as those under Clause 47 (1), (2), and (4) - that would fundamentally alter the legal basis of Scottish forestry regulation, forestry and practice. SCCS would expect to see full consultation and public debate on such fundamental changes, undertaken separately from the Climate Change (Scotland) Bill.

It concerns us that forestry has been isolated as a form of land use. Other aspects of Scotland's land use have not been included in the Bill, nor are they being debated.

SCCS is also extremely concerned that the proposal to lease substantial parts of the National Forest Estate to private companies threatens jobs. We share the concerns about the risk to jobs that have been raised by the Forestry Commission Trade Unions, who oppose the leasing proposal. The unions back the Bill’s
targets on climate change and the expansion of renewable energy programmes. They acknowledge that the Scottish Government has promised no compulsory redundancies, but they warn that this commitment and staff terms and conditions could be at risk under any transfers and they conclude that several hundred good quality jobs could be lost in the forestry, timber processing, recreation and tourism sectors.

As drafted, the Bill also offers no guarantee that the money generated from the sale of the forestry estate will be allocated to climate change mitigation. We also note that this method of funding climate change-related activities is not sustainable as it would be a one-off payment in return for the land, and therefore does not provide a secure source of financing in the years and decades to come.

Overall, we believe that the Climate Change (Scotland) Bill should take a more holistic approach to rural land use, rather than just considering forestry and muirburn. It is vital to addressing within the Bill the 25% of Scotland’s greenhouse gas emissions that come from land use. An indication in the Bill that the forthcoming Land Use Review would set out a strategic approach for managing Scotland’s land use in relation to climate change would be welcomed.

Q12 The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?

While SCCS supports the requirement for Ministers to produce an action plan setting out measures to improve the energy efficiency of buildings in Scotland, we are concerned that the measures set out in this section of the Bill do not match the level of ambition laid out in earlier sections of the Bill, nor in existing statute. It is essential that the Scottish Government adopts a comprehensive and sustainable approach to reducing emissions from energy use, and brings forward, at an early date, a comprehensive energy strategy taking account of demand reduction, energy efficiency and renewables, and to review it periodically.

SCCS is concerned that the current drafting of this section would actually lead to a weakening of the duty on Scottish Ministers. In section 179 of the Housing (Scotland) Act 2006, Ministers have a duty to improve energy efficiency in domestic housing. In contrast, the drafting of this section of the Bill merely gives Ministers a duty to promote energy efficiency, while section 179 of the Housing (Scotland) Act would be repealed by the passage of this Bill. Such a weakening of the duties on Scottish Ministers is unacceptable.

Q13 The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government’s thinking in this area.

What are your views on this approach?

SCCS welcomes the proposals in the Bill, which confer on Ministers the power to make regulations providing for the assessment of the energy performance of non-domestic buildings and emissions associated with such buildings. However, we believe the voluntary approach outlined will fail to deliver the level of emissions cuts required. The Bill should therefore confer powers on Ministers to mandate energy efficiency improvements in both domestic and non-domestic buildings.

Q14 The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

What are your views on this proposal?

SCCS supports the encouragement of promoting more district heating systems and the financial assistance the government is committing in this area.

However, the illusive definition of renewable sources raises serious cause for concern. The use of waste as a renewable fuel directly conflicts with the attempts to reduce CO₂ emissions. Incinerator technologies
(gasification, pyrolysis, mass burn, plasma) emit almost a third more CO₂ per unit electricity generated than coal-fired power stations. It is also a contradiction of internationally recognised definitions of zero waste.

SCCS does not view these technologies as renewable and wants to see the government promotion of anaerobic digestion as the primary 'renewable source' in this commitment, as being the least harmful thermal technology to human health and climate change emissions.
SCCS believes that a reducing amount of waste incineration should be permitted, and that energy from waste facilities must maximise energy conversion possibilities with strict heat recovery rules, while avoiding policies that require waste production to feed energy from waste plant.

Q15 The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas:

- Waste prevention and management plans;
- Waste data;
- Deposit of recyclable waste;
- Procurement of recyclate;
- Reduction of packaging;
- Deposit and return schemes;
- Charges for carrier bags.

What are your views on these proposals?

SCCS welcomes the introduction of powers to establish deposit and return schemes, targets for packaging reduction schemes, and charges for supply on carrier bags and further recycling provisions. However, further work is required on waste reduction and prevention, as the priorities of the waste hierarchy.

SCCS supports a move towards zero waste as one important strand of climate change mitigation, but is disappointed with the Scottish Government’s definition of zero waste. SCCS opposes the definition of waste incineration as either renewable energy or as part of zero waste. Among the range of definitions, many of our members support the following internationally recognised definition of zero waste, as set by zero waste practitioners and scientists, recyclers and community waste organisations:

"Zero Waste is a goal that is both pragmatic and visionary, to guide people to emulate sustainable natural cycles, where all discarded materials are resources for others to use. Zero Waste means designing and managing products and processes to reduce the volume and toxicity of waste and materials, conserve and recover all resources, and not burn or bury them. Implementing Zero Waste will eliminate all discharges to land, water or air that may be a threat to planetary, human, animal or plant health." 15

The Government’s inclusion of energy recovery has no place in this definition and aim of zero waste. It only provides disincentives to further developments on reduction, reuse and recycling by including the 25% of waste targeted for energy from waste.

SCCS encourages Scottish Government Ministers to further refine their definition of zero waste, based on sustainable development principles within the context of global climate change.

SCCS welcomes the introduction of waste prevention and management plans for businesses and public bodies, alongside other waste reduction and recycling measures. Much can be learned from the community sector which has been active in this area for many years. It is essential to bring businesses fully on board in this area, while public bodies have a crucial role to play in leading by example, as part of overall sustainable development strategies.

Concerted action by the public sector can make a major contribution to reducing Scotland's waste, can set a good example for the private sector and can encourage employees to change their behaviour at home - although often now workers find they are doing far more recycling at home than at work and want employers to take much stronger action.

These proposals should help ensure public and private sectors tackle waste prevention, waste reduction and recycling in a focused, planned manner in line with all relevant legislation, guidance and targets and making use of sustainable procurement policies to effect improvements. Negotiated workplace environmental agreements will ensure the best chance of successful implementation of plans.

15 Zero waste International Alliance, November 2004
Q16 What are your views on the adequacy of the Scottish Government’s consultation in advance of publishing the Bill?

The fact that more than 20,000 people responded to the Scottish Government’s consultation is a measure of how important the Climate Change (Scotland) Bill is perceived to be. With this in mind, it was disappointing that the Scottish Government did not make more effort to engage individuals and communities around Scotland in the consultation process. The majority of the respondents became aware of the consultation because of the hard work of NGOs, rather than because of any genuine attempt by the Scottish Government to solicit their views.

This was particularly disappointing given that in order to achieve the targets within the Bill, the Scottish Government is going to need buy-in and support from every sector of society, and every individual in Scotland. The earlier people can engage in the process the better.

It was also a stark contrast with the consultation on the Smoking, Health and Social Care (Scotland) Bill – where significant Government effort was made to engage members of the public and due respect was paid to their opinions.

Finally, SCCS believes that the questions in the consultation document could have been significantly more accessible. Obviously there was a need to consult on the detail of trading schemes, carbon budgeting etc, but we believe there was also a need for more general questions about the principles and objectives of the Bill, responsibility of different sectors to take action, the role of Scottish communities in climate change mitigation and adaptation, and the broader international context.

Q17 Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government out on the consultation proposals?

No view.

Q18 Does the Bill raise any equalities issues you would wish to highlight?

We already know that climate change is compounding existing global inequalities. Poverty increases people’s exposure to the adverse effects of climate change, and poor communities are the most vulnerable, even though they have minimal responsibility for creating the problem. Between 2000-2004, 262 million people were affected by climate disasters annually. 98% of these people were in the developing world.

Climate change is also projected to increase the number of refugees and immigrants from areas least able to cope with a changing climate to areas with greater resources. The possibility of increased immigration flows raises equality and societal issues around questions of race and immigration.

By making a legislative commitment that Scotland will keep within a fair share of a global greenhouse gas budget, at least 3% reductions per year and at least 80% reduction by 2050, the Scottish Government will set a positive precedent and consolidate its position as a global leader on climate change, as well as playing its part in addressing global and intergenerational inequalities.

It is equally important that mitigation and adaptation policies are held against criteria of social and environmental justice within Scotland. Efforts to reduce emissions and adapt to the impacts of climate change must go hand-in-hand with existing work to lift people out of fuel poverty and address environmental injustices.

Q19 Do you have any comments on the impact of the Bill on sustainable development?

Global sustainable development must be an underpinning principle of the Bill and SCCS would like to see this acknowledged in the long title of the Bill. This may have precedence given that the Rural Agriculture and Environment Committee have recommended that the Flood Risk (Scotland) Management Bill be amended to include ‘more specific reference to sustainability on the face of the Bill.’

16 UNDP 2007 World Development Report
17 Rural Affairs and Environment Committee, Stage 1 Report on the Flood Risk Management (Scotland) Bill
SCCS further believes that the Climate Change (Scotland) Bill should place a duty on the Scottish Government to ensure that any mitigation and adaptation efforts contribute to the furthering of sustainable development and ensure the avoidance of negative social, economic and environmental impacts; either within Scotland or in the developing world.

- **Be explicit that sustainable development is core to the purpose and delivery of the statute in relation to mitigation and adaptation.**

**Q20**  Do you have any other comments on the Bill?

SCCS is keen to ensure that the provisions in the Bill are implemented effectively. We believe the courts should have a role in scrutinising the delivery of the targets. We would like it made clear that, as in England and Wales, the courts have an important preventative role in using their powers to quash Ministerial decisions on issues such as future targets, or projects or programmes that were likely to lead to breaches of the targets. In doing so, the courts would have to be able to consider the merits of the matter, and in particular the relevant advice of the relevant Advisory Body. It would also be critical that access to the court was timely and affordable. Unfortunately, these three criteria, despite being established by the Aarhus Convention and the three EU Directives arising from this, are not met fully in Scotland at present.

Even judicial review is less easily accessible in Scotland than in England and Wales where the courts have accepted the principle of ‘protective costs orders’ where campaign groups take such actions in the public interest. These provide a guarantee that the threat of a punitive costs award cannot deter a legitimate action to seek judicial review. New provisions in Scottish law are needed to ensure that affordable, timely and merits-based access to justice is available in cases relating to the Bill’s objectives. This would ensure that public interest groups could seek a court ruling if ministers were failing to comply with their duties under the Bill. Such provisions may not require primary legislation, but we would expect Ministers to commit to ensuring that the necessary provisions are brought forward.

- **Ensure that strong enforcement measures are set in place in statute.**

Therefore, Stop Climate Chaos Coalition Scotland priorities for the Climate Change (Scotland) Bill are that it must:

1. Set out a framework that will achieve at least an 80% reduction in greenhouse gas emissions by 2050.
2. Establish in statute annual emission reductions of at least 3% year-on-year from the start, not just from 2020, compatible with a fair and safe cumulative budget identified by the advisory body (see 4).
3. Include emissions from all sectors in the framework and targets set out in the Bill, including those from international aviation and shipping, from the very start.
4. Establish a Scottish advisory body, a Scottish Climate Change Commission, in the primary legislation to support delivery of the Bill when it is enacted.
5. Ensure that at least 80% of the effort to cut emissions takes place in Scotland.
6. Establish duties on all public bodies to reduce greenhouse gas emissions in line with the national target.
7. Set in place robust, transparent reporting measures so the Scottish Parliament is well informed on progress in meeting targets and Government is held to account on mitigation and adaptation.
8. Ensure that strong enforcement measures are set in place in statute.
9. Ensure Scotland counts all its emissions and reports on those produced by products and services we consume as well as emissions produced domestically.
10. Be explicit that sustainable development is core to the purpose and delivery of the statute in relation to mitigation and adaptation.

SPT welcomes the opportunity to engage with the Transport, Infrastructure and Climate Change Committee regarding Scotland’s leading commitment to climate change. We look forward to working closely with our public and private sector stakeholders in this challenging time to deliver a world class transport system that may contribute significantly to the statutory framework proposed by Government that will result in considerable reductions in greenhouse gas emissions across Scotland.

SPT recognises transport’s contribution to greenhouse gas emissions and actively promotes more sustainable transport through the development and delivery of our Regional Transport Strategy. The RTS is available to view or download via the SPT website (www.spt.co.uk), however, copies of all documents are available on request.

In terms of the consultation questions, SPT provides the following comments:

**Q1** The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

SPT believes that, while ambitious, both the 2050 target (80% GHG emission reduction) and 2030 interim target (50% GHG emission reduction) show that the Scottish Government recognises the need for immediate and sustained action over the long-term to mitigate the impact of Climate Change due to GHG emissions.

**Q2** The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

What are your views on the setting of targets in batches from 2010 to 2022?

We agree that the setting of batches, with the first from 2010 to 2022, is necessary to ensure that mitigation measures are developed and implemented in the short term.

**Q3** The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

SPT agree that this is a suitable approach.

**Q4** The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

SPT believe the concept of a ‘net Scottish emissions account’ will provide the essential baseline to which future targets can be measured at national level. We believe that a limit should be implemented on the number of carbon units which Scotland can purchase because
it will ensure that Scotland takes further strides to sustainability through real change rather than offsetting our emissions through fiscal measures. The Scottish Government should also consider implementing a process to further reduce the limit over time to encourage even greater levels of reduction through innovation and working in partnership.

Q5 The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

SPT agrees that the proposed definition of Scottish emissions is suitable.

Q6 The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government’s approach to obtaining independent, expert advice on climate change?

SPT agrees that provision to obtain independent, expert advice is necessary to ensure that Scotland’s needs are met, particularly since more stringent GHG emission reduction targets than the rest of the UK are being set. Furthermore, it is appropriate that the Scottish Government obtains advice that is fully impartial on prioritisation of actions needed to reach the targets.

Q7 The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

We agree that the proposed reporting arrangements are fit for purpose.

Q8 The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

SPT agree it is right to impose duties on public bodies in relation to climate change. However, we recommend that those public bodies should be consulted as early as possible to ensure that those duties, and associated targets, are both realistic and achievable. Furthermore, we recommend that there be a strong commitment from the Scottish Government to provide sufficient financial support to public bodies in order to achieve their agreed targets.

Q9 The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on this proposal?
SPT agree that the proposed reporting arrangements should be introduced.

Q12 The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?

SPT believe that the energy efficiency of buildings in Scotland will be an important component in reducing GHG emissions since it is recognised that non-domestic buildings are responsible for nearly a fifth of all carbon emissions.

SPT is committed to improving its environmental performance through the development and implementation of an Environmental Management System accredited to ISO14001. As part of this commitment, we have developed a corporate Environmental Policy Statement that outlines key environmental objectives, including building energy efficiency measures, and how SPT will act to achieve these.

Similarly, SPT seeks to enable behaviour change through initiatives encouraging the use of more sustainable transport options, for example through campaigns, improving bus services, travel planning, and new initiatives such as the recently launched car-sharing scheme, SPT Journey Share (www.sptjourneyshare.co.uk).

SPT therefore agree that the creation of an action plan covering the energy efficiency of buildings and the behaviour change is vital for a co-ordinated approach in Scotland. We would welcome a commitment from the Scottish Government to involve organisations such as SPT in the development and delivery of the action plan, and again, that adequate resources are in place which allow organisations like SPT to deliver on the commitments in the action plan.

Q19 Do you have any comments on the impact of the Bill on sustainable development?

The introduction of the Bill will necessitate a ‘step-change’ in Scotland’s approach to sustainable development. A focus on more sustainable transport options – and investment therein – is vital as part of an integrated approach to achieving targets set. A key part of this will also be the further integrations of transport and land-use planning, particularly for new developments, ensuring that appropriate sustainable transport options are in place and thereby encourage people to leave their car at home, at least for part of their journey. SPT, at a regional level, is working closely with Glasgow and Clyde Valley Strategic Development Planning Authority on the first Strategic Development Plan, both organisations being focused on ensuring a more sustainable approach is taken to development in future.

SPT recognises the vital role that the public sector will play in meeting the targets set by Government. As a Regional Transport Partnership, SPT understand that we cannot tackle climate change in isolation, and that we must work in partnership with our member councils, other public sector agencies and the private sector (e.g. operators). Public sector financial support can encourage greater levels of commitment from the private sector to improve vehicle technologies that will reduce emissions.

A recent example includes SPT’s trial introduction of two state-of-the-art hybrid buses – low floor vehicles converted from purely diesel power to the latest diesel-electric hybrid drive technology. Hybrid-drive buses are powered by a battery pack connected to a small car-sized diesel engine or the existing bus diesel engine running at greatly reduced speed. The buses also use regenerative braking technology as a further energy-saving feature, which recharge the batteries whilst braking. These buses were provided to a private bus operator under contract to SPT. We intend to monitor reduced CO2 emissions, fuel consumption and noise...
levels throughout this extensive trial and will communicate the results to industry to encourage greater uptake of newer, cleaner technology.

However, the trial could only have been undertaken through both collaboration and investment from SPT. Therefore, it is essential that the public sector must be fully supported by the Scottish Government to ensure that we continue to lead the way in the implementation of more sustainable transport practices.
We support the general thrust of the CRNS (Community Recycling Network Scotland – click link) response, but would want to emphasise the potential for re-use to markedly improve the commercial viability of the "used resources" industry. We have recently completed an analysis of the economic benefits of repairing/re-using/dismantling parts and selling white goods such as washing machines which arrive at Dundee City Council's three bring sites. Our conclusion was that reclaimed goods to the sum of at least one third to half a million pounds sterling per annum are being lost through the standard WEEE compliance schemes. We can send figures if you wish. Extrapolate this across Scotland......We hope you are fully reflecting on the impact of the forthcoming "Re-use Directive" from Europe.

We have operated in the same territory as our local councils in Tayside for almost twenty years and generally have witnessed a dearth of enterprise in their approach to waste. We advocate the non-profit-distributing community enterprise model for maximising the value in "waste". We advocate releasing this potential through requiring councils to put the management of civic amenity/recycling sites out to tender with a community benefit clause where the bottom line is real, unsubsidised local job creation.

Energy in Buildings new and existing

We deplore the failure to implement the likes of SPP6 and would raise the bar for minimum building standards to Scandinavian levels. We have no chance at present of achieving zero carbon buildings by 2016, unless we start now. A higher investment in buildings energy performance will easily be recouped by long term revenue savings and if we don't do that now, we will have the awesome task of upgrading (retrofitting) poorly performing buildings in the future.
Dear Sir

CLIMATE CHANGE (SCOTLAND) BILL

Tearfund is a Christian relief and development agency building a global network of local churches to help eradicate poverty. Tearfund undertakes operational work on climate change adaptation and disaster risk reduction and campaigns on mitigation and adaptation issues as well as undertaking other relief and development work.

Tearfund Scotland is a national branch of Tearfund and is based in Glasgow with charitable status in Scotland. We submitted a response to the Consultation Document issued by the Government last year and are pleased to have the opportunity to comment further now on the Bill. We are a member of the Stop Climate Chaos Scotland Coalition and endorse the observations which the Coalition is submitting. Any differences in detail between our views and those of the Coalition should not be taken as any disagreement with the overall content of the Coalition’s submission.

We believe the proposed legislation to be immensely important. Many of the areas in which Tearfund is working are already experiencing the impact of climate change. A report published by us in 2005 drew together observations from our contacts in 13 countries in Africa, Asia and Latin America. They spoke of the devastating effect on individuals and communities of unpredictable seasonal changes, especially uncertainty about the onset and duration of annual rains. They spoke of widespread flooding and of droughts which had already lasted for several years. In some cases both flooding and drought were experienced in the same country in the same year and were affecting areas that had not previously been prone to them. Conditions have not improved since 2005 and the work which Tearfund undertakes to assist adaptation does not resolve the problem.

The consequences are broadly fourfold: lack of access to water for drinking and for livestock, food insecurity as crops fail to flourish, an increase in water borne and endemic disease, and migration. In 2005 there were estimated to be 25 million environmental refugees. In Mali, as an example, the situation was described as follows:

*Arable lands and pastures are diminished and potential workers are unemployed and hungry. Huge numbers of people move to the towns where other difficult problems await them. They are malnourished and subjected to under-development with its consequent diseases, illiteracy and misery.*

We are pleased therefore that the Scottish Government proposes to take serious steps towards the reduction of emissions internationally by taking a robust approach to the reduction of emissions from Scotland.

Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050. What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

Tearfund Scotland supports the proposal to require emissions of greenhouse gases in 2050 to be at least 80% less than those of the baseline year of 1990. This accords with current scientific advice of what is necessary to prevent global temperature rising more than 2°C above the pre-industrial levels, and represents a fair share of allowable emissions from Scotland to that end.
We feel some concern, however, that the interim target date is more than twenty years away and as such does not adequately reflect the urgency of the need to secure substantial reductions in emissions. We note that the Climate Change Act 2008 for the UK as a whole, in Section 5 relating to carbon budgets, effectively has an interim target for 2020. We would like to see the Bill contain a first interim target date in 2020 while also retaining the later 2030 date.

Q2 The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

What are your views on the setting of targets in batches from 2010 to 2022?

Joint answer with Q3.

Q3 The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

The interim and 2050 targets are important, but it is essential that emissions should be reduced progressively from the time the legislation comes into force if greenhouse gases are not to continue to accumulate in the meantime. Accordingly we support the intention of setting annual reduction targets; 3% per annum must be regarded as the minimum if the interim and 2050 targets are to be achieved.

We have indicated earlier in our letter that, from our experience, the impact of climate change is already being felt in many other parts of the world and is having an especially serious impact on communities that are already living in marginal and disadvantaged circumstances. We consider the problem to be urgent and that reductions of at least 3% per annum should be made statutory well before 2020. We recognise that there may need to be some lead-in time, but consider that it would not be unreasonable for 3% targets to become mandatory from 2012, ie three years after the likely enactment date, which would phase with the next set of Kyoto targets from 2012.

The Bill provides for annual targets to be set up to sixteen years in advance, or even longer if they are set before the statutory latest dates proposed in Section 4(2). We do wonder whether there will be sufficient flexibility in setting targets so far in advance to allow for the extent to which targets were met in previous years or for changes in scientific knowledge or advice. We note that Section 6 would allow Ministers to modify annual targets after they have been set, but this would seem to detract from the certainty which setting targets in advance might be deemed to provide.

Q.4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?
A fundamental point must be that the majority of effort towards meeting targets set by the legislation should be made within Scotland. It would be undesirable if future Scottish administrations were able to claim to be meeting their statutory obligations because substantial purchases of international credits had been made. At worst, it would be possible for a Scottish Government to take no action in reality to reduce emissions but to claim success by a massive purchase of credits.

Tearfund Scotland believes that the Scottish Climate Change Bill should:

limit the proportion of emission reductions that can be achieved outwith Scotland (ie through trading) to levels and standards to be advised the advisory body of Section 19 (our preference would be that the limit should be less than 30 per cent);

require that annual reports on progress show actual gross reductions achieved in Scotland as well as net reductions which take into account any credit trading.

Q5 The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

We are disappointed that the Bill proposes to give Ministers only the power and not a duty to include emissions from international aviation and shipping within the Scottish emissions account.

Data in the AEA Energy and Environment report on greenhouse gas emissions for the period 1990-2006 show that emissions of carbon dioxide attributable to Scotland from navigation and civil aviation in 2006 accounted for 3.2% of emissions from all uses of energy. They had increased by 28% since 1990 at a time when emissions from all energy use sources had fallen by 2%. Emissions from civil aviation alone increased over that period by 115% and accounted for 1.3% of all energy use emissions in 2006 compared with 0.6% in 1990.

While emissions from navigation and aviation at present represent a relatively small proportion of total energy use emissions the rapid rate of growth which has occurred, especially in emissions from aviation, convince us that must be included in the Scottish Emissions Account from the outset.

Q6 The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government’s approach to obtaining independent, expert advice on climate change?

No submission.
Q7 The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

No submission.

Q8 The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

The targets for emissions reduction are ambitious and it will not necessarily be easy for the Scottish Government to achieve them. We agree with the statement in the Policy Memorandum that the public sector will have a pivotal role to play. Local authorities in particular are likely to have a significant role to play in their property management, traffic management, land use planning and waste disposal functions. We note that the Scottish Government is committed to working in partnership with the public sector, but we consider that the Bill should require statutory emissions reductions targets to be imposed on all public bodies at an early date, say within five years. The Memorandum suggests (para. 39) that statutory duties may only be imposed as in due course emissions reductions become harder and more expensive to deliver. This is a clear invitation to public sector bodies not to implement those easier, less expensive measures to reduce emissions now, but to retain them as available options to ensure that eventual statutory targets can be met.

The imposition of duties should be accompanied by a duty on the Government to issue guidance and a requirement on public bodies affected to report on compliance.

Q9 The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on this proposal?

No submission.

Q10 Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are your views on this proposal?

No submission.
Q11 The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

No submission.

Q12 The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?

No submission.

Q13 The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government’s thinking in this area.

What are your views on this approach?

No submission.

Q14 The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

What are your views on this proposal?

No submission.

Q15 The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas:

Waste prevention and management plans;
Deposit of recyclable waste;
Procurement of recyclate;
Reduction of packaging;
Deposit and return schemes;
Charges for carrier bags.

What are your views on these proposals?

Q16 What are your views on the adequacy of the Scottish Government’s consultation in advance of publishing the Bill?

No submission.
Q17 Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government out on the consultation proposals?

No submission.

Q18 Does the Bill raise any equalities issues you would wish to highlight?

No submission.

Q19 Do you have any comments on the impact of the Bill on sustainable development?

In our response to the Consultation Document we said the following:

*It would appear* (in the fourth paragraph of the foreword to the Consultation Document (p.2)) *that the Scottish Government’s only clear purpose is to make Scotland a ‘more successful country’.* We would have thought in view of the admirable aspirations expressed in the previous paragraphs, and given the potential seriousness of the impact of climate change for humanity as a whole, that at least one other purpose, with high priority, would be to work individually as a Government and with the international community to adopt measures to minimise further climate change. This would provide an appropriate rationale for the Discussion Document.

*Instead, it would seem that the theme of ‘sustainable economic growth’ is to be taken as the foundation for much that follows in the Discussion Document. ‘Sustainable’ economic growth is too close in general understanding to ‘sustained’ economic growth and does not allow for the possibility that continued economic growth may not be possible, particularly in the more developed countries, if emissions are to be reduced to the extent that is required.*

‘Sustainable economic growth’ is not the same as ‘sustainable development’. The clear implication of that concept, as it emerged at Rio de Janeiro in 1992, is that development can only be considered sustainable if it accommodates social and environmental objectives as well as economic ones. The outcome of the Rio conference reflected concerns of many of the poorer countries of the world, and it is these countries that are now beginning to experience, and increasingly will experience, the worst impacts of climate change. The potential impact of unrestricted climate change on society and the environment in these countries will be immense.

We continue to be concerned that the Scottish Government may believe that the Scottish targets will be achieved primarily through economic growth. While there undoubtedly will be commercial opportunities for renewable energy technologies, we do not envisage that technology alone will secure the reductions that are required. The Consultation Document noted that it is our consumption patterns which are unsustainable (para. 2.6). Changes of lifestyle are likely to be necessary to achieve the emission reduction targets and this may, in more developed countries, involve a diminution of economic growth. Further, an emphasis on growth may mean that economic priorities in times of recession become a justification for failing to meet emissions targets. We consider it important that the Bill should make clear that it is underpinned by the concept of sustainable development.

The current preamble to the Bill is no more than a summary of the Bill’s contents. We would like it to contain a clear statement that the purpose of the Bill is to ensure that Scotland, as a member of the international community, makes a fair contribution towards minimising further climate change. We would also like the Bill itself to require Ministers, as they exercise the powers and duties given them by the Bill, to do so with the objective of contributing to sustainable development. This would accord with other legislation such as the Town and Country Planning (Scotland) Act 1997 as recently amended by the Planning etc (Scotland) Act 2006, Section 1.
Q20  Do you have any other comments on the Bill?

Section 4(4) requires Ministers to have regard to various criteria when setting annual targets. These include consideration of the impact of the target on those living (presumably in Scotland) in poverty (subsection (4) (e)) and those living (again presumably in Scotland) in remote and rural communities (subsection (4) (f)). As we have noted earlier it is those who are living in poverty and those who are living in remote communities in the developing world who are especially vulnerable to the impact of climate change. We would therefore like to see subsection (4) require Ministers, having taken appropriate advice, also to have regard to the impact of climate change (as opposed to the target) on those who are living in poverty around the world or who are brought into poverty as a consequence of climate change. The requirement to have regard to international policy relating to climate change (subsection (4)(h)) does not adequately address this point.

We are grateful for the opportunity to comment on the Climate Change (Scotland) Bill. We have not sought to comment on all Sections but trust that the observations we have made will be of assistance to the Committee in their deliberations. We would particularly urge them to consider making amendments to the Bill to incorporate those points which we suggest would strengthen the Bill.
Stop Climate Chaos Scotland is a coalition of more than 30 organisations campaigning together to tackle climate change. The coalition members include environment and development NGOs, faith groups, trade unions, community councils, student societies, women’s organisations, a mental health charity, and many others. In Scotland, the members have a combined supporter base of over 1.5 million people.

The Stop Climate Chaos Coalition Scotland priorities for the Climate Change (Scotland) Bill are that it must:

Set out a framework that will achieve at least an 80% reduction in greenhouse gas emissions by 2050.

Establish in statute annual emission reductions of at least 3% year-on-year from the start, not just from 2020, compatible with a fair and safe cumulative budget identified by the advisory body (see 4).

Include emissions from all sectors in the framework and targets set out in the Bill, including those from international aviation and shipping, from the very start.

Establish a Scottish advisory body, a Scottish Climate Change Commission, in the primary legislation to support delivery of the Bill when it is enacted.

Ensure that at least 80% of the effort to cut emissions takes place in Scotland.

Establish duties on all public bodies to reduce greenhouse gas emissions in line with the national target.

Set in place robust, transparent reporting measures so the Scottish Parliament is well informed on progress in meeting targets and Government is held to account on mitigation and adaptation.

Ensure that strong enforcement measures are set in place in statute.

Ensure Scotland counts all its emissions and reports on those produced by products and services we consume as well as emissions produced domestically.

Be explicit that sustainable development is core to the purpose and delivery of the statute in relation to mitigation and adaptation.
1. Introduction

1.1 Transform Scotland is the national sustainable transport alliance. We campaign for a more sensible transport system, one less dependent on unsustainable modes such as the car, the plane and road freight, and more reliant on sustainable modes like walking, cycling, public transport, and freight by rail or sea. We are a membership organisation bringing together rail, bus and shipping operators; local authorities; national environment and conservation organisations; local environment and transport campaign groups; and individual supporters.

1.2 We wish to thank the Committee for the opportunity to submit views on this important piece of legislation.

1.3 We gave oral evidence to the Committee at its meeting held on 10th February 2009.1 Our written views submitted in advance of that evidence session should also be read in conjunction with this submission.2

1.4 We are a member of Stop Climate Chaos Scotland and are happy to support its views that the Bill should:

1. Set out a framework that will achieve at least an 80% reduction in greenhouse gas emissions by 2050.
2. Establish in statute annual emission reductions of at least 3% year-on-year from the start, not just from 2020, compatible with a fair and safe cumulative budget identified by the advisory body (see 4).
3. Include all emissions in the framework and targets set out in the Bill, including those from international aviation and shipping, from the very start.
4. Establish a Scottish advisory body, a Scottish Climate Change Commission, in the primary legislation to support delivery of the Bill when it is enacted.
5. Ensure that at least 80% of the effort to cut emissions takes place in Scotland.
6. Establish duties on all public bodies to reduce greenhouse gas emissions in line with the national target.
7. Set in place robust, transparent reporting measures so the Scottish Parliament is well informed on progress in meeting targets and Government is held to account.
8. Ensure that strong enforcement measures are set in place in statute.
9. Ensure Scotland counts all its emissions and reports on those produced by products and services we consume as well as emissions produced domestically.
10. Be explicit that sustainable development is core to the purpose and delivery of the statute in relation to mitigation and adaptation.

1.5 Our responses to the 20 questions set out by the Committee in its Call for Views are outlined in the following section. In our answer to question 20, we express the view that the Bill should be accompanied by sectoral targets and action plans for the principal emission sectors: e.g. heat, transport, and land use.

Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

We support the 2050 target (80% reduction by 2050).

We do not support the proposed 2030 interim target (50% reduction by 2030). This target is inadequate as it is not on the required emissions reduction trajectory.

We note the recommendation of the UK Committee on Climate Change in its December 2008 report that UK emissions be cut by 42% by 2020.3 Given Scotland’s abundance of renewable energy potential and its tradition of compact cities, Scotland is in a good position to over-contribute towards meeting the UK target; as such, we support the proposal of Stop Climate Chaos Scotland that the interim target should be set at a 50% reduction by 2020 (instead of 50% by 2030).

---

1 See <http://www.scottish.parliament.uk/s3/committees/ticc/or-09/tr09-0601.htm>.
Q2 The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

What are your views on the setting of targets in batches from 2010 to 2022?

The Bill should be amended to put in place reductions of at least 3% per annum from the start. This would effectively negate the requirement to set targets in batches.

Q3 The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

This is not acceptable (because of volume of cumulative emissions that would be generated by following this emissions trajectory). The Bill should instead provide for annual reductions of at least 3% per annum from the start.

Q4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

We have concerns with the entire practice of carbon trading. The system is open to abuse at an international level and is difficult to monitor in practice. In particular, we have concern that the concept of purchasing units will be used as a mechanism by which the most polluting nations can put off reducing their carbon output. The recent collapse in the carbon price used in the EU ETS demonstrates the innate vulnerability of attempting to use carbon markets as a response to climate change.

There should be a strict limit on the extent to which Scotland can operate this mechanism, and we support the proposal made by Stop Climate Chaos Scotland that at least 80% of effort to reduce emissions be carried out in Scotland.

Q5 The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

We are content with the description used in the policy memorandum.

However, we are not content with the Bill’s treatment of this matter. The Bill should include emissions from international aviation and shipping from the start - rather than only allow for them to be included at a later date. There is an established methodology for reporting on these emissions and there is no good reason why they should be excluded from the emissions covered in the Bill.

Indeed, the failure to include emissions from international aviation and shipping would deeply undermine the credibility of the Bill. It would certainly be difficult to sustain claims that the Scottish climate change bill was in any way a “world-leading” piece of legislation if it was to specifically exclude emissions from international aviation.

The Bill also fails to make provision for consumption reporting (e.g. for emissions arising from goods imported from overseas). We support the Stop Climate Chaos Scotland proposal on this topic.
Q6  The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government’s approach to obtaining independent, expert advice on climate change?

We support the proposal of Stop Climate Chaos Scotland that the Scottish Committee on Climate Change be established at the earliest opportunity.

Q7  The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

We are broadly content with the reporting framework proposed.

However, reporting is not in itself sufficient. We are very concerned that the Bill provides no financial incentives towards meeting the targets, or an enforcement framework to ensure that action is taken to meet the targets. We are in broad support of the approach set out by Oxfam and Friends of the Earth Scotland on this topic.

Q8  The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

Given the financial resources available to public bodies, we see no prospect of the emission reduction targets being met unless their efforts are directed towards acting in accordance with the national targets. Otherwise, we expect the ‘free rider problem’ to predominate - that is, individual local authorities (for example) will decide that they are a special case and that it is instead the responsibility of others to take action.

Public bodies should be expected, from the start, to contribute to emission reduction in line with the national targets. Public bodies should be expected to be responsible for emissions across their areas of operations (e.g. for local authorities, emissions across their local authority areas) rather than just from their own estate.

Q9  The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on this proposal?

Because of the long delays in implementing measures to reduce greenhouse gas emissions, we are now faced with the impacts of climate change - irrespective of the measures that are now taken to decarbonise society. As such, it is important that plans now be put in place to introduce adaptation mitigation measures against the most obvious risks. We made our views on this topic available in our response to the Scottish Government’s consultation on its proposed climate change adaptation strategy.4

---

---
Q10 Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are your views on this proposal?
We have no views on this proposal.

Q11 The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?
We have no views on this proposal.

Q12 The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?
We have no views on this proposal.

Q13 The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government’s thinking in this area.

What are your views on this approach?
We have no views on this proposal.

Q14 The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

What are your views on this proposal?
We have no views on this proposal.

Q15 The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas:

Waste prevention and management plans;
Waste data;
Deposit of recyclable waste;
Procurement of recyclate;
Reduction of packaging;
Deposit and return schemes;
Charges for carrier bags.

What are your views on these proposals?
We have no views on this proposal.
Q16 What are your views on the adequacy of the Scottish Government’s consultation in advance of publishing the Bill?

We are content with the consultation carried out.

Q17 Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government out on the consultation proposals?

We have no views on this topic.

Q18 Does the Bill raise any equalities issues you would wish to highlight?

We have no views on this topic.

Q19 Do you have any comments on the impact of the Bill on sustainable development?

We have no views on this topic.

Q20 Do you have any other comments on the Bill?

1. Absence of provisions on transport

We note that the Bill highlights several areas where measures are to be taken, such as building insulation, renewable heat, waste reduction and plastic carrier bags, yet it makes no mention of transport, despite this being the second largest source of greenhouse gas emissions. (Indeed, the only specific mention of transport in the Bill is to propose an exemption for international aviation and shipping - despite the former being widely acknowledged as one of the most swiftly growing source of greenhouse gas emissions.)

2. Requirement for sectoral targets and action plans

We have severe doubts regarding the likelihood of the Scottish Government to meet the targets set out in the Bill given its current priorities in transport. There is a fundamental mismatch between Scottish local authority and Scottish Government priorities and the comprehensive decarbonisation of society that the Bill in effect calls for. As such, we consider it important that the Bill be accompanied by sectoral targets and action plans for the principal emission sectors: e.g. heat, transport, and land use.5

We note that the Sustainable Development Commission Scotland, in its November 2008 second assessment report, stated that: 6

“[T]he continued growth of road transport will make achievement of proposed greenhouse gas emission reduction targets difficult unless there is a considerable reduction in these emissions from other sectors of the economy. Government transport policy and spend does not yet demonstrate a strong commitment to progressively “decarbonise” Scotland’s transport sector.”

Yet in the three months since the publication of the SDC’s report, we have seen the publication of the Strategic Transport Projects Review and the final version of the revised National Planning Framework. Amongst other things, the former set out a new £9 billion programme of spending on trunk roads, while the latter aims to legislate for airport expansion and a new motorway bridge over the Firth of Forth. Furthermore, the past months have also seen the Parliament reject the proposal of the TICC Committee that the Scottish Budget be amended to provide for an increase in expenditure on the active travel modes, the most sustainable modes of transport.

---

5 We would note that the setting of sectoral targets was a specific recommendation of the Scottish Parliament Environment and Rural Development Committee’s report on its climate change inquiry (paragraph 29): “The Committee recommends that the Executive should set robust and challenging sectoral targets where adequate data is available. It should set out an urgent plan for how it will develop targets in other sectors, and from there produce a national target in due course.” Available at <http://www.scottish.parliament.uk/business/committees/environment/reports-05/rar05-05-vol01-01.htm>.

In the absence of major changes in policy and implementation in the areas of land use planning and transport, we have no confidence that the transport sector will contribute to the (at least) 80% reduction in greenhouse gas emissions required over the forty-one years. Under current policies, and given the size of emissions from the transport sector, there appears little prospect of meeting the UK Committee on Climate Change’s recommendation that emissions be cut by 42% by 2020.

The Scottish Government will require to be proactive in providing a framework for local authorities so that they will achieve significant reduction in emissions over time, whilst at the same time improving the look and ambience of our towns and cities and improving public health. This could include measures such as:

- Implementing road user charging - a policy which remains within the powers of the Scottish local authorities and the Scottish Parliament.7
- Converting the car and public transport fleet from fossil fuels to renewable power sources.
- Increasing commuter cycling to continental levels (20-30% of all trips).
- Reducing urban congestion by a combination of the above measures plus prioritising road space in favour of walkers and cyclists and reductions in inner city parking.

Recent developments in Denmark show the sort of initiatives that must be taken if reductions are to be achieved in a reasonable timescale. The Danes have just concluded a deal that will see the installation of battery recharging stations throughout the country. This will allow the gradual replacement of the car fleet by electrically-powered vehicles. It is initiatives of this sort that are needed in Scotland if we are to have any hope of meeting the challenging target set in the Bill. We still wait for similar boldness to emanate from the Scottish political classes.

---

7 This was also a specific recommendation of the Scottish Parliament Environment and Rural Development Committee’s Report on Inquiry into Climate Change. Available at [http://www.scottish.parliament.uk/business/committees/environment/reports-05/rar05-05-vol01-01.htm](http://www.scottish.parliament.uk/business/committees/environment/reports-05/rar05-05-vol01-01.htm).
WRITTEN SUBMISSION FROM UNISON SCOTLAND

Executive Summary

- UNISON is a member of Stop Climate Chaos Scotland, which is campaigning for Scotland to have a strong, world-leading climate change Bill that helps influence UN talks in Copenhagen in December. This response complements the SCCS response, available at www.stopclimatechaos.org/scotland and lists ten key SCCS priorities.
- These priorities include: a target of at least an 80% reduction in greenhouse gas emissions by 2050; statutory annual emissions reductions of at least 3% year-on-year from the start; the inclusion of international aviation and shipping emissions from the start; a Scottish advisory body, a Scottish Climate Change Commission, established in the primary legislation.
- The public sector has a key role in leading by example. We and SCCS also want to see a duty on all public bodies, similar to the public equalities duties, to consider climate change in all their decisions, and to reduce emissions in line with the national target. This duty should include annual reporting, should be established in the primary legislation and implemented in line with the next funding deal for local government. All public bodies should be required to seek to negotiate a workplace environmental agreement with their recognised trade unions.
- The Bill should also be explicit that the principles of sustainable development – Living within environmental limits, Ensuring a strong, healthy and just society, Achieving a sustainable economy, Using sound science responsibly and Promoting good governance - are core to the purpose and delivery of the statute in relation to mitigation and adaptation.
- As part of a sustainable development approach, trade unions, in Scotland, at UK level and internationally, promote 'Just Transition' policies, seeking to manage the employment and training implications of the transition to a low-carbon economy in a fair way.
- With the STUC, UNISON supports planning the transition in Scotland via four inter-linked strategies to accompany targets for emissions reductions: strategies on green workplaces, transitional skills and Just Transition, and a low-carbon industrial strategy. We are keen to consider with the TICC Committee ways in which a Just Transition strategy framework might be given a statutory basis in the Bill.
- The global financial crisis must not be used as an excuse not to invest now in proper mitigation and adaptation measures. As the Stern Review said, the costs of not acting are far greater than acting now.

Introduction

This paper constitutes UNISON Scotland’s response to the Scottish Parliament Transport, Infrastructure and Climate Change Committee’s Call for Views on the Climate Change (Scotland) Bill.

UNISON Scotland welcomes the opportunity to respond. UNISON is Scotland’s largest public service trade union, representing more than 162,000 members working largely in the public sector in Scotland. Many of our members are at the forefront of protecting the environment and the quality of life for everyone in Scotland.

Our response is informed by the fact that UNISON has long supported sustainable development and green workplace policies as key trade union issues that also link with our international outlook on social justice. At UK level, the Trade Union Sustainable Development Advisory Committee, a joint TUC/DEFRA body subscribes to the view that climate change is perhaps humanity’s greatest challenge in the 21st century. It points out that:
‘Sustainability’ is not something we put in a separate box marked ‘green’. It is a core trade union and workplace issue. It directly impacts on jobs, in numbers, types, skills and locations. The employment and training implications of the transition to a low carbon economy are profound, as is the need to manage the changes fairly - through the so-called ‘just transition’.

UNISON Scotland is a member of the Stop Climate Chaos Scotland coalition and has worked closely with other members to call for a strong, world-leading Scottish Climate Change Bill. SCCS has submitted a joint response.¹ This document does not repeat that, but instead lists the 10 SCCS priorities, then comments on economic policies and climate change. We also make some further comments on the public bodies’ duty, green workplaces, forestry and waste.

Stop Climate Chaos Scotland

Stop Climate Chaos Scotland is a coalition of more than 30 organisations campaigning together to tackle climate change. The coalition members include environment and development NGOs, faith groups, trade unions, community councils, student societies, women’s organisations, a mental health charity, and many others. In Scotland, the members have a combined supporter base of over 1.5 million people.

The Stop Climate Chaos Coalition Scotland priorities for the Climate Change (Scotland) Bill are that it must:

1. Set out a framework that will achieve at least an 80% reduction in greenhouse gas emissions by 2050.
2. Establish in statute annual emission reductions of at least 3% year-on-year from the start, not just from 2020, compatible with a fair and safe cumulative budget identified by the advisory body (see 4).
3. Include emissions from all sectors in the framework and targets set out in the Bill, including those from international aviation and shipping, from the very start.
4. Establish a Scottish advisory body, a Scottish Climate Change Commission, in the primary legislation to support delivery of the Bill when it is enacted.
5. Ensure that at least 80% of the effort to cut emissions takes place in Scotland.
6. Establish duties on all public bodies to reduce greenhouse gas emissions in line with the national target.
7. Set in place robust, transparent reporting measures so the Scottish Parliament is well informed on progress in meeting targets and Government is held to account on mitigation and adaptation.
8. Ensure that strong enforcement measures are set in place in statute.
9. Ensure Scotland counts all its emissions and reports on those produced by products and services we consume as well as emissions produced domestically.
10. Be explicit that sustainable development is core to the purpose and delivery of the statute in relation to mitigation and adaptation.

Climate change and economics, local and global

The world is at a crossroads as politicians decide whether or not to fully commit to, quite literally, saving the planet for current and future generations. At the same time, a massive financial crisis has rocked economies internationally. To those who say we cannot afford to switch to a low carbon economy, we would argue that we cannot afford not to. Analyses from around the world, including the 2006 Stern Review, and the 2008 report from the UK Committee on Climate Change highlight that it is possible and affordable to cut greenhouse gas emissions to prevent runaway climate change, but that we must act urgently and it will cost less financially to do so now, than if we delay.

¹ The full SCCS submission, and key Briefing Papers, are online at: www.stopclimatechaos.org/scotland
These policy areas are inter-linked, as highlighted by trade unions and a wide coalition who are focusing on Jobs, Justice and Climate at a rally on 28 March in London. The aim is a message to the April G20 summit, including new US President Barack Obama, to ‘put people first’. Marchers want to highlight that even before the banking collapse, millions suffered poverty, inequality and the threat of climate chaos. Governments, business and international institutions have followed a model of financial deregulation that has encouraged short-term profits, instability and an economy fuelled by ever-increasing debt, both financial and environmental. Our children’s future depends on creating a low-carbon economy based on a fair distribution of wealth, locally and globally, with decent jobs and public services for all. We must act now on all these issues, before it is too late.

UNISON believes that the Climate Change (Scotland) Bill can be strengthened along the lines SCCS has suggested to help deliver that fair, low-carbon society. In doing so, we can have immense international impact, influencing post-Kyoto United Nations negotiations in December 2009 in Copenhagen. We have highlighted the importance of a ‘Just Transition’, managing the changes fairly. The International Trade Union Confederation has been making the case for Just Transition and green workplace policies in the UN climate change talks, most recently in Poznan in December 2008. Its proposals are recorded in a UN Framework Convention on Climate Change report on what intergovernmental organisations, NGOs, environmental groups, business and research institutions and other observers at the talks want to see in a new global treaty.

There are employment and economic benefits in switching to a green economy, including from investment in renewables, energy efficiency in industry and housing and improvements in public transport. Scotland should be grasping the opportunities, planning for change and investing in low-carbon technologies. We agree with the STUC proposal that this transition should be planned via four inter-linked Scottish strategies to accompany targets for emissions reductions.

- A green workplaces strategy
- A robust and comprehensive low carbon industrial strategy
- A transitional skills strategy
- A Just Transition strategy

Through such efforts, the Scottish Government, working with social partners, can put in place the right consultation mechanisms, training and innovation policies, along with the right financial support. This should help create the conditions for a ‘just transition’ encouraging green jobs, green enterprise and growth, as already seen in countries such as Germany and Denmark.

UNISON Scotland Response to the Call for Views Questions

For our response to questions 1- 7, 9-10, 12-14 and 16-20, please see the SCCS response. UNISON adds to the SCCS response on the following questions:

Q8 The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

---

2 Put People First march for Jobs, Justice and Climate: www.putpeoplefirst.org.uk
4 STUC written evidence to the TICC Committee 24 Feb 09: www.scottish.parliament.uk/s3/committees/ticc/papers-09/trp09-07.pdf
5 For further details, see the TUC pamphlet A Green and Fair Future (2008) www.tuc.org.uk/touchstone/justtransition/greenfuture.pdf
6 TICC Committee Call for Views: www.scottish.parliament.uk/s3/committees/ticc/inquiries/ClimateChangeViews.htm
First and foremost, we believe that a general climate change duty on public bodies should be in the Bill as primary legislation, enacted now, not at some possible date in the future.

We would want the Bill to establish a general duty on public bodies to consider the impact of climate change in all their decisions and to pursue, in a manner based on sustainable development principles, reductions in greenhouse gas emissions in line with national targets. This would also apply to adaptation work. This should be implemented in line with the next funding deal for local government.

Public bodies will only be able to contribute to climate change targets if these targets are included in their procurement and commissioning practices and this needs to be reflected in the Scottish Government’s procurement regulations and guidance. All public bodies should be required to report annually on compliance with their climate change duty/duties. They should also be required to seek to negotiate a workplace environmental agreement with their recognised trade unions.

We would also wish to see these duties apply to the private sector. However, we recognise that this may require the exercise of some reserved powers outwith the scope of this bill.

Clearly, on a ‘Just Transition Strategy’, we also believe that public bodies, private sector employers, trade unions and other stakeholders should have key roles as partners in developing it and the other three strategies outlined above, as part of each organisation’s overall work on emissions reduction. We join the STUC in asking that the TICC Committee consider ways in which a Just Transition national framework or mechanism to ensure long-term planning and representative decision making on environmental transition might be given a statutory basis in the Climate Change (Scotland) Bill.

We argued in our consultation response on the proposed Bill that public services have a vital role in leading by example in reducing greenhouse gas emissions, and that a climate change duty would be a similar legal provision to the various equality duties. Action by the public sector can have a major impact on behavioural change, as has been seen with recycling and as should be an important influence through food in schools, hospitals, prisons and other public sector catering. (UNISON has promoted ‘Food for Good’, a campaign for fresh, local, sustainable, healthy food across the public sector, and is pleased that the Scottish Government has appointed East Ayrshire healthy school meals pioneer Robin Gourlay to lead a group developing guidance for the public sector.)

We believe that bringing in a duty in the primary legislation would provide a number of important benefits, would build upon excellent examples such as East Ayrshire’s school meals initiative, and would underpin the commitments made by all Scotland’s councils in signing the Scottish Climate Change Declaration. By signing, they have agreed voluntarily to incorporate greenhouse gas reduction and climate change adaptation measures into new and existing strategies, plans and programmes, in line with sustainable development principles, and to report annually on their climate change response.

---

7 UNISON Scotland Climate Change Bill consultation response April 08: www.unison-scotland.org.uk/response/scottishclimatechangebill.pdf
8 Scottish Climate Change Declaration, online at: www.sustainable-scotland.net/climatechange/documents/declaration08.pdf
While some local authorities and other public bodies are innovative and ambitious in their emission reduction plans, existing guidance and voluntary measures such as SCCD are not enough and do not currently apply across the full public sector. If they were enough, serious action would be happening already. Without a statutory duty, there is a real danger that the public sector will not contribute its share to the essential early reductions in greenhouse gas emissions to help put Scotland sufficiently on trajectory to meet its targets. As Cathy Peattie MSP pointed out in the Transport, Infrastructure and Climate Change Committee on 20 January 2009, work on equalities issues has required mainstreaming and legislation to make any significant progress. In 2007, the IPCC warned that global emissions must start reducing by 2015. The potential international leadership role offered by this Bill would be weakened without establishing this duty now.

If no duties are laid out at the start, the Scottish Government may have to be more prescriptive to ensure action is taken, through policies and regulation. A general duty across the public sector would be fairer and more flexible. How they deliver those duties can be based on what is appropriate for each organisation and local authority area. It would also help public bodies and relevant investors and stakeholders have confidence in planning, instead of the uncertainty of wondering what might be asked of public bodies in coming years. Scotland's Climate Change Business Delivery Group said that: “Local authorities and the private sector alike will benefit from the universal application of policy measures and setting expectations as early as possible”. At UK level, the need for a similar duty on public bodies to help deliver the Climate Change Act was not included and a need for it has been identified. The 2007 Final Report of the Local Government Association's Climate Change Commission said that much of the evidence it received recommended imposition of a statutory duty on councils in England and Wales to act on climate change. The Commission concluded unanimously that a statutory duty should be imposed on those authorities that after two years have not responded to climate change and it recommended to the LGA that it reconvene the Commission in late 2008 and late 2009 and then re-assess the case for a statutory duty. In our view, Scotland should not delay, and should have it from the start. When consulted, the majority of Scottish local authorities responded positively to the proposed duties.

The statute as drafted would just serve to delay implementation and require consulting these bodies all over again on the same question, which they have just responded positively to, thereby delaying investment and planning towards delivery of the national goal.

The Carbon Reduction Commitment, being introduced in 2010, will apply to large public bodies but will not set even those, let alone all public bodies, on a path to reducing greenhouse gas emissions in line with national targets. A public body duty will cover the full range of activities carried out by the body, including the extremely important one of procurement, which can be a very effective lever outside the public sector. In relation to local authorities, it could help fulfil outcomes in many Single Outcome Agreements, such as emission reduction or footprint reduction.

Annual reporting by public bodies will boost local accountability and we argue that it could be reinforced by the relevant Parliamentary committee calling in a selection of annual reports each year for scrutiny. In addition, innovative ways of involving local communities directly should be explored, such as local hearings. For example, an annual schools gathering where students could question appropriate councillors and officials on the report.

12 ‘A climate of change’ The final report of the LGA climate change commission: www.lga.gov.uk/lga/aio/20631
The Bill should give Ministers powers to bring in any further specific duties through secondary legislation. This would ensure that if new scientific evidence or policy changes require further action by public bodies, the necessary duties can be established by order.

Our main concern about the Bill’s proposals on the monitoring of the climate change duty/duties of public bodies, is that there must be sufficient expertise within the monitoring body (whether, for example, that is Audit Scotland, SEPA, another body or a combination) to properly assess progress on all relevant factors, including sustainable development.

**Green workplaces.** An important part of UNISON’s proposals for the Bill has been that much more should be done to encourage employers, in consultation and negotiation with their trade unions, to support change in the workplace. This includes action on energy use and conservation, waste and recycling, travel, water use and environmental education. Good practice is best delivered through a genuine partnership between employer and employees - as already exists on health and safety issues. Apart from the environmental benefits, the public and private sectors will benefit from a reduction in costs, greater job satisfaction amongst the workforce and a shared commitment to success.

Union environmental reps can act as a conduit between management and members/staff, feeding concerns, suggestions and responses in both directions, and working with the workforce and management to develop best environmental practice. They can help review or shape environmental policies and initiatives, and help ensure that such policies are properly understood, fit for purpose, and can be put into practical effect at each workplace. Those involved in the TUC/Carbon Trust Green Workplaces (GW) project have included shop stewards, H&S reps, and those new to union activism.

It is important that environment reps have the same legal rights and employment protection as other workplace representatives and we would urge the Scottish Government to support the case for this being made to the UK Government, as employment rights are reserved to Westminster. We would also like to see funds made available, on a basis similar to the successful lifelong learning model, to help trade unions resource workplace environmental programmes.

**Q11** The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation. What are your views on this proposal?

We wish to emphasise here, as in the SCCS response, our strong concerns that the forestry provisions are distracting from discussion of the overall aims and objectives of the Bill, the urgency of reducing emissions and how to meet targets. These provisions were introduced late in the day without appropriate consultation on the details. We do not believe the Climate Change (Scotland) Bill is the appropriate place for the Government to propose new forestry provisions and enabling powers and would expect full consultation and debate on such fundamental changes to be undertaken separately from this Bill.

UNISON is also extremely concerned that the proposal to lease substantial parts of the National Forest Estate to private companies threatens jobs. We share the concerns about the risk to jobs that have been raised by the Forestry Commission Trade Unions, who oppose the leasing proposal. The FCTU back the Bill’s targets on climate change and the expansion of renewable energy programmes. They acknowledge that the Scottish Government has promised no compulsory redundancies, but they warn that this commitment and staff terms and conditions could be at risk under any transfers and they conclude that several hundred good quality jobs could be lost in the forestry, timber processing, recreation and tourism sectors.
Q15 The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas:

- Waste prevention and management plans;
- Waste data;
- Deposit of recyclable waste;
- Procurement of recyclate;
- Reduction of packaging;
- Deposit and return schemes;
- Charges for carrier bags.

What are your views on these proposals?

In addition to the SCCS response to this question, we would like to highlight UNISON’s Waste Management Charter for Public Sector Organisations ¹³ and our opposition to any use of PFI/PPP for new waste projects. PPP schemes don’t achieve best value for public funds. Planning of new public infrastructure, including waste management projects, should take into account the uncertainties we face about the coming impact of climate change. Lengthy, inflexible, costly PFI/PPP type contracts do not make sense, for schools, for hospitals or for waste.

The UNISON Waste Management Charter urges public bodies to: agree an internal waste management and recycling strategy, which also looks at procurement in an overall sustainable development strategy; consult and involve staff on development and implementation of the strategy; ensure it promotes prevention, minimisation and other options from the top of the waste hierarchy, along with internal and external awareness-raising; agree realistic but challenging targets for the strategy, with regular monitoring and evaluation; provide easily accessible, clear information on the organisation’s strategy, targets and progress on key indicators; use tools such as the Ecological Footprint in policy development, monitoring progress and raising awareness.

We also reiterate here a welcome for the introduction of waste prevention and management plans for businesses and public bodies. It is essential to bring businesses fully on board in this area. Concerted action by the public sector can make a major contribution to reducing Scotland’s waste, can set a good example for the private sector and can encourage employees to change their behaviour at home. Often now, workers find they are doing far more recycling at home than at work and want employers to take much stronger action. These proposals should help ensure public and private sectors tackle waste prevention, waste reduction and recycling in a focused, planned manner in line with all relevant legislation, guidance and targets and making use of sustainable procurement policies to effect improvements. Negotiated workplace environmental agreements will ensure the best chance of successful implementation of plans.

Conclusion

UNISON Scotland believes this Bill is one of the most important pieces of legislation that will ever be presented to the Scottish Parliament. With Stop Climate Chaos Scotland, we welcome the commitment to the target of at least 80% cuts in greenhouse gas emissions. We hope that the Scottish Government and the Scottish Parliament will wish to provide genuine international leadership and strengthen the Bill in the ways that SCCS has highlighted, to ensure that target can be delivered - and to send a strong signal to the UN climate change talks in Copenhagen.

¹³ UNISON Scotland Waste Management Briefing 2006 www.unison-scotland.org.uk/briefings/wastemanage.html
It is essential that at Scottish and local government levels, adequate financing is available to ensure the necessary actions are taken. It would be wrong to say that these are ‘extras’, which in a time of global financial crisis, cannot be afforded. The Stern report made clear that the benefits of strong, early action considerably outweigh the costs. Leadership is required to make this happen and to communicate clearly to the public the ways in which everyone can contribute to reducing greenhouse gas emissions and to adapting to the global warming already underway. Scotland’s politicians have the opportunity with this Bill to rise to the challenge and provide that leadership.
WRITTEN SUBMISSION FROM UNITE THE UNION SCOTLAND

Introduction

Unite - the Union represents around 200,000 working people and their families throughout Scotland. We are the UK and Ireland’s largest trade union with 2 million members in a range of industries including transport, construction, financial services, manufacturing, print and media, the voluntary and non-profit sectors, local government and the NHS.

As a Union with a significant membership in the wider energy sector - including workers in electricity, gas and nuclear power stations, offshore oil and gas production and opencast coal sites - we have a wide-ranging stake in the energy and climate change debate. Unite has continually articulated our belief that more needs to be done in a number of areas including renewable energy, energy efficiency, transport and the key role that our members can perform in the transition to a low carbon economy.

We also believe that existing low carbon-emitting energy sources including clean coal, nuclear power and carbon capture have a vital role to play in sustaining our energy demands and meeting our carbon emissions targets and wider environmental commitments.

Incorporated in this is response are a number of short responses to the areas of the interest Unite holds in this matter. For a fuller insight into Unite energy and environment policy please refer to our previous responses to Scottish Government consultations on these topics, which can be obtained from the union or via the Scottish Government’s website.

Emissions Reductions Targets

Unite - the Union believes a balanced energy strategy (incorporating clean coal, nuclear, oil, gas, and renewable sources), in tandem with improved transportation standards and changes in social behaviour, is crucial to facilitate the achievement of our wider emissions targets – in Scotland and the UK.

It is also essential that more support is directed towards established and emerging renewable technologies. This support must include incentivising companies and also in skills, training and retaining people in the sector to fulfil Scotland’s significant low carbon energy potential. Great faith has been placed by the Scottish Government in the renewables agenda to solve the low carbon question. However, significant gaps exist between potential and reality.

A report by the Carbon Trust (2006), for example, illustrates the massive potential for tidal and wave power for supplying a significant amount of power to the electricity grid. The Trust estimate that marine energy could provide up to 20% of the UK’s current electricity needs and become cost competitive with conventional and other renewables in the long term.

Marine energy has massive potential but there is still little operational capacity currently installed. At present there are two wave power devices in the UK – the Limpet unit of Islay and Pelamis on Orkney. Therefore, if Scotland, and the UK, is to realise the potential of marine technology then this will be dependent upon the right level of investment and support.

The position of Unite is further strengthened by comments made by the Minister for Finance and Sustainable Growth, John Swinney, at a STUC organised event on Energy and Climate Change in February 2008 when he predicted that the emerging renewables sector in particular wave and tidal power would not be mature nor commercially viable technologies for up to ten years. However, industry experts admitted at an Energy Conference organised by Unite and Scottish Engineering that while marine technology would play a major role in the future it was not going to make a substantial contribution for 20-30 years.
In relation to wind power, which we believe to be a potential major contributor to the energy sector, Unite has welcomed in principle the steps being taken to speed up the planning process (i.e. setting a target of nine months for new energy applications to be determined where there is no public inquiry). However, Unite retains concerns about the inconsistency in approach towards planning applications in the renewable sector. We note in particular the consent given to the wind farm proposals in Dumfries and Galloway and in Perthshire in contrast with the decision to refuse consent to Lewis Windpower for a wind farm at Barvas Moor in Lewis.

Furthermore there are outstanding issues in relation to the intermittency with wind power. On renewables, the House of Lords Economic Affairs Committee reported on 25th November 2008 concerns about security of supply. It concluded that wind turbines are the most readily available source of increases in renewable electricity but, as these only operate intermittently, they cannot be relied upon to generate electricity when it is needed.

Eon has also commented in August 2008 that due to the unreliability of wind energy particularly during the season of winter other forms of energy would be required to provide stability and the security of supply. Mike Farley of Doosan Babcock Energy has also recently highlighted a SKM report which stated that: “Combined Scottish wind generation output will be 10% or less for around 20% of the time (i.e. one in five winters on average will experience wind power levels of 10% or less at times of peak demand)”. This means one winter in five or one day in five we must completely (90% or more) backup the wind capacity with firm power.

We have been highly critical of the Scottish Government’s energy policy which in our opinion has placed ideology above the national interest. This contention is based on our belief that by rejecting at the outset a proven, reliable and low carbon technology in the form of nuclear power it not only prohibits a full appraisal of the options available but it more fundamentally does a disservice to the national discourse on the vitally important subject of energy supply and emissions targets.

Additionally, the aforementioned factors of the intermittency of wind, the immaturity of marine technology, and, uncertainty over the timing regarding planned large scale Carbon Capture Storage demonstrations (estimates presently suggest the first operational capacity being in 2020) further strengthens our belief in the major operational difficulties that the Scottish Government's present energy policy will face - as it stands – to deliver Scotland’s energy needs while fulfilling our ambitious climate change targets.

**Forestry**

In conjunction with our trade union partners in the Forestry Commission Scotland (FCS), Unite as part of the Forestry Commission Trade Union (FCTU) side has previously responded to the Scottish Government’s Consultation on Forestry Provisions in the Scottish Climate Change Bill.

We believe the National Forestry Estate (NFE) should continue to play a lead role in delivering Climate Change targets and we welcome the proposals for enabling legislation for Forestry Commission Scotland (FCS) to enter into Joint Ventures for development of renewable energy programmes. This is likely to provide significant income to meet Scottish Government targets five to ten years from now.

However, we are absolutely opposed to the proposal to lease substantial areas of NFE land for forestry purposes and the granting of cutting rights over this forest. It follows, therefore, that the Unions are also opposed to transfer of this leased land to any Trust. A copy of the full response to the Scottish Government on the National Forest Estate can be obtained on request from the unions involved in the Forestry Commission.
Energy Efficiency

Across the UK Unite members have worked with employers on energy efficiency projects. Unite drivers at Wincanton for example have been trained to use their vehicles to reduce fuel consumption and demonstrated that this could be done in a way that also made a significant financial saving for the company. The pilot involved detailed training of drivers without which fuel reduction would not have been achieved despite the introduction of sophisticated technology.

Other examples of Unite members’ role in improving energy efficiency include:

**CUMMINS** - Workers at this company have helped to establish an environmental committee to reflect the eco-credentials of the employer. The company manufactures wind turbines and aims to recycle all waste produced in the manufacturing process.

**PANASONIC** - Unite members have argued the case for flexible working as a means of reducing the environmental impact of their workplace. A petition was submitted to the company to make starting and finishing times flexible in order to reduce traffic congestion.

**FUJITSU** - At Fujitsu, our members participate in the company’s ‘GreenTeam’ initiative and have introduced environmental training for employees. Unite has also campaigned for CRT monitors to be replaced by flat screens to reduce electricity consumption, and, increasing video/teleconferencing usage.

The Energy Saving Trust for example predicts that by 2020, 45% of domestic electricity will be consumed by IT and electronics products. In Unite’s previously published report ‘How Green is Your Workplace’, a number of measures and technologies are highlighted which, if adopted, could improve energy efficiency. Examples include:

- Smart buildings technologies, which monitor and adjust lighting, heating and energy use;
- Broadband, which facilitates communications through email, video and teleconferencing, and VOIP (Voice over internet protocol); and
- Multifunctional devices such as i-phone, all in one printers with inbuilt fax and scanner and blackberries help reduce the proliferation of electronic devices and can cut the use of paper.

Unite is optimistic about what workers can contribute to the preservation of the environment and to reducing energy consumption. Incremental and, in some cases, innovative and dynamic changes in workplaces are occurring because our members are raising awareness of climate change and energy issues.

Transport

Encouraging a shift from the private car to bus and rail services will play a key role in helping to cut carbon emissions from the transport sector. In 2006, 67% of commuters travelled to work by car or van, 14% walked, 12% used the bus, 3% by train, 2% cycled and 2% used other modes of transport (source: the Scottish Transport Statistics (No. 26 – 2007 edition)).

It is, therefore, vital that we address the issue of road traffic in Scotland because it is forecasted to grow by between 22% and 34% over the period 2002-2011 and it is also the second fastest growing source of emissions according to the Transport Scotland report titled ‘Opportunities for offsetting carbon emissions on the Scottish trunk road network’ (2007).

The Department of Business, Enterprise and Regulatory Reform’s Energy Trends Brief (March 2008) highlights that the transport sector accounted for 24% of CO2 emissions in 2007 - 92% was from road transport. Transport emissions are 11.5% higher than during 1990. The total number of vehicles licensed in Scotland was almost 2.6 million in 2006 which is 32% higher than in 1996 with road traffic forecasted to grow by between 22% and 34% over the period 2002-2011 according to Scottish Transport Statistics (no.26 -2007 edition).
Therefore, encouraging a shift from the private car to bus and rail services will play a central part in reducing carbon emissions and energy consumption. It is for these reasons Unite is very supportive of the Regulation of Bus Services Bill consultation launched by Charlie Gordon MSP. Unite believes this Bill to be a key component to this debate and urge all political parties in the national interest to support it.

**Conclusion**

Unite retains a number of major concerns relating to the ability of the Scottish Government to deliver its climate change targets and delivering Scotland’s future energy needs – both of which are inextricably linked. The Scottish Government’s climate change target of an 80% cut in emissions by 2050 surpasses the aims of most countries.

However, the inconsistency in approach to renewables applications, in particular wind-power projects, the rejection of the future role of the nuclear industry, the lack of current investment in skills and training in key energy sectors, continued high rates of private cars for journeys as opposed to public transport, and, the present low levels of operation capacity in renewables industries means Scotland faces significant challenges if it is to fulfil its ambitious climate change targets while keeping the lights on.

Unite also wishes to state that we also have a series of consultation responses and documents which could complement this paper and provide greater in-depth analysis into the various facets of this debate e.g. energy and transport. Unite representatives would also be willing to supplement this paper by having further dialogue with the Committee via written and/or oral presentations.
Introduction

Waterwatch Scotland (WWS) is the national complaints handling authority for all domestic and non domestic water customers and consumer representative body for the water industry in Scotland.

Our role is to:
Investigate complaints
Represent customers’ interests and views
Influence policy
Inform and advise

WWS’ responsibility for second tier complaints handling means that it can take forward individual customer grievances against water providers. WWS can also make statutory recommendations to Scottish Ministers, the Scottish Government, Scottish Water and other industry regulators on customers’ behalf including: Scottish Environment Protection Agency (SEPA), Drinking Water Quality Regulator (DWQR) and the Water Industry Commission for Scotland (WICS). WWS can report on any matter that it understands to be relevant to the customer and in the customer’s best interest.

WWS also has a statutory remit to champion water efficiency within Scotland. WWS sees this as a key and significant component for Scotland to achieve climate change targets.

Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

In principle, Waterwatch Scotland (WWS) supports the Bill’s reduction targets for 2050 and 2030. In particular, WWS would be keen to highlight the contribution that the successful implementation of water efficiency policy would make to an overall reduction in greenhouse gas emissions. However, in order to successfully achieve these targets, they must first be supported and championed by key policy makers within public and private sector in order to drive cultural change within domestic and non domestic settings, and must be enforced through legislation.

Q2 The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

What are your views on the setting of targets in batches from 2010 to 2022?

In principle, WWS supports setting targets in batches as it provides a more measurable means of assessing progress and achievement of targets. WWS would be further interested in understanding what key activities are to be progressed within each batch, how batches are to be measured and supported locally and nationally.

Q3 The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

In principle, WWS supports this approach.
Q.4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

No comment.

Q5 The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

No comment.

Q6 The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government's approach to obtaining independent, expert advice on climate change?

No comment.

Q7 The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

WWS supports this approach.

Q8 The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

WWS supports this approach as it places emphasis on public bodies to own and champion policy and measures that address climate change.
Q9 The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on this proposal?

WWS supports this proposal. A report produced by the Scottish Government will provide stakeholders with the opportunity to monitor progress being made to achieving targets set by the Bill and to flag up any issues foreseen.

Q10 Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are your views on this proposal?

No comment.

Q11 The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

No comment.

Q12 The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?

WWS fully supports this view. WWS is keen to promote the need for measures that will encourage behavioural change, especially with a view to championing water efficiency and the relationship between water use and energy consumption within both domestic and non domestic settings.

Q13 The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government’s thinking in this area.

What are your views on this approach?

WWS supports the development and communication of policy and regulations to assess the direct impact that non-domestic buildings have on greenhouse gases, but also the indirect impact they have through associating water / energy use with responsible consumerism and awareness.
Q14 The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

What are your views on this proposal?

WWS supports steps to highlight the relationship between carbon emissions and heating water. Emphasis on heat from renewable sources factored into this issue to change behaviour and promote responsible consumerism is welcomed.

Q15 The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas:
Waste prevention and management plans;
Waste data;
Deposit of recyclable waste;
Procurement of recyclate;
Reduction of packaging;
Deposit and return schemes;
Charges for carrier bags.

What are your views on these proposals?

No comment.

Q16 What are your views on the adequacy of the Scottish Government's consultation in advance of publishing the Bill?

Consultation with industry stakeholders has been adequate.

Q17 Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government out on the consultation proposals?

No comment.

Q18 Does the Bill raise any equalities issues you would wish to highlight?

No comment.

Q19 Do you have any comments on the impact of the Bill on sustainable development?

WWS supports the Bill in that it champions a focused and committed approach to identifying measures that will result in reduction of carbon emissions. WWS would support greater emphasis on WICS and WWS having a duty to support ScW in the implementation of sustainable solutions by statute.

Q20 Do you have any other comments on the Bill?

No comment.
The World Development Movement (WDM) campaigns for a world without poverty and injustice. We work in solidarity with activists around the world to tackle the causes of poverty. We research and promote positive alternatives which put the rights of poor communities before the interests of big business.

WDM urges the Transport, Infrastructure and Climate Change committee to take a global view of the importance of the Climate Change (Scotland) bill. Climate change is perhaps the greatest global injustice. It is the richest people in the world who have produced and who are still producing most of the greenhouse gases causing climate change. Yet it is poor people in poor countries – those who contribute little or nothing to the problem – who will suffer the most severe consequences. Each year the average Scot produces 9.3 tonnes of CO₂. The average Malawian produces just 0.06 tonnes per year. And yet Malawi is already suffering the measurable effects of climate change in increasing temperatures, unpredictable seasons, higher incidences of flood and more droughts; all of which threaten the lives and livelihoods of Malawians.

If we are to avoid passing the two degree threshold identified by the IPCC, and reduce the risk of runaway climate change, then we have just eight years to stabilize and begin to reduce global greenhouse gas emissions. It is absolutely vital that the UN negotiations on the successor to the Kyoto Protocol, taking place in Copenhagen later this year, are successful. We hope that, in writing its report on the bill, the committee will take into account the positive impact that a strong Scottish climate bill could have on those international negotiations.

WDM is a member of the Stop Climate Chaos Scotland coalition, made up of more than 30 organisations campaigning together to tackle climate change. The coalition members include environment and development NGOs, faith groups, trade unions, community councils, student societies, women’s organisations, a mental health charity, and many others. In Scotland, the members have a combined supporter base of over 1.5 million people.

WDM fully supports the Stop Climate Chaos Coalition Scotland priorities for the Climate Change (Scotland) bill, which are that it must:

1. Set out a framework that will achieve at least an 80% reduction in greenhouse gas emissions by 2050.
2. Establish in statute annual emission reductions of at least 3% year-on-year from the start, not just from 2020, compatible with a fair and safe cumulative budget identified by the advisory body (see 4).
3. Include emissions from all sectors in the framework and targets set out in the Bill, including those from international aviation and shipping, from the very start.
4. Establish a Scottish advisory body, a Scottish Climate Change Commission, in the primary legislation to support delivery of the Bill when it is enacted.
5. Ensure that at least 80% of the effort to cut emissions takes place in Scotland.
6. Establish duties on all public bodies to reduce greenhouse gas emissions in line with the national target.
7. Set in place robust, transparent reporting measures so the Scottish Parliament is well informed on progress in meeting targets and Government is held to account on mitigation and adaptation.
8. Ensure that strong enforcement measures are set in place in statute.
9. Ensure Scotland counts all its emissions and reports on those produced by products and services we consume as well as emissions produced domestically.
10. Be explicit that sustainable development is core to the purpose and delivery of the statute in relation to mitigation and adaptation.
WDM's additional evidence relates to point five, above, on domestic effort and carbon trading.

WDM has many reservations about the way that carbon trading currently works. Our main concerns are over its ability to deliver large enough cuts in climate change emissions, the impact that some of the projects are having on developing countries and the signal that it would send to the rest of the world were Scotland not to limit carbon trading in the bill.

WDM urges the Transport, Infrastructure and Climate Change committee to support SCCS’s demand to ensure that at least 80% of the effort to cut emissions takes place in Scotland.

Carbon trading and the Clean Development Mechanism

1. Carbon trading currently works primarily through the EU’s Emissions Trading Scheme. A cap is set for the total amount of CO₂ which can be emitted from large industries in Europe, such as power stations and factories. Permits equal to this cap are then distributed to companies. The cap, and thereby the number of permits, are reduced over time. Companies can buy-and-sell the permits between themselves, meaning companies can choose whether to cut their emissions or pay someone else to do so.

2. However, companies can also buy permits from companies operating in developing countries, through the Clean Development Mechanism (CDM), rather than purchasing permits to reduce emissions in Europe. The EU energy and climate package states that from 2013-2020 at least 50 per cent of reductions in the Emissions Trading Scheme can be made through buying Clean Development Mechanism credits, rather than reducing emissions in the EU.

3. Carbon trading as it currently operates is carbon offsetting. Buying carbon credits allows the EU and UK not to cut emissions domestically, but to pay for offsetting in developing countries instead. This prevents the creation of a low carbon economy in the EU and UK.

4. To prevent the worst impacts of climate change rich countries like the UK have to cut their own emissions, and in addition assist developing countries in curbing the growth in, and ultimately reducing emissions. Support to developing countries to cut emissions needs to be additional to action in the UK and EU, not instead of action in the UK and EU.

5. The UK Committee on Climate Change has said: “rich developed economies need to start demonstrating that a low-carbon economy is possible and compatible with economic prosperity, in order to gain developing country commitment to long-term emissions reductions, and need to start driving the technologies and energy efficiency improvements which will make a low-carbon economy possible. They can only do this by employing measures which drive down emissions in rich developed economies rather than relying solely on purchased credits.”

6. However, there are also further problems with how the Clean Development Mechanism works, which we address below:

The Clean Development Mechanism does not necessarily reduce emissions in developing countries

7. Under the CDM the largest number of carbon credits has been generated by projects claiming to reduce the potent greenhouse gas HFC-23, rather than CO₂. One study has found that the value of credits given to HFC-23 projects at current carbon prices is 4.7 billion euros. However, an estimate of the cost of technology needed to capture and destroy the same amount of HFC-23 is 100 million euros. Around 4.6 billion euros has been generated in profit by HFC-23 generating plants, which could then further expand their operations with the reinvestment of this profit.
8. For example, one Indian chemical company, SRF, made 87 million euros from the sale of carbon credits in 2006/07. Ashish Bharat Ram, managing director of SRF, claimed: "Strong income from carbon trading strengthened us financially, and now we are expanding into areas related to our core strength of chemical and technical textiles business."

9. A Joint Committee of the UK Parliament has said that: “the economic incentives offered by the CDM [Clean Development Mechanism] appear actually to be encouraging the building of refrigerant plants in the developing world, simply in order that the HFC by-products from the plant can be incinerated, and the credits generated from this sold at a large profit.”

10. The Committee on Climate Change has said: “there remain concerns as to whether offset credits can ever be as certain a form of emission reduction as domestic reductions. While the procedures for the approval and monitoring of CDM projects are being continually improved, any system of credits for reduction against a hypothetical business-as-usual scenario, is inherently less robust than a cap and trade system where reductions are required in the certifiable total of all emissions."

11. A report by International Rivers Network found that three out of four CDM projects were already up-and-running by the time they were approved to generate CDM credits, strongly suggesting that the projects would all have happened anyway. David Victor from the Californian University concludes from his research that: “It looks like between one and two thirds of all the total CDM offsets do not represent actual emission cuts.”

The negative impacts of CDM funding

12. Carbon credits are produced on the basis of having a positive climate change impact, so it is natural to assume that projects are also socially responsible. Yet carbon credits are sold by private companies which are normally unaccountable to the communities in which they seek to implement their projects. Unfortunately, there are already examples of carbon credit projects exacerbating social harm.

13. The Indian state of Gujarat is one of the most industrialised states in India. Between 2006 and February 2008, 19 projects in Gujarat qualified to receive carbon credits under the Clean Development Mechanism. Of these, 13 (68 per cent) are to reduce HFC-23 emissions from factories (see above on HFC-23 projects). In total, the 19 projects are claimed to have reduced emissions by 12.5 million tonnes of CO2eq.

14. The Gujarati NGO Paryavaran Mitra says that some of the industries funded by CDM produce toxic or hazardous local pollution. The reinvested profit from CDM allows these industries to expand their operations, producing more local pollution, without any regulation of the impacts. Mahesh Pandya from Paryavaran Mitra says: "It is unjust that the rich are allowed to emit whilst paying for more pollution for the poor."
WWF Scotland welcomes the opportunity to provide evidence to the Transport, Infrastructure and Climate Change Committee on this important legislation, the Climate Change (Scotland) Bill. Almost 20,000 people submitted responses to the Scottish Government’s consultation on the Bill backing WWF calls for a strong Bill last year. This year, more than 5,000 individual actions have been taken by people across Scotland actively supporting WWF’s key recommendations for strengthening the Bill, for example by writing to or visiting their own MSP.

Climate change is the biggest threat facing humanity and we are presented with a closing window of opportunity in which to tackle it. This Bill has the potential to be the strongest climate change legislation in the world and act as both a catalyst for further international action and demonstrate what a developed nation can do in response to climate change. The Bill has the potential to provide a strong framework, but it needs to be strengthened in a number of critical areas if it is to actually lead, deliver and ensure Scotland plays its full part in tackling climate change.

WWF Scotland is a member of the Stop Climate Chaos Scotland (SCCS) Coalition, therefore positions are shared with this coalition of more than 30 organisations campaigning together to tackle climate change. As WWF supports all of the written evidence submitted by the Coalition, rather than duplicate the evidence which has been developed across the membership, WWF’s evidence complements it with supplementary evidence in some key areas.

Stop Climate Chaos Scotland is a coalition of more than 30 organisations campaigning together to tackle climate change. The coalition members include environment and development NGOs, faith groups, trade unions, community councils, student societies, women’s organisations, a mental health charity, and many others. In Scotland, the members have a combined supporter base of over 1.5 million people.

The Stop Climate Chaos Coalition Scotland priorities for the Climate Change (Scotland) Bill are that it must:

1. Set out a framework that will achieve at least an 80% reduction in greenhouse gas emissions by 2050.
2. Establish in statute annual emission reductions of at least 3% year-on-year from the start, not just from 2020, compatible with a fair and safe cumulative budget identified by the advisory body (see 4).
3. Include emissions from all sectors in the framework and targets set out in the Bill, including those from international aviation and shipping, from the very start.
4. Establish a Scottish advisory body, a Scottish Climate Change Commission, in the primary legislation to support delivery of the Bill when it is enacted.
5. Ensure that at least 80% of the effort to cut emissions takes place in Scotland.
6. Establish duties on all public bodies to reduce greenhouse gas emissions in line with the national target.
7. Set in place robust, transparent reporting measures so the Scottish Parliament is well informed on progress in meeting targets and Government is held to account on mitigation and adaptation.
8. Ensure that strong enforcement measures are set in place in statute.
9. Ensure Scotland counts all its emissions and reports on those produced by products and services we consume as well as emissions produced domestically.
10. Be explicit that sustainable development is core to the purpose and delivery of the statute in relation to mitigation and adaptation.

In December 2009 Copenhagen will host the UN climate change talks to forge a new global deal intended to deliver the emissions reductions we need to prevent dangerous climate change. The timing of Scottish Climate Bill means it has the opportunity to show what is possible and lead other nations down the path to a safe climate; if it falls short of this it risks setting a dangerous precedent at a time when the world is looking for leadership.

1. The 2050 Target

WWF supports the SCCS position that the Bill should include a 2050 target of at least an 80% reduction in all greenhouse gas emissions.
There is an increasing body of scientific evidence that shows this must be the minimum level of our ambition\(^1\). Scientific research on climate change published since the deadline for the latest assessment report from the Intergovernmental Panel on Climate Change (IPCC) is revealing that global warming is accelerating, at times far beyond IPCC 2007 Fourth Assessment Report forecasts.

- The Arctic Ocean is losing sea ice 30 or more years ahead of the projections presented in the Fourth Assessment Report (Stroeve et al, 2007).
- Floating tide-water glaciers in the Antarctic Peninsula are losing ice faster and are making a greater contribution to global sea level rise than reported in the Fourth Assessment Report (Pritchard and Vaughan 2007).
- Since 1990, global sea level has been rising one and a half times faster than forecast in the IPCC’s Third Assessment Report (published in 2001) (Rahmstorf et al 2007).
- The actual emissions growth rate since 2000 has been greater than any of the scenarios used by the IPCC in either the Third or Fourth Assessment Reports\(^2\).

2. **Annual targets of at least 3% reductions per year**

WWF Scotland supports the SCCS position that the Bill must require statutory annual greenhouse gas emission reductions of at least 3% year-on-year from the outset, not just from 2020. The rate of emissions reduction determines the total volume of greenhouse gases that Scotland will emit between 2010 and 2050.

WWF has carried out some preliminary analysis of the various emissions scenarios provided to the Committee by the Scottish Government.\(^3\) The different volumes of greenhouse gases are set out in the table below.

<table>
<thead>
<tr>
<th>Scenario</th>
<th>Meets the UKCCC Interim Target 2020</th>
<th>Meets the UKCCC Intended Target 2020</th>
<th>Total emissions 2000-2050 MtCO(_2) equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scenario 1</td>
<td>×</td>
<td>x</td>
<td>2,010</td>
</tr>
<tr>
<td>Scenario 3(^4)</td>
<td></td>
<td>x</td>
<td>1,990</td>
</tr>
<tr>
<td>Scenario 4</td>
<td></td>
<td>x</td>
<td>1,940</td>
</tr>
<tr>
<td>Scenario 5</td>
<td></td>
<td>x</td>
<td>1,895</td>
</tr>
<tr>
<td>Scenario 6</td>
<td></td>
<td></td>
<td>1,870</td>
</tr>
<tr>
<td>Manifesto Promise</td>
<td></td>
<td></td>
<td>1,826</td>
</tr>
</tbody>
</table>

It is apparent from this analysis that only Scenario 6 and delivering on the SNP Manifesto Promise would be sufficient to hit the ‘Intended Target’ of a 42% reduction by 2020 recommended by the UK Committee on Climate Change. However, if the Climate Change Bill is to limit Scotland’s emissions to a safe and fair cumulative budget, calculated as approximately 1,470 MtCO\(_2\) equivalent between 2000 and 2050\(^5\) the manifesto commitment of annual reductions of at least 3% must be the absolute minimum emissions reduction required by the Bill. Anything less than this will mean the Scottish Bill fails to deliver on the First Minister’s commitment that “in every respect the legislation will be more ambitious than the Labour Government legislation [at Westminster]”.\(^6\)

In addition to dictating the maximum volume of emissions allowed by the Bill annual reductions of at least 3% from the very start are also vital to ensure the Bill delivers on the scientific requirement for urgent action now. The climate change models used, for example, by the IPCC, the UK Committee on Climate Change, The Hadley Centre and the Tyndall Centre all describe how global emissions must peak in the next 5 – 8 years and then begin a steep reduction curve. If the world is to avoid the worst consequences

---

\(^4\) Scenario 2 is almost identical to Scenario 3 and so is not covered separately in this analysis.

\(^5\) See SCCS briefing [http://www.stopclimatechaos.org/files/docs/SCCS-Briefing2-3pc-annual-targets_F1.3.pdf](http://www.stopclimatechaos.org/files/docs/SCCS-Briefing2-3pc-annual-targets_F1.3.pdf)

of climate change Scotland, and all other developed nations, must commit to immediate reductions of at least 3%.

The importance of early and significant annual reductions was identified when Lord Turner and David Kennedy, the Chair and Chief Executive of the Committee on Climate Change, gave evidence to the Environmental Audit Committee on the 4th February. Mr Kennedy said “the 50 per cent global emissions reduction with 2016 peaking requires a four per cent annual emissions reduction globally”.

3. Emissions from international aviation and shipping

WWF Scotland supports the position of SCCS that all emissions for which Scotland is responsible, including international aviation and shipping, are included in the Bill from the very start. This is probably the most important area where Scotland can show international leadership. As it was introduced to the Scottish Parliament the Bill simply provides that Ministers may include these emissions and even then, it would require secondary legislation to do so.

Scotland has reported on its emissions from both international shipping and aviation since 1990 according to the most robust and accurate methodology set out by the relevant IPCC working group. While this methodology will almost certainly be refined over time such potential future revisions should not be seen as justification to exclude these emissions from the very outset. Indeed, methods of data collection for any other source of emissions, such as land use, may be amended over time and the Bill has the capacity to adopt such changes without excluding the source from the start.

When accounting for emissions from international aviation and shipping the Bill must make allowance for the extra impacts that aircraft emissions have compared to ground emissions; burning 1kg of aviation fuel at ground level has less climate change impact than burning that fuel in an airplane engine at altitude.

### The importance of including an aviation multiplier

Emissions of nitrogen oxides, water vapour and particulates at altitude generate a number of chemical processes that combine to amplify the climate change effect of aviation. The following table provides a summary description of the range of figures applied as an ‘emissions multiplier’ to ensure a more complete description of the contribution aviation makes to climate change.

<table>
<thead>
<tr>
<th>Reference</th>
<th>Suggested multiplier</th>
</tr>

<td>1.9</td>
</tr>
</tbody>
</table>

Although the final figure from the EU TRADEOFF research programme represents the best scientific understanding, the calculation of an aviation multiplier remains the focus of scientific research. In particular it is necessary to establish a better understanding of the role of aviation in generating contrails and cirrus clouds both of which have a warming effect on the atmosphere. The Bill should include the aviation multiplier but also allow it to be amended to reflect improvements in understanding.

4. Focusing on domestic reductions

WWF supports the view of SCCS that the Scottish Climate Change Bill must require that at least 80% of the effort to cut emissions should take place in Scotland.

---

¹² The EC TRADEOFF project (Aircraft emissions: contributions of various climate compounds to changes in composition and radiative forcing – tradeoff to regulate atmospheric impacts) involved ten European scientific organisations, including Manchester Metropolitan University. The project completed in 2003 (Sausen et al, 2005).
The question of what proportion of the emissions reductions should be achieved in Scotland, rather than be met through international offsetting, is fundamental and will determine whether Scotland becomes a low carbon economy or remains dependent on fossil fuels. Currently the Bill contains no legal requirement that any of the emissions reductions should be achieved in Scotland.

The Bill must require that domestic emissions reductions form the vast majority of the total emissions savings. We can not expect the existing EU ETS cap and trade system to provide sufficient incentive to achieve the vitally important transformation of Scotland’s energy sector. It is clear that the carbon price under the ETS will not in the short to medium term be high enough to drive all the investment required to reduce Scotland’s emissions in time. In the meantime, decisions made now before the carbon price has matured could ‘lock’ Scotland into long-lived, high-carbon infrastructure for decades.

WWF’s own analysis has shown there must be a decarbonised power sector by 2030 if other technologies in the transport and heating sectors are to contribute their full potential to emissions reductions. This conclusion has also been made explicit in the recent report by the UK Committee on Climate Change which also highlighted that this would not be delivered by the ETS on its own and there is a pressing need for market mechanisms to be ‘buttressed’ with domestic policy.

The table below describes the actual reduction in Scotland’s emissions with varying levels of access to international credits. It is clear that if Scotland is to actually reduce its emissions by at least 80% by 2050 it must limit the use of offsetting.

<table>

5. Reporting

WWF believes it is critical that this Bill establishes a strong scrutiny process so that the Scottish Parliament is able to hold the Scottish Government to account on delivery.

It must be a robust and transparent process, as outlined in the SCCS evidence, informed by independent advice from a Scottish advisory body, see the evidence on the Scottish Climate Change Commission below and in the SCCS evidence as well.

6. Consumption

WWF believes Scotland should count all its emissions and reports on those produced by products and services we consume as well as emissions produced domestically.

The Scottish Climate Change Bill includes a target to reduce our emissions by at least 80% by 2050. This target is to be based on Scotland’s territorial emissions, all those emissions produced within Scotland plus those from our share of international aviation and shipping. This is the correct target, however, these are not the total emissions Scotland is responsible for; our consumption of goods and resources generates emissions that are not counted under a production-based reporting system.

Scotland interacts with many different countries, importing and exporting goods around the world, the net effect of which has been to shift our production-based emissions abroad. A requirement to report on

---

13 A joint report by WWF, the RSPB and the ippr entitled ‘The 80% Challenge’, shows that the 80% reduction target is technically feasible, economically affordable and sustainable, [http://www.wwf.org.uk/filelibrary/pdf/80percent_report.pdf](http://www.wwf.org.uk/filelibrary/pdf/80percent_report.pdf) The report also shows that a decarbonised power sector is central to efforts to reduce emissions. This is because low carbon technologies in the power sector are more mature than in others and because other solutions – such as electric heating and electric vehicles – will contribute more with a clean energy supply.
consumption-based emissions, or our carbon footprint, alongside territorial emissions, would provide a clear understanding of our impact on global carbon dioxide emissions.

This information can be used to ensure that while territorial emissions fall, Scotland does not ‘off-shore’ its responsibility for greenhouse gas emissions to other countries. After all, we import cars, televisions, and food which have created carbon emissions in their production somewhere else in the world. Only by understanding our global impact can we reduce it.

7. **Scottish Climate Change Commission**

WWF believes that the Bill should establish a Scottish advisory body, a Scottish Climate Change Commission, in the primary legislation to support delivery of the Bill when it is enacted.

It is critical that Scotland has an advisory body that can advise on the distinctive Scottish targets, is well informed on Scottish data, understands the policy and institutional landscape of Scotland, is plugged into Scottish networks (e.g. academic, public, voluntary and private sector) and is visible to the people of Scotland. This should not be delayed, but set in place through the primary legislation – the Climate Change (Scotland) Bill – itself.

The preferred model is that outlined in the Stop Climate Chaos Scotland submission, a Scottish Climate Change Commission that retains some independence from Government and supports Parliament in its scrutiny of delivery of this legislation.

8. **Duties on public bodies**

WWF believes the Bill should establish a general duty on public bodies to ensure they address the impact of climate change in all their decisions and to pursue, in a manner based on sustainable development principles, reductions in greenhouse gas emissions in line with national targets. This should also apply to adaptation work.

Public bodies are in a unique position to help reduce Scotland’s greenhouse gas emissions through their service provision and in making their own operations more energy efficient. Local authorities working with their community planning partners can also have significant influence over the emissions from their communities, though land-use planning, community planning and community leadership. And, of course, local authorities will be in the front-line in adapting and responding to climate change impacts.

While some local authorities and other public bodies are innovative and ambitious in their emission reduction plans, existing guidance and voluntary measures are not enough – as can be seen by the recent publication of progress against the Scottish Climate Change Declaration, now two years old. Time is of the essence, and a duty should be given now to the public sector, giving them the flexibility and powers to act

9. **Energy Efficiency**

WWF welcomes the recognition the Bill gives to the role energy efficiency will play in driving down emissions and closing any future energy gap. With immediate measures it would be possible to reduce our total energy consumption without restricting economic growth. As currently drafted, there are several areas where this section of the bill could be strengthened:

- The bill should refer to ‘improving’ rather than ‘promoting’ energy efficiency wherever possible, maximising devolved powers in this area while respecting what is reserved. At the least, language from the Housing (Scotland) Act 2006, section 179 (duty of Scottish ministers to prepare strategy for improving the energy efficiency of living accommodation) could be echoed here.

- The Energy Efficiency Action plan should be published as soon as possible given that such a plan has now been promised for six years. The Plan should include targets on energy efficiency, and progress reported in terms of reduced energy demand, reduced emissions, and increase in microrenewables as part of the Annual Report set out in Part 3 – Reporting Duties.
The Bill offers the opportunity to enable a range of fiscal incentives to help achieve the rapid uptake of energy efficiency measures. Such incentives include local tax incentives and loan schemes.

The Bill should include enabling clauses to enhance Energy Performance Certificates for domestic buildings (as it does for non-domestic). Existing homes account for a third of Scotland’s carbon emissions. 85% of today’s homes will still be homes in 2050. It is clear that existing homes must be part of any solution to address Scotland’s climate emissions. WWF Scotland’s Carbon Countdown for Homes report calls for a Scottish retrofit strategy which can achieve at least 35% reduction of emissions from homes by 2020 and 80% by 2050.\(^\text{14}\)

We welcome government’s stated commitment to introduce a requirement for a Renewable Heat Action Plan at the second stage. The plan should include targets, based on a proper assessment of Scotland’s renewable heat potential. In addition to targets, strategic drivers will be needed, such as those in the German Heat Act which introduces an obligation to use renewables for heat requirements, market incentives and provision for local heat grids.

WWF is a member of the Steering Group for the Member’s Bill on Microgeneration and Energy Efficiency and has welcomed the Parliamentary support for provisions proposed within that Bill to be addressed in the Climate Change (Scotland) Bill.

Conclusion

WWF Scotland is pleased to support the Stop Climate Chaos Scotland evidence, which contains further detail on the ten key issues outlined by the Coalition. See [www.stopclimatechaosscotland.org](http://www.stopclimatechaosscotland.org) for more information or [www.wwfscotland.org.uk/holyrood](http://www.wwfscotland.org.uk/holyrood) for more information on WWF’s work on the Climate Change (Scotland) Bill.

Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

The impact of climate change matters to me for my children and my children’s children. The devastating impact on whole communities and nature has to be recognised and reduced by taking strong action now.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Mrs Patricia Abel
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Tackling climate change matters to me because I am concerned about the devastating impact it will have for people and nature around the world. The resulting migration will stress all our social services and systems and endanger world peace.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

- Serious action to reduce emissions - starting now. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Miss Amanda Addison
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Unlike the economy, Climate Change may not be reversible, so we have to do what we can now. I plan on living a healthy life for as long as possible and I also at some point plan on having children. I'm 25 now and I want to say to my kids that I tried. I tried to make Governments change their minds and start to wean themselves off oil. I tried to help people around me see what a devastating effect Climate Change is currently having and will continue to have on the world. I tried to open the Government's and people's eyes to see that this is the only world we have got, so we can to take care of it so we can live on it. I may tell my children stories of faraway worlds and alien life forms, but that's all they are - stories. We have nowhere else to go, this is our home. Earth will sort itself out eventually, I have no doubt. However, if we continue the way we're going, we may not still exist. This isn't so much as save the planet, as save us. I want more than anything to not just say to my children that I tried, but to say to them that I tried, we all tried and we succeeded.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.
• All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Miss Regina Alcock
Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

The targets appear extremely ambitious and blind obedience to them may create problems as a side effect i.e. windfarms onshore detract from our wild and beautiful scenery in some areas which will affect the tourist industry. Wave and tidal energy should be encouraged due to its dependency and lack of visual intrusion.

Q2 The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

My views are similar to Q1, a poorly thought through strategy could harm other industries if we try too hard to obey unrealistic targets.

Q8 The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

Good but any duties should be realistic and achievable both by the public and private sectors alike.

Q10 Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are your views on this proposal?

Agree but as long as appropriate advice is taken from scientists/conservationists etc and does not have draconian effects on established industries.

Q11 The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

To allow the Forestry Commission to help tackle climate change makes common sense as they are well equipped to do so. Adding the means to be more creative in joint ventures would reinforce this ability. Leasing should not be attempted and the land left under FC management where they can make the best contribution to tackle climate change.
Q12 The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?

Agree fully, building standards should be akin to the best Scandinavian measures for insulation, community heating schemes etc. We do need to change our attitudes to heating/keeping warm, there are many things that can be done publicly and personally.

Q14 The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

What are your views on this proposal?

I agree but our renewable power plants should use all the energy they produce and not allow heat to escape up the chimney ala the EON plant at Lockerbie. Care to be taken not to wildly pursue unpopular sites i.e. have a planning strategy for these plants.

Q15 The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas:
Waste prevention and management plans;
Deposit of recyclable waste;
Procurement of recyclate;
Reduction of packaging;
Deposit and return schemes;
Charges for carrier bags.
What are your views on these proposals?

Fully agree, again public attitudes need to be changed to create a community that cares for itself. Unfortunately probably the most successful way is to charge i.e. carrier bags. SG should consider assistance to home grown companies to get involved in there own recycling schemes.
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. Yours sincerely

Miss Alexa Allen
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Tacking climate change is important to me as I am concerned about the devastating impact it will have to future generations. It is important that the Scottish Government has a clear plan of how it will achieve 80% reduction in carbon emissions by 2050. It is all very well to state this target but there must be a plan of how this can be achieved. The government must ensure that the power companies continue to invest in the renewable technologies such as wind and wave power. This could be achieved by feed-in tariffs. This is a legal requirement on energy suppliers to agree to buy clean energy from generators at a fixed price above the wholesale price for 15-20 years. This system has been used very successfully in European countries such as Germany.

The government must also continue to support research into new technologies such as carbon capture. It is only with the application of several ‘clean’ technologies that we will be able to meet this target whilst still having enough power.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

- Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

- All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

- Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

- A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

- Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

- Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.
• All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely

Dr Lesley Allton
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

We need to make changes now - the Scottish Government need to act now to make this happen. Please don't let us down.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

- Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

- All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

Miss Kirstie Anderson
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Tackling climate change is I believe the single most important threat to people in Scotland and around the world. Rapid, significant and concerted, even sometimes unpopular, action can be taken in respect of the credit crunch threat - climate change demands an even stronger stance as the long-term consequences are yet more severe. Without action now, future generations will be paying a vast environmental debt which far outweighs anything owed due to the present financial situation.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. Yours sincerely
Mr Eric Annandale
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

It is crucial that climate change is tackled now. Not only because of the devastating effect it will have on people and nature all over the world but also because we do not have the right to hand on a damaged and diminished planet to the generations to come. I am proud that Scotland is preparing to step forward and show the way. What follows is not my own words, but expresses my views better than I can.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Ms Linda Ashera
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

The climate change bill should be about making changes now and action should be taken immediately so that the impact of human induced climate change can be kept to a minimum and so that the world does not have to suffer catastrophic weather because of procrastination by the richer countries of the northern hemisphere who have contributed most to making the problem in the first place. Scotland can, and should take a lead.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. Yours sincerely
Ms Ruth Atkinson
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

This is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet. It is very exciting that we have the opportunity here in Scotland to enact the most progressive climate change legislation in the world.

I believe that tackling Climate Change is the key issue now. We know that already it's consequences will be huge. Reducing emissions is not just about changing the way we generate power. We need to empower people to reduce their own consumption. It doesn't make sense to exclude international aviation and shipping emissions form the targets, why not include them from the start? Starting the targets from now with a 3% reduction year on year will start to make an impact immediately, why wait until 2020?

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

- Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Miss Katie Nicoll Baines
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

I strongly believe that it is crucial that the strongest action is taken to combat the effects of climate change which could be utterly devastating in the not too distant future. I really feel that the window of opportunity that may exist to enable a reversal in this process shrinks by the day and that failure to produce a suitable climate change bill that can address this problem would betray our future generations to an unprecedented degree.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at the very least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

- Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

- All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

- Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

- A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change. Personally I find the idea of carbon trading a wholly ridiculous concept.

- Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

- Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

- All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Ms Anne Bankier
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Mr Lang Banks
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Any bill to tackle climate change must have realistic targets that are binding within the lifetime of the current parliament. Action is needed now as we are already seeing the effects of human made climate change around the world. Scotland is not immune from migration issues or changes in climate zones caused by climate change.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Mr Rodrigo Barnes
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Unless we act with the greatest urgency to avert the worst consequences of climate change, there will be collapse of ecosystems worldwide, very unpredictable weather patterns, widespread extinctions because evolution cannot keep pace with rapid changes, and great human suffering and loss of life. We must have the strongest Climate Change Bill possible, which must include strong, enforceable targets set for every three to five years, starting NOW, leading to at least an 80% cut by 2050 - preferably more - and the Bill must include curbs on emissions from aviation and shipping. (I wrote this before reading the campaign letter. Although it repeats much of what I have said, I'm leaving my contribution in, to show how strongly I agree. I agree entirely with the rest of the letter, too, and am very deeply concerned about this severe threat to survival of life as we know it.)

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

- Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

- All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

- Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

- A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

- Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

- Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.
• All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Mrs Sara Barry
Dear Convener of the TICC Committee

Yours sincerely
Mr Kenneth Bell
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Climate Change cannot be stopped but just one individual, it needs EVERYONE to do their part - individuals, businesses, energy suppliers, governments. I work in the countryside, educating people and conserving habitats and it is paramount that climate change is dealt with on a world wide scale. Developed countries such as Scotland need to show we are dedicated to tackling global warming. If the big developed countries do not make a massive difference, how can the developing countries be expected to cut carbon emissions! They will only spend money on this issue once it is clear that the developed world are taking it seriously. MAKE SCOTLAND PROUD

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

- Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Yours sincerely

Miss Paula Bell
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Tackling climate change matters to me because I am concerned about the devastating impact it will have for people and nature around the world. I sincerely hope that the Scottish Government heeds the advice and recommendations of experts in the field, who are calling for stringent measures to mitigate climate change.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

- Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

- All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

- Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Ms Alexandra Birch
1. The Scottish Climate Change Bill is welcomed, including the commitments to reduce greenhouse gas emissions by at least 80% by 2050, and to set interim targets. These are both necessary but not sufficient for starting to make Scotland’s contribution to the global process of reducing the impact of climate change.

2. It is vital that these commitments are backed up by duties within the Bill, so that there is the prospect of delivery. To do this, the Bill must itself:
   - Be comprehensive in scope
   - Impose duties on all public bodies to contribute, with provisions to provide support, and sanctions against non-delivery
   - Make provision for a strategy setting out how the commitments and targets will be achieved
   - Make provisions for public, rigorous and independent scrutiny
   - Avoid making provisions for emissions trading and off-setting which enable evasion or displacement of the objects of the Bill
   - Be set unambiguously in the context of contributing towards sustainable development.

Comprehensive in scope

3. The most significant contributions to greenhouse gas emissions in Scotland arise from:
   - The built environment: conditioning the environment of buildings, and moving people, goods and information between them
   - Energy production, including generation and distribution
   - Agriculture and food.

4. However, as improvements are made in reducing emissions from these sources, the proportion of emissions from international aviation and shipping are likely to grow. These too should be included with the emission targets.

Duties on all Public Bodies

5. Public bodies have significant impacts directly and indirectly on greenhouse gas emissions, including the sectors identified in paragraph 3. While the Scottish Government can put forward legislation and provide resources, it cannot achieve reduction in greenhouse gas emissions alone. It is vital that the Bill imposes duties on public bodies to contribute to the Scottish targets, and does not leave this to subordinate legislation.

6. There is a special responsibility on local government, which has a key role in delivery. This arises through its responsibilities including, inter alia, for buildings, transport, town and country planning, waste management, and procurement. It also arises through its role in Community Planning Partnerships, and its remit for governance of its area. There should be duties not only for each Council to reduce its own emissions, but also a requirement for it to produce strategies to show how the emissions from its area will be reduced too.

7. An effective role model is provided by the success in improving municipal waste recycling. This has only come about through a combination of legislation (EU Directives transcribed into UK and Scottish requirements), coupled with regulatory requirements and targets, financial support from Scottish Government, and a threat of fines for non-compliance with the targets.

The need for a Strategy

8. The Bill should require the production, monitoring and regular up-dating of a realistic strategy, or route map, to show how the greenhouse gas emission reductions will be met, and provision made for adaptation. This strategy should not be confined to the energy efficiency of buildings alone.
9. At present a variety of agencies in Scotland have signed up to desirable and ambitious commitments, such as Scotland’s Climate Change Declaration, but many have little clear idea of how these will be delivered. While we do not have a command and control economy, without a strategy it will be impossible to mobilise the scale of activity required to meet the targets of the Bill. In practice this will need to extend to supporting and monitoring demonstration projects, and devising ways to ensure the replication of success.

10. An illustration of what happens without an effective strategy map is the UK commitment to all new houses being carbon neutral by 2016. The evidence on the ground is that there is as yet no significant UK development which is carbon neutral, and no prospect of the commitment being met. Even the few very worthwhile and pioneering developments underway have largely unresolved problems of additional costs, technical constraints and behavioural change implications.

Independent Scrutiny

11. It is vital that the Bill incorporates provision that the targets, duties and requirements of the Bill are subject to scrutiny which is public, authoritative and independent. The UK Climate Change Committee does not have the capacity to address the separate legislative, institutional and cultural context in Scotland.

12. The Bill should establish a Commission, which should be answerable to the Scottish Parliament. For reasons set out below, that body should be a Sustainable Development and Climate Change Commission for Scotland. Scrutiny should not be left to a Non Departmental Public Body, with members appointed by and answerable to Ministers. Such bodies find themselves in the ambiguous role of “critical friend”, where the requirement to be a friend inhibits effective independent critical scrutiny.

Avoid evasion or displacement

13. In drafting the Bill, it will be necessary to be cautious and even sceptical about reliance on any provision for carbon trading or off-setting. It is true that the real price of carbon, i.e. the cost of the environmental damage it imposes, should be factored in, so that market prices are adjusted to internalise the externalities caused by greenhouse gas emissions. However, the risk is that measures have the character of religious indulgences, paying for the burden to be carried elsewhere and/or by someone else, and otherwise allowing business as usual to continue.

14. As a corollary, it is essential that in the reporting of greenhouse gas emissions, account is taken of the outsourcing of much of Scotland’s material consumption: that the goods we import generate emissions elsewhere.

Sustainable Development

15. Finally, the Bill should have regard for the intimate relationship between sustainable development and climate change, which are two sides of the same coin. Tackling climate change is not a separate matter, or one only affecting the environment, but it has intimate connections to economic wellbeing and social justice, i.e. it is an integral part of sustainable development. For this reason, the Commission set up to scrutinise progress on climate change should also scrutinise progress on sustainable development. These two should not be treated separately.

16. To illustrate the close connection:
   - Trying to reduce emissions from buildings will be socially unjust if it does not take place together with, and as part of, tackling fuel poverty by providing affordable warmth for those on lower incomes;
   - There is no tension between the long term need to tackle climate change and the short term need to tackle the recession. Both need investment in renewable energy, energy efficiency, public transport, urban and rural regeneration, and are fully consistent with a green jobs strategy, which has the potential to provide a myriad of jobs and training opportunities.
17. Public bodies in Scotland already have a statutory duty to contribute to sustainable development as part of Best Value. This is imposed by s1 of the Local Government in Scotland Act 2003, and on the wider public sector through a requirement for Accountable Officers flowing from the Public Finance & Accountability (Scotland) Act 2000. Although not yet effectively scrutinised by Audit Scotland, some Councils and other bodies are making progress. This should be built on, avoiding duplication and aiming to secure joined-up governance by ensuring that the duty to tackle climate change, advocated in paragraph 5 should be conjoined with these existing duties.

Tim Birley is a former senior civil servant. He was a Scottish Office Inquiry Reporter; a Deputy Director with the Scottish Development Department; then Head of Rural Affairs and Natural Heritage Division in The Scottish Office. Since 1995 he has been an independent adviser and facilitator working with public, private and voluntary bodies taking forward sustainable development.
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Miss Victoria Bowdidge
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Climate change is a big enough problem that we should all be very scared indeed. I would say there are enough studies showing that the cumulative effect of individuals is more of an issue here than big companies and a well-rounded bill has the power to change the behaviour of both for the better.

The environment should be priority one for all politicians, because our planet is the stage on which everything else takes place ... and we don't have another one.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

- Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

- All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

- Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

- A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

- Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

- Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

- All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Mr Michael Black
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

We must act now to create a strong legislative framework with short, medium and long term targets. There is no escaping the truth of what is happening and those countries that set ambitious goals now, along with staged targets, will find it much easier in the years to come. Historically Scotland has failed to take the lead on environmental issues and has lost out economically as a result. The Scottish Government should follow its example on Zero Waste and set an aspirational target for Zero Fossil Fuel for energy use as well as the 80% reduction target. This will attract the right kind of investment to Scotland. Annual reduction targets of around 3% must commence within the next 5 years to be credible. This gives up to five years to refine our GHG accounting to an accurate level for year on year measurement purposes. Scotland is waiting to be a world leader again - don't fail us.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

Mr James Blake
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Climate changes concerns everyone as the effects have an impact to all the people and to the nature all around the world not just in one place. In order to preserve a planet for future generations to live in it is important to change the attitude of people make them see that every person has an impact on the climate change and it is everyone responsibility to make sure to live in a more responsible way.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. Yours sincerely
Mrs Susan Bonar
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

My house will be swamped as sea level rises, but I also think we are putting our children’s future in jeopardy if we haven’t secured a clean source of energy for their future.

Tackling climate change is the most important thing we can look to do to secure our children’s future, and I believe the most important of any of the work that the Scottish Parliament can do. (not to mention keeping the Greenland icecap out of my kitchen!) I feel that tackling climate change now will also provide in the short term construction phase much needed jobs.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely

Mr Anthony Brightman
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

It is important our leaders understand the huge public opinion on climate change, we need the Scottish Government to create a good example to the rest of the world and not be hoodwinked by corporate greed. Fossil fuel power is NOT the answer whether or not we can hide the pollution, we should not be taking from the earth, but instead be looking at wind, solar and hydro power for our needs, we owe it to our children. Look to your conscience, not your pocket!

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely

Miss Annabel Bromley
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Climate Change bothers me a lot, because unless fundamental worldwide action is taken, I believe that (due to positive feedback effects kicking in) this planet will quite rapidly become untenable by human life. Instead each generation should leave the planet in a viable state for their successors - our use of fossil fuel as a basic building block of our way of life is not sustainable due to its contribution to climate change. Developed countries, having largely caused the problem, need to start setting their houses right so as to demonstrate conviction and example to developing countries. Therefore Scotland must have a strong climate change bill that leads to rapid and effective action.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty
within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Mr Clive Brown
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

It is important to tackle climate change because of the devastating impact it will have on people and nature around the world if nothing is done to slow this process down.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

- Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

- All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

- Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

- A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

- Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

- Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

- All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Ms Elaine Burns
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Tackling climate Change matters to me because I am concerned about the devastating impact it will have for people and nature around the world.

I am about to have a child and it concerns me greatly that we continue to plunder the world’s natural resources and leave every ecosystem in decline. Every day all sorts of chemicals including hormones and antibiotics are washed into the sea. We are leaving tonnes of waste that will take hundreds of years to decompose. Frankly it's disgusting.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start. Yours sincerely

Mr Ewen Cameron
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

I want my grandchildren to have a world worth living in. Even moderate predictions of the effects of climate change could jeopardise this. My priorities are; first have a really strong Climate Change Bill, and secondly to mobilise public opinion so that we really all, here and world wide, make life style changes fast' as if it is a war effort.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Ms Mandy Carter
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

It is better to find that we took action that wasn't needed than to find out we didn't do enough and now it's too late. Precautionary principle doesn't apply to climate change. Act now and do more.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

Yours sincerely
Miss Charlotte Clarke
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

I believe the current Climate Change bill is lacking in any real substance and must be tightened up by the Scottish Government. In particular, a more solid and costed business case must be presented for the various options being looked at.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate
change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely

Mr Victor Clements
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Tackling Climate Change matters to me because there is no going back once the damage is done. It will have a devastating effect on people and nature around the world. I want to be remembered as the generation that helped the planet, not harmed the planet. There is still time to heal what has gone before...but we have to ACT NOW.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Mrs Morag Cloughley
Comments on the Climate Change Bill

I strongly welcome the introduction of the Scottish Climate Change Bill and the principles and objectives behind it. There is a clear opportunity to not only “think global” about the issue of climate change, but also to “act local” in introducing legislation to drive environmental issues in Scotland. In particular we are in a position to show an example to other countries of our commitment to reducing climate change in an effective and coordinated fashion.

I wish to be assured that the main features of the Bill are not diluted through the Committee stages and indeed there are areas which I would like to see strengthened or consolidated. I have noted these here:

The long term targets of at least an 80% reduction in all greenhouse gas emissions by 2050 and 50% for 2030 must remain as headline targets.

Annual targets to achieve the headline targets in 2030 and 2050 need to be at least a mandatory 3% year on year and starting in 2010. The existing targets in the Bill are not specific enough for the period up to 2020 and could result in a weakening of the programme. Evidence from SPICe research briefings show that annual targets of less than 3% from 2010 could seriously erode the Scottish headline targets.

Emissions from international aviation and shipping must be included in the targets. Ministers have made this commitment, yet the Bill indicates that emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should be amended to include all emissions.

The setting up of a Scottish Climate Change Committee is welcomed and this should be instituted immediately. It should be independent and contain a wide range of interests from the public, private, voluntary and community sectors. It should be given a key role in the scrutiny process for assessing progress towards headline and annual targets.

The suspicion exists that excessive carbon trading could dilute the real and practical efforts to reduce emissions in Scotland. The legislation should limit the amount that can be bought from overseas to 20%. A SPICe briefing paper indicates that there are installations based in Scotland who are already involved in the main existing emissions trading scheme (EU ETS). However, I understand that information from trading installations in Scotland is currently confidential. Steps are required to ensure these figures can be taken into account in monitoring.

The Bill contains reporting mechanisms on progress on tackling emissions in Scotland. These are essential in holding Ministers to account. Reporting should be in the public domain, with serious commitment to achievement of the targets set. The Scottish Climate Change Committee should be given powers in the reporting and scrutiny process.

All policy documents and publicly funded projects should be subject to scrutiny at the time of inception, possibly as part of Strategic or Local Environmental Assessments, to test for emission increase or potential for reduction. These should also be monitored and be subject to reporting and scrutiny.

All public bodies should have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a there should be a duty within the Climate Change Bill to ensure they take the appropriate action to deliver their fair share. The public sector should demonstrate leadership.

The Bill should consider sectoral reduction targets, or at the very least, scrutiny of particular sectors from where heavy emissions are recognised. This need not be comprehensive, as some sectors are small or difficult to measure. Transport and energy are two which seem eminently suited to rigorous monitoring and scrutiny.
On the **Forestry provisions**, it makes sense to seek ways of increasing woodland cover in Scotland and using land to foster renewable technology. I support the proposal for the Forestry Commission to work with developers, and particularly communities, to bring forward renewable energy development. Proposals to sell land and cutting rights to the private sector are not supported, but I would welcome joint-ventures over new planting schemes and renewable developments, so long as there are adequate safeguards over existing employment, land management and fostering public access to woodland areas.

In progressing with the Climate Change legislation, **the context within which it operates must be considered**. In particular, the Scottish Government's National Performance Framework, Strategic Objectives, and National Outcomes provide the key to the Scottish Government’s agenda to make Scotland a more successful country. The underlying physical, social and economic objectives are vital for Scotland to become a place which is wealthier, fairer, smarter, healthier, safer, stronger and greener. The Climate Change Bill should acknowledge its position in this wider context, so that actions and targets take into account the wider societal interests and sustainability.

Thank you for considering these comments. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently.

Yours sincerely

Alexander Cook
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

This is an issue that affects absolutely everyone and must be acted on as soon as possible.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Miss Emma Copland
Dear Convener of the TICC Committee

Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Mr Colin Crabbie
The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

This is yet another over-the-top response by politicians to the theory of global warming and is yet another tax raising exercise. That politicians want to parade their green credentials and set targets higher than any other country is mad. Scotland has only 0.2% of global CO2 emissions. Meanwhile China and India will continue with their economic plans regardless of us.

People cause pollution. The world population is 6.6 billion and will be 9.5 billion by 2050. The UK will increase from 61 million to 70 million by 2028 and 78.6 million by 2081. Yet not a word about population controls.

The Al Gore film, which started all this and the “hockey stick” graph, has been discredited. The whole renewables industry has only come about by taxpayers’ subsidies.

The Bill requires that the Scottish Government set annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

What are your views on the setting of targets in batches from 2010 to 2022?

By all means set targets but state that unless others set similar targets then bets are off. If others fail (as I expect) then we should reduce our target correspondingly.

The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

Not a chance in hell

The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

Scottish carbon credits are a waste of time when other countries are building coal-fired power stations at 2/3 a week or marketing the £1000 car. The rich only get richer.
The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

We have no manufacturing left so why take on the responsibilities for others??

The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government's approach to obtaining independent, expert advice on climate change?

I would welcome an INDEPENDENT expert advice not one who is in bed with the climate change zealots.

The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland's emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

The voters need to know what is happening and I suspect how far behind we are from unrealistic targets.

The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

Seems like a growth industry is being set up with thousands more jobs in the public sector which we cannot afford.

The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced. What are your views on this proposal?

If you warned about a new ice age, as some scientists are predicting this would be useful.
Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are your views on this proposal?

Fine if you can also control the volcanoes that would be helpful.

The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

Pie-in-the-sky.
As the rain forest is cut down to grow the ill thought out EU biofuels directive planting a few saplings will do ziltch.

The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioral change.

What are your views on this proposal?

The first bit of sense coming out of this sham consultation

The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government’s thinking in this area.

What are your views on this approach?

Good but start of with Edinburgh Council who leave their new office lights blazing overnight. Evening News letters 9 February.

The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

What are your views on this proposal?

Part of our requirements should be from renewables but there is a gap and the lights WILL go out if we do not invest in nuclear facilities
The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas:

- Waste prevention and management plans;
- Waste data;
- Deposit of recyclable waste;
- Procurement of recyclate;
- Reduction of packaging;
- Deposit and return schemes;
- Charges for carrier bags.

What are your views on these proposals?

All that means is more council snoopers. In West Lothian there are 18 litter wardens costing £492,000. Income from fines £5,200. Value for money?? I think not.

What are your views on the adequacy of the Scottish Government’s consultation in advance of publishing the Bill?

You will get the climate change zealots organising separate responses to fix the result and you will say that it has got unanimous approval. Not true too many people disagree with the global warming pundits but are too lazy to put pen to paper and hence allow a false result

Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government out on the consultation proposals?

Have not heard of this

Does the Bill raise any equalities issues you would wish to highlight?

I do not understand what you mean by equalities. Race?? Diversity?? Women/men

What possible good is this??

Do you have any comments on the impact of the Bill on sustainable development?

No we need productive jobs not more pen-pushers

Do you have any other comments on the Bill?

Yes you must ask those numerous scientists who are challenging the theory and include their findings in this report/consultation. There are too many scientists, politicians and paid employees who are paid lots of taxpayers money so they will continue to beat the global warming drum for fear of their jobs. Ask those not paid by government, or rather taxpayers’, money and you will get a truthful answer.
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Tackling climate change should be the top priority for the government as eventually there is going to be a devastating impact for everyone and we all have a duty to protect our beautiful wildlife for future generations.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely

NIKKI CURRIE AND FAMILY
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely

Mr Neil Dawson
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Climate change will have a devastating impact on the environment, and us, the people who depend on it. The cost, both economically, spiritually and morally, of not acting now, and emphatically, would be an impossible burden for our children to inherit. Technology will be a significant player in helping reduce emissions, but behaviour change is an immediate priority, at all levels of society, and including corporate responsibilities overseas.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Dr Robert Dawson
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

Tackling climate change urgently, comprehensively, and authoritatively, is imperative if the greatest global threat to our planet is to be diffused effectively before it is too late.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Mr David Deeson
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Tackling climate change matters to me because I am concerned about the devastating impact it will have for people and nature around the world.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Miss Deborah Dent
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

I am particularly concerned about the effects climate change will have on some of the poorest people and on the plants and animals that we are so dependent on. This bill offers governments the opportunity to change the way we live so to promote healthier societies both in Scotland and in other countries.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

Miss Laura Digan
Some reflections on issues arising from Questions 3, 4 and 5

Setting a target of an 80% reduction in Scotland’s greenhouse gas emissions is sound in that it is based on solid peer reviewed science and is a goal that should certainly be pursued.

The establishment of interim targets and basing those on a 3% per annum reduction from 2020 is virtuous to the extent that it sends clear signals in advance to business, industry and the populace at large. Its appropriateness, however, depends on the control framework to be established – nationally and internationally.

Greenhouse gas emissions in Scotland split broadly equally between the domestic, the commercial and the industrial sector. Again rough equally they arise from transport, heating and electricity production. The control framework for emissions must therefore address this broad range of activities and should aim to be responsive, economically efficient and enforceable in each of these areas. If the year on year targets are to be met reductions across will require to be closely co-ordinated.

Control measures may be based on behaviour change, direct regulation or market instruments. Behaviour change would be the most desirable route to follow – in that the populace would support it and it would require less detailed regulatory and policy intervention. However progress in securing such change has been slow and I therefore concentrate on regulation and markets – nonetheless any progress that can be made to reduce energy consumption by behavioural change will make the task easier.

Currently the framework for control is patchy and has different embedded carbon values e.g. the EUETS, the climate change levy and the Renewables Obligation each have a different embedded carbon values. Other sources such as heat have no carbon value. This is arguably inefficient policy making – and can lead to perverse price signals.

Government’s record in designing complex policy instruments (and industries response) has been patchy. For example the Renewables Obligation has consistently undershot the targets resulting in sizeable ‘buyout payments’ being recycled to operators and the desired level of renewable energy not being secured even when prices are rising. Initial allocations under the EUETS were such that the carbon price in the first compliance period fell to near zero and many industries received what in effect were sizeable windfalls leading to a ‘lobbying culture’ in which promises of action are ‘exchanged’ for future permits (e.g. the operation of the New Entrant Reserve).

Stern, in his review of costs and options, indicated that the cost of making an 80% reduction was affordable and he presents therein details of the cost of savings for various measures. The review suggests that savings be made on the basis of cost alone, without technological or geographical restriction. This is also the underlying logic of emissions trading as envisioned by the Kyoto Protocol.

Emissions Trading as established by Kyoto also allowed as a principle the sharing of burden between signatories (JI) and credit for reductions made in non Annexe 1 countries. Implicit in trading is that reductions be made where most cost effective and that technology transfer can be facilitated – in effecting smoothing out step by step achievements over time and amongst participants. Major emitters such as US, Australia, China and India are supportive of the principle of trading and there is a body of thinking that suggests that developing countries will not accept binding targets without some element of wealth and/or technology transfer – indeed a figure of 0.7% of developing country GDP has been mooted as an opening negotiating position. Scotland needs to consider in designing the detail of the Climate Change Bill that it will have to fit with likely future international frameworks – and hopefully will facilitate them.
The placing of limits on the use of carbon credits could therefore be argued to make it more difficult to secure international agreement on post Kyoto measures. It also will increase global compliance costs that in the absence of such trade would result in Stern’s cost estimates to be low. Using a geographical basis rather than a cost basis for reductions could therefore be thought likely to be economically inefficient and a barrier to the agreement of flexible international agreement.

Placing strict non-tradable geographical limits is also likely to result in different carbon abatement costs in different regions. This in turn is likely to lead to industries moving to areas where targets are currently lighter or compliance costs cheaper e.g. iron and steel to countries with loose targets, aluminium and paper to areas with cheaper carbon free hydro power etc. The smoothing and flexibility impact of trading is in effect lost because of the need for short term stepwise compliance rather than a move to broader targets.

Direct regulation has been proposed by some commentators as an alternative means of ensuring that the 3% per annum targets can be met. However this would require robust legislation and regulators with extensive knowledge of industry costs, abatement options etc. (a much tighter regime than any of us have seen thus far). Emissions trading on the other hand is argued to be more likely to be certain in effect in that abatement costs will rise or fall, driving compliance measures. (Whereas regulation requires regulators to always get it right).

In addition different regulatory standards, requiring products to be made by different processes in different countries (unless regulation could be harmonised globally) would have significant impacts on free trade.

Scotland is a small country with a comparatively small number of major emitters most of whom operate in open markets (electricity on a UK basis, whisky, paper and oil refining on an international basis). Plant size for many operators is large and often a measurable percentage of total Scottish emissions. Abatement measures are usually a step change – the changing of a method of firing, the closure of a plant or the fitting of carbon capture and storage. It would be a very significant task to ensure that these could mesh together (with transport and domestic heating) to result in something close to a 3% per annum target which is consistently met without sizeable over or undershoot - take as examples the closure of Torness, the opening of a new carbon capture ready coal fired power station (with capture actually fitted later) or a cessation of refining operations at Grangemouth.

In the absence of banking and borrowing or burden sharing, the setting of a 3% per annum reduction is therefore going to be very difficult to achieve by pure regulation. This is equally true of trading unless that is allowed to operate on an international (or at least EUETS wide) scale. These points suggest that because of the size of our country and the scale of major processes then setting a Scotland specific emissions budget is likely to be very limiting and economically inefficient in comparison to the flexibility and certainty of working within a tight international trading framework.

As noted above the great variety of policy measures designed to limit emissions, each having a different embedded carbon value is a barrier to economic efficiency. A control framework based on regulation would be likely to exacerbate this situation unless the regulator could second guess abatement costs and issue licenses accordingly. The logic behind emissions trading without international limits is that the market would discover a cost and abatement would take place wherever it is most cost effective (and this is Stern’s assumption). If this were adopted, Scotland’s emissions might rise, not fall and we might see a quite different range of technologies implemented (for instance Stern suggests abatement using nuclear power is much cheaper than many renewables). Economic purists would argue that this is how it should be – actions being driven by cost without devising complex regulation and a variety of technology support measures etc. This also would fit with the concept that over time all products and services, on a global basis should contain a carbon value – hence avoiding the need for continued Government intervention.
Turning briefly to the situation with regard to heat and to transport, some analysis of abatement possibilities also points to large step changes being common. Changes in emissions arising from heat production are likely to arise from a switch to Combined Heat and Power in industry (triggered by plant refurbishment) and by increases in gas price in the domestic sector. Securing a target of an 80% reduction will require heat and electricity to be produced in a largely carbon free fashion if some level of aviation use is to continue (as carbon free alternatives to aviation fuel are not currently regarded as feasible in the 2050 timescale).

Transport emission reductions too are likely to be driven largely by technology and that technology is likely to be driven by international policy – EU vehicle emission standards, the inclusion of aviation in the EUETS etc. and/or by major infrastructure projects such as rail electrification. This too points to it being difficult to see how Scotland as small country can meet fixed shorter term targets in a cost effective fashion.

In summary, then, setting fixed targets and restricting Scotland's emissions budget in terms of trade will result in the design of control frameworks becoming very difficult. It is quite arguable that with full flexibility Scotland could realistically set targets that are tougher still, going beyond the 80% currently proposed.

If the control approach is to be based on regulation then extensive legislation and policy instruments will be needed (many of which may not currently be possible in terms of devolution, EU legislation, GATT rules etc.). If an approach based on trading were to be adopted, then that would be highly distorted by these restrictions – and would result in different embedded carbon costs for Scottish produced goods and services. The more flexibility, the less the cost, the less the need for complex regulatory intervention, the more likelihood of compliance and the ability to set tighter targets still.

In conclusion, therefore, we need to think carefully about the kind of control frameworks we feel are preferable and the fit with international emission control mechanisms before finalising the approach – and that desired approach has to be embedded in the final wording of the Climate Change Bill.

Fred Dinning is a Fellow of the Institute of Engineering and Technology and of the Energy Institute. He was Energy and Environment Director with the ScottishPower Group until retiring at the beginning of 2006 where he was involved in energy policy issues since privatisation, both in the UK and US. He was a founder member of the UK Emissions Trading Group, represented the UK Electricity Industry on Emissions Trading in Brussels. He represented the electricity industry at a number of the COPs. During his career spent a considerable period working on the economics of generation planning and in roles covering most areas of electricity technology.

He is currently a Board member of the Scottish Environment Protection Agency, Chair of the Carbon Trust's Consultant Accreditation Panel and is Chair of the Advisory Group to the Energy Joint Research Partnership of the Edinburgh Research Partnership (a co-operation between Edinburgh, Heriot Watt and Napier Universities). He was also Convenor of the Church of Scotland Church and Society Council's sub group looking at energy/environment issues and sits on WWF Scotland's Advisory Council.

This response is made in a personal capacity reflecting his own experience and opinion and not those of any of the organisations listed above.
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

I'm particularly keen that aviation and shipping are included directly in the Bill from the start. This seems the most ground-breaking aspect of the Scottish Bill in international terms and could really move things along in the run up to the Copenhagen meeting.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

Yours sincerely
Dr Julia Dorin
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Tackling climate change is of huge importance to me because rising temperatures and climate chaos are putting the futures of our children and grandchildren at risk, increasing global poverty and threatening the ecology of our planet. I am especially concerned about the Scottish Government’s decision not to build any more nuclear power stations in Scotland, given that nuclear power is carbon free and can provide a constant, reliable supply of electricity. If the Scottish Government is serious about meeting it’s climate change targets, it’s reliance on coal power must be reduced.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All public bodies have a duty to deliver the targets set out in this Bill from the start Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Mrs Griselda Dow
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

In my opinion we now have a short window in which to tackle climate change and if we do not, we have lost any hope to ensuring that the planet continues to be productive, healthy and beautiful for people and wildlife. At the same time, in my opinion, we should begin to consider the needs for optimising population levels in order that we do not overstretch the capacity of limited renewable resources.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

- Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

- All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

- Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

- All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Ms Penny Edwards
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

I am frustrated that I am doing everything I can to reduce my own environmental footprint (shopping locally, buying low-impact local products where possible, using train instead of flying, choosing not to own a car but use bike & public transport instead etc etc), but don't see the same will from our authorities. Many of my 'green' actions are all the more difficult because they aren't 'main-stream' and therefore not well catered for.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Mr Larry Egar
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

We need a Climate Change Act with teeth that can deliver results, not a meaningless pile of paperwork worded to make politicians look good. It must include at least a 3% reduction in emissions year on year now, not in a decades time. Emissions from all transport should be included from the outset, that means from international aviation and shipping as well. All emissions, including consumption based emissions must be included, so we are doing what we “say on the tin” and not simply being good at home but then importing goods and services derived from poor practices abroad. The more Governments that implement good practices now, the more that will be inclined to follow and may be encouraged if they wish to gain trading opportunities.

To achieve this there needs to be commitment, which requires empowered people, so set up a Scottish Climate Change Commission now - why wait! In support of the Commission, Parliament should hold Scottish Ministers to account, making them deliver results, not more debate. To lead by example, have all public bodies deliver the emission reduction targets set out in this Bill from the start - we know the problem is not going to get better by itself so take definitive action and be part of engineering a global solution.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I want to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. I want the Scottish Parliament to deliver strong climate change legislation that will be implemented urgently and be a leading nation setting an example for other developed nations to follow.

Yours sincerely
Mr David Ferguson
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Climate change is the single biggest threat facing the planet and as the prime driver of global warming is human action it is our responsibility to take action to reduce the impact of our lifestyles. The Scottish Climate Change Bill is a measure that must therefore be supported.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

Yours sincerely
Mr Mark G N Ferguson
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

Please ensure that the Bill is robust with annual, measurable targets commencing in 2010 and penalties for non compliance.

Many thanks.

Yours sincerely

Mr Michael Ferrigan
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Quite simply, our and future generations prosperity and well-being depends on the strongest possible leadership from our Parliament on climate change. The Parliament has a unique opportunity to rise to this challenge through doing all it can to produce the strongest possible Scottish Climate Change Bill. I wish you well in deliberations - all our futures depend on you.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Yours sincerely
Ms Lorraine Finnie
Dear Convener of the TICC Committee

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

My friends and I have just become aware of the details of the proposed bill, and that today is the last day for comment. We hope that the strongest possible form of the bill will be adopted, allowing Scotland to lead the world in proactive response to climate change.

Specifically we look for annual targets to start now, inclusion of aviation and shipping emissions, provision for robust oversight, reporting, and accurate counting, limits on carbon trading, and inclusion of all public bodies in responsibility.

My friends hope to be able to send their own messages today, but in case they can't get to a computer, asked me to give their names as well as mine. They are: Vanessa Stuart, Michael Stretch, Jackie Adkins, Trish Fenton. We hope you will take our view into consideration!

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

Yours sincerely
Mr Vince Fitzpatrick
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

We need to find sustainable ways to run our country and to curtail our abuse of the world's resources. It is unacceptable that we assume it is OK to use more than our fair share to the detriment of people in other parts of the world.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Mrs Gina Ford
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

In the midst of an economic crisis, it's easy to shelve action on tackling climate change. Meanwhile climate change continues unabated and the consequences look very grim.

The probable timescale of change is frighteningly rapid. For example, the artic may be ice free (during the summer) in as little as 20 years! That would cause extinction of many artic species, most notably, the noble polar bear. The thought that our grandchildren will be burdened with such loss is extremely depressing and shameful.

Another concern is the acidification of seawater, due to changes in ocean currents and atmospheric CO2. This would apparently lead to further CO2 emissions from the ocean floor resulting in stagnation and certain death of marine food sources.

Given the timescales and the severity of the changes, delaying reductions in Scottish emissions is undefendable and counter productive.

We all need to change our lifestyles to reduce carbon usage now, not in 5 or 10 years.

We need radical political leadership to enact financial burdens (taxes) on consumption (energy, car use, flights and even imported food) and to subsidise cleaner alternatives (lpg public transport, micro-renewables, research on domestic energy efficiency). This is the only way we, the public, will change our behaviour.

In addition, we must contribute and campaign for international measures such as agreeing a model to reduce aviation and shipping emissions and to control damaging land use policies (i.e. palm oil plantations).

Finally, the climate change policies have to be robust, with penalties and incentives to ensure they are effective and not simply a redundant wish list, like the UN charter. Where there is a will, there is a way!

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

- Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

- All emissions are addressed from the start.
- A limit on carbon trading.
- Robust reporting

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Dr Irene Fortune
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Tackling climate change NOW is crucial to the healthy survival of our beautiful planet. As a loving mother and grandmother I want to ensure that future generations will be able to enjoy the countryside, coasts and seas pollution-free and full of the land and sea creatures which enhance our lives so much. I have been to the Arctic and the Antarctic- such pristine environments - but my heart is here in Scotland.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely

Mr Jamie Fry
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

I personally think it is of major importance to tackle the issue of climate change because of the impact it is having on our planet. When I choose to have children, I would like to be confident that there will be magnificent animals and beautiful scenery for them to experience. The way the world is headed just now, in my own lifetime, these things will be gone. This MUST change!

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Miss Stephanie Gardiner
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely

Mr Jonathan Geary
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Yours sincerely
Miss Carra Geddes
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

After two centuries of polluting the atmosphere with greenhouse gases the time has come when we must all attempt to reduce our carbon footprint - failure to act will result in catastrophic climate change affecting all living things. Scotland has an opportunity to be a world leader in showing how dependence on fossil fuels can be reduced by the use of alternative sources of power generation.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

Yours sincerely
Ms Anna Goss
WRITTEN SUBMISSION FROM HARRY GOUDIE

Climate change happens all the time. I don’t believe that we are experiencing man made climate change and therefore there is nothing we can do to influence it.

However, if I am wrong, and we are causing climate change then we have to address the problem at source and that is human population. If you reduce the world population by half then you will reduce emissions by half and that should fix your climate change problem!

The questions that you should be asking are:

1. Is there a climate problem?
2. Are we causing a climate problem?

Please don’t spend yet more money on something that probably does not exist or on something that is beyond our power to change.

Harry Goudie
Dear Convener of the TICC Committee

Yours sincerely
Mr Ross Graham
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Climate Change is important for many number of reasons:

a) Protecting threatened habitats and species
b) Ensuring we manage our lives sustainably so that future generations can benefit
c) Allowing those within developing countries not to be affected by materialistic westernised ways, and suffer direct consequences from our actions
d) For ensuring the wellbeing of the planet

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

Yours sincerely
Miss Amy Gray
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

The World Health Organisation tell us that are already over 160,000 climate change related deaths per annum, the vast majority in the world's poorest countries. It is the people in those countries who already suffer the most devastating impacts of climate change and will increasingly do so whilst we live in relative comfort having created the climate change problems through our earlier development. Tackling climate change NOW is essential and we in Scotland can lead the world with a strong Climate Change Bill.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Ms Claire Green
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Tackling Climate Change matters to me because I am concerned about the devastating impact it will have for people and nature around the world, and I believe developed, high carbon polluting countries such as Scotland have a responsibility to change their lifestyles and reduce their emissions as much as possible.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

- Serious action to reduce emissions - starting now. I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely

Mr Colin Hamilton
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

One person cannot change the world but collectively we as a nation can lead the way for others to follow. Climate change is real it is here we the people of Scotland must set an example to the rest of the nation and the world. Scotland has always been at the forefront it is in our interest to preserve nature once gone it is gone forever, where are the dodos? extinct!! Climate change will devastate more than one species us included it is time for reform now!

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Mrs Antosa Hamilton-Isherwood
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

While variation in global climatic conditions is by no means unusual based on geological evidence of prior periods of climate change, the current phase of global warming is unprecedented in its speed. The speed of this dynamic breaches what can be accommodated through normal ecosystem adjustment mechanisms, and as a result there is a clear danger (and growing evidence, such as the sharp decline in Scottish Puffin breeding success) of severe damage to ecosystems and the environment on a global scale.

Much remains unknown about other consequences that could be unleashed by rising global temperatures, including disruption of the Gulf Stream, or destabilisation of gas hydrates. In view of these consequences society needs to act swiftly and effectively in halting and reversing the factors contributing to global warming, of which reduction in CO2 emissions is one important element.

Some of the required changes require a major change of direction in areas like transportation and power generation, but there are a large number of small changes that can be made at the individual level. In many cases these individual changes require minimal effort. Unfortunately, this alone does not assure that they will take place, and politicians must therefore drive this process, in some cases through large scale policy actions aimed at issues like transport, but in others by leading by example. The Scottish Climate Change Bill will form the central pillar of these efforts and I would appeal to you to ensure that the Bill, through its targets and policies, tackles these issues in a serious, inclusive and convincing way.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

- Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

- All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

- Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.
• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Mr IAIN HANNAH
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Tackling climate change matters to me because I am concerned about the devastating impact it will have for people and nature around the world.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Mr Adam Harrison
Dear Convener of the TICC Committee

Dear MSPs,

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

The world, vested interests and the innocently ignorant apart, is realising that we must act and act soon to save our planet from the catastrophic effects of global warming. Scotland has an opportunity to be a world leader in tackling climate change and we should be proud to do so. It might also appeal to the Scots’ natural inclination towards thrift - something that is resurfacing in these difficult financial times. Please take this opportunity to make a real difference to the future of life itself.

Thank you.

Yours sincerely,

Ms Sally Harrower
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Climate change affects everyone and everything. The long term effects will be catastrophic to Humans and many other forms of life. The effects are already being seen and will continue to get worse unless significant changes are made to the way we live. The Scottish Government must take the lead in making those changes.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Yours sincerely
Mr Stuart Hay
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill. It is vital that serious reductions in harmful emissions are made each year, starting now. Please don't allow powerful special interest groups to use "the economy" as a fig leaf to resist the changes we all need to be making as of now.

I and many other people I know are already modifying our behaviour: people will not be prepared to go on doing this if they see others - including industries - being allowed to footdrag and negating their own efforts.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. Yours sincerely
Mr Michael Hellicar
Dear Convener of the Ticcc Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

I've looked at the Climate Change Bill and note the following points:

Re - 58 Deposit and return schemes
(c) ensure that some or all of such packaging is recycled.

I'm just wondering what is the point of a deposit and return scheme if only some of the packaging is recycled. Surely the requirement would be for most to be re-used where appropriate, or recycled then re-used by the manufacturer where appropriate. Surely it is generally better to recycle at the point of use (unless the manufacturer has set up a system specific to their product), otherwise the only benefit of returning packaging to a manufacturer would be to re-use it.

Re - 59 Charges for supply of carrier bags

There doesn't seem to be any differentiation between types or size of carrier bag. Are paper bags or bags made from natural/readily bio-degradable materials to be treated the same as bags made from non-renewable resources? Are crates and boxes used for carrying goods included?

Things I would have expected to see in the bill...

Energy self-sufficiency for Scotland could and should be achieved as soon as possible. Scotland could be world leaders in new energy and needs urgent investment in wave, hydro, and wind power (renewable resources we have aplenty).

Action on other disposable "one-use" products - e.g. plastic cups, disposable nappies, polystyrene packaging.

Some Cradle to Cradle thinking.

Action on product labelling, regarding environmental impact of product life cycle, to give consumers a more enlightened choice.

The updating of recycling facilities and transparency of information regarding what happens to recycled material, and who benefits financially from re-use of materials.

Requirement for new buildings to be zero carbon - the technology is available now so there is no need to delay on this.

Substantial investment for public buildings to be more energy efficient - (or even energy producing)

Water metering and use of grey/rain water.

My overall impression of the bill is that it seems rather half-hearted and narrow, and does not reflect the urgency and importance of this issue.
I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start. Yours sincerely

Mr Kenny Hogg
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Tackling climate change matters to me because I and very worried about the effect this will have on the human race. I also believe that you will not even read this section and will send your standard blurb researched political response. Which indicates the level of concern you have for your constituents worries.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Mrs Christina Hollinshead
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Climate change and peak oil are both linked - if both issues are not tackled we will all starve. The BBC documentary "A Farm for the Future" explains it beautifully and can be watched on the BBC iPlayer at http://www.bbc.co.uk/programmes/b00hs8zp for the next 25 days or so.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

- Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

- All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

- Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

- A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

- Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

- Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

- All public bodies have a duty to deliver the targets set out in this Bill from the start Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Ms Erica Hollis
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

This is a really important issue we need to be addressing, we are wrecking the planet and need to urgently do something about it if we are going to be able to live normally. We need to conserve the environment and the animals that live in it, the earth was fine before we started living on it but because of our selfish ways its getting destroyed. Please don’t reply to me by letter as many politicians already have because paper requires trees to be cut down which wrecks the environment!!!

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

- Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

- All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

- Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

- A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

- Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

- Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

- All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Miss Laura Hopkins
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is now an even more critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet. Here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050 but the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change. In my view it is vital that the current financial and associated political "crisis" is seen as an indication of need to strengthen this legislation rather than as an excuse to weaken it.

Therefore I hope you can make sure Scotland gets a strong Climate Change Act that ensures that:

- Serious action to reduce emissions starts now. Delaying a requirement for at least 3% reductions in emissions until 2020 means action may well be too late.
- All emissions are addressed from the start including that from international aviation and shipping.
- Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies.
- There is a limit on carbon trading.
- There is a robust reporting system to help Parliament hold Scottish Ministers and Government to account.
- As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.
- All public bodies have a duty to deliver the targets set out in this Bill from the start.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Tim Hughes
WRITTEN SUBMISSION FROM MICHAEL HUI

Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Tackle climate change matters to me as I want to ensure my children and the generations beyond can live in the same if not better world than we are at present. I think it is the best legacy we can leave them.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Mr Michael Hui
In response to the consultation I'd like to make the following points:

The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

The minimum 3% reduction p.a. should apply from 2010 onwards.

The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

International shipping and aviation should be included from the outset.

Yours
Roger Humphry
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

"Tackling climate Change matters to me because I am concerned about the devastating impact it will have for people and nature around the world".

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

Yours sincerely
Mr Tim Jacobs
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

There is a huge opportunity to enact the most progressive climate change legislation in the world. Reading the new scientist this week reminded me that significant changes to the climate are already stored up. If we do not act decisively NOW we won't be able to introduce remedies in the future. The ambitious Bill needs to set stringent annual targets to reduce CO2. It doesn't have to be suffering hairshirtism but an opportunity to build our communities for a resilient creative and supportive future. Take action and bask in the glory of getting credit from future generations. A truly great legacy. So more funding for alternatives to energy guzzling activities. Just two examples: Promote cycling walking and keeping it local. A comprehensive programme of energy efficiency measures with a team of auditors holding people's hands through the process. Give us the targets and lets get a plan of action organised. warmer more efficient homes and happier people for a start!

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate
change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely

Miss Pauline Jewett
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

From my perspective as a doctor (an Edinburgh GP), I am very concerned that runaway climate change will have serious effects on health world wide, due to increasing problems with food production, water shortages, and a change in the pattern of some infectious diseases, which will have the worst effects on the world’s poorest people, who have also made a negligible contribution to rising CO2 emissions in the first place. On the other hand, thinking more locally, measures to encourage people to leave their cars at home, and walk or cycle short journeys, (I cycle 5 miles each way to work, and feel all the better for it!), would significantly reduce CO2 emissions, and have a great benefit on the incidence of obesity, diabetes, heart disease, cancer and depression.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Dr Guy Johnson
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

It is vital that politicians look beyond their individual and their party’s short term interests and take action now to tackle the causes of climate change if we are to pass on a world which is worth living in to future generations.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

- Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

- All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

- Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

- A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

- Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

- Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

- All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely

Mr Alan Jones
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

I am concerned about climate change because it is vital to the quality of life of present and future generations.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

- Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

- All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

- Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

- A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

- Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

- Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

- All public bodies have a duty to deliver the targets set out in this Bill from the start. Yours sincerely
Mr Robert Kay
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Tackling climate change matters to me as I am concerned about what kind of world my children are growing up in. I want my children to grow up knowing what the Arctic circle is, what the North Pole is, what polar bears are, etc. The way things are going now, they only ever read about them in a History class. We need to have change and fast so that all our children and grandchildren grow up knowing all about nature in its full glory. Please help tackle climate change!

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

Yours sincerely

Ms Dianne Laing
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Tackling climate change is of utmost importance and as such should be our number one priority. Climate change will affect everyone, and everything on the planet. If we don’t act now, it will be too late. We need to ensure the climate change bill is strong enough to make the differences that are needed now to save the world for the future.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

Yours sincerely
Miss Tamara Lang
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Doing something about climate change is important because of the very serious impact it has for nature and for many of the poorest people in the world.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

- Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

- All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

- Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

- A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

- Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

- Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

- All public bodies have a duty to deliver the targets set out in this Bill from the start Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Mr Paul Latham
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Tackling Climate Change is essential for the well-being of future generations as well as for Scotland and its natural heritage. Unless a substantial commitment is made and followed through we are facing something much worse than recession.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely

Mr Lukas Lehmann
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

I really care about tackling climate change because I care about my children and their future. Just like any other parent, I want them to enjoy a good quality of life, and know the wonders of our planet - be it wildlife, the rainforest or the Arctic. I would find it very hard to explain to them why we didn't take action when we could.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start. I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Ms Elizabeth Leighton
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Tackling climate Change matters to me because I am concerned about the devastating impact it will have for people and nature around the world. There are a lot of pressing issues in the world at the moment, but I believe climate change should be at the top of the agenda because it concerns the very world we live in and whether the human race will survive the next century without any devastating consequences.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Miss Emma Levy
WRITTEN SUBMISSION FROM DAVID LIDDELL

Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Making efforts to recycle more efficiently, making less use of my car and cycling instead, purchasing local produce when possible and being more energy conscious - these are all ways that I am personally trying to help our climate.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Mr David Liddell
Please find my comments below:

The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

Such an ambitious target by Scotland alone is a nonsense - if indeed the theory of global warming is real (which it is by no means proven (quite the contrary) any emissions reduction MUST be achieved on a global basis - after all Scotland is only currently responsible for less than 0.2% of world CO2 emissions!!

The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

What are your views on the setting of targets in batches from 2010 to 2022?

Any such target set for such a long period ahead MUST have interim targets - if only to be used to compare with the achievements of other countries

The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

See response 2 above

The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

Purchase of so called carbon credits is a nonsense - remember that this has to be done on a global basis!!

The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

Again - what's the point of doing this as stand alone Scottish effort?? Recall that UK heavy industry emitting the highest CO2 levels have already been "exported" so the net impact on global emissions is ZERO.
The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government's approach to obtaining independent, expert advice on climate change?

Certain things simply CANNOT be done on a local and parochial manner

The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland's emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

Why just parliament - the populace needs also to know

The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

"Guidance" alone will never be enough to achieve the targets the bill sets

The Bill places a duty on the Scottish Government to produce a report for Scotland, setting out its objectives in relation to adaptation to climate change, proposals and policies for meeting them and the timescales within which they will be introduced.

What are your views on this proposal?

Not only objectives need to be set surely - the HOW to must also be spelled out - a wing and a prayer hope is not enough

Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are your views on this proposal?

Not a clue

The Bill will allow modification by order of the functions of the Forestry Commissioners to enable the Forestry Commission in Scotland to play a greater role in tackling climate change. The immediate intent of the Scottish Government is to take forward proposals relating to renewable energy development on the National Forest Estate and the release of capital from the National Forest Estate for woodland creation.

What are your views on this proposal?

Surely all the FC can do is grow more trees!!??
The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?

Regardless of ones beliefs re global warming this is a good idea - the earth's resources are, after all, limited

The Bill confers powers on the Scottish Ministers to make regulations providing for the assessment of (a) the energy performance of non-domestic buildings; and (b) emissions of greenhouse gases produced or associated with such buildings. The provisions are enabling in nature and the Policy Memorandum provides further information on the Scottish Government's thinking in this area.

What are your views on this approach?

No comment

The Bill places a duty on the Scottish Government to take such steps as it consider appropriate to promote the use of heat from renewable sources. The Scottish Government has indicated this provision will enable it to introduce measures it deems appropriate to incentivise the production of heat from renewable sources.

What are your views on this proposal?

Depends on what is defined as renewable sources - these must be defined

The Bill sets out measures aimed at improving waste and recycling. The Bill gives powers to the Scottish Government to make regulations in the following areas:
- Waste prevention and management plans;
- Waste data;
- Deposit of recyclable waste;
- Procurement of recyclate;
- Reduction of packaging;
- Deposit and return schemes;
- Charges for carrier bags.

What are your views on these proposals?

No comment

What are your views on the adequacy of the Scottish Government’s consultation in advance of publishing the Bill?

No idea - don't know the extent of the consultation

Do you have any views on the Strategic Environmental Assessment which was carried out by the Scottish Government out on the consultation proposals?

Never heard of this assessment - see 16 above
Does the Bill raise any equalities issues you would wish to highlight?
Some people can resort to use of renewables but others can't by virtue of their location - e.g. I do not have a stream/river on my property so cannot resort to hydro

Do you have any comments on the impact of the Bill on sustainable development?
No

Do you have any other comments on the Bill?
No
Dear Convener of the TICCC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Climate change is happening. There is enough scientific proof of this to know that a tough stance must be taken in order to reduce CO2 emissions.

The Climate Change Bill must take the view of the worst possible scenario and address emissions with immediate effect, imposing strong financial sanctions on companies who fail to reduce emissions to the level required.

Scotland needs its own Commission which should be set up immediately so Scotland can begin to act with accordance with its particular needs.

There needs to be a limit on the amount of emission reductions that Scotland can buy from overseas, to ensure Scotland Industries do everything they can to reduce their emissions without relying on a buy-out clause.

Finally I believe all public bodies should have a duty to deliver targets from the beginning of the Bill.

As a professional working in the environmental industry I am extremely concerned about climate change and believe that this Bill could go a long way in helping mitigate emissions, but only if it is executed in the correct way and a strong stance is taken.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Miss Katy Littler
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

I believe that climate change is the single most important issue facing the planet today, as it's potential repercussions will affect all aspects of life for people and the natural world all over the globe - no-one, nothing, nowhere will be spared from it's effects.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

- Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

- All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

- Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

- A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

- Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

- Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

- All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Mr Justin Littlewood
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Tackling climate change matters to me because I am concerned about the devastating impact it will have for people and nature around the world. I see the beautiful polar bears on TV and I think of how they may not be around in years to come. How can we teach our children to care for the world and about sustainability if the government does not act on it! I am a primary teacher and there is only so much I can teach the kids and get them to do. I can only help change the attitudes and actions of a few but you have the ability to make a huge difference.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely

Miss Charlotte Longmuir
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Climate Change matters to me because I am concerned about the devastating impact it is currently having for people and nature around the world.

Also, I am very concerned about the level of consumption of products, and think we need to move towards a subsistence or sustainable economy.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start. I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Miss Rebecca Lyon
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Tackling climate change is important in so many ways. People in the UK are already experiencing some aspects with the freak weather and warmer summers but it’s people in developing countries that will suffer the most - small changes in temperature can wreck people’s livelihood and if we can stop this happening then we should. Another reason is that in the end it will save us money. If we force industry to become cleaner quicker and try to persuade members of the public to do their bit, we will all be better off healthwise and financially. Obviously the issue of endangered species is very important, I do not want to grow old knowing that actions we have taken or have not taken have led to amazing, important animals being made extinct!

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

- Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

- All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all major emissions are included from the start.

- Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

- A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

- Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

- Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.
• All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Miss Louise McCafferty
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Yours sincerely
Mr Graeme McDermott
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

It is vitally important that the Scottish government sticks to it’s word and adheres to the original criteria as outlined in the Climate Change Bill. I do my bit to reduce my environmental impact but the government really needs to implement changes to help people like myself and others to further reduce national emissions. There is only so much one can do ALONE! The plight of many species such as the polar bear rests in our hands and this is one of the most worrying and alarming outcomes of global warming. Please implement a STRONG climate change bill for Scotland so we can help our planet and the species that inhabit it.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

Yours sincerely
Mr James MacGillivray
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

We all know why it's important to tackle climate change so I won't bother reiterating that here. The question facing us is: will we do enough about it to make any difference? Our parliament has an historic opportunity to take a lead on this most pressing issue, and I urge you to do the right thing, to make the difficult choices, and to take a principled stand. Give us a climate change bill the Scottish people can be proud of; one that boldly pushes forward, an example to the rest of the world.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

- Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

- All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

- Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

- A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

- Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

- Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Dr Donald Macintyre
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

Alarmed as I am about the devastation climate change will bring to our planet in the near future, I am pleased to see that the Scottish Parliament is on its way to making its Climate Change Bill an Act at the end of 2009. However, I believe that the aims of the Bill could be made much stronger.

The Bill currently proposes that we delay our annual reduction in carbon emissions target of 3% until the year 2020, and that emissions from international aviation and shipping will only be included after more consultation. Climate change is happening now and I am anxious to see Scotland take immediate action to reduce its emissions. What is there to be gained by delaying until 2020? It is essential that we act now if we even have a hope of protecting our planet and its endangered species from climate change.

I would also like to see a Scottish Climate Change Commission set up in the very near future which will advise and support the delivery of the emissions reduction targets in Scotland. Furthermore, it is vital that we impose a strict limit on the amount of emissions reductions that Scotland can buy from overseas if we want to ensure that Scotland does its fair share in tackling climate change. What is the point in purchasing more emissions reductions than are only absolutely necessary? This will only offset our efforts to reduce our carbon footprint. Finally, I would like the Bill to ensure that Scotland also considers consumption based emissions, as we are responsible for emissions produced when goods made in another country are then exported to Scotland.

Ultimately, time is of the utmost essence and the most crucial message I hope to convey here is that we must act now to reduce our impact on climate change. If the above steps are taken in strengthening the Climate Change Bill, I believe that our country will stand a much better chance of meeting its emission reduction targets and thus will be much more effective in tackling climate change.

Thank you for your time and I very much hope that my views will be taken into account.

Yours sincerely,
Miss Jilly McKay
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

This, probably more than any other Bill the Scottish Parliament are considering, is very important to me. I’ve been hearing about climate change for about two decades now and I still don’t see enough action being taken by Governments around the globe. I trust that my own Government will seek to change that and lead the way with a strong and robust bill. No watering down the commitments please!

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Mr Cameron McLatchie
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Tackling climate change matters to me because I care about the kind of world that my children (and any children they may have) are going to live in when they grow up. It's vital that we do something now to mitigate the worst effects of climate change. Delaying reducing emissions till 2020 is just leaving things too late, action must be taken now. Please let my children and your children and all the children of the world have a future in a world worth living in and please let Scotland take the opportunity to lead the world on this issue.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

Yours sincerely
Mrs Linda Macniven
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Tackling climate change matters to me because I am deeply concerned about the impact it will have on the life support systems that are vital to every living organism on this planet.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

- Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

- All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

- Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

- A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

- Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

- Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

- All public bodies have a duty to deliver the targets set out in this Bill from the start Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Mr Charles Macpherson
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

We all know with certainty now about the impact of climate change on our world. Please make the Scottish bill count. The onus should be put on house builders to provide eco friendly homes. Our very powerful supermarkets should be forced to reduce packaging and air miles in the food that they sell. The home owner would therefore be much more encouraged if they could see efforts being made by the rich and powerful.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

Mr J. Paul & Ana Maria Maguire (Mr & Mrs Maguire)
WRITTEN SUBMISSION FROM SANDY MAIN

The Climate has ALWAYS changed, so if any (supposed ) change which are currently being experienced, may or may not be due to man’s activities.

What is undoubtedly true is that there are TOO MANY People on Earth, and with the World Population rising by 220,000 a Day, action is urgently required to bring some redress and relief to a completely overstretched and exhausted World.

Sandy Main
Dear Convener of the TICC Committee

Please consider my views on the Climate Change (Scotland) Bill.

Climate change is the most important issue that anybody can tackle over the coming years as it dictates whether people have a future or not. They say money makes the world go around, and so far, all I can see is that money is bringing the world to a halt. Greed is the driving force for many and it stripping the resources from our planet and eventually all forms of life too. What we are doing is very badly wrong and it needs people now to stand up and be accountable and make important real changes for the future rather than a few soundbites to pacify the publics growing unrest on the way the world is being raped of everything good.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

Yours sincerely

Miss Eileen Mauchline
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

The Scottish Parliament should take a lead and show the world that we are an intelligent nation which realises that procrastination can not be allowed to happen over matters of global urgency such as climate control. We should not accept any watering down of legislation to appease the flat-earthers who will no doubt use the current credit crunch crisis as an excuse to do nothing.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All public bodies have a duty to deliver the targets set out in this Bill from the start Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely

Miss Colleen Middleton
Dear Convener of the TICC Committee

Can you please accept this as my response to the Climate Change (Scotland) Bill.

Climate change matters to me because we are only caretakers in this world and if we are selfish enough to continue on the path of carrying on regardless there will be nothing for future generations to pass on. We must have a clear strategy now and the Bill must ensure that we act now and in an effective manner.

Most people in Scotland are aware of the gravity of Climate Change but it should be everybody and not most people.

Yours sincerely
Miss Alison Mitchell
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

We should aim to support innovative approaches to dealing with environmental change. We should strengthen the balance of life on this planet for every creature - especially with recent decline. It would be good if Scotland could set a benchmark in standards. We need to think about adapting our current ways of operating and introducing eco-friendlier methods. We are an adaptable society now due to the nature of evolution - therefore people should be willing to embrace change. This should start from the top-down and communication is critical. If we could also better our economy/job market on this front then this would also be an advantage.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

- Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

- All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

- Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

- A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

- Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

- Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

- All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

William Clark Mitchell
Dear Convener of the TICCC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.
Yours sincerely

Dr Paul Graham Morris
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Tackling climate change matters to me because I am greatly concerned about the devastating impact it will have on people, biodiversity and ecosystems, particularly in developing countries where people are most vulnerable to climate change impacts.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The Bill must require at least 3% annual reductions in emissions (in line with the SNP Manifesto commitment), starting immediately and not in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. This is not acceptable.

• Scotland has a Scottish Climate Change Commission that understands the Scottish context, data and policies. The Commission should advise and support delivery of the emissions reduction targets in Scotland, and support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change. Where Scotland does purchase carbon credits, purchases should be made from projects that contribute to sustainable development, and ideally projects that have a climate change adaptation element or help build livelihoods in developing countries (e.g. Plan Vivo projects).

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland fully quantifies its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy. I am continually frustrated with the Kusnets curve argument, that we have developed to a point where we have started to decarbonise our economy - this is simply not true where we are continuing to consume goods whose impact is not included in our calculated footprint.

• All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and setting an example to the private sector.
I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely

Miss Alexa Morrison
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Tackling climate change is no longer a choice, it is now an obligation that we must fulfil if we have any consideration towards the future of our planet. It only takes one country to step forward and lead the way before others will undoubtedly follow. We have this chance to prove to the rest of the world that we are no longer willing to sit back and relinquish responsibility for countless years of over indulgence and misguided excess.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

Yours sincerely

Ms Shona Munro
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Adopting a strong and effective climate bill gives the Scottish Parliament the opportunity to help build a sustainable future, not only for the children of Scotland, but also for children in developing countries around the world. These countries are likely to be the hardest hit by increasing levels of climate insecurity, yet their carbon emissions are among the lowest in the world.

Let's lead the way, and show what a committed, caring country can achieve as we develop a blueprint for all our children's futures.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

- Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

- All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely

Mr Ben Murray
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

As Chief Executive of South Georgia Heritage Trust, working to support conservation projects in the British territory of South Georgia has made it clear to me that Scotland’s carbon emissions are contributing to climate change. This is having a devastating global impact, wiping out many species and endangering the future of the polar regions.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Mrs Alison Neil
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Tackling climate change matters to me because it is not just a small problem we can put aside and hope it will disappear. It is a global issue that affects all wildlife and people around the world. I believe if Scotland takes a stand, not only will it show larger countries that we can take a stand too, but it will encourage other small countries to do the same thing.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However, the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

- Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

- All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

- Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

- A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely

Mr Paul Nicholson
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

To dramatically reduce greenhouse gases, urgent action is required. I believe that the correct action in the short term is to maintain the nuclear generating capability (or even increase it) to provide breathing space until more renewables can be brought on line. Eric Nisbet

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Mr Eric Nisbet
Dear Convener of the TICCC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Because the results will not be seen in any way soon, is no reason to do nothing.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

Yours sincerely
Miss Rebecca Osborn
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

We must tackle climate change because, the damage we create now will leave an indelible mark on future generations. Our planet simply cannot sustain the current levels of CO2 emissions and the use of fossil fuels as a sole means of creating energy. There are many alternative methods and emerging technologies for generating energy from alternative sources, ie natural energy such as wind, sun and water. These sources were granted on earth to sustain life and can be utilised in effective manner to generate “green” energy.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

- Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

- All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

- Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

Yours sincerely
Ms Elsa Panciroli
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Pretty soon it is going to be too late. What’s left of the human race, after the short-sighted lack of action, will remember the Governments and people of today as a pack of greedy near-do-wells, just like the bankers, who didn’t care about anyone themselves. Remember we don’t own the world we are merely keeping it in trust for future generations. Show you care by taking action NOW.!

Once the Methane from melting permafrost gets into the atmosphere the heating up from greenhouse gasses will be unstoppable.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Mr Richard Pascal
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Tackling Climate Change matters to me because I am concerned about the devastating impact it will have for people and nature around the world.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

- Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

- All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

- Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

- A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

- Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

- Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

- All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Mrs J Paterson
Re the Greenhouse gas emissions reduction target-

Targets should be set even higher and should begin as early as possible so that the incremental effect begins to work immediately. To delay radical change makes achievement of the aims unrealistic.

Implementation of the measures needs to be rigorously enforced- this applies to all areas that the Bill covers.

George and Heather Paul
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

We must take strong action NOW to reduce our output of CO2 and radically change our lifestyle in order to do it.

This will need courage and consensus from the government, as there will be no votes to be gained.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.
I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely

Mrs Margaret Peacock
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely

Miss Aimee Penman
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Tackling climate change matters to me because I am concerned about the devastating impact it will have on people and nature around the world. While I try to do my best to reduce my carbon footprint, and that of my family, I know that it depends on governments to make a real difference.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Miss Catherine Peters
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

We need to tackle climate change so that our children have a planet to live on, and to spare them the resource wars that will come if we do nothing. But before then green technology is the way out of this recession, and not developing that technology will lead to a much worse recession next time as environmental degradation destroys our economies.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Mr Allan Price
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

I, along with a large number of my friends, are becoming cynical about our government and believe they are only paying lip service to their support for action on climate change. Where is the immediate action that the Stern Report and US’s Jim Hanson say is imperative if methane release from the melting permafrost in the Arctic is to be halted? The government's credibility is now at stake.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

- Serious action to reduce emissions - starting now. I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Mr Gideon Rathinaraj
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

It is really easy to set targets, the bill should also set out how they are to be achieved. This can be done by setting out what will be done to use the massive potential in wave and tidal energy that Scotland has. In this way a world beating piece of legislation can help to achieve world beating results.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Mr David Rennie
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Climate change is likely to have many devastating impacts on the environment, the natural world and mankind. These will cause misery and death for many millions of people, maybe in Scotland and the rich West but almost certainly for poor people particularly in the third world. Annual targets for the reduction of greenhouse gas emissions are needed for Scotland to make a meaningful contribution to addressing mankind’s greatest problem.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

- Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

- All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

- Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

- A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

- Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

- Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

- All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.
I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely

Mr Euan Renton
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

We are at a crucial point in the history of humanity. Rapid moves to tackle climate change and move to a zero-carbon economy must be the driver for all decisions of the Scottish Parliament.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

- **Serious action to reduce emissions** - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

- **All emissions are addressed from the start.** Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

- **Scotland gets a Scottish Climate Change Commission** that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

- **A limit on carbon trading.** A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

- **Robust reporting to help Parliament hold Scottish Ministers and Government to account.** The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

- **Scotland counts all its emissions.** As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

- **All public bodies have a duty to deliver the targets set out in this Bill from the start.** Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am already playing my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Dr Philip Revell
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Yours sincerely,
Mr Ruairi Revell
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Miss Kirstin Reynolds
WRITTEN SUBMISSION FROM SALLY RICHARDS

Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. Yours sincerely
Mrs Sally Richards
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

I am greatly concerned with climate change, as we will all ultimately be affected by it. Putting forward a strong climate bill is definitely a great start, and seeing strong policy and governing towards this is the first step. I believe that a top down method of management is the biggest way to get movement in this area, as we are breaking decades of human nature and habit, to try and move towards a greener and more understanding future.

Let's make the change, make real progress, and tell our children that we did everything we could. We saw the "bend in the road", took our foot off the gas, and put our foot firmly on the brakes. Let us not look back in shame, but with pride and unity.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Mr Peter Rickard
WRITTEN SUBMISSION FROM TREVOR RIGG

Q3 The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

I am concerned that the draft Bill proposes putting off annual reductions of at least 3% until 2020. Time for action is now, so the Bill must require immediate action of at least 3% reductions in emissions per year (in line with the SNP Manifesto commitment) from the start, not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

Q4 The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

There must be a limit on the amount of emissions reduction that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reductions and plays its fair part in tackling climate change.

Q5 The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

Ministers have made a commitment to include international aviation and shipping from the start, but the Bill as drafted does not provide those assurances. It says emissions from aviation and shipping will only be included after more consultation and legislation. The Bill should be clear all emissions will be included from the start.

Q7 The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

Trevor Rigg
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Tackling climate Change matters to me because I am concerned about the devastating impact it will have for children, adults and nature around the world. I find it somewhat frustrating that, despite cries from the public as well as the scientific information provided by researchers within this field, we still have to procrastinate and deliberate about installing vital legislation which will inevitably protect our future on this planet. I understand that drastic targets are daunting and that no party wish to commit to the 'first step' for fear of public disapproval, however there is no point in protecting a ideology or economy that without our environment would cease to exist in the first place. Based on the opinions voiced to myself from members of the public, as I work within the environmental sector, I can assure that committing to these targets will be interpreted as a bold move made by a government who cares not only for today's economy but also for the future generations who will ultimately be left with the repercussions of our choices we make today. It is for them, the future generations, I feel the most for, as where we are still dealing with the consequences of the wrong environmental decisions made during the industrial revolution, they will have to face a vast decrease in their quality of life as conditions change, possibly leading to displacement of the greater population.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - Starting Now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Yours sincerely
Miss Kerry Roberts
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

It's important to tackle climate change NOW as we are all reassessing our values. People are concerned on the energy they use because of prices and are therefore more likely to LISTEN to changes they can personally make which will also have a much bigger impact on the world around them. Children are being educated and are taking these ideals home, and this will grow to become the norm. Children often question the decision we as adults make, when they often seem to be more in tune with the planet than the adults that are motivated by money and greed. The time is right - THE TIME IS NOW

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

- Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

- All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

- Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

- A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

- Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely

Catriona

Ms C ROBERTSON
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Tackling climate change matters to me because I am concerned about the devastating impact it will have for people and nature around the world. I’d like my little baby daughter to enjoy the world as we know it - possibly better than we know it now - and you can control this.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Mrs Angela Rose
Our experience in the Glasgow Carbon Rationing Action Group (CRAG) has shown us that reducing personal carbon emissions by 50 to 75% below the national average can be achieved at zero cost by simple albeit significant lifestyle changes. We have made these changes voluntarily. Others will require incentives. However, our experience leads me to believe that rapid and dramatic decarbonisation is possible and that it need not rely on expensive and uncertain techno-fixes.

Q1 The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

The clear message from the scientists is that there is no more time to lose.

“If there’s no action before 2012, that’s too late. What we do in the next two to three years will determine our future. This is the defining moment.” Rajendra Pachauri, Scientist, Economist and Chairman of the Nobel-winning International Panel on Climate Change, November 2007.1

“Arctic ice is in its death spiral.” Mark Serreze, NSIDC Climate Scientist, 27 August 2008.2

“What happens in the Arctic actually does not stay in the Arctic.” Richard Spinrad, NOAA Deputy Chief, October 2007.3

“A 50% reduction would stabilise atmospheric CO₂, but only for less than a decade. After that, atmospheric CO₂ would rise again as the land and ocean sinks decline owing to well-known chemical and biological adjustments.” IPCC Fourth Assessment Report Working Group I.4

The 2050 and 2030 targets are inadequate. A growing body of scientific evidence indicates that atmospheric greenhouse gases are already at unsafe levels5,6. In this case, the only reasonable course of action is to start reducing global emissions straight away and to bring them back to safe levels as soon as possible. Scotland is uniquely placed to lead the global race out of carbon.

Scotland can take a lead within the UK…

Unfortunately, as the Bill currently stands, by 2020 Scotland is likely to be well off the pace, even in comparison with the rest of the UK. The UK Climate Change Committee has recommended two reduction targets for 2020: 34% in the absence of a global climate agreement and 42% if an agreement is struck. To achieve these targets, Scotland would have to make cut emissions at an annual rate of 2.7% and 4% respectively over the period 2011-20207. Currently, the Bill permits Scotland to make no significant cuts in emissions until 2020. To reclaim poll position within the UK context, the Scottish Government would have to amend the Bill to incorporate annual cuts of at least 4% from the first year of implementation. …and globally by setting credible targets.

---

2 http://www.reuters.com/article/environmentNews/idUSN2745499020080827?sp=true
The 2050 target is in line with the UK Climate Change Committee’s recommendation that an 80% cut from 1990 levels is the UK’s fair share of a global cut from 2000 levels of 50%. However, the 80% target is flawed on three counts.

Firstly, it is tantamount to abandoning efforts to limit global warming to the danger threshold of 2 degrees as defined by the IPCC and recognised by the European Union and the UK government. This is because the Climate Change Committee has calculated that a 50% global cut (including an 80% UK cut) results in a better than evens chance of exceeding 2 degrees of warming. The IPCC 2007 report states that in order to limit global temperature rise to 2 degrees, emissions must peak by 2015 and fall by 85% by 2050. This is consistent with a cut in Scottish emissions of 95% by 2050 from 1990 levels. To achieve this degree of decarbonisation, the Scottish Government would need to amend the Bill to incorporate annual cuts of at least 7% from the first year of implementation. Such a move would be essential in order to restore Scotland to a position of global leadership in climate change policy.

The Scottish Government must communicate the irrationality of pursuing the current UK proposals and make the moral and economic case for far more ambitious action.

The second problem with the 2050 target is the unacceptable tolerance of risk and excessive aversion to the costs of mitigation that it implies. The Climate Change Committee has estimated that the economic cost of following its proposed trajectory would by 2050 amount to 1-3% of GDP globally and 1-2% of GDP in the UK. These losses translate to a reduction in annual rates of income growth of less than 0.1%! It is nonsense to assume that present and future generations would be unwilling to pay more than this to ensure an inhabitable world for their children and grandchildren. The Scottish Government must clearly communicate the dire consequences of taking insufficient action at this critical juncture and make the moral and economic case for the far more ambitious action that is required in order to safeguard all our futures.

The Scottish Government must persuade itself and others to be responsible in the way it employs the scientific evidence to set policy.

The third flaw applies as much to the notional 95% target as it does to the currently proposed 80% target. Both targets are drawn from IPCC models that adopt the best estimate value of 3 degrees for climate sensitivity. Climate sensitivity is the expected increase in global average temperature as a result of a doubling of atmospheric greenhouse gas concentrations. The IPCC itself suggests that “policymakers may want to use the highest values of climate sensitivity (i.e. 4.5 degrees) within the ‘likely’ range of 2 to 4.5 degrees set out by the IPCC...to guide decisions.” This would seem reasonable given that current models do not yet include the faster than expected Arctic ice melt and its potential impact on sea levels and on the degradation of arctic land and sea-bed sinks.

If the more responsible climate sensitivity value of 4.5 degrees were to be adopted, atmospheric concentrations of greenhouse gases would have to be stabilised at no more than

---

9 Refer to Figure 1.11 in Chapter 1 of UKCCC 2008 Report.
11 This assumes global emissions in 2000 of 44.7GtCO₂e (as per Fig SPM3 of IPCC 2007 AR4), a global population of 9.2 billion in 2050 (as per http://www.un.org/News/Press/docs//2007/pop952.doc.htm), Scottish emissions of 68MtCO₂e in 1990 and a constant population of 5 million.
12 Refer to p2 of Executive Summary of UKCCC 2008 Report
380ppmvCO\textsubscript{2}e in order to limit temperature rise to 2 degrees. This is lower than the current concentration of atmospheric CO\textsubscript{2} alone. Returning to these levels will take decades, even if we were to drastically cut emissions overnight. According to the IPCC, “complete elimination of CO\textsubscript{2} emissions is estimated to lead to a slow decrease in atmospheric CO\textsubscript{2} of about 40ppm over the 21\textsuperscript{st} century.”\textsuperscript{18} The Bill’s targets must reflect this more precautionary approach.

A simple and equitable framework for decarbonisation must be implemented at the earliest opportunity.

The most important policy move following the enactment of the Bill will be to introduce a meaningful carbon price into all economic transactions. Current policies are failing. This could be done through a carbon tax or an auctioned cap. Crucially, the revenues must be recycled equitably into the pockets of the population at large to provide compensation for the inevitable price rises in carbon intensive goods services and also to facilitate the massive behavioural change that will be required. The Scottish Government should urgently consider how a Cap and Share-type model might be implemented in Scotland.\textsuperscript{19}

**Summary**

The clear message from the scientists is that there is no more time to lose. Scotland can take a lead within the UK and globally by setting credible targets. The Scottish Government must communicate the irrationality of pursuing the current UK proposals and make the moral and economic case for more ambitious action. It must persuade itself and others of the need to take a much more precautionary approach to climate policy. To claim to be showing international leadership, it must at the very least adopt an annual rate of reduction of 7\% from 2011. This translates into targets for 2020, 2030, 2040 and 2050 of 52\%, 77\%, 89\% and 95\% respectively below current levels. To ensure public support for rapid decarbonisation, the government must implement a simple and equitable framework at the earliest opportunity.

\textsuperscript{18} IPCC Fourth Assessment Report, Working Group I, 2007, Frequently Asked Question 10.3 “If emissions of greenhouse gases are reduced, how quickly do their concentrations in the atmosphere decrease?” available at [http://www.ipcc.ch/ipccreports/ar4-wg1.htm](http://www.ipcc.ch/ipccreports/ar4-wg1.htm)

Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Miss Jayne Russell
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

We are presently having to face considerable challenges due to recession. Climate change is, however, and will continue to be a far greater challenge for our future. We need to take the strongest action possible.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

Yours sincerely

Mr Jonathan Russell
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

The erratic weather patterns of the last few years and their impact on Scottish wildlife show how much we are already affected by climate change. We cannot afford to do nothing and we have the resources and potential to do much in the way of renewable energy. Don't let the (temporary) credit crunch postpone the impetus to act against (urgent) climate change.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

Miss Claire Samuel
Dear Convener of the TICC Committee

I have just this week started my climate-related research in the University of Glasgow. I am writing to express my ardent wishes concerning the Scottish Climate Change Bill. I think it's vitally important that:

-the Bill requires at least a 3% reduction in emissions from the very beginning, not from year 2020 (as it will be too late by then)

-the Bill addresses the emissions from international aviation and shipping, from the very beginning (for the same reason as above)

-the Bill sets a limit on the amount of emissions reductions that Scotland can buy from overseas (to preserve its effectiveness)

-that all emissions are counted, including consumption based (as changes in our consumption habits are inevitable, if the global warming is to be tackled at all)

I trust you will do your best to preserve all life on the only planet we have!

Yours,

Paula Sankelo
MA, MSc
PhD student, the University of Glasgow
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Tackling Climate Change seriously is literally 'vital', because of the devastating impact Man's actions are having on people and nature, around the world.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

Mr Jan Semotam
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Apart from the disastrous effect on wildlife and the ecology, by ignoring the potential effect of climate change we are, quite literally, committing suicide. We simply have no alternative to this world and Scotland now has an "opportunity", once again, to demonstrate awareness of this and a willingness to remedy it.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

- Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

- All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely

Mr Fraser Shand
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Ms Jacqueline Sharp
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Tackling climate change is the most important issue for the world. The Scottish Parliament should use all endeavours to take positive action to address this. I am concerned about the devastating impact it will have for people and nature around the world.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

Yours sincerely
Mr Gordon Shaw
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

We now have an urgent duty to act.

Back in the summer of 2008, we were told by the Green New Deal group that we had 100 months to save the Earth. By this it was intended that we needed to act in order to mitigate as far as possible irreversible changes to our climate, and ultimately to mankind's way of life. The clock is now ticking and action so far has been painfully limited.

We need government leadership, accurate and convincing public information and legislation in order to make this happen. This needs to be forthcoming, and this year's Scottish Government budget is a prime example of how it has not been forthcoming.

Already there are problems in developed countries, such as Australia and in developing countries such as India and China. If a developed nation like Scotland does not take the action and lead the way showing how it is possible to thrive whilst acting in an environmentally sensitive way, these developing countries will not see the need to act either.

Our countries have caused the damage over the last 200 years of industrialised civilisation, and we must now lead the way in showing how to repair this damage so that others can follow.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.
• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely,
Mr Lee Shelton
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Tackling climate change matters a great deal to me. I firmly believe that, if it is left unchecked, it will have a devastating impact not just globally and environmentally, but also upon the foundations of our own economy and society.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

Yours sincerely

Mr Peter Sheridan
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Recent actions by the Scottish Parliament, for instance in diluting the Green Party proposal to increase spending on insulation, suggest there is little appetite to really grasp the importance of both climate change and peak oil. These two issues mean we have to think beyond "business as usual", and an effective Climate Change Act is essential to starting the change.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. I appreciate there are practical difficulties in measuring Scotland’s share of international emissions, but nevertheless, the Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A challenging limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Mr Martin Sherring
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, that could be the best in the world and could be a blueprint for other developed nations.

After all, as millions of years of evidence suggest, the Earth can and will eventually survive anything that is thrown at it, the question is can mankind say the same?

Yours sincerely
Miss Lorraine Simpson
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

As a university student studying Geography and Environmental Science at Dundee University, I am very aware of the environmental impacts that are present.

It is imperative that something be done to tackle climate change both to maintain and preserve a clean environment and to put more emphasis on the actions that should be taken to combat these problems. I urge you to take action in order to reduce environmental damage.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

Miss Katrina Smith
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

We need to care what happens to people and animals and our world.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Mrs Michelle Smith
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

As convener of Balfron Church Eco-Congregation Team I have long been trying to encourage people to take seriously the way that our lifestyles are squandering the earth's resources. However each individual can have very little effect. It needs concerted efforts by governments in the developed countries. I would like Scotland to take a lead in this, (and also to build up the expertise to become world leaders in the provision of renewable energy from tidal and wave power.) I know that this involves cutting back on unsustainable practices I may have become used to, but I will be all the more happy to do so if the law means that I am not alone, and the tax system encourages such changes.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Mrs Margaret Sparkes
WRITTEN SUBMISSION FROM ROBERT SPARKES

Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

We have a limited time left to cut carbon emissions before the world's climate reaches its "tipping point", after which it becomes too late. If we don't act decisively now, we'll get sea level rises to wipe out most big cities (including Edinburgh) and unsupportable mass migration to Europe. Millions will die of starvation and/or floods and there'll be major world wars to maintain/seize territory. We need to act NOW.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Mrs Rachel Steele
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Climate change is the one issue that will affect every aspect of life on this planet and that no species, continent or country will be exempt from no matter how poor or wealthy they are. Governments are understandably concerned with economics when considering climate change legislation: but a catastrophic degree of global warming - which is just around the corner - will clearly trigger economic crises on a far grander scale than anything we are currently witnessing. If we and the many species with whom we share the planet are to have a future, this must be prevented.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

Yours sincerely
Ms Julie Stoneman
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

With crucial climate talks in Copenhagen later this year, Scotland is uniquely placed to influence the world in tackling climate change.

Yet the Climate Change Bill needs to be strengthened in 4 particular areas in order to be world-leading:

The Bill should

1) include our fair share of international aviation and shipping emissions on the face of the Bill
2) ensure annual targets are set with regard, and at a level, that ensures a cumulative budget for Scotland between now and 2050 is met
3) include sufficient incentives and sanctions for public bodies to make cuts
4) ensure the majority of emissions cuts are made in Scotland and not bought in from elsewhere

In addition I support Stop Climate Chaos demands below:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Mr Francis Stuart
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Dearest Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

I think it is important to tackle climate change, not simply because it will be good for the planet but also good for Scotland.

It would put a great deal of focus on our tiny country and in a world where it is cool to be green, there can't be any negatives in pushing the country towards a trendsetting position.

We keep being told that Scotland has the natural resources to provide over 100% of the energy required by the Countries population. We have huge potential in Wind, Wave and Tidal energies. Should we not take the chance while the oil industry is flagging and the engineering resource is still within the country boundaries to shift our focus and become the main player on the World stage when it comes to 'Green Energy'.

Scotland could go from being at the forefront and a central member of the Oil business to a forward thinking and the World leader in Green Energy, employing thousands and boosting the economy in a way that the Oil industry does presently.

The country is headed into a recession and if the Government is correct and 'buying' the country out of the recession is the way forward, then surely buying into infrastructure projects is the most cost-effective route? Unlike roads etc there would be a long-term return, recuperating money over the long term and attracting focus from all corners of the world and this energy provision won't 'run-out' like oil, therefore energy prices will be secure, a benefit for every member of the Scottish population.

This is our chance, once again to shine on the world stage, we should take it!

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

- Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

- All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

- Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.
• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Mr James Taylor
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

As a Grandparent, I very much want to ensure that my Grandchildren will have a world to inherit. I strongly urge the Scottish government to urgently tackle climate change for the sake of the next generation of children, wildlife and the environment in general.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

Mrs Yvonne Taylor-Robertson
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

I would like you, who represent us, to set the example in acting responsible. We are not talking about a theoretical future. We are talking about a future your children, if not yourself, will experience. A future made up of violent storms over here, and possibly a third world war triggered by tensions around precious resources such as water. Please think as a human being, not as a fixed-term elect. Your children will owe this to you.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely

Mr Yann Tessier
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

I believe that politicians and others who are closely involved with climate change have a huge responsibility to the public at large. We must ensure that urgent action is taken to mitigate the impacts that climate change would otherwise have on our society. Future generations will not forgive us if we fail them at this critical time.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

Yours sincerely
Dr Barbara Tinto
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Tackling climate Change matters to me because I am concerned about the devastating impact it will have for people and nature around the world.

It is our responsibility to ourselves, each other and the planet to take whatever steps we can to reduce global warming and I think that the Bill needs to be stronger. The problems of Global warming and climate change are immediate, they are critical right now and action needs to be taken right now, not x years down the line.

With this bill we have the opportunity to make a difference immediately. Lets grasp that opportunity fully, and not work in half measures. Pass a bill that will make a real difference, that will give us the best possible chance of helping the world and not just a token gesture.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. Yours sincerely

Ms Sue Walker
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

I consider that tackling the causes of human induced climate change both radically and positively is the most important issue facing humanity today.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Ms Alice Walsh
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

We are entering a critical time in our battle to avert dangerous levels of climate change as the IPCC have stated that we have a rapidly closing window of opportunity to act. Climate change is the most serious issue that faces humanity and we must take urgent action if we are to secure our own wellbeing and the wellbeing of other life on Earth. I am extremely proud that Scotland is leading the way, putting in place world-leading legislation. But I am deeply concerned that the Climate Change Bill will fall short of both our ambitions and what experts tell us is necessary.

This legislation can be both strengthened or weakened as it goes through the Scottish Parliament and I expect those that were elected to represent me to do all they can to strengthen this legislation. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However I urge that the Bill is strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous levels of climate change.

I wish to see a Scotland a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

As a founding member of our Transition Town group I am already playing my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Ms Morag Watson
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Please - do it properly and do it now - include all emissions, and start reductions immediately. This is more important than politics and more important than short-term economic troubles.

Wouldn't it be nice for Scotland to lead in something again, especially something critical to the future of the world.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Mr Barbara Weir
Dear Sir

Climate Change (Scotland) Bill

It seems to me that the more people there are in our population, the more emissions there are. This is simple arithmetic. If our population increases by 10%, then emissions increase by 10% also.

For example, if we have approximately 5,200,000 people now, each emitting approx 5.4 tonnes C02 per year, the aggregate emissions are 28,080,000 tonnes C02.

If we allow the population to drift up by 10% to 5,720,000, at the same rate of production per individual, the aggregate becomes 30,888,000 tonnes C02.

But if we consider that emissions of 28,080,000 tonnes C02 form a target not to be exceeded, emissions per individual must be reduced to 28,080,000 / 5,720,000 which equals only 4.9 tonnes per individual per year.

If we allow our population to drift upwards, it will become more and more difficult to meet our targets of maximum aggregate emissions. We will fail in our obligations.

Population size is surely related to aggregate emissions as voltage is to electricity, or the height of a water tank to water flow from a tap. And of equal fundamental importance.

It is clear a population control policy should form part of the Climate Change (Scotland) Bill.

I am surprised to find no mention of this in the ‘Bill as it stands. I very much hope this will be remedied as a matter of urgency.

Yours sincerely

Eric J. White (M.Sc)
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Tackling climate change should really be at the forefront of all minds right now. Whereas your Government may not be around in years to come, the human race, hopefully, will...let's ensure this planet can sustain the life-forms on it - its the only one we have.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

Yours sincerely
Mr Tharindu Wijetunga
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Climate change is undoubtedly one of the biggest threats to our way of life. It is also a very imminent threat to countless species of wildlife, many of which are already feeling the effects of a warming atmosphere and sea temperatures. It is important to develop as a nation, but we must do this in a very much more sustainable way than we have up until now. We must be more efficient and less wasteful, especially when it comes to energy expenditure. I strongly urge the Government to make the climate change bill as strong as possible so as to lead the world in terms of legislation to tackle climate change.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Ms Sarah Williamson
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Issues on which the Committee is seeking views:

The Bill creates a statutory framework for greenhouse gas emissions reductions in Scotland by setting a 50% reduction target for 2030 and an 80% reduction target for 2050.

What are your views on the 2050 target and a 2030 interim target proposed in the Bill?

1. I am very seriously concerned that the ’80% target by 2050 is inadequate.

It seems to generally accepted now that we must not go beyond a threshold of 2 degrees of warming above 1990 levels in order to avoid ‘dangerous’ warming.

This target is based on a stabilisation level of 450ppm-500ppm. IPCC 2007 shows that this is not guaranteed to keep global temperatures below a 2 degrees increase. It gives only a 50:50 chance.

In a 2007 paper written by James Hansen of NASA in the Philosophical Transactions of the Royal Society, it says we cannot go beyond 1.5 to 1.7 degrees of warming above 1990 levels.

The speed of ice melt has been underestimated by the IPCC and the loss of reflection (albedo) from the poles will add further to warming.

He also states that ‘If you leave us at 450ppm for long enough it will probably melt all the ice - that’s a sea rise of 75 metres. What we have found is that the target we have all been aiming for is a disaster - a guaranteed disaster’ (Guardian).

His suggested safe stabilisation level is 350ppm which means a considerably more serious target. I have not been able to calculate the appropriate target but George Monbiot has recently suggested a cut of 25% by 2012. This indicates that an appropriate target would be much more serious and underlines the importance of early cuts.

There is a website relating to 350ppm here http://holyrood350.org/

Though I appreciate this is a very difficult problem, particularly in a democratic system, we absolutely must avoid runaway climate change because the human and economic costs are immeasurably more serious than economic and political concerns about measures to avoid it. By the time most of the electorate are convinced of this, it will be too late to do anything about it.

2. Secondly as the NGOs say, the Interim target is a useful milestone in principle, but the 2030 target set is not on the trajectory that would have been achieved with at least 3% emission reduction targets annually from the start. This would have meant a 60% rather than 50% reduction by 2030, significant in terms of what needs to be achieved.
It is a more inadequate target within an inadequate target. Furthermore, early cuts are more valuable in terms of reducing climate change because climate change is accelerating due to positive feedbacks. The melting ice and loss of albedo is just one of these.

3. We must take into account ALL of Scotland’s emissions. International aviation is the fastest growing source of climate change emissions. If it is excluded, and passenger numbers grow as predicted, research carried out by the World Development Movement shows that aviation in Scotland will account for more than 100% of our 2050 greenhouse gas allowance, making a mockery of emissions reductions achieved in other sectors.

There is no problem determining which emissions are Scottish. There is no need for alignment/agreement with the UK bill because Scottish emissions from aviation and shipping are known. We know what we are responsible for so we can include it in the Scottish bill.

In principle you just have to add up half the emissions from every journey to and from Scotland.

What can Scotland do to reduce these emissions?

As a nation, we could do more to promote tourism within Scotland, encourage people to holiday at home and reduce demand for flights outside the country. This would not just be of benefit in terms of emissions reduction, but of benefit to Scotland’s economy and heritage as well.

Scotland has policy levers to promote and encourage use of other methods of transport such as train links to the major cities across the UK and Europe. By using Scotland’s planning powers to rule out future runway expansion and airport infrastructure, the Scottish Government can play a key role in curbing the growth in demand to more sustainable levels.

http://assets.wwf.org.uk/downloads/scottish_climate_change_bill_briefing_3___aviation___shipping.pdf

4. Lastly there must be no carbon trading, they must be all be Scottish emissions.

The Bill requires that the Scottish Government sets annual targets, in secondary legislation, for Scottish emissions from 2010 to 2050. It is proposed that these annual targets will be set in batches, the first being for the years 2010 to 2022 inclusive.

What are your views on the setting of targets in batches from 2010 to 2022?

in early years, targets must be absolutely strict - at least 3% and any overshoot should not be taken to reduce the requirement in other years. Early cuts will be more effective than later ones.

This should only be relaxed in later years if the massive cuts have been achieved in earlier years and then current science indicates that this is reasonable (which is highly unlikely).

The Bill provides that from the year 2020, the annual emissions targets must be set so that each is at least 3% lower than the target for the previous year. Prior to 2020, the Scottish Government has indicated that it intends to set annual targets which build towards delivering emissions reductions of at least 3% each year.

What are your views on this approach or any possible alternative approaches?

WWF Scotland state ‘the time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.’
A report for the Australian government last year states that the developed nations including Britain, the US and Australia, would have to slash carbon dioxide emissions by 5% each year over the next decade to hit the 450ppm target.

There is an objection that winters could be cold or mild and summers mild or hot, which makes it difficult to keep to statutory annual targets, and consequently we should allow average targets of 3%.

In answer to this I would say that, in early years, targets must be absolutely strict - at least 3% and any overshoot should not be taken to reduce the requirement in other years. Early cuts will be more effective than later ones.

This should only be relaxed in later years if the massive cuts have been achieved in earlier years and then current science indicates that this is reasonable (which is highly unlikely).

To overcome this difficulty about winters and summers, the target should be sufficiently in excess of 3% in order to absolutely guarantee a minimum of 3%.

This is necessary in order to ensure the target of at least 80% by 2050 is reached. The bill is meaningful if its terms ensure the target of at least 80% reduction by 2050 is achieved. An exact or average 3% reduction a year would not achieve the target. Targets must be achieved - not just set.

The important thing about the target is the reduction in total emissions. The target assumes a steady reduction in emissions.

The Bill introduces the concept of a “net Scottish emissions account” as a point of reference against which the target for reducing greenhouse gases can be measured. It is defined as the net Scottish emissions plus or minus any carbon units credited to or debited from the account. Any units purchased may be used to offset Scottish emissions. Any carbon units generated in Scotland and sold to customers outside Scotland, count as emissions made in Scotland.

What are your views on the proposals in the Bill relating to the net Scottish emissions account, and should there be a limit on the number of carbon units which Scotland can purchase?

Scotland counts all emissions, including consumption based emissions. All emissions that we are responsible for should be considered - including those made in another country when goods are produced but are then exported to Scotland.

No carbon trading should be permitted at all. No buying emissions from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

The Observer Sunday 18 January 2009

Plans to include carbon trading schemes in talks about future climate agreements were a desperate error, he said. "It's just greenwash. I would rather the forthcoming Copenhagen climate talks fail than we agree to a bad deal," Hansen said. Only a carbon tax, agreed by the west and then imposed on the rest of the world through political pressure and trade tariffs, would succeed in the now-desperate task of stopping the rise of emissions, he argued. This tax would be imposed on oil corporations and gas companies and would specifically raise the prices of fuels across the globe, making their use less attractive. In addition, the mining of coal - by far the worst emitter of carbon dioxide - would be phased out entirely along with coal-burning power plants.
The Bill defines “Scottish emissions”, in relation to a greenhouse gas, as being emissions of that gas which are attributable to Scotland. The policy memorandum states that “Scottish emissions” are defined as being those greenhouse gases which are emitted in Scotland or which represent the Scottish share of emissions of gases from international aviation and international shipping.

What are your views on this definition of Scottish emissions?

Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

Ministers have made the commitment to include international aviation and shipping emissions in the targets from the start, but the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should be absolutely clear that all emissions have to be included from the start.

The Scottish Government has indicated that initially it intends to seek independent, expert advice on climate change from the UK Committee on Climate Change. The Scottish Government states in the policy memorandum that if it determines that the UK Committee on Climate Change does not meet all the advice needed for Scotland, the Bill contains provisions which will allow the Scottish Government to establish a Scottish Committee on Climate Change or to designate an existing body to exercise these advisory functions.

What are your views on the Scottish Government’s approach to obtaining independent, expert advice on climate change?

It is welcome that the Bill does make provision for a Scottish advisory body on climate change, that is able to advise and steer progress in Scotland with an awareness of Scottish policy, institutional, geographical, social and economic context. A Scottish body is needed now, not some time in the future. The independence of this body and ability to inform and support Parliament need consideration - a Commission model as proposed by Stop Climate Chaos may be more appropriate.

The Bill places duties on the Scottish Government requiring that it reports regularly to the Scottish Parliament on Scotland’s emissions and on the progress being made towards the emissions reduction targets set in the Bill. The Bill sets out details of these reporting requirements.

What are your views on these proposed reporting arrangements?

Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

The Bill contains powers to allow the Scottish Government, by regulations, to impose duties on public bodies in relation to climate change, to issue guidance to those bodies relating to their climate change duties and to require that they report upon the discharge of those duties.

What are your views on this proposal?

All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.
Muirburn is the act of controlled burning of vegetation on open semi-natural habitats such as muir (Scottish word for moor) or moorland, and includes the burning of plants such as gorse, heather and grass. The Bill contains an enabling power to allow the Scottish Government to vary the permitted times during which muirburn may be made where they consider it necessary or expedient to do so in relation to climate change.

What are your views on this proposal?

Stop Muirburn completely

Grouse-shooting popularity boosts global warming - New Scientist 12 August 2006 by Fred Pearce:

"In terms of carbon storage, the moors can be thought of as Britain's rainforests," says Adrian Yallop, an ecologist at Cranfield University in Bedfordshire. Yet gamekeepers are burning the moors at an unprecedented rate to encourage the growth of heather, a prime habitat for grouse. The burning threatens to release billions of tonnes of carbon locked into the peat bogs underpinning the moors. "Where burning occurs, the hydrology changes and the peat is open to decomposition and erosion. This strips the moor of carbon as surely as setting fire to the Amazon forest."

The Bill requires the Scottish Government to produce an action plan setting out current and proposed measures to improve the energy efficiency of buildings in Scotland, as well as measures to encourage behavioural change.

What are your views on this proposal?

These should include measures firstly to stop leaks of hydrofluorocarbon coolant from air conditioning and secondly stop the use of this as soon as possible as it has 2000 the capacity of CO2 for global warming

Do you have any comments on the impact of the Bill on sustainable development?

Dealing with climate change must take precedence over development. The present situation is clearly so far from sustainable as to make discussion of 'sustainable development' pointless.

We have to move quickly to a way of life that addresses climate change. This is not compatible with economic development. We need economic retreat.

Do you have any other comments on the Bill?

Climate change science by definition a changing situation and it takes too long to prepare the scientific and papers and IPCC reports and too long for governments to act on them when they emerge. The IPCC last report in 2007 on which the bill is based uses papers going back to 2004. Our response to climate change must take changing situation into account and our targets should involve all sectors and keep up to date with present science and allow an adequate margin for error. We cannot wait for adequate action any longer.

Aside from targets, government must urgently go through every area of government policy and cut emissions as the highest priority. It is critically important not to wait for international agreements.

Even made as strong as possible in its detail this bill is inadequate.

I suggest you need a coalition government (advised by climate scientists) as in the 2nd world war to take electorally unpopular action to seriously address climate change.
Also required are population control measures, as civilised and equitable as possible. Jonathon Porritt sensibly suggests do not have more that 2 children. Measures must not unfairly affect the less well off.

Please also look at http://holyrood350.org/

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Gordon Wilson
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely

Mrs Janet Wilson
Dear Convener of the TICC Committee

Yours sincerely
Miss Laura Wilson
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

We need to tackle climate change because of the devastation it is already causing, from the Arctic (polar bears dwindling for lack of ice floes to travel on to find food) to Pacific islands where rising sea levels are threatening their very existence. This will continue but we must limit the extent by reducing the human part in it - the huge carbon emissions caused by industry as well as domestic use.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely

Ms Marion Wilson
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

If we do not all act now, then we may well destroy the planet for our children and all future generations - as well as for all other life on the planet......who are we to decide to take what we want without care for the consequences? When will we as supposedly being civilised, to destroy the marvel that is our planet? Even if our actions or lack of - do or do not affect the planets climate - it is better to be safe than sorry. It is better not to risk upsetting the delicate balance that is the care of nature, we need to be a part of the balance - not apart from this balance.

The time for action is here, it is now. We have already damaged the planet beyond belief, however it is never too late. We are a nation of forward and indeed great thinkers - so we need to act - even if it is alone - to become a shining beacon in the darkness that is approaching......an example to the rest of the world - that they might follow......we must lead by example and NOW!!!

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Kind Regards
Mr Scott Wilson
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Climate change will have a devastating and lasting effect on the flora, fauna and of course people around the world. We need clear and meaningful legislation to reduce greenhouse gases and emissions. Global warming will have a much greater impact on this world than the current financial crisis. The climate bill must be stringent enough to make a real difference.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. • Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start . Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Mrs Stephanie Wolfe-Murray
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

It is imperative that we pass this legislation to reduce CO2 emissions. We cannot afford not to, especially as latest scientific evidence suggests that 80% reduction is too little to avert large rises in temperatures.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely
Ms Fiona Wolfenden
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

I fully support this action. I have a strong belief in trying to help the reduction of carbon emissions etc. I do my bit, you should do yours!

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Miss Katy Wright
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

Yours sincerely
Mr Kunemoemi Zacchaeus
Dear Convener of the TICC Committee

I would be grateful if you and your Committee would consider my views in relation to the Climate Change (Scotland) Bill.

2009 is a critical year for climate change, as internationally we seek to create a new global deal to tackle this massive threat to our planet, and here in Scotland there is a huge opportunity to enact the most progressive climate change legislation in the world.

Climate change endangers life on earth - it must be dealt with as soon as possible

I know that the legislation can be strengthened or weakened as it goes through the Scottish Parliament. I welcome the long-term target of at least an 80% reduction in all greenhouse gas emissions by 2050. However the Bill needs to be strengthened further to ensure the action it prompts will tackle emissions and avoid dangerous climate change.

I hope you can make sure Scotland gets a strong Climate Change Act that ensures:

• Serious action to reduce emissions - starting now. The time for action must be now, so the Bill must require at least 3% annual reductions in emissions year-on-year (in line with the SNP Manifesto commitment), starting immediately and not just in ten years time. Delaying a requirement for at least 3% reductions in emissions until 2020 means action will be too late.

• All emissions are addressed from the start. Ministers have made this commitment, yet the Bill says emissions from international aviation and shipping will only be included after more consultation and legislation. The Bill should make sure all emissions are included from the start.

• Scotland gets a Scottish Climate Change Commission that understands the unique Scottish context, data and policies. The Commission will advise and support delivery of the emissions reduction targets in Scotland, and critically will support their scrutiny in the Scottish Parliament.

• A limit on carbon trading. A limit on the amount of emissions reductions that Scotland can buy from overseas. This is vital if the Bill is to ensure Scotland benefits from real domestic emissions reduction and does its fair share to tackle climate change.

• Robust reporting to help Parliament hold Scottish Ministers and Government to account. The spirit of the Bill is good, but the mechanisms and processes need to be strong, transparent and ensure accountability, with scrutiny always in the public domain.

• Scotland counts all its emissions. As well as direct emissions we should also be reporting on consumption-based emissions - those arising in another country when they produce the goods that we buy.

• All public bodies have a duty to deliver the targets set out in this Bill from the start. Public bodies have a critical role to play in delivering the necessary emissions reductions and a duty within the Climate Change Bill would ensure they take the appropriate action to deliver their fair share.

I am willing to play my part in reducing emissions and believe Scotland can lead the way in tackling climate change. Now I am looking to the Scottish Parliament to deliver strong climate change legislation that must be implemented urgently, could be the best in the world and could be a blueprint for other developed nations.

Yours sincerely

Mrs Anne Zuill
The Climate Change (Scotland) Bill, currently under consideration, requires careful scrutiny as it is expected to formulate our nations response to issues emanating from an industrialised world. It rightly should address pollution, conservation, greenhouse gas emissions and preservation of the environment for future generations and examination of the projected Bill must be absolute.

Disastrously, one part of this proposed Bill, Section 59, apparently slipped in at the behest of the Westminster hierarchy, will undoubtedly increase pollution, increase waste, increase greenhouse gas emissions and inevitably damage the environment significantly more than if it were omitted. I refer to the appalling inclusion of Mr Browns attempt to “get rid of plastic bags” which manifests itself with the inclusion of a clause granting power to the Government to levy, tax or simply ban what they confusingly mis-represent as single use carrier bags”.

This appalling inclusion in an Environment Bill should be rejected by Parliament as its presence will create unintended consequences which will be in direct contravention of the Kyoto protocol, the Bali agreement and the EU requirements on reducing greenhouse gas emissions and reducing waste. The Scottish Government will rightly be ridiculed by intelligent environmentalists throughout the world for introducing an Environment measure which will further damage the very environment they are charged with protecting.

Ali Raza Ahmed
February 2009
I wish to register my disapproval of the inclusion of Section 59 of the aforementioned Bill.

We learn from a Partial Impact Assessment (PIA) of powers to require charges for single use carrier bags document prepared by Defra, that the use of “single use carriers” is indicative of consumer’s behaviour towards the environment, and that action on this issue may act as a catalyst for wider changes in preferences for environmental goods.

What a load of political gobbledegook! The use of erroneously named “single use carriers” is indicative solely by the need to transport retail purchases from store to home in a waterproof, hygienic, resource efficient and reusable bag. Should change occur in the status quo as a result of this ignorance, then quite simply, it is a proven fact that MORE harm will be done to the environment as a result of substitution of efficient lightweight bags by heavier, bulkier and greenhouse gas producing alternative products.

The PIA states that direct environmental effects will be:

1. Less litter — Wrong. It is well proven that more litter will occur due to substitution of heavier, bulkier alternatives.
2. Less harm to Marine Life — Wrong and unproven. This refers to unsupported evidence with nothing to which it can be compared.
3. Fewer transport emissions. —Wrong. MORE transport will be needed to transport alternatives that must be heavier and bulkier.
4. Waste management — Wrong. More tonnage and volume of waste will be generated as a result.
5. The aspirational benefit of increased recycling participation in recycling by consumers will be pathetically insignificant and unable to be quantified.

This is no more than a cynical attempt by Government to enhance their green credentials, putting an estimated 5000 jobs throughout the UK at risk, further taxing every member of the public with unnecessary expense, without any understanding of the unintended consequences which will make a mockery of their attempt.

The British public is again being fooled and patronised by the following quote from Environment Secretary, Richard Lochhead, who has submitted correspondence to the TICC Committee saying:

“Incidentally, you will note that the UK Climate Change Act provides a power to set carrier bag charges in England, Wales and Northern Ireland: it would be odd if a similar power were not set out in our equivalent Bill.”
Cherry picking political stances when it will be detrimental to the environment is not what I expect of the Scottish Environment Minister.

This section 59 should be removed from the Scottish Bill and the Westminster Bill. Please register my objection to it.

Munir Ahmed
February 2009
The Association of Charity Shops welcomes this opportunity to contribute to the Committee's inquiry.

**Background**
The Association represents 300 charities across the UK, which together operate 6,800 shops, more than 600 of which are in Scotland. Last year, charity shops in the UK generated £120m for vital charitable causes.

Charity shops play a key role in waste prevention and waste minimisation, through the reuse of goods and materials sold in shops. We estimate, for example, that 250,000 tonnes of textiles are prevented from entering the waste stream each year by charity shops. Where these cannot be reused through general sale, they are sold on for recycling or reuse elsewhere. Very little (only about 1%) ever joins the waste stream.

Given this background, and the sector's key role in encouraging reuse of goods, charity shops should be seen as part of the solution in terms of zero waste, and we very much hope that the Scottish Government and Parliament will recognise and promote this role.

**Comments**
Our comments are limited to Question 15, on waste reduction and recycling, and reflect the comments we made in our response to the Scottish Government's formal consultation last year. It is impossible at this stage to say how much individual proposals might impact on the sector. For some (for example, on green procurement), the proposals will have no immediate effects. Therefore, we offer general comments only.

**Legislative burden**
We are concerned that substantive legislative solutions only are being proposed to promote waste reduction and recycling.

The charity shops sector is already over-regulated – it is subject to charity law, to the range of consumer, employment and safety regulation imposed on all retailers, has waste carriers and management obligations, and must comply fully with tax and VAT measures to be able to operate. *Additional, non-necessary legislative burdens would be disproportionate and would damage the sector.*

**Effectiveness of the legislative route**
We do not believe the case has been made for the effectiveness of environmental regulation over other forms of (non-statutory) measure. Indeed, given the acknowledged need for environmental behaviour change to be accompanied by a change in mindset (for example, in the Executive's
consultation, Managing Scotland’s Climate Risk), an argument may be put that legislative routes might – in fact – be counterproductive.

Voluntary measures to reduce the environmental impacts of plastic bags, for example, have demonstrated that collaborative solutions may have significant benefits. In the charity shops sector, measures such as promoting customers’ reuse of plastic bags, reusing plastic bags at the till, offering alternatives or simply charging for new bags are all making an impact. The effectiveness of these measures may be diluted if they are needlessly surrounded by legislative imperative.

We very strongly urged the Executive, therefore, to bring forward non-legislative alternatives, and not to be seen – however unfairly – to be making a presumption in favour of legislation (please also see below, on the Waste Framework Directive).

Rather than, for example, requiring recycling facilities to be provided in offices and other work places, business to charity partnerships could be encouraged, such as the Choose2Reuse@Work initiative launched by the Choose2Reuse campaign, a pilot project funded by the Department for Environment, Food and Rural Affairs in London, operated by the Association and involving charity shops and other community reuse organisations. In this, goods originally intended to be discarded are collected in the workplace and reused via charity shop sales, with significantly greater environmental benefits than recycling would provide.

Interplay with implementation of the Waste Framework Directive
We are concerned about the suitability of the legislative route for these measures, and we note that powers in the Bill appear to be enabling powers only. However, we also note (and Executive officials have confirmed this) that the Bill itself does not seek to meet the requirements of the Waste Framework Directive. Officials confirmed that these would be met via secondary legislation. Given this, it seems inevitable that the Scottish Government will be required to use these powers, in order to meet its Treaty obligations. As drafted, therefore, the Bill must presuppose the legislative route.

Conclusion
We welcome, of course, achievable measures to prevent waste. We believe that charity shops have a key role to play in this, by promoting reuse through donations of unwanted items to shops that would otherwise end up in the waste stream. However, we do not believe that legislative solutions are necessarily good or desirable routes to take.

Association of Charity Shops
24 February 2009
I am grateful for the opportunity to respond to some of the points contained within the above Bill and submit the following for consideration:

My main issue of concern is in relation to Question 15, Waste Reduction and Recycling, and in particular the section relating to charges for carrier bags. However, many of the issues of concern can be applied to many of the other questions set out in the Call for Views document.

Committee members will be familiar with the Environmental Levy on Plastic Bags (Scotland) Bill, introduced in June 2005 by Mike Pringle MSP, which was unanimously rejected by the then Environmental and Rural Development Committee (ERDC) and subsequently withdrawn by the proposer in October 2006.

I would like to remind the Committee that this was one of the most detailed examination of any Bill brought before the Scottish Parliament which, incidentally, received in excess of 1,200 responses with over 1,000 of those responses opposing the proposal to implement charging for carrier bags. I may add that it was also estimated to have cost the taxpayers of Scotland somewhere in the region of £2 million for the process, procedures and due diligence carried out by the ERDC.

In considering all the evidence before them the ERDC also took into consideration an independently commissioned report on behalf of the Scottish Executive conducted by AET Technology (AEAT). This report initially stated that the introduction of a charge for carrier bags would lead to an increase in Scotland's waste arisings by some 4,500 tonnes annually due to other types of carrier bags, such as paper carrier bags, being used as alternatives to conventional plastic carrier bags. The figure of 4,500 tonnes was subsequently proven, with factual evidence, to be totally incorrect and grossly underestimated. Consequently the figure of 4,500 tonnes, in agreement with the Executive, was revised upwards to 13,700 tonnes per annum.

In April 2008, accompanied by a Statement of Reasons, a second attempt to introduce his Bill was lodged by the same Member and considered by the current Rural Affairs and Environment Committee (RAEC) and was again rejected on the same grounds as the previous ERDC since no new evidence was presented to the RAEC in support of the Bill. It should also be noted that the Bill had fallen in May 2008 since no further proposals had been lodged within the required timescale.

The inclusion of carrier bags within the Climate Change Bill suggests that all the considerations, findings and conclusions of both the ERDC and RAEC have been totally disregarded in what can only be described as a "witch hunt"
against carrier bags by those ill-informed and ill-advised. It is a proven fact that by charging for carrier bags, waste arisings will ultimately increase, greenhouse gases will ultimately increase and carbon emissions will ultimately increase, thereby defeating the whole objective of the Climate Change Bill which is to reduce all three.

The original voluntary agreement objective agreed with all parties was to reduce, by 25 per cent the environmental IMPACT of plastic carrier bags over a two year period, and, by early 2008, and having clearly demonstrated that this target would be achieved, the goal-posts were suddenly changed, after only 12 months, from a 25 per cent reduction in the environmental impact of carrier bags to a 25 per cent reduction in their NUMBERS. What we now have in the market place is a plethora of carrier bags in all different types of materials adversely affecting the long term objectives and our desires to reduce profligacy.

Paper bags that truly are "single use" and end up in landfill, Jute bags that can't be recycled because they're lined with the heavier LD type plastic and therefore end up in landfill, Cotton bags that can't be recycled because many have the handles stuffed with a so called "fabric" that's nothing more than a common permeable plastic material, they end up in landfill, Woven and Non-Woven Polypropylene, Nylon etc, etc. Each and every one of them has a greater environmentally damaging impact through the carbon dioxide and methane emissions released when in landfill, substantial increases in transportation, fuel, carcinogenic emissions and decreased energy efficiency.

We have heard the cries of late from many politicians who wish "ban plastic bags", unfortunately they've failed to take on board the recent exchange in the House of Commons where Mr Ellwood asked of the Environment Minister, Jane Kennedy, if there were plans to enable local authorities to prohibit the use of "single-use" carrier bags, to which the Minister responded: "The Government have no such plans. It would be illegal under EU law to prohibit the use of bags, and the Government have no plans to do so or empower local authorities to do so. A very significant reduction in the number of single-use carriers distributed by supermarkets is in prospect following the agreement reached between the Government and the British Retail Consortium in December, under which leading supermarkets have pledged to reduce bags by 50% by the spring". (Hansard, 19th January 2009)

Another ill-informed and ill-advised term used by many is the term "single-use" in relation to plastic carrier bags. Following correspondence to Cabinet Secretary for Rural Affairs and Environment, Richard Lochhead, as to his frequent use of the term "single-use", his reply of the 6th January 2009 was to agree that the term "single-use" should NOT be used.

Furthermore, I can also bring to your attention a Scottish Government sponsored article that appeared in a Scottish daily newspaper on July 17th 2008 where a so called "Eco friendly" Jute shopping bag was being promoted by the newspaper and a supermarket chain. On finding that this bag released a black / blue dye when wet a sample bag (Laboratory Reference
50167602) was presented for examination to the Public Analyst for West Lothian, Dr Andrew Mackie, who's report concluded "I do not consider that the amount of dye which might leach from the bag under normal conditions of use would have any effect on food carried in the bag, provided it was contained in protective packaging". "Food not protected by packaging carried in the bag might be affected by dye leached from the bag should it become wet. This is undesirable, although is unlikely to present a significant hazard to health." For reasons unknown, no further analysis was carried out on possible contaminants contained within the dye such as a lead content, often found in dyes and paints, or phthalates.

I can also confirm, in relation to the above Jute bag promotion, that a successful compensation claim for articles of material irreparably damaged due to the leachage of dye from one of those bags was made by a member of the public to both parties involved in the promotion, the claim being settled in full.

Members of the Committee, much nonsense has been spoken with regards to plastic carrier bags and I would respectfully request that both the TICC Committee and the RAE Committee endorse the findings and decisions made by the former ERDC and current RAEC, both of whom, after great deliberations rejected calls to impose a charge on carrier bags. The following figures, based on projections which can then be accurately calculated, show just how damaging an effect on our Scottish environment alone this persistent and ill-advised drive to curtail the use of plastic carrier bags will have.

The figures show the assumptions and consequences upon reaching a 50% reduction in plastic carrier bag usage with half of that 50% remaining as lightweight supermarket carrier bags. The projected percentages of HDPE, LDPE, paper, woven and non woven polypropylene, jute, cotton and other types of bags are all included in the 2009 figures which are based on the 2006 baseline figure used by WRAP.

**Mid 2009 Projections based on a 50% reduction in plastic carrier bags in Scotland:**

<table>
<thead>
<tr>
<th></th>
<th>2006/7</th>
<th>Mid 2009</th>
</tr>
</thead>
<tbody>
<tr>
<td>Weight of all carriers (tonnes):</td>
<td>10,600</td>
<td>38,340</td>
</tr>
<tr>
<td>Weight of transit cardboard packaging (tonnes):</td>
<td>700</td>
<td>4,100</td>
</tr>
<tr>
<td>Transport and Landfill volumes in cubic mtrs:</td>
<td>27,700</td>
<td>232,500</td>
</tr>
<tr>
<td>20ft Containers required for one journey:</td>
<td>3,500</td>
<td>29,100</td>
</tr>
</tbody>
</table>
Pallets required for delivery (assumed to be full pallets):
76,100          639,300

In closing may I take this opportunity to make myself available to the Committee where I would be only too willing to enhance in greater detail the factual realities of the environmental impact and damage the introduction of a charge on carrier bags would bring, not only to Scotland but to the UK as a whole.

Baggit Ltd
9 February 2009
RURAL AFFAIRS AND ENVIRONMENT COMMITTEE

CLIMATE CHANGE (SCOTLAND) BILL

SUBMISSION FROM GRAHAM BARNES

I refer to Section 59 of the above Bill whereby you seek approval that any future Scottish Parliament has the right to pass legislation to require the suppliers of goods to charge for carrier bags.

I do not agree with the inclusion of this Section because:

- I do not understand the link between a carrier bag tax and climate change

- it is fact that Scottish Parliament and the Scottish people have already determined that there is no justification for a carrier bag tax.

- the introduction of a carrier bag tax in Ireland, although leading to a reduction in number of carrier bags used, has led to an increase in the total tonnage of polythene packaging which is contrary to what was intended.

- it is fact that the current approach of educating retailers to discriminate more in the issue of free carrier bags coupled with educating the public to use less carrier bags has led to a significant drop in the numbers of carrier bags used, so why tamper with a proven formula of success, unless the real purpose of the inclusion of this Section is to raise taxes by stealth.

- carrier bags account for around 0.1% of collected waste. This is such a small percentage that I believe that enough time and money has been wasted on the topic already.

Thank you for giving me the opportunity to express my concerns.

Graham Barnes
24 February 2009
I wish to object to section 59 of the Climate Change (Scotland) Bill as the consequences of introducing any charge for carrier bags is that more waste and carbon dioxide will result.

If the Scottish Government are serious about reducing waste then Section 59 should not be a part of Scotland's Climate Change Bill as we will see a massive increase in so called "bags for life" such as jute, cotton and nylon which cannot be recycled thereby increasing waste. Polythene carrier bags are extremely lightweight and highly reusable which is why I have a stash in my kitchen cupboard to be used as bin liners, pet waste bags, and carrying files to work every day. Even DEFRA acknowledge that 80% are reused at least once. What other form of packaging has such a high rate of reuse? Surely government time and taxpayers money should be spent on targeting and reducing "one-use" packaging?

Polythene carriers can also be recycled into other goods ensuring an even longer lifecycle. Surely reuse of waterproof, lightweight bags is far more favourable than putting old, dirty, smelly (due to lack of waterproofing) heavier bags such as jute, cotton and nylon into landfill. No bag is for "life" so surely it is best to re-use the thinnest material possible, and then recycle the bag at the end of its lifecycle?

Why should Scotland be saddled with yet another tax, due to lack of education? People should be encouraged to reuse and recycle after all that is why we have 4 bins outside our homes. This is the way to help the environment, not put heavier, bulkier bags into landfill creating more greenhouse gases.

Linda Barnes

What a ridiculous idea to include a proposal to charge for carrier bags in a climate change bill. Charging for carrier bags will increase not only waste but harmful emissions. I was under the impression that we are trying to reduce waste and emissions not increase them, section 59 should be scrapped.

Also in these hard economic times you would think that the decision makers that we, the taxpayer pay, could come up with some innovative ideas, where does adding another tax onto people help reduce emissions, what would be done with the revenue raised, we keep hearing that money is being used to protect the environment, so what specifically would this money be used for, how about applying your minds and come up with something else rather than more stealth tax, taking more money from people to solve problems is an old record that people are absolutely sick of hearing, if all you can come up with is old answers to new problems maybe we should help the environment by sacking you lot and saving the carbon footprint you cause during your brilliant deliberations and put the money into planting trees. how much has this idea cost us already, or are you to ashamed to tell us!!!

Mark Barnett

Please register my objection to the section in this Bill (Section 59) which gives power to the Scottish Ministers to introduce charges for carrier bags.

We in Scotland have already seen this plea for legislation rejected by Parliament and spent time and taxpayers money doing so

Lightweight carrier bags are being touted as “single use” by our Environment minister Richard Lochhead. If they are, then more fool him for not reusing them as most of the public already do. Even his own DEFRA colleagues acknowledge that 80% are reused at least once.

Now he wants to tax these efficient bags for no other reason than to educate the public. What drivel emanates from Government — pray tell us uneducated masses when was the last time the imposition of a tax educated anyone on a specific policy other than to educate them that their Government is grasping at straws.

Pray tell the world, who is it that wants more taxes which will result in damage to the environment on already stretched incomes, when we are being advised we should be trying to help the environment?

If the Scottish Government are serious about reducing waste then Section 59 should not be a part of Scotland's Climate Change Bill.

Our Association represents the leading beverage can makers in Europe, namely Rexam Beverage Can Europe & Asia, Ball Packaging Europe and Crown Bevcan Europe & Middle East.

We strongly support the view that “packaging recycling can be classified with a relatively high degree of certainty among the most cost-efficient options to reduce CO2 emissions and other environmental impacts” (European Commission Report COM (2006) 767 final, 6.12.2006).

The present Bill is a framework legislation enabling the Scottish Ministers to make regulations to implement one or several options laid down under Chapter 4 Waste Reduction and Recycling. The options range from voluntary initiatives to increase collection and recycling of waste to compulsory deposit and return systems.

During the Government consultation, our Association stressed that along with WRAP it recently launched a large scale programme (“Every Can Counts”), orchestrated by Alupro (Aluminium Packaging Recycling Organisation), to specifically target the “Away from Home” consumption of beverage cans. It is designed to provision work places, public areas and institutions with comparable recycling facilities to those typically offered by kerbside. In addition, our Association is currently preparing, with the support of WRAP, a pilot-project to increase collection and recycling of kerbside programmes.

It indicates that our members strongly support the flexible options in the Bill and are determined to actively contribute towards achieving the ambitious collection and recycling targets in the order of 75%.

We took notice that section (58) on deposit and return systems should be used only insofar as the more flexible measures do not allow to promote or secure an increase in the recycling of materials.

The SPICe briefing on the waste provisions (15 January 2009 – 09/04) shows genuine concern that any deposit system should comply with legal requirements, in particular overriding EU law. It recalls that “some provisions, such as section 58 on deposit and return schemes, could take up to five years to be in force because of the need for a full implementation group to consider the matter in detail.”

We trust that the enclosed paper on EU lessons concerning deposits on single-use drinks containers will help your discussions and thank you in advance for your attention.
Deposits on single-use drinks packaging - EU lessons –

1. Status of deposits under EU law
Deposits are considered as a potential trade barrier by the EU Court of Justice (ECJ):

- " A deposit causes every producer and distributor to incur additional costs connected with organisation of the taking back of packaging, refunding of sums paid by way of deposit and any balancing of those sums between distributors…"

- " The replacement of a global packaging collection system with a deposit is such as to hinder the placing on the market of drinks imported from other Member States…” (judgment in C-309/02 German deposit)

As a trade barrier, deposits are allowed only as an exception to one of the fundamental Treaty freedoms ( free movement of goods). Their necessity, appropriateness, proportionality must be strictly justified on a case-by-case basis by the Member State concerned. This burden of proof extends to all competent authorities such as the Scottish Government.

2. Environmental justification of deposits
The ECJ insists that the waste management objective in Member States shall be " that the system chosen ( global collection v deposit system) is designed to channel packaging to the most appropriate waste management alternatives and form part of a policy covering all packaging and packaging waste…”

It means that the comparative merits (including costs) of a general collection system and/or a deposit system must be carefully balanced. It also means that a specific deposit system for drinks packaging is questionable as experience with national measures on drinks containers has shown unacceptable trade barriers and domestic distortions of competition (EU Commission Report of 6.12.2006 on the EU Packaging & Packaging Waste Directive).

Two environmental objectives may justify, however, a deposit:
- Increase volume and quality of packaging recycling
- Reduce litter.

2.1. Recycling performance
Experience shows that deposits allow to achieve high return rates for drinks containers up to 90% and more. Some national systems operating without a deposit achieve, however, similarly high recycling for drinks containers beyond the EU targets ( B, NL, CH,…). More precise sorting for materials such as plastics ( higher scrap quality) may be pursued equally without a deposit – cf. present NL setting-up of separate collection of rigid plastic packaging ( not simply drinks) via igloos near retail shops.
Anyway the Packaging Directive does not mean that 100% of packaging waste should be recycled as the “level of environmental protection sought must be reasonable.” (EU Advocate General in Danish cases on the can ban)

Taking out drinks containers from the general household collection system - diminishes the efficiency as two collection systems must be run in parallel-deprives the general collection system of a key income source (high scrap value of drinks packaging) thus increasing costs for other packaging recovery-increases considerably costs for drinks containers (x 3 per container in Germany).

2.2. Anti-litter measure
A recent cross-border comparative study for ADEME (French environment administration) concluded that deposits tend to reduce litter, but that measurements of the actual impact are inconclusive. The study confirms the absence of an agreed measurement methodology (by weight, by unit, by visual impact,). No precise figures on the cost savings for municipal cleaning -up.

The Netherlands may serve as a key political reference as the Environment Minister reported the following to the national parliament after intense discussions and unfruitful litter measurement attempts:

"I realise that the litter problem has been aimed one-dimensionally for many years at bottles and cans, and along the lines on deposits. This is understandable on the one hand because this packaging is rather conspicuous. The easy remedy for reducing bottles and cans in litter therefore appears to be the introduction of deposits on them... But even if all the bottles and cans are cleared away, this would still not solve the litter problem, as litter consists of many more components than just cans and bottles. And because the root of the problem is not tackled by a deposit, attitude and behaviour are the other aspects which must be addressed. In the policy conducted in practice to prevent litter and to clear it away, attention should therefore be given to all the components. This means that an integral solution should therefore be sought which yields a much larger result than deposits on a few packaging items...." (April 2006).

Instead of deposits, the Dutch municipalities now levy fines of 50-60 € for citizens who litter packaging and other items such as cigarettes. For packaging, a special “impulse programme” against litter is financed by a joint effort of environment ministry, municipalities and industry.

The experience in other EU countries shows, therefore, that the aims targeted by a compulsory deposit may be achieved by less burdensome measures. Under settled EU case-law, the State concerned should show that a compulsory deposit is appropriate, necessary and proportionate in any given case to pursuing these two environmental objectives and cannot be attained by measures which are less restrictive for intra-Community trade. This also applies to any Scottish enabling law with, additionally, the issue of affecting the smooth functioning of the UK market.
3. Operational burdens of a deposit system

The following **minimum operational conditions** must be fulfilled by a deposit system imposed on non-reusable containers:

- The system must be comprehensive which means that it shall not be such that consumers, retailers or producers may no longer use legally admissible packaging.
- A sufficient number of return points must be available so that consumers can recover the deposit even if they do not go back to the initial place of purchase;
- To ensure that consumers may return their used packaging to any point of sale, there must be, as a minimum, an operational clearing system for deposit amounts between retailers;
- The system must ensure that all producers, especially from other Member States, may have access to the deposit system under reasonable and non-discriminatory conditions;
- Producers, especially importers, must not be obliged to modify their packaging (for instance new shapes), but may continue to use their normal packaging.

**Labelling, registration, fees**: The obligation to re-label goods lawfully produced and marketed in their country of origin (in this case also goods originating from elsewhere in the UK) constitutes a barrier to trade although it applies without distinction to domestic and imported goods as “it makes it necessary to alter the packaging or labelling of the products concerned for the purpose of marketing them in [the importing State].” The ECJ has held that “even supposing that those extra costs are ultimately borne by consumers, the mere prospect of having to lay out those costs constitutes a barrier for traders since it is capable of acting as a disincentive to those of them who are contemplating marketing the products concerned in [the importing State].”

The obligation to participate in the deposit system leads to the necessity of attaching to the labelling a deposit mark, registering with the national deposit system, reporting duties and payment of fees. Thus, producers and importers are forced to specifically adapt the marketing of their product to the system requirements. Particular obstacles have arisen from country specific EAN codes and/or deposit marks which “may force the importer to alter the packaging of his products on the basis of the place where they are marketed and therefore to incur additional packaging and labelling costs.”

4. The German and Scandinavian models

4.1. Germany

German law imposes a deposit of 25 Cent € for single-use containers. The amount was supposed to discourage single-use in favour of refillable bottles.

---

1 Re reasoned Opinion of the EU Commission of 20 April 2004 in case 2003/2133 GERMANY (unpublished)
2 ECJ judgment in Case C-217/99 Commission v Belgium
3 same judgment as under previous footnote
4 see ECJ judgment of 16 November 2000 in Case C-217/99 Commission v Kingdom of Belgium
The objective failed as the refill share of soft drinks and mineral water is declining dramatically

Industry was allowed only to set up framework deposit conditions (labelling, deposit clearing system, by the antitrust authority. It should be anticipated that similar antitrust law hurdles will be raised for Scotland (UK). No integrated deposit system, therefore, in Germany which means, for instance, that unredeemed deposits do not reduce general system costs, but benefit individual operators.

Many cost factors deriving from the deposit (i.e. logistics) are freely negotiated between operators leading to much higher costs for smaller companies. Hard discounters are major winners of the system and cross-subsidize their product prices with income derived from the deposit system (unredeemed deposits, income from scrap sales,).

Globally, it has been calculated that industry pays 33% of collection costs to handle just 7.3% of the total packaging volume, that every extra drink container collected by the deposit system costs 22 Cent (marginal cost), that retailers have invested so far > 700 million € for reverse vending machines.

The German system still leads to intolerable import and export barriers notwithstanding the EU Commission closure of the infringement case.

4.2. Scandinavian model

There is no common Scandinavian model as deposit amounts, labelling requirements etc differ between countries. Sweden appears to have the most flexible system with deposit conditions freely agreed between operators to achieve the required recycling targets.

Deposit systems in Scandinavia have provoked critical scrutiny from the national and partly EU Commission competition authorities. They have experienced cross-border difficulties concerning e.g. private and parallel imports (due essentially to different alcohol taxes).

Denmark offers the model of a totally controlled monopoly system which includes subsidies for installing reverse vending machines. Its detailed deposit regulation is more than 70 pages long! Scotland quotes this country as a possible model, but it should have in mind the high complexity of this foreign deposit system which was criticized by the EU Commission.

Contrary to Germany, the number and variety of operators concerned by the deposit system is much lower and, most importantly, Scandinavian retailers and consumers are supportive of a deposit and build on the existing refill/deposit systems. It allows a competitive positioning of different packaging with a clear trend, however, towards increased convenient single-use containers.
5. Fundamental pre-requisites for a deposit system

Existing deposit systems in a very few EU countries show that effectiveness depends on:
- Absence of an alternative effective collection system
- Minimum per capita consumption, i.e. > 50 drinks cans per year
- Consumers to be familiar with deposit concept (refillable system in operation)
- Well organised, structured and motivated retail trade
- Leading drinks producers and retailers must be supportive of deposit
- High level of reliability in control of deposit handling and repayment
- Deposit amount must be set by industry and be reasonable
  (No discrimination between single-use / refillable bottle deposit amounts)
- Financing body willing to guarantee up-front investment in equipment
- Regulatory framework preventing distortions of competition by free riders.

I wish to object to section 59 of the climate change (Scotland) Bill as the consequences of introducing any charge for carrier bags is that more waste and carbon dioxide will result. This section should be excluded.

RURAL AFFAIRS AND ENVIRONMENT COMMITTEE
CLIMATE CHANGE (SCOTLAND) BILL

SUBMISSION FROM BRITISH POLYTHENE INDUSTRIES PLC

It has been brought to my attention that there has been a submission to the Scottish Parliament on the issue of Climate Change by Cameron McLatchie. (Address not available on the web-site).

For the avoidance of doubt, this submission was not made by Cameron McLatchie, chairman of British Polythene Industries PLC.

In the capacity of chairman of British Polythene Industries, I would now make the following submission.

British Polythene Industries PLC sells a very small amount of retail carrier bags in the UK (around 0.1% of annual turnover) – so we have no material interest in the outcome of any tax / ban / reduction in carrier bag usage. We do have access to detailed knowledge on the production, distribution and re-use of polythene carrier bags and have made this evidence available to both the UK and Scottish Parliaments.

It is absolutely clear from that evidence that any ban or reduction in polythene carrier bags will have a negative effect on climate change. We accept that any ban or reduction may have a positive effect on litter, although this has not been evident in countries which have introduced a ban or reduction. However, we have no doubt that a reduction in the use of polythene carrier bags and an increase in paper or cloth alternatives will lead to an increase in vehicle movements and CO2 emissions.

All of the alternative bags use considerably more energy in production, require a greater number of vehicles to deliver their increased weight and volume and have the effect of increasing CO2 emissions.

If the Parliament is interested, we are more than happy to provide facts and figures – as we have done on previous occasions.

However, we would hope that the Parliament can focus on the real drivers of climate change – electricity generation and road transport – and leave the polythene carrier bag out of this debate.

Cameron McLatchie, chairman, British Polythene Industries PLC
22 February 2009
The British Soft Drinks Association is the national trade association representing the interests of the UK’s manufacturers, factors and franchisors of soft drinks, including fruit juices and bottled waters. Member companies make up over 90% of the industry, with annual retail sales in excess of £12 billion in the UK which includes over £1 billion in Scotland. BSDA supports measure to protect the environment and welcomes the Scottish Government consultation to tackle waste impacts.

Reponses to the proposals

1. Duties on public bodies and businesses to provide recycling facilities.

1.1 BSDA believes that voluntary action would be the most appropriate and effective way encourage businesses and public bodies to recycle

1.2 Local Authorities should work with public bodies and businesses to provide facilities and infrastructure to collect recyclable materials from non-residential sources.

1.3 The Scottish Government should consider following the English example for guidance on ‘Recycling on the go’. Soft drinks companies are already involved in initiatives to increase recycling out of the home.

2. Packaging

2.1 The focus on packaging does not recognise the positive role packaging can play in protecting products and reducing waste, particularly food waste.

2.2 There is an unnecessary and disproportionate focus on packaging when seeking to tackle waste in Scotland. Little attention is paid to other waste streams that may have far greater impacts on the environment than packaging.

2.3 It is not necessary to set statutory targets for retailers to reduce packaging. The Government should follow the example of the Courtauld commitment and seek voluntary action from industry. This action is in addition to many years of work by manufacturers to light-weight their packaging to work towards recyclability. It should be noted that commercial pressures help companies focus efforts on packaging reduction. Packaging is a significant business expense and where reductions can be made manufacturers are already working hard to reduce packaging.
3. Recycled material

3.1 Many companies across a range of sectors are already taking action by including recycled content in their packaging. This is particularly true for soft drinks, where companies regularly use recycled materials in their packaging ranges.

3.2 It is not appropriate to place a requirement for a minimum content of recycled material as this would not appreciate issues of availability of recycled material and importantly, some of the technical issues in using recycled material. Including recycled material is not necessarily the best environmental option for all packaging. Including recycled content in some instances can affect the ability to recycle packaging and may also impede on the function of the packaging.

3.3 Where it is feasible soft drinks manufacturers have been including recycled material for many years. For certain formats of packaging there is already a significant amount of recycled material, for example, cans and glass bottles. For PET plastic, there are serious limitations with regard to specifying a minimum content as the material has limited availability and this can fluctuate significantly in a short timescale. It is essential to increase recycling rates in order to obtain recyclate so that more can be used.

4. Waste prevention plans

4.1 Soft drinks manufacturers are captured under PPC regulations. Part of PPC is to use resources and materials efficiently, and this would include minimising waste.

4.2 Requiring businesses and public bodies to develop and publish waste prevention plans seems to be excessive and it would be more appropriate to encourage organisations to do this on a voluntary basis. Commercial pressures are already causing companies to reduce waste arisings, therefore reducing costs.

4.3 Waste prevention plans could help increase focus on waste issues and encourage recycling but would not necessarily reduce waste. It is important that appropriate infrastructure and facilities are developed or improved to make it practical to recycle out of the home.

5. Deposit and return schemes

5.1 It is not clear why deposit and return issues have not been incorporated under Proposal 2 ‘Packaging’, i.e. measure to tackle packaging. Deposits may be one of the ways to increase collection of materials but this should be considered as only one of the options amongst a wider range of others. In any case BSDA believes strongly that it is not appropriate to have statutory requirements for deposit and return
Companies should be allowed to take decisions on deposit and return schemes on an individual voluntary basis, taking into account the local market needs and local infrastructure issues. While there is one example of a deposits system in Scotland, it must be remembered that this is only one, unique scheme and this should not be used to justify nationwide mandatory deposits for all drinks containers.

It is unreasonable to expect retailers to manage the sorting, storage, sort and collection of containers once they have been returned, particularly for smaller convenience stores. There are also many health and safety implications with operating mandatory deposits schemes.

The financial implications outlined in the Consultation are far from robust and it is not as simple as calculating the operational cost of a scheme in Scotland using costs of the scheme in Denmark on the basis of similar populations. BSDA recommends that the Government carry out a more thorough impact assessment of deposits before enabling powers on deposits.

The consultation is not clear on the distinction between deposits for single use or refillable containers. The financial implications for refillable systems versus single use are very different and the Government should be clear about what costs relate to which proposed system.

Requiring manufacturing companies to use returnable containers is likely to cost several hundred million pounds in capital costs for new manufacturing equipment with annual operational costs in the tens of millions. For single use systems there would be less set up costs but retail outlets would still be required to modify their premises to manage the materials. This is likely to cost many tens of millions, while the annual operational costs would in tens of millions of pounds.

We do not believe that mandatory deposit and returns are the most cost effective or most environmentally responsible way to collect waste packaging and we would support improvements in kerbside collection and on the go recycling.

BSDA firmly believes that kerbside collection is the more cost and environmentally effective way to capture material for recycling and that deposits systems will divert valuable material away from local authority collection schemes, potentially making kerbside collection uneconomic to operate.

BSDA recommends that before powers are enabled in relation to deposits, the Scottish Government should carry out more detailed
investigation into deposits and engage with manufacturing, retail and waste management sectors to understand the issue and implications of any proposals and to assess whether or not deposits are the most effect measure to tackle packaging impacts.

6. Mandatory waste data returns from businesses

6.1 The Producer Responsibility Regulations 1996 ready requires packaging producers, packer/fillers and retailers to account for, and fund the recovery of packaging that is placed on the market. This information should be sufficient for the purposes of policy development and planning in relation to packaging.

7. Other measures, including plastic bags

7.1 We believe that the Government should in the first instance seek voluntary action from businesses and public bodies. The government should back up voluntary action with funding, infrastructure and best practice advice.
Appendix - BSDA position on deposits (please find below)

BSDA position on the use of mandatory deposit systems on single use drinks containers

October 2008

1. Summary

1.1 The soft drinks industry supports measures to protect the environment when these are based on comprehensive environmental investigation and is committed to sustainable consumption and production.

1.2 Where packaging is concerned, studies have not produced definitive answers to the vital questions asked of mandatory deposit schemes, i.e. do they improve the environment cost effectively? It would be unwarranted to implement a system that does not have a desired environmental outcome.

1.3 Many principles risk being compromised with the introduction of deposit schemes, namely the capacity of such measures to:

- Undermine kerbside collection
- Divert valuable material away from Local Authority waste collections
- Cause unnecessary environmental impacts
- Disproportionately increase costs to consumers, manufacturers and retailers
- Discriminate unfairly against soft drinks
- Restrict the free movement of goods within the EU

1.4 The British soft drinks industry firmly believes that the introduction of mandatory deposit schemes would be an ineffective and counter-productive method of reducing the environmental impacts of packaging. It is convinced that the solution lies with multi-material kerbside schemes that address all waste streams. BSDA also supports efforts to provide for recycling out of the home.

2. Soft drinks packaging and sustainability

2.1 The nature of beverage packaging has changed dramatically over the years. Many decades ago drinks were solely packed in glass bottles. Cans were then added followed by cartons and plastic bottles. There is now a much greater variety of shapes, sizes and material types than ever before.

2.2 Packaging continues to be a major cost for the industry, both from a financial and environmental perspective. Members have historically looked for ways to reduce the amount of packing used and have made significant achievements.
2.3 The primary function of packaging is to maintain the safety and quality of the product, ensuring it reaches the consumer at the same levels as when it was first produced and throughout its shelf life.

2.4 Soft drinks manufacturers have always sought to address environmental concerns in relation to packaging:

- Light-weighting of all formats of packaging has been carried out for decades and drinks manufacturers and packaging suppliers continue to seek further opportunities to lightweight.
- Soft drinks packaging is amongst the most recyclable of all materials collected. It is easily recognised, sorted and is also of high value.
- Manufacturers have been using varying volumes of recycled materials in their packaging for many years and at present companies are overcoming technical challenges to work towards significant increases of recycled PET in their plastic bottles.

2.5 Members recognise that there is still further work to be done to address packaging and sustainability while maintaining the primary function of packaging.

3. Undermining kerbside collection

3.1 According to WRAP, 35% of plastic bottles in the household waste stream are now being collected for recycling whereas in 2001 this figure was just 3%. This is predicted to increase to 50% in 2008 and 71% in 2009. These figures indicate that the efforts of local authorities in developing kerbside schemes have been enormously successful and this has been complemented by WRAP’s work to communicate recycling messages to consumers.

3.2 European Directives to increase recovery and decrease land filling of waste are comprehensive in their application. They do not target one particular waste stream and aim to reduce all wastes to landfill. This stimulates recovery and reprocessing industries to adapt and grow to meet demands.

3.3 Effective kerbside collection schemes are considered by many to be the best environmental option in addressing the recycling and recovery of packaging. The 2001 RDC/PIRA Study demonstrates that, combined with achievable recycling rates, kerbside schemes deliver optimum environmental benefits compared to other packaging recovery scenarios. A deposit system on drinks containers would only tackle a small percentage of household waste. Kerbside collection captures far higher volumes of waste across all material categories.
3.4 Mandatory deposit schemes would therefore undermine the success of local authority kerbside collection as they would divert the most identifiable, easily sorted and valuable materials away from cost effective materials collection by local authorities.

4. Deposits: an expensive way to recycle

4.1 Data collected in the US have shown that kerbside collection schemes cost around $100 - $200 per tonne of material collected, whilst deposit systems cost $500 - $800 per tonne of recycled material. Experience in Germany suggests that the cost of collecting materials through deposit schemes is three-times that of kerbside collection.

4.2 Kerbside collection schemes offer the following advantages:

- They focus on a range of materials not just a subset of cans and bottles, thus achieving greater economies of scale.
- Most recycling schemes manage materials by commodity type (e.g. glass, PET, paper), rather than pack type, size or brand, which minimise handling and sorting costs for the supply chain and allow for an increasing number of pack types to be recycled.
- The operation and collection of materials are managed by the waste industry and Government, rather than the food distribution and retail chain, which are not well suited to handling materials for recycling.

4.3 Mandatory deposit systems will result in increased prices to the consumer and throughout the supply chain. Returned beverage containers must be counted, sorted and stored requiring additional infrastructure, planning and resources. The burden on small retailers would be even greater. For example:

- They would have to collect and store containers and refund deposits on behalf of the manufacturer.
- A regular CTN would struggle to do this even with a small number of product lines.
- The impulse buy sector does not have the square footage required to operate such a scheme.
- Such a measure would be impractical to manage and would severely disadvantage corner shops and garage forecourts.
- There would be a significant increase in vehicle movements as pick-ups would be needed on a regular basis for retail outlets. This would add to congestion, hinder efforts to improve air quality.
quality and would be counter to efforts to reduce climate change impacts from transport.

5. Discrimination without environmental reasoning

5.1 Deposit systems operate randomly across Europe for different drinks’ packaging. For example:

- In Finland the deposit system covers beer and carbonated soft drinks only
- Denmark levies a deposit on all soft drinks other than milk

5.2 The final goal of any deposit scheme is a comprehensive reduction in environmental impact. There is no logic in singling out certain products and not others

5.3 Complex redemption systems can lead to increased environmental degradation. For example, in Sweden, used single trip containers are returned to the point of fill where they are counted individually. Designed to achieve a high rate of recycling, the additional transport costs and energy required to complete this process far outweigh the benefits.

5.4 In Germany deposits were added to drinks containers in 2003. The main objectives of the schemes were to reduce litter and to reduce the overall contribution of carbon dioxide emitted due to packaging. A study in 2007 showed that there had been no significant reduction in the amount of litter or cost to local authorities in dealing with litter and the reduction in carbon was also negligible. The cost of the German scheme was assessed to be over €900m per year.

6. Deposit fraud

6.1 Potential for fraud and misuse is a serious concern for the single trip/deposit market. Deposits create an incentive to redeem containers that do not bear a charge. This increases consumer prices. Each redeemed container imposes a cost for redemption, collection, and reprocessing. If a pack is returned fraudulently the refund is a direct cost to the distributor.

6.2 US studies into the use of reverse vending machines have suggested that 7% to 30% of drinks cans returned in this way were on non-deposit bearing items, despite the refund being paid.

7. Barriers to trade

7.1 Deposit schemes may restrict the free movement of goods within the European Union (Article 28EC).
7.2 Despite achieving recovery and recycling rates under the European Directive, some member states impose deposit systems to further increase recovery levels.

7.3 Importing goods into a member state operating a deposit scheme requires packaging that adheres to each country’s requirements. This may include specific labelling, bar-coding or exclusive marking to identify the package as ‘recoverable’. In addition, contributions to the cost of a deposit return system are required. These costs may be significant, even more so for smaller producers.

7.4 Deposit systems go beyond the scope of the EU Packaging Directive. They could be considered protectionist, favouring local producers, and represent a clear barrier to trade.

8. Achieving further improvement in recycling rates: Alternatives to deposits

8.1 The BSDA believes the simplest, cost effective and environmentally sound way to increase recycling rates is through effective kerbside collection schemes as opposed to deposit schemes. These are already well established and run along side municipal waste collection.

8.2 The success of local authority collection schemes across the UK has been significant in recent years. WRAP data has shown that in 2001 recycling of plastic bottles was just 3%, by 2007 this had risen to 35%. WRAP expect the recycling of plastic bottles to reach over 70% by 2010, while estimates have shown that deposits schemes might retrieve 80% of the containers with deposits on them.

8.3 To improve recycling out of the home, the government and local authorities, with the help of WRAP, should continue with the strategy for ‘recycling on the go’: manufacturers are becoming involved in such schemes. It is important that consumers have the opportunity to recycle out of the home. This will not only improve recycling rates but is also likely to help reduce all forms of litter.

8.4 In conclusion, BSDA argues strongly that there are no valid economic or environmental reasons to impose mandatory deposits schemes on single use drinks containers.

Consultation on Zero Waste Proposals — Analysis of Responses

You will no doubt be aware of the consultation undertaken by Government with specified bodies requesting their views on a range of planned legislative measures to implement Zero Waste proposals which have been reported upon last month (December 2008).

Firstly, it should be brought to your attention that correspondence received on behalf of the Cabinet Secretary for Rural Affairs and Environment, Richard Lochhead, on 9th January 2009 in response to a letter sent to him on 17th October 2008 requesting that the Cabinet Secretary define the term “single use” carrier bag. His response makes it abundantly clear that the term “single use” should NOT be used as it is clearly inaccurate.

The UK Government’s own Waste Resource Action Programme (WRAP) found that 74% of plastic bags are re-used at least once, and are not single use. These are used as pedal bin liners, lunch bags and for multiple uses beyond shopping, e.g. collecting dog dirt. “Single use” carrier bags are a very rare species indeed.

One of the proposals, number 7, was specifically targeted to “include action on single use carrier bags”, and in the response analysis it clearly states in the second bullet point of the main findings that such a proposal received support from only a minority of the respondents. Therefore it is clear that the majority of the responses are against legislation, yet the subsequent analysis goes on to describe in detail the views of the minority - now that’s blatant misrepresentation and manipulation of the facts.

In the expanded response analysis on question 7, it, at length, reports upon potential legislation and on taxes and levies being applied, despite these points being made by an agreed minority of the respondents with, clearly, the views of the majority being overlooked and ignored in the fuller context of the analysis. Democratically that is out of order and unacceptable if the majority rule is to apply. There is NO mention of the INCREASE in waste and environmental damage which would result in this proposal being instigated, nor the other inevitable consequences of the reduction in use of lightweight supermarket carrier bags all of which have been endlessly quantified, debated, and dismissed. Parliament has already spent an estimated £2 million of public money discussing this issue and concluded that it was not to be pursued. Additionally, on the consultation taken on that proposal, at that time, over 90% of the respondents were against a levy or tax on plastic carrier bags.
This is supposed to be a proposal to implement ZERO waste for Scotland, and the Minister is well aware (he was a member of the Committee which unanimously rejected the proposed Bill to levy charges on plastic bags in 2006) that lightweight plastic bags that are removed from the public’s use will require to be replaced by heavier, bulkier, carbon dioxide emitting, unhygienic, filth absorbing and unsanitary substitute bags, which, in turn, will significantly increase the waste tonnage generated by carrier bags in Scotland. When will this Government realise this make no sense in a Zero Waste proposal?

Furthermore such alternative carrier bags (paper, jute, cotton, polypropylene, nylon etc.) all require more transport (estimated at 23,000 extra lorry journeys in Scotland annually, spewing out carcinogenic exhaust fumes) to manufacture, deliver, store, and these alternative products will take up more space in warehouses, shops, and inevitably landfill, where they will create more carbon dioxide emissions and more methane emissions than the lightweight plastic bags they replace. The UK has signed up to a 20% reduction in waste by 2020, with a reduction of 20 % in their carbon dioxide emissions in the same timescale. This proposal will increase waste findings and increase carbon dioxide emissions and produce significant additional environmental damage to our country. Where is the recognition of this additional damage to the environment identified and explained?

Significantly, whilst one paper bag manufacturer (with an inherent biased view) was “consulted”, there is no evidence that any request for an opinion was made to any of the companies in Scotland who are commercially involved in the business of manufacturing or supplying lightweight supermarket plastic carrier bags, yet the majority of the respondents were still against making legislation in relation to “single use carrier bags”. The public simply do not want to be forced into paying for something they currently believe they are entitled to when making retail purchases, particularly when they are providing free advertising to the retailers.

The Government should be far more proactively encouraging the public to reuse their lightweight plastic carrier bags where hygienically possible, and to recycle them in the plethora of disposal units now visible in the forecourts of most major supermarkets. Plastic is environmentally easily and economically recycled, using less resource than any of the substitute products, and we should be encouraging continued use of lightweight bags rather than reducing their use which leads to further damage to the environment from substitute products.

CBC Scotland
14 January 2009
I wish it to be recorded that I object in the strongest possible terms to the inclusion of Carrier Bags within the proposed Climate Change (Scotland) Bill.

It was clearly stated by the previous Environmental and Rural Development Committee (ERDC) that the environmental objectives in introducing a charge could not be met and to proceed with the inclusion of such a proposal in the Climate Change (Scotland) Bill without any further robust evidence is a condemnation of the scrutiny and conclusions reached by the ERDC.

It has already been proven, categorically, that the introduction of such a proposed charge will see a substantial increase in the waste findings in Scotland and in doing so will see the Scottish Government incur the most severe penalties under EU agreements. Those penalties will run into millions of pounds which will ultimately have to be met by the Scottish taxpayer.

I am writing as I wish to object to section 59 of the Climate Change (Scotland) Bill as the consequences of introducing any charge for carrier bags is that more waste and carbon dioxide will result. I feel that this section should be excluded. My reason for this is that Scotland has already voiced its opinion on proposals to tax carrier bags, which was a resounding NO vote.

Fred J Carss

RURAL AFFAIRS AND ENVIRONMENT COMMITTEE

CLIMATE CHANGE (SCOTLAND) BILL

SUBMISSION FROM HUGH CLARKSON

I wish it to be recorded that I object in the strongest possible terms to the inclusion of Carrier Bags within the proposed Climate Change (Scotland) Bill.

It was clearly stated by the previous Environmental and Rural Development Committee (ERDC) that the environmental objectives in introducing a charge could not be met and to proceed with the inclusion of such a proposal in the Climate Change (Scotland) Bill without any further robust evidence is a condemnation of the scrutiny and conclusions reached by the ERDC.

It has already been proven, categorically, that the introduction of such a proposed charge will see a substantial increase in the waste findings in Scotland and in doing so will see the Scottish Government incur the most severe penalties under EU agreements. Those penalties will run into millions of pounds which will ultimately have to be met by the Scottish taxpayer.

Hugh Clarkson
February 2009
We are a small business and it is total hypocrisy to suggest that by charging for carrier bags it will somehow reduce our waste. It has already been proven that to do so would increase waste.

Scrap Section 59 of this bill forthwith.

Stewart Collins
25 February 2009
I wish to object to the inclusion of Section 59 of the aforementioned Bill. The Environment Minister wants to tax single use carrier bags as a measure to educate the public to be aware of our disposable society. They have stated that it is neither a waste nor a litter matter, which is just as well as the inevitable consequences will be more tonnage and cubic capacity taken in waste findings due to alternative products substituted. Section 59 is what appears to be a last minute hook onto the Climate Change Bill to grant this power to the Government should they require to do so, yet we have had no definition of what a “single use” carrier bag encompasses.

The ERDC dismissed a proposal in 2006 to do exactly what Section 59 wants to do. Section 59 will increase only increase waste and should be deleted.

Defra and Wrap, between them have acknowledged that 80% of all UK carrier bags are currently already reused at least once, so presumably that takes such bags out of the tax net although just how that is going to be policed is yet to be determined. There is, contrary to what Ms Kennedy has stated, no public support for a further tax on the public and whilst there may be a number of wealthy politicians who believe this to be an insignificant tax, the public who have less income than they have, are content with the present free plastic carriers secure in the knowledge that they will have a receptacle for sports gear, packed lunches, shoes and the myriad of SECONDARY uses to which lightweight carrier bags are reused.

Lightweight supermarket bags are specifically being targeted, yet their very lightness is what makes them so highly efficient. There is NOTHING that is engineered to carry 25 kilos that is waterproof, hygienic and as easy to carry than the lightweight supermarket bag which itself, weighs under 8 grams.

Should this singularly daft proposal become part of law, the Government will be ridiculed worldwide for introducing a measure in an environment Bill which will increase the damage to the very environment they are charged with preserving.

John Cunningham
February 2009

1. Introduction

The Community Recycling Network for Scotland (CRNS) was established in 2004 to provide support and information for community led organisations involved in recycling, reuse, composting, reduction and waste education activities.

The CRNS is a membership body for community recycling organisations throughout Scotland. We provide information, advice and support to both existing and emerging community recyclers.

Mission Statement
The CRNS exists to build a stronger community recycling sector in Scotland which can create real social, environmental and economic benefit within our local communities.

Values
These are the underlying principles that guide the work of the CRNS) The CRNS is:

• Committed to the principles of Zero Waste and sustainable development.
• Committed to and directly accountable to the Membership.
• Committed to local communities delivering local recycling solutions.
• Committed to carrying out all of its activities with trust, integrity and openness.
• Committed to social and environmental justice.

Objectives

Our current objectives are:

• To build more robust organisations
• To assist the sector to maximise the recycling, reuse, composting and waste prevention opportunities available to it
• To provide networking opportunities and information exchange to allow the sharing of best practice
• To represent and raise the profile of the sector
• To provide an accessible portal and range of advice to sustainable communities on recycling opportunities
• To improve Membership services and benefits

Impact of Sector

The size and impact of the community recycling sector in Scotland was mapped by the CRNS in 2006. The mapping study found that there were;

• diverted almost 73,000 tonnes of materials from landfill
• had a turnover in excess of £26 million
• employs 1,100 full time equivalent staff
• offers over 950 training places and over 3,200 volunteering opportunities
• helps over 68,000 people

2. Overview

The CRNS welcomes the opportunity to respond to the consultation document. Our response focuses not only on answering the questions posed by the Scottish Government in the consultation, but also an overview of the impact that any proposed legislation may have on the community recycling sector as well as some of the opportunities that the proposed legislation presents.

We have assumed that the proposals that have been included in the consultation have been set out because the progress in these areas has not happened to date through market forces, voluntary codes and other guidance and therefore the role of legislation in driving these issues forward needs to be further investigated.

It is also interesting to note the impact that the publication of the consultation has already had with some of the major supermarkets announcing more robust waste prevention plans as well as trials of reverse vending systems.

As you are aware, the CRNS is fully committed to the goal of Zero Waste. The Zero Waste philosophy focuses on the redesigning of our one-way industrial system into a circular system, similar to the successful strategies found in nature where waste becomes an asset rather than a liability. Products that cannot will simply be designed out of the system (prevented). Waste would then cease to exist in its current form and the waste management industry would be replaced by a resource re-utilisation sector led by empowered community organisations that would realise the value of the assets flowing through their communities for local economic and social gain. This is surely a fundamental part of sustainability in the truest sense.

Zero Waste should therefore not only be seen as a function of waste management, but as a new economic system for Scotland with all policies and strategies coming from the Scottish Government benchmarked against
whether they move us towards and away from a Zero Waste society. The CRNS would therefore like the legislation to reflect the fact that it will be part of the solution on the journey towards a Zero Waste society within the Zero Waste philosophy as outlined above.

In support of these principals the CRNS has responded to the questions in the consultation as requested in an attempt to shape waste policy in the direction of sustainability which embraces social and economic goals as much as environmental ones and seeks to address waste as a resource which when managed locally can lead to a positive impact on communities and the environment.

3. Responses to the Consultation Questions

3.1 Proposal 1: Duties on public bodies and businesses to provide recycling facilities

Proposal

To further encourage recycling by giving a power to the Scottish Government to make regulations which would impose duties on public sector bodies and businesses to provide recycling facilities for customers, staff and, where appropriate, members of the public. The regulations would specify which bodies and businesses were to be subject to this duty and the nature of the recycling facilities that would be required.

Response to questions

1. Do you consider that legislation should be made in this area?
2. If so, what form should that legislation take?

Comments

Of the options outlined the CRNS would propose Option 1

Given that over 80% of waste arisings are from commercial and industrial sources and that targets are going to be increasingly hard to meet, it is no longer the time for the commercial sector to be given the option of a voluntary Code of Practice. The CRNS believes that recycling, reuse and composting should be obligatory particularly where the services and infrastructure are available.

The criteria for determining which bodies and businesses would be subject to this legislation needs to be very clear. Factors to consider should include number of staff, customers, members of the public that access the bodies or business, the amount of waste they currently generate etc. Where appropriate and depending on the size and nature of these bodies and businesses they should be required to have onsite composting.

In addition steps should be taken to move from a volume/frequency of collection charging system to a weight based charging system to allow direct
cost savings to be made through waste prevention. Furthermore the cost of collecting residual waste for disposal should be much higher than the cost to collect recyclates.

These bodies and businesses also need to have access to guidance, support and resources to help them minimise their waste (see Proposal 4 Waste Prevention Plans) This may be delivered through existing bodies including the Scottish Waste Awareness Group, Envirowise, the Business Environment Partnership and Scottish Enterprise.

The Scottish Government should also give consideration as to whether this legislation could be broader to include wider measures to reduce the carbon footprint and climate change impact including energy use, water and utility use and transport.

This also links to Proposal 6 about mandatory waste data returns

3.2 Proposal 2: Packaging

Proposal

To encourage waste prevention by giving powers to the Scottish Government to make regulations on packaging which would set statutory targets on retailers for packaging reductions. Response to questions

1. Do you consider that legislation should be made in this area?
2. If so, what form should that legislation take?

Comments

Of the options outlined the CRNS would opt for Option 1

There are already challenging targets within existing packaging legislation and the work being undertaken by WRAP and the major retailers and supermarkets through the Courthald Commitment has seen some significant progress made in this areas.

In addition the work of packaging compliance schemes such as Valpak are also making good progress in this area, including raising awareness amongst consumers and the public about the role of packaging and the progress that has been made to date.

There is a need to encourage further lightweighting and best in class approaches across a wider range of packaging as well as increasing the amounts of recycled materials in packaging and greater levels of reusable packaging in particular in the transit and secondary packaging areas.

Could also investigate the possibility of variable VAT rates for materials with greater levels of recycled content and where reusability I recyclability is linked to VAT rates.
3.3 Proposal 3: Specifying recyclate

Proposal

To encourage recycling by taking powers to enable the Scottish Government to place a duty on public bodies and businesses to specify a minimum percentage of material made from recyclate in procurement contracts.

Response to questions

1. Do you consider that legislation should be made in this area?
2. If so, what form should that legislation take?

Comments

Of the outlined options the CRNS would propose Option 3

3.4 Proposal 4: Waste Prevention Plans Proposal

To encourage waste prevention and recycling by taking powers to enable the Scottish Government to place a duty on public bodies and businesses to have waste prevention plans.

Response to questions

1. Do you consider that legislation should be made in this area?
2. If so, what form should that legislation take?
3. What public bodies and businesses should be covered?

Comments

Of the options proposed the CRNS would opt for Option 1

Substantial quantities of organic waste could be diverted from the waste stream if appropriate incentives are put in place to encourage public and commercial organisations to compost garden and food waste on site or have their compostable waste collected, if a collection service exists in their area. This is particularly important for hospitals, offices with canteens, schools or hotels generating large quantities of food waste, and equally important, in terms of reducing carbon emissions, for the hospitality industry in remote, rural locations of Scotland.

Obviously this could not be made obligatory at this stage as organic waste collections do not exist in many areas and not all commercial and public sector premises have the suitable space for on-site composting. On-site composting could range from one or two home composters or green cones to small-scale in vessel composters depending on the size and type of organisation. In vessel composting on site is a labour intensive process which
needs significant staff time especially in the start-up phase. As the regulations stand the site would also have to have room for the use of the finished compost unless they have the compost (reduced in volume) uplifted as a waste product.

As outlined in the CRNS response to the Better Waste Regulation Consultation in June 2007, there is an urgent need for the current Waste Management Licensing Regulations to be amended to allow non-household premises to compost their own meat-included food waste on site under an exemption or low level permit as currently a Full Waste Management Licence and a Certificate of Technical Competence is required, costing £3348 in Year 1 and £2073 per annum thereafter, plus on average £2500 for a COTC. At present meat-excluded waste can be composted under an exemption by these premises but the segregation of the meat component from the food waste stream discourages participation and reduces the amount of waste that can be diverted.

If the CRNS goes ahead with the Compost Doctors Programme trained community sector employees will be able to assist a number of public and commercial sector Organisations each year in selling up their on site composting operations.

Promotion of the benefits of on-site composting including potential cost savings and where to find information need to be promoted to the public and private sectors. Incentives to compost on site could include the waiving of VAT on composters, extending the current Big Hanna type government type deals such as reduced price in-vessel composters to companies purchasing them via LA (this has the advantage of LA’s recording what companies are using the deals and targeting training or expertise to those companies to make sure they are doing the work. This would also link to Proposal 6 about mandatory waste data returns) Alternatively offering direct discounts subsidised by the government (such as have been offered through WRAP to householders).

In terms of the bodies and businesses the criteria for identifying them should be very clear but should include the tonnage of materials generated by these bodies and businesses and the extend to which they

All Scottish Local Authorities and non-governmental departmental bodies should be required to have a Waste Prevention Plan. However, rather than targeting individual companies perhaps make encourage industry bodies to have waste prevent plans in place for their industry. Not only would this take some of the pressure from small companies to undertake them but it would allow for smaller resources to be directed towards these bodies to roll out initiatives. Initially those bodies which could have the biggest impact such as the Tourism Industry should be targeted firstly perhaps rolling out to other industry bodies in the longer term. As per comments on Proposal 1 existing organisations should be further resourced and partnered with those bodies to develop Waste Prevention Plans in addition these could be linked to wider sustainability/climate change/ carbon footprint action plans. Finally, it would
allow for an industry wide waste data returns system which might see better data returned.

3.5 Proposal 5: Deposit and Return

Proposal

To encourage recycling and reuse by taking powers to enable the Scottish Government to introduce deposit and return systems.

Response to questions

1. Do you consider that legislation should be made in this area?
2. If so, what form should that legislation take?
3. Your views on the practicalities of such schemes in Scotland?

Comments

Of the three options outlined I prefer Option 1

3.6 Proposal 6: Mandatory Waste Data Returns from Business

Proposal

To ensure more effective planning and policy making on commercial and industrial waste by taking powers to make regulations requiring businesses to send waste data returns to SEPA. Responses to questions

1. Do you consider that legislation should be made in this area?
2. If so, what form should that legislation take?
3. Do you have any views on the kind of businesses to be covered?

Comments

Of the three options outlined the CRNS opts for Option I although criteria for choosing businesses should be based on more than just size and should relate to amount of waste generated. Consideration should also be given to undertaking this action in the short to medium term on an industry body basis as outlined in proposal 4 comments above which might improve the quality of data returns.

Any mandatory waste data returns should be rolled out in such a way that it is linked to environmental risk and volume of waste. As such it should be based on amount of waste specific businesses generate in particular hazardous waste and bio-degradable/organic waste.

The collection of data is crucial but any systems introduced need to ensure they are not too onerous on businesses, especially if an individual business approach is adopted as against a industry body approach. If so a simplified version of the Waste Data Flow system should be used bearing in mind that a
lot of these companies are not waste management companies so support must be available from SEPA/Government to assist initially in completing a data flow, perhaps having an online support resource.

Perhaps we should also focus on the quality and quantity of waste data that is currently collected and ensuring that this is good data by requiring waste management companies to provide more details to businesses and to government/SEPA about the quantities and types of materials that they collect.

3.7 Proposal 7: Other measures to encourage waste prevention, including action on single-use carrier bags

Proposal

The Scottish Government would also welcome other ideas on legislation which could help to prevent waste.

Responses to questions

1. Do you consider that legislation should be made in this area?
2. If so, which areas should these powers cover?
3. Are there any other areas, not covered by this consultation, where legislation could be made to increase recycling and promote waste prevention?

Comments

The CRNS would like to suggest a tax on high-impact products such as bottled water in plastic bottles and more public awareness raising on the impact of such products and their waste materials (especially in areas of tourism, as raised at the Cairngorms Forum).

Single use carrier bags — the current definition is not clear as to what these bags are as many products/consumer goods come in single use carrier bags (potatoes, toilet roll etc.) and therefore any definition has to be extremely clear.

Landfill Bans—the Government may want to consider banning certain products/goods from landfill particularly focusing on those products/materials that either has a market value or has a recycling or reprocessing route. Again any definitions used need to be very clear in order that there is minimal room for interpretation. Furniture should be banned from landfill as should clothes, textiles and all wood/wood derived products.

Variable VAT on environmentally/recycling friendly products and packaging

CRNS
October 2008
RURAL AFFAIRS AND ENVIRONMENT COMMITTEE
CLIMATE CHANGE (SCOTLAND) BILL
SUBMISSION FROM MARLENE DEEKS

This plan to reduce the use of carrier bags is fraught with danger. Section 59 of the aforementioned Bill should be removed forever from the Bill and I wish to register my wish that this should be noted. The consequences are disastrous for the country, the environment and for climate change.

Just what is a carrier bag? Are there ANY carrier bags manufactured that are specifically engineered not to be reused? The answer to that as every intelligent adult knows is NO, there are no such bags.

We define a carrier bag by size, weight and thickness, so let us look at the standard supermarket carrier bag which is essentially a shaped like a T shirt. The main supermarkets carriers all measures approximately 300mm across the face, when opened out, 500 mm and is 550 mm long. It weighs about on average 7.35 grams per piece and has a thickness of about 17 microns.

ALL the alternatives to this lightweight supermarket carrier bag are heavier, bulkier and use more natural resources by way of water, electricity and transportation costs delivering them to the market place. Nobody surely pretends that we all can do without carrier bags, so we must quantify the consequences of significant reductions which Holyrood have insisted upon. Holyrood did just that in a partial way in 2004 – 2006 and concluded that to alter the status quo would probably produce an extra 13, 500 tonnes of waste findings every year in Scotland alone. When the Environment Committee realised that, they quickly and intelligently dropped plans to tax carrier bags and the then proposed Bill was not recommended to the House.

Now in 2009, the consequences are clearly visible, with jute, cotton, woven and non woven polypropylene carrier bags being sold as alternatives to the free lightweight bags. Nobody at Holyrood has updated the quantification on the unintended consequences done by them at that time, but it has been shown, using expert software based on actual products in today's market, just how disastrous this has been for Scotland.

If the 50% reduction in numbers undertaken by retailers can be achieved, then

1 The weight of product will increase from 10,600 tonnes per annum to 27,700 tonnes per annum
2 The weight of product transit packaging, will increase from 700 tonnes per annum to 3,400 tonnes per annum( more than 50% in weight of the reduction in lightweight bag weight)
3 The bulk of product will increase from 27,600 cubic meters per annum to 232,500 cubic meters per annum
4 The number of lorries travelling around Scotland alone, spewing out carcinogenic exhausts will increase from 3,500 per annum to 29,100 per annum
The number of FULL (unlikely) pallets moving around Scotland will increase from 76,000 to 639,000 pallets per year.

That’s just a few of the consequences – It is a certainty that these will occur and that more damage will be incurred to our environment as a result.

Ms. Marlene Deeks
27 February 2009
I wish to object to the inclusion of Section 59 of the aforementioned Bill. The Environment Minister wants to tax single use carrier bags as a measure to educate the public to be aware of our disposable society. They have stated that it is neither a waste nor a litter matter, which is just as well as the inevitable consequences will be more tonnage and cubic capacity taken in waste findings due to alternative products substituted. Section 59 is what appears to be a last minute hook onto the Climate Change Bill to grant this power to the Government should they require to do so, yet we have had no definition of what a “single use” carrier bag encompasses. Section 59 has no place within the Climate Change (Scotland) Bill and should be removed.

Defra and Wrap, between them have acknowledged that 80% of all UK carrier bags are currently already reused at least once, so presumably that takes such bags out of the tax net although just how that is going to be policed is yet to be determined. There is, contrary to what Ms Kennedy has stated, no public support for a further tax on the public and whilst there may be a number of wealthy politicians who believe this to be an insignificant tax, the public who have less income than they have, are content with the present free plastic carriers secure in the knowledge that they will have a receptacle for sports gear, packed lunches, shoes and the myriad of SECONDARY uses to which lightweight carrier bags are reused.

Lightweight supermarket bags are specifically being targeted, yet their very lightness is what makes them so highly efficient. There is NOTHING that is engineered to carry 25 kilos that is waterproof, hygienic and as easy to carry than the lightweight supermarket bag which itself, weighs under 8 grams.

Should this singularly daft proposal become part of law, the Government will be ridiculed worldwide for introducing a measure in an environment Bill which will increase the damage to the very environment they are charged with preserving.

William Dick
February 2009
I wish it to be recorded that I object in the strongest possible terms to the inclusion of Carrier Bags within the proposed Climate Change (Scotland) Bill.

It was clearly stated by the previous Environmental and Rural Development Committee (ERDC) that the environmental objectives in introducing a charge could not be met and to proceed with the inclusion of such a proposal in the Climate Change (Scotland) Bill without any further robust evidence is a condemnation of the scrutiny and conclusions reached by the ERDC.

It has already been proven, categorically, that the introduction of such a proposed charge will see a substantial increase in the waste findings in Scotland and in doing so will see the Scottish Government incur the most severe penalties under EU agreements. Those penalties will run into millions of pounds which will ultimately have to be met by the Scottish taxpayer.

Mr Archie Douglas
February 2009
I wish to object to section 59 of the Climate Change (Scotland) Bill as the consequences of introducing any charge for carrier bags is that more waste and carbon dioxide will result.

If the Scottish Government are serious about reducing waste then Section 59 should not be a part of Scotland's Climate Change Bill as we will see a massive increase in so called "bags for life" such as jute, cotton and nylon which cannot be recycled thereby increasing waste. Polythene carrier bags are extremely lightweight and highly reusable which is why I have a stash in my kitchen cupboard to be used as bin liners, pet waste bags, and carrying files to work every day. Even DEFRA acknowledge that 80% are reused at least once. What other form of packaging has such a high rate of reuse? Surely government time and taxpayers money should be spent on targeting and reducing "one-use" packaging?

Polythene carriers can also be recycled into other goods ensuring an even longer lifecycle. Surely reuse of waterproof, lightweight bags is far more favourable than putting old, dirty, smelly (due to lack of waterproofing) heavier bags such as jute, cotton and nylon into landfill. No bag is for "life" so surely it is best to re-use the thinnest material possible, and then recycle the bag at the end of its lifecycle?

Why should Scotland be saddled with yet another tax, due to lack of education? People should be encouraged to reuse and recycle after all that is why we have 4 bins outside our homes. This is the way to help the environment, not put heavier, bulkier bags into landfill creating more greenhouse gases.

Yvonne Douglas
February 2009
I wish it to be recorded that I object in the strongest possible terms to the inclusion of Carrier Bags within the proposed Climate Change (Scotland) Bill.

It was clearly stated by the previous Environmental and Rural Development Committee (ERDC) that the environmental objectives in introducing a charge could not be met and to proceed with the inclusion of such a proposal in the Climate Change (Scotland) Bill without any further robust evidence is a condemnation of the scrutiny and conclusions reached by the ERDC.

It has already been proven, categorically, that the introduction of such a proposed charge will see a substantial increase in the waste findings in Scotland and in doing so will see the Scottish Government incur the most severe penalties under EU agreements. Those penalties will run into millions of pounds which will ultimately have to be met by the Scottish taxpayer.

Louise Dowds
February 2009
The provisions of section 59 of the proposed Bill will INCREASE the waste generated in Scotland, rather than reduce it. This was clearly agreed and acknowledged in 2006 when the Bill for the introduction of a levy on plastic bags was finally rejected by ALL members of the Committee at Holyrood which was charged with investigating it. Government and Parliament agreed that an extra 13,500 tonnes of waste would arise resulting in the Bill being thrown out by a unanimous all party committee in 2006.

Since then matters have gone from bad to worse, with the supermarkets introducing heavyweight jute, cotton, polypropylene and other types of bags with greater weight and bulk than those bags they purported to replace. Even with a 50% reduction in the NUMBER of bags used in Scotland every year, it is estimated that with the products actually in the market place the weight of the products used will increase from 10,600 tonnes per annum to 38,400 tonnes per annum. Even worse, the bulk of these products will increase from 27,000 cubic meters to 232,000 cubic meters annually. This means we have to transport this bulk around the country using more transport and when it all goes to landfill or to recycling centres, then we will need not 76,000 pallets full of material but 639,000 pallets full of material to do so.

The Climate Change Bill is supposed to reduce Carbon emissions, the inclusion of this section 59 will INCREASE these emissions as well as further damage our infrastructure and our environment.

This clause must be removed in its entirety if the Government is serious about reducing the effects of Climate Change. I strongly object the inclusion of this Section 59 in the proposed Bill.

J Doyle
February 2009
SECTION 59

I believe Scotland has voiced its opinion on the Climate Change (Scotland) Bill and Section 59 should be removed.

NO TAX on CARRIER BAGS

Susan Dunbar (Mrs)
19 February 2009
I wish it to be recorded that I object in the strongest possible terms to the inclusion of Carrier Bags within the proposed Climate Change (Scotland) Bill.

It was clearly stated by the previous Environmental and Rural Development Committee (ERDC) that the environmental objectives in introducing a charge could not be met and to proceed with the inclusion of such a proposal in the Climate Change (Scotland) Bill without any further robust evidence is a condemnation of the scrutiny and conclusions reached by the ERDC.

It has already been proven, categorically, that the introduction of such a proposed charge will see a substantial increase in the waste findings in Scotland and in doing so will see the Scottish Government incur the most severe penalties under EU agreements. Those penalties will run into millions of pounds which will ultimately have to be met by the Scottish taxpayer.

Yvonne Dunslay
February 2009
Please register my objection to Section 59, dealing with carrier bags, in the proposed Bill.

There is a headlong rush by the Westminster Government to deny the public the continuing convenience of free carrier bags when they spend their hard earned and already highly taxed earnings on retail purchases of their choice, and now Scotland, with this power devolved to them, have meekly included the same provision in the subject proposed Bill.

No consultation with the public has taken place, and despite the ongoing existence of a voluntary Code of Conduct entered into by all major retailers which has reduced the environmental impact of all carrier bags by 25% by the end of this year, and a further commitment by retailers to reduce the number of carriers in use by 50% by the summer of 2009, we are already being informed by the Department of Environment, Food and Rural Affairs (DEFRA), that their “preferred option” is that laws are required to take powers to charge and use their existence to motivate stronger voluntary action by retailers, with compulsory charging as a fall back if this does not work.

So, without any consultation, we are to have laws enacted giving powers to produce more environmental damage, more greenhouse gas emissions and more destruction of our country emanating from a Government which claims to have the protection of the Environment as a priority. This Government is pursuing policies which further damages and humiliates their reputation.

This is yet another example of Government choosing to ignore facts in favour of political spin and to promote an issue which will inevitably produce more waste and unwelcome greenhouse gas emissions contrary to the Kyoto Protocol, The Bali Agreement, the Posnam accord and subsequent EU requirements on reducing carbon dioxide emissions and is simply irresponsible. This measure will INCREASE carbon dioxide emissions, increase methane emissions, increase tonnage of waste, increase landfill requirements, from 28,000 cubic meters per annum to 232,000 cubic meters per annum, and increase transport requirements from 76,000 pallets per year running around Scotland to 639,000 pallets running around Scotland.

Remove section 59 in its entirety and let the retailers meet their commitment. They will be delighted to do so as they will make more profits as a direct result, but please remember, the public will still need bags to carry retail purchases home.

Anne Edwards
27February 2009
I wish to object to the inclusion of Section 59 of the aforementioned Bill. The Environment Minister wants to tax single use carrier bags as a measure to educate the public to be aware of our disposable society. They have stated that it is neither a waste nor a litter matter, which is just as well as the inevitable consequences will be more tonnage and cubic capacity taken in waste findings due to alternative products substituted. Section 59 is what appears to be a last minute hook onto the Climate Change Bill to grant this power to the Government should they require to do so, yet we have had no definition of what a “single use” carrier bag encompasses.

Scotland has already voiced it’s opinion on proposals to tax carrier bags, a resounding NO.

Defra and Wrap, between them have acknowledged that 80% of all UK carrier bags are currently already reused at least once, so presumably that takes such bags out of the tax net although just how that is going to be policed is yet to be determined. There is, contrary to what Ms Kennedy has stated, no public support for a further tax on the public and whilst there may be a number of wealthy politicians who believe this to be an insignificant tax, the public who have less income than they have, are content with the present free plastic carriers secure in the knowledge that they will have a receptacle for sports gear, packed lunches, shoes and the myriad of SECONDARY uses to which lightweight carrier bags are reused.

Lightweight supermarket bags are specifically being targeted, yet their very lightness is what makes them so highly efficient. There is NOTHING that is engineered to carry 25 kilos that is waterproof, hygienic and as easy to carry than the lightweight supermarket bag which itself, weighs under 8 grams.

Should this singularly daft proposal become part of law, the Government will be ridiculed worldwide for introducing a measure in an environment Bill which will increase the damage to the very environment they are charged with preserving.

Hazel Elliot
February 2009
Introduction

The Federation of Small Businesses is Scotland’s largest direct-member business organisation, representing around 20,000 members. The FSB campaigns for an economic and social environment which allows small businesses to prosper.

FSB Scotland has consistently highlighted the need for the Scottish Government to examine how waste disposal options for small businesses can be expanded, to allow Scotland and business to benefit from the opportunities offered by increased business recycling.

We recognise the role that business must play in achieving a more sustainable Scotland and we believe that small businesses have demonstrated their commitment to this in recent years; however small businesses require support to change, particularly in the current financial climate. While we support the government’s aim to take action in relation to improving business (including public sector) recycling, we strongly believe that offering carrots, instead of, or in addition to, sticks would be a more beneficial way to progress.

Small Businesses and the Environment

We have always been happy to share data on environmental performance of small businesses with the Scottish Government. We previously carried out a membership survey on waste disposal in late 2004. At that time we learned that 43% of our members recycled some waste. The majority did not have hazardous waste streams, mainly disposing of paper, cardboard, and food waste (similar to household waste). Most businesses had their waste collected by their local authority.

 Recent survey work with FSB members suggests that Scottish businesses have made progress and have a commitment to environmental improvement. Initial data (not yet published) shows that 40% of our members have changed the operation of their business as a result of climate change.

In examining the most important catalyst for future improvements, the main factor cited was a general concern for the environment — fines and penalties were less important as motivation for change.
Data gathered in early 2008 for the biennial FSB membership survey. Data referred to is based on 708 Scottish responses.

Waste

This recent data also shows that 84% of small businesses are now recycling some of their waste — a substantial improvement on the 2004 survey data. Responses also underline the ongoing importance of local authorities in small business waste disposal in Scotland, particularly when compared with other areas of the UK. The majority see local authorities as the main source of advice on environmental legislation and Scottish respondents are most likely in the UK to recognise that their local authority offered business kerbside recycling at a charge. 63% and 68% report that they use local authority facilities to recycle cardboard and paper respectively.

We remain concerned that some of the persistent problems relating to recycling are still a factor. Many businesses still feel that no facilities are available for recycling (21% felt no recycling was available for catering waste for example) and cost was cited as the main barrier in waste disposal. Overall only 43% were satisfied with the level of recycling offered by their local authority, perhaps suggesting a frustration at current limitations.

Moving Forward

We believe that evidence from our members shows that progress has been made in improving recycling amongst small businesses, as well as strong indications of support for environmental improvement. The fact that we have made such dramatic progress suggests that a legislative approach is not the right way to improve and risks alienating the goodwill that clearly exists in the small business community.

Yet again we see evidence of the key role played by local authorities in waste disposal for small businesses in Scotland. We understand the concerns of local authorities regarding pressure of landfill targets but we reiterate our view that developing recycling services and facilities for local businesses would help increase valuable recyclate collected by local authorities and reduce the small business contribution to municipal landfill. We are pleased that many local authorities have made progress in recent years but this issue cannot be ignored and local authorities must recognise this if we are to make progress as a nation.

In considering the evidence we are concerned that the Scottish Government should not proceed with plans to force all businesses to recycle, or offer facilities to do so to their customers, until cost-effective, facilities are in place to cope with increased demand. We do not believe that appropriate infrastructure or services exist at present.

If the Scottish Government wishes to set specific standards for parts of the public sector — and the evidence for facilities at certain public amenities is
convincing - then small businesses should be specifically exempted at this stage. In the main this is because a large number of small businesses are not customer-facing (i.e. not shops or cafes open to public) and have hardly any employees (93% of all businesses have less than 10 employees). Therefore, legislation aimed at providing facilities for employees and customers would unfairly impact on the majority of small businesses.

Finally, we are disappointed that the consultation paper lacks detailed proposals, particularly since these proposals are likely to feature in primary legislation. The consultation paper is well structured and ambitions for legislation are clear but we reiterate our opposition to vague, enabling legislation. Some of the measures proposed have the potential to affect anywhere between a number of prescribed public sector premises, to tens of thousands of businesses. Clearly there is a vast difference in the cost and practicality of such extremes. To proceed to primary legislation without options which have been subjected to an effective business impact assessment would be both unwise and contrary to the Scottish Government’s support for the principles of better regulation. As a first step, when citing examples from other EU member states, the Scottish Government should, as a matter of course, also obtain relevant impact assessment information from the member state (down to costs per business, where available) to inform discussion of the practicalities and costs of such options.

Questions

PROPOSAL 1: DUTIES ON PUBLIC BODIES AND BUSINESSES TO PROVIDE RECYCLING FACILITIES

As outlined above, we do not believe the case has been made to place a duty on small businesses to offer facilities to customers and staff. Such a duty imposed on businesses would likely impact on the majority when in fact it aims to provide facilities in some specific locations and premises as an obvious first step to improving availability of recycling facilities. This is not a sound basis on which to impose a cost on businesses and we therefore welcome the reference to only applying this duty to units over a certain size.

If such a duty is placed on public bodies (particularly local authorities), we hope this might build capacity by encouraging greater thought about the availability of uplifts and facilities for recycling which could also be used, at a later stage, for small businesses.

PROPOSAL 2: PACKAGING

There is little doubt that there is a growing public mood against excessive packaging. The problem lies in identifying those with influence and responsibility to reduce packaging — most small businesses have no clout whatsoever in terms of supply chain pressure.

The suggestions for legislation tend to suggest that retailers will be expected to provide a lot of paperwork on excess packaging when they are not the main
source of the problem. We cannot see what will be gained by placing a further reporting burden on small retailers.

PROPOSAL 3: SPECIFYING RECYCLATE

We see the need to continue to support the use of recycled material in, say, construction contracts and to extend this where appropriate to other spend by the public sector. We must, however, be careful to ensure this duty does not contradict wider aims of sustainable procurement, particularly the benefits of buying from local sources. We cannot see any relevance to purchasing by small businesses and recommend they be exempted from such a duty.

PROPOSAL 4: WASTE PREVENTION PLANS

We support the Scottish Government’s aim to place greater emphasis on commercial and industrial waste. We recognise that having a forward strategy for dealing with waste will be a key factor for many organisations, particularly large parts of the public sector involving many different complex services and premises. For the majority of small businesses who probably operate from one premises, have few employees, and straightforward waste streams, we cannot see the benefit of such plans outweighing the bureaucratic burden. We do support, however, an increase in advice and aware-raising for small businesses about the benefits to the business of reducing, re-using and recycling waste but we must be careful not to raise expectations — many businesses would like to recycle more waste but simply do not see practical, affordable options.

PROPOSALS: DEPOSIT AND RETURN

We agree that there is a history of operating deposit and return schemes in Scotland; therefore it may be easier to encourage public participation in such a scheme. There are clearly a number of issues which would need to be addressed and which cause particular concern for small businesses. We agree that a working party to help develop such proposals would be an effective way to proceed. We note the likelihood of exemptions for small businesses not being available however we think it would be worth exploring phased introduction, should the government decide to proceed with deposit and return. This could result in a pilot project (perhaps voluntary?) as a first step, followed by rolling out to larger stores in the first instance.

We will gather more detailed views from smaller retailers regarding practicalities of such a scheme however in the meantime the concerns for small businesses would include:

- Practicality of storing cans/bottles — consider fire and health and safety aspects
- An increase in paperwork and costs associated with running the scheme, particularly clarity of deposit money for accounting purposes
• Enforcement — would local authorities be best-placed to interact with local businesses?
• Fees — businesses should be encouraged to participate, therefore imposing a fee/licensing structure would not be helpful
• Reverse vending — we support the use of technology to facilitate the scheme but will this be possible or affordable for small businesses?’
• Support - in rolling out such a scheme it is likely small businesses would require some kind of source of information and advice
• Impact on existing kerbside recycling by local authorities

Lastly, since this proposal is based on two existing schemes, it would be helpful (in advance of any working group) to gather relevant information from those countries regarding the practicalities for businesses of: separation, storage and collection of the goods; any impact on existing waste collection and additional costs on business; and, bureaucratic and accountancy implications for business.

PROPOSAL 6: MANDATORY WASTE DATA RETURNS FROM BUSINESS

While we accept that it is clearly necessary to have information on waste streams in order to plan and build appropriate infrastructure, we would nonetheless like to see more explanation of which specific information is required and for which policy purposes. This justification would make it clearer where information requirements should be targeted and there would then be a clearer proposal for legislation or working with particular sectors to develop a plan for gathering more comprehensive data (with the threat of legislation). We also believe that there must be scope to improve the sharing of data gathered through different licensing procedures and/or government agencies. We welcome SEPA’s indication that they will address this - surely, this should be completed before any legislation is discussed?

At present, we are not convinced that the small amounts of non-hazardous waste from most small businesses require blanket legislation potentially forcing them to complete paperwork which would be of little value. If any data requirement legislation is introduced, it must be combined with a review of other environmental data gathered from businesses so that some kind of streamlining or reduction can be achieved.

PROPOSAL 7: OTHER MEASURES TO ENCOURAGE WASTE PREVENTION, INCLUDING ACTION ON SINGLE-USE CARRIER BAGS

The FSB’s response to legislative measures to reduce the use of plastic carrier bags is well documented. We believe that previous proposals were likely to impact most severely on small, non-food retailers — who we suggest are least likely to be perceived as the main perpetrators’ of excess use of carrier bags. We believe that focusing on carrier bags has been a distraction from more substantial issues regarding business recycling — some of which have been discussed in this document.
RIA
We welcome the work initially carried out for the partial RIA but would encourage the Scottish Government to incorporate the use of the Business Impact Assessment, as recently recommended by the Regulatory Review Group in Scotland. We do feel that some of the conclusions reached regarding costs to business are perhaps rather optimistic.

Further detailed information (particularly looking at costs) from other countries would help develop the RIA further and would then help the Scottish Government determine which proposals are viable on the basis of excessive cost and practicality implications for businesses (and the public sector).

FSB
October 2008
RURAL AFFAIRS AND ENVIRONMENT COMMITTEE
CLIMATE CHANGE (SCOTLAND) BILL
SUBMISSION FROM KERRY FLEMING

The arrogance of Environment Minister, simply beggars belief. He informs us the public want Government to do something about the carrier bag issue and so he invidiously includes powers to deal with such bags in the proposed Climate Change (Scotland) Bill.

The fact of the matter is that there have been two official consultations on the subject: one received over 1200 individual responses of which over 1100 were specifically against the introduction of a levy or tax on plastic carrier bags. The second stated categorically that the proposal relating to carrier bags (section 59 in the Bill) only received support from a minority of respondents.”

If the Government were to be honest enough to ask the nation, if the introduction of a projected tax of over 600% on a product which was currently given away free was on their personal wish list, they would be told to check in to the mental institution.

This is yet another example of Government choosing to ignore facts in favour of political spin and to promote an issue which will inevitably produce more waste and unwelcome greenhouse gas emissions contrary to the Kyoto Protocol, The Bali Agreement, the Posnam accord and subsequent EU requirements on reducing carbon dioxide emissions is simply irresponsible.

This measure will INCREASE carbon dioxide emissions, increase methane emissions, increase tonnage of waste, increase landfill requirements and increase transport requirements from 76,000 pallets per year running around Scotland to 639,000 pallets running around Scotland.

This section 59 in the proposed Bill should be eliminated in its entirety. Please register my objection accordingly.

Kerry Fleming
February 2009
I wish it to be recorded that I object in the strongest possible terms to the inclusion of Carrier Bags within the proposed Climate Change (Scotland) Bill.

It was clearly stated by the previous Environmental and Rural Development Committee (ERDC) that the environmental objectives in introducing a charge could not be met and to proceed with the inclusion of such a proposal in the Climate Change (Scotland) Bill without any further robust evidence is a condemnation of the scrutiny and conclusions reached by the ERDC.

It has already been proven, categorically, that the introduction of such a proposed charge will see a substantial increase in the waste findings in Scotland and in doing so will see the Scottish Government incur the most severe penalties under EU agreements. Those penalties will run into millions of pounds which will ultimately have to be met by the Scottish taxpayer.

Amanda Galisden
25 February 2009
I wish to object to section 59 of the Climate Change (Scotland) Bill as the consequences of introducing any charge for carrier bags is that more waste and carbon dioxide will result.

Many supermarkets now impose a charge on lightweight carrier bags yet our waste mountain is increasing. The inclusion of Section 59 will see a massive increase in bags such as paper, jute, cotton and nylon which cannot be recycled thereby increasing waste. Section 59 will not address the real climate change dilemma merely increase costs for everyone.

Sandra Giddy
26 February 2009
RURAL AFFAIRS AND ENVIRONMENT COMMITTEE

CLIMATE CHANGE (SCOTLAND) BILL

SUBMISSION FROM GRANT JAMES HENDRY

I wish it to be recorded that I object in the strongest possible terms to the inclusion of Carrier Bags within the proposed Climate Change (Scotland) Bill.

It was clearly stated by the previous Environmental and Rural Development Committee (ERDC) that the environmental objectives in introducing a charge could not be met and to proceed with the inclusion of such a proposal in the Climate Change (Scotland) Bill without any further robust evidence is a condemnation of the scrutiny and conclusions reached by the ERDC.

It has already been proven, categorically, that the introduction of such a proposed charge will see a substantial increase in the waste findings in Scotland and in doing so will see the Scottish Government incur the most severe penalties under EU agreements. Those penalties will run into millions of pounds which will ultimately have to be met by the Scottish taxpayer.

William Hamilton
February 2009
I wish to object to the inclusion of Section 59 of the aforementioned Bill. The Environment Minister wants to tax single use carrier bags as a measure to educate the public to be aware of our disposable society. They have stated that it is neither a waste nor a litter matter, which is just as well as the inevitable consequences will be more tonnage and cubic capacity taken in waste findings due to alternative products substituted. Section 59 is what appears to be a last minute hook onto the Climate Change Bill to grant this power to the Government should they require to do so, yet we have had no definition of what a “single use” carrier bag encompasses.

Why we in Scotland need to have this Section 56 included just because the UK Government wants it is unjustified.

Defra and Wrap, between them have acknowledged that 80% of all UK carrier bags are currently already reused at least once, so presumably that takes such bags out of the tax net although just how that is going to be policed is yet to be determined. There is, contrary to what Ms Kennedy has stated, no public support for a further tax on the public and whilst there may be a number of wealthy politicians who believe this to be an insignificant tax, the public who have less income than they have, are content with the present free plastic carriers secure in the knowledge that they will have a receptacle for sports gear, packed lunches, shoes and the myriad of SECONDARY uses to which lightweight carrier bags are reused.

Lightweight supermarket bags are specifically being targeted, yet their very lightness is what makes them so highly efficient. There is NOTHING that is engineered to carry 25 kilos that is waterproof, hygienic and as easy to carry than the lightweight supermarket bag which itself, weighs under 8 grams.

Should this singularly daft proposal become part of law, the Government will be ridiculed worldwide for introducing a measure in an environment Bill which will increase the damage to the very environment they are charged with preserving.

David Houston
February 2009
Please register my objection to the section in this Bill (Section 59) which gives power to the Scottish Ministers to introduce charges for carrier bags.

We in Scotland have already seen this plea for legislation rejected by Parliament and spent time and taxpayers money doing so.

Lightweight carrier bags are being touted as “single use” by our Environment minister Richard Lochhead. If they are, then more fool him for not reusing them as most of the public already do. Even his own DEFRA colleagues acknowledge that 80% are reused at least once.

Now he wants to tax these efficient bags for no other reason than to educate the public. What drivel emanates from Government — pray tell us uneducated masses when was the last time the imposition of a tax educated anyone on a specific policy other than to educate them that their Government is grasping at straws.

Pray tell the world, who is it that wants more taxes which will result in damage to the environment on already stretched incomes, when we are being advised we should be trying to help the environment?

B Jervis
26 February 2009
I am writing as part of the above call for views on behalf of the John Lewis Partnership (JLP). Across the UK, the Partnership operates 27 department stores johnlewis.com, 198 Waitrose supermarkets and Greenbee.com, a direct services company. The business has an annual turnover of over £6.8bn. It is the UK’s largest example of worker co-ownership where all 69,000 staff are Partners in the business, sharing in its decision making and in its financial success. We welcome the opportunity to contribute to the committee’s call for views and support the Scottish government’s commitment to tackling climate change through the Climate Change Bill and more specifically its aim of zero waste.

The John Lewis Partnership’s waste strategy is based on our ambition to divert our waste from landfill by reducing, reusing, recycling or recovering energy from all our commercial waste and packaging. We have an overarching target to divert 95% of our waste from landfill by 2013. Delivery of this is supported by a range of specific targets and initiatives in John Lewis and Waitrose.

In summary:

**Waitrose targets**
- Recycle 75% of all Waitrose waste by year-end 2012
- Reduce own-brand packaging by 2013 on a like-for-like basis, compared with 2005, and work with suppliers to encourage similar reductions
- Apply packaging recyclability labelling to own-brand products by year-end 2009
- Continue to explore ways to reduce food waste and provide practical information in-store and online to raise customer awareness of this issue
- Continue anaerobic digestion trials

**John Lewis targets**
- Recycle 50% of all John Lewis waste by year-end 2010
- Help achieve the collective retailer, WRAP, Government target of a 50% reduction in single use carrier bags

**Scottish Government’s zero waste proposals**

**Question 15 – Recycling**

The Partnership believes that as a responsible retailer it is helping to establish examples of best practice in this area. The Scottish Government’s packaging and waste proposals are welcomed and we supporting voluntary codes to take these forward. These have worked well in the past and good progress is being made. Regulation seems to us unnecessary where voluntary agreements with industry could produce as constructive and positive outcome.
The Partnership actively encourages customers to recycle both in and out of the home. We have highlighted some of the recycling initiatives and our efforts to encourage customers, below:

**Recycling initiatives**

Our waste and recycling procedures continue to deliver significant improvements, helping us towards our ongoing objective to divert 95% of our waste from landfill. In 2008–09, Waitrose diverted half (50%) of our waste, saving over 23,257 tonnes from going to landfill.

In an attempt to maximise the recycling opportunities across the business, our efforts have included:

- introduced battery recycling and polystyrene briquette-making at Cambridge
- shared backhauling capacity at Rushden and in Scotland
- plans to send non-recyclable waste from the Waitrose head office in Bracknell to the first purpose-built ‘energy from waste’ incineration facility, due to be commissioned next year.
These procedures continue to deliver substantial cost savings and a step change in our waste recycling. In 2008/09 John Lewis we diverted 4,814 tonnes of waste from landfill (43%).

A collaborative arrangement sees cardboard and polythene bales from Waitrose Comely Bank, as well as segregated waste material from John Lewis Edinburgh, backhauled to our local Distribution Centre.

Under the terms of the Packaging Waste Regulations, we are also legally obliged to recover and recycle 55–80% of our product packaging. We do this by contributing over £1 million a year towards a recycling compliance scheme, which invests in kerbside collections and public recycling centres so that customers can recycle the packaging they take home. We also use returnable transit packaging for around 41 million trips annually through our Waitrose supply chain. We encourage Local Authorities to offer other recycling points in our Waitrose car parks, where space permits, for materials such as clothing, glass and paper, and encourage customers to reuse and recycle plastic bags, or switch to more sustainable alternatives. There are also carrier bag recycling facilities in Waitrose shops, with certain John Lewis shops trialing such facilities.

**Encouraging customers**

To help our customers to recycle, where possible, we clearly identify the materials used in our own-label packaging, and we have recently worked with the Waste and Resources Action Programme (WRAP) and other retailers to develop concise, consistent recycling messages on back of pack.

We fully support the Waste Electrical and Electronic Equipment (WEEE) Regulations which allow people to recycle old electrical and electronic appliances at sites across the UK, free of charge. The Partnership has contributed funds to the Distributor Take Back Scheme, which we helped to establish. This scheme is investing £10 million in local recycling facilities so customers can locally recycle their waste electrical and electronic items.

As a manufacturer of own-brand electrical products, we also have a responsibility for recycling waste electricals. So we are funding a compliance scheme to do this on our behalf. Our customers can learn more about the legislation, and their recycling options, through in-store leaflets and online at www.recycle-more.co.uk. All John Lewis and Waitrose Food and Home shops also offer mobile phone recycling.

**Fighting food waste**

Waitrose is the first national food retailer to successfully trial anaerobic digestion as a food waste solution. A trial for the past three months at five Waitrose branches (including Scotland) has been successful in sending food waste, both naked and primary packaged, to an anaerobic digestion plant in north Bedford. This has turned 251 tonnes of food waste into 50 megawatt hours of electricity - enough to boil 12,000 electric kettles for one hour.
This initiative will see us routing approximately 25% of the Partnership’s food waste to electricity production - rather than to landfill. The cost to do so is neutral compared to the current collection method of transporting food waste to landfill. However, as landfill costs continue to rise, this approach will reduce our future costs.

In addition to the energy which is generated, the digestate residue from the process, which is high in nitrates, can be spread on the land at certain times of year as a fertiliser to grow crops - and no damaging methane gas is released into the atmosphere.

The only constraint is that today the number of anaerobic digestion plants is very small as it is new technology to this country. As plants proliferate there is every reason to believe that all our food waste could be recycled in this manner.

Packaging
We are actively pursuing a policy of packaging reduction. While we agree with the assertion that there is significant scope for the reduction in packaging, certain types of packaging are essential to ensure that goods remain undamaged in transit and are hygienically presented to consumers. Any new regulations in this area should take account of this.

We have set out below the work we are doing in this area and believe that a combination of guidance and voluntary action will achieve further significant progress. The Scottish Government’s proposal to detail and report on all types of packaging for shops the size of John Lewis and Waitrose would require significant resource allocation, time and investment. We believe that as long as retailers are setting ambitious targets and meeting those targets such an approach is unnecessary.

Reducing packaging
We continually strive to find a balance between reducing packaging and making sure it still protects our products in transit and on the shelf. Waitrose, is a signatory of the Courtauld Commitment and has helped WRAP o achieve the first Courtauld target of eliminating packaging growth, despite a sharp increase in sales. Waitrose has itself reduced packaging consumption relative to sales by 36% since 2000 and our packaging designers are working to improve its performance and, where possible, reduce its weight. As part of our commitment, 50% of our organic produce now comes in degradable, biodegradable or compostable packaging. John Lewis is also playing its part in reducing packaging

Specifying recyclate
We are also looking at introducing products and packaging utilising recycled materials. However, we believe that business should be given the flexibility to innovate in this area without the constraints of legislation. Introducing recycled content tends to increase weight, which provides a challenge, as many of the measures currently in place are weight based.
Waste Prevention Plans
The John Lewis Partnership through its varied initiatives is committed to preventing waste. Guidance and voluntary action supported by government will help drive good practice and ensure that companies who already undertake measures to prevent waste continue to set and achieve ambitious targets. Also opportunities to share best practice and provide an ‘incentive’ to other companies at the start of the waste journey.

Deposit and Return
We would be willing to work with government to extend customer educational programmes and encourage the public to take responsibility for recycling and reducing the impact of their personal waste. Waste reduction on a large scale will only happen if the general public are educated, provision is made locally and responsibility is taken at home for personal waste. The implications of this scheme are difficult to quantify and may prove challenging and resource intensive to implement. Any such scheme also needs to be backed up by comprehensive consumer research to evidence their effectiveness and joined up with wider and more integrated waste management measures.

Mandatory Waste Data Returns from Business
We believe that a mandatory approach to data returns is unnecessary and would be expensive and bureaucratic to set up and operate. The voluntary targets and existing measures are designed actively to reduce consumption, recycle, reuse and dispose of waste sustainably. Such a measure, in our view, would only serve to add further layers of bureaucracy where that none are necessary. We already provide data as part of our Packaging Waste and WEEE obligations (this will soon include Batteries as well). Also, we voluntarily report data for Waitrose as part of our commitment to the Courtauld Commitment and the Voluntary Agreements on carrier bags. We also participate in the British Retail Consortium’s Better Climate Initiative. In addition, we voluntarily report our performance across this whole area through our Corporate Social Responsibility work.

Other measures to encourage waste prevention, including action on single-use carrier bags
We agree with the Scottish Government’s voluntary approach to plastic bags. We have carefully evaluated all options open to us for driving a reduction in customer usage. We firmly believe that a national campaign supported by both retailers and Government is the only way to change people’s habits. This is why both John Lewis and Waitrose signed up to the initial Government Voluntary Code of Practice on Carrier Bags in 2007 and the more recent agreement with food retailers. As part of this commitment we have installed many practices to reduce the environmental impact of our carrier bags and to discourage use or encourage reuse. In Waitrose activities such as increased Partner training, prominent customer communications instore, ensuring our mainline checkout are visibly clear of carrier bags and offering customers a Bag For Life before any single use bags are dispensed, has already helped us to achieve a cumulative reduction in carrier bag usage to date of 37.5% (avoiding the use of around a million bags). Waitrose is optimistic that we can achieve an overall 50% reduction by May 2009 and build on this longer term.
In John Lewis, the introduction of a Bag for Life has also helped drive reductions in free issue plastic bags. John Lewis are also working to introduce a wide variety of reusable bags to help drive further reductions in carrier bag usage.

**Summary**
The John Lewis Partnership welcomes the Scottish Government's commitment to 'zero waste'. We take pride in our reputation as a responsible retailer and we are committed to reducing, reusing, recycling and disposing of waste responsibly. We believe that a voluntary approach, supported by the sharing of good practice and government guidance is the right approach. A statutory approach may add unnecessary and cumbersome levels of bureaucracy and cost. These could place Scottish companies at an unfair competitive disadvantage.

We would welcome the opportunity to engage with the Transport, Infrastructure and Climate Change Committee and the Scottish Government to take any of these proposals forward.

John Lewis
5 March 2009
Dear Sirs,

Re call for views on Climate Change (Scotland) proposed Bill.

Kindly register my objection to the section of this proposed Bill which relates to carrier bags.

The Environment Department is presumably supposed to be protecting the environment, yet we are expected to suffer the ignominy of paying a tax for our carrier bags at the supermarket which has been specifically proven by the Scottish Government in 2006 to result in more damage to the environment by the substitution of smelly, bulkier and heavier alternatives.

If we have no free plastic bags we will just have to buy plastic bin liners instead, costing us even more of our hard earned net of tax, earnings, and by so doing will only increase the amount of raw materials used. Is this not simply madness?

L Lammie
February 2009
I wish to object to the inclusion of Section 59 of the aforementioned Bill. The Environment Minister wants to tax single use carrier bags as a measure to educate the public to be aware of our disposable society. They have stated that it is neither a waste nor a litter matter, which is just as well as the inevitable consequences will be more tonnage and cubic capacity taken in waste findings due to alternative products substituted. Section 59 is what appears to be a last minute hook onto the Climate Change Bill to grant this power to the Government should they require to do so, yet we have had no definition of what a “single use” carrier bag encompasses. Exactly how legislation to impose a charge for carrier bags will improve our waste findings is utterly baffling.

Defra and Wrap, between them have acknowledged that 80% of all UK carrier bags are currently already reused at least once, so presumably that takes such bags out of the tax net although just how that is going to be policed is yet to be determined. There is, contrary to what Ms Kennedy has stated, no public support for a further tax on the public and whilst there may be a number of wealthy politicians who believe this to be an insignificant tax, the public who have less income than they have, are content with the present free plastic carriers secure in the knowledge that they will have a receptacle for sports gear, packed lunches, shoes and the myriad of SECONDARY uses to which lightweight carrier bags are reused.

Lightweight supermarket bags are specifically being targeted, yet their very lightness is what makes them so highly efficient. There is NOTHING that is engineered to carry 25 kilos that is waterproof, hygienic and as easy to carry than the lightweight supermarket bag which itself, weighs under 8 grams.

Should this singularly daft proposal become part of law, the Government will be ridiculed worldwide for introducing a measure in an environment Bill which will increase the damage to the very environment they are charged with preserving.

Lynda Lammie
February 2009
Please register my wish to see the whole of section 59 of the Climate Change (Scotland) Bill removed from this proposal.

Should we get rid of single use carrier bags as the Government is encouraging us to do or they will introduce legislation to charge the public for free bags? Just what do they expect us to use to transport retail purchases from shop to home? They want us to use alternative reusable bags which they erroneously believe will help the environment, yet all give cause for environmental concern.

Degradable lightweight bags are not acceptable to environmentalists even though they are made from polyethylene which is easily recycled. If a 4% degrading additive is added to make them so called BioDegradable the plastic is lost to the world forever as BioDegradable films, by their very nature, are not recyclable. In these days of recycling surely this is socially unacceptable.

Starch based compostable carrier bags are not currently strong enough or economically viable. They too are socially unacceptable considering the requirement of having to grow high yield starch based food crops to make them whilst more than 25% of the world’s population is starving. We have, within the last three months already seen food riots in various parts of the undeveloped world due to food prices increasing dramatically as corn and other food is used to produce ethanol for motor fuels.

Woven polypropylene and non woven polypropylene bags, now prevalent in our supermarkets, are just plastic bags in a different guise. Jute and cotton bags are the preferred option of the well intentioned Environmentalists. Both products essentially emanate from the Indian sub-continent and little wonder, considering they do not give one jott about the environment.

Just how on earth can transporting these heavier, bulkier, fuel guzzling alternative products all the way from India and beyond, be more Environmentally friendly?

The lightweight, waterproof, non-absorbent plastic carrier bag is the best alternative. Reuse it where hygienically possible and when its useful life expires, recycle it in one of the major supermarkets collection bins. It will then be recycled and converted into a whole host of products i.e. black refuse sacks, bin liners, agricultural and building films to name just a few.

As responsible adults we should REDUCE – REUSE – RECYCLE if it just wasn’t so damned difficult.

Claire Lamont, 25 February 2009
I wish it to be recorded that I object in the strongest possible terms to the inclusion of Carrier Bags within the proposed Climate Change (Scotland) Bill.

It was clearly stated by the previous Environmental and Rural Development Committee (ERDC) that the environmental objectives in introducing a charge could not be met and to proceed with the inclusion of such a proposal in the Climate Change (Scotland) Bill without any further robust evidence is a condemnation of the scrutiny and conclusions reached by the ERDC.

It has already been proven, categorically, that the introduction of such a proposed charge will see a substantial increase in the waste findings in Scotland and in doing so will see the Scottish Government incur the most severe penalties under EU agreements. Those penalties will run into millions of pounds which will ultimately have to be met by the Scottish taxpayer.

Donna Lee

Please register my objection to the section in this Bill (Section 59) which gives power to the Scottish Ministers to introduce charges for carrier bags.

We in Scotland have already seen this plea for legislation rejected by Parliament and spent time and taxpayers money doing so

Lightweight carrier bags are being touted as “single use” by our Environment minister Richard Lochhead. If they are, then more fool him for not reusing them as most of the public already do. Even his own DEFRA colleagues acknowledge that 80% are reused at least once.

Now he wants to tax these efficient bags for no other reason than to educate the public. What drivel emanates from Government — pray tell us uneducated masses when was the last time the imposition of a tax educated anyone on a specific policy other than to educate them that their Government is grasping at straws.

Pray tell the world, who is it that wants more taxes which will result in damage to the environment on already stretched incomes, when we are being advised we should be trying to help the environment?

February 2009
The provisions of section 59 of the proposed Bill will INCREASE the waste generated in Scotland, rather than reduce it. This was clearly agreed and acknowledged in 2006 when the Bill for the introduction of a levy on plastic bags was finally rejected by ALL members of the Committee at Holyrood which was charged with investigating it. Government and Parliament agreed that an extra 13,500 tonnes of waste would arise resulting in the Bill being thrown out by a unanimous all party committee in 2006.

The Scottish purse has already been pillaged of two million pounds in arriving at that decision, is there any need to waste more taxpayers money to arrive at the same answer.

Since then matters have gone from bad to worse, with the supermarkets introducing heavyweight jute, cotton polypropylene and other types of bags with greater weight and bulk than those bags they purported to replace. Even with a 50% reduction in the NUMBER of bags used in Scotland every year, it is estimated that with the products actually in the market place the weight of the products used will increase from 10,600 tonnes per annum to 38,400 tonnes per annum. Even worse, the bulk of these products will increase from 27,000 cubic meters to 232,000 cubic meters annually. This means we have to transport this bulk around the country using more transport and when it all goes to landfill or to recycling centres, then we will need not 76,000 pallets full of material but 639,000 pallets full of material to do so.

The Climate Change Bill is supposed to reduce Carbon emissions, the inclusion of this section 59 will INCREASE these emissions as well as further damage our infrastructure and our environment.

This clause must be removed in its entirety if the Government is serious about reducing the effects of Climate Change. I strongly object the inclusion of this Section 59 in the proposed Bill.

D Millar
26 February 2009
I wish to object to section 59 of the Climate Change (Scotland) Bill as the consequences of introducing any charge for carrier bags is that more waste and carbon dioxide will result. This section should be excluded as I clearly do not agree with it.

What a ridiculous idea to include a proposal to charge for carrier bags in a Climate Change Bill. Charging for carrier bags will increase not only waste but harmful emissions. We will see a massive increase in bags such as paper, jute cotton and nylon which cannot be recycled thereby creating and increasing more waste???

A possible rethink is due on this one.

Thanks

Roseanne Miller
20 February 2009
Please register my wish to see the whole of section 59 of the Climate Change (Scotland) Bill removed from this proposal.

Should we get rid of single use carrier bags as the Government is encouraging us to do or they will introduce legislation to charge the public for free bags? Just what do they expect us to use to transport retail purchases from shop to home? They want us to use alternative reusable bags which they erroneously believe will help the environment, yet all give cause for environmental concern.

Heavyweight plastic carrier bags have always been available, but are limited in their reuse. If blood from meat or fish taint the insides then the bag should be discarded or the risk of cross infection on reuse becomes prevalent. Similarly bleach, soap powder or milk spills render the bags hygienically suspect and discarding such spoiled bags is the only safe option.

Degradable lightweight bags are simply not acceptable to environmentalists as they are made from over 90% polyethylene which is easily recyclable but if the 4% degrading additive is added, then the plastic is lost to the world forever. In these days of recycling this is socially unacceptable.

Bio-degradable bags are not currently strong enough or economically viable and are not socially acceptable when you have to grow food to make them with over 25% of the world’s population going to bed hungry. We have, within the last three months seen food riots in various parts of the undeveloped world due to food prices increasing dramatically as corn and other food is used to produce ethanol for motor fuels.

Woven polypropylene and non woven polypropylene bags now prevalent in our supermarkets are actually both plastic bags and whilst sturdy, are both internally absorbent for all spills mentioned in the preceding paragraph. Additionally non woven polypropylene bags are externally and internally absorbent and this able to transfer street dirt (dog excrement, street germs, both human and animal) into the fabric.

Jute and cotton bags are the preferred option of the well intentioned Environmentalists and the blue rinse brigade. Both products essentially emanate from the Indian sub-continent and if you examine in situ, the standards of working conditions, public health, hygiene, and ethical issues of underage workers in that area, it is highly unlikely that anyone with a modicum of intelligence or any interest in hygiene or moral issues would ever consider using either of these types of bags. Dirty, filthy, badly lit, working conditions, open to insect infestation, where cows freely roam the streets outside, where 90% of the population do not have ACCESS to a toilet, where there is no
running water, crowded workers, many of them clearly underage, work for a pittance in unsafe conditions using antiquated machinery, producing jute and cotton bags for direct food contact is not what anyone should consider an environmentally friendly option. Good luck with the e-coli, the sanitation diseases, the salmonella, and the other diseases commensurate with a product into which grubby hands and feet have been sewing in unhygienic conditions. Again these products are absorbent and not waterproof rendering them susceptible to hygiene implications. Some of the jute bags do have plastic inside, so defeat the point anyway, and washing uses water, electricity, chemicals and damages the environment further.

The transport implications are horrendous with heavier and bulkier alternatives using an estimated 4,000,000 more full (unlikely) pallet journeys every year throughout the UK, of which some 500,000 will be in Scotland.

The lightweight, waterproof, non-absorbent plastic carrier bag is the best alternative. Reuse it where hygienically possible, when its useful life expires, recycle it in one of the major supermarkets collection bins where it is turned into black refuse sacks, bin liners, agricultural and building films.

Alastair Monteith
25 February 2009
RURAL AFFAIRS AND ENVIRONMENT COMMITTEE

CLIMATE CHANGE (SCOTLAND) BILL

SUBMISSION FROM MURDOCH BROTHERS BUTCHERS

I would like to register an objection to the introduction of section 59 in the bill allowing Ministers at Holyrood to impose charges on carrier bags. As we are a butchers business selling fresh meat to the public, disposable carrier bags is the most hygienic method of transporting meat from the retailer to the home. Other materials paper cloth etc are not suitable for fresh meat products if the packages in the carrier bag leaks.

Graham Murdoch
25 February 2009
I write specifically in regard to Section 59 of the Climate Change (Scotland) Bill. My frustration is that I want to write volumes about this matter but I doubt that you would have time to read them. I will therefore be extremely grateful for nine minutes of your time to read what follows.

An independent report carried out in 2005 by AEA Technology, and commissioned by the Scottish Government, concluded that a levy on plastic carrier bags would INCREASE Scotland’s waste by 13,700 tonnes annually. Strange, but true! Check the report, or perhaps give Richard Lochhead a ring to confirm this fact. He was a member of the committee which studied this report. In 2006 he said, quote, “SNP accepts the urgent need to cut down the amount of waste produced but this proposed Bill (to charge a levy on plastic bags) may have simply resulted in displacing the environmental impact of plastic bags to other areas ... even the introduction of a simple levy would turn into a legislative and practical nightmare.

In 2006, members of the Environmental and Rural Development Committee had access to what was described as the most comprehensive study of this subject ever, and a study which cost a reported £2 million of taxpayers’ money. Not a single member of this committee, which included Richard Lochhead and a representative of the Green Party, concluded in favour of a levy on plastic carrier bags.

Please do not be fooled by the much proffered claim that, “My old mam used to do her shopping in a shopping bag that she’d had for twenty years.” The reason your old mam managed this was because she stayed at home! She did the cooking, she did the washing and the cleaning, and more. And, DAILY, she went with her one shopping bag to the corner shop (which is no longer there) to do her daily shopping and she topped up later in the evening from the grocers’ vans which went round the doors. Things have changed. Most families would now have to cart 10-15 of these bags to the supermarket to carry the family’s WEEKLY shopping, if indeed the family can find a slot to do the WEEKLY shopping in today’s busy, often stressful lifestyle.

Please also do not be influenced by the perennially produced photographs of plastic carrier bags stuck in trees. If Scotland (and, indeed, the rest of the U.K.) has anything to be ashamed of environmentally, then it is its abysmal, constant failure to tackle litter louts. So much so, that most school children no longer even know that it is wrong to discard litter. Such an easy problem to solve if the will was there; such a miserable failure by politicians.

Plastic carrier bags are such an easy, but misguided target. It could be difficult to come up with a modern creation which has such a wide range of good uses and which creates so much convenience for the public AND which disturbs the environment so little, making up only 0.3% of landfill. As I say, such an easy, misguided target. I could offer 1001 alternative environmentally threatening targets for politicians but they simply would not have the courage
to take aim at them. I smiled inwardly recently, when discussing this matter with a good friend. She told me she always re-used plastic carrier bags as she always had some spare in her car. I asked her where she shopped. She shopped 300 yards from her home! Quite oblivious she was to the extensive damage she caused to the environment with her car while believing that she was single handedly saving the planet by re-using plastic carrier bags. I have to take my hat off to my opponents in this regard. They have done a magnificent job in convincing a sizeable (minority) of people that the planet can indeed be saved if we just start charging for plastic carrier bags. Of course, there is absolutely nothing wrong in re-using plastic carrier bags, and that is why the government funded organisation, W.R.A.P., was delighted to point out that 74% of plastic carrier bags are RE-USED, with this percentage rising. And yet, we still hear the constant mantra of ‘single use’ carrier bags. Also, if people are priced away from buying plastic carrier bags they will buy other plastic bags for their pedal bin liners, their dogs’ dirt and their 101 other uses. The same landfill percentage (0.3%) will accrue.

Two other points, if I may, to illustrate how we plastic carrier bag supporters have to compete against a referee who appears to have been told what the final score should be. In 2008, Griffiths and Scott of Glasgow Caledonian University published Social Research Document No.4/2008. In the document they clearly refer to a proposal to charge for ‘single use’ carrier bags having only received support from a MINORITY of respondents. Yet, in their extended analysis, significantly more emphasis was given to the minority of respondents who wanted legislation and what these people suggested any legislation should cover. It was a blatant manipulation of the finding that the MAJORITY of respondents did NOT want any legislation. Check the paper out for yourself; it would have been returned to any sixth former marked, “More work needed.”

Secondly, Parliament’s website says, “There are a few situations where we do not publish all the evidence sent to us. This may be for practical reasons: for example, where the number of submissions we receive does not make this possible or where we receive a large number of submissions in very similar terms. In that case, we would normally publish only a list of the names of people who have submitted evidence.” In 2006, when a Bill was put forward to charge a levy on plastic carrier bags the names of over one thousand of its opponents were simply listed as a ‘pro forma’ petition because the content of their submissions was deemed to be similar.

I now invite you to check out, [link]

You will see the names of approximately 190 people who have written in support of charging for plastic carrier bags. These people have not been listed as a petition because they have all made a very minor amendment to a standard letter which has been circulated to them. Mr. Eric Nisbet has been particularly helpful in this regard. If you scroll to his submission you will note that he has inadvertently entered his name after his customised ‘insert’.-
So, there we have it. The MAJORITY of people who are against charging are given less prominence in the Glasgow Caledonian University report than the MINORITY who want to introduce charging. And, the one thousand plus people who previously opposed such legislation were listed as a petition while the 190 who entered a ‘customised’ sentence to a ‘round robin’ letter are given individual status. I sense an uneven playing field!

Some other random points:

I often hear reference to taxing plastic carrier bags to increase our awareness of the environment. We are taxed throughout life and we are even taxed when we die. Please spare us a tax to make us think We deserve better than that.

I have many friends in Ireland; not researchers, not environmentalists, not politicians, but real people. They detest the inconvenience and added expense that has been foisted upon them by their government by charging for plastic carrier bags.

There has been talk about such a tax showing a surplus of income. It will never realise a surplus. I have worked for a local authority for thirty years and as sure as the sun rises in the morning an ever increasing costly empire will be created in each authority to deal with the ramifications of this Bill. Someone will be appointed to ‘police’ the levy. That person will require an assistant. Two people will require secretarial support. All will require computers and, of course, mileage claims. The department will soon require a manager. All these people will require extensive training, mainly health and safety, with costly annual ‘refreshers’. The end game? Another pointless, costly and ‘here to stay’ department in each local authority.

Please also don’t burden owners of small shops with the additional administration and the resultant hassle from customers. Independent owners are already struggling to survive.

The report before the E.R.D.C. committee in 2006 very clearly acknowledged that a tax on plastic carrier bags will impact most on people with a low income and people with a disability. Did these people expect such a tax when they voted for a Scottish Parliament?

I made a complaint to the BBC about a Radio 5 programme which featured two people against the use of plastic carrier bags and NONE in favour of their use. In his reply to my complaint (see attached) Philip Abrams, Complaints Director wrote, “Firstly, the report prepared for the Scottish Parliament, and the website you directed me to, considered the question of whether a levy on plastic bags would be effective. I don’t think it oversimplifies its findings much to say that it found the levy as planned, and a number of similar alternatives, would have, overall, more disadvantages than advantages, so it’s not surprising that the Scottish Parliament rejected the levy. An objective observation from someone with no axe to grind!

Anyone looking for other interesting reading would be advised to read the contribution of Lord Lawson to the House of Lords on the 17th of November 2008. Referring to the Climate Change Bill he said, “ Bill will go down in history, and future generations will see it, as the most absurd Bill that this House and Parliament as a whole as ever had to examine Strong stuff from someone who is no-one’s fool! The most interesting part of his speech,
however, is his reference to other countries now falling over themselves to retreat from previous ‘environmental commitments’ which they now realise will cost people money and which will also be grossly inconvenient for people. I think a tax on plastic carrier bags fits very comfortably into this particular bracket!

IF there ever becomes a good reason to charge for plastic carrier bags (doubtful) then please ensure that the matter comes before Parliament for a root and branch investigation of the issues at that time. To give ministers carte blanche to introduce a charge at any time is to render them vulnerable to the unceasing gnawing of people who are determined to make life as complicated and as expensive as possible for the rest of us in pursuit of their ‘Holy Green Grail’. Ministers only have to weaken once and we will be needlessly paying for plastic carrier bags forever against the logic of common sense. There is one other important point in this regard. Spare some thought for the hundreds of hard working, decent Scots folks whose jobs are under threat if charges are introduced. They have already lived through a stressful period in 2006 and now they and their families are being subjected to the same worries again at a time when jobs are being lost in tens of thousands. Don’t leave these hard working, decent Scots people with the Sword of Damocles hanging over them for ever and a day because a ridiculously easy environmental target has been identified.

I make one final plea to you because it is the one which will impact on your fellow Scots the most. Before you decide on this matter, please, go and watch the check outs in a busy supermarket. In your mind’s eye see the queue; see the person in front of you, including older people and people with a disability who already do magnificently in the rigours of supermarket shopping, footer about, trying to unravel the correct number of plastic bags brought from home before trying to calculate the minimum additional bags they have to purchase, followed by the recount when these are not sufficient. Or, alternatively, having to pay a charge from their moderate incomes. See the additional delays adding to an already stressful chore as people re group from the spillages as they try to cram ever more items into a single plastic bag. Ask yourself, were you really elected to make life more expensive, difficult and stressful for your fellow Scottish citizens?

Please, please kick Section 59 of this Bill well and truly into touch

Thank you for taking the time to read this.

J. Murdoch
27 Februaury 2009
5 Live Breakfast, 1 October 2008

Thank you for your further email of 31 January about this discussion of plastic bags. I’ve looked on the website you mention, and at the report prepared for the Environment Committee of the Scottish Parliament “Environment Group Research Report Proposed Plastic Bag Levy — Extended Impact Assessment” (available at http://www.scotland.gov.uk/Publications/2005/08/1993154/31553) I have also listened to the recording of the relevant part of the programme, and been in touch with Richard Jackson, its editor who told me

The peg for the item was the fact that Sainsbury was banning plastic bags from its checkouts. We wanted to consider with a PR expert whether this was a good strategic marketing move by the company. We also thought it would be interesting to reflect on the experience of a small town which had banned plastic bags completely.

The item came at a time when there was a momentum among stores to stop using plastic bags — and we were trying to assess the PR and marketing impact of the move. We were not attempting to base a discussion about whether plastic bags should be banned or not - we were attempting to explore whether supermarkets were enhancing their reputation by having such a ban. The guest from the town of Modbury was there to give his description of how a complete ban had worked.

The PR man was there to consider, whether the supermarkets were seeking to jump on a green bandwagon. The guest we had from a PR perspective came across as a keen advocate of the ban on bags, and so was not the impartial observer we were looking for.

I conceded in my earlier reply that I felt the presenter could have done more to put the view that some people are against a ban and doubt its worth, I have also said that we should bear in mind the arguments against the bag ban when doing future items. I am certainly happy to take up Mr Mudoch’s suggestion of looking the issue from the perspective of the industry and also the effectiveness of the bans some months after they came into force.

I would agree with much of this. It is certainly a matter of regret that Danny Rogers from “PR Week” chose to engage with the topic from a personal perspective. However, there are a number of points on the oilier side that I also have to consider.

Firstly, the report prepared for the Scottish Parliament, and the website you directed me to, considered the question of whether a levy on plastic bags would be effective. don’t think it oversimplifies its findings much to say that it found that the levy as planned, and o number of similar alternatives, would have, overall, more disadvantages than advantages, so it’s not surprising that the Scottish Parliament rejected the levy. But I don’t think the report considered the question of whether attempts to discourage plastic bag use by other means — such as Sainsbury’s decision to make them harder to obtain for customers - would be sensible.

Secondly, the presenter did make so efforts to put the arguments for plastic bags, pointing out that “plastic bags account for a very small amount of
landfill” and, when Danny Rogers suggest making plastic bags socially unacceptable, like smoking, and continued “just ban plastic bags because they are destroying the environment she responded:

Oh dear now you’re being controversial , making it the same as smoking, there, are still a lot of people who think the smoking ban, whatever the health messages, is an incursion of freedom, is that not the same, saying on can not have a bag or you will be a social pariah.

Thirdly the Guideline I quoted gives latitude to programme maker’s to “produce content about any subject, at any point on the spectrum of debate as long as there are good editorial reasons , for doing so “ As Richard Jackson explained, this was never intended as an examination of the merits of plastic bags, it was a discussion triggered by Sainsbury’s’ decision to keep plastic bags under the counter, rather than make them freely available to all customers.

Finally. I have considered whether plastic bags do fall into the category of a “controversial subject”. The guidelines’ explanation the term (and I apologise for omitting this from my previous letter) says:

In the United Kingdom controversial subjects are issues of significance for the whole of the country, such as elections, or highly contentious new legislation on the eve of a crucial Commons vote, or a UK wide public sector strike.

I do not think the use of plastic bags is the subject of any legislation currently before parliament, so I do not feel it falls into the category of a “controversial issue.

The test I have to apply is whether this discussion constituted a serious breach of the standards in the editorial guidelines. I think this is a closely balanced question here, because, like Richard Jackson, I do not think the item was wholly satisfactory. However, after reflecting carefully on the balance of arguments, I think this is the kind of case where the item was not itself so flawed it constituted a serious breach of standards. The presenter did make efforts to put the counter-arguments, and the facts suggest that it is the kind of subject where the guidelines give producers some latitude. In the circumstances, I do not feel I have grounds to uphold your complaint. I hope, however, I have been able to go at least some way to addressing your concerns. Nevertheless, if you are not satisfied with my decision I would be happy to consider any additional points you might wish to make. In any event, it is open to you to appeal to the Editorial Standards Committee of the BBC Trust. Correspondence for the Committee should be addressed to its Secretary, at the BBC Trust Unit, 35 Marylebone High St. London W 1U 4AA. The trust would normally require that an appeal is received within four weeks of the date of this letter, or of my subsequent letter in the event that you raise further issues with me within that time.

Complaints Director
Please note my objection to the section which grants powers to the Government to charge for carrier bags.

It is no coincidence that Marks and Spencers introduction of a charge of 5p for a plastic food carrier bag roughly coincides with a reported 6% reduction in their food sales. I for one, will not buy a carrier bag which advertises for free the shop which sells it, and regardless of their smarmy insistence of donating MY money to charity, I have voted with my feet. Patronising their customers will never be regarded as sound commercial practice, and so it has proved.

Furthermore, just earlier this month, they have INCREASED the weight of the green food bags they supply from 8.3 grams per piece to 17.5 grams per piece, thus using more than 100% more material when they should be REDUCING materials if they wish to help the environment.

All alternative carrier bags weigh more, cost more to make, cost more to transport and do more proven damage to the Environment than lightweight plastic bags.

This part of the Bill should be excluded as there is simply no need for any more regulation on carrier bags. Hasn't the public been taxed enough?

Sandi Murdoch
26 February 2009
Kindly register my objection to the section of this proposed Bill which relates to carrier bags.

The Environment Department is presumably supposed to be protecting the environment, yet we are expected to suffer the ignominy of paying a tax for our carrier bags at the supermarket which has been specifically proven by the Scottish Government in 2006 to result in more damage to the environment by the substitution of smelly, bulkier and heavier alternatives.

If we have no free plastic bags we will just have to buy plastic bin liners instead, costing us even more of our hard earned earnings, and by so doing will only increase the amount of raw materials used. Is this not simply madness?

Yours faithfully,

Jim Nicolson
18 February 2009
RURAL AFFAIRS AND ENVIRONMENT COMMITTEE

CLIMATE CHANGE (SCOTLAND) BILL

SUBMISSION FROM LYNNE ROBSON

This is in connection with section 59 of this proposed Bill

Marks and Spencer are again advertising free smelly part recycled plastic “bags for life” in their stores this weekend. That makes my family now able to have accumulated over 50 of these smelly recycled bags kicking about inquiry house with absolutely no chance of me reusing them for food. At least 5 of them are torn, 12 others have dried blood from meat bought at the butcher, 8 more have dried milk or fish liquid dried spills, 3 have soap powder grains in the base, 2 have spilt bleach and the many of the remainder have shoe polish scuffs or dirt from my golf shoes, dirt from potatoes, sweaty gym kit and bits of extraneous matters collected from work taken home, DIY projects and other indeterminate tasks that comprise my fairly normal lifestyle. The hygiene risk to the health to my family comes first, long before my sense of doing our bit for the environment.

These 50 bags collectively weigh 1920 grams which is already 166% of the collective weight of the average number of lightweight supermarket bags I am told I use every year. Furthermore I have not paid one penny for one of them, nor will I ever do so.

Earlier this month they have introduced a “New Greener Bag” in their food department which is supposedly made from recycled plastic. This new bag uses more than twice the plastic of the bag it replaced. Where is the sense in this stupid idea that this is protecting the world?

Am I alone in thinking this Government has again shot itself in the foot promoting at OUR expense a measure to, in the words of Gordon Brown “get rid of plastic bags”, when the unavoidable consequence of that unintelligent policy is to increase waste and damage the environment further?

Please register my objection to Section 59 of the Climate Change (Scotland) Bill as it has no place in our society as it will increase waste generated in the country and not in any way decrease waste generated.

Lynne Robson
February 2009
I first of all have to state that I agree with the principles of the Scottish Government on Climate Change. We all have a duty to reduce, recycle and reuse and lower our Carbon emissions.

I DO NOT agree with the proposal to lease (practically SELL OFF) forestry land and timber. I find this really strange on the concept of a 'Nationalistic Government' "selling off" the land to private and foreign companies. The Forestry Commission (FC) land holdings and operations are funded from the public purse, not just from Scotland but from all the UK. Has the question been put the people of these other countries concerning the loss of land which they fund?

The Forestry Commission has been in existence for ninety years and in that time has seen many changes and developments, this is by far the most draconian to date. The outcome could be the loss of employment for 100s of people and in a rural economy, devastating. The UK forest industry is seen by many organisation across the globe as a leader in forest management, land management, conservation, environmental protection and recreation it would be a great loss to the people of this country to lose that recognition.

Having had some time to consider the Governments proposals I strongly feel that changing the forestry act would permit the (FC) to enter into joint venture agreements with the major energy companies and businesses that would benefit the whole country and still help to reduce carbon emissions.

The FC has land and facilities that could be developed in partnership with private companies to generate income, create employment and be sustainable. Hydro power, wind power and bio power ventures are just a few that spring to mind.

In Scandinavia the use of Bio fuel is one area where joint venture investment has been successful. Local power plants, constructed by private companies or the state purchase the fuel from the forestry companies (both private and state owned) and sell the energy to the local communities. Everyone involved with the supply of the energy is being financially compensated.

We all know the potential financial returns from large scale hydro electric power schemes. However; small hydro power plants located within FC land generating energy to supply to local communities or the national grid could be just as profitable?
Kielder forest in North England is a good example of partnership working. The dam was constructed in the early 80s to supply power to the Consett Steel Works. With the steel works closing the water and potential energy was not required. Investigation and partnership working with several companies and organisations, including the FC and local council has seen the area prosper from energy being fed into the national grid and an expansion of recreation facilities around the dam. Which is creating employment, revenue to the local and national purse.

I see no reason why the Forestry Commission, Scotland (Government) cannot enter into these type of ventures with the power supply companies, instead of selling the ‘family jewels’ (cheaply I may add) to create a fast but short term answer to our current financial problems. Which has nothing to do with Climate Change of Carbon Reduction!!

25 February 2009
I wish it to be recorded that I object in the strongest possible terms to the inclusion of Carrier Bags within the proposed Climate Change (Scotland) Bill.

It was clearly stated by the previous Environmental and Rural Development Committee (ERDC) that the environmental objectives in introducing a charge could not be met and to proceed with the inclusion of such a proposal in the Climate Change (Scotland) Bill without any further robust evidence is a condemnation of the scrutiny and conclusions reached by the ERDC.

It has already been proven, categorically, that the introduction of such a proposed charge will see a substantial increase in the waste findings in Scotland and in doing so will see the Scottish Government incur the most severe penalties under EU agreements. Those penalties will run into millions of pounds which will ultimately have to be met by the Scottish taxpayer.

David Saunders
February 2009
f the Scottish Government are serious about reducing waste then Section 59 should not be a part of Scotland's Climate Change Bill.

It is a ridiculous idea to include a proposal to charge for carrier bags in a Climate Change Bill. Charging for carrier bags will do nothing to tackle waste and will cause even more harmful emissions.

Section 59 should be removed from the bill.

Douglas Scott
February 2009
Please register my objection to the section in this Bill (Section 59) which gives power to the Scottish Ministers to introduce charges for carrier bags.

We in Scotland have already seen this plea for legislation rejected by Parliament and spent time and taxpayers money doing so.

Lightweight carrier bags are being touted as “single use” by our Environment minister Richard Lochhead. If they are, then more fool him for not reusing them as most of the public already do. Even his own DEFRA colleagues acknowledge that 80% are reused at least once.

Now he wants to tax these efficient bags for no other reason than to educate the public. What drivel emanates from Government — pray tell us uneducated masses when was the last time the imposition of a tax educated anyone on a specific policy other than to educate them that their Government is grasping at straws.

Pray tell the world, who is it that wants more taxes which will result in damage to the environment on already stretched incomes, when we are being advised we should be trying to help the environment?

This submission is presented on behalf of the Scottish Beer & Pub Association, the Society of Independent Brewers, the National Association of Cider Makers, the Gin and Vodka Association, the Wine & Spirit Trade Association and British Hospitality Association Scotland. Our members represent the vast majority of alcohol retailed in Scotland as well as supermarkets, pubs, restaurants and hotels. As responsible members of the business community we fully appreciate the dangers of Climate Change, have adopted policies to counter it and will support effective, proportionate measures to deal with this important issue.

Alcohol drinks producers have taken significant steps in recent years to reduce the amount of packaging they use. Working with the Waste & Resources Action Programme (WRAP), major steps have been taken to reduce the amount of glass in bottles, whether this is in beer, cider, wine or spirits. All our drinks sold in cans and bottles are now fully recyclable. As part of Climate Change Agreements Scottish producers have made extensive savings in Carbon emissions, and are amongst the most efficient in the world.

As well as this submission, a number of our individual members will be making wider submissions on the Climate Change (Scotland) Bill as a whole; however this submission responds solely on the issue of “deposit and return”, as identified at Question 15 in the TICC Committee’s call for views.

Our general view on deposit and return

We do not believe that legislation is needed in this area. It places a disproportionate cost on producers and retailers, and there are more effective ways to increase recycling already in place, such as increased kerbside collection from consumers. In addition local authorities should be allowed to count commercial waste towards their recovery targets.

As to reuse, this is now accepted as being more costly, in environmental terms as well as in cash, than recycling and could lead to concerns about hygiene and so public safety. Reuse schemes should not be encouraged except perhaps as a responsible procedure in tightly limited local schemes with full understanding of the risks and negligible Carbon footprint.
The practicalities of a return and deposit scheme in Scotland

**Considerable cost:** A deposit and return scheme would cause considerable additional cost to retailers. They are obliged to collect and store containers on behalf of manufacturers. They also have the responsibility for charging and returning the deposits. This places additional cost burdens throughout the supply chain and consequently on the consumer. Whilst this is a burden on the retail sector as a whole, it is particularly onerous on smaller retailers, who do not have the space or resource to deal with such an operation.¹

**Setup costs:** As well as the ongoing costs to business the set-up costs of such a scheme should not be ignored. Automated tills would need to be amended to allow the charging of a deposit, and there would also be training costs involved to assist staff in recognising which products are obliged to pay a deposit.

**Potential for fraud:** Putting a financial value on a container clearly incentivises potential criminality. With a value attached to each container there is the risk of fraud, whereby non-deposit paying containers are exchanged in return for a deposit. This can be negated in part by training (at a cost) but if the financial value is sufficient, then there is the potential for more sophisticated fraud. Deposits can also lead to people searching through litter for containers with deposits. There is also a danger with such a scheme that it could lead to counterfeiting of products as reused bottles lose their brand identity.

**On-trade issues:** The practicalities within the on-trade (pubs, clubs, restaurants, etc) are even more difficult. For a busy pub to operate a scheme would be very difficult indeed. A pub would be burdened with the same cost pressures as other retailers but would suffer particularly at closing time. There is likely to be a large number of people leaving at the same time, demanding the return of their deposit. This would cause huge problems for bar staff, who are concentrating on the orderly dispersal of their customers. A busy bar would be likely to need additional staff to deal with deposits, imposing additional costs on the business. If a deposit and return scheme were to be introduced, it seems logical that on-trade premises are excluded due to the specific aforementioned issues, especially given that existing arrangements already ensure high levels of recycling take place.

**Cross-border deposits:** A further issue arises with cross-border deposits. With a deposit scheme in Scotland and not in England there is the potential for Scottish retailers to be disadvantaged. Firstly, as the upfront cost will be lower in England then Scottish consumers are likely to purchase from England, particularly if this is a large purchase. The second potential downside is that consumers will purchase their goods in England and redeem

¹ The brewing industry has recently been considering a deposit scheme for kegs and casks. This is totally unrelated to this issue and was as a result of container thefts due to the high value of scrap metal. The scheme has not been introduced due to the high costs involves, even with much larger containers than bottles.
the deposit in Scotland. If this was carried out on a large scale then this could cause significant costs to Scottish retailers.

**Cash flow:** Retailers are also likely to have issues arising from cash flow. Whilst the scheme should be broadly neutral, a situation could arise where certain retailers are liable to pay out more through deposits than they receive. For example, consumers may buy from their local shop on a regular basis but then redeem their deposits during their weekly deposits at a supermarket, potentially acting as a disincentive to accept containers for recycling. Alternatively the opportunity could arise where a consumer stores up the bottles they have bought from the supermarket and takes them to the local pub to collect the deposits.

**Producer specific issues:** Without knowing all the details of a scheme it is difficult to identify exactly which factors are likely to hit producers hardest. However issues such as labelling and re-labelling, complications concerning transactions and the potential removal of recyclable material could all place a financial and logistical burden on producers, which will ultimately result in higher prices to the consumer.

**Infrastructure:** In addition, to be able to reuse containers, producers would have to invest in major alterations to their distribution and collection operations and to bottling and canning plant to allow returnable containers to be collected, cleaned and refilled safely.

**Product quality:** If a refillable system were to be introduced this would cause problems for producers in terms of maintaining excellent quality standards for their products. Returnable bottles became notorious for being chipped and generally low quality when they were commonplace in the beer market. The modern consumer expects a higher level of presentation from their product. The only remedy would be for producers to increase the amount of glass used in their bottle to maintain the damage caused by multiple use. This would be counter-productive to the aim of reducing the use of packaging used in products.

**Light-weighted bottles:** Enormous steps have been taken by producers to introduce light-weighted bottles, and these are nearly universal in the alcoholic drinks sector. This has brought significant benefits in terms of reducing environmental and financial costs. This type of glass cannot be reused as it would be unsafe but can be recycled.

**Uneconomic:** Further, the reuse of glass containers has been shown to be uneconomic in cash and environmental terms. The costs of distribution and return and then reuse are higher than the use of one-trip bottles followed by efficient kerbside recycling.

**Benefits of kerbside collection:** In terms of long-term solutions to the recycling of beverage containers, the most cost-effective solution must be specialised kerbside collection. A deposit and return scheme results in a proliferation of sites needing to collect, store and administer a scheme before
the containers are even removed for recycling. With kerbside collections still needed for other forms of waste/recycling collection the most cost- and environment-efficient method of recycling must be a centralised system of collection. Building up a critical mass of recyclable material on routes gives the economies of scale necessary to make this happen – and reducing the kerbside collection volume is likely to result in higher prices for remaining users.

**Local Authority targets:** Another option to increase recycling, particularly in the on-trade, is to allow Local Authorities to count commercial recycling towards their recycling targets. This would lead to an increase in recycling of containers sold in the on-trade. It would also encourage pubs to site bottle banks on their premises, providing a service to the wider community – and consequently boosting recycling without the need for additional costs to the consumer. These actions as well as increased information to the general public would be a far more effective method of increasing recycling rates and reducing packaging waste.

**General points**

Clause 58 of the proposed legislation states that the Climate Change Bill will enable Ministers, by regulation, to introduce a deposit and return scheme. While the Bill will not introduce such a scheme in itself, we would suggest this approach, of introducing such a major policy change by regulation, rather than by primary legislation will inevitably mean any future development in this area could be introduced with far less scrutiny by the Scottish Parliament. We do not believe the current approach is a sensible one, especially given that the scope of the powers which could be granted to Scottish Government Ministers by Clause 58 are so wide-ranging and currently lacking in detail that they are difficult to meaningfully respond to.

The Scottish Government have not actually indicated their intention of pursuing the introduction of a “deposit and return” scheme, at this stage, or indeed at some point in the future. We would hope that the Committee’s deliberations on the Climate Change Bill would clarify the Scottish Government’s stance on this issue and that the final legislation would reflect their position and plans.

In any event we would hope that the Committee would reject the concept of a “deposit and return” scheme in light of our concerns, and the availability of other more effective policy options to increase recycling rates. We are willing to supply further information and comment if required by the Transport, Infrastructure and Climate Change Committee.
Trade Bodies Supporting This Submission

The Scottish Beer and Pub Association

The Association's members are Scotland's brewing and large pub companies representing the licensed trade industry in Scotland. The main aim of the Association is to contribute to the economic and social wellbeing of Scotland through employment, investment and training. SBPA's members account for 1,500 of the 5,200 licensed public houses in Scotland.

The Society of Independent Brewers

Formed in 1980 as the Small Independent Brewers' Association, to represent the interests of the emerging new wave of microbrewers. With growing credibility and campaigning success, SIBA has come to represent the broad spectrum of the independent brewing sector. There is no longer a ceiling on membership and the Society of Independent Brewers – renamed in 1995 – is now one of the most authoritative and respected bodies in the brewing industry.

The National Association of Cider Makers

The voice of the UK’s cider makers. Founded in 1920, the National Association of Cider Makers (NACM) is the governing body of the cider and perry industry in the UK. It represents both the larger producers and the many hundreds of smaller scale Cider Makers. The NACM itself is a member of the Association of the Cider and Fruit Wine Industries of the European Union and through this body is able to represent the interests of Cider Makers with the European Union.

The Gin and Vodka Association

The Gin and Vodka Association is a non-profit, non-trading association. Membership is open to any individual, firm, limited company or corporation, which is a producer, brand owner or importer of gin or vodka. There are currently 35 members who, between them, represent an estimated 98% of the gin and vodka trades in the UK.

The Wine and Spirit Trade Association

Established in 1824, the WSTA represents the whole of the wine and spirit supply chain including producers, importers, wholesalers, bottlers, warehouse keepers, logistics specialists, brand owners, licensed retailers and consultants. The WSTA has over 330 members and works with them to promote the responsible production, marketing and sale of Alcohol and to share best practice with the entire trade.
The British Hospitality Association (BHA) In Scotland

The BHA is the national association for the hotel, restaurant and catering industry and it has been representing the hotel, restaurant and catering industry for over 90 years. The BHA represents some 3,000 establishments in Scotland, across all sections of the industry – not just group-owned properties, but also hundreds of individually owned hotels and restaurants.

Scottish Alcoholic Drinks Producers
27 February 2009
SESA is the trade association representing Scotland’s waste and secondary resource industry.

Driven by EU environmental law, we are a leading partner in Scotland’s transformation from a disposal to a recycling society: since Devolution, we have helped Scotland’s household recycling rate to increase more than five fold to above 32%.

Two out of every three voters in Scotland believes the waste collection, recovery and management service our Members provide in partnership with local authorities is the most valued local service.

Our Members provide one third of the Country’s renewable electricity.

Preface

Law relevant to recovery, recycling and management of waste is overwhelmingly governed by EU law. As a general principle, it is therefore particularly important that Scotland’s laws are demonstrably consistent with EU law and use definitions wholly consistent with, for example, the Waste Framework Directive (2008/98/EC). To give one example, we believe references in the Bill to “recycling” - when their meaning is much closer to “recovery” as defined by the Directive - are an unhelpful recipe for confusion;

We have no objection to Scotland seeking to be more ambitious than EU law when there is a clear justification for - and route map to - such ambition, but Scotland’s law should still be framed in a way that is manifestly consistent with relevant EU law;

Further, we note that the Bill proposes very wide powers for Ministers through regulations. We would prefer to see greater clarity and detail in the primary legislation to inform the democratic process. Unlike an EU Directive which permits flexibility within a Member State as to how prescribed outcomes are achieved, such imprecision in the Bill is clearly not aimed to deliver subsidiarity across Scotland but instead seeks wide executive powers where the likely character of such execution remains opaque.

Clause 52: waste plans

We would greatly welcome good, clear plans for the management of waste, with clear targets for recycling and recovery of waste and how these targets are to be achieved. It would be more helpful if Clause 52(1) reflected the terminology used in the Waste Framework Directive setting out the five tier hierarchy and the distinction between recovery and disposal;

We also recognise that Scotland should reflect reference in the Waste Framework Directive to minimisation of waste. However, this must not
distract from the need to provide infrastructure to recover value from existing volumes of wastes diverted from landfill. A legal requirement for site waste management plans for construction and demolition projects is one example of a useful approach to adopt;

We advise against the definition of “recycling” proposed in Clause 52(4): it is not consistent with the EU law with which Scotland must comply.

- **Clause 53: waste data**

  Clause 53(1) is an example of a Clause providing such wide-ranging powers for Ministers as to make the primary law almost meaningless. For example, the primary law ought to indicate how and on whom the burden of the law is likely to fall;

  Our industry has long recognised the need for better and more relevant and timely data on waste. We believe this requires significantly better capture of data from waste producers and from sites exempted from waste management licences;

  Data from our industry should generally be required by regulation and the requirement should avoid being framed in terms that require duplication of effort. In addition, this is an area where there should be consistency across the UK to avoid, for example, the need to replicate computer systems.

- **Clause 54: recovery facilities**

  This Clause reflects a presumption in the Waste Framework Directive in favour of recovery over disposal of waste and, again, should be both couched in such terms and provide sufficient detail in the primary legislation to give an indication as to what in practice the law is likely to mean;

  In broad terms, we welcome the general provision of the polluter pays principle at Clause 54(2)(e) provided SEPA and other relevant authorities are adequately resourced to enforce zero tolerance of fly-tipping across Scotland;

  Notwithstanding current turbulence in global commodity markets, we believe the Landfill Tax escalator and other drivers will over a relatively short period suffice to promote higher levels of recovery of business waste and that an unduly prescriptive regime for this waste stream may not provide the best possible results.

- **Clause 55: facilities at events**

  Subject to comment already made, this provision seems sensible.

- **Clause 56: green public procurement**

  We warmly welcome the prospect of greener public procurement as a stimulant for markets in recycled materials. Frankly, however, public
authorities across the UK should now be able to provide far more detail than the generic framework offered by Clause 56.

- **Clause 57: packaging targets**
  It is important not to disrupt the functioning of existing producer responsibility obligations, transposing the EU Packaging Directive, placed on the packaging sector;

  The Producer Responsibility Obligations (Packaging Waste) Regulations, applicable in Scotland, England and Wales, already provide a direct incentive for those using packaging to reduce its use. Further regulation on this matter may be seen to be redundant;

  Also, the Packaging (Essential Requirements) Regulations already require that packaging weight and volume must be reduced to the minimum necessary for safety, hygiene and consumer acceptance of the packaged product. More robust policing of existing law might be preferable to new law.

- **Clause 58: deposit and return**
  Statutory deposit and return schemes appear to work well in a number of EU Member States;

  However, given the scale of investment in infrastructure required to enable Scotland to comply with relevant EU law, it is important that there is a measure of consistency in Scottish official policy extending beyond the ebb and flow of specific administrations. We simply note that this proposal represents a change of policy since the Strategic Waste Fund provided resources for collection infrastructure: there is potential for deposit and return schemes to conflict with investment assumptions behind such investment in infrastructure and this could mean, for example, that the Scottish taxpayer might not secure the best value for money;

  We would invite the Scottish Parliament to probe the Scottish Government on the evidential base behind its current proposal and to give a very precise indication as to why it is believed to offer better prospects than the rapid increase in recycling and public participation rates in recycling being secured through the model of investment in collection infrastructure.

- **Clause 59: carrier bags**
  We do not consider this to be a priority;

  Far more important is the need to extend general awareness of broader waste management issues such as the need to segregate materials for recycling and the pressing need for new facilities to recover value from waste.
• **General points**

Much of the 22 million tonnes of waste produced each year in Scotland is potentially either a recyclable material or a renewable, decentralised source of energy providing a net carbon benefit and making a significant contribution towards Scotland’s carbon reduction targets. Appropriate waste laws in Scotland can therefore deliver both compliance with EU waste laws and also an opportunity to reduce net CO2 emissions at no additional marginal cost;

It would clearly be easier for public authorities to determine optimised policies for waste in a context where there were internationally accepted, relevant and robust indicators of sustainability. SESA’s Members are filling a vacuum by compiling methodology which will enable specific waste facilities to benchmark their carbon footprint against those of other such facilities. We hope to conclude this work in 2009.

Scottish Environmental Services Association

22 January 2009
On behalf of the Scottish Food and Drink Federation (SFDF), I would like to thank you for the opportunity to contribute to this consultation process and to welcome the Scottish Government’s stated ambition of moving towards a Zero Waste society. As the largest manufacturing sector in Scotland, not only does the food and drink manufacturing industry consider minimising any negative impact of our activities on the environment as a responsibility, but we also view minimising waste and improving resource efficiency as an economic driver.

A successful food and drink manufacturing industry is a vital component of a healthy Scottish economy, not least, because it provides employment for around 50,000 people – that is, one in five people who work in Scottish manufacturing – and generates annual sales of £7.57 billion and exports worth £3.57 billion. Achieving sustainable economic growth is quite rightly the Scottish Government’s key priority. Therefore, it is our view that it is the role of Government to set the framework that will ensure the physical infrastructure is put in place that is not only fit for purpose, but that will facilitate growth and not constrain it.

SFDF is a devolved division of the Food and Drink Federation (FDF).

**Industry Leading by Example**

In October 2007 FDF announced its commitment to making a significant contribution to improving the environment by targeting priorities where we, as a sector, can make the biggest difference. In summary, working collectively, our Five-fold Environmental Ambition is to:

- Send zero food and packaging waste to landfill from 2015
- Make a significant contribution to WRAP's work to achieve an absolute reduction in the level of packaging reaching households by 2010 compared to 2005.
- Achieve a 20% absolute reduction in CO₂ emissions by 2010 compared to 1990 and to show leadership nationally and internationally by aspiring to a 30% reduction by 2020
- Achieve significant reductions in water use and contribute to an industry-wide absolute target to reduce water use by 20% by 2020 compared to 2007
- Embed environmental standards in our transport practices, including our contracts with hauliers as they fall for renewal, to achieve fewer and friendlier food transport miles.

In the intervening period, SFDF also convened round-table discussions with all of the main Scottish Government funded business support programmes to ensure food and drink manufacturing companies in Scotland are enabled to
access a coordinated programme of support and advice that will assist them in delivering progress towards achieving these targets. The Sustainability Group that has now been established is currently chaired by SFDF and involves the Carbon Trust, the Energy Savings Trust, Envirowise, the National Industrial Symbiosis Programme Scotland, the Waste & Resources Action Programme, Scottish Enterprise and Highlands and Islands Enterprise.

The Role of the Government

It is the role of the Scottish Government to ensure that the physical infrastructure is in place and in the correct locations to deliver on their five strategic themes. It is self evident that poor infrastructure is a major impediment to economic growth, and to how industry manages their environmental obligations in terms of reducing waste, energy efficiency and cutting emissions. The waste infrastructure currently in place in Scotland is simply not sufficiently developed to support the legislative obligations currently placed on industry, let alone any longer-term aspirations to make progress beyond these. This represents a major barrier to the sustainability of the food and drink manufacturing sector in Scotland.

For some time we have advocated a more strategic approach to major infrastructure projects. To that extent, we have previously applauded the Scottish Government for its Infrastructure Investment Plan and the national perspective it is taking in relation to major infrastructure projects, strategic priorities for Scotland and key industries, such as food and drink. However, whilst the Scottish Government is ambitious for the Infrastructure Investment Plan to take forward its priorities on climate change and achieving a zero waste society, in our view the absence of a national dimension in terms of commercial waste treatment, recycling and disposal infrastructure needs to be urgently addressed.

Furthermore, against a backdrop of increasing raw material costs and competition from low cost economies, charges for business are also set to spiral over the next few years with the Scottish Environment Protection Agency predicting that landfill costs are likely to rise by between 400 and 800%. As noted above, our industry is already working to find cost effective solutions to existing waste management issues. A well developed and integrated infrastructure is therefore critical if our industry is to be both sustainable and successful in the long-term.

Mapping Provision to Encourage Investment in Infrastructure

We urge the Scottish Government to recognise the strong links that exist between investment in infrastructure, the business growth rate and sustainable development. By taking steps to ensure the physical infrastructure in Scotland promotes the dual objective of achieving business growth in a sustainable way, industry will be enabled to minimise further its environmental impact and manage their costs more effectively and the Scottish Government could make real progress towards its ambition of a zero waste society. Thus,
together, we will be able to ensure that we ‘strike the right balance’ between economic, social and environmental factors, securing improvements and progress without damaging the underlying competitiveness of industry.

By mapping the current waste infrastructure provision in Scotland – for commercial as well as domestic waste – the Scottish Government will be able to identify any gaps. Painting this national picture of waste infrastructure and comparing that with waste streams generated, will enable local authorities to make key strategic decisions about whether or not to service the commercial as well as domestic waste markets (individually or via shared service projects with other authorities or by adapting existing facilities) and potentially stimulate private sector interest in plugging those gaps. Ensuring the waste infrastructure is ‘fit for purpose’ will enable businesses and others to divert materials away from landfill.

When it comes to food packaging specifically, it is worth noting that some lightweight mixed material packs, which often contain food residues, are not currently worth recycling as it would require more energy and resources to do so than would be recovered. However, as this form of packaging is less bulky, it often has environmental benefits earlier in its life such as savings on fuel through transportation. It would still be possible to extract value from these materials, provided local authorities had energy from waste plants available for use and information from a Scottish Government waste mapping programme could facilitate this.

Regulation

When it comes to regulation, SFDF do not consider that additional legislation is required in this context as existing legislation in combination with voluntary agreements such as FDF’s Fivefold Environmental Ambitions and a widened Courtauld agreement, alongside continuing consumer and media pressure should go a significant way to achieving our shared ambitions of a zero waste society.

Indeed, as things stand, the food and drink industry continues to face considerable regulatory burden, which adds significantly to its cost base and affects its ability to compete successfully in domestic and international markets. Indeed, regulation remains one of the biggest perceived threats to the competitiveness of our industry, a fact that needs to be better understood across Government – in the Scottish, UK and EU contexts.

Furthermore, the process of enacting and then implementing primary legislation would be likely to take several years. Given the industry initiatives around zero waste that are already in place and beginning to deliver, this would seem an unnecessary distraction from delivering progress.

I trust our comments will be taken into consideration and look forward to the opportunity for the Scottish Food and Drink Federation to continue the dialogue with Government and others as the national policy is developed and an implementation plan drawn up.
RESPONSE TO SPECIFIC PROPOSALS

PROPOSAL 1: DUTIES ON PUBLIC BODIES AND BUSINESSES TO PROVIDE RECYCLING FACILITIES

SFDF do not consider that legislation should be made in this area.

A voluntary Code of Practice on recycling for public sector bodies, could be implemented within a relatively short timeframe and deliver benefits more quickly in terms of reduction of waste to landfill. Showing there was a long term demand from the public sector could serve to stimulate private sector investment in reprocessing capacity and infrastructure and expand the availability of waste management facilities for use by businesses.

When it comes to SMEs, the lack of affordable recycling facilities around Scotland leave many companies who generate smaller quantities of waste with no option but to send waste to landfill. This cost – amounting to millions of pounds every year – is bad for business and the unnecessary waste is bad news for Scotland’s environment. Indeed, a recent report commissioned by Highlands and Islands Enterprise found that recycling of paper and cardboard alone would reduce the waste burden on SMEs in Scotland by 32%, saving £200 million per year.

As the rules stand, SEPA classifies joint collection schemes as ‘collection centres’. However, allowing SMEs to cooperate in the joint collection of waste could make waste collection more economical and assist SMEs in not only cutting their own costs, but also in making a greater contribution to our shared ambition of reducing the amount of waste they sent to landfill. We recommend that the Scottish Government considers how best to introduce some flexibility into the waste management system and so enable companies to pursue practical, common sense solutions.

PROPOSAL 2: PACKAGING

SFDF do not consider that legislation should be made in this area.

SFDF believes that existing legislation, voluntary agreements such as the FDF’s Fivefold Environmental Ambitions and Courtauld, together with continuing media and consumer pressure will together lead to further reductions in packaging used and make additional legislation unnecessary.
Our members’ activities under WRAP’s Courtauld commitment to send zero food and packaging waste to landfill from 2015 are already producing tangible results. Indeed, the first target to end packaging growth has been recently met. A new agreement for 2010 is currently being discussed with signatories.

SFDF continues to promote the Courtauld commitment and, going forward, we plan to work closely with WRAP as it develops its thinking regarding a possible follow-up to Courtauld.

In addition, FDF and its member companies have been involved in the Packaging and Recycling Action Group since its formation which is seeking both to optimise the amount of packaging used on products and to identify ways to stimulate collection and recycling of household packaging waste. It comprises stakeholders from across the packaging chain as well as the Scottish Government.

PROPOSAL 3: SPECIFYING RECYCLATE

SFDF do not consider that legislation should be made in this area.

SFDF would suggest that there is no case for specifying recycled content on a generalised basis. Use of recycled content needs to be considered on a case by case basis, taking into account technical properties of the material, fitness for purpose, sourcing, functionality, manufacturing capability and cost. This is particularly true since the availability, quality and technical specification of recycled material varies by material. In addition, food contact issues have to be considered for a range of materials, such as plastics in each case. Therefore, we do not believe that specifying mandatory recycled content levels will work.

PROPOSAL 4: WASTE PREVENTION PLANS

SFDF do not consider that legislation should be made in this area.

SFDF believes that voluntary approaches such as our Five Fold Environmental Ambitions already adequately address waste prevention, for example our overall support for the waste hierarchy. Moreover, European Union Member States will shortly be required to draw up waste prevention plans when the revised Waste Framework Directive is implemented.

PROPOSAL 5: DEPOSIT AND RETURN

SFDF does not consider that legislation should be made on deposits, particularly since such schemes have a number of well documented shortcomings. Notably:

- A number of European countries with no deposits achieve higher recycling rates for metals and plastics than those with. (Source: official figures submitted by Member States to the Commission).
Deposit and return schemes apply only to a small proportion of packaging, usually beer and soft drink containers which are less than 10% of used household packaging.

UK consumers are no longer in the habit of returning containers to retailers. Even in the 1970s with a 12p deposit less than a third of bottles were returned.

These schemes divert the comparatively high priced recyclate from existing collections so kerbside and ‘bring schemes’ would cost much more per tonne to operate.

High administrative costs.

Complex handling procedures both for redeeming the deposits and for transferring funds through the supply chain.

Increases the environmental impact of collecting recyclables because a separate fleet of lorries would be needed to transport material to sorting centres and reprocessors.

These schemes lead to higher prices for consumers as they cost more to run than industry can make from retention of unclaimed deposits. These costs would likely be passed on to the consumer.

PROPOSAL 6: MANDATORY WASTE DATA RETURNS FROM BUSINESS

SFDF do not consider that legislation should be made in this area.

SFDF considers that existing mechanisms should be explored first before considering additional legislation. Food and drink manufacturers already provide waste information to the Scottish Environmental Protection Agency as part of their annual pollution inventory return and it should be for those who collect that data to ensure they make best use of it. Any creation of mandatory waste data returns would simply duplicate efforts already made to no discernible commercial advantage or other obvious benefit to producers.

PROPOSAL 7: OTHER MEASURES TO ENCOURAGE WASTE PREVENTION, INCLUDING ACTION ON SINGLE-USE CARRIER BAGS

SFDF do not consider that legislation should be made in this area.

SFDF considers that resources should not be diverted away from the development of an integrated waste management infrastructure by single-issue subjects which may, as is the case with carrier bags, only contribute to a relatively small proportion of waste. By focussing and prioritising effort in this way genuine progress will be made across the range of issues, delivering genuine, significant and sustained environmental wins without the distraction of additional legislation.
The Food and Drink Manufacturing Industry

The Scottish Food and Drink Federation (SFDF) represents the food and drink manufacturing industry in Scotland. The food and drink manufacturing industry in Scotland has a gross output of around £7.57 billion and exports worth £3.57 billion.

SFDF is a devolved division of the Food and Drink Federation (FDF), the voice of the UK food and drink manufacturing industry.

As the largest manufacturing sector in the UK, food and drink manufacturers employ over 500,000 people and have a combined annual turnover of £70bn. UK food and drink exports in 2005 were almost £10bn.

The following Associations are members of the Food and Drink Federation:

ABIM  Association of Bakery Ingredient Manufacturers
ACFM  Association of Cereal Food Manufacturers
BCA  British Coffee Association
BCCCA  Biscuit, Cake, Chocolate and Confectionery Association
BOBMA  British Oats and Barley Millers Association
BSIA  British Starch Industry Association
CIMA  Cereal Ingredient Manufacturers’ Association
EMMA  European Malt Product Manufacturers’ Association
FA  Food Association
FOB  Federation of Bakers
FPA  Food Processors’ Association
GPA  General Products Association
IDFA  Infant and Dietetic Foods Association
MSA  Margarine and Spreads Association
NACM  National Association of Cider Makers
SB  Sugar Bureau
SIBA  Society of Independent Brewers
SMA  Salt Manufacturers’ Association
SNACMA  Snack, Nut and Crisp Manufacturers’ Association
SPA  Soya Protein Association
SSA  Seasoning and Spice Association
UKAMBY  UK Association of Manufacturers of Bakers’ Yeast
UKTA  UK Tea Association

Within FDF there are the following sector organisations:

FF  Frozen Food Group
LDT  Lifestyle and Dietary Trends Group
MG  Meat Group
ORG  Organic Food and Drink Manufacturers’ Group
SG  Seafood Group
VEG  Vegetarian and Meat Free Industry Group
YOG  Yoghurt and Chilled Dessert
RURAL AFFAIRS AND ENVIRONMENT COMMITTEE

CLIMATE CHANGE (SCOTLAND) BILL

SUBMISSION FROM SCOTTISH GROCERS’ FEDERATION

The Scottish Grocers’ Federation (SGF) is the trade association for the Scottish Convenience Store Sector. It is the authoritative voice for the trade to both policy makers and the media.

The SGF brings together retailers throughout Scotland, from most of the Scottish Co-operatives, Somerfield, SPAR and local independents who are our largest category of members. Our members sell a wide selection of products and services throughout local town centre, rural and community stores. According to recent statistics (2007) there are just over 5,600 convenience stores throughout Scotland, with annual sales in excess of £3.2 billion.

Our members share the environmental concerns of the public at large and incorporate procedures into their businesses to reduce their carbon footprints. However, zero waste is a concept that does not seem realistic to many small shops. This goal is even harder to envisage due to the limited facilities available to small shops.

SGF is concerned that the Climate Change Bill takes considerable enabling powers whilst providing very little detail. As a result is extremely difficult to determine the likely impact of the legislation on small shops, should the enabling powers be enforced.

Increased costs and additional administration would be very damaging to small shops, especially in the current economic climate. SGF is concerned there is insufficient detail on the cost of these proposals. The Government must acknowledge small shops require support and encouragement via voluntary methods in order to meet recycling targets.

DUTIES ON PUBLIC BODIES AND BUSINESSES TO PROVIDE RECYCLING FACILITIES

1. In March 2008, DEFRA published their analysis of responses to the consultation “Recycle on the go”. In the main voluntary initiatives were preferred ahead of considering introducing legislation. Because a key outcome must be behaviour change (i.e. people recycle more), it was not widely thought that legislation could be an especially effective driver for securing the outcome.
2. If England is to pursue a voluntary approach and Scotland a legislative route, Scottish businesses would be put at a disadvantage compared to their English counterparts.

3. A number of SGF members, who own stores with customer car parks, already provide recycling points for newspapers, glass bottles, clothing, plastic bottles etc often in conjunction with the local authority. There may be an opportunity for public places including sports grounds, parks, cinema car parks etc where people are consuming and disposing of the types of items which are recyclable, to offer recycling facilities. This service is on a voluntary basis and should continue.

4. Small shops, whilst proactive in addressing waste issues relating to their back of store operating, do not have the physical space required within their selling floor to offer recycling facilities to their customers. It would be impractical for a number of reasons including, space, hygiene, manual handling, health and safety and lack of knowledge of waste issues, to offer these facilities.

5. Many small shops, located in village and town centres, are accessed by customers on foot. The bulky nature of items which can be recycled including plastic and glass bottles means it is easier for the public to use kerbside collections to recycle. The doorstep is the most accessible place for collection. Alternatively, the public are likely to use their cars to take items to a superstore which has recycling facilities located within its car park or a local amenity recycling centre. The town centre car parking policy of many local authorities throughout Scotland discourages many people from attempting to drive into town centres and park their cars.

6. Local authority kerbside collections are far more convenient for the public, cost effective and deliver better results. This is a tried and tested regular service, there will be many issues with on-street retail collection related to on demand services which are costly and could affect volumes from kerbside.

7. Out with the central belt of Scotland there are few recycling companies prepared to collect material to be recycled. In these areas it is inevitable that local authorities must take the lead role in recycling.

8. Initiatives to provide recycling facilities should be carried out in a voluntary capacity. If it were to be mandatory SGF believe small shops, under 289 sq m (this threshold size has a precedent in UK legislation in relation to Sunday trading in England and shelf-edge labelling requirements throughout the UK) should be exempt due to store capacity and the administrative burden complying with such a proposal would place on small shops.
PACKAGING

9. In 2007 the UK disposed of an estimated 10.5 million tonnes of packaging waste, of which around 59% (Source: NYPD) was recovered and recycled. This is a significant achievement when compared to the fact that only 27% of packaging waste was recovered in 1998 (Source: publication: e-Digest of Environmental Statistics, March 2006).

10. The packaging producers including retailers made a £1 billion contribution to the UK recycling and recovery industries over the last ten years. Retailers have also played a part in raising customer awareness of the need to recycle packaging waste and the environmental benefits it brings.

11. SGF and some of its leading members are signatories to the Courtauld Commitment, established in 2005. The Courtauld Commitment is a voluntary agreement between WRAP and major UK grocery organisations that supports less packaging and food waste ending up in household bins. It is a powerful vehicle for change and in 2008 has led to zero growth in packaging despite increases in sales and population.

12. A campaign called “Love Food Hate Waste” was launched in November 2007 aimed at helping consumers, local government and business to cut back on food waste. Several of the signatories are already actively supporting WRAP in this work. The campaign has already delivered a reduction of 110,000 tonnes in the annual amount of household food waste.

13. Small shops do not have the necessary buying power required to allow them to have an influence on the style of packaging used by food manufacturers.

14. Many packaging producers and suppliers are already, on a voluntary basis, taking measures to reduce the amount of waste. This included designing out waste, lighting, substitution of expanded polystyrene for recycled paper and other initiatives. These companies should be encouraged to promote and publicise these waste prevention measures in order to encourage behaviour changes in the public.

15. Packaging must be fit for purpose. Packaging must be of an appropriate standard in order to protect the food and avoid spoilage. If packaging requirements were too restrictive any reduction in waste from packaging could be offset by an increase in food waste which could be significantly more harmful to the environment.

16. The consultation document states some packaging is required to ensure the goods reach consumers in a safe and hygienic way and to ensure that key information is provided to the consumer. The health and safety implications of any changes to packing would need to be considered and
could result in an inappropriate level of responsibility being placed on the retailer.

17. The Producer Responsibility Obligations (Packaging Waste) Regulations 2005 already require any business which handles more than 50 tonnes of packaging per annum or has a turnover of more than £2 million per annum to register with SEPA or via a compliance scheme. It requires businesses to recover and recycle specified tonnage of packaging waste each year and to certify this recovery and recycling has been achieved. If the current framework is not achieving the level of recycling the Government requires, rather than creating additional legislation, it would be more appropriate to review and amend existing legislation.

18. Without investment in new technologies it would be extremely difficult for retailers to provide information on the amount of packaging on goods being sold to consumers. The financial investment required would be prohibitive for small retailers.

19. Taking into consideration the current legislation relating to packaging and the progress made by retailers in reducing levels of packaging through a voluntary arrangement, SGF believe voluntary initiatives should continue to be used.

SPECIFYING RECYCLATE

20. Many small retailers already provide materials in their stores made from or incorporating recycled material including carrier bags, paper, glass and plastic bottles etc.

21. SGF would suggest a voluntary approach with business being offered financial incentives to purchase material which contains an agreed level of recycled material.

22. Guidance should be provided by WRAP and should apply to all local authorities throughout Scotland.

WASTE PREVENTION PLANS

23. SGF does not support the introduction of mandatory waste prevention plans.

24. Retail businesses already have a duty to ensure any waste produced is handled safely and within the law.

25. Many retailers already have waste prevention plans in operation to avoid paying landfill tax and to reduce levels of waste which doubled in cost in the last two years. In addition, the Producer Responsibility Obligations (Packaging Waste) Regulations 2005 requires certain businesses to recover and recycle specified tonnage of packaging waste each year and
to certify that this recovery and recycling has been achieved. This would imply that much of the information included in a Waste Prevention Plan is already known to the authorities and a plan would therefore result in a duplication of effort.

26. The average amount of food waste produced by a typical convenience store (under 289 sq m) is approximately double the amount produced by an average family household. Due to the very small amounts of waste produced, a waste prevention plan would be an unnecessary and additional cost and a further administrative burden for small retailers already having to cope with an increase in licence fees and with the prospect of additional costs relating to new tobacco regulations.

27. For a small shop to produce a waste prevention plan for goods purchased via a cash and carry would be time consuming, costly and of little use.

28. In addition to paying business rates a small shop has to pay the local authority, in which it operates, a fee for uplift of waste. For a typical convenience store (under 289 sq m) this is approximately £1500 per annum.

29. In the current economic climate, additional financial burdens could place a small shop at risk of closure. This is not the time to introduce “nice to do” for little return.

**DEPOSIT AND RETURN**

30. Convenience is key to engaging people in recycling and changing their behaviour. By far the most convenient method of recycling is kerbside collections which avoid members of the public driving to recycling points. Any competition to kerbside collections is likely to lead to confusion and could undermine local authority schemes.

31. Most glass bottles are not designed to be washed and reused. There are only a few soft drinks manufacturers in Scotland who continue to pay a deposit for the return of bottles and crates.

32. Currently there is no supply chain established to handle a deposit and return scheme and no supporting infrastructure in place. This would need to be established and could result in additional costs for small retailers.

33. Small retailers do not have available space to operate a deposit and return scheme nor the funds available to purchase a deposit and return vending machine.
34. The costs of implementing such a scheme for a retailer in terms of manpower would be prohibitive. Additional sales staff would be required to enable a store to accept and handle returned bottles, cans etc and maintain records.

35. A deposit and return scheme raises health and safety issues. There could be a risk to public health if fresh food were to be contaminated as a result of used returned packaging being stored in close proximity.

36. Within the consultation document reference is made to the deposit and return scheme in Denmark. Denmark has strong recycling systems in place that are approximately ten years ahead of the UK. The quality of recycling material is far superior compared to the UK to the extent that Novelis, the UK’s largest aluminium recycler, prefers to use Danish material compared to UK stock.

37. In addition to the measures proposed in this consultation document, the Scottish Government has recently proposed changes to tobacco and alcohol legislation. All these proposals will result in increased costs and additional administration for small shops, if they are to proceed.

38. In addition it has been proposed that all these schemes will be enforced by different officials. Licence standards officers for alcohol, trading standards for tobacco and SEPA for waste. Obviously there will be a cost implication and it is likely this cost will only increase over time.

MANDATORY WASTE DATA RETURNS FROM BUSINESS

39. Under the duty of care retailers must keep a record of the disposal of waste. A mandatory waste data return would be a replication of regulation and a further burden on small businesses. SGF is not convinced for the small amount of waste produced by small shops that blanket legislation is required and small shops should therefore be exempt.

40. The consultation suggests the total cost to submit the return is going to be £20. SGF believe the costs would be considerably higher and does not take into account the additional administration burden this proposal would create for small shops, if implemented.

41. The consultation states that SEPA already collect data from business by way of surveys. The surveys are voluntary and currently returns tend to be low. Rather than requiring mandatory data returns the Scottish Government should continue to engage with business and generate support through voluntary initiatives.
OTHER MEASURES TO ENCOURAGE WASTE PREVENTION, INCLUDING ACTION ON SINGLE-USE CARRIER BAGS

42. Carrier bags are not significant in terms of net environmental impact. However, SGF recognises the symbolic nature of single use carrier bags in relations to the environment and the Scottish Government’s desire to reduce their usage.

43. SGF is a member of the Zero Waste Retailers Group and is working with the Scottish Government to investigate how carrier bag usage can be reduced.

44. SGF welcomes the Scottish Governments preferred use of a voluntary initiative to reduce bag usage. SGF believes mandatory charging for carrier bags would affect the poorest and most vulnerable in society, who least can afford it.

45. Due to the disparate nature of the convenience sector, a unified and centrally monitored target would be impossible to deliver. We would therefore have to agree a workable means of our sector being involved in the activity and feasible monitoring criteria.

46. Supermarkets recently agreed to achieve a 50% reduction in bag use by Easter 2009, from a baseline to be agreed. SGF believes the Scottish Government may need to take into account the different type of shopping and customer base in the convenience sector, compared with the large format stores. There is a difference in bag use between weekly planned shops and more spontaneous visits to shops (where customers are less likely to take their own bags).

47. Consumers have been in the habit of using single use carrier bags in this way for many years and it will take a significant effort to change this pattern.

48. If the Government were to decide to proceed with mandatory charging stores smaller than 289 sq m should be exempt from the requirement to charge for bags due to the bureaucratic burden that compliance and reporting would place on tens of thousands of small businesses and the administrative burden on local authorities charged with monitoring and enforcement.

49. SGF members have taken steps to reduce carrier bag usage through various voluntary initiatives.

50. To succeed in achieving waste reduction requires behaviour change. SGF welcomes the Government’s use of education rather than penalties
to reduce single use carrier bags and would welcome a similar approach to all the proposals included within the consultation. Legislation targeted at business is unlikely to encourage the public to recycle more.

51. SGF is very willing to work with the Scottish Government to develop voluntary initiatives with the Government to encourage our members to reduce waste and improve recycling.

Scottish Grocers’ Federation

RURAL AFFAIRS AND ENVIRONMENT COMMITTEE

CLIMATE CHANGE (SCOTLAND) BILL

SUBMISSION FROM SEPA

[Due to time constraints, this submission is a copy of the original submission made in response to the Scottish Government’s consultation on the provisions in the Bill relating to waste.]

Proposal 1: Duties on Public Bodies and Businesses to Provide Recycling Facilities.

**Question 1: Do you consider that legislation should be made in this area?**

SEPA does not consider that a Voluntary Code of Practice on Recycling outwith the home would on its own deliver a zero waste society. We therefore believe that legislation would be beneficial in this area. Significant quantities of recyclable materials exist in waste streams outside the home within both public spaces and work facilities that could usefully be recovered.

**Question 2 If so, what form should that legislation take?**

Legislation could be based on a revised form of a number of existing regulatory systems such as:

- Producer responsibility
- Duty of Care
- Building regulations
- Event licensing process
- The Planning System

Town and Country Planning legislation could be a useful vehicle to deliver appropriate requirements. The Town and Country Planning General Development Procedure Order could potentially be amended to require all qualifying new development to provide details of recycling and composting provision when submitting a planning application. The planning application would not therefore be registered as “valid” without this information, in a similar manner to requesting details of drainage and road access. Amending planning legislation would ensure developers took this requirement on board at the earliest design stage where the facilities and any land area required can be properly considered. Failure to consider this at the planning application stage may result in applications subsequently being submitted for Building Warrant where the layout would have to be changed to provide recycling facilities, materially affecting the entire development. This would then, in some cases, result in the developer having to submit a revised planning application so delaying the development process. Separate legislation would be required to enforce this requirement retrospectively.
Legislation should address a range of specific issues including:

- the type of waste, for example, cans, glass, paper, batteries, household hazardous wastes and plastics to be recycled
- facilities should be appropriate to the location and types of waste likely to arise
- powers should enable material collections systems and capacities to be specified based on the type of location in question

The following issues must also be addressed:

- assess and resolve the availability of UK reprocessors and end markets.
- establish the dependence on overseas markets and assess any long term risks in dependence on such markets
- address how geographical issues will be considered such as remoteness from markets, collection systems and the related cost implications for businesses and public sector bodies in remote or rural areas?
- demonstrate that reuse has been explored (especially for furniture and WEFE) before materials are recycled

The legislation should apply to all public sector bodies and commercial businesses (especially retail, fast food, travel and entertainment centres) which attract large numbers of members of the public; or in buildings with more than 50 employees, or part of a national chain or franchise that are frequented by the public.

Other Issues to be considered:

- Resources for enforcement of legislation.
- How to assist developers with any costs with “retrofitting” existing sites/developments, for example, through local business rate relief or some similar mechanism.
- Importance of guidance being prepared on what type of provision is to be made for different scales/types/thresholds of development.
- That materials recovered in public spaces would count towards local authority recycling targets irrespective of who owns the collection system or undertakes the collection. Materials collected from businesses not designated as public spaces would be considered as commercial and industrial waste.

Proposal 2: Packaging.

To encourage waste prevention by giving powers to the Scottish Government to make regulations on packaging which would set statutory targets on retailers for packaging reductions.

**Question 1 : Do you consider that legislation should be made in this area?**

SEPA considers it important that the specific application of any such measures are clear in their intent. SEPA does not support the introduction of
new measures on recovery (one way of reducing packaging waste) due to the risk of introducing inconsistencies or tensions in the existing UK regulatory systems for packaging. These may not be perfect but they are beginning to work. The cross UK nature of retailing would make this complex and probably highly unpopular.

There is adequate data from statutory returns from compliance schemes at a UK level to evaluate progress in packaging recovery, re-use and dematerialisation. However this is difficult to interpret in a purely Scottish context.

SEPA would suggest the following approach:

- an increased obligation on wholesalers and retailers acting in Scotland to provide improved data on the packaging material entering the consumer market in Scotland — this would improve our data as this tends to be produced at a UK company level and is therefore hard to partition into Scottish data.
- improved measures to penalise excess packaging — probably via a revised Essential Requirements Act in Scotland. This has proved to be an ineffective regulatory system and if designed appropriately would act to place pressure on packaging manufacturers, packer fillers and retailers to further reduce packaging.
- powers to enforce take back of specific packaging materials. This has proved highly effective in some Scandic countries for aluminium packaging for example. If we propose this we should seek for them to be general ‘take back’ and ‘deposit return’ powers as it would be useful in other non-packaging areas such as batteries and some HHW materials (see Proposal 5).
- consideration could also be made for retailers above a certain size to have deposit facilities either in or within the vicinity of their premises to enable packaging materials to be deposited for recycling. This is to some extent linked to the issues raised in Proposal 1.

**Proposal 3: Specifying Recyclate.**

**Question 1 : Do you consider that legislation should be made in this area?**

SEPA would support legislation in this area to require public bodies to procure goods with a minimum specified recycled content.

Public bodies have significant procurement powers to influence the supply of products with higher recycled content. More effort needs to be made in closing the recycling loop, rather than just focussing on simply increasing recycling targets.

SEPA would have concerns as the practicability and resourcing implications of imposing such a requirement on businesses. It would be more practical to implement this through the manufacturers selling into the UK/EU market via existing producer responsibility powers. In SEPA’s view this would need to be
achieved at an EU level. However positive promotion of the benefits of green procurement to business should be ongoing and with increased commitment. Consideration should be given to imposing a requirement on any private bodies that supply goods or services to the public sector. This supply chain pressure would be one practical way to influence businesses directly.

There is a need to continue support towards recyclate quality via ISO or PAS or British Standards to ensure that the use of recyclate does not diminish quality standards. There is similarly a need to undertake significant awareness raising to overcome current perceptions that recycled products are inferior quality.

**Question 2: If so, what form should that legislation take?**

• The legislation should lay down the nature of the materials and the contracts to which the duty would apply (including exemptions and whether the requirements would not apply to contracts below a certain value) with a particular focus on paper and paper products (towels and tissue); container/packaging glass; a wide range of plastic consumable goods; building works; grounds and road maintenance contracts. A similar obligation should apply when refurbishing offices and buildings. There is potential for enactment through Building Regulations for new build projects. Refurbishment contracts should also demonstrate that reuse of existing furniture and WEEE has been explored before new products are bought.
• The legislation should be developed in partnerships with experts in sustainable procurement rather than solely from a waste angle. The legislation would need to be based on a clear life cycle analysis of the various product areas to be addressed. Price comparisons would need to be made to quantify the cost to the public sector. Similarly procurement methods should be investigated which would act to reduce the costs of such a requirement through high volume purchasing contracts.

Key elements of any such legislation would include:

1. Type/definition of organisations to be covered.
2. Key product areas to be targeted.
3. Product standards specifying the minimum recycled content.
4. Monitoring and record keeping requirements for verification.
5. Any necessary enforcement powers.

SEPA recommends that consideration should be given to the implementation of such a requirement via a Scottish wide Agency based on some existing body with a national procurement function.

**Proposal 4: Waste Prevention Plans.**

*The responses to the following questions are taken as a whole below:

**Question 1: Do you consider that legislation should be made in this area?**
Question 3: what public bodies and businesses should be covered?

Question 2: If so, what form should that legislation take?

SEPA considers that legislation is required in this area but largely only for public bodies and larger companies. Public bodies are readily controlled within the wider public estate and as such should be required to demonstrate best practice and best value by driving down the costs of waste management within the public estate.

In general SEPA does not agree that such a requirement should be placed on smaller business for the following reasons:

- The administration of such a scheme would be burdensome on both business and the administering authority
- The operation of the market with disposal costs rising sharply should be trusted to change behaviour with the support of well targeted resource efficiency programmes. In tandem to this carbon and emission trading schemes will act to focus attention on resource efficiency.

SEPA however sees two specific areas where we would support the implementation of waste prevention plans on business:

- We would support an extension of the powers under Pollution Prevention & Control (Scotland) Regulations 2000 to address waste prevention in currently regulated industries.
- In addition to the above, consideration could be given to extending this duty to other large companies in Scotland (delineated by either turnover or employee number) with these powers integrated with those set out above in proposal 3 on specifying recyclate. This may then filter down the supply chain as these companies seek to improve supplier performance. This avoids the implementation of such a duty on SMEs which due to their number would require disproportionate efforts to both monitor and administer and would probably raise questions on the benefits of such regulation in an era of less and better regulation.
- We would support the mandatory implementation of Site Waste Management Plans (SWMP5) with the enforcing body identified. As a national organisation SEPA could be a suitable body to fulfil this enforcement role, helping to ensure the creation of a level playing field. In addition, SEPA already regulates or has an established relationship with many of these industries. SWMP development and enforcement should also be linked to Health and Safety legislation as they also regulate construction sites.

Site Waste Management Plans:

- Site Waste Management Plans should mirror what is happening in England where any new development (costing more than £300,000) to submit a Site Waste Management Plan at Planning Stage.
- Implementation of the SWMP legislation in England should be fully assessed in order to ensure that any legislation in Scotland is as effective as possible
Proposal 5: Deposit and Return.

Question 1: Do you consider that legislation should be made in this area?

SEPA considers that legislation should be made in this area. Such mechanisms are powerful consumer behavioural change drivers. More research is however required into the barriers which prevent businesses from introducing this type of system so that this can be addressed in the future.

Question 2: If so, what form should that legislation take?

• SEPA would suggest the development of general powers that would place a take back responsibility on retailers of specific products or powers to implement a deposit refund scheme on retailers of specific products.

Question 3: Your views on the practicalities of such schemes in Scotland?

• A deposit system would work but for recycling not return for re-use. Re-use containers tend to have double transport miles (to the retailer and back), increased use of raw materials (need to be more robust) so more lorries to transport (because they are heavier) and increased use of detergents and water (need to be cleaned).
• Full life cycle analysis would have to be undertaken to ensure that the measures were contributing to improving the environment impact of products. We should seek to understand why a once strong deposit and return system on bottles died out. What were the business reasons for these measures not continuing?
• The scheme would have its major applications in non-packaging areas (perhaps with the exception of aluminium containers due to the very high energy savings). Products such as batteries, small electrical items and some HHW products would in our view benefit from deposit refund schemes.
• We believe the public would respond well to such schemes and this would greatly assist recovery in these areas some of which produce problematic wastes.

Careful consideration would need to be given to the structure of any deposit refund system. This requires a central collection agency to hold deposit funds and allocate funds based on returned products. This could prove costly to administer. However a number of working models exist that could form the basis of an options assessment.

Proposal 6: Mandatory Waste Data Returns from Business.

Question 1: Do you consider that legislation should be made in this area?

SEPA strongly supports a statutory requirement on waste producers to provide data on waste arisings. Increasingly with the complexity of global
resource pressures a far clearer perspective on what materials are flowing through the Scottish economy which then arise as waste materials is needed. An improved understanding of this would assist in identifying a more rapid response to specific resource pressures. Such a measure would also act to focus business on its resource use and provide opportunities for cost savings.

The following applies:

• The principal area where waste data is still lacking is for the waste produced by business, as there is currently no way to collect this directly. A limited amount of information on business waste arisings is available through Special Waste Consignment notes and through the returns for the Scottish Pollutant Release Inventory (SPRI).

• The information on business waste arisings is needed to:
  — aid national policy development;
  — aid in the assessment of capacity needs for the tertiary treatment of residual wastes and in improving technology choices for such treatment;
  — support policy development in organisations such as local authorities, enterprise agencies and others;
  — monitor change and policy impact;
  — help the development of the new National Waste Plan;
  — provide data for planning applications and investment in waste infrastructure;
  — identify potential benefits for businesses
  — and meet internal and external reporting requirements including the Waste Statistics Regulations.

• Currently SEPA does not have sufficient, detailed data to adequately satisfy a number of these. There is a need for information on the type of waste, the quantity of waste, the geographical origin of the waste and the Standard Industrial Classification (SIC) code of the business producing the waste.

• SEPA has attempted to fill this lack of information in two ways; first, directly, by carrying out national business waste surveys and second, indirectly, by using information gathered by the quarterly licensed/permitted waste management site returns. Both have their drawbacks.

(1) The principal issue with the survey is that it does not provide sufficiently accurate data for SEPA’s needs and those of its stakeholders. For example the 2006 survey showed that the total business waste produced in Scotland in 2006 was estimated to be 7.64 million tonnes with a 95% confidence interval of 2.60 to 13.42 million tonnes. This was mainly because of the poor response from businesses to the survey. A portion of Scottish businesses, about 29,800, were surveyed and there was a usable response rate of 10.8 % (3,232). This represented only 2.3% of all businesses in Scotland. It was clear from the survey that some businesses who replied had little knowledge of their waste. The cost of a survey would be about £80,000 at present values.
The information collected by the quarterly licensed/permitted site returns is good but only deals with the waste managed. It does not collect any information on the producer of the waste and only limited information on its geographical origin. Because of possible double counting issues is also not possible to get completely accurate figures for the waste produced.

• Whilst it would be unfair to place too much of a burden on business it does not appear unreasonable to require businesses, particularly larger ones, to have a knowledge of their waste and to report this to SEPA. This would complement the good work already carried out by Scottish local authorities in increasing waste recycled and reducing waste to landfill. Businesses are part of Scottish society and should be expected to contribute towards a zero waste Scotland. They contribute over two thirds of the annual waste arisings in Scotland.

• There are a number of ways that the reporting burden could be reduced. For example:

— There could be a de minimus limit under which businesses would not be required to report: of the 148,000 businesses in Scotland in 2006 only 6,680 had 50 or more employees and over 82,500 had less than five. Another approach would be to set a limit based on annual turnover in a similar way to the packaging waste obligations. The limit could be set to balance the need for information with the need to keep the burden on industry to a minimum.
— SEPA is currently developing an online data collection system for statutory returns, through the Operator Data Returns project. Businesses could potentially use this system for reporting data to SEPA, eliminating the need to create a new data collection system.
— An alternative approach for collecting the information could be to carry out compulsory business waste surveys on a third of all Scottish businesses annually. This would provide sufficient information for SEPA’s needs.
— A further alternative would be to undertake a root and branch review of the Duty of Care system and implement it effectively.

• SEPA does not consider such a duty to be a burden to business. Businesses themselves are likely to benefit in a number of ways from this statutory reporting including:

— identification of cost reduction opportunities through waste minimisation and increased recycling;
— benchmarking their performance against others in their sector;
— an enhanced image and reputation by being able to prove good environmental practice;
— and improved dialogue with the Government and SEPA;
— more aware of potential future resource pressures (and risks) arising from a rapidly globalising economy;
— access to education materials/initiatives associated with this obligation.

SEPA believes that placing a statutory duty on businesses to report on the waste they produce would provide the information needed by SEPA
and its stakeholders, and more importantly help progress towards a zero waste Scotland, ultimately improve the environment and make Scottish business more profitable and robust in terms of future resource pressures.

• SEPA recognises that the introduction of a new system comes with challenges. There will be a need for a promotional campaign aimed at publicising the benefits to business. Guidance (written and verbal) will need to be available for businesses and on going support will need to be provided. There may be initial problems with the quality of returns and with non-returns. However, from the SEPA Waste Data team’s experiences in introducing and operating the quarterly licensed/permitted waste management site returns these can be overcome relatively quickly by supporting the businesses.
• DEFRA is currently consulting on a proposal to add the requirement to report the SIC code of the waste producer to the waste transfer note. If this requirement was introduced the SIC code could be requested by a licensed/permitted site when waste is transferred for recovery or disposal. This would be reported in the returns made by licensed waste management facilities to the Environment Agency.
• This type of system could work in Scotland but would increase substantially the workload on both SEPA and the waste management industry, Its main strength is that it builds on an established system but there may be some reluctance from the waste management industry. SEPA’s Waste Data team believes that this methodology could provide the information required but that it removes the need for businesses to have knowledge of and be responsible for the waste they produce.

Proposal 7: Other Measures to encourage Waste Prevention, including action on single-use carrier bags.

Are there any other areas, not covered by this consultation, where legislation could be made to increase recycling and promote waste prevention?

SEPA considers that consideration should be given to the following additional areas for potential regulatory powers:

A local tax or levy on disposable and single use products should be considered when there are alternatives e.g. disposable picnic ware, razors, nappies, and cigarette lighters. This could include single use plastic or paper bags. However in this latter case SEPA believes we should see how the voluntary code of conduct agreed with national retailers is working prior to implementing any such action on carrier bags;

• Reduced VAT on products that have a high content of recyclate;
• Consideration should be given to encourage products to have a built in 5 year warranty to encourage repair rather than planned obsolescence. We again note that this would not be a devolved matter with significant implications at an EU level;
• Repair services should be VAT free;
• The implementation of landfill bans. SEPA however notes this can be addressed with existing powers;

SEPA considers that resource management is ultimately about materials management. As such powers should be developed that could be used to require specified materials to be managed in ways that represent the Best Practicable Environmental Option (including carbon management benefits).

General Comments

Whatever legislation is developed there needs to be a communication plan and guidance linked to it. The more engagement and guidance provided the better the legislation will be implemented.

SEPA is disappointed to see that the proposal for direct variable charging for waste has been withdrawn from proposals. Householders should equally apply to the Polluter Pays principle and be more aware of the impact that their wasteful activities have. It seems to be more of political decision to pull this option, which is concerning when some difficult and often unpopular political decisions need to be made if we are to seriously move Scotland towards a Zero Waste society. It is difficult in SEPA’s view to justify the challenging recycling targets placed on municipal authorities without the requisite powers to change public behaviour.

The resourcing implications of enforcing legislation also need to be given careful consideration and, where possible, SEPA would support the review of similar legislation with the other UK administrations that could result in consistency of UK legislation and greater environmental benefits.

SEPA
3 October 2008
I will address the one area where I believe I have something to offer and that is under sections 52 – 61 which covers Waste Reduction and Recycling, and specifically, section 59 relating to “Charges for supply of carrier bags”. Why this appears anywhere in this Bill and particularly under waste reduction remains a travesty of our democratic process. The Scottish Parliament has already in 2004 – 2006 spend an estimated £2,000,000 of taxpayers money investigating a proposed Environmental Levy on Plastic Bags Bill and unanimously rejected that Bill for very clear unambiguous reasons that to do so would create substitution of lightweight plastic bags by heavier bulkier and more inefficient carriers which was clearly and quantifiably proved to be counterproductive in reducing waste. Whilst Section 59 is all encompassing and non specific as to the material from which the carrier bags are manufactured, there is no doubt that measures already undertaken to reduce the number of bags used (as endorsed by all four UK environment Ministers) has inevitably increased the weight of product used, the bulk of the product used and defeat the very intention of the measure suggested.

There have already been two long and costly “consultations” undertaken by Parliament on this issue. The first when examining the proposed Levy Bill elicited over 1100 responses, over 1000 of which specifically said “no” to a levy on plastic bags. The second, on the Implementation of Zero Waste proposals, stated that “the proposal relating to single-use carrier bags only received support from a minority of respondents”. Both indicated clear majority opposition to the idea of having to pay for carrier bags. It is therefore undemocratic to include such a measure when the issue has already twice been consulted upon, and unanimously rejected by Parliament.

Furthermore, all of the major UK retailers have already signed up to a voluntary code of conduct in 2007, instigated and endorsed by the Carrier Bag Consortium (www.carrierbagtax.com), which required retailers to reduce the ENVIRONMENTAL IMPACT of carrier bags by the end of December 2008 by 25%. This has not yet been officially reported upon (WRAP have however indicated that the target has been exceeded) but the retailers involved have now undertaken with the UK Government to reduce the NUMBERS of carrier bags by 50% from the base line in mid 2006, by the summer of 2009.

You will all have seen and understood the retailer campaigns being run, including being asked if you need a bag, to bring back the previously used bag, to pay for a carrier bag, to buy alternative products, jute, cotton, nylon, bags for life, woven polypropylene and nonwoven polypropylene, and the occasional switch to paper from plastic in non food applications.
All of these campaigns are been promoted as being “better for environment” and more “ecologically friendly” so why did the Scottish Parliament unanimously reject that in 2006?

The answer is a combination of many reasons which are listed below and expanded in further detail for your understanding. Be aware that it is only the lightweight polyethylene (plastic) supermarket carrier bag that is actually being targeted under this scheme as it is the one which is most in use throughout the UK, and no other type of bag has shown any reduction with all the substitute products having increased availability and use.

Accordingly, a reduction of 50% (as prescribed by the agreement mentioned above) in the number of carrier bags will probably

1. Increase the weight of bags used in Scotland from 10,610 tonnes to 38,343 tonnes per annum
2. Increase the bulk and cubic capacity of bags used in Scotland from 27,660 cubic meters to 232,476 cubic meters per annum of product.
3. Increase the weight of transit packaging from 704 tonnes to 4,100 tonnes per annum
4. Increase the number of lorries - full (unlikely to be full) 20 ft lorry loads from 3,457 to 29,059 per annum
5. Increase the number of full pallets moving around our country from 76,064 to 639,306 per annum
6. Increase the amount of carcinogenic exhaust fumes from vehicles as a result
7. Increase the traffic congestion in our cities, towns and countryside as a result
8. Increase the incidence of road kill of our animals and probably humans
9. Contravene the Kyoto principle, the Bali agreement, the Posnam agreement, EU, UK and the Scottish targets set for Carbon Dioxide, Methane and other greenhouse gas reductions, by increasing their emissions.

This is a much increased and greater environmental cost than that which was estimated in 2006 as the substitute products for the lightweight carrier bags being replaced which are all being sold in today’s retail market are far heavier, bulkier and incidentally more expensive than was anticipated in 2006.

These are more accurate figures from those which the Environment and Rural Development Committee (ERDC) reviewed in 2006, as we now know what substitute products have been introduced, and when this potential disaster was understood by them, they had the foresight to understand the damage to the environment that they were being asked to make into law. Thankfully they intelligently voted unanimously against this ill conceived idea. Further consequences not able to be quantified by me, inevitably include more exhaust fumes, more traffic congestion, more road damage, more wildlife and probably human road kill as well.
Sadly the damage does not end there. In that significantly fewer lightweight supermarket carrier bags are available, the public will be forced to replace their re-use which, according to WRAP pre the introduction of the Code of Conduct, stood at between 74 and 80 %, with alternative truly single use products. These are likely to be an increased use of plastic black bin bags, pedal bin and swing bin liners, nappy bags, dog dirt bags, and food, freezer and sandwich bags to carry lunches and sandwiches to work, all of which will negate any perceived benefit from the introduction of charges to reduce lightweight plastic carrier bags.

Detailed analysis of the calculations based on actual weights of products currently available and, estimated usage based on information obtained in the market place, are attached for your perusal. They show clearly the position as it was for Scotland alone in 2006/7 and as it is likely to be in mid 2009 with the products currently available. Back up sheets show the product analysis with weights and the packaging and bulk calculations for all products. To really frighten yourselves, multiply all figures by 13 to arrive at the UK damage which will be inflicted on our Environment.

Do not be misled by either the tacit mildly reluctant acceptance by the retailers of this required reduction in number of bags or that they are anything other than ecstatic and enthusiastic about these plans to reduce free carrier bags. Please take time to understand the following,

1. The retailers reduce their costs by reducing the number of bags they give away “free”. In the UK when there is a 50% reduction in number, that is tantamount to Government handing them extra net profit annually of £100,000,000
2. Should they charge 5p for the remaining lightweight bags (as M & S do) they will save another £50 - £120 million per annum, less what they generously give of the public’s money to charity after deducting the costs of the bags, an administration cost, and the VAT remitted to the Treasury. The ever suffering public believes all their 5p is going to charity, and it most certainly is not.
3. They now sell many different types of alternative bags, jute, cotton, heavyweight plastic, woven and non woven polypropylene and nylon bags, all making significant profit for the retailers.
4. They are seen to be “generous” giving the “net proceeds to charity”. It’s the PUBLIC’S money they are donating without any contribution from them.
5. They are perceived to be “doing good for the environment” when, if you understand this letter, they are actually damaging it.

This remains a shrewd commercial decision rather than a studied philanthropic one for the retailers.

These are some of the quantifiable DIRECT environmental costs which will occur by simply reducing the number of lightweight supermarket bags in
circulation. The unquantifiable, but inevitable, increased damage from points 6 – 10 above, will be hugely significant.

There are further INDIRECT costs to the environment as well. In Eire, when they introduced a €15 cent plastax (now increased to €24 cents per bag) in 2002, the whole retail experience changed. No plastic bag was exempt from the tax other than small bags under approximately 250 x 375 mm. As a consequence, there was, and remains a visual and almost universal change from plastic to paper bags in the non food retailers. Boots, Mothercare, Next, Topshop, Evans, Miss Selfridge, M & S, Topman, Burton, Debenhams, to name but a few, all changed from plastic to paper in Eire only, whilst retaining plastic in their UK operations. Furthermore, in Eire, many of the paper bags had to be laminated with polypropylene (another plastic) to stop them disintegrating when wet and avoiding ink transfer onto clothes when carried. Yet another unintended consequence of the tax was therefore using more plastic than saving.

In the Irish food supermarkets the whole retail presentation of food altered with all fruits, vegetables, pies, bakery products and deli products changing from being sold loose, to being sold in collation packs, so that they were not contaminated by being placed in the dirty, reusable non-plastic substitute carrier bags inevitably soiled by milk spills, dirt absorbed from the pavement, soap residues and other unsavory unhygienic contaminants (this is a public health hazard waiting to happen).

You simply cannot buy loose fruit or vegetables in an Irish supermarket – they are all now prepackaged in plastic trays and plastic clam shells, wrapped inevitably in shrink film. To give you some indication of the crass stupidity of this decision, 4 bananas in an Irish supermarket are now presented on a plastic tray, covered in shrink film with two paper adhesive labels attached thereto, one showing country of origin and the other the price. The weight of all that packaging is equal to 7 times the weight of a UK supermarket check out carrier bag and 16 times the weight of a fruit and vegetable carrier we use at present. The packaging consisted of 4 different base materials which rendered the waste very difficult to recycle. These changes WILL inevitably happen in the UK if the public increasingly do not have free carrier bags supplied at the checkout.

The Irish turn a blind eye to these massive hidden waste increases, please do not make the same mistake by ignoring these inevitable consequences for Scotland.

Recently, the Environment and Rural Development department announced a £5 million fund availability over a two year period for improving material recovery facilities and to develop a home market for plastics reprocessing, and inform us that they will be working to significantly increase public awareness of waste issues, including reprocessing carrier bags. Whilst I am truly encouraged that Parliament is at least making some attempt to address the plastics issue, the inclusion of plastic carrier bags under this funding is
totally unnecessary and compounds a glaring lack of knowledge of facilities already available within Scotland.

May I respectfully remind you of the statement from John Langlands, the MD of British Polythene Industries, a major Scottish Plc, at the evidence taking on the failed attempt to levy a charge on plastic bags in 2005, whose recorded response to the Environment Committee, including Mr. Lochhead the current Environment Minister, on October 26th 2005 was as follows:

“We are the largest recycler of polythene film in the UK and probably in Europe—we recycle about 75,000 tonnes of polythene film a year. If you can get it to us by whatever means, we can recycle it. The stuff that we cannot turn into refuse sacks or building film we turn into Plaswood, which we use to manufacture park benches and signs, for which we have won awards and which we sell to Scottish local authorities. That is a good use of recycled products and something that must be encouraged and developed in the community.”

This Scottish facility for recycling plastic film and carrier bags is and has been in place for over two decades. Why don’t local authorities use it? Also your Department should be educating these local authorities in an understanding of what is needed to instigate a collection service from the public which delivers what you seek without a penny of your £5 million allocation. Save the fund for hard plastics, ABS, PET, PP, PS and PVC, all of which are far more prevalent, both in tonnage and in bulk, in our waste stream than polythene film. It would be a very brave, and some will say stupid, businessman who, in these desperate times, would invest in recycling plastics or paper with such uneconomic price levels for these products coupled with surplus raw material product already available worldwide.

Plastic is environmentally easily and economically recycled, using less resource than any of the substitute products both initially and on recycling, and parliament should be encouraging continued use of lightweight bags rather than reducing their use which leads to further damage to the environment from substitute products.

The Government should be far more proactively encouraging the public to reuse their lightweight plastic carrier bags where hygienically possible, and to recycle them in the plethora of disposal units now visible in the forecourts of most major supermarkets. It should demand and encourage Local Authorities to instigate a collection from householders of plastic carrier bags. It should provide educational literature for schools aimed at encouraging the intelligent use, reuse and recycling mantra on plastic bag use, and not demonising them. The carrier bag industry, more specifically the plastic carrier bag industry, is under attack from all sides

1. The UK Customs and Excise impose import duties on imports ranging from 3% to 25%
2. The EU has imposed additional anti-dumping duty on plastic bags ranging from 5% to 29%
3. Towns and villages attempt to force a ban plastic bags which is legally unenforceable, as confirmed by Jane Kennedy, the UK’s Environment Minister (Hansard Monday 19 January 2009)

4. Government in Westminster regards them as evil with the Prime Minister stating that he “wants to get rid of plastic bags”

5. Government in Scotland specifically includes them in their Zero Waste initiative and again specifies them in the draft Climate Change (Scotland) Bill

6. A two year campaign, voluntarily undertaken by all the major retailers to reduce the ENVIRONMENTAL IMPACT of carrier bags by 25% then subsequently changed to 25% in NUMBER of carrier bags without consulting the parties involved.

7. A further extension to that policy to reduce the NUMBER of carrier bags by 50% from the 2006 base level (around 1 billion carrier bags in Scotland) by summer of 2009.

All aimed at reducing what you must think is a massive part of our household waste findings.

The reality is that household waste arisings in Scotland amount to some 3,500,000 tonnes annually, of which, in 2006, ALL plastic carrier bags accounted for less than 8,500 tonnes per annum. At that time, paper and card based household waste accounted for 850,000 tonnes and with the demise of a paper maker in Fife that claimed to recycle over 100,000 tonnes per annum, that figure is actually around 950,000 tonnes of paper waste per annum. The voluntary scheme mentioned in point 6 above has (as agreed by WRAP) been met and exceeded, therefore reducing the tonnage of plastic to less than 6,400 tonnes per annum.

This now represents less than 0.2% of waste arisings and why should time and energy be wasted on such an insignificant percentage of waste when there is a mountain of paper waste and other identifiable component groups like food requiring more immediate action.

Furthermore, the reduction by 50% of the NUMBER of carrier bags used in Scotland, will have consequences which will hugely damage the environment of our country as the public are forced, by ill conceived Government policy, to reduce the number of lightweight bags in use only to substitute them with heavier reusable bags made from paper, jute, cotton, woven and non-woven polypropylene. This is not just a possibility – it has and continues to be happening right now. If even half of the surviving 50% of the carriers remain lightweight supermarket carriers then these unintended consequences are already damaging our environment.

Do not close your mind to these consequences and understand that they ARE ALREADY HAPPENING, and as a result, the Kyoto protocol, the Bali agreement, the EU targets for carbon dioxide and methane gas reductions all will be significantly more difficult to achieve as this new mountain of waste, enough to cover the pitch at Hampden to a depth of
30 meters every year, will generate significant increases in both these greenhouse gases and more if the landfill physical conditions are met.

In terms of transport here are some facts: One 20 ft container will hold approximately:-

1. 1,700,000 lightweight plastic supermarket bags or
2. 300,000 heavyweight plastic “bags for life” o
3. 70,000 equivalent strength paper carrier bags or
4. 45,000 woven polypropylene plastic carrier bags or
5. 35,000 non woven polypropylene plastic carrier bags or
6. 22,000 jute carrier bags (with laminated plastic lining) or
7. 30,000 cotton carrier bags

Please relate these numbers to storage, transport and disposal logistics.

Serious awareness should also be understood about the “down weighting” which continues unabated in all forms of packaging and manufacturing today: the substitution of glass bottles by plastic bottles: the change from cardboard collation packs to plastic packs, the lightening of motor cars, and all forms of public transport by changing from steel bodywork, bumpers and interior fittings to plastic panels: shrink film and plastic vacuum packs replacing cardboard cartons; plastic pallets replacing wooden ones: paint pots changing from steel to plastic; fruit and vegetable transit packaging to avoid damage and extending food shelf life changing from paper and cardboard to plastic; paper carriers changing to plastic carriers; soup tins changing to plastic cartons and pouches; metal pipes changed to plastic, wooden and metal windows changed to plastic, are just a few of the changes seen recently.

Why? – simply to reduce packaging waste, reduce overall weight for transport considerations and increase energy efficiency, preserve products from spoiling and transit damage, increase shelf life, reduce theft, increase efficiency and preserving resources - all of these are achieved by down weighting and all are achieved by changing from various materials to plastic. What this section of the draft Bill will do is increase the weight and bulk of the product and in many cases increase the complexity and variety of materials used, rendering them more difficult to recycle – clearly going against all that is happening in the market place to use less of the world’s resources and become more efficient. The Courtauld Commitment, a voluntary agreement, launched in 2005, between WRAP and the major grocery retailers has as one of its aims, that the signatories must seek ways to reduce the weight of packaging. This Bill will be doing exactly the opposite.

Do not be taken in or take decisions under the mistaken belief, that we will save any oil as a result of this projected change. Polyethylene (plastic) bags are manufactured from by products, naphtha and ethylene, resulting from the distillation of oil and gas into fuel. Accordingly, for as long as we drive cars, use buses, trains, aircraft and bikes or switch on an electric light, these by products will be produced and if not used in the manufacture of plastics, it would be flared off into the atmosphere.
My overview of the targets set by the draft Bill is that they are commendable but probably unrealistic and therefore unachievable and accordingly are likely to concentrate efforts in the wrong direction. We should be encouraging solutions to deal with the possible 2 degree warming estimated to occur within the next 100 years, for example bringing more current unproductive cold agricultural land into producing additional food and revenues. Continue to seek alternative energy solutions by all means, but do not ignore the opportunities which such warming will bring.

There will be an enormous cost to the people of Scotland (and to the rest of the World) in the cause to reduce emissions, in the perhaps mistaken belief that in so doing, we will address the problem of climate change. I do not profess to be an expert in this field, but I would recommend that every member of the Committee, in order to gain a comprehensive alternative view to that which is currently in vogue on this issue, reads the following books on the subject of Climate Change, which will undoubtedly change their perspective of what they are attempting to achieve.

1. The Skeptical Environmentalist by Bjorn Lomborg published in 2001
2. Cool It by Bjorn Lomborg as an update published in 2007
3. An Appeal to Reason by Nigel Lawson, former Chancellor of the Exchequer

Lomborg, a Danish statistician regarded by Time magazine as one of the 100 most influential persons on Earth, comprehensively and with unchallenged statistical facts, destroys Al Gore’s “An Inconvenient Truth” analysis of the problem, and whilst Lomborg does not deny that there is a slight warming of the earth, he provides historical evidence suggesting that this is a natural, perfectly normal, repeating cycle. These three books explode the many myths associated with the current hysteria on climate change and that we are responsible for it. Lomborg’s view is that the cost of fighting climate change cannot be justified by the likely benefit, and that there are more pressing problems for the world to address. He proves, for example, that many more people die from winter cold than would perish in future from summer heat waves, and that climate change will, therefore, save more lives than it costs. He also proves that the reduction in numbers of polar bears is caused by humans killing them and has nothing whatsoever to do with global warming.

This draft Climate Change Bill has many sensible and very demanding targets for the country to meet. However there is no justification for the continuing attack on the ubiquitous plastic carrier bag as such a move will only make those targets much more difficult to meet.

Contrary therefore to what is proposed in the draft Bill, Parliament should avoid the stigma of introducing a Bill which increases environmental damage and produces even more carbon dioxide and methane gases, by not only encouraging the use of lightweight plastic bags, but also their sensible re-use and highlighting their recycling properties, for the simple reason that they are
clearly the most efficient environmentally friendly product currently available for transporting retail purchases home.

Should you require any further information or understanding of these issues, I am usually, business permitting, available for an honest and open discussion. Should any detailed consultation or evidence taking be required, then I would wish to be considered by the Committee as part of the oral evidence taking.

I wish to object to section 59 of the Climate Change (Scotland) Bill as the consequences of introducing any charge for carrier bags is that more waste and carbon dioxide will result. This section should be excluded. The inclusion of Section 59 will see a massive increase in bags such as paper, jute, cotton and nylon which cannot be recycled thereby increasing waste.

Shaws Fine Meats

RURAL AFFAIRS AND ENVIRONMENT COMMITTEE

CLIMATE CHANGE (SCOTLAND) BILL

SUBMISSION FROM MARGARET SMEATON

Kindly register my objection to the section of the proposed Bill which relates to carrier bags.

The Environment Department is presumably supposed to be protecting the environment, yet we are expected to suffer the ignominy of paying a tax for out carrier bags at the supermarket which has been specifically chosen by the Scottish Government in 2006 to result in more damage to the environment by the substitution of smelly, bulkier and heavier alternatives.

If we have no free plastic bags we will just have to bur plastic bin liners instead, costing us more of our hard earned net of tax, earnings, and by doing so will only increase the amount of raw materials used. Is this not simply madness?

Margaret Smeaton
18 February 2009
Please register my objection to the section in this Bill (Section 59) which gives power to the Scottish Ministers to introduce charges for carrier bags.

We in Scotland have already seen this plea for legislation rejected by Parliament and spent time and taxpayers money doing so.

Lightweight carrier bags are being touted as “single use” by our Environment minister Richard Lochhead. If they are, then more fool him for not reusing them as most of the public already do. Even his own DEFRA colleagues acknowledge that 80% are reused at least once.

Now he wants to tax these efficient bags for no other reason than to educate the public. What drivel emanates from Government — pray tell us uneducated masses when was the last time the imposition of a tax educated anyone on a specific policy other than to educate them that their Government is grasping at straws.

Pray tell the world, who is it that wants more taxes which will result in damage to the environment on already stretched incomes, when we are being advised we should be trying to help the environment?

P Timmins
26 February 2009
I wish to register my disapproval of the inclusion of Section 59 of the aforementioned Bill.

I am at a loss to understand why so called educated people continually lambaste lightweight plastic carrier bags.

These bags are made from waste products i.e. Naphtha & Ethylene which is produced during the refinement of oil into gasoline etc. These products would otherwise be flared off (burnt) and indeed used to be, until the invention of Polyethylene and other related plastic products.

So they are immediately at birth, in their raw polymer state, Eco friendly by utilizing a waste product.

Furthermore, they are Clean, Safe for Food Use, Cost Effective, Strong, Suitable For Purpose, Lightweight, Small Carbon Footprint to produce & distribute, Have Hundreds of Secondary Uses AND when no longer serviceable are 100% recyclable.

There is no other product that has those credentials.

There is a huge market for recycled polymers and demand outstrips supply. We already have in Scotland (though our ministers don’t seem to know it) the largest recycler of polymers in Europe who are literally screaming for more product. So, why is it that most councils in Scotland do not have the facility to recycle ANY plastics, let alone polyethylene? Surely, with scrap polymer fetching £350 / Tonne on the open market it makes financial sense for the councils to be generating income from this product rather than sending it to landfill. Instead they continue to collect thousands of tonnes of paper and coloured glass that nobody wants and invariably ends up in landfill anyway!

Did you know that a 2 Litre plastic milk bottle will make (if recycled) 12 lightweight carrier bags? Or 18 in the case of a large bottle of Squeezy or Fair Liquid! How many of these go to landfill every day? You will be gobsmacked when you find out the answer. Should we not be banning these? Or indeed the estimated 800,000 disposable nappies that go to landfill in Scotland EVERY day?

If indeed this bill is about Climate Change then we should be looking at CO2 & METHANE emissions. These are without any question of doubt the main cause of Global Warming caused by Climate Change.
Neither of them are caused by plastic bags!!

Section 59 has no place in this Bill.

Alistair M. Tough.
29 February 2009
I am writing to object to section 59 of the Climate Change (Scotland) Bill as the consequences of introducing any charge for carrier bags would be disastrous for the environment in terms of the extra waste and carbon dioxide that will result. This was all investigated in 2006 by an independent committee and was found not to be a viable solution to the environmental concerns we all have. The possibility that this is going to be re-visited again is just ridiculous. Enough time and expense has already been spent on this topic.

In these times of financial hardship, many small businesses are struggling to keep their business going. Their priority is to reduce costs to their business and in effect, what you are proposing is to limit their choices, insisting with legislation that they commit financially to more expensive packaging for their products at the point of sale, which in effect will increase their expense and ultimately not resolve the waste and Co2 issues.

Many alternative, so called long term carrier bag solutions, do not last due to poor workmanship. These bags are then thrown away and do not decompose. To my knowledge these bags are mainly made in India and Asia. There is a polythene manufacturing base in the UK that will be destroyed - more people out of work - while we as a country will then be advocating the importing of products made by workers from other countries. In this time of growing unemployment does the Scottish Parliament want to be responsible for adding to the jobless figures? **This is not the time to be introducing this.**

In my opinion, further investment in recycling facilities is required by local councils and a more uniform approach to "wasteful packaging" rather than singling out carrier bags and demonising them. I hope that you will consider my opinion, which is shared by many of my colleagues, friends and family.

Thank you

Carri-Ann Walker
19 February 2009.
RURAL AFFAIRS AND ENVIRONMENT COMMITTEE

CLIMATE CHANGE (SCOTLAND) BILL

SUBMISSION FROM DR ROBERT B WALKER

The arrogance of Environment Minister, simply beggars belief. He informs us the public want Government to do something about the carrier bag issue and so he invidiously includes powers to deal with such bags in the proposed Climate Change (Scotland) Bill.

The fact of the matter is that already there have been two official consultations on the subject of carrier bags; one received over 1200 individual responses of which over 1100 were specifically against the introduction of a levy or tax on plastic carrier bags. The second stated categorically that the proposal relating to carrier bags (section 59 in the Bill) “only received support from a minority of respondents”

If the Government were to be honest enough to ask the nation, if the introduction of a projected tax of over 600% on a product which was currently given away free was on their personal wish list, they would be told to check in to the nearest mental institution. (Though perhaps on reflection, members of the Government are already sitting in one such!)

This is yet another example of Government choosing to ignore facts in favour of political spin and of aggravating an issue in a manner which will inevitably produce more waste and unwelcome greenhouse gas emissions - contrary to the Kyoto Protocol, The Bali Agreement, the Posnam accord and subsequent EU requirements on reducing carbon dioxide emissions. The less than honest approach and provisions of section 59 in this Bill are grossly irresponsible.

This measure will increase carbon dioxide emissions, increase methane emissions, increase tonnage of waste, increase landfill requirements and increase transport requirements from 76,000 pallets per year running around Scotland to 639,000 pallets running around Scotland.

Section 59 has no place within the Climate Change (Scotland) Bill. This section 59 in the proposed Bill should be eliminated in its entirety. Please register my objection accordingly.

Dr Robert B Walker
24 February 2009
Please register my objection to the section in this Bill (Section 59) which gives power to the Scottish Ministers to introduce charges for carrier bags.

We in Scotland have already seen this plea for legislation rejected by Parliament and spent time and taxpayers money doing so.

Lightweight carrier bags are being touted as “single use” by our Environment minister Richard Lochhead. If they are, then more fool him for not reusing them as most of the public already do. Even his own DEFRA colleagues acknowledge that 80% are reused at least once.

What drivel emanates from Government — pray tell us uneducated masses when was the last time the imposition of a tax educated anyone on a specific policy other than to educate them that their Government is grasping at straws.

Pray tell the world, who is it that wants more taxes which will result in damage to the environment on already stretched incomes, when we are being advised we should be trying to help the environment?

P Walker
26 February 2009
I wish it to be recorded that I object in the strongest possible terms to the inclusion of Carrier Bags within the proposed Climate Change (Scotland) Bill.

It was clearly stated by the previous Environmental and Rural Development Committee (ERDC) that the environmental objectives in introducing a charge could not be met and to proceed with the inclusion of such a proposal in the Climate Change (Scotland) Bill without any further robust evidence is a condemnation of the scrutiny and conclusions reached by the ERDC.

It has already been proven, categorically, that the introduction of such a proposed charge will see a substantial increase in the waste findings in Scotland and in doing so will see the Scottish Government incur the most severe penalties under EU agreements. Those penalties will run into millions of pounds which will ultimately have to be met by the Scottish taxpayer.

Christine Walker
February 2009
Executive Summary
WRAP Scotland welcomes the opportunity to respond to the *Climate Change (Scotland) Bill*, launched by the Scottish Government.

In summary, our three key points are as follows:

- WRAP Scotland welcomes the introduction of a section dedicated to waste management in the *Climate Change (Scotland) Bill*. We applaud the decision of the Scottish Government to link resource efficiency and waste management with the climate change agenda.

- We would like to take this opportunity to refer back to the previous consultation responses that WRAP Scotland submitted to the Scottish Government, which can be found in the annex to this response.

- We would like to highlight that the Scottish Government might need to introduce legislation in order to ensure the creation and smooth implementation of the enforcement authority in charge of monitoring the deposit and return scheme, as stated in paragraph 58(7)(i) of the *Climate Change (Scotland) Bill*. 

Introduction to WRAP & WRAP Scotland

1. WRAP (the Waste & Resources Action Programme) is a not-for-profit UK company providing recycling and resource efficiency programmes for Defra, the Scottish Government, the Welsh Assembly and the Northern Ireland Assembly. The organisation was formed in 2000 to implement a number of the actions set out in the Government White Paper *Waste Strategy 2000*. 

2. WRAP works in partnership to encourage and enable businesses and consumers to be more efficient in their use of materials, and to recycle more things more often. This helps to divert waste from landfill, reduce carbon emissions and improve our environment.

3. Since its creation, WRAP’s work has contributed to reductions in greenhouse gases (CO2, but also methane), by decreasing the amount of waste going to landfill, promoting recycling, creating markets for recycled materials and encouraging waste minimisation.

---

4. Consistent with the adoption of the Zero Waste Policy by the Scottish Government, WRAP has established a specific WRAP Scotland team to lead and develop dedicated programmes in Scotland to support the Government, local authorities, businesses and community sector in the delivery of increased waste prevention, recycling, reuse and composting infrastructure and services.

5. This consultation is, therefore, highly relevant to our work.

GENERAL COMMENTS ON THE CONSULTATION

6. WRAP Scotland welcomes the introduction of a section dedicated to waste management in the Climate Change (Scotland) Bill. We applaud the decision of the Scottish Government to link resource efficiency and waste management with the climate change agenda.

7. We would like to take this opportunity to refer back to the previous consultation responses that WRAP Scotland submitted to the Scottish Government, which can be found in the annex to this response.

9. We believe that this previous response gives a comprehensive picture of WRAP Scotland’s position on the management of waste in Scotland in respect to the areas highlighted in the proposed Climate Change (Scotland) Bill.

10. WRAP Scotland would like to confirm that any proposed Scottish deposit and return scheme, as outlined in paragraph 58(2)(b), will return the full deposit to the customer. To our knowledge there are a number of schemes around the world which only a proportion of the deposit is returned to the consumer thus allowing income to be generated to cover the costs of administering the scheme.

11. Finally, we would like to highlight that the Scottish Government might need to introduce legislation in order to ensure the creation and smooth implementation of the enforcement authority in charge of monitoring the deposit and return scheme, as stated in paragraph 58(7)(i) of the Climate Change (Scotland) Bill.

CONSULTATION ON PROPOSALS FOR A SCOTTISH CLIMATE CHANGE BILL:
A CONSULTATION DOCUMENT

Response from WRAP
(Waste and Resources Action Programme)

Executive Summary
WRAP welcomes the opportunity to respond to the Consultation on Proposals for a Scottish Climate Change Bill, launched on 29 January 2008 by the Scottish Government.

Our response focuses on the environmental benefits of recycling and waste minimisation activities, and suggests that these should be considered as important elements of the response to the challenge of climate change.

Introduction to WRAP

1. WRAP (the Waste & Resources Action Programme) is a not-for-profit UK company providing recycling and resource efficiency programmes for Defra, the Scottish Government, the Welsh Assembly and the Northern Ireland Assembly. The organisation was formed in 2000 to implement a number of the actions set out in the Government White Paper Waste Strategy 2000.

2. WRAP works in partnership to encourage and enable businesses and consumers to be more efficient in their use of materials, and to recycle more things more often. This helps to divert waste from landfill, reduce carbon emissions and improve our environment.

3. In particular, WRAP Scotland supports the Zero Waste Agenda of the Scottish Government to create a zero-waste, resource-efficient society. To achieve this, WRAP is working in collaboration with several Scottish delivery bodies.

4. Since its creation, WRAP’s work has contributed to reductions in greenhouse gases (CO₂, but also methane), by decreasing the amount of waste (and, in particular, biodegradable waste) going to landfill, promoting recycling, creating markets for recycled materials and encouraging waste minimisation. WRAP is in the process of setting up CO₂ reduction targets for

---

each of our programmes, to start from June 2008, when our next Business Plan comes into operation.

5. This consultation is, therefore, highly relevant to our work.

**General Comments**

6. WRAP welcomes the creation of a Scottish Climate Change Bill as a key commitment from the Scottish Government to tackling the effects of climate change. Also, we applaud the challenging targets proposed, and the Scottish Government’s commitment to creating and enabling new means of reducing emissions.

7. We note that the Scottish Government intends to review the National Waste Plan, as well as to consult separately on legislative measures to include in the Scottish Climate Change Bill. However, we would like to take this opportunity to comment on the measures identified in the Scottish Climate Change Bill.

8. The draft Scottish Climate Change Bill focuses greatly on energy efficiency as the main method of cutting CO\textsubscript{2} emissions. However, we believe that there should also be a strong focus on having a sustainable waste strategy in place, as well as resource efficiency and sustainable consumption, and production policies and measures.

9. To illustrate how important is to have a good waste strategy, it is worth noting that, according to WRAP and Defra calculations, current levels of recycling in the UK save more than 18 million tonnes of CO\textsubscript{2} a year through avoided primary material production – equivalent to the annual use of five million cars, or 14\% of UK transport sector emissions\textsuperscript{3}. In the case of Scotland, municipal waste recycling saved 1.2 million tonnes of CO\textsubscript{2}\textsuperscript{4}, which is equivalent to taking 395 000 cars off the road for one year in Scotland, or 18\% of cars in Scotland.

10. Regarding resource efficiency, over-consumption will result in higher-than-necessary greenhouse gas emissions, regardless of the efficiency of production and transportation. Therefore, an effective climate change strategy needs to address resource efficiency and demand measures, as well as supply efficiency measures.

11. A range of new and existing techniques can be used to address non-energy and non-CO\textsubscript{2} greenhouse gas emissions. In particular, measures to improve resource efficiency can have a high impact on CO\textsubscript{2} and non-CO\textsubscript{2} emissions savings. We have highlighted three of these below:

- Waste minimisation
- Recycling; and
- Food waste minimisation.

---

Waste minimisation

12. The top rung of the waste hierarchy is waste minimisation or waste reduction, where actions are taken to stop waste from arising in the first place. Actions during a product’s life cycle can result in greenhouse gas emissions at the point of extraction, processing, transportation, manufacture, use and disposal. If a product is used only once or is used inefficiently, the energy and greenhouse gas emissions from the preceding and following steps will be sub-optimal.

13. Given that, on average, one tonne of finished product requires the extraction from the ground of around ten tonnes of material\(^5\), the material savings to be made through waste minimisation are obvious. However, what is perhaps less obvious is the embedded energy associated with finished products – in other words, the energy it took to produce them – and the potential that waste minimisation has to save this embedded energy.

14. As an example, the manufacture of one tonne of primary aluminium requires 55 gigajoules (15,400 kilowatt hours) of energy\(^6\). Now if, through waste minimisation activities (such as eco-design), the lifetime of an aluminium product could be doubled, this would cut the waste of embedded energy by 50% over the lifetime of the new, longer-life product.

15. The sustainable design and use of products can provide significant benefits across all sectors of society. The manner and rate of resource consumption can be addressed through Government initiatives (e.g. the phasing-out of conventional light bulbs), legislation and taxation policies.

16. WRAP has worked with 112 local authorities in England and Scotland to provide over 1.6 million home composting bins since 2004. As a result, more than one-third of English and Scottish households are now composting at home, thanks in part to WRAP support. And each person who composts at home saves not only the embedded energy in the compost they would have otherwise had to buy commercially, but also avoids the emissions of methane (a greenhouse gas 23 times more powerful than CO\(_2\)) that their organic waste would have generated in a landfill site.

Recycling

17. In May 2006, WRAP published *Environmental Benefits of Recycling*\(^7\), a specialist review of international studies which shows how increased recycling is helping to tackle climate change. The report shows that in the vast majority

---

\(^5\) See, for example, The Strategy for Sustainable Farming and Food: Facing the Future (Defra, 2002), page 11 (in relation to food production).

of cases, the recycling of materials has greater environmental benefits than incineration or landfill.

18. As mentioned in paragraph 9, the current recycling figures for Scotland are equivalent to taking 18% of cars off the road in Scotland. In the case of the UK, the current rates of recycling these materials saves 18 million tonnes of CO₂-equivalent greenhouse gases per year⁸, which equates to taking 5 million cars off UK roads⁹.

19. The message of this 2006 study is unequivocal. Recycling is good for the environment, saves energy, reduces raw material extraction and combats climate change. It has a vital role to play as waste and resource strategies are reviewed to meet the challenges posed by European Directives, as well as in moving the UK towards more sustainable patterns of consumption and production, and in combating climate change by reducing greenhouse gas emissions.

20. As recycling rates increase, the CO₂ savings will also increase as a result. According to a recent Defra report, every UK household could reduce CO₂ emissions by 540 kg per annum through increased recycling¹⁰. WRAP’s work on increasing the number of committed recyclers should help households to move towards this target.

Food Waste Minimisation

21. Savings can also come from avoided food waste, reduced energy consumption and reduced demand for raw materials. These savings are typically higher than recovering energy through incineration or other means, as they conserve the embedded energy (and greenhouse gases) represented by the materials.

22. Regarding food waste, WRAP estimates that the 6.7 million tonnes of food waste produced by householders in the UK every year is responsible for 30 million tonnes of CO₂ equivalent over its life¹¹. Even assuming that half of this food waste is inedible (e.g. bones), the potential exists to avoid 15 million tonnes of CO₂ equivalent.

23. In Scotland, WRAP’s internal research¹² estimates that around 650,000 tonnes of food waste are produced by Scottish households every year. This is the equivalent of 2.9 million tonnes of CO₂ emissions a year.

---

¹⁰ DEFRA (2008) A Framework For Pro-environmental Behaviours

¹² WRAP estimate based on 19% food waste calculated for England.
WRAP’s Love Food Hate Waste campaign\(^{13}\) highlights the environmental costs of the food wasted in Scotland.

24. Reducing this wastage, as well as food wasted in commerce and industry, can have a significant impact on emissions of nitrous oxides and methane, the two main greenhouse gases other than CO\(_2\).

25. Eunomia’s report *Dealing with Food Waste in the UK*\(^{14}\) stresses that the best environmental option is to have a separate collection of food waste coupled with anaerobic digestion. As well as producing energy, this option contributes to reducing the tonnes of waste that go to landfill.

**Conclusion**

26. There is a danger that when discussing how to tackle climate change, the most obvious areas, such as energy efficiency measures, become the focus of the discussion.

27. Resource efficiency measures can also contribute directly to the mitigation of the UK’s greenhouse gas emissions. Research has shown that activities such as recycling, reduction of food waste and waste minimisation have a clear and direct impact on the total emission of CO\(_2\), methane and other gases that contribute to climate change.

28. We would therefore urge the Scottish Government to ensure that the Scottish Climate Change Bill’s remit is wide enough to consider the wider resource efficiency and sustainable consumption and production agendas in taking its work forwards.

CONSULTATION ON POTENTIAL LEGISLATIVE MEASURES TO IMPLEMENT ZERO WASTE

Response from WRAP

(Waste and Resources Action Programme)

Executive Summary
WRAP welcomes the opportunity to respond to the Consultation Paper on Potential Legislative Measures to Implement Zero Waste, launched on 25 July 2008 by the Scottish Government.

In summary, our three key points are as follows:

- WRAP welcomes the efforts that the Scottish Government is making to move towards a Zero Waste society and to implement the necessary measures to achieve this goal.

- WRAP operates at the top end of the waste hierarchy, which gives priority to reducing waste at source, reusing products and recycling materials.

- WRAP believes that the decision to introduce legislation in the seven areas highlighted is for the Scottish Government to decide. However, WRAP strongly encourages making every single effort to reduce the waste our societies produce, recycle as much as possible and minimise our greenhouse gas emissions.

Introduction to WRAP

29. WRAP (the Waste & Resources Action Programme) is a not-for-profit UK company providing recycling and resource efficiency programmes for Defra, the Scottish Government, the Welsh Assembly and the Northern Ireland Assembly. The organisation was formed in 2000 to implement a number of the actions set out in the Government White Paper Waste Strategy 2000\(^\text{15}\).

30. WRAP works in partnership to encourage and enable businesses and consumers to be more efficient in their use of materials, and to recycle more things more often. This helps to divert waste from landfill, reduce carbon emissions and improve our environment.

31. In particular, WRAP Scotland supports the Zero Waste Agenda of the Scottish Government to create a zero-waste, resource-efficient society. To achieve this, WRAP is working in collaboration with several Scottish delivery bodies.

32. WRAP operates at the top end of the waste hierarchy, which gives
priority to reducing waste at source, reusing products and recycling materials.
One of the major programmes within our current business plan aims to
address waste reduction issues as they arise in the food sector. WRAP
introduced the Courtauld Commitment in July 2005 as a means of securing
the commitment of major retailers to concrete actions to address packaging
waste reduction.

33. Since its creation, WRAP’s work has contributed to reductions in
greenhouse gases (CO₂, but also methane), by decreasing the amount of
waste going to landfill, promoting recycling, creating markets for recycled
materials and encouraging waste minimisation.

34. This consultation is, therefore, highly relevant to our work.

General Comments

35. WRAP welcomes the efforts that the Scottish Government is making to
move towards a Zero Waste society and to implement the necessary
measures to achieve this goal. We applaud the challenging measures
proposed as a key commitment from the Scottish Government to tackling
some of the causes of climate change.

36. WRAP notes that a Zero Waste society does not only emphasise the
reduction of the use and consumption of resources. Actions during a product’s
life cycle can result in greenhouse gas emissions at the points of extraction,
processing, transportation, manufacture, use and disposal. If a product is
used only once or is used inefficiently, the energy and greenhouse gas
emissions from the preceding and following steps will be sub-optimal.

37. Given that, on average, one tonne of finished product requires the
extraction from the ground of around ten tonnes of material\(^{16}\), the material
savings to be made through waste minimisation are obvious. However, what
is perhaps less obvious is the embedded energy associated with finished
products – in other words, the energy it took to produce them – and the
potential that waste minimisation has to save this embedded energy.

38. As an example, the manufacture of one tonne of primary aluminium
requires 55 gigajoules (15,400 kilowatt hours) of energy\(^{17}\). Now if, through
waste minimisation activities (such as eco-design), the lifetime of an
aluminium product could be doubled, this would cut the waste of embedded
energy by 50% over the lifetime of the new, longer-life product.

economic dimensions. Policy Studies Institute, London and Centre for Environmental Strategy,
University of Surrey, available from:
PROPOSAL 1: Duties on Public Bodies and Business to Provide Recycling Facilities

Question 1.1 Do you consider that legislation should be made in this area?

39. WRAP believes that the decision to introduce legislation in this area is for the Scottish Government to decide. However, WRAP strongly encourages small and large businesses to have recycling schemes and to have separate materials collections on their premises, since it has been proven to have many benefits, not only for the environment, but also for the reputation of the businesses.

40. WRAP’s *SME Recycling Feasibility Trials Evaluation Report* concluded that 97% of those who work for an employer that started a recycling scheme on its premises are satisfied with the scheme mainly because it is easy to maintain and implement. Additionally, over a third of businesses involved said recycling had improved their reputation within the local community. Furthermore, recycling was perceived as a cost-effective method of dealing with the business waste, simply because it was often cheaper when compared with general waste disposal. In many cases, businesses were able to save money on services like paper recycling. Finally, 36% explained that another benefit of recycling at work was the general feel good factor from doing something useful and worthwhile.

1.2. If so, what form should that legislation take?

41. WRAP has no views on this issue.

PROPOSAL 2: Packaging

2. 1. Do you consider that legislation should be made in this area?

42. WRAP has no opinion on the need to introduce legislation in the field of packaging in order to encourage packaging waste prevention. However, WRAP has played a major role in introducing the Courtauld Commitment, a voluntary agreement between WRAP and major UK grocery organisations, aimed at working towards creating less packaging. The Courtauld Commitment is a powerful vehicle for change, and in 2008, has led to zero growth in packaging despite increases in sales and population.

43. As regards packaging, we believe that there are significant opportunities to promote the use of packaging technology as a means of achieving further packaging reduction whilst, at the same time, helping the public to consume more of the food that they buy, thus wasting less of it.

---

http://www.wrap.org.uk/downloads/SME002_-_final_evaluation_report_-_web_version_-_11_03_08.603a0c3d.5154.pdf
2. 2. If so, what form should that legislation take?

44. WRAP has no views on this issue.

**PROPOSAL 3: Specifying Recyclate**

3. 1. Do you consider that legislation should be made in this area?

45. WRAP supports any scheme that provides reliable and up-to-date information to the consumer, so that he or she is empowered to make informed decisions. Consequently, WRAP would welcome the proposals to require the specification of a minimum percentage of recyclate material.

46. WRAP is currently working, under the auspices of the Courtauld Commitment, in order to develop consistent labelling that informs consumers how widely packaging items are recycled.

3. 2. If so, what form should that legislation take?

47. WRAP has no views on this issue.

**PROPOSAL 4: Waste Prevention Plans**

4. 1. Do you consider that legislation should be made in this area?

48. WRAP strongly believes in working on the top of the waste hierarchy, waste minimisation or waste reduction, where actions are taken to stop waste from arising in the first place. Consequently, WRAP welcomes any waste reduction measures that implement changes in the way our society creates waste.

49. For example, the sustainable design and use of products can provide significant benefits across all sectors of society. The manner and rate of resource consumption can be addressed through Government initiatives (e.g. the phasing-out of conventional light bulbs), legislation and taxation policies.

50. However, we consider that it is for the Scottish Government to decide whether making legislation is the most effective way to achieve the desired outcomes.

4. 2. If so, what form should that legislation take?

51. WRAP has no views on this issue.

4. 3. What public bodies and businesses should be covered?

52. WRAP has no views on this issue.
PROPOSAL 5: Deposit and Return

5. 1. Do you consider that legislation should be made in this area?

53. WRAP believes that it is for the Scottish Government to decide. WRAP’s\(^{19}\) report on refillable packaging and refill systems concludes that such systems have the potential to:
   - Divert a significant quantity of discarded packaging from landfill each year;
   - Provide significant savings for the retailer; and
   - Provide added value to the customer.

54. Refills are well established in the UK for stationery products such as pens, ink cartridges and toners. Some household cleaners and laundry products are also available in refills.

55. However, there is a significant opportunity to expand the refill product range in the UK, provided that social attitudes can be changed with good point-of-sale literature/advertising. Many food and non-food products in the UK could utilise a refill system if suitable pack technologies were available.

5. 2. If so, what form should that legislation take?

56. WRAP has no views on this issue.

5. 3. Your views on the practicalities of such schemes in Scotland?

57. WRAP has no views on this issue.

PROPOSAL 6: Mandatory Waste Data Returns from Business

6. 1. Do you consider that legislation should be made in this area?

58. The availability of detailed data would be welcomed, but we believe that it is for the Scottish Government to decide.

6. 2. If so, what form should that legislation take?

59. WRAP has no views on this issue.

6. 3. Do you have any views on the kind of businesses to be covered?

60. WRAP has no views on this issue.

PROPOSAL 7: Other Measures to Encourage Waste Prevention, Including Action on Single-Use Carrier Bags

7.1. Do you consider that legislation should be made in this area?

61. WRAP believes that there are many measures that can be introduced to encourage waste prevention. For example, promote the repair of electronic equipment or support the use of reusable nappies.

62. Regarding carrier bags, we believe that it is for the Scottish Government to decide if legislation should be introduced. WRAP would like to see a substantial reduction in the environmental impact of free single-use carrier bags. Recent developments show that there is now clear momentum from retailers, although more clearly work needs to be done.

63. In February 2007, WRAP, the UK Governments and 21 of the UK’s leading high-street and grocery retailers\(^{20}\) reached an agreement to reduce the environmental impact of carrier bags by 25% by the end of 2008.

64. One year on, interim results indicate a 14% reduction in the environmental impact of carrier bags as measured by the use of virgin plastic. The total number of bags used by the signatories was reduced by one billion bags from 13.4 billion to 12.4 billion. However, performance had been very variable, with retailers reporting activity ranging from a 70% reduction in virgin plastic use to an increase of 22% in one case\(^ {21}\).

65. The carrier bag agreement between retailers and Government highlights valuable examples of ways forward, such as the maximum amount of reuse for carrier bags, the widespread adoption of bags for life and the use of recycled content in bags.

7.2. If so, which areas should these powers cover?

66. WRAP has no views on this issue.

7.3. Are there any other areas, not covered by this consultation, where legislation could be made to increase recycling and promote waste prevention?

[http://www.wrap.org.uk/retail/about_us/carrier_bags.html](http://www.wrap.org.uk/retail/about_us/carrier_bags.html)

WRAP (2008) Carrier Bag Statement

67. There are many areas where more could be done. WRAP would be happy to support the Scottish Government with any measure that is taken forward.

WRAP
9 October 2008
I am astonished to find that the question of charging for carrier bags is being brought before Parliament, now for the third time in as many years.

Firstly The Environmental Levy on Plastic bags (Scotland) Bill was rejected after 2 years and much of my money being spent on it, resulting in thankfully the Committee investigating it rejecting it as it would have produced more waste had it proceeded.

Secondly the proposer again reintroduced his Bill last year only to have a flea put in his ear by Parliamentary colleagues who denounced him as being “arrogant” as he attempted again to introduce the same Bill which had been rejected.

Now, for the third time it rears its head, not in quite the same format, but under section 59 of the subject proposed Bill.

The lead Committee in this Bill is the Transport, Infrastructure and Climate Change (TICC) committee who are charged with examining and reporting upon it.

Transport — This section 59 will produce the equivalent in Scotland of a minimum of 560,000 EXTRA pallet journeys annually thundering around the country. How many extra lorries will be used for this?

Infrastructure— Implementation of Section 59 will produce more damage to roads, more urban and countryside congestion, more carcinogenic exhaust fumes, waste thousands of extra tonnes of fuel, produce more road kill and stress as a direct result.

Climate Change — Increase in heat generated by extra transport, increase in carbon dioxide from landfill from the extra waste generated from bulkier and heavier alternative products, increase in methane emissions from landfill when the products eventually degrade.

What part of “this measure in this Bill will produce and has been proven to produce more waste, more carbon dioxide emissions and more methane emissions” don’t you understand? All of these consequences will inevitably lead to increasing Climate Change and accordingly this section 59 should be removed from this Bill without any further waste of taxpayers money being spent on what has already been rejected by Parliament.

Ailsa Young
23 February 2009
I wish to specifically request that the powers requested under Section 59, allowing charges to be made now and at any time in the future for carrier bags of whatever shape or size, is clearly an abuse of the power of democracy. Were this section be allowed to pass into law, then the democratic process would have no further say in this matter and charges could be introduced overnight.

There are jobs at stake in Scotland here, around 500 people were estimated to depend on the manufacture, import, storage, and distribution of just plastic bags so the figure for all types of bags must be considerably higher.

This matter has already been discussed over two years (2004-06) by the Scottish Government at great expense to the taxpayer and found to be inconsistent with improving the Environment. More waste was agreed by the Government to be produced, more greenhouse gas emissions and more transport required to carry the heavier bulkier and more environmentally UNFRIENDLY products around our country.

Section 59 of the proposed Bill simple has no place in the proposed Bill which, I presume, is intended to improve the effect of Climate Change. This section has a negative effect and should be discarded completely.

James Nairn Young.
23 February 2009
RURAL AFFAIRS AND ENVIRONMNT COMMITTEE

CLIMATE CHANGE (SCOTLAND) BILL

SUBMISSION FROM ABERDEENSHIRE COUNCIL

Question 1:
What are your views on allowing the Forestry Commissioners to enter into joint ventures, with the intention of participating in renewable energy programmes on the national forest estate?

Aberdeenshire Council Response:

- We are in agreement with this proposal. As the largest landowners in Scotland, Forestry Commission Scotland (FCS) has a significant opportunity to undertake renewable energy projects which can help to tackle climate change. In order to benefit fully from these potential renewable energy projects, FCS should be able to enter into joint ventures.

- We are of the opinion that forestry should remain the main land use on FCS land and that any joint ventures entered into should be sensitive to the existing land use. Opportunities for joint ventures into biomass energy projects should be encouraged.

- Income generated from joint ventures should be ring fenced to fund woodland expansion in order to meet the Scottish Forestry Strategy target of 25% woodland cover in Scotland by the second half of this century.

Question 2:
What are your views on allowing Scottish Ministers and Forestry Commissioners to offer leases and cutting rights over parts of the national forest estate?

Aberdeenshire Council Response:

The national forest estate is a valuable resource for the people of Scotland and it is imperative that it remains as such, regardless of who holds the lease for the land. We would wish the following points to be noted:

- Any lease of land in the national forest estate should ensure the land continues to be managed for forestry and retained as such and does not automatically open the forest up for other development opportunities.

- It is understood the desire is to see up to 25% of the national forest estate leased to one single entity in a long lease of up to 75 years. Leasing should be through an open tendering process. It may be advantageous to
consider splitting the leased forest block into two lots in order to encourage competitive tenders from indigenous bidders.

- The lease agreement should incorporate break points to enable regular review throughout the tenure. Ideally, an up-front lump sum payment should be secured in exchange for cutting rights, particularly in these times of corporate financial uncertainty, but consideration could be given to bids from bona fide indigenous applicants offering staged payment terms linked to actual harvesting activity.

- In order to meet climate change objectives, it is extremely important that income generated from leasing of sections of the national forest estate should be ring-fenced for forestry, particularly for woodland expansion.

- We welcome the portfolio analysis carried out to date by FCS to help identify suitable forests for leasing and are assured that this analysis has objectively identified the most appropriate 25% of the national forest estate for leasing which is commercially productive and therefore attractive to investors but with only limited public benefits. The package of national forest estate properties offered should however incorporate some smaller, more remote and less productive woods to avoid FE being left with a multiplicity of rump fragments which are very expensive to manage.

- There is a need to consider the impact of the proposals upon indigenous timber buyers and processors who have made significant and recent investment in new mills in areas likely to be affected and who are already suffering from reduced demand due to the significant reduction in house-building. It will be necessary to ensure timber from leased forests will continue to be offered on the open market (for at least 20 years) as supplies from local rump fragments will be inadequate to maintain the viability of the local timber processing industry. Open tendering should also maximise sales value for the successful lessors. It is important to point out that it may be necessary to accept a lower offer for the leased forest estate in order to safeguard the indigenous processing industry as it would be disastrous to accept a higher offer from a power company looking for co-firing supplies.

- It is essential that the very best improved genotype planting stock is used so that timber produced can compete with imported material. This should be a condition of any lease(s).

- The FCS has made significant advances in recent years in managing their forests for biodiversity and public access to meet the objectives of the Scottish Forestry Strategy and in adherence to the UK Forest Standard. It is extremely important that these achievements are maintained and that proactive management is continued. We welcome the assurance that the lease holder will be subject to the same duties as FCS in respect of the Land Reform (Scotland) Act and the Nature Conservation (Scotland) Act.
The identity of potential leasers will attract wide publicity. It will essential to ensure that the successful bidder is completely reputable and able to demonstrate their credentials in delivering forest management to the highest environmental standards and in community relations and partnership working.

Large sections of the national forest estate are extremely well used by the public for formal and informal recreation. While the Land Reform (Scotland) Act provides a right of responsible access which would ensure access continued regardless of how the land was leased, there is a public perception that land leased off would result in the forest being closed to the public. We support the use of the portfolio analysis in identifying areas of forest for leasing as those where the public benefits are at the lowest, however notwithstanding that we welcome the assurance that the forest would still be able to host a multiplicity of uses.

The importance of community acquisition of land through the National Forest Land Scheme should not be overlooked and it is important that proposed leasing arrangements do not jeopardise opportunities for this. Although it is unlikely that there will be a community interest in the areas of land selected as suitable for leasing, it is important that local communities are given an opportunity to identify their interest in any small sections of forest prior to the area being leased.

Question 3:
What are your views on (i) transferring the proceeds from leases and cutting rights to a not-for-profit trust, for investment in woodland creation; (ii) transferring the landlord’s interest in this land to a not-for-profit trust (iii) Minister’s stipulating the constitution of such a not-for-profit trust.

Aberdeenshire Council Response:

i. The proceeds from leases and cutting rights should be ring-fenced for forest expansion in order to meet the target of 25% forest cover in Scotland by 2050. We agree that transfer of the proceeds from the lease(s) to a not-for-profit trust, for investment in woodland creation would be the best option. Every opportunity should be taken to maximise the value of the trust including consideration of charitable status.

ii. We are concerned about the public accountability of a membership led voluntary body being responsible for a national body’s landlord interest. We are of the opinion that this would not be necessary.

iii. For the sake of public accountability, we are in agreement with this proposal. Any such trust must be properly constituted with balanced representation.
Question 4:
Are there other actions which need to be taken, or are there other changes in legislation which need to be made, in order to allow the public and private forestry sector to contribute to Scotland's target of reducing emissions by 80% by 2050? If so, please outline what these are.

Aberdeenshire Council Response:

- **Woodland expansion**
  The current grant scheme is not attracting sufficient interest to meet the targets of new planting, however we acknowledge the current review of the SRDP and await the outcomes of that. Flexible incentives such as regional challenge funds and/or locational premiums should be considered. There is a real need for continuity of grant schemes which ensure stability and allow for familiarisation and confidence in the process.

- **Greater support for nursery and maintenance sectors**
  There is great potential to boost the indigenous forest industry and drive economic benefit across the whole of Scotland by encouraging the forestry sector (both private and public) to contribute to Scotland’s target of reducing emissions by 80% by 2050. However, support is needed for many sectors of the industry.
  
  There are limited resources within both the indigenous forest nursery sector and establishment contractors to respond to potential increase in demand after years of decline. Nurseries are unwilling to grow plants speculatively, there is a long lead time for production and they are very sensitive to changes in planting programme timetables. There will be a need for the trust to award growing contracts for planting stock.
  
  There is considerable scope for improvement in productivity of forests through quicker restocking after harvesting. Increased use of local contractors would be welcomed and immediate replanting of sites following timber harvesting would result in higher levels of activity, employment and carbon sequestration.

- **Carbon Off-Setting**
  The opportunities arising from carbon offset money should be captured and utilised with Scotland. Currently much of the money from major industrial corporations operating within Scotland is going elsewhere (although credit is due for the Scottish Forest Alliance scheme). A properly accredited and audited scheme requires to be established.

- **Biomass Incentives**
  Biomass energy projects should be given increased incentives as they represent an excellent renewable energy resource specifically linked to the forest industry. Incentives should be given to projects which seek to add value, which use the best stock and increase thinnings for biomass.

- **Partnership Working**
In seeking to find the best ways of creating new woodland, all opportunities for partnership working should be considered. Partnerships of private/public/trust bodies should be welcomed depending on what will attract the greatest benefit in each specific situation.

Aberdeenshire Council
27 February 2009
Summary
Scotland has some of the finest open and historic landscapes in Europe. These are important both to local communities and tourists from around the world. The forestry provisions of the Climate Change Bill are based on the assumption that expanding woodland cover is one of the most effective ways of combating climate change. Archaeology Scotland believes the environmental and economic cost of altering our open rural landscapes has not been properly considered.

Scotland is important internationally for its moorland habitats, open vistas and extensive archaeological & historic landscapes. It is these landscapes that are most at risk from new plantations with ploughing or mounding corrugating the landscape, inhibiting access and destroying the habitats and archaeological landscapes that have been forming since the last ice age. These landscapes attract visitors from outside the country and support our tourist industry. Increasing woodland cover in Scotland will remove carbon from the atmosphere within the 30-year plantation cycle, but this must be balanced with other interests in the countryside, whether the production of food or the retention of our open and iconic historic landscapes. The latter have been formed over thousands of years, both in response to previous climate change and human actions. Archaeology Scotland believes that the inclusion of forestry provisions within the climate change bill are based on the proposal to increase Scotland’s woodland cover to 25% by 2050 at a rate of 10,000 hectares of new planting per annum. This was only an aspiration in the Scottish Forest Strategy and now appears to have become a target. Extra funding is now being sought through challenge funds to increase the rate of planting to achieve this. While it is natural for the forest industry to argue for increased funding for this sector, Archaeology Scotland would question whether this is necessarily the best use of government funding in response to climate change. Proposals to expand woodland cover should form part of a much wider debate on rural landuse and its social and economic value to the Scottish people.

1. Do you envisage that the Forestry Commission could play a greater role than it does at present in reducing greenhouse gas emissions or in alleviating or responding to the effects of climate change? If so, what suggestions would you make?

Forestry Commission Scotland does excellent work at present on promoting responses to Climate Change both in supporting community responses and industrial level activities. If the attitudes developed within FCS were more prevalent across rural Scotland, behaviour change in response to climate change would be more extensive. Of course FCS could spend extra funding...
on climate change responses but this has to be balanced with spending in other sectors.

2. Do you consider that either of the Government's consultation proposals (on entering into joint ventures and on leasing cutting rights) would enhance the Forestry Commission's role in dealing with greenhouse gas emissions and climate change?

Archaeology Scotland is not convinced that the proposal to lease cutting rights will necessarily increase FCS’s role in responding to climate change. The business case for this has not been made and it is unclear what the impacts of such activity would be.

3. Do you envisage any implications for nature conservation, biodiversity or recreational interests from the two proposals and, if so, what are they?

Archaeology Scotland is concerned that the excellent work that FCS currently carry out in support of environmental protection and social activities within the national estate would be at risk if the income from the leased land was earmarked exclusively for climate change activities. We would include in this category landscape and the historic environment, as too often biodiversity is used a short hand for the environment when a much wider definition should be used. FCS is the largest manager of Scheduled Ancient Monuments in Scotland, having responsibility for 328 Scheduled Ancient Monuments, 30 Listed Buildings, 16 Designed Landscapes and 8,000 unscheduled sites. FCS agreements to manage positively the monuments in its care would be put at risk by this proposal, as it remains unclear how far FCS commitments to landscape, environment and recreational access would be transferable in practice or how they could be enforced.

4. Do you believe there are any implications for rural employment from the two proposals and, if so, what are they?

Archaeology Scotland believes that there will be reduction in rural employment from the leasing proposal. Commercial companies buying the lease of the proposed woodlands would have to reduce current costs to create a profit and though TUPE agreements may maintain employment in the short term we do not see these as being sustainable in the long term.

5. Do you have any other views on these two proposals from the Government?

As expressed above, Archaeology Scotland believes that a fully-costed business case with a comprehensive Strategic Environmental Assessment should have been carried out before inserting these proposals into the Climate Change Bill. The Scottish Government should produce an integrated rural land use strategy before committing one sector alone to major structural change. Such a rural strategy must include and evaluate historic environment, tourism, landscape, recreation and community interests as well as farming, forestry and biodiversity concerns.
Precise values on landscape and heritage to local communities, Scotland and the rest of the world are difficult to produce but the following survey shows the relative importance of cultural heritage to the tourist economy of Scotland. **Tourism Scotland Survey 2005**

Provisions for Forestry in the Climate Change (Scotland) Bill

There is concern over the Government's proposal to create long term leases over Forestry Commission land. There are other ways of providing resources for forestry in Scotland, through joint ventures and grant schemes. This has been lacking for the last 2 years. The government's proposals give no security on whether cash from leases would remain with the Commission and in forestry. The proposal would fragment the Forestry Commission and create inflexibility for the future. The Forestry Commission has been and continues to be central to the development of the forest industry in Scotland.

1. Do you envisage that the Forestry Commission could play a greater role than it does at present in reducing greenhouse gas emissions or in alleviating or responding to the effects of climate change? If so, what suggestions would you make?

Answer: Yes

The Forestry Commission given the resources could increase the planting of new productive woodlands and enhance the management of existing ones by themselves and the private sector. Such woodland can be used in construction and the making of other artefacts which use less energy than other building materials and store carbon.

The proposals to plant 10,000ha per annum should be at least two thirds productive species. It should be recognised that new planting has decreased over the last 10 years and that wind farm developments have resulted in significant cutting of woodlands thus reducing our national resources.

2. Do you consider that either of the Government's consultation proposals (on entering into joint ventures and on leasing cutting rights) would enhance the Forestry Commission's role in dealing with greenhouse gas emissions and climate change?

Answer: The joint venture proposals should be supported, always provided that the income remains with the Forestry Commission and is used for forestry and forestry support (planting and management); thus increasing productive woodlands for carbon benefits.

The leasing/cutting rights should not be supported. The removal of 25% of the Forestry Commissions productive woodland (33% of income) would fragment our national forest and would increase the Commission's unit costs and threaten resources for research which benefits the whole forestry sector. There would be significant cost of setting up leases and monitoring them.
75 year leases have been proposed, this is not related to rotation length. Tenants would therefore be required to manage woodlands they had replanted, and would not harvest and wish for extensions or sale. It would in practice be privatisation.

There are proposals that there should be one, or possibly two tenants. Unlike FC, a tenant might 'mothball' potential timber supplies at times of lower prices thus disrupting the supply chain. Such tenants would be unlikely to enter into long term contracts (LTC). Saw millers would then be reluctant to invest. (They are currently regarded as among the most efficient saw millers in Europe). There would also be job losses. None of this would be beneficial for carbon storage.

3. Do you envisage any implications for nature conservation, biodiversity or recreational interests from the two proposals and if so, what are they?

Answer: No, provided the UK forestry standard applies.

4. Do you believe there are any implication for rural employment from the two proposals and, if so, what are they?

Answer: Joint ventures could create new jobs. Land easing proposals would result in the loss of expertise with the loss of jobs in FC. The affect of loss of confidence by the timber industry could result in job losses and a slow down in sawmilling investment.

5. Do you have any other views on these two proposals from the Government?

Answer: Continue to progress joint ventures on the basis that cash realised would remain in the forestry sector (FC and private sector)/

I am happy to discuss these matters in more detail

Jean Balfour
Jan 2009
As a person involved in conservation land management for over 15 years, I would like to submit some comments for your consideration regarding the consultation for proposals involving the public forest estate in the Climate Change (Scotland) Bill;

1. *Do you envisage that the Forestry Commission could play a greater role than it does at present in reducing greenhouse gas emissions or in alleviating or responding to the effects of climate change? If so, what suggestions would you make?*

I believe that the Forestry Commission Scotland (FCS) has a pivotal role to play in leading the forestry sector in helping to mitigate against climate change. The national forest estate is and should continue to be managed in the public's best interests and the challenges of climate change, the long term impacts of which are still unknown, require a long term and considered approach to land management. I believe that the short term aim to release funds to help deliver political targets is not in the best interests of the public, the forests or climate change. This is because the private sector is driven by market forces, which are likely to lead to increased harvesting of timber for economic gain resulting in an increased loss of stored carbon rather than longer rotations that the FCS operate or, may I suggest long term retention of standing timber to help keep carbon locked up. FCS is in a unique position in the forestry sector being able to demonstrate best practice to land managers, be supported in developments by Forest Research and operate the national forest estate with economics, recreation and the environment all treated as a high priority.

At this time, taking the opportunity to review best land management practice in light of climate change should be wide ranging and include conservation of peatlands, restoring them to active bogs and from carbon emitters to carbon sinks again. Consideration should be given to broadleaf planting as well as short term carbon capture in conifers to support wildlife as it responds to climate change and where possible woodlands could be designated for long term retention instead of harvesting.

2. *Do you consider that either of the Government’s consultation proposals (on entering into joint ventures and on leasing cutting rights) would enhance the Forestry Commission’s role in dealing with greenhouse gas emissions and climate change?*

I believe that reviewing the legislation and allowing FCS to enter into joint ventures would be very beneficial to the organisation and to the Scottish Government. The potential income from windfarms on FCS land for example would generate significant additional income that may be invested in
woodland expansion, wider environmental and public benefits and help reduce the FCS operational deficit.

I strongly disagree with the proposal to lease cutting rights, particularly in view of the non-existent information provided by the Scottish Government to support its case. Leasing the most productive areas of the national forest estate will reduce the income generated by FCS to help support its work, is likely to increase the operational deficit if, as we are reassured, the standard and level of recreational and environmental service is to be maintained at current levels and will, I am sure, lead to a reduction in the standards of management of the leased areas. As I mentioned above, with economics being the number one driver in the private sector, thinning and felling rotations are likely to become shorter, reducing the effectiveness of the forest in storing carbon.

There have been moves within FCS in recent years to carry out habitat restoration of peatland habitats and this is very unlikely to take place under the private sector without additional funding in the form of SRDP payments or reductions in the value of the lease agreements. I am concerned that if the private sector were sufficiently motivated to apply for SRDP payments, then the complex and competitive scheme would be even more thinly spread than it currently is.

3. **Do you envisage any implications for nature conservation, biodiversity or recreational interests from the two proposals and, if so, what are they?**

I would envision the potential for positive benefits coming from joint ventures, both from increased income, but also from partnership working with the private sector and local communities.
I would expect a negative impact on nature conservation and management for biodiversity in leased areas under the private sector, because without external funding it is not in their interests to invest time and effort in these measures. I can't comment on the recreational impact in the leased areas as I understand that they would be the more remote and less visited areas, but I would be concerned about the knock on impact to the rest of the national forest estate from the reduction of income from these most productive areas. The loss of SRDP money to these areas to help support work that is currently done in-house by FCS would also result in a negative impact on the environment and rural business in the wider countryside.

4. **Do you believe there are any implications for rural employment from the two proposals and, if so, what are they?**

Rural employment may be increased through partnership working, whether through more FCS staff to facilitate these partnerships, or staff or local contractors on the ground to implement practical projects in the forests. Operationally, FCS varies in its approach across Districts, either harvesting timber themselves and selling at the roadside, or selling timber standing which is then harvested by contractors. I don't know what is the best approach economically or for rural employment.
FCS is not market led like the private sector has to be but, I believe, helps to support aspects of the private sector through difficult times, continuing to harvest timber and sending this to sawmills to help keep the trade going. If the timber price drops below an economic threshold then the private sector have no choice but to stop harvesting, putting the industry at risk.

5. Do you have any other views on these two proposals from the Government?

I would like to suggest that when the SRDP funding is reviewed, that payments for woodland expansion are significantly increased to make landowners and land managers more interested in new planting, e.g. new shelterbelts, small copses, targeted links to improve habitat linkage, etc...Despite significant funding, it would appear to be difficult for FCS to purchase a sufficient number of large areas of land (in the central belt at least) to achieve the targets set by Government in the time scale and is it more likely that far more numerous, but smaller plantings by farmers and landowners would help contribute to the target far more effectively? The Conservancy and bodies such as Central Scotland Forest Trust or The Woodland Trust do have a very significant role in this sort of expansion.

Peatland restoration should be factored in as part of the work to reduce emissions and help to lock up carbon - FCS in Scottish Lowlands have a large raised bog resource which should be restored to active peat bogs.

To expand native woodland in the uplands, a tougher stance on deer control should be developed to reduce deer numbers to allow recolonisation with scrub and woodland.

Careful consideration should be given to the establishment of new woodlands to ensure that a combination of native broadleaved trees as well as quick growing conifer species are utilised to help lock up carbon in both the short and longer term.

Stephen Blow
28 January 2009
ConFor (Confederation of Forest Industries) represents forestry and wood using businesses from nurseries and growers to wood-processing end-users. It has by far the largest membership of any representative body in the sector and works closely with members who own and/or manage the majority of Scotland’s actively managed non-public forests and who process the large majority of wood from those forests.

**Delivering a low carbon economy**

In the context of the current consultation on the Climate Change Bill it is important to recognise that the forestry and wood-using sector is well positioned to help deliver the Bill’s aim of developing a low carbon economy in Scotland. The sector contributes nearly £1 billion a year to Scotland’s economy\(^1\), provides employment for 20,000, in particular in rural areas, and has capacity for growth.

The sector is one of the few in Scotland that can boast that the more it expands the greater carbon benefit it provides.

This benefit is realised through planting trees in the right places, and using wood to substitute for more energy-intensive materials. Unutilised wood or solid wood at the end of its useful life can also be used to generate renewable energy.

In order to inform its response to the consultation ConFor organised a number of meetings for businesses across the sector to be briefed on the consultation and to feed into ConFor’s response. Over 100 people attended, and we have received numerous comments that have been used to inform this paper. We therefore trust that this response will be given due weight when being considered by the Committee.

**Climate Change (Scotland Bill) – proposals on forestry**

1. *Do you envisage that the Forestry Commission could play a greater role than it does at present in reducing greenhouse gas emissions or in alleviating or responding to the effects of climate change? If so, what suggestions would you make?*

   As part of the Scottish forestry and wood-using sector the Forestry Commission (FC) is already playing a valuable role in responding to the challenges of climate change. More can be achieved through a greater focus

\(^1\) cebr report for the Forestry Commission and ConFor (2006)
on partnership activity with the private sector, in part because these businesses can deliver outputs more cost effectively.

As an example, the FC is currently raising £15m a year to deliver 2,000 hectares of planting (£7.5m per 1000 ha). £15m in grants to the private sector would deliver 5,000 ha (£3m per 1000 ha).

The FC should support and help deliver a more coherent approach to climate change mitigation. Current activities by FC focus overwhelmingly on supporting the development of the wood fuel market, and do not do enough to promote the use of wood in construction where the carbon and employment benefits are greater.

The public sector should take a lead in promoting the greater use of wood in construction, in particular through its use in public buildings and publicly-funded house building. The FC should do more to recognise and promote the benefits of a hierarchy of wood use that sees wood fuel make its most appropriate contribution to a low-carbon economy in Scotland.

Through the FC’s role in research, it has the capacity to do more to support silvicultural and tree breeding improvements that will make forestry more profitable and increase its carbon impact, as well as supporting the greater use of wood products.

2. Do you consider that either of the Government’s consultation proposals (on entering into joint ventures and on leasing cutting rights) would enhance the Forestry Commission’s role in dealing with greenhouse gas emissions and climate change?

The FC is already able to undertake renewable energy projects on its land and therefore the big opportunity from both joint ventures and leasing (or an alternative mechanism) would be the opportunity to raise additional money - in the case of leasing by realising, upfront, the value of the estate. This money could be used to deliver increased new planting through the private sector.

It is likely that any forest considered for leasing (or an alternative) would be composed of productive softwoods. While the private sector believes it can manage such forests more efficiently, and against the same standards as the FC, this would make only a minor difference to their role in carbon sequestration.

ConFor would wish to raise one important point regarding renewable energy projects on forest land, in particular wind farms. There is potential for a significant loss of productive forest with consequent negative carbon impacts. ConFor has pressed for action to minimise forest loss and to ensure that compensatory planting takes place.

3. Do you envisage any implications for nature conservation, biodiversity or recreational interests from the two proposals and, if so, what are they?
There may be impacts where a renewable project joint venture results in a loss of forest area. Productive softwoods provide valuable biodiversity benefits that are rarely properly recognised.

If leasing of commercial forests owned by FC was to take place we would expect little or no impact on nature conservation, biodiversity or recreation. It is expected that any areas to be leased would have no significant recreational use such as mountain biking or visitor centres, and that the current level of access would remain as provided for under legislation. The Land Reform Act applies equally to private and publicly owned land.

The leased forests would be productive softwood forests and therefore would be managed in that manner by a lease-holder. The same standards of management would apply – the Government’s UK Forestry Standard, and most likely the independent certification standard UKWAS that the private sector, FC, environmental and access groups all endorse.

Questions have been raised about lost potential to secure new and additional biodiversity benefits from these forests or on the cost to groups, such as car rally organisers, of exceptional use of these forests. It is important to note that the FC does not provide public goods for free. These are paid for by public subsidy to the FC. The private sector, including forestry businesses and organisations such as RSPB and Woodland Trust, is able to provide additional benefits if public subsidy is available.

4. Do you believe there are any implications for rural employment from the two proposals and, if so, what are they?

If the joint venture proposal went ahead and this raised additional funding which could be used in forestry then this will have a positive impact on jobs overall.

Leasing of 100,000 ha, if it was undertaken, would result in some displacement of employment between the public and private sectors.

If, and there are currently no guarantees, money raised from leasing and joint ventures was made available to deliver increased new planting then this would stimulate additional employment – see answer to question 5 below.

5. Do you have any other views on these two proposals from the Government?

The proposal to lease forests contains insufficient information on which to determine its impact on Scotland’s forestry and wood-using businesses. ConFor would wish to reiterate the central message from its response to the consultation, that:

- there is benefit in delivering increased new planting;
- this could be delivered by a variety of mechanisms and requires improvements to the SRDP;
• ConFor is keen to utilise both its and its membership’s expertise in developing a way forward that addresses legitimate concerns raised.

In terms of delivering new planting we would note that good information is available on where and how best to establish new forests to maximise carbon sequestration while securing other economic and environmental benefits. Current sustainable management standards provide a firm basis for Scotland to really begin to achieve a target of 25% forest cover.

ConFor recognises the benefit of delivering this within the context of a broad land-use policy. However, there is land currently available and planting a very small part of this now while developing a policy to guide future activity is vital to help secure jobs in the sector at a time of economic downturn.

Internationally agreed climate change targets focus on 2050. If Scotland planted 15,000 hectares a year with 9,000 ha being productive softwood forests then it would deliver the Government’s target of 25% forest cover by 2050 and provide significant, additional carbon benefits - up to 33.5 MtC.

**TABLE:** Estimated carbon sequestration for additional productive and broadleaf forest under new planting regimes of 10,000 ha/yr and 15,000 ha/yr from 2010 to 2050

<table>
<thead>
<tr>
<th>Planting regime over period 2010-2050 inc.</th>
<th>Productive softwoods</th>
<th>Broadleaves</th>
<th>Total</th>
<th>Total</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>New planting (ha/yr)</td>
<td>Carbon sequestration (MtC)</td>
<td>New planting (ha/yr)</td>
<td>Carbon sequestration (MtC)</td>
</tr>
<tr>
<td>10,000 ha/yr</td>
<td>6000</td>
<td>15.5</td>
<td>4000</td>
<td>6.9</td>
</tr>
<tr>
<td>15,000 ha/yr</td>
<td>9000</td>
<td>23.2</td>
<td>6000</td>
<td>10.3</td>
</tr>
</tbody>
</table>

NB On a sustainably managed basis, at 10,000 ha/yr, the total additional forest would continue to sequester 1.1MtC/yr after 2050, and 1.6MtC/yr on a 15,000 ha/yr planting regime.

Such a planting programme would secure significant jobs and investment benefits. For productive softwood forests this is estimated at around 180 new jobs in planting and up to 900 for harvesting, transport and wood processing. Current investment in the sector is running at £100m a year and this would increase significantly.

**Increased use of Scottish wood**

Wood products are low energy materials that can save significant amounts of carbon when substituted for other building materials. Research shows that average savings of 0.8tCO2e can be achieved by replacing 1m³ of concrete/bloc/bricks with 1m³ of sawn timber. Long-term wood products also

---

provide a benefit through their potential storage capacity, estimated at 0.9 tCO₂ in 1 m³ of wood³.

ConFor calculates that over the period to 2050 the additional productive forest area achieved from planting 9,000 ha/yr of productive softwoods could provide, based on current proportions, an additional 33.5 M m³ timber available to the construction market. This then gives the potential for substitution of materials delivering emissions savings of 27 mtCO₂. This would be a tremendous resource for Scotland.

Wood can also be used to generate renewable energy. ConFor has campaigned for this to focus on wood that currently has no market, and to promote its use locally and in generating heat. It has also noted that carbon and jobs benefits are higher in solid wood products, not least because these can be used and re-used, and then be made available to generate energy at the end of their useful life. There is a danger that current and evolving public policy could provide such large incentives to burn wood that jobs are lost and the carbon emissions potential of wood is not fully realised.

Scottish broadleaves and softwoods

ConFor represents people who own and work with broadleaf woods. We support efforts to manage broadleaf woods sustainably and to develop markets for hardwoods. It is important, however, when talking about climate change mitigation, jobs and investment to recognise the scale and potential of Scotland’s diverse forest and wood-using businesses.

Including Scots Pine, Scotland produces over 6 million tonnes of softwood each year, while hardwood production, including non-native species, is just over 400,000 tonnes for the whole of the UK with the majority of this estimated to be in England.

Scotland is internationally competitive in growing softwoods and producing wood products that have a large market and where there is scope for significant growth. The businesses in the sector are mainly Scottish owned or headquartered.

The sector is unusual in that it combines successful, modern manufacturing with land management that is governed by environmental standards that are second to none.

The sector suffers from an image hang-over from the planting of last century, driven by the FC which did not deliver the multi-purpose forests that are being established today. Those single-species, forest blocks are now being restructured to improve their biodiversity and visual impact. Using lessons learnt from the past there is scope now for a modern forestry and wood-using sector that all Scotland can be proud of.

---

³ Dr A Fruhwald, Hamburg University in CEI-Bois (2006) Tackle Climate Change: Use Wood
Unfortunately Scotland’s broadleaf woods are largely unmanaged and provide limited amounts of timber for wood fuel and for small businesses that produce furniture, flooring, etc. The potential for use in construction is limited by the lack of quality trees and the established, highly competitive operations on mainland Europe that dominate the hardwood market. This will not change in the near future as hardwoods take up to 150 years to grow (against 40 for softwoods).

There is scope for development of the broadleaved resource and of hardwood markets, but by far the largest opportunity for sustainable growth and climate change mitigation sits with the softwood resource, and public policy and its delivery must reflect that.

Stuart Goodall
ConFor
29 January 2009
As a retired forester who spent all his career in the private sector I am pleased to have the opportunity to comment on the proposals on forestry in the Climate Change (Scotland) Bill and do so as follows on the five questions posed:-

1. In so far as it is believed that the growing of trees – although some doubt the efficacy of the growing of conifers in Northern latitudes for this purpose – help to lock up carbon then I have no objection to the F.C. expanding its planting programmes but suggest greater emphasis should be given to growing timber producing hardwoods which will help to reduce our reliance on importing timber especially from rain forest areas. In this connection I would draw the committee’s attention to the recently announced research to be undertaken by the University of Edinburgh into the precise locations of where carbon is being produced and released into the atmosphere.

2. I am totally opposed to the egregious proposal to lease out 25% of the F.C.’s most productive forest to the private sector – the ‘boring’ parts according to Mike Russell, the Environment Minister, in a recent contribution to the Scotsman. (It is alarming to learn how the Scottish Government view commercial activity). My reasons are as follows:-
   a) I have no confidence that the timber areas leased will not be undervalued – most of the State assets which have been disposed of to date have been grossly under valued.
   b) The highly successful wood utilisation industry – sawmills, pulpmills, and board mills – rely heavily on continuous supplies which the F.C. is able to provide; The private sector will not do likewise as is evident at the present time when timber prices are so low.
   c) It is argued by the critics of the F.C. that they require a substantial subsidy from the taxpayers. I suggest that if 25% of their commercial forest is removed they will in effect become more indebted.

3. Some of the most productive / profitable conifer forests on the West of Scotland are also popular and important to the local tourist industry. There is absolutely no doubt that the F.C. has a more open door policy than the private sector and even when they are welcoming it is usually because they have been well rewarded by the public purse.

4. In fact the F.C. does not presently have as good a record in employing ‘workers’ as previously with much of the work now being done by contractors but there is no evidence to support the view that the private sector will do any better. In the past the F.C. was the main source of training for foresters and workers for the forest industry and it is to them that the private sector owes its awareness of and support for conservation, biodiversity and health and safety.
5. The F.C. have over the past 90 years built up one of the most successful publicly owned industries in the World and the Scottish Parliament earns no credit in attempting to plunder their success for its ill thought out schemes to justify it bankrupt energy policies.

Peter M. Fairweather MICFor
28 January 2009
The Forestry Commission Trade Unions (FCTU) have submitted a full response to the Consultation on the Scottish Climate Change Bill, but we aim in this response to focus on the five questions posed in the Questions for Consultees from the Committee and have answered them in the order set out.

Question 1. Greater role for Forestry Commission Scotland (FCS)

FCS has built up a significant capital asset from the funds allocated by Government over its 90 year history and it has already started to use this asset to contribute to Climate Change planting targets. There is scope to do more on this. The current programme known as ‘Repositioning’ is to raise £15m per year over the three years of the Public Expenditure round from 2007-8 to 2009-10. This is focussed on areas of forest which contribute least to the aims of the 2006 Scottish Forestry Strategy (SFS). The money has then been used to acquire new planting land in areas closer to communities or where planting can contribute to the 10,000ha target for Scotland.

The key aspect to selection of these sites is that it considers all three of the legs of sustainability – economic, social and environmental. It is only when a scoring system shows low values in all of these, that they are considered for sale. The impact on staff is minimal as sales are dispersed around Scotland and there is no element of flooding a market. At the moment, the investment market in woodland is good and prices realised meet expectations.

Question 2. Effects of Joint Ventures and Leasing on FCS role in climate change.

Joint ventures have been widely accepted as allowing added value to the role of FCS. While they can only lease land for non-forestry purposes at present, this provision in the bill will generate greater opportunities for FCS to facilitate developments, particularly in wind and hydro power generation. Initial survey of the FCS estate has shown great potential and income from this should flow in the period about 5-10 years from now.

Leasing as presented by the Consultation document has been widely condemned by the public and is opposed very strongly by the Trade Unions. It considers only the economic aspect of sustainability and fails to recognise the added value of FCS staff in areas where the environment has less natural attractions for environment and tourism. Considerable staff resource and funding has been put into remote rural areas such as the Galloway Forest Park by such ventures as the 7Stanes Mountain Biking facilities.

Question 3 Implications for Nature Conservation or biodiversity.
Joint ventures could release funds for additional planting and if this is the right trees in the right place, as set out in the SFS, could have great benefits for the environment, with protection of peatlands and other Priority Habitat Types currently under threat from over-grazing, opportunities for expansion of native woodlands and increased development of the woodland environment which has been so successful in allowing parts of Perthshire to be badged as ‘Big Tree Country’

With respect to tourism, the success of the Joint Venture between FCS and the Caravan and Camping Club GB in creating ‘Forest Holidays’ has shown the potential for this provision to be added to future Scottish legislation not linked purely to Climate Change.

Question 4 Implications for Rural Employment.

There is provision under the National Forest Land Scheme (NFLS) for communities to buy areas of FCS land, but this means many small communities cannot consider this option due to the large sums of capital they would have to raise. A better option would be to allow them to enter into Joint Ventures with FCS to lease the land or work in partnership with FCS to generate local employment opportunities. Heat generation from woodfuel is a particularly good example, with the necessity to increase the use of local sources of fuel and Combined Heat and Power schemes. The reduction in transport on fragile rural roads would be of particular benefit. Leasing as proposed at present will take this opportunity away from some of the most remote communities as the private manager is unlikely to have the same public benefit priorities as FCS.

Question 5 Other views.

We have set out our views above and welcome the opportunity to subject these to questioning by the Committee and expand on the detail on 11th February.

Forestry Commission Trade Union
4 February 2009
GENERAL COMMENTS

1 This consultation is to be welcomed. It strongly argues the role of forestry in helping to combat climate change and it is important that that role be fully maximised as well as gaining the support of the Scottish people. The Minister for Environment is to be applauded in bringing forward this debate and the crucial role for forestry.

2 The proposal to offer leases and cutting rights over parts of the national forest estate, has however resulted in a vigorous debate both within and outwith the forest industry, not to mention Commission employees themselves. The proposal represents a fundamental sea-change in the way the estate is managed. It is of concern that such a significant proposal has “come out of the blue” and is perhaps premature given that FCS is currently undertaking a wider options review of the national forest estate.

3 For FCS to pursue any significant programme of woodland creation will be dependent on the availability of suitable and affordable land. This is seen as a potentially major constraint and perhaps puts the argument for incentives (existing and additional) to be mainly placed with existing land owners and occupiers.

4 It is reported that leasing some 25% of the national forest estate could provide some £200M for reinvestment. It is not clear if the current economic downturn has been factored into the above assumptions. Timber prices have fallen some 25% in the past six months and are likely to fall further.

5 There is no guarantee that all sums raised would necessarily go into forestry related climate change activities. In the event that £200M was made available, it is unlikely that the forestry industry would be able to spend such a sum in one financial period.

6 The annual net cash cost of FCS is around £90M (08/09). Timber receipts are crucially put against that cost These amounted to some £43M in 08/09. The potential, very significant loss of receipts (estimated in the order of a third and perhaps more given likely sawlog content) places real concern over the ability of FCS to continue its present function and the delivery of multiple benefits to the Scottish people.

7 It is not clear if any lease and cutting rights agreement will require the timber to supply Scotland’s wood processing sector or if it will be
RESPONSE TO SET QUESTIONS

Question 1: What are your views on allowing the Forestry Commissioners to enter into joint ventures with the intention of participating in renewable energy programmes on the national forest estate?

Response: The Highland Council (THC) warmly welcomes the opportunity for the Forestry Commissioners to enter into joint ventures with developers and local communities and subject to the following considerations:

- Secure and maximise opportunities to benefit from joint ventures, including an equity stake in investments.
- Joint ventures that involve community ownership.
- Extend range of joint ventures to include biomass, especially wood fuel.
- Appraisal process requires to consider development on peat and carbon flux issues.
- Public Sector Reform Bill may offer a wider use and benefits from joint ventures.
- Working with Carbon Trust (‘Partnership for Renewables’) to develop and manage on site renewable energy projects.
- Opportunity for partnerships with LA’s in providing heat and power for local communities.

Question 2: What are your views on allowing Scottish Ministers and Forestry Commissioners to offer leases and cutting rights over parts of the national forest estate?

Response: THC has very strong reservations over these proposals and does not support them. A criticism of the consultation paper is that it offers limited detail, and no business case to underpin the proposals. THC main concerns are as follows:

- Lack of business case – to demonstrate overall public benefit and forestry’s contribution to climate change.
- Scale of proposals and control retained by one party.
- Impact on the function and funding of the remaining part of the national forest estate.
- Loss of regional presence.
- Impact on the stability and development of timber markets as presently underpinned by FCS.
- Impact (immediate and longer term) on FCS employees and the communities they live in.
- Loss of community acquisition opportunity through the National Forest Land Scheme.
• Loss of a wider range of non-market benefits as provided through FCS and which will be greater than provided through any lease arrangement.
• No guarantee that funding raised will be placed specifically to forestry related climate change measures.
• Potential for further leases.
• Member states of the E.U. have generally supported and protected their national forests.

Question 3: *What are your views on (i) transferring the proceeds from leases and cutting rights to a not-for profit trust for investment in woodland creation; (ii) transferring the landlord’s interest in this land to a not-for profit trust; and (iii) Ministers stipulating the constitution of such a not-for profit trust.*

Response: Please refer to the response to Question 2.

• What problem does the Trust resolve – option of increased accountancy flexibility to FCS?
• How will it operate – membership, structure and powers?
• How do you guarantee that Trust reflects public interest?
• Results in reduction of other Government funding?

Question 4: *Are there other actions which need to be taken, or are there other changes in legislation which need to be made, in order to allow the public and private forestry sector to contribute to Scotland’s target of reducing emissions by 80% by 2050? If so, please outline what these are.*

Response:

• Fully maximise opportunities for joint ventures.
• Consideration of only cutting rights over a greatly reduced scale and range of sites.
• Opportunities for some considered and limited expansion of the 'Repositioning Programme'.
• Early and significant refinement of SRDP, including simplified application and approval process.
• Targeted funding (e.g. Locational Premiums).
• Early revisit of fiscal support to encourage increased investment level and industry confidence.
• Active encouragement of agricultural sector to plant trees and use wood fuel.
• Proven benefits of communities and FCS working together to deliver a wide range of rural benefits (Sunart Oakwood Initiative).
• Woodland creation partnerships with other public agencies and land based organisations (e.g. SNH, MOD, Scottish Water, National Trust, RSPB, Woodland Trust).
- Audit of public land suitable for woodland creation.
- Maintaining and enhancing carbon stocks in trees or soils through longer term management and role of unmanaged woodland.
- Redistribution of Government spending to forestry.
- Carbon Trading.
- Opportunities of ‘Futures Market’ in raising funds at this time.
- Urgent need for an integrated Land Use Policy.
- Early update of Indicative Forestry Strategies with a clear promotion for woodland creation.

The Highland Council

RURAL AFFAIRS AND ENVIRONMENT COMMITTEE

CLIMATE CHANGE (SCOTLAND) BILL

SUBMISSION FROM ICF

The Institute of Chartered Foresters (ICF) appreciates the opportunity to comment to the committee on the forestry proposals under section 47 of the Climate change (Scotland) Bill.

ICF is the only Chartered Institute for forestry and arboriculture in the UK. Its members work in all aspects of forestry and forest management in both Forestry Commission Scotland (FCS) and the private sector.

ICF strongly supports (a) powers for FCS to enter into joint ventures with developers on forestry land. ICF notes (b) that powers are also sought to lease cutting rights to more commercial parts of the national forest estate. Leases whether for forests or cutting rights raise a number of issues which as yet have not been clarified.

ICF would in general wish to see some constraints on overall enabling powers to Ministers, to safeguard forestry and forest resources in Scotland.

Turning now to the specific questions:-

1. Do you envisage that the Forestry Commission could play a greater role than it does at present in reducing greenhouse gas emissions or in alleviating or responding to the effects of climate change? If so, what suggestions would you make?

Yes, given resources. FCS could increase new planting along with management of existing forests. It could also support the private sector in doing so. (It should be noted that there has not been a grant scheme for two years and the new SRDP scheme is both bureaucratic and difficult to operate).

2. Do you consider that either of the Government’s consultation proposals (on entering into joint ventures and on leasing cutting rights) would enhance the Forestry Commission’s role in dealing with green house gas emissions and climate change?

Answer: (i) Joint Ventures would be beneficial and allow for innovation. It would also create significant resources to the benefit of Question (1) above. (ii) Leases are proposed for 25% of Forestry Commission Scotland estate which equates to approximately 33% of FCS income. This will increase Forestry Commission Scotland unit costs. If these are 75 year leases they will be expensive to monitor and will create inflexibility for the future. Roll over of leases or sale may result.
3. Do you envisage any implications for nature conservation, biodiversity or recreational interests from the two proposals and if so, what are they?

No, provided the lessee is compelled to subscribe to the UK Forestry Standard, and any future amendments to it, an acceptable minimum level multipurpose management would be maintained.

4. Do you believe there are any implications for rural employment from the two proposals and, if so, what are they?

Forestry provides significant jobs in rural Scotland and in sawmills and processing plants. (The saw milling sector is one of the most efficient in Europe). Joint Ventures can only be beneficial in employment terms since they stimulate activity. However, leases of forested land/cutting rights to others would reduce the FCS holdings significantly and increase its unit costs. It could mean the loss of regular timber contracts to the timber trade, thus reducing employment and risking investments made or planned by the timber trade. The Forestry Commission has been and remains crucial in making available steady flows of timber to saw millers and processors.

5. Do you have any other views on these two proposals from the Government?

Proposals for leasing/cutting rights have so far been without detail or consideration of the many issues that could arise. This is a matter of concern. ICF would be ready to discuss these further.

RURAL AFFAIRS AND ENVIRONMENT COMMITTEE

CLIMATE CHANGE (SCOTLAND) BILL

SUBMISSION FROM DUNCAN IRELAND

Re: Response to the Climate Change (Scotland) Bill - Proposals on Forestry

The Forestry Commission was established in 1919 with the purpose of increasing Great Britain's forest cover. With pressure on limited timber reserves during the First and Second World Wars the main aim of the afforestation programme the Commission was charged with was to provide a strategic reserve of timber.

When Great Britain developed a nuclear deterrent the need for a strategic reserve of timber was removed, but the demand for forests remained due to new objectives. Scotland has always contributed significantly to the total coverage of British forestry and the national forest estate has adapted to meet new objectives while steadily increasing in area. The Forestry Commission's role has seen it respond to changing demands; health, recreation, environment, education and landscape benefits have been embraced by the organisation.

Throughout these changing objectives the Forestry Commission has been able to adapt because of the huge variety of forest and habitat types that comprise the national forest estate. The diversity of our forests has provided the steady foundation to adapt to changing demands and only through maintaining control over the entire forest estate will the Forestry Commission be able to provide the sort of forests that will have the flexibility to respond to current forest objectives such as reducing climate change and those of the future, as yet unknown. This is the essence of sustainability.

The process of forest expansion has not been achieved without mistakes; huge public backlash resulted across Scotland from the planting of the 'Flow Country', with negative habitat consequences. Against the spectre of the Flow Country afforestation the Forestry Commission has striven to regain public support. Faced with a public highly in-tune with environmental issues improving its public image has been a long process with huge developments made in environmental habitat creation and recreation provision.

Maintaining the versatility of forestry to respond to changing forest objectives is not a case of dogmatically maintaining 'risk adverse' management. It is a case of safeguarding a resource that has taken nearly a century to establish since the founding of the Forestry Commission. A resource that has been hard won and achieved through large public investment on behalf of the people of Scotland and that through its current size and diversity has the flexibility to adapt to our changing needs.

Leasing the most productive components of the national forest estate in
Scotland will threaten the security of sustainable management provided by the Forestry Commission. The leasing proposal has the potential to be another ‘Flow Country’ disaster with all the associated political fallout for comparatively little economic gain.

The people of Scotland to whom the national forest estate belongs have the right to a forest reserve that is safeguarded in perpetuity to provide them with the multitude of objectives they place on this vital resource. This is too great an asset to risk putting under control of commercial companies that are solely motivated by profit, not the needs of the Scottish people. Entering into leased cutting rights would not enhance the Forestry Commission’s role in alleviating climate change and the political, financial and environmental repercussions of so doing would be negative.

Best practice standards exist to which all forests in Scotland should be managed in order to achieve recognised certification. However, achieving exceptional standards for environmental and recreation management above minimum certification criteria is where the Forestry Commission have set their standard, delivering world class public access and environmental management for Scotland.

All this is at risk if the Forestry Commission loses the revenue from the most productive 25% of the national forest estate. There is no guarantee that revenue for the proposed leasing scheme will be used for future afforestation and while many climate change reduction initiatives may be supported by the anticipated revenue this is no substitute for our existing safeguarded tangible forest asset.

Leasing the most profitable of the nations forests to private companies would place huge economic power in their hands with no safeguards for the timber processing sector which the Forestry Commission has always safeguarded by maintaining the flow of timber despite poor prices. The strategy of any company set on maximising the financial benefit of forestry assets would be to halt timber production during depressed timber prices with terrible consequences for the forestry harvesting and processing industries. These industries are vital for rural employment. The consequences for rural employment and resulting political backlash should not be underestimated in a nation where resentment for historical injustice to the rural population still resound.

For nearly one hundred years the Forestry Commission has been the custodian of the national forest estate in Scotland. The proposals of the Climate Change (Scotland) Bill allowing leasing of this most valuable asset risk failing the people of Scotland and Great Britain, and compromising the sustainability of forestry in this country for the next century.

Duncan Ireland
27 January 2009
I. What are your views on allowing the Forestry Commissioners to enter into joint ventures, with the intention of participating in renewable energy programmes on the national forest estate?

In principal James Jones & Sons Ltd ("JJSL") does not have any objection to the proposal of participation in renewable energy programmes. The renewable energy programmes should however be backed up by proven scientific evidence that the outputs are likely to yield lower CO2 emissions and meet the Government targets.

For this proposal to be widely accepted by the entire Scottish forestry industry there needs to be ecoconditionality between all of the government’s aims and targets. This will require an approach that balances all the environmental and economic needs of the entire supply chain. Legislation and standards must be clearly defined to safeguard all of the interests and variances that exist between sectors.

There are some fundamental issues which would need to be addressed which would ensure unqualified support:

1. Will the afforested land area that might be designated to renewable energy programmes be replaced in other areas? This is vital to ensure a net increase in forested area to maintain carbon sequestration from forests in the UK.
2. There are currently a large number of wind farm proposals awaiting, or having been granted, planning approvals. This has meant that a significant volume of standing timber will be felled in a very short period of time, and sold to a market that is currently contracting (mill slowdowns, mill closures, additional downtime, redundancies, poor end user demand etc.). This is clearly devaluing the financial returns to the Forestry Commission when it can least afford diminishing revenues. The principal projects are per the following table:

<table>
<thead>
<tr>
<th>Site</th>
<th>Volume</th>
<th>Proposed completion date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bien an Turk, Argyll</td>
<td>80,000T</td>
<td>August 2009</td>
</tr>
<tr>
<td>Arracliach, Ayrshire</td>
<td>150,000T</td>
<td>Infrastructure to be completed 2009</td>
</tr>
<tr>
<td>Clyde</td>
<td>350,000T</td>
<td>September 2010</td>
</tr>
<tr>
<td>Harestanes, Ae</td>
<td>150,000T</td>
<td>Start 2010</td>
</tr>
<tr>
<td><strong>TOTAL</strong></td>
<td><strong>730,000T</strong></td>
<td></td>
</tr>
</tbody>
</table>

3. Significant volumes such as these being marketed in a short period of time create problems for the entire supply chain.
a. Dislocation of harvesting machinery (currently a major issue)
b. Dislocation of haulage contractors (currently a major issue)
c. Disturbance on other long term contract agreements (currently a major issue)
d. Effect on price throughout the supply chain (currently a major issue)

4. Where areas are deforested for renewable energy programmes what action will be taken to ensure certification of the harvested timber? There is evidence currently that much of this volume will be unlikely to be certified (Reference: UKWAS Interpretation Panel. Note 7. October 2008). How will this issue be resolved?

5. Will the revenue generated by these joint ventures be ring fenced back in to new replanting schemes or will the revenue stream be utilised to fund other renewable energy programmes? What guarantees will be provided?

6. Failure to restock felled areas or to replant new areas will create uncertainty in the sawmill and panel board sectors and will result in the postponement, or more likely the cancellation, of any major processing investment programmes.

7. Who will be granted the ultimate responsibility for decision making, regulation and arbitration on these investments and programmes:
   a. FCS?
   b. Government?
   c. Ministers?
   d. Trusts?
   e. JV Partners?

8. Will the Forestry Commission, in the future, be allowed to sell standing or harvested timber to the proposed joint ventures even if it is an equity participant? What conditions will be applied to ensure competitive tendering?

9. What conditions will be placed on energy generators looking to clear fell large land areas?
   a. Restocking
   b. Comparable land coverage of forestry on alternative sites
   c. Certification issues also apply to this point as per point 4 above.

10. On page 5 of the Paper, the following statement is made: “...and, if it were possible to release capital from the estate, this could provide additional funding for woodland creation. Both these opportunities are currently constrained by legislation, but suitable provisions in the Scottish Climate Change Bill could help remedy this.”
   a. The current repositioning programme already releases capital by selling off certain areas with the intention of purchasing land for more productive forestry.
   b. The “suitable provisions” should therefore be capable of ring fencing the proceeds and providing the “additional funding” required.

There is significant concern within the timber processing sectors that a headlong rush in to renewable energy programmes will starve the sector of
roundwood, particularly of the smaller diameter logs. The small roundwood harvested from the UK’s forests contribute the following key facts:

1. JJSL has invested more than £100M in sawmilling capacity in Scotland over the past 25 years and sales of pallet and packaging products account for more than 40% of turnover per annum.
2. 8,000 direct jobs in the UK in the wooden pallet and packaging sector
3. These jobs are supported by more than 20,000 direct and indirect jobs in the UK sawmilling and forestry sector.
4. In UK 60M wooden pallets are produced per annum and the majority of the UK’s pallet boards are supplied directly from UK grown forestry and processed in UK owned sawmills.
5. In Europe 400M wooden pallets are produced per annum.
6. In Europe wood packaging provides a market for almost 20% of timber production.

Due consideration must be given to the processing sectors to ensure that they remain vibrant and able to support UK pallet producers. Demand for UK produced pallet and packaging is very elastic. The biomass sector through economies of scale, government subsidies and purchasing power could squeeze the competitiveness of UK sawmill producers and restrict the flow of palletwood and small roundwood timber. Two key recent statements support the view that the two sectors can exist together, but requires thorough scrutiny:

1. “If 30% of the waste wood currently sent to landfill were used, it would generate 2,600 Gwh of electricity and save 1.15M Tonnes of CO2 equivalent emissions.” (Defra, Waste Strategy for England, 2007)
2. “Forestry…can make a significant contribution to reducing greenhouse gas emissions…by using wood as a substitute for energy intensive materials.” (UK Government, Securing the Future – Delivering the UK’s Sustainable Development Strategy, 2005)

The Government should also not be blinded to the supply chain benefits that the wood processing sector provides towards mitigating climate change, particularly in the construction sectors. Failure to support the sawmilling and panel board sectors would represent a gross misjudgement and would prevent architects, specifiers, house builders and contractors from meeting the challenges of zero carbon housing and high scoring environmental profiling. The following are key statements which should not be overlooked:

Whilst renewable energy programmes can meet Government targets, these should not disguise the benefits that trees and forestry have on the environment. A few key facts are listed below:

1. Commercial woodlands absorb 1T of CO2 per m3 of growth (Edinburgh UNECE/FAO, State Centre for Carbon Management)
2. On average trees absorb a tonne of carbon dioxide for every cubic metre’s growth – and they produce almost three quarters of a tonne of oxygen – helping to create the air we breathe.
3. Other respondents will argue more coherently the scientific facts and benefits.
4. Substituting a cubic metre of wood for other construction materials (concrete, blocks or bricks) results in savings of between 0.75 and 1.1 tonne CO₂.

5. A tonne of brick requires four times the amount of energy to produce as sawn softwood, concrete five times, glass six times, steel 24 times and aluminium 126 times.

6. 3 tonnes of CO₂ can be saved by using timber frame from the 20 tonne CO₂ footprint of a typical 3 bedroom detached house.

7. Wood also provides a more cost-competitive solution to achieving higher ratings levels for the Code for Sustainable Homes, through the materials credits.

8. Waste wood from the demolition of buildings at the end of their life can provide a useful bioenergy resource as a substitute for fossil fuels.

9. Using waste wood as a carbon neutral energy source increases the CO₂ benefit of using wood as a construction material in the first place and will be reflected in even better LCA scores.

10. Already the advantages of timber frame, the lower on-site labour costs, the reduced construction time, earlier weather-tight conditions and reduced snagging, have led to significant growth in timber frame’s share of the UK’s new housing starts.

11. Timber frame now accounts for over 22%, from just 12% at the beginning of the decade.

12. 'The thermal conductivity of softwood timber is typically some 6 times lower than brickwork or heavyweight concrete block, over 8 times lower than concrete, almost 400 times lower than steel and over a thousand times lower than aluminium.' This means wood is more effective at preventing heat loss than any other mainstream construction material. TRADA, Energy Efficient Housing – A Timber Frame Approach, 1989

In conclusion, JJSL does not object to the Government’s Climate Change aspirations and targets. However, the following key points must be agreed to unless the Government wishes to see the contraction of rural employers, a vibrant industry and a sector which contributes significantly towards carbon emission reductions:

1. Funds raised must be ring fenced within the Forestry Sector, both now and in the future. Legislation will be required to safeguard this core premise.

2. Where afforested land is converted in to other forms of renewable energy programmes, replanting equal to or greater than the felled forestry must be carried out.

3. Where commercial forestry is removed, a proportionate amount of commercial replanting must be carried out.

4. Renewable energy programmes must be phased and planned to avoid the wholesale “dumping” of felled material on to the market at any one time.

5. A solution to the certification problems must be agreed before a headlong rush into clear felling, without commercial restocking, is carried out.
6. Clear felling windfarm areas, and burning the material is not a viable solution.
7. Further clarification is required on what the definition of “joint ventures” means.
8. The effect of continuing subsidies, ROC’s etc on the energy sector’s ability to pay more for log classes which have an intrinsic value to the processing sector must be fully evaluated and considered.
9. Will the joint venture partners be eligible to participate in the lease and cutting rights too?

II. What are your views on allowing Scottish Ministers and Forestry Commissioners to offer leases and cutting rights over parts of the national forest estate?

The offering of leases and cutting rights is not a new proposal, and the Consultation Paper offers no real guidance on the strategic direction that is likely to be adopted. There are 19 principal concerns which are laid out below:

1. Michael Russell stated on 4th December 2008 that he would agree to the establishment of a working group to look at the terms of any lease. If this working group does not materialise or is censured in some way, JJSL will not support the consultation process or the resultant Bill. Without a working group, clear terms of reference and assurances that the findings will be pursued, industry has no confidence that its genuine concerns will be heard or acted upon.

2. JJSL is supportive of Government Scottish Forestry Strategy objectives and especially of increased woodland cover. A critical balance of commercial vs non commercial species must be maintained in order to provide the long term security to the processing sector.

3. Do these Scottish Forestry Strategy objectives however require the dismembering of FC to achieve the stated objectives?

4. Government objectives can be delivered just as well by a combination of State and Private forests.

5. FES incurred a deficit of £29.1M (2007-08), despite an income increase of £5.4M to £42.1M from sales of timber. Leasing off 25% of the most productive land and forestry will only exaggerate any future FES deficits and reduce future income streams.

6. Will money raised from leases be hypothecated to more woodland cover and in particular productive forestry?

7. It would appear that any money raised could be utilised in other climate change objectives for a low carbon economy. From a processors perspective this will be unacceptable and could result in a tightening of supply, and the slow death of a currently vibrant rural economy.

8. There are clear examples, historical and present, where the private sector has withdrawn from harvesting and marketing of wood where log prices drop below a particular level.

9. Already within the first few weeks of 2009 JJSL is aware of a number of private forestry investors who will not be bringing timber volumes to
market. One investment portfolio harvested in excess of 200,000T in 2008 and have indicated that they will withdraw from a similar programme planned for 2009. Private growers have the liberty to do so, but this will increase the already intolerable margin pressure on the sector.

10. It is stated that the lease will be for a period of 75 years? Will the lease be transferable and tradeable? What safeguards would the Government instigate to prevent any tenant receiving a significant capital gain on disposal? Would the Government participate in any capital gain?

11. If the lease is tradable how could the Government control any subsequent tenants? How could the Government prevent a subsequent tenant from operating in ways which could be detrimental to the forestry sector?

12. It is suggested that a term of 75 years has been recommended by the Scottish Executive's Environment and Rural Affairs Department, and their financial advisors, and that a discount of 15% has been factored. A greater opportunity for competitive tendering and financial liquidity would be for shorter management contracts of say 5 years.

13. Which areas are likely to be leased?

14. If leases do not comprise entire Forest Districts, fragmentation of the remainder will inevitably lead to increased management costs on the remainder

15. If the areas are fragmented does this mean that there will be a greater probability of multiple owners, thereby increasing the uncertainty for processor groups?

16. If there are multiple owners leasing smaller areas of land this could increase the probability that timber is not brought to market in a managed and proactive fashion in a downturn.

17. Multiple ownership will create fragmentation and decrease transparency of production forecasting and forward management and harvesting programmes.

18. If the first lease is deemed to be a success by Government, there is a presumption that the remaining 75% of the plantation and productive forestry could be leased at a future date. What guarantees, if any, will the Minister provide that this will not take place? In the meantime considerable uncertainty will prevail in the industry and is certain to stifle vital rural development and investment.

19. There is no indication within the paper that gives any information on the possibility/probability that renewable energy programmes may exist or occur within the leased land. What provisions and conditions will be made to ensure that FCS benefits from the resultant revenue streams, rather than the tenant? What guarantees will be made that these revenue streams are committed back to replanting programmes?

The issue of Long Term Contracts is an extremely important area which will require full scrutiny from existing LTC holders. These have brought about stability and security to the sector and any removal of these, now or in the future, will negate the levels of support for the Bill.
1. What guarantees will be provided to current holders of Long Term Contracts?

2. Either direct replacements or other safeguarding Long Term Contracts contracts need to be adopted by any leaseholder.

3. The majority of LTC’s are contracted for 5 years with an option to extend for a further 5 year period. Any potential leaseholder could simply ignore or waive the “option” which make the Minister’s guarantees of honouring contracts meaningless without concrete safeguards.

4. Alternatively a mechanism of “right of first refusal” could be implemented to offer the current contract holders the opportunity to take up the volume allocations over longer durations. This would ensure stability of supply to processing companies.

5. What guarantees will be made to ensure that LTC’s will continue to be negotiated and issued during the consultation process? Failure to provide these vitally important mechanisms, particularly in the current climate, will diminish confidence amongst end users.

6. The majority of capital expenditure programmes are predicated on mutually convenient, long term contracts between FES and private enterprises to ensure continuity and security of supply. Failure to support these will result in a contraction of new investments.

The economic downturn in 2008 has been unprecedented and severe. As a result of consultation with industry representatives, FES agreed a series of measures that would provide some assistance to processor groups. This was published on 26th November 2008 by Brian Mahony, Director, Forestry Commission Harvesting and Marketing, in conjunction with Confor and UKFPA. Leasing off circa 25% of productive forestry will remove any fall back mechanisms that the Forestry Commission has provided and could result in large scale closures and companies entering into administration. The following key points were made:

1. “FC wish to see the forest industry delivered as intact as possible into the next upturn and request all involved to contribute to this goal.

2. In support of these principles the Forestry Commission will aim to support both movement of timber and cashflow by:
   a. Continuing to operate its normal contract and credit arrangements.
   b. Offering a constructive approach to agreeing reasonable extensions to existing contracts with the objective of securing completion as soon as is practically possible.
   c. Enabling customers to work existing higher priced contracts alongside more recently purchased lower priced contracts in order to reduce their impact on cashflow.
   d. Offering customers the opportunity to seek deferral of an agreed portion of sums due.
   e. Continuing to offer planned Sales Plan volumes to the market.
   f. Setting sale reserves based on a realistic view of the market. FC will be provided with monthly market price information from the Trade Associations.
g. Ensuring that harvesting contractors and hauliers are paid promptly in accordance with contract terms and conditions.
h. FC will enter discussions with any customers who request support.”

It is too early to state whether these measures have staved off any more redundancies, but this form of public/private collaboration and partnering would be severely limited in the future through the ownership dilution of the national Forest Estate.

The current consultation process refers to 25% of the National Forest Estate being leased. The following critical points need be addressed:

1. The areas under consideration are some of the most productive and profitable in the Estate and by current estimates could yield approximately 1M Tonnes per annum.
2. It is understood that in order to achieve this volume, the felled area will be eligible for grants thereby increasing the pressure on the already poorly functioning process.
3. The core commercial area of 150,000 hectares would yield in excess of 1m tonnes of timber per annum on a 50 year rotation. This programme of felling would clear some 3000 hectares per annum for restocking.
4. Based on the current SRDP grant rates for forest restructuring the lessee would be eligible for approximately £500 per hectare totalling £1.5m per annum. It is also conceivable that a private owner would seek additional grants for work required, and currently being carried out by FE, to meet UK forestry and certification standards. Applications and demands for grants would commence immediately after the approval of the lease.
5. Inevitably the additional requirement for this new area of “private” land will add to the existing burden and requirements for funding on this potentially oversubscribed SRDP scheme and lead to the significant dilution of existing grant rates or exclusion of valuable projects in the future.
6. Currently the "cost" of replanting felled areas, which is mandatory for felling and revenue generation to occur, is covered within FE budgets. Following the lease of forestry land from FES this cost will fall to the lessee under the support of current and future schemes. Overall the capitalised burden of this could be well in excess of £112M over the 75 year period of the proposed lease.

In conclusion, the following points need to be addressed:

1. The setting up of a lease “working group” to set out the conditions of the lease terms and conditions must include representatives from the processor sector.
2. A full cost benefit must be carried out in a transparent fashion to prove publicly that the leasing of 25% of the most productive and profitable forestry area is viable, and importantly to justify the cost structure of the remainder of FES/FCS.
3. Money raised from the lease MUST be ring fenced and utilised solely for the purpose of replanting and restocking and to meet the 10,000 hectare annual new woodlands target.
4. Full transparency of the areas chosen and an impact assessment carried out in relation to the impact on localised processors.
5. Multiple, fragmented ownership will not be supported.
6. Leaseholders must be beholden to the existing LTC’s and the options that currently exist to roll forward in the future.
7. Forward management and harvesting programmes must be publicly issued, pre lease, to ensure that the security and continuity of supply is guaranteed under new ownership.
8. Guarantees that the Government does not have plans to carry out further leases on the remaining 75% of productive forestry.

III. What are your views on (i) transferring the proceeds from leases and cutting rights to a not-for profit trust, for investment in woodland creation; (ii) transferring the landlord’s interest in this land to a not-for profit trust; and (iii) Ministers stipulating the constitution of such a not-for-profit trust.

The establishment of a trust could ensure that the safeguards that the processing and panel sectors require, but it appears to have been given little thought or definition by the architects and authors of the Consultation Paper. The following issues require to be considered:

1. A not for profit trust appears to offer little other than an additional layer of administration and significant cost, performing duties and functions currently being carried out by FES.
2. Under the correct safeguards a not for profit trust could act as a body which can define and manage the different and divergent views of all stakeholders in forestry.
3. What would FES do then?
4. What would be the cost of rationalising FES, and would the proceeds from the lease be utilised to meet the significant liabilities of a contraction of FES.
5. No mention has been made during the consultation process of the all the other important functions that FES conducts eg planning, recreation, forest research, climate change research, publications, PR etc. Who would assume the responsibility for all of these diverse and important functions?
6. The Scottish Executive’s Environment and Rural Affairs Department, and their financial advisors, appear to have ignored these important departments during the due diligence and appear to have concentrated solely on revenue generation rather than significant practicalities of setting up a not for profit trust which would operate in parallel and potentially in conflict with FES if it was set up.
7. Michael Russell stated on 4th December 2008 that he would agree to the establishment of a working group to look at the terms of a long term lease. JJSL would expect that this statement would apply equally to any not for profit trust due diligence.
IV. Are there other actions which need to be taken, or are there other changes in legislation which need to be made, in order to allow the public and private forestry sector to contribute to Scotland’s target of reducing emissions by 80% by 2050? If so, please outline what these are.

James Jones & Sons Ltd has looked at a number of different scenarios and options and would welcome the opportunity to discuss these in more detail. The forestry sector and the entire wood chain from cradle to cradle has a huge amount to offer to the Scottish emission reduction target of 80% by 2050. By potentially stifling the innovation, investment, R&D, employment and GVA contribution the Scottish Government, through disturbing the forestry distribution channels, will both hinder the industry and not meet the ambitious targets.

Through the pursuit of gaining a windfall gain of £200M the Government will be potentially jeopardising private enterprises and the entire rural economy for short term gain. This consultation does not provide the safeguards or the solutions.

There are a number of specific areas that should be considered, in addition to all of the comments already made in reference to the questions above:

1. A processing sector group meeting with the Minister to air concerns and to provide information on alternative propositions.
2. The timing of the proposal given the economic downturn
3. Implementation of the proposed improvement plan and continued development of the SRDP and grant mechanisms
4. Defence of UK processing sector to allow it to contribute to the low carbon economy eg construction, environmental profiling
5. Defend domestic, UK businesses
6. Simplify the process of changing land use from agriculture to forestry
7. Relax current restrictions to make more land available for new woodland creation
8. Review of the single farm payment mechanism and neutralise its effect of discouraging a change of land use to forestry
10. The environmental costs to any change in ownership
11. Social/Community impacts
12. Defend the work and outputs of Forest Research.
13. If FES in control of a single private operator – at an extreme all harvested production could go to Co-Gen.
14. Can FES be more efficient and cost-effective yielding greater returns to Government

James Jones & Sons Ltd
28 January 2009
On the subject of leasing this will have a negative effect on the long term viability of the FC. The leasing option should be removed from the bill. If such large areas in the South of Scotland are lost then future investment in recreation and conservation, will be badly hit. During times of recession the timber trade relies on the Forestry Commission maintaining supplies of timber even at a loss. This would not happen with such large areas leased off.

The FC should have the power to join in joint ventures on Hydro and wind farm schemes to gain a larger share of the cake. The increased revenue could then be used to purchase more land.

Gordon Kennedy
25 February 2009
I wish to air my views on the proposed bill to alter the forestry bill in relation to the climate change proposals.

I am in opposition to these proposals completely as I feel the government is using publicly managed forests to foot the costs towards reducing climate change emissions and meet targets previously set without budgeting for accordingly or making provision.

The decision to reduce carbon emissions and encourage future forestry expansion I do agree with but not at the expense of leasing or selling off one of our national assets.

Governments have claimed for decades that they will tackle climate change and initiate future forest growth in forestry since at least the early 90's with the Rio conference and subsequent Helsinki gathering. With proposals to increase forest cover by 10's of thousands of hectares per annum without ever reaching the targets claimed. Who's fault is this!

Forestry in the UK needs investment that is beyond doubt, however if these aspirations are to be met then surely they have to be tackled without reducing the national estate at the overall loss of the public's interest. Publicly managed and owned forests provide the benchmark for multiple use woodlands with social and environmental focus NOT primarily geared for financial gains for stakeholders and carbon credit seeking organisations whose primary interest is deflecting the bad publicity they face from unsustainable activities in poorer managed regions.

Sustainable forest management provides far more reaching benefits to the public through increased opportunities in recreation for public health and wellbeing without even touching on the benefits to overall biodiversity to our natural habitats and the sustainable natural resource they provide.

Reducing national and global carbon emissions and providing more naturally sustainable renewable measures means, to improve the effects on the earth's composition is and should be paramount to any governments integrity and should be given the level of importance it deserves. This is not going to be achieved through short sighted quick fixes that are dressed up as progress to score points.

I have no doubt that multi-national companies and organisations with their vast amounts of disposable moneys can be brought in through these proposals but at what real expense with seriously damaging effects to the public's interests in utilising public land and the freedom they currently provide.
Climate change is a very serious problem that needs to be addressed now and needs the full backing of the people, not headline seeking governments with no real true substance in its foundation. Money is tight in all areas at the moment with the exception of the oil and gas monopolies and their mega profits (what credit crunch are they involved in) but the future of our wellbeing and sustainability relies on investment now not the sale of one of our only assets that is at least trying to improve the opportunities for its stakeholders, the public.

The forestry commission at the very least are constantly attempting at working to provide opportunities for the public's benefit without financial gain, who else will provide this in reality.

John Mulgrew
26.02.09.
1) Do you envisage that the Forestry Commission could play a greater role than it does at present in reducing greenhouse gas emissions or in alleviating or responding to the effects of climate change? If so, what suggestions would you make?

As a land manager, producer and transporter of forestry products as well as a regulatory authority and producer of best practice guidelines there are a number of areas where the Forestry Commission could play a greater role. These include:

- Making greater use of existing landholdings for renewable energy generation, as proposed.
- Developing markets for wood products.

There is a need to create both local and national markets for timber products. Localised demand will encourage investment and better management of our woodland resource and limit the need for the transportation of products across the country. There needs to be a significant commitment to using more timber products in house building (including insulation products) and further assistance to put in biomass boilers in homes etc. Without development of the demand side we will have a lot of forests (that do help mitigate climate change) but no end markets for the raw material.

- Encouraging more land into forestry

More planting could be encouraged if it were allowed on land that receives Single Farm Payment. This would increase planting and would need no additional government investment.

Early indications suggest that the rate of take up of forestry options under Rural Priorities would be increased if the rates of payment were more attractive.

Woodlands in and around town (WIAT) should continue to be supported as they not only contribute to mitigating climate change but also help to absorb localised pollution and limit leisure travel by providing a full range of recreation facilities within easy travelling distance of major centres of population.

- Developing innovation and best practice in forest roads and timber transport
More sustainable forms of timber transport should be developed to reduce road haulage, specifically options and potential subsidies for rail and water transport should be investigated.

With increasing intensity of rainfall, greater encouragement should be given to non standard engineering solutions for forest roads. Improved designs must reflect the changing climate and aim to minimise erosion and land slippage.

2) Do you consider that either of the Government’s consultation proposals (on entering into joint venture and on leasing cutting rights) would enhance the Forestry Commission’s role in dealing with greenhouse gas emissions and climate change?

LLTTNPA supports the proposal to allow the Forestry Commissioners to enter into joint ventures to develop renewable sources of energy on the national forest estate. This appears, in principle, to be a practical way for the Forestry Commissioners to increase the profitability of the national forest estate while contributing to the mitigation of climate change.

The NPA supports joint ventures between FCS and local communities which provide opportunities for the development of sustainable and affordable community renewable energy schemes. The development of sustainable and affordable energy generation is particularly important for those rural communities, off mains supply, that remain heavily reliant on fossil fuels for heating. This will help to engage and empower communities, creating local solutions for some of the issues of climate change. Any income generated from joint ventures with developers and local communities should be used directly to fund further measures to mitigate climate change.

Within the National Park, medium (generating between 1MW and 20MW with multiple turbines) and small-scale (generating below 1MW) wind renewable energy projects will be supported where, the siting, design, access and scale of the proposal does not create a detrimental impact on the landscape, natural or cultural heritage or has any adverse impacts on local communities or the rural road network. Large-scale wind renewable projects are unlikely to be acceptable. Within the National Park boundary, small-scale (generating less than 1MW) are likely to be acceptable where there is no significant environmental or landscape impact. Energy generation from biomass heating or combined heat and power combustion plants are likely to be acceptable in the National Park where the siting, scale and design, future support infrastructure and production of raw materials, do not have adverse impacts on the natural or cultural heritage of the area or on local communities.

There is an urgent need to undertake a feasibility study on the national forest estate to assess the potential for income generation from renewable energy schemes taking into consideration development constraints. If the potential is sufficient to generate adequate funding for FCS to make a significant contribution to climate change mitigation, leasing of land may not be necessary.
3) Do you envisage any implications for nature conservation, biodiversity or recreational interests from the two proposals and, if so, what are they?

We would draw your attention to the potential impact on bats, a European Protected Species, of siting wind renewable projects within forestry. Early indications suggest that bats may be particularly vulnerable to the localised disturbance created by turbines and this requires further research before specific proposals are developed.

Other key species which may be impacted upon by micro-renewables and associated infrastructure such as tracks, borrow pits etc include red squirrels, otter, water vole, birds, such as raptors and some fish species etc. Guidance would need to be developed to minimise impacts on the natural heritage, prior to this policy being progressed.

The Forestry Commission and Forest Enterprise work to best practice guidelines and aim to combine economic forestry with biodiversity (this is a duty for them under the Nature Conservation (Scotland) Act 2004), minimising landscape impact, community involvement and access and recreation. It is difficult to see how commercial operators, to whom the biodiversity duty does, not apply, will be able to maintain this balance and continue to deliver to high standards.

Whilst land is unlikely to be removed from access rights, the provision of well managed, quality access provision; which is important for a visitor destination such as the National Park, is likely to deteriorate if large areas of the National Forest Estate are leased out.

The siting and scale of micro-renewables can have significant effects on landscape and biodiversity. Cumulative effects can combine to magnify these impacts. In dealing with a single landowner (the Forestry Commission) planning authorities will have greater ability to seek plans and appraisals which can address the potential for cumulative impact. This will become more complex if multiple interested parties come forward individually and potentially in competition.

4) Do you believe there are any implications for rural employment from the two proposals and, if so what are they?

The majority of woodland management is mechanised and involves time limited amounts of skilled/unskilled labour on individual sites. Consequently the majority of private woodland managers subcontract works and an increasing number use management firms to manage contracts and apply for state aid and subsidies where appropriate.

As such leasing arrangements are unlikely to have significant long term impacts on the number of permanent rural jobs in forestry.
Rural jobs might be increased if the number of local markets for wood produce were increased as more jobs could be created in the processing and finishing of products.

Micro-renewables are creating new jobs in manufacture and installation; however these are unlikely to be rural as staff are concentrated in manufacturing areas.

5) Do you have any other views on these two proposals from the Government?

The consultation document does not provide enough detail on the proposed offer of leasing and cutting rights over areas of the National Forest Estate to the private sector to fully comment on this proposal. However, we have concerns that the basic principal of selling cutting rights or leasing sections of publicly owned land undermines the concept of a National Forest Estate and may, in the long-term, undermine its economic viability.

Whilst leasing may release capital for the delivery of climate change objectives, the disposal of 25% of the most profitable estates may limit opportunities for FCS to cross subsidise work on their less profitable estates. It may also limit opportunities for savings arising from economies of scale.

As a theoretical argument, if the Forestry Commissioners wish to release capital then a case could be made for a disposal policy. This should look across the range of assets, rather than simply at the most profitable and might include small scale disposals to communities or investors. Income could then be used for future acquisition or planting schemes.

However, the NPA remains concerned that either leasing or disposal could undermine the concept of an economically viable, publicly valued National Forest Estate.

The NPA strongly supports the current consultation arrangements on FE Forest Design Plans. All current FDP’s have been subject to stakeholder engagement, including the NPA. FE has a strong policy commitment to improving the environmental value of the National Forest Estate, providing for recreation and conserving the historic environment above and beyond the minimum required by the UK Forestry Standard. The NPA is concerned that leasing of land to a third party, with the principal management objective of profitable timber production, will result in erosion of the environmental value and non-timber interests of the estate and the wider benefits forestry brings to the general public. The NPA is further concerned that leasing 25% of the Forest Estate may lead to pressure to increase timber production on the remaining forest estate, which again may result in a reduced commitment to conserving and enhancing non-silvicultural interests.

The proposal, as outlined in the Consultation Paper, does not discuss funding arrangements for management of the National Forest Estate by the private sector. If third party managers were to be eligible for funding through SRDP
(and any subsequent funding mechanisms), and it is difficult to see why leasing/cutting rights would be attractive to the private sector if funding were not made available for management, additional funding would need to be made available through SRDP for planting/management to minimise the impact on other landowners who would potentially be affected by the additional pressure on the limited funding currently available.

A rigorous selection process for leasing sites will need to be put in place to ensure that other interests are not compromised as a result of change of tenure and management objectives.

With reference to not-for-profit trusts, FCS is a public body, acting for the public interest, so the benefits of transferring profits made from joint ventures or leasing to a not-for-profit trust are not immediately apparent. Indeed, at first glance the added layer of administration may give little advantage.

FCS has led many Challenge Funds over the years and has proven this to be a workable and successful model for prioritising spending to achieve maximum public benefit. The NPA recommends the establishment of a Climate Change Challenge Fund, funded through the revenue received from joint ventures. A Climate Change Challenge Fund could finance a range of measures such as new planting or the use of forests to reduce emissions or mitigate the effects of climate change while keeping the money in the public domain and having it administered through a tried and tested mechanism.

Loch Lomond & The Trossachs National Park Authority
29 January 2009
View on Climate Change Bill. Question 11 Forestry.

I support the overall objectives of the bill but I am astonished and gravely concerned over the proposal to lease part of the forest estate. I set out below my reasons for my opposition to this part of the bill.

Summary

I believe that allowing Scottish Ministers and Forestry Commissioners to offer leases and cutting rights over part of the national forest estate is naïve and ill conceived. This part of the bill will result in the destabilisation of FCS, sawmills and wood processing units and represents poor value for money for the tax-paying public.

On November 4 all in the FCS were shell shocked when the bill was published and the implications of the section on cutting rights and leases became apparent. What is also worrying is the short timescale allowed to put through the legislation. There was no prior consultation or communication with FC staff, who could, at that stage, have pointed out the flaws in the proposals. We are now undertaking to do this retrospectively.

Reassurances have been given that not one square inch of public land will be sold. This is untrue as three sizeable blocks of FC woodland have been sold in the Tweed Valley since the turn of the year. This is described as repositioning, and there may be some merit in disposal of outlying blocks at the real market value but that is a minor concern compared to the leasing option.

To lease 25% of the forest estate for 75 years amounts to a sale of land as far as anyone over the age of 10 is concerned. The problems that I can foresee with this plan are as follows:

Accessibility

Rights of access are guaranteed under the SOAC legislation and the FC endeavour to minimise restrictions to access whilst forest operations are undertaken. A less accommodating landowner could use operational and health and safety issues to exclude the public from large areas of forest for long periods of time.

Sustainability

A commitment to ensure that any leased land would be managed under the UKWAS standard has been made. However it is unlikely that stewardship of the leased area would be improved by the change. The Commission often
exceed standards demanded by UK WAS. The standard is also most effective when adopted over a large-scale forest area for example management of forest corridors for red squirrel conservation.

**Commitments to timber markets.**

Many of today’s timber markets were created and developed after commitment by the FC to guarantee a supply of timber. The private sector seldom makes the same commitments preferring to market their timber when prices are at a premium. The area proposed for leasing amounts to around 35% of the commission’s production and thus timber markets could be jeopardised by the leasing option. At the present time the private sector have virtually stopped sale of timber and all markets are being kept going with FC timber.

**Value for money**

Let’s assume that the 100 thousand ha of woodland for lease is made up as follows:

- 25 thousand ha of fallow ground
- 25 thousand ha of 15 year old crops
- 25 thousand ha of 30 year old crops
- 25 thousand ha of 45 year old crops

The timber value alone of the 45-year-old crop could conservatively be expressed as follows. 45-year-old sitka spruce could yield 400 m³ per ha at a standing price of £15 per m³.

Therefore timber value alone on one quarter of the leased area would be 25000 x 400 x £15 = £150 million.

This probably equates to the value the Government would receive from the lease in current market conditions. That means that the lessor would get the 15 and 30 year old crops free. In addition he would be eligible for grant aid to replant the fallow ground and the newly felled ground. This does not demonstrate responsible management of public money.

**Consequences for FC staff.**

The minister has dismissed all concerns regarding job security by offering the ‘triple guarantee’ of no compulsory redundancies, transfer to an alternative FC post or transfer to the leasing company under the TUPE regulations. Transfer of staff within FC would be very expensive, as would be the selection process. If voluntary redundancies were offered to staff nearing retirement age this would also be costly. Meanwhile only the current administration has any confidence whatsoever in job (and pension) protection through TUPE.
Staff in the short term, would be employed by the leasing company, but the terms and conditions of employment would be quickly diluted and eroded. Job losses would follow thereafter.

**Devaluing of the forest estate.**

The Forestry Commission value is far in excess of the sum of its parts. Its worth for recreation (public health), landscape, bio-diversity and heritage is immense. It is well managed by the FC for the people of Scotland. This stewardship has endured since 1919 this proposal if adopted would undermine the future of FCS. The head office in Edinburgh has GB wide responsibilities. Leasing out a large area of the estate simply increases the unit cost of managing the balance of the portfolio.

**Use of cash raised.**

The Scottish Government has refused to give a mandate that money raised from the proposed lease will be used for forestry purposes.

**Achievement of Objectives?**

Whilst everyone must be concerned with the effects of climate change the uproar over the leasing option has diverted attention away from the laudable objectives of the rest of the legislation. Carbon capture is a complex issue and differing opinions exist within land based groups on the merit of increased tree planting. There is insufficient detail in the bill to make an informed decision. It is irresponsible to push through this legislation for a quick cash return.

**Conclusions and recommendations**

I accept that the climate change issue must be addressed and if our current Government required the FCS to raise money to assist in this aspiration we must do so. In my opinion the leasing option is a non-runner and therefore we must continue and if necessary accelerate the repositioning of the estate. However this must not include selling to raise cash quickly if the price of stocked land is depressed.

Sale of land may result in a requirement for fewer staff. Natural wastage and a reduction in recruitment could achieve this.

Opportunities with the renewable energy sector must be maximised and opportunities for partnerships sought out and vigorously pursued.

Stewart Mache
February 2009
Response of Munro Sawmills Ltd to RAE committee on Forestry proposals in the proposed Climate Change Bill

1. Do you envisage that the Forestry Commission could play a greater role than it does at present in reducing greenhouse gas emissions or in alleviating or responding to the effects of climate change? If so, what suggestions would you make?

Currently, because of environmental constraints the Forestry Commission replants only 70% of the woodland area it fells. The rest is open space, natural regeneration, ecological areas, slow growing hardwoods. In order to just maintain the existing forest cover large areas of new planting are required every year. The most effective carbon capture trees are fast growing conifers in plantations. If you are serious about carbon capture you have to embrace this idea, or we will end up with low density hardwood scrubland with little carbon capture potential.

This idea is unpopular but it must be faced that at the present time, because of environmental constraints, the Forestry Commission (and the Private sector) are losing productive forest and releasing more carbon from this sink.

How can new planting (and proper replanting) be stimulated? If the government attempts this it will be expensive and controversial. Current priorities are for environmental concerns, access, community woodlands, woodlands around towns etc. None of these issues aid carbon capture and have no direct benefit in what is, after all, a Climate Change Bill. It would be difficult and contentious for the government to buy large areas of land for planting. The solution has to be in the private sector where large areas of land are available for planting, and given the right incentives estate owners will be ready and willing to create new forests. This would have a direct and rapid effect with less controversy.

2. Do you consider that either of the Government’s consultation proposals (on entering into joint ventures and on leasing cutting rights) would enhance the Forestry Commission’s role in dealing with greenhouse gas emissions and climate change?

With regard to joint ventures we welcome any activity which will increase the viability of the Forestry Commission without impinging upon its normal commercial customers. Income from these sources should be put to use in maintenance and expansion of the national forest estate.

We have grave reservations on Forest Leasing. Handing 25% of the Forestry Commission estate to one leaseholder would seriously jeopardise investment in the timber processing industries currently supplied by these woodlands. In
the event of leaseholder default there would be no guarantee of proper replanting after felling and the carbon sink would be depleted. Rather than hand over woodlands to the private sector we feel the Commission should retain its productive woodlands and the Private sector should be encouraged to plant new woodlands.

3. Do you envisage any implications for nature conservation, biodiversity or recreational interests from the two proposals and, if so, what are they?

It would be harder for the Commission to regulate a leaseholder to comply with their environmental standards etc than it would be for them to retain control of the woodlands so, yes, these aspects would all suffer.

4. Do you believe there are any implications for rural employment from the two proposals and, if so, what are they?

The leasing idea would remove the need for local employment in the areas under question. The work would be done by contractors and city based managers with fewer people on the ground. There can be no guarantee that the leaseholder would continue to cut in hard times when sales are unprofitable. This would lead to discontinuity of employment rurally, and worse could precipitate the decline and collapse of wood processing industries in small towns and rural areas. (We are in Dingwall)

5. Do you have any other views on these two proposals from the Government?

We believe Forest Leasing is a bad idea for several reasons:

From the processors point of view it would lead to one leaseholder holding a huge area of Forest, effectively gaining control of the roundwood market in one particular area. The effect would be to stifle investment (who would invest with no security of log supply?) and to starve processors of raw material when times are hard and the roundwood price is low. Remember the UK timber industry is very much a commodity market and with only a 20% market share UK producer selling prices are set by import prices. If the leaseholder refused to sell for a period because of low prices the industry would collapse. It would be impossible to create terms that would force the leaseholder to sell in bad times. If the leaseholder were a foreign investment corporation it could export roundwood leaving the UK industry to sink without trace. If the leaseholder were an energy company (such as Drax or E-on) it could burn the total output of the forests and destroy the existing processors. If the leaseholder were a processing company it would have a virtual monopoly and destroy all competition in the industry. These and other points have all been eloquently made in a recent letter from Tom Bruce-Jones to the Minister, of which we were a signatory along with the majority of Scottish processors.
From the monetary point of view it is a massive gamble. Who knows what the price of timber will be over the next 75 years? Any leaseholder will take a conservative estimate of likely returns and bid accordingly. Therefore it is inevitable that the lease will generate less return than normal sales practice. Future generations will look back with anger at any government that leases an asset for so long a period for such a short term gain! Current long term contracts with the Forestry Commission are subject to constant price negotiation ensuring the maximum possible return at any one time. Thinking you can forecast and fix the price for 75 years would be foolhardy.

From the legal point of view it is fraught with danger. Attempts to ensure continuity of supply to processors would be very difficult as price would have to be negotiable and this would negate any conditions imposed on the lessee. Sanctions against the lessee for failure of contract on matters such as access, environment and replanting would be a minefield – and too late if breaches have occurred. And in hard times how could the lessee fulfill conditions if no income is available to do it? What happens if the lessee goes bankrupt or is subsumed into another organization, possibly abroad. There is a huge devil in all this detail and no obvious way to circumvent it.

From the timing point of view it is inopportune. Apart from all the above reservations there could not be a worse time to lease assets than the present. Our currency is on the slide; our economy is in recession. You will get the worst possible price. This is the time to hold non-monetary assets that will not devalue. What could be better than standing timber? Remember Gordon Brown selling off our gold reserves at the worst possible time? Do you want to be cast in the same light?!

Munro Sawmills Ltd
28 January 2009
Introduction

1. NFU Scotland recognises that the Minister for Environment, Michael Russell, launched a consultation paper outlining proposals on 4 November 2008 to generate funding in order to plant more trees as part of plans to increase the area of Scotland covered in woodland by the second half of this century.

2. In the consultation, Scottish Ministers are asking Forestry Commission Scotland (FCS) to work up options to create funds via the national forest estate in the name of tackling climate change, while also safeguarding the important public benefits that the estate generates throughout Scotland.

3. NFU Scotland acknowledges that the consultation relates to legal provisions in the Scottish Climate Change Bill that may help with these aims, such as the potential to give Ministers the power to modify certain functions of FCS. This is not of primary or overriding concern to NFU Scotland.

Summary

4. NFU Scotland has some major concerns that these proposals may well adversely impact on Scottish agriculture if they are given the go ahead. These can be summarised as

- NFU Scotland is extremely concerned by the potential adverse impact that these proposals may have on the future development of many rural areas where farming plays the principal and pivotal role in securing and enhancing a huge range of economic, environmental and social benefits.

- NFU Scotland considers that the final outcome of these proposals, skewing the funding balance within the Scotland Rural Development Programme (SRDP), could have a major impact on the entire Scottish agriculture industry - including upstream input suppliers and downstream processors - and all that it underpins in rural Scotland.

- NFU Scotland doubts very much whether this approach to tackling climate change will achieve anything positive. It is naive in the extreme to think that simply planting more trees on mainly agricultural land, to lock up carbon, will make a significant contribution in addressing what is a global and complex problem.

- Given the uncertain and variable impacts that climate change will have on Scotland, and globally, NFU Scotland considers that a far more
A sophisticated approach to tackling climate change is required - rather than simply expanding tree cover across productive agricultural land.

- NFU Scotland considers that it would be far more effective to divert funding to farm businesses in order that they can take informed and supported decisions so as to adapt agricultural practices and mitigate climate change impacts, and thereby deliver a range of wider rural development benefits as a consequence.

- NFU Scotland considers that agriculture's function could have an even greater positive impact if the policy environment in which farming and farmers currently operate in were more receptive to agriculture's primacy in both land use and tackling climate change.

- NFU Scotland believes better integration between currently separate policy themes such as farming and food, forestry, flooding and biodiversity - all of which are linked to land use and require some degree of spatial co-ordination and co-operation across different parcels of land and therefore different farms - must be pursued.

- NFU Scotland considers that there is a real need to avoid overly simple or naive policy approaches to tackling climate change - and the blunt tool of diverting resources to planting trees on good agricultural land falls right into that trap.

- Attention also needs to be paid to designing market mechanisms to promote mitigation - agriculture’s inclusion in an emission trading scheme should be explored.

- In what effectively becomes a land use debate, NFU Scotland firmly believes there must be a focus on preserving and enhancing the benefits delivered by active farming and food production - including those in relation to climate change.

- There is a limit to the uses that any area of land can deliver and the Scottish Government must recognise that if it is to reconcile concurrent policy aims.

**Background**

5. On 29 January 2008, the Scottish Government launched a consultation on its proposed Scottish Climate Change Bill that sets out a target to reduce emissions by 80% by 2050. It pointed out that the debate has clearly shifted in recent years from whether climate change is happening to what is causing it and what needs to be done about it.

6. It suggested that climate change presented major challenges for Scotland's land using industries, but that a well-planned and co-ordinated adaptation response would minimise the negative impacts and highlight potential opportunities.
7. The Climate Change Bill was brought forward to create mandatory climate change targets to, among other things, drive decisions in government and business, create and enable new means of reducing emissions and adapting to climate change, and provide a strong example to other countries.

Tackling Climate Change

8. NFU Scotland considers that the Scottish Government is well placed to influence many of the policy areas central to a strong mitigation and adaptation response in Scotland. NFU Scotland supports the development of a Scottish adaptation strategy to identify priority adaptation action required in Scotland and to clarify roles and responsibilities in achieving this action.

9. However, whilst the existence of climate change is widely accepted, there is still some uncertainty in the pace, pattern and magnitude of this change. Nevertheless, it is expected that, on average over the course of this century, annual temperatures will rise whilst precipitation will increase in winter but decrease in summer. In addition, the frequency and intensity of extreme events such as storms or droughts may increase, possibly sooner than changes to average conditions.

10. As a result, most areas in Scotland are likely to experience a longer agricultural growing season. Improved crop and grass growth will lead to new enterprises becoming viable as their biological limit extends northwards.

11. Conversely, the viability of some existing enterprises will reduce due to, for example, increased soil moisture deficits or heat stress. Equally, some existing and new weeds, pests and diseases will become more common in warmer and wetter conditions. Within this, there will be regional variation across Scotland - as with current conditions from north to south and west to east.

12. Therefore, given the uncertain and variable impacts that climate change will have on Scotland, and globally, NFU Scotland considers that a far more sophisticated approach to tackling climate change is required - rather than simply expanding tree cover across productive agricultural land.

13. NFU Scotland considers that it would be far more effective to divert resources to farm businesses in order that they can take informed and supported decisions in order to adapt agricultural practices and mitigate climate change impacts, and thereby deliver a range of wider rural development benefits as a consequence.

14. In responding to the challenge and opportunities posed by climate change, individuals and representative bodies across the farming industry have a key role to play.
15. In adapting to climate change, farmers and other land managers need to be aware of the potential positive and negative influences of climate change and adjust their business practices accordingly. For example, within-season adjustments to the timing of field and marketing operations and longer-term adjustments such as choice of livestock breed, mix of enterprise and business structure and land use system.

16. Farmers and other land managers also need to contribute to mitigation of climate change. This may require wider adoption of current best management practices, such as nutrient budgeting and energy efficiency informed by carbon and energy audits but, given appropriate policy support, more significant adjustment to the nature of agricultural land management could be achieved to provide ‘win-win’ outcomes.

The Balance of Land Use in Scotland

17. NFU Scotland is clearly of the view that Scottish agriculture and individual farm business can make a very positive contribution to tackling climate change. At the same time, the industry takes the principal role in rural development - not least through its contribution to local economies and delivery of other landscape and biodiversity benefits.

18. However, NFU Scotland considers that this function could have an even greater impact if the policy environment in which farming and farmers currently operate in were more receptive to agriculture’s primacy in both land use and tackling climate change.

19. NFU Scotland believes better integration between currently separate policy themes such as farming and food, forestry, flooding and biodiversity - all of which are linked to land use and require some degree of spatial co-ordination and co-operation across different parcels of land and therefore different farms - must be pursued.

20. This is essential because climate change issues can not easily be separated from other aspects of land use policy, or from broader sustainable production and consumption issues. It is essential that there is co-ordination and consistency of climate change policy across all other areas of the economy. In particular, adaptation and mitigation options need to be compared across, not just within, sectors to ensure comparability of true costs. NFU Scotland seeks clarity and consistency of approach to climate change targets and responses across all sectors.

21. In the short-run, the scope for modifying SRDP measures and funding must be explored to ensure that farming, as well as forestry, can play a lead role in tackling climate change. NFU Scotland considers that there is a real need to avoid overly simple or naive policy approaches to tackling climate change - and the blunt tool of diverting resources to planting trees on good agricultural land falls right into that trap.
22. Instead there is a need for policies structured to allow for localised flexibility, whilst achieving national aims. For the longer-term, attention needs to be paid to designing market mechanisms to promote mitigation - agriculture’s inclusion in an emission trading scheme should be explored.

23. The proposals for the forestry provisions in the Scottish Climate Change Bill also raise more fundamental questions of how Scotland uses its land. NFU Scotland firmly believes there must be a focus on preserving and enhancing the benefits delivered by active farming and food production - including those in relation to climate change.

24. Scotland’s farmland cannot reasonably be expected to deliver against all Scottish Government policies on food, flooding, climate change, tourism, access and inclusion without some trade-offs. If farmland is to deliver multiple public benefits, then there needs to be a proper evaluation of its worth backed by fully resourced and accessible measures that allow farmers to optimise that ‘value’ for the greater good.

25. The stated intention that this study does not focus on land ownership but instead looks at productivity is clearly welcome. While the findings of this study are not due to be presented until late next year, the fundamental changes taking place in Scotland’s hills and uplands means that decisions to address those changes need to be made on an ongoing basis rather than waiting until the study reports.

26. The Scottish Government must face up to the clear conflicts in land use that are raised by such proposals. Every year 1,200 hectares of ‘greenfield’ - an area the size of a large town - is lost to housing and industrial development. That development is generally taking place on some of Scotland’s most productive arable land, with that limited resource lost to food production forever.

27. At the same time, the Scottish Government has set itself the target of forestry coverage on 25% of Scotland’s land area. Any expansion in forestry area is likely to take place on ground traditionally used for grazing livestock. The Scottish Government, therefore, must also address whether the priority lies with active farming and food production - and all the rural development co-products that go with that - or elsewhere.

There is a limit to the uses that any area of land can deliver and the Scottish Government must recognise that if it is to reconcile concurrent policy aims.

CLIMATE CHANGE BILL & THE NATIONAL FOREST ESTATE

The National Trust for Scotland (the Trust) welcomes this opportunity to comment on this consultation on forestry provisions in the current Climate Change Bill. The main comments are set out below under Consultation Questions as set out in the Consultation Proposal.

Introductory Comments

The Trust’s comments are informed by both its role as the conservation charity that protects and promotes Scotland’s natural and cultural heritage and its roles as property owner and woodland manager.

We recognise that climate change targets and increases in woodland cover have been included in national strategies on Climate Change and Forestry and in principle see merit in looking at how all sectors can make greater contribution to tackling climate change. The Trust has considerable concerns though about some of the proposals contained in the Consultation Paper and the way they are set out without adequate supporting information.

As a result the consequences and merits of the proposals cannot be adequately assessed and we see potential disadvantages and risk from the public perspective which we consider below. We also note that despite the new importance given to woodland expansion and concern for climate change at present only 6500 hectares of grant aided woodland on average is being created per year compared with some 14500 hectares in the 1980’s (Figure 4: Grant aided woodland creation over the last 40 years - ‘Discussion Paper on Woodlands Expansion in Scotland’ June 2008).

The rest of this letter gives the Trust’s responses to the specific questions raised in the call for written evidence.

Consultation Questions

The key points the Trust wishes to comment on are:

Q 1: What are your views on allowing the Forestry Commission Scotland (FCS) to enter into joint ventures, with the intention of participating in renewable energy programmes on the national forest estate?

FCS already undertakes joint ventures for renewable energy projects. The arrangements for any new joint venture are not clear and are set out in only the very broadest terms. However it is our understanding that there could be potential from joint ventures for FCS to offer greater added value, develop its project management expertise, increase its revenues and expand community engagement. The Trust would be in support of further consideration being given to enabling FCS to carry out more joint ventures including those for renewable energy programmes.
renewable energy generation as long as these follow appropriate planning and environmental assessment procedures, are located and sited appropriately with safeguards being met for landscape and other aspects of natural and cultural heritage.

Q 2. What are your views on allowing Scottish Ministers and the Forestry Commissioners to offer leases and cutting rights over parts of the national forest estate?
The Trust is concerned that little detail is offered to support the figure for additional income, which seems small in relation to the cost of renewable energy generation development, nor for justifications for the scale and time spans under consideration. The potential for the removal of such large areas of land for such a long time could erode the concept and the operation of a ‘national forest estate’. The Trust does not see adequate evidence that the changes proposed will bring the degree of benefit suggested nor that there has been any analysis of the risks that there may be for sensitive landscapes, protected woodlands, the public interest or for the operations of the FCS. FCS currently takes a strong lead in delivery for most woodland Biodiversity Action Plan priority habitats and species and has done much to develop its remit in relation to cultural heritage issues including protection of archaeological remains, historic but unlisted buildings, public access and recreational uses. These broader yet important sustainable activities might be put at risk.

Q 3. What are your views on (i) transferring the proceeds from leases and cutting rights to a not-for profit trust, for investment in woodland creation; (ii) transferring the landlords interest in this land to a not-for profit trust; and (iii) Ministers stipulating the constitution for such a not-for profit trust.
The Trust has concerns that transferring leases away from FCS would reduce its income, especially as these are to take place over areas where ‘the timber production element is dominant’. A not-for profit Trust, as a new and additional organisation rather than one that already exists with other income streams, would have to offset its own and additional set-up, management and public duty costs against income that might have accrued to FCS. This could mean FCS would receive less than it currently does from such leases and so have less to spend on the rest of the estate, weakening its strategic position, eroding the quality of management, losing its expertise and so reducing the delivery of public benefits, even those directed towards climate change.

It is also disappointing then that no consideration or assurances have been made about the sort of conditions for such transfers or leases. No reference is made to requirements to address planning, environmental assessment and consultation procedures, to carry out new forestry to UKWAS certification, to meet forestry ‘best practice’ standards, to provide a range of public benefits like access, amenity, educational and employment benefits, co-ordinated network creation with FCS and others, biodiversity improvements and respect for Scotland’s species. Lease conditions and arrangements may bring further loss of income due to a need for independent monitoring of performance.
The not-for profit trust is to be constituted to reflect the ‘public interest’ and ‘appropriate objectives and arrangements’ but the consultation should have been more explicit, for example, about aims for sustainable woodland activities, the sort of provision for public benefits and the involvement of local communities.

**Q 4. Are there other actions which need to be taken, or are there other changes in legislation which need to be made, in order to allow the public and private forestry sector to contribute to Scotland’s target of reducing emissions by 80% by 2050. If so please outline what these are.**

The Trust recognises that the primary focus in the Climate Change and Sustainable Development Strategies is on reducing CO2 emissions from buildings and transport through energy efficiency and the development of alternatives to carbon based energy systems. As a step to interpreting and addressing these aims the Trust supports calls for an explicit duty towards Sustainable Development for all public bodies.

The ability of the forestry sector to contribute to Scotland’s targets then needs to be viewed against such a perspective and balanced against a range of public benefits including enhancement of the natural and cultural heritage. We understand there are best practice and low impact silviculture systems that can contribute to emissions reduction and ways should be explored on how to promote these as standards across the whole industry.

The Trust has also pointed out in a previous consultation response on Woodland Expansion that there is a need for better understanding of the balance between the release of carbon from different soil types and the amount of carbon sequestration achievable by woodland growth. If cyclical cropping is encouraged then the benefits of sequestration will be consequently limited.

For the avoidance of doubt the Trust is happy that these views be made available to the public. We would be grateful to be kept informed of progress in this matter and for a copy of the proposed consultation report and of the Report to Ministers. In view of the urgency in considerations on the Climate Change Bill we are offering similar comments to the Clerk of the Rural Affairs Committee and to SPICe. I hope that this response will be helpful. Please contact me if any of my colleagues or I might be able to provide any additional information or clarification.

**The National Trust for Scotland**

**29 January 2009**
1 I agree with the proposed change in legislation to allow FCS to enter into joint ventures. Income from such ventures should be ring fenced for Forestry and flexibility given to FCS accounting to enable monies to be rolled over into subsequent years to even out the income stream.

2 I am against any proposal to lease out areas of the national forest estate or allow cutting rights. Changes in legislation to allow this are unnecessary as the objective of meeting the planting target of 10,000ha per year could be funded through an increase of the repositioning programme (see 4 below).

Leasing out large area of the forest estate is unlikely to realise the full market value of the asset while losing control of the land and so be able to respond to or take advantage of future changes in land use priorities or opportunities.

The leasing out of the 25% most productive areas will reduce FCS income by an estimated 35% leaving a funding gap for managing the remainder of the national forest estate as the minister has stated that no extra funding will be available.

Although this may not have an impact on the delivery of nonfinancial benefits in the short term these areas are bound to suffer in the medium to long-term, as investment will be greatly reduced. The ministers recent restriction on any significant further investment in mountain biking trail building by FCS can be seen as a precursor to future policy made necessary by reduced budgets.

There is no guarantee that any money raised through leasing or cutting rights would be reinvested in forestry and even if £200m was raised up front the forest industry wouldn’t be able to respond to investing that amount in one or even two years. This money would then be lost to forestry and funding to achieve the new planting objective would fall short in subsequent years.

The guarantees made to FCS staff by the minister in letters to the press are disingenuous. To say that there will be no compulsory redundancies and that any staff not wishing to transfer to a private company ignores the reality that if you reduce the size of the estate and the budget of FCS you have to reduce staffing costs. Many of the lower grade staff in the FCS are non-mobile and refusal to transfer to another area would be considered to be resignation.
The safeguards under the TUPE regulations are not as good as they are made out to be, once transferred conditions of service can be changed or redundancies made if an economic justification can be made.

The likely concentrating of the areas to be leased will also result in a significant social and economic cost to these areas.

3 As stated I am against leasing of the national forest estate and removing this from the bill would remove any argument for creating Trusts.

4 As stated above it is my view that the most practical and cost effective way of raising the extra funding from the forest estate for new planting until the income from joint ventures becomes available is an increase of the repositioning programme to £30m a year. This would allow areas throughout the country that don’t meet FCS’s core objectives to be sold, realising their full value and with out high local impact.

Chris Ross
27 January 2009
Summary
RSPB Scotland welcomes the opportunity to contribute to the debate around the management of Scotland’s forests in relation to climate change adaptation and mitigation. We support the ambitious targets for reducing green house gas emissions in the draft Climate Change (Scotland) Bill. These targets must be met in an environmentally sustainable manner, protecting Scotland’s wildlife and giving it the best chance to respond to our changing climate. We are concerned that the forestry provisions are distracting from discussion of the urgency of reducing our emissions and how we propose to meet the targets.

It concerns us also that forestry has been isolated as a form of land use and that other aspects of Scotland’s land use - which contributes 25% of Scotland's greenhouse gas emissions- have not been included in the Bill, nor are they being debated.

We strongly support the idea of Forestry Commission Scotland being able to participate in environmentally appropriate joint ventures to address climate change under Section 47 (3).

We consider that the broad nature of the provisions in Section 47 (1), (2) and (4) would alter the legal basis of Scottish forestry regulation, policy and practice and risk undermining existing government commitments on biodiversity objectives and sustainable forestry.

Reports that up to a quarter of the state forest will be put out to long-term lease cause us potential concern. We fear that it could restrict the Scottish Government’s ability to improve the biodiversity value of this land, and to meet public policy objectives of the Scottish Biodiversity Strategy, UK Biodiversity Action Plan, the EU Birds and Habitats Directives and the Ramsar Convention. The role and function of the National Forest Estate must be strategically considered and planned. Leasing options must enhance public benefits and should the lease proposals go ahead, a new environmental reference group should be established to vet lease applications and subsequent management plans.

Vital conservation and climate adaptation work funded by the Government's land management grants for farm and croft land must not be compromised by the sudden introduction of over 100,000 hectares of leased forestry land into the SRDP.
Our key recommendations

- Introduce an overarching sustainability duty in the Bill to ensure that forestry and other land uses provide multiple environmental, social and economic benefits.
- Remove the open-ended provision for changing the Forestry Commissioners' duties and functions in Section 47, subsection 1, 2 & 4.
- Retain Section 47, subsection 3 measures for FCS ‘joint ventures’ for supporting the development of renewables and other climate change benefits.
- Introduce a holistic approach to land use in the Bill through the addition of a duty to develop an integrated set of land use policies.
- Strengthen provisions for adaptation in Section 45 to ensure climate change impacts on Scotland’s forests are properly identified and that adaptation policies are subject to independent scrutiny.
- Use Forestry Commission’s current review of carbon science to shape future forestry proposals.

Response to consultation questions

1. **Do you envisage that the Forestry Commission could play a greater role than it does at present in reducing greenhouse gas emissions or in alleviating or responding to the effects of climate change? If so, what suggestions would you make?**

Yes. There is also a very important role for Forestry Commission Scotland (FCS) to implement climate change adaptation plans, for example by restoring the biodiversity, hydrology and carbon of peatlands it has in its stewardship. This would also have climate change mitigation benefits as Scotland has most of the UK’s peatlands, which are rich carbon stores when in good ecological condition.

There is real scope for forestry to help Scotland’s important biodiversity to adapt to climate change, such as black grouse, capercaillie, peat bogs, Western Atlantic oakwoods and native pinewood. As they stand, the forestry proposals consulted on miss this key opportunity to help Scotland’s wildlife adapt to climate change. Forestry’s role in helping other sectors adapt to climate change also needs to be considered. Sustainable flood management for example requires consideration of forests within both upland and lowland water catchments.

There are other climate change mitigation actions that FCS could be involved with on the National Forest Estate. E.g. encouraging the use of Scottish grown and manufactured timber/wood products to replace steel and concrete, and promoting more efficient energy use in forest management and the wood supply chain. FCS has embarked on aspects of this.

Much of this can be delivered by FCS without needing the open-ended changes to duties and functions contained in Section 47 (1, 2 & 4) in the draft Climate Change (Scotland) Bill (the ‘Bill’). Indeed the main climate change provisions in the early chapters of the Bill will help FCS deliver greater climate change benefits.

Woodland expansion in Scotland must be carried out sensitively to ensure the protection and enhancement of important biodiversity – priority species, habitats and designated sites. We urge the Scottish Government not to repeat the woodland expansion mistakes
of the past, and to reverse the damage to biodiversity and landscapes caused by inappropriate afforestation.

Despite the fact that afforestation on organic soils in temperate countries is not necessarily a carbon sequestration measure, this programme is being presented as a way of meeting carbon targets through woodland creation. Forestry carbon science is under debate and the role of soil carbon is little understood. The Forestry Commission is undertaking a review of carbon science, so it is unwise to claim substantial benefits until this is demonstrated.

2. Do you consider that either of the Government’s consultation proposals (on entering into joint ventures and on leasing cutting rights) would enhance the Forestry Commission’s role in dealing with greenhouse gas emissions and climate change?

Tree planting for climate change 'mitigation' is a distraction from reducing green house emissions reductions at source. These proposals also do not properly address adaptation. There is a danger that by singling out forestry as proposed in the Bill undervalues the wider and considerable climate change benefits of other land uses. This ignores the need for a more holistic integrated approach to land use planning in both climate mitigation and flooding.

The proposal for long term leasing of parts of Scotland's national forest estate to fund new climate work looks innovative, but the Scottish Government must ensure that the leased area delivers no less - and preferably more - for biodiversity conservation than if the land had remained in public management.

The ability of Forestry Commission Scotland to enter commercial partnerships could help deliver positive climate change work¹, so we welcome the Climate Change (Scotland) Bill proposals under sub-section 3 of Section 47, but we have concerns about the objectives, functions and operations of new trusts. Ministers must make sure that any trust is publicly accountable, delivers public policy objectives and does not raise memberships.

RSPB Scotland is concerned that the mechanism that has been proposed under Section 47 (1) for obtaining powers to lease Forestry Commission Scotland land is inappropriate because undermines the biodiversity duties and function of the Forestry Commissioners under Section 1 of the Forestry Act 1967 and Section 1 of the Nature Conservation (Scotland) Act 2004.

3. Do you envisage any implications for nature conservation, biodiversity or recreational interests from the two proposals and, if so, what are they?

Yes. The woodland expansion elements of the proposals could threaten the conservation of open ground habitats and species, either by woodland creation, or lost opportunity to restore such habitats. Woodland expansion in Scotland must be carried out sensitively to ensure the protection and enhancement of important biodiversity.

¹ We note that similar wording to Section 47 (3), was used in 2006 to introduce incidental powers for the Forestry Commissioners in England and Wales to assist the financing of the Forest Holidays business and recreational provision: Section 7 of the Forestry Act 1967 in England & Wales was amended by the Regulatory Reform (Forestry) Order 2006. Statutory Instrument 2006 No. 0780. http://www.opsi.gov.uk/si/si2006/20060780.htm See also FC info: http://www.forestry.gov.uk/pdf/explaindoc.pdf [Link no longer operates] & http://www.forestry.gov.uk/rroforestryact [Link no longer operates]
We strongly urge the Scottish Government, and its delivery bodies, not to repeat the woodland expansion mistakes of the past, and to reverse the damage to biodiversity and landscapes caused by inappropriate afforestation. This could provide real climate change mitigation as well as adaptation benefits.

Despite the fact that afforestation on organic soils in temperate countries is not necessarily a carbon sequestration measure, this programme is being presented as a way of meeting carbon targets through woodland creation. The benefits of sequestering carbon are by no means straightforward. The science behind this needs ground-truthing which should be a role for the state forestry research sector. Scottish Ministers must take account of the independent review of forest carbon science that the Forestry Commission has recently commissioned, and the recommendations of the FC Carbon Advisory Group.

If a significant proportion of the state forest is put on long-term lease to commercial interests (reportedly 25% in the first instance), it will restrict the Scottish Government’s ability to improve the biodiversity value of this land to meet public policy objectives of the Scottish Biodiversity Strategy, UK Biodiversity Action Plan, the EU Birds and Habitats Directives and the Ramsar Convention. Leasing options must favour maximising public benefits.

RSPB Scotland is concerned that this approach to splitting the state forest into ‘commercial forests’, and ‘heritage forests’ ignores current government ‘multi-purpose sustainable forestry’ policy, as well as forestry practice. High quality biodiversity outputs can, and should be generated from ‘commercial’ plantations, including those held for the Scottish people.

Changes to the management of the state forest should be done in accordance with the recommendations of Forestry Commission Scotland’s Environment Review Group. The role and function of the National Forest Estate must be strategically considered and planned. Should the lease proposals go ahead, a new environmental reference group should be established to vet lease applications and subsequent management plans. All lease proposals, forest management plans and grant applications, must go on to the FC’s Public Registers.

The management of state forest land, including that on long term-lease, should include the ambitious restoration of open ground habitats within commercial plantations, and meaningful work for priority species, such as black grouse and capercaillie. This goes beyond meeting the biodiversity requirements of the UK Woodland Assurance Standard (UKWAS).

Income generated from leasing state forests should be used to accelerate action to help Scotland’s wildlife and landscapes adapt to climate change. These funds – a reported

5 See: http://www.forestry.gov.uk/forestry/INFD-5ZADT9 [Link no longer operates]
£200 million - must finance action to restore the carbon and wildlife value of damaged peatlands and coastal dune systems, create carefully located native woods and help priority species. Vital conservation and climate adaptation work funded by the Government's land management grants for farm and croft land must not be compromised by the sudden introduction of over 100,000 hectares of newly eligible leased forestry land.

Currently the National Forest Estate is certified to the voluntary UK Woodland Assurance Standard (UKWAS) – this has to remain. The Scottish Government has commitments to maintain the state forest’s UKWAS certification, and to increase UKWAS uptake in Scotland.

4. **Do you believe there are any implications for rural employment from the two proposals and, if so, what are they?**

RSPB Scotland does not have the expertise to comment on this question.

5. **Do you have any other views on these two proposals from the Government?**

Yes. Unfortunately, consideration of the forestry provisions in Section 47 have created an unhelpful distraction from important discussions over the main parts of the Climate Change (Scotland) Bill. We are also disappointed that the forestry proposals do not sufficiently address action for climate change adaptation for biodiversity.

Climate change is the greatest single threat to Scotland’s wildlife. It is imperative that Scotland starts delivering greenhouse gas reductions and enabling swift and deep cuts. RSPB Scotland welcomes the challenging targets for reducing emissions in the Bill. In meeting these targets we must protect our precious wildlife, and give it the best chance to respond to our changing climate.

The Bill needs to address the contribution Scotland’s other land uses, as well as forestry, make to climate change, and to facilitate environmentally sustainable mitigation action. 25% of Scotland’s greenhouse gas emissions come from land use. We would welcome an indication in the Bill that the forthcoming Land Use Review would set out a strategic approach for managing Scotland’s land use in relation to climate change mitigation and wildlife adaptation.

Forestry’s role in helping other sectors adapt to climate change also needs to be considered. Sustainable flood management, for example requires consideration of forests within both lowland and upland water catchments.

The proposed adaptation measures under Part 5 Chapter 1 of the Bill are insufficient because that they rely entirely on a UK assessment of climate change risks and offer no independent scrutiny of the Scottish Government’s adaptation policies and subsequent progress on adaptation.

In relation to forestry there is the danger that a purely UK assessment of risks might not provide sufficient consideration of particularly Scottish issues such as the impacts on native Scots pinewoods. Failure in the Bill to provide for independent scrutiny or advice from other bodies in relation to the Scottish Government’s adaptation policies could mean that important issues concerning forestry be overlooked. Indeed, the fact that forestry

---

6 This was made at the 2002 UN World Summit on Sustainable Development, see: http://www.forestry.gov.uk/website/pdf.nsf/pdf/ukforestpartnership.pdf/$file/Aikforestpartnership.pdf
adaptation and its role in helping other sectors adapt was not included in the climate change consultation demonstrates the need for wider engagement to avoid missing key opportunities.

We do not welcome the additional broad powers being sought by the forestry minister in Section 47 (1, 2 & 4) to over-ride the Forestry Commissioners’ duties under the Forestry Act 1967, and to delegate their functions. If enacted, these provisions could result in environmentally unsustainable forestry that would harm, not enhance biodiversity. The RSPB would expect full and proper consultation and public debate on any fundamental changes to the primary legislative framework of forestry in Scotland. This should be done separately from the Climate Change (Scotland) Bill.

Overall, the RSPB believes that the Climate Change (Scotland) Bill should take a more holistic approach to rural land use, rather than just considering forestry and muirburn. It is vital to addressing within the Bill the 25% of Scotland’s greenhouse gas emissions that come from land use. An indication in the Bill that the forthcoming Land Use Review would set out a strategic approach for managing Scotland’s land use in relation to climate change would be welcomed.

RSPB Scotland
29 January 2009
I first of all have to state that I agree with the principles of the Scottish Government on Climate Change. We all have a duty to reduce, recycle and reuse and lower our Carbon emissions.

I DO NOT agree with the proposal to lease (practically SELL OFF) forestry land and timber. I find this really strange on the concept of a 'Nationalistic Government' "selling off" the land to private and foreign companies. The Forestry Commission (FC) land holdings and operations are funded from the public purse, not just from Scotland but from all the UK. Has the question been put the people of these other countries concerning the loss of land which they fund?

The Forestry Commission has been in existence for ninety years and in that time has seen many changes and developments, this is by far the most draconian to date. The outcome could be the loss of employment for 100s of people and in a rural economy, devastating. The UK forest industry is seen by many organisation across the globe as a leader in forest management, land management, conservation, environmental protection and recreation it would be a great loss to the people of this country to lose that recognition.

Having had some time to consider the Governments proposals I strongly feel that changing the forestry act would permit the (FC) to enter into joint venture agreements with the major energy companies and businesses that would benefit the whole country and still help to reduce carbon emissions.

The FC has land and facilities that could be developed in partnership with private companies to generate income, create employment and be sustainable. Hydro power, wind power and bio power ventures are just a few that spring to mind.

In Scandinavia the use of Bio fuel is one area where joint venture investment has been successful. Local power plants, constructed by private companies or the state purchase the fuel from the forestry companies (both private and state owned) and sell the energy to the local communities. Everyone involved with the supply of the energy is being financially compensated.

We all know the potential financial returns from large scale hydro electric power schemes. However; small hydro power plants located within FC land generating energy to supply to local communities or the national grid could be just as profitable?
Kielder forest in North England is a good example of partnership working. The dam was constructed in the early 80s to supply power to the Consett Steel Works. With the steel works closing the water and potential energy was not required. Investigation and partnership working with several companies and organisations, including the FC and local council has seen the area prosper from energy being fed into the national grid and an expansion of recreation facilities around the dam. Which is creating employment, revenue to the local and national purse.

I see no reason why the Forestry Commission, Scotland (Government) cannot enter into these type of ventures with the power supply companies, instead of selling the ‘family jewels’ (cheaply I may add) to create a fast but short term answer to our current financial problems. Which has nothing to do with Climate Change of Carbon Reduction!!

Colin J Saunders
25 February 2009
Scottish Environment LINK (LINK) welcomes the opportunity to give written and oral evidence to the Committee on the forestry proposals in the Climate Change (Scotland) Bill. Established in 1987, LINK is the forum for Scotland's voluntary environment organisations - 33 member bodies representing a broad spectrum of environmental interests with the common goal of contributing to a more environmentally sustainable society. LINK provides a forum and network for its member organisations, enabling informed debate, and assisting co-operation within the voluntary environmental sector. LINK assists communication between member bodies, government and its agencies and other sectors within civic society. Acting at local, national and international levels, LINK aims to ensure that the environment is fully recognised in the development of policy and legislation affecting Scotland.

Introduction

In principle we welcome the fresh look at how the Forestry Commission Scotland (FCS) can deliver for climate change but we are particularly uncomfortable, as we have highlighted before\(^1\), with woodland creation for carbon sequestration becoming the primary driver for the government and the National Forest Estate (NFE). LINK has repeatedly expressed its view that the best way to respond to climate change is to first reduce green house gas emissions by moving away from carbon based energy production, reducing energy consumption and energy loss. We see carbon sequestration as one of the secondary responses that feature further down the list of the multiple benefits forestry provides.

The plans proposed in the recent consultation and the enabling powers in the Climate Change (Scotland) Bill are controversial and as yet, they have not been fully explained or costed. Our detailed concerns on these proposals are presented below.

It is LINK’s view that these proposals require more considered thought and discussion. As a result we are unhappy with the wide reaching enabling powers in Section 47, Sub-sections 1, 2 and 4 being included in the Bill. Rather we would like to see any specific powers that may be identified, brought forward in the future, after they have been properly explored and consulted upon.

---

We do however welcome the inclusion of Sub-section 3, a), b), c) and d) (i) which allows the FCS to enter into joint ventures for renewable energy projects because these proposals are specific, directly relevant to the Bill’s aims, and help to enable objectives already set out in the Scottish Forestry Strategy (SFS).

**Question 1. Do you envisage that the Forestry Commission could play a greater role than it does at present in reducing greenhouse gas emissions or in alleviating or responding to the effects of climate change? If so, what suggestions would you make?**

It is LINK’s view that there has been a clear change in policy drivers for forestry in the last 18 months, in favour of forestry and woodland creation for climate change ‘mitigation’. LINK has always accepted that creating new woodland contributes to the process of carbon sequestration but it cannot sequester more than a small proportion of the total carbon emissions generated each year.

Government efforts to reduce CO₂ emissions are best concentrated on mitigation activities such as better insulation of the existing housing and office stock, reduction of transport emissions and restructuring our energy supply away from carbon based energy sources.

The National Forest Estate, whilst having a role to play in carbon sequestration, has a greater role to play in climate change adaptation and making space for nature. Unfortunately climate change adaptation has not been properly considered in these forestry proposals.

Therefore, LINK believes, carbon sequestration should not be a primary driver for woodland creation. Rather it should be one of a range of benefits arising from long term, multi-benefit forestry. This would mean carbon storage can be assured in perpetuity and the woodland creation can provide additional benefits to society, such as new and enhanced public access, greater biodiversity, and landscape maintenance and enhancement.

LINK believes that to properly address these issues and to look at the role of carbon across all types of land use in Scotland, we need a Sustainable Land Use Strategy to be implement a holistic approach to integrated land use and delivery of multiple public benefits.

**Question 2. Do you consider that either of the Government’s consultation proposals (on entering into joint ventures and on leasing cutting rights) would enhance the Forestry Commission’s role in dealing with greenhouse gas emissions and climate change?**

**JOINT VENTURES:**

In principle we have no objection to legislation being amended to allow FCS to undertake joint ventures with renewable energy companies, subject to appropriate safeguards, because we support the principle of injecting new resources into forestry and climate change delivery. These joint ventures would be directly contributing to the government’s renewable energy targets.
and could provide funding and expertise in developing our renewable energy sector.

Any joint ventures would require careful consideration and we would expect safeguards to be in place to prevent inappropriate developments and an adverse effect to habitats that must be retained to enable adaptation to climate change. These safeguards should include the following requirements:

- That there is protection for other public benefits such as: Plantation Ancient Woodland Sites (PAWS), woods of high nature conservation value, biodiversity, priority open ground habitats, public access and recreation provision.

- That FCS will undertake full Environmental Impact Assessments on the joint ventures.

- That all proposals will follow the full planning process and any supplementary planning guidance on preferred locations for renewable projects.

Any money raised from such ventures would need to be properly reinvested in climate change actions and a protocol may need to be developed to ensure this delivers the greatest possible environmental benefit, including emissions reductions and wildlife adaptation.

CUTTING RIGHTS
There is considerable concern that by implementing this proposal, other non-timber production public benefits would not be well served. This is largely because the income that the FCS generates from the leased production forest may impact on other multi-benefit forestry it carries out on the rest of the estate.

For these proposals to be considered further, LINK would expect that:

- The economic case is properly laid out. This has not yet happened and therefore it is not possible for us to comment on the financial aspects of the proposals with any confidence.

- A full and satisfactory Strategic Environmental Assessment is undertaken on the fully costed proposals.

- A proper assessment is undertaken of the impact on the remaining FCS activities and ability to deliver the SFS. At present the FCS carry out a complicated balance of economic, social and environmental activities (including for the landscape and the historic environment) within their forests. Transferring the more commercial parts of the national estate for a period of perhaps 75 years could potentially and severely constrain funding of the social and environmental aspects of FCS activities.
• There is a full explanation of how enhanced delivery of non-market benefits will take place. For example meeting the commitments of the Scottish Biodiversity Strategy, UK Biodiversity Action Plan, EU Birds and Habitats Directive and the biodiversity theme of the SFS.

• Evidence is provided that all the capital raised from the leases would be reinvested into forestry and associated climate change actions. So far there have only verbal ‘in principle’ assurances which are inadequate. In the absence of clearly set out protocols and structures we are not be able to further consider the proposals.

• Accessibility must be retained if the land is leased. There is a significant difference between a right to access and accessibility.

• Any company or body leasing the land would have to ensure that the land was certified against the UK Woodland Assurance Standard (UKWAS) for the entirety of the lease.

There is concern that releasing over 100,000ha of new land into the Scottish Rural Development Programme (SRDP) may lead to increased competition for woodland management funds, without increasing the SRDP budget. LINK would wish to see assurances that high quality land management for biodiversity, landscape conservation, historic environment and access would not lose out.

**Question 3.** Do you envisage any implications for nature conservation, biodiversity or recreational interests from the two proposals and, if so, what are they?

LINK is concerned that the woodland expansion elements of these proposals could threaten the conservation of open ground habitats and species, either by woodland creation, or lost opportunities to restore such habitats. For that reason, LINK urges the Scottish Government and its delivery bodies not to repeat the woodland expansion mistakes of the past, and to actively reverse the biodiversity damage created by inappropriate afforestation. Woodland expansion in Scotland must be carried out sensitively to ensure the protection and enhancement of important biodiversity and the delivery of multiple public benefits.

**Question 4.** Do you believe there are any implications for rural employment from the two proposals and, if so, what are they?

LINK does not have a specific view on the employment implication of these proposals because it is largely outside of our members’ direct remit. We would however say that we would not want to see a reduction of actively managed woodland in Scotland and it would be a disadvantage to the forestry sector if valuable skills and knowledge is not retained within the industry.

**Q.5.** Do you have any other views on these two proposals from the Government?

Within the FCS consultation document, there was a suggestion of creating a not-for profit trust (NFPT). This suggestion strongly implies a social and
environmental purpose for such a body (i.e. public rather than commercial benefit), as well as some stakeholder representation in its governance arrangements, but this is not explicit in the proposals and that gives us some cause for concern.

LINK would need to see the following guarantees in order to further consider the proposal:

- All income from the lease of land and cutting rights to be invested through the NFPT into multiple public benefits through forestry and related climate change actions. This means investment in climate change adaptation as well as ‘mitigation’.

- The NFPT is constituted to deliver forestry related public benefits and priorities as laid out in the Scottish Forestry Strategy and in particular in relation to climate change ‘mitigation’ and adaptation.

- The NFPT will enable creation of significant areas of new native woodland.

- All woodland creation funded through the new structure should be UKWAS certified.

LINK would not support the idea of the NFPT using lease and cutting rights income to solely create new production forests. All new woodland created should be multi-purpose and provide significant public benefit. If the NFPT creates new woodland in the same proportion as the current estate, it will create 87% exotic species – this would be contrary to the vision of the SFS and would not be supported by LINK. In order to achieve the current SFS vision, more than 6,000 hectares of native woodland is required per annum for the next 50 years (35% of the enlarged forest cover of 25% land area). We cannot see the logic of the NFPT creating more production forest to sell or lease off and create more in a cyclical fashion.

**LINK Woodland Task Force,** 3 February 2009.

Call for Evidence on the Forestry Provisions in the Climate Change (Scotland) Bill Inquiry

Thank you for inviting Scottish Natural Heritage (SNH) to comment on the forestry provisions in the Scottish Climate Change Bill. These would modify the functions of Forestry Commission Scotland (FCS) in a number of ways. Most notably they would allow Scottish Ministers to lease out parts of the National Forest Estate (NFE), with associated cutting rights. The intention would be to use the funds so generated to finance measures designed to mitigate or adapt to climate change.

Current FCS Management of the NFE

Afforestation, and the management regimes applied to existing forests, was for many years - especially from the 1960s to the late 1980s - one of the most environmentally contentious issues in the Scottish countryside. Although many of the most controversial cases related to private sector forestry proposals, the Forestry Commission's own activities also attracted criticism.

It is greatly to the credit of FCS that over the past 15–20 years, this situation has been substantially transformed. FCS's enthusiastic adoption of multiple objectives, and willingness to engage local communities and other stakeholders in its decision making about the future management of its woodlands, has not only radically altered the way it is viewed in environmental and recreational circles but has also delivered very substantial benefits on the ground. These benefits have extended from biodiversity, through improved landscape quality to high valued recreational facilities, catering positively for a range of activities in a way which goes well beyond the open access requirements established by the Land Reform (Scotland) Act 2003. These enhancements have in turn helped to support an extensive range of rural businesses, as became very apparent at the time of the 2001 Foot and Mouth Disease outbreak.

Of equal importance has been the lead that FCS has thereby provided to the wider forestry industry. This is a diverse community, the more far sighted members of which have long aspired to ideals and standards of multi-purpose management at least on a par with those recently embraced by FCS. But overall, private sector forestry has, perhaps understandably given its commercial imperatives, delivered far less by way of environmental and recreational public benefit than the NFE.

SNH is anxious to ensure that any changes in the management of the NFE preserve the gains that have been secured through FCS management over the past decade or more. Indeed, it sees it as important, in terms of the
Scottish Government’s objectives in the fields of biodiversity, sustainability and increased participation in outdoor recreation, that these benefits are extended more widely across the country’s woods and forests.

In these circumstances SNH sees it as very important that any leasing out of existing NFE land is subject to safeguards carefully designed to secure the maintenance of these public benefits. The aim should be to preserve them alongside the additional benefits, in terms of climate change mitigation and adaptation, that are sought through these proposals. The latter should not replace the former.

Detailed responses to the Committee’s questions are set out in Annex 1. I hope that these answers of assistance to you.

ANNEX 1

Do you envisage that the Forestry Commission could play a greater role than it does at present in reducing greenhouse gas emissions or in alleviating or responding to the effects of climate change? If so, what suggestions would you make?

FCS, with its partners, has committed considerable research effort to help clarify the approaches that it should adopt in adapting to the effects of climate change. This includes work on tree growth, disease and stand/landscape-scale adaptation to changing environmental conditions. This consultation relates more to the actions that FCS might take to mitigate climate change, including energy production, soil carbon management and products that replace less green alternatives (e.g. timber for concrete). Wise choices need to be made, for which a key step is to develop robust ‘carbon accounting’ procedures – that is, to understand the contribution of a range of activities to greenhouse gas (GHG) emissions and the timescale over which any benefits occur. Work is already underway on this, but until we have this information it will be necessary to be cautious about advocating some more dramatic steps – for example the planting of new forests on wet, peaty upland soils may result in a medium term increase in GHG emissions, as soil carbon is oxidised.

Do you consider that either of the Government’s consultation proposals (on entering into joint ventures and on leasing cutting rights) would enhance the Forestry Commission’s role in dealing with greenhouse gas emissions and climate change?

SNH is supportive of well designed renewable energy developments and we see no problems with FCS being involved in to joint ventures to deliver these, particularly as any developments will be subject to the same assessment and decision-making procedures as any other renewable development.

The extent to which this proposal enhances FCS’s role in tackling climate change will depend on the details of any final proposal. At present we can
only set out our view of potential **benefits**, **risks** and **safeguards** against these risks.

There are clearly potential **benefits** in the raising of funds to meet Scotland’s wider climate change mitigation and adaptation aims, which are strongly supported by SNH. One suggested use of such funds is for woodland creation; we are very interested in further discussion on the type and location of any proposed new woodlands both for their natural heritage impacts and to see the assessment of impacts on GHGs in the short/medium/long term. Other related actions could be also contribute – especially promoting significant natural regeneration from existing native woodlands, and increasing the carbon capture/storage ability of peatlands (e.g. reducing erosion and drain blocking).

**Do you envisage any implications for nature conservation, biodiversity or recreational interests from the two proposals, and if so, what are they?**

The leasing proposal carries with it a number of **risks**, which collectively could jeopardise the gains secured through a substantial investment of public funds over recent years.
These include:

- reduced commitment to biodiversity, landscape and amenity care, and recreational and educational provision – restricting future provision and possibly resulting in a loss;

- an erosion of the scope for cross-subsidisation within the NFE, whereby surpluses generated on some properties support public interest provision elsewhere;

- a weakening of FCS’s credibility as an industry leader, able to demonstrate by example how the provision of public benefit can be reconciled with commercial, timber production objectives;

- pre-emption of already limited SRDP resources, as operations in the leased forest become eligible for grant support; and

- the possibility that it would become hard to raise regulatory standards in an industry which had entered into a financial contract with Government on the basis of an existing set of standards.

For any leasing arrangements to bring significant net public benefit it would in SNH’s view be important to put in place safeguards against these risks. SNH does not feel competent to advise on precisely how best to achieve this goal. We would, however, like to suggest some principles that might be followed in attempting to do so. These would involve commitments:

- to maintain for public benefit management an income stream comparable to that previously generated by commercial income from the leased forests. One possibility would be to earmark income from the proposed “joint vehicle” renewables projects for this purpose;

- to fund from lease income new public benefit provision/assets at least comparable with any lost as a result of the leasing exercise. Moreover, the benefits provided should be of broadly the same types, and in broadly the same proportion, as those lost and should thus extend across biodiversity, landscape, amenity and recreation and should not be restricted to carbon management; and

- to review the lease arrangements at regular intervals (perhaps every ten years) to make sure that the terms remained adequately protective of public (and specifically natural heritage) interests. We consider this important because the original terms could well become increasingly outdated and unreflective of current public priorities as circumstances changed.
Do you believe there are any implications for rural employment from the two proposals, and if so, what are they?

The proposals are not sufficiently detailed to answer this, nor is rural employment an area in which SNH has any particular expertise. We would, however, like to point out that, as technology in the forestry industry itself has developed, an increasing proportion of the employment generated by the sector has been indirect, relying on the use of forests for other purposes, notably recreation and tourism. This is an aspect of forest management and facilities provision where FCS has very much taken the lead. It has engaged in a large number of initiatives designed to ‘add value’ to the forest resource in this way. Many of these have involved partnerships in which SNH has also participated, along with other bodies with more specifically economic and social objectives. We would be concerned about the consequences of any net reduction in this activity for the rural economy as well as the natural heritage.

Do you have any other views on these two proposals from the Government?

SNH does not regard the leasing option as the only, or necessarily the best, means of raising money to fund climate change-related measures. One alternative particularly appropriate to woodland expansion measures would be some form of carbon offset scheme. There is at present a shortage of adequately accredited and policed schemes of this kind, in part as a result of the lack of a robust carbon accounting system. There could in our judgement be considerable potential for such a scheme dedicated to the financing of environmentally responsible, sustainable woodland expansion in Scotland.

SNH
January 2009
Scottish Renewables warmly welcomes the progress made in tabling the Climate Change (Scotland) Bill which is one of the most significant pieces of legislation ever considered by the Scottish Parliament. Scottish Renewables is Scotland’s leading green energy trade body. We represent over 230 organisations involved in renewable energy in Scotland and include many environmental NGOs in our wider associate membership. Further information on our work and membership can be found on our website – www.scottishrenewables.com

Scottish Renewables believes that the harnessing of renewable energy sources in a sustainable manner provides a unique opportunity to not only tackle climate change but to provide economic benefits to Scotland. The setting of statutory targets to reduce emissions is vital if we are to send the right signals to industry and wider society that significant changes are required to establish a low carbon economy.

Scottish Renewables is pleased to respond to the Rural Affairs and Environment Committee’s call for evidence in respect of the forestry proposals contained within the proposed Bill and has addressed the five questions which the Committee is seeking information on.

If Scottish Renewables can be of any further assistance to the Committee, we will be happy to provide further written or oral evidence in support of our statements.

1. Do you envisage that the Forestry Commission could play a greater role than it does at present in reducing greenhouse gas emissions or in alleviating or responding to the effects of climate change? If so, what suggestions would you make?
